Career Integration with Science, Health and Life Skills at the Grade 6 Level

Abstract

This paper presents and discusses the effectiveness of integrating a career planning unit with both Grade 6 Science and Health and Life Skills curricula. The data presented is both quantitative and qualitative in nature. Within this career planning unit, a variety of learning activities will be outlined and discussed as to the benefits of integrating career planning into the Alberta Education Curriculum for Science and Health and Life Skills. Clear descriptions of each activity are outlined and resources and templates used for evaluation of the unit are provided. This career planning unit was delivered to a grade 6 class in a small hamlet in Southern Alberta, consisting of 18 students from mostly

rural/farming households. 99% of the students who participated in the unit indicated that the activities were either *Good* or *Great*. Objectives of the unit were met with 53% of the students reporting that the unit plan helped them to learn a lot about themselves, 35% stating that this unit plan helped them to learn a lot about careers, 82% noting that this unit plan made them excited about what they could do with their life and 47% reporting that this unit plan made them want to learn more about different careers. Discussion regarding this integrated career planning unit at the grade 6 level will clarify how the unit was demonstrably successful, even though some of the data may look contrary to that end. Suggestions as to ways in which the unit could be altered to improve student feedback will also be discussed. Students were able to demonstrate increased self-awareness regarding their unique interests and passions, as well as how this self-knowledge applied to making decisions regarding their future lives. Further, longitudinal data following the career paths of students with whom this sort of career integration has been made, would prove useful in analyzing the long-term benefits and outcomes of career planning initiatives of this kind.

Becoming an Apple Distinguished School  
(1:1 Laptop/iPad Roll-out)

Educational Technology

Panel Session

Panelists will share the journey Second Baptist School embarked upon when it began a 1:1 laptop program in grades 5-12 and a 1:1 iPad program in grades 3-4. Topics addressed include visionary leadership, innovative learning and teaching, relevant and timely professional development, compelling evidence of success and flexible learning environments. Learn what it takes to become an Apple Distinguished School, an honor Second Baptist School received in 2013.

Parents perceptions of the quality and availability of early intervention services for young children with autism spectrum disorder in Saudi Arabia

- Ola Abusukkar

- Submission ID Number is “13”.

## **Introduction**

An increasing number of autism cases are reported. Autism has become the second most common childhood developmental disability, with a lower prevalence rate than intellectual disability, but a higher rate than all other disabilities. A recent report study conducted by the Center for Disease Control and Prevention (CDC) reported that the prevalence of children with Autism Spectrum Disorder has risen to 1 in every 88 births, and nearly 1 per 54 boys in the United States (CDC, 2012a; Autism Society of America, 2012; Autism Speak, 2013a). This increasing prevalence draws attention to the necessity of taking action.

### *Prevalence of Children with ASD in Saudi Arabia*

According to the 2011 Census in Saudi Arabia, the total population is nearly 28,376,355 people that live in Saudi Arabia (Central Department of Statistic and information, 2011). Even though half of the population is under 15 years old, services and supports for children with developmental and psychiatric needs are not well established (Qureshi, Habib, al-Ghamdi, Majzoub, & Fender, 2001). Although there is no statistic that shows the correct number of individuals with ASD in Saudi Arabia, as a researcher we have to accommodate children with ASD and their family's needs in order to help them collaborate effectively and have positive attitude toward early intervention and other related services.

For this reason, Understanding parents' perspectives leads to increased parental satisfaction and involvement. Increased satisfaction and involvement is considered key to the development of greater outcomes for both children with ASD and their families. Consequently, this study is needed to help the voices of parents of children with ASD be heard in order to meet the needs of children with ASD and their families, as well as help to develop and improve early intervention services in order to provide better services for children with ASD in Saudi Arabia.

### **Purpose of the pilot Study**

This study has three purposes. The first purpose is to investigate parents' perceptions of the quality and availability of early intervention services in Saudi Arabia for children diagnosed with autism (infancy to eight years). The second purpose is to discover how parents' perceptions of quality and availability vary according to parent and child characteristics. The third purpose is to find out how early intervention services for children with autism in Saudi Arabia can be improved based upon parents' perceptions of needs.

### **Statement of the Problem**

The growing number of children who are diagnosed with ASD has significantly increased at an alarming rate internationally as well in Saudi Arabia. The prevalence of children with ASD reported in 2007 was six out of 1000 children in Saudi Arabia. Also, the prevalence of autism is four times higher in males compared to females (American Bedu, 2009). There is no recent statistic that shows the correct number of individuals with ASD in Saudi Arabia. As a result of

the researcher's estimation in this study, the prevalence of children with autism in Saudi Arabia is 322,459 among the total population. Even with this significant prevalence, there are still limitations in early intervention services provided for children with ASD and their families. There is no data that shows the quality and availability of early intervention services provided for young children from infancy to eight years old in Saudi Arabia.

### **Significance of the study**

Parents of children with ASD are struggling to find appropriate and sufficient early intervention services that meet their children's unique needs because of the increasing number of children who are diagnosed with ASD and the recent awareness of the spectrum in Saudi Arabia. The lack of studies that investigate the quality and availability of early intervention services creates a significant need for information for parents and professionals in the field of autism and early intervention. This information is needed to improve early intervention services in Saudi Arabia. Parents play an important role in their children's education and development, and it is critical to develop and improve services, which leads to increased parental satisfaction and gradually enhanced parental involvement. This study is essential due to the lack of studies that examine parents' perceptions and needs of the early intervention services in the kingdom of Saudi Arabia. The key findings of this study will help the parents' voices of children with ASD be heard in order to develop and improve early intervention services, as well as help policy makers and professionals better understand parents' needs in order to provide better services for parents in Saudi Arabia.

### **Research Questions**

1. What are parents' perceptions and need of the quality and availability of early intervention services (infancy to eight years) in Saudi Arabia for children diagnosed with autism?
2. How do parents' perceptions and needs of quality and availability vary by parent and child characteristics?
3. How can early intervention services for children with autism in Saudi Arabia be improved based upon parents' perceptions of needs?

## **METHODOLOGY**

### **Participants**

- ☉ A descriptive study using a quantitative design (Survey) was chosen as the best way to gather information regarding parents' perceptions (Creswell, 2012).
- ☉ The 20 parents' participants for this study were drawn from many centers in three cities: Jeddah, Makkah, and Riyadh.
- ☉ **Children:**
- ☉ 53% female- 47% male.
- ☉ 65% were less than 5 years old- 15% were 6 years or more.
- ☉ 70% were diagnosed at the age of 2 to 3 years.

- Ⓢ 85% received diagnosis in Riyadh.
- Ⓢ 65% attending Autism centers, 5% public KG, 5% public hospital, 20% centers for children with special needs.
- Ⓢ 55% attend special education settings, 40% did not attend in a school.

## **Results**

The primary objective of this study is to investigate the parent's perceptions and needs of the quality and availability of the early intervention services in Saudi Arabia for children diagnosed with autism. Parent's perceptions and needs were measured by the Parent Perceptions Questionnaire (PPQ) and Parent Need Questionnaire (PNQ) respectively. The PPQ utilized five subscales to determine parent's perceptions: Early intervention services, Services on response, specialized curriculum focusing on Autism, family training and involvement and degree of engagement. The PNQ utilized five subscales as well to determine parent's needs: Need of information, Need of training, Need of support, financial assistance and Need of quality services. The data from the survey were analyzed and interpreted regarding parent perceptions and needs of the quality and availability of early intervention services for their children with ASD. The demographic information related to participants of the study and results from data analyses are reported and discussed by responding to each research questions. Bar charts with percentages were reported related to demographics of participants. Means and standard deviations were calculated to assess the levels of parent perceptions and needs of quality and availability of early intervention services for their children with ASD. Multivariate analysis of variance (MANOVA) were used to determine differences among parent perceptions and needs in total and subscale scores across demographics of the participants.

### **Research Question 1**

What are the parents' perceptions and need of the quality and availability of early intervention services (0-8 years) in Saudi Arabia for children diagnosed with autism?

Parents' perceptions and need of the quality and availability of early intervention services were measured using PPQ and PNQ respectively.

	Total score of Parents' perceptions	Early intervention services	Services on responses	Specialized curriculum in ASD	Family training	Degree of engagement
Mean	2.4115	2.4395	2.2685	2.6667	2.2237	2.3202

	Total score of Parents' needs	Need of information	Financial assistance	Need of support	Need of training	Need of Quality services
Mean	1.5946	1.5684	1.5789	1.7939	1.4895	1.5702

- ⊙ Highest rate on Specialized curriculum focusing on Autism (**mean= 2.67 and SD=0.486**) meaning that the specialized curriculum focusing on autism that their child received is not appropriate.
- ⊙ The result of the parent's need of quality and availability is quite unexpected as most of the parents found these needs "unnecessary" or "don't need" on an average whereas most of them disagree or found the quality and availability of early intervention services normal.

## Research Question 2

How do parent's perceptions and need of quality and availability vary by parent and child characteristics?

*An analysis of Total Parent's Perceptions and Needs on Parent and Children*

*Characteristics:*

- ☉ **Gender:** mothers perceptions & needs higher than fathers. (n=20) 15 mothers-5 fathers, the results indicated that there are significant differences between mothers and fathers in their perceptions and needs. The female parents expressed higher needs of early intervention services than male parents. This finding can be explained as that according to Saudi Arabia culture the mothers are responsible in taking care of children while male parents responsibilities is to provide (money, food, clothes...etc.). Accordingly, raising a child with ASD alone led mothers to seek out more supports for their children and themselves.
- ☉ **Monthly income** (1 RS=\$0.27) parents whose income less than 7000RS were more satisfied with current early intervention services than parents whose income 10.000RS or more and considered as wealthy families. That can simply be explained as wealthy families were able to access to information in English language as the fact that higher income means higher education levels, and those parents compare what they read or know about different early intervention services around the world and the actual services in Saudi Arabia. Which led them to set higher expectation and insist to receive higher quality early intervention services and supports?
- ☉ **Age:** majority age between (31-40) were significantly less agreed about early intervention services, and the researcher can interpret that parents who are (31-40) were able to access information about early intervention and autism and they displayed higher expectations on the current services. While parents age 30 years or less reported high level of needs, and it can simply be explain as they might be new parents with a new experience with children, and as having a child with ASD their experience become harder and seek out for needs.
- ☉ **Educational level:** (bachelor and higher less satisfied with early intervention services than those held high school or less. This finding should be interpreted as following: according to Saudi's culture parents who are less educated have strongly believe on professionals' suggestions and recommendations (professionals always right). The finding also can be interpret as that the Saudi Arabia still in early stage in the field of autism and early intervention, and might many research and information available in English language. Accordingly, high level education is able to access this information and set higher expectation for early intervention services in Saudi Arabia. While there is no significant differences in the parents' needs.

- ② **Number of children:** Parents who have one child showed significant lower involvement in EI. This can be explained as lack of experience for those consider as new parents with new experiences.
- ② **Age at diagnosis and start early intervention:** Parents whose children diagnosed after age 3 reported higher mean scores in both their perceptions than children diagnosed younger. That can be explained as and.
- ② **City of Intervention:** Parents from Jeddah reported higher need of training and need of information that can be explained as there are less early intervention services in Jeddah when comparing with Riyadh where there are many centers that provide early intervention services and supports for children with ASD and their families. The three cities; Jeddah, Riyadh, and Makkah reported significant needs of parents training and high quality early intervention services.
- ② **Type of class attended:** the parents whose children with ASD attended inclusive classroom setting reported higher satisfaction level than parents whose children attended self-contain or not attended school at al. the reason maybe the children who attended self-contain classroom or not attended school at all might have severe autism and need more supports and cares than others.

## Conclusion

Findings from this study provided important recommendations about early intervention services and supports provided for children with ASD and their families:

1. The needs to increase society awareness about autism, and ASD treatments as well as early intervention services and supports that available for children with ASD.
2. The importance of early diagnosis that resulting finding early intervention services as early as possible.
3. The needs of intensity early intervention services in order to get positive outcomes and improve the quality of children with ASD life and their families.
4. The important to understand the needs of parents in order to help them have positive perceptions toward early intervention as a resulting in higher parents' involvement.
5. It is important to have greater collaboration and communication between early intervention services, schools, and department of Special Education under the ministry of education in order to maximize children with ASD benefits.
6. The need of ongoing training and professional development is essential in order to improve the early intervention services for children with ASD in Saudi Arabia.
7. The needs of establish special programs for parents' training as an important stone in successful early intervention program which are parents.

## **Effects of Intelligence and Personality in the Academic Achievement of University students**

Lars Larsen & Anna Vedel, Department of Psychology, School of Business and Social Sciences, Aarhus University

**Introduction:** It has been proposed that general educational performance is a multiplicative function of ability and motivation and that these two domains can be conceptualized as intelligence and personality (Rinderman & Neubauer, 2001). By now there is a large body of evidence supporting intelligence and personality as important predictors of educational achievement (Chamorro-Premuzic & Furnham, 2003). Overall, general intelligence is the best psychological predictor of educational success (Jensen, 1998). However, it has been suggested that individual variation in general intelligence might be less important in high-ability populations (Jensen, 1980). This poster presents preliminary results from an ongoing study on predicting academic achievement in university students.

**Objective:** To determine the extent to which intelligence and personality can account for academic achievement in a high ability population.

**Methods:** Participants were 40 university students, mainly female psychology students. Intelligence was measured with the Bochumer Matrizen-test (BOMAT), personality was measured by way of the NEO-PI R personality test and the participants' bachelor grades were used as a measure of academic achievement. The data was analyzed by way of Linear Regression Analysis with bachelor grade as dependent variable and intelligence and personality dimensions as independent variables.

**Results:** The results were statistically non-significant (due to the small sample size). Intelligence showed the strongest correlation (.26) followed by Conscientiousness (.21) and Openness (.17). Intelligence accounted for 6.6 % of the variation in academic performance whereas the five personality dimensions accounted for an additional 7.7 % for a total of 14.3 % explained variance. Closer inspection of the Conscientiousness and Openness dimensions revealed that not all facets were equally important. Especially the O-facet Ideas which measures intellectual curiosity and openness to new ideas and the C-facets Self-discipline and Achievement Striving seemed important for academic achievement.

**Discussion:** The present study indicates that both general intelligence and personality play a role in academic achievement and that curious, open-minded, self-disciplined, ambitious and intelligent university students are more likely to achieve academic success. In future research and praxis it would seem promising to focus not only on ability, but also on specific motivational factors such as curiosity, self-discipline and ambition. Obviously other factors than intelligence and personality must be considered, as the predictive value of these variables were after all modest.

## Constructing Narratives as a Context for Algebra

Terri L. Kurz

### **Abstract:**

Using narratives in mathematics helps students situate mathematics within a context. This paper presents a framework for the integration of narratives into an algebra course designed for preservice teachers. The preservice teachers designed and created narratives using technology (digital cameras and PowerPoint) to support algebraic investigations at the elementary school level based on the *Common Core Standards*. A seamless unification of language arts and mathematics content is possible with these narratives. The framework can be extended beyond the university classroom by guiding children in creating their own algebraic narratives.

Preservice teachers often struggle with the content of preparatory classes that involve advanced mathematical teaching and learning (Ticknor, 2012; Bates, Latham, and Kim, 2011; Nathan and Petrosino, 2003). In addition, they question the relevance of algebraic thinking introduced at the elementary school level (McGowen and Davis, 2001). In order to help the students understand the importance of introducing advanced concepts to younger learners, an assignment was developed in a university preparatory class that required preservice teachers to create algebraic narratives using the Common Core Standards (CCSSI, 2012).

For the assignment, students were first introduced to the idea of employing story narratives as a means of conveying richer characters, settings, and plot development than those typically encountered in the traditional mathematical curriculum. Because the course was in mathematics rather than developing technology skills, the PowerPoint format was chosen as the story transmission vehicle due to its simplicity and adaptability for students with varying degrees of technical versatility.

Inherent to the idea of narrative creation is that the fictional world is explicated for the reader in order that it becomes a real and possible world for the mind to imagine and engage in. Potentially the narrative holds the promise of altering the imaginer's (or in the present case, the learner's) cognitive understanding and perspective (Ryan, 1991). Making certain all the elements of a persuasive, informational and detailed story are in place is necessary for this to occur. The responsibility for having all the information in place and in proper sequence will be the student storyteller/narrator's job. More demanding than this, however, will be role that follows this of the reading decoder, or interpreter, in making connections, and searching for inferences, or clues, to reveal the meanings (here, mathematical symbols, formulae, or patterns) that will be needed both for text comprehension and mathematical problem solving (Graesser, Singer, and Trabasso, 1994). To design a successful algebraic story narrative will require learners to assume all roles—transacting nuance, mathematical accuracy, and meaning—as they check and edit for understanding (Rosenblatt, 1969).

To situate a fictional story with algebraic ideas at its center for a mathematical investigation requires a writer understanding of both storytelling and mathematics. While the story may be a means for demonstrating knowledge of algebraic thinking and organization, its success is predicated upon the preservice teacher's ability to express his knowing in word selection, sequence and calibration of mathematics-to-story, visual aids, and examples to make the concepts to be conveyed clear, fruitful and enjoyable.

Stonewater (2002), studied two groups of college calculus students whom he required to write expository accounts describing their personal understanding of selected calculus principles he had taught. He then analyzed common elements shared by successful writers as opposed to those employed by unsuccessful writers. Drawing on the prior work of Cross and Steadman's

“classroom-based research” (1996), Stonewater hypothesized that better comprehension outcomes were achieved through improving the unique means by which each student learned—a sort of internalized map of subject understanding. Mathematical explication through writing, Stonewater found, was one means of gauging this progress. From his inquiries and findings he suggested the following checklist, or criterion system, be utilized to assess student writing outcomes reflecting higher comprehension and achievement: 1) students will use more specific mathematical language and terminology; 2) students will build a clear and comprehensible context to situate their knowledge; 3) students will provide clear and relevant examples within the text; 4) student essays will include more than one mode of modeling knowledge (algebraic, graphical, numeric); 5) students will display accurate examples of mathematical notation; and 6) students will produce a comprehensible piece of writing, or essay, that addresses its topic.

The authors believe Stonewater’s criteria for assessing mathematical comprehension through classroom writing retain their generalizability as applied to the present work despite departures in class content (calculus) and literary genre (expository). For purposes of preservice elementary teaching and learning, the Stonewater elements provide a pathway, or general rubric, for both teacher and student to gauge writing efficacy.

### The Narratives

Elementary preservice teachers were enrolled in an upper division mathematics content course for future elementary teachers entitled *Investigating Change: Patterns, Functions and Modeling*. The course focused on algebraic content with an emphasis on understanding the meaning of functions, equations and graphs.

Preservice teachers wrote two narratives: one for students in grades 3-5 and another for students in grades 6-8. The narratives had to tell a story, like children’s literature, and present

ideas that required algebraic problem solving to solve. Generally, a solution requires clues presented in the narrative. (See Kurz and Bartholomew (2012) for a framework guiding the integration of preservice teacher created stories into university methodology courses.) The requirements for the narrative include: 1) title page, 2) Core Content Standards, 3) six or more pages of story, 4) an algebraic dilemma (without a solution) and 5) original art or photographs (no clip art or Internet photographs).

### Difficulties

Preservice teachers often struggle with both the language arts and mathematics aspects of the activity. In language arts, they struggle with the framework of a story. For example, they are unaware of how to develop characters. They may name a character and present him/her without developing any kind of meaning or relevance to the narrative. The narrative may read like bullet points, never adequately drawing in the reader.

Of course, preservice teachers also struggle with basic writing conventions-including sentence structure and spelling, which will require explanation or a separate tutorial addressing grammatical correctness. Finally, they struggle with plot. They do not always know how to write a creative story with a plot. Instead, the narrative may read like slides with mathematical word problems written on them. Inviting a cooperating English faculty to present a brief lecture prior to beginning the writing task is an excellent way to address both grammatical and plot issues. Visiting faculty could be asked to bring handouts, including basic plot structure graphic organizers to accompany the talk.

In terms of writing about mathematics, preservice teachers sometimes do not know how to provide structure without providing too many hints or an answer (or nearly an answer). They try to help the students so much that the student does not have to think to solve the problem. For

example, one preservice teacher used patterning in her story. She listed the pattern for the students in the form of an input/output chart, leaving only the last two values for the learners to fill in. Additionally, students often exhibit difficulty with the required mathematics. Some cannot solve their own dilemma. Finally, they may have trouble developing their own stories. It is not uncommon to find a student who has copied a word problem from another source, like a textbook, and modified it into narrative form. Designating one or two advanced students to work with others during class time as “editors-at-large” can help struggling writers advance in their confidence and know-how without the embarrassment of requiring constant teacher intervention.

### Conclusion

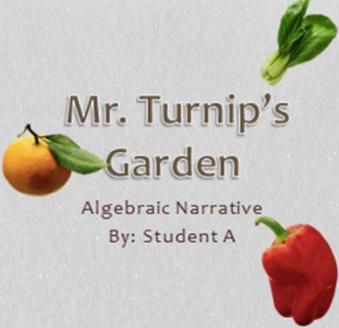

When preservice teachers explore mathematics, it is important for them to experience mathematics within a context. The narrative framework presented here can be extended to support elementary students’ growth in algebra and other areas of mathematics, as well. Children can create their own narratives within a specific mathematical topic or content area allowing for them to internalize mathematics and create relevance to their own daily lives (Kurz & Bartholomew, 2013).

## Appendix (Sample)

 <p><b>Mr. Turnip's Garden</b> Algebraic Narrative By: Student A</p> 	<h3>Standard</h3> <p>4.OA.5: Generate a number or shape pattern that follows a given rule. Identify apparent features of the pattern that were not explicit in the rule itself.</p>
 <p>During spring, Mr. Turnip loves to garden. The sunshine is gentle, warm, and perfect for growing the ideal garden. Mr. Turnip grew up on a farm in Wisconsin. So when he moved to Arizona, his happiness relied on the success of his garden!</p>	<p>• Mr. Turnip waited all year long to grow his succulent, ripe, red, juicy tomatoes. He anticipated the moment he could grow his own green heads of lettuce. But most of all, he constantly craved his vibrant, orange carrots.</p> 
 <p>• Mr. Turnip is a little obsessive when it comes to planting his garden. He must separate each plant by exactly 6 square inches to give each vegetable its own space to grow. The dimensions of the garden are 10 vegetable rows (left to right) by 5 vegetable columns (up and down).</p>	<p>• Mr. Turnip read in his favorite magazine <i>Better Homes and Gardens</i>, that a very particular arrangement will grow the most delicious vegetable garden.</p> 

- Mr. Turnip plants in the order of one tomato, 2 heads of lettuce, 2 bunches of carrots from left to right (a total of 10 vegetables per row). He begins the same routine for each of the rows of vegetables.

- If Mr. Turnip follows *Better Homes and Gardens* rules on planting vegetables, what is the core of the pattern for his vegetable planting? How many times will the core repeat on each row?

## Mr. Turnip's Perfect Planting Plan

*Drawing a t-chart or picture may help solve these problems*

- What is the 7<sup>th</sup> vegetable in Mr. Turnip's garden? Explain how you found your answer.
- If Mr. Turnip decides to move his garden into a much bigger space but with the same 10 vegetable per row amount, what will the 99<sup>th</sup> vegetable be (if the garden was observed from top left corner to bottom right corner)?
- Do you recognize any other patterns in the columns of Mr. Turnip's garden?  
(Hint: What vegetable will numbers 2, 12, 22, 32, 42, etc. be? )
- If Mr. Turnip decides to extend his rows to 12 vegetables per row and did not start the pattern over for each row, how would it affect the above patterns? Would the 99<sup>th</sup> term change?

**Abstract**

Rubrics have been described as an assessment tool that saves time grading, conveys objective feedback, and promotes student learning. In this session, we will look at how rubrics can accomplish these three worthwhile objectives, as well as explore their limitations, and engage in the process of rubric development.

Within kinesiology, there are several opportunities that lend themselves to the use of rubrics. Not only can they be effective for written, oral, and group assignments, but during practical and clinically-based assessments, rubrics can be used by multiple instructors, preceptors and peers with similar outcome measurements. Additionally, students can use rubrics as a self-evaluation tool.

The session time will be divided into five main areas:

- Definition of what a rubric is and description of its main elements.
- Types of rubrics, including the advantages and disadvantages of each.
- The outcome of rubric scoring and benefits to instructors, preceptors, and students.

- Proper preparation of an assignment to be graded via a rubric.
- Assistance in creation and editing of rubrics.

The first four areas will be presented through PPT presentation and discussion. The fifth area will include an opportunity to create individual rubrics and interactively critique other examples.

The outcome goal is to offer educators with an objective grading alternative that allows students to have a better indication of strengths and limitations of their assignments, projects, practical exams, or clinical experiences.

1. The audience will be able to generate a grading tool that will convey objective feedback to the student.
2. The audience will properly apply the grading rubric to enhance student learning.
3. The audience will discern the difference between an effective and ineffective rubric model.

The session will begin with a PPT presentation describing the why, what, and how of scoring rubrics. During the presentation, open discussion will be encouraged. Examples of blank rubrics will be provided to the audience. Small groups will be formed and asked to create their own rubrics for each of the following: group, written, and oral presentations, and practical evaluations. Once the rubric is created, the groups will trade and critique the rubric.

The presentation's emphasis will be on the interactive portion and creation of rubrics.

## **Hawaii International Conference on Education**

Please include all of the following six items with your proceedings submission. The following information is required and is to be in the following order:

1. Title of the submission:

THE WORLD OF GOOGLE : INSTRUCTION AND MANAGEMENT

2. Name(s) of the author(s):

Dr. H. Jurgen Combs

3. Affiliation(s) of the author(s):

Professor, Leadership Studies, Shenandoah University

4. Address(es) of the author(s):

**Running head: THE LEAP MODEL: PERCEPTIONS OF LEGITIMACY**

**The LEAP Model: Perceptions of Emergency Service Leaders of Legitimacy**

Topic area: **Higher Education**

Presentation format: **Paper Session**

This paper explores Emergency Services leader perceptions of legitimacy in the eyes of the followers. A new leadership model, the LEAP model is introduced and compared with traditional definitions of legitimacy and position power. Skills, attributes, and education/training are shown to be more important than appointed authority for administering in the emergency services. The need to develop leadership curriculum to fit the legitimacy attributes is identified.

## PERCEPTIONS OF LEGITIMACY

### ABSTRACT

This study adds to the qualitative data showing how leaders in the emergency services perceive legitimacy and the bases of power. The study examines the perception of leaders and their perspective on why subordinates view their leader as legitimate and/or authentic. Two definitions of legitimacy are presented: the traditional viewpoint of French and Raven (1959) associating legitimate power “with having status or formal job authority” and the other proposed by Maxfield (2012) in the LEAP leadership model basing legitimacy or authenticity more on the characteristics and skills leaders bring to their positions. Emergency service students interviewed leaders in their career fields, determining their view of legitimacy. They found that few emergency services leaders perceived legitimacy as traditionally defined, but rather they saw it as the experience, education and training, the skills and traits they bring to the position. Subordinate trust was important to their definition of legitimacy and this was on leader experience and integrity. The results of this study posit that leadership education should include developing the legitimacy and authenticity of leaders beyond the traditional aspects of position and/or rank.

# PERCEPTIONS OF LEGITIMACY

## INTRODUCTION

Over the last few decades, leadership training and leadership education have permeated business, politics, academia, and our national lexicon. Yet, it appears that as a nation we have little or no confidence in our leadership. Barbara Kellerman (2012), in her book, *The End of Leadership* contends that, "...while the leadership industry has been thriving growing and prospering beyond anyone's early imaginings—leaders by and large are performing poorly, worse in many ways than before, miserably disappointing in any case to those among us who once believed the experts held the keys to the kingdom (p. xv)." Her premise is that because of technology such as the Internet, cell phones, social networking, etc., followers are finding ways to make traditional leaders, using traditional methods, less effective. In some ways we agree with this phenomenon. However, we also see something more serious and alarming with regard to contemporary leadership.

Over the last 20 years or so, we have observed society becoming obsessed with instant gratification and glamour. Consequently, leaders and in a general sense, parents, have gravitated toward seeking popularity and/or fame as opposed to providing character and substantive leadership. Leaders have used hollow platitudes of hope and change to gain favor with followers, but have not been able to deliver leaving their followers disenchanted, if not jaded.

French and Raven's (1959) research on the bases of social power is the most widely quoted writing on the source of leader power. Their research provides a framework of dyadic relationships connecting the person with the power and the persons influenced by the power. French and Raven identified five types of power as legitimate, reward, coercive, referent, and expert. Northouse (2013, pp. 10-11) further divided the types of power into position and personal power. Position power is the power a person acquires from being holder of a position,

## PERCEPTIONS OF LEGITIMACY

rank or office within an organization. Because of position, these leaders can exercise any or all of legitimate, reward or coercive authority as the bases of their power. French and Raven defined legitimate as being “associated with having status or formal job authority.” Reward power comes from the leader’s ability to provide rewards to subordinates. Coercive power is “the capacity to penalize or punish others.” Personal power, on the other hand, is the authority followers attribute to leaders. It is gained based on referent or expert power. Referent power comes from the followers’ liking or identification for the leader. Followers attribute expert power to the leader when they perceive a leader as being competent and knowledgeable as a leader or in the business enterprise.

The question is, “Why are our leaders so ineffective?” Barbara Kellerman may be right in her assertion that technology has changed the role and function of leaders. However, we feel there may be a much simpler explanation. If our premise is correct, it will take much effort from scholars, those in positions of authority, and most importantly, parents to educate and implement a shift in thinking.

Leadership is holistic, not prescriptive. This may be where people have gone wrong in their thinking. As Barbara Kellerman asserts in her book, the leadership-training/education trend is somewhat nascent and based on the belief that anyone can become a leader if they take a few classes and apply a few principles. But as she points out, this does not seem to be necessarily true. Max Van Manen (1990), an educator/scholar argues that the prescribed method for human science, in contrast to natural science involves description, interpretations, and self-reflective or critical analysis. In other words, we explain nature, but we must understand human life.

Scholarly work on leadership, in a relative sense, is lacking. We feel that the Newtonian approach to the study of leadership has been one of the reasons. What we mean by this is

## PERCEPTIONS OF LEGITIMACY

scientists have used the approach that if leadership can be broken down to its most basic unit or atomized, it can then be rebuilt in a step-by-step method, thereby creating a prescription for building great leaders. Yet, because we are dealing with the dynamics of being human, leadership is a *subjective*, not an objective experience. Therefore, we subscribe more to an Einsteinian approach. The Einsteinian view *infers* a reality based on the analysis of the relationship between the observed and the observer. It is easy to study, survey, quantify, and statistically analyze formative and summative results of various leadership strategies to find what works. However, it does not tell us how it works; or how one leader is able to get results that another leader does not, while using the same strategies. Applying strategies or theories is only part of the leadership equation.

### **Leadership Theories**

There are dozens, if not hundreds of definitions for leadership. All of them are probably right in one form or another because leadership is so hard to pin down to a specific concept. So, for the purposes of this paper we will offer a working definition of what we believe to be one of the better leadership characterizations. Leadership is: *A process and state where an individual influences a group and the group agrees to the influence of the individual in order to reach a desired ideal or vision.*

With that thought in mind, it would be beneficial to briefly introduce (or re-introduce) some of the more prevalent theories on leadership. This is by no means an exhaustive list, as there are too many. We are just presenting the more common and well-known theories for a better understanding of some of the research and work developed around leadership. We will not explore these theories in depth, but they will be important to understand as we look at our *LEAP* leadership model.

## PERCEPTIONS OF LEGITIMACY

### Nature versus Nurture—The Great Man Theory

Are great leaders born, natural leaders or were they developed or nurtured to become great leaders? This debate has been going on for a long time and there is probably some legitimacy in both positions. Maybe a better way to describe these differing views is to look at them as *trait, attribute, or characteristic leadership* versus *skill-based leadership*.

Trait, attribute, or characteristic leadership ascribes that a leader is born with certain characteristics, attributes and/or traits that endow them with leadership abilities. Some of these traits may be things like intelligence, extroversion, verbal proficiency, physical factors (such as height), and so on. This particular concept has been studied for years. Researchers have worked to discover those traits that are common among many leaders. This is appealing to most of us because it fits with our experience and beliefs (or at least our hopes that a great leader has been born and will emerge when needed). One problem with this research approach is that while some traits and characteristics were identified it seems that the list continues to grow. This may be because in these studies leadership was not explored by context or situation.

Skills-based leadership ascribes that a leader develops those skills and abilities that make a good leader. Those skills and/or abilities can basically be broken down into three main areas: Technical skills, interpersonal skills, and conceptual/analytical skills. This also is appealing in that it gives hope to those who may not have, or believe they have the inborn traits of leadership. By learning and developing specific skills, a person may be able to enhance his or her leadership potential. One of the biggest weaknesses of this approach is that just having or developing these skills is not a good predictor of leadership success. Another weakness we find in this approach is that many of the skills can really be considered traits or characteristics, so it is hard to define what skills really enhance leadership ability (Northouse, 2010).

### Path-Goal Theory

The Path-Goal theory basically asserts the function of a leader is to motivate the follower by finding ways of increasing personal payoffs for the individual with his or her employment goal attainment and making the route to those payoffs easier by clarifying desired outcomes, eliminating barriers and increasing the opportunities for personal growth and satisfaction of the follower. One of the interesting aspects of the Path-Goal theory is that it identifies some different approaches to leadership, namely:

1. Directive Leadership—the leader gives the followers instructions about their task (e.g., what is expected, how it is to be done, and when it is to be done).
2. Supportive Leadership—the leader is friendly, approachable and taking care of the needs and wellbeing of followers.
3. Participative Leadership—the leader is one who invites the followers to share in the decision-making processes by consulting and incorporating the ideas, input, and opinions of followers.
4. Achievement-Oriented Leadership—the leader challenges followers to rise to their highest levels of personal and/or team achievement.

A major strength of the Path-Goal leadership theory is that it underscores the importance of leadership's relationship with subordinate performance by removing barriers to performance and giving clarity to goals and outcomes. However, the biggest weakness we see in this theory is that it seems to be a bit nebulous in identifying the relationship between motivation and leadership, or in other words, it seems to be more of a management tool than a leadership attribute and is a little too complex to be easily understood (Northouse, 2010).

## PERCEPTIONS OF LEGITIMACY

### Psychodynamic Approach

The Psychodynamic Approach is not really a theory of leadership, but rather a different way to approach leading. It is based on the assumption that everyone has a different personality type and responds differently to leadership based on their personality. Many of you may be familiar with or even have participated in surveys or questionnaires designed to determine your personality type. An example of this would be the Meyers-Briggs Type Indicator. This approach is based in some of Sigmund Freud's, Carl Jung's, and others' work in psychology. In fact, Carl Jung's work on personality types led to the classifications most prevalent today. They are: 1) extroversion vs. introversion; 2) sensing vs. intuiting; 3) thinking vs. feeling; and 4) judging vs. perceiving. From these four classifications there are 16 different combinations of personality dimensions.

The Psychodynamic Approach asserts that the leader needs to become more aware of subordinates' personality types as well as his or her own, and how the subordinates will respond in work and task relationships. This identifies the apparent strength of the Psychodynamic Approach—that the leader becomes more aware his or her own approach to leadership, of the individual subordinate needs and the relationship between tasks and success. Yet, as one can imagine, that is also identifies the greatest weakness. It appears to be a gargantuan task for the leader to learn, be aware of, and facilitate the needs of each subordinate. While this may be very effective among small work groups, it seems apparent that it would have major drawbacks in larger more complex organizations (Northouse, 2010).

### Servant Leadership

Robert Greenleaf, in the 1970s coined the phrase "servant leadership," which has since gained popularity and become a topic of study and research. Basically, Servant Leadership is just

## PERCEPTIONS OF LEGITIMACY

as it sounds, to lead by being a servant. Greenleaf argued that a person becomes a leader because it is his or her nature to serve. In other words, Greenleaf was asserting that a person first becomes a servant by being concerned about the needs and well-being of others, and then is bestowed leadership by those being served.

As one can imagine, this has become very popular. Who does not want to feel that he or she matters and that someone is looking out for him or her? The great strength of servant leadership is that focuses on people first; serve the needs of subordinates and they will perform at higher levels. The biggest weakness we see in this approach is that the leader may become so involved in serving they have no time or compulsion to create and strive toward a preferred future or vision of where the group or organization needs to move (Greenleaf Foundation, 1970).

### Contingency Leadership or Leader-Match

Contingency Theory, introduced by Fred Fiedler (1964) asserts that a leader's effectiveness is based upon the situation or context of the issue. In other words, contingency theory is that a leader is matched to a situation based upon the leader's personal style; hence the situation determines the type of leader needed. Fiedler developed the "least preferred co-worker" scale (LPC) to help determine a person's style or orientation to match their potential for leadership in a certain context. This scale is used widely today by many organizations with the hope of identifying the right leader for the right situation.

One of the strengths of this theory is the fact that there has been a lot of research and empirical support for it. One other strength is the fact that contingency theory asserts a leader does not have to be effective in all situations, which implies that a one-size-fits-all leader is not necessarily the best approach.

## PERCEPTIONS OF LEGITIMACY

The biggest weakness to contingency theory we see is that it does not explain what to do when a person in a leadership position is not the right fit for the situation. Because this theory is developed around personality, there seems to be little consideration for development and training of current leaders, nor does it explain well why some leaders whose styles do not match the situation or context are still successful.

### Transformational Leadership

Transformational Leadership's goal is to transform people and/or organizations into more vibrant, robust, and dynamic entities that are in congruence with core values and principles of excellence. To simplify, the transformational leader creates vision and provides the supportive network to allow followers to achieve the vision. This is usually accomplished by the leader using one or more of the following means to achieve success: 1) Inspiration, 2) Intellectual simulation, 3) Trust, and 4) Individualized attention.

One of the strongest features of transformational theory is that it is not just based on the attributes and/or needs of the leader, but also incorporates the needs and desires of the followers. So, leadership emerges as a result of the interaction of the leader and followers. One other strength similar to the one previously mentioned, is that transformational leadership has a strong emphasis on morality, values, ethics, and follower needs. This gives the theory an intuitive appeal.

One weakness of transformational leadership is that it is hard to measure this and may be because the four factors introduced above seem to be inter-related rather than independent. Another weakness we see is that the theory may depend too much on trait or personality characteristics, which leads one to question whether or not this can be taught or developed. Our last criticism on transformational leadership theory is that there may be a tendency for this theory

to develop a concept of a “hero” leader by focusing on the leader and not the holistic interaction of the leader, followers, organization, and environment (Northouse, 2010).

### **Management vs. Leadership**

Because leadership has been unconsciously married to business and/or military settings, we feel that a natural confusion has occurred between management and leadership. In our opinion, this confusion has been exacerbated through the process of scientific inquiry. While both of these skills are important to the function of administration, they are also the anathema of each other. Take a moment to think about the role and attributes of management and the role and attributes of leadership.

First of all, what is the main function of management? If one really breaks it down to the most basic level, management is the process of controlling and compressing (to the best of one’s ability) the events of one’s environment in order to ensure efficiency and desired outcomes. In other words, it focuses on the processes or means by which outcomes are reached. It seeks to eliminate chaos or to tone-down any disruptive noise which may affect the processes and ultimately the outcome (or so that is the implied reason). However, doesn’t that tend to make the focus on means and processes? Isn’t that why there are policies and strict procedures for job performance? In fact, aren’t we expected to be busy at all times so that our process and productivity can be measured? Aren’t we compensated for our efficiency and output?

Leadership, on the other hand is expansive and nurturing. Leaders foster exploration, experimentation, reflection, and surprisingly, a little chaos (Wheatley, 2006). Leaders try not to be bound by firm policies, rules and procedures because they may inhibit the ability to move toward the vision. Leadership’s main role is to keep the vision (end) as the focus and foster a sense of community in seeking the vision. The focus is on doing the right thing. As Peter

## PERCEPTIONS OF LEGITIMACY

Drucker said, “Managers do things right (**means**); leaders do the right thing (**ends**)” (parenthetical comments added). Sometimes means and ends can complement and other times they conflict. It is for this reason we think that legitimacy is more just having authority (French and Raven, 1959).

### **LEAP Model of Leadership**

Maxfield (2012) introduced a new leadership model, which redefines the bases of power and legitimacy. This model, designated by the acronym LEAP, provides a guide for developing and assessing leadership. Maxfield and Fisher (2012) propose it as an effective tool in professionalizing fire and emergency service leadership (or for that matter, any other discipline). The LEAP model is comprised of the four leader traits or characteristics they believe to be most important. A leader is: 1) Legitimate—a leader has legitimate power, knowledge, skill and ability developed through his or her work, experience, education, and attention to detail; 2) Ethical—a good leader has strong character, strong values, and makes ethical and value-based decisions when confronted with choices and/or dilemmas; 3) Affective—a good leader has the ability to instill, trust, confidence, emotion, passion, and create vision with others; and, 4) Persistent—a good leader does not give up when times are tough or there is resistance to a righteous idea or plan, but shows determination in achieving goals and objectives.

The LEAP model appears to fit when applied to the desired proficiencies/outcomes of the Professional Fire Officer Development Standard (National Fire Protection Association, 2012). The education, training, and experience components of the professional standard seek to demonstrate the individual’s legitimate expertise in the discipline by assessing the demonstrative outcomes of the taxonomies of learning, e.g., cognitive, affective and psychomotor domains (Bloom, Krathwhol, & Masia, 1964; Bloom, 1956).

## PERCEPTIONS OF LEGITIMACY

Benjamin Bloom, David Krathwohl and other colleagues (1964) studied the objectives of education. After many exploratory meetings with college and university examiners, they identified divisions within the objectives of education. They were:

1. *Cognitive*: Objectives that emphasize remembering, recalling or reproducing something that has been believed to be learned. Cognitive objectives also vary from simple recall of material to combining and synthesizing new ideas and/or material.

2. *Affective*: Objectives that emphasize a feeling, an emotion, or acceptance or rejection of material. They further identified these objectives as interests, attitudes, appreciations, values, and emotional sets or biases.

3. *Psychomotor*: Objectives that emphasize motor skills (muscular), manipulation of materials and objects, or some act that requires a neuromuscular coordination.

From our observations and study it appears that most educators have placed emphasis for training and educational methods on the cognitive and psychomotor domains. While these are important and effective, it is the affective domain that seems more intriguing and relevant to adult learning. In other words, once something has been put into one's awareness, has it been accepted enough to bring about change in one's viewpoint and/or behavior?

The self-development section of the proposed NFPA Professional Standard assesses the individual's growth and understanding of inter-personal skills, values, ethics, communication and efficacy in creating/ promoting vision, emotion, passion, etc. It can be posited that self-efficacy, or the belief that one has the knowledge and skills to produce creative solutions and outcomes seems to demonstrate or reflect intrinsic motivation to engage in ethical development and affective or creative activities such as vision building (Gong, Huang, & Fahr, 2009).

## PERCEPTIONS OF LEGITIMACY

Finally, implied as is the intended outcome of the professional development model, an individual demonstrates a certain amount of persistence in completing the process and portfolio requirements of the standard. No empirical evidence exists (yet) that this fire and emergency services standard's process completely develops an individual's leadership ability. However, considerable anecdotal evidence shows the correlation between education, training, experience and leadership success.

### METHODOLOGY

Twenty-eight senior emergency services students in a leadership capstone course were asked to interview public administrators. Most chose to interview administrators in their career field – fire (14), police (7), or emergency management (3). Other fields (4) included city government, health and university administration, and disaster agency management. Three interviewees were female, none from police or fire. One of the questions the leaders were asked was: “What personal characteristics or background do you have that your subordinates would say legitimize you as a leader?” Other questions were related to ethics, vision, and persistence. The students asked to have the responses supported by leadership experiences and specific examples or stories. Then they wrote the responses into a narrative as part of a paper about leadership. The interview was chosen because it is suitable for the novice as well as the sophisticated researcher (Turner, 2010).

The goal of this study was to determine how legitimacy was defined by leaders/administrators as interpreted by the students and whether they discovered new insights about leadership legitimacy. The construct of this study was based on the premise that legitimacy is a social dynamic, which means that it is not a *thing* but a *relation* within a group of people (see definition of leadership above).

## PERCEPTIONS OF LEGITIMACY

The interviews provide rich qualitative data resulting in better understanding of phenomena, as well as generating hypotheses or propositions related to the phenomena. Grounded theory methodology provides a process for analysis through developing categories of information, interconnecting them, and then developing theoretical propositions. This research methodology follows a process of analysis, described as the data analysis spiral (Creswell, 2013, p. 183). Interview data is organized and then read, while the researcher makes notes and memos in the margins. Subsequently, a process of describing, classifying and interpreting begins. This process puts the data in context, makes comparisons, and categorizes the information using codes. Codes are combined, reduced in number and, propositions are put forward connecting the phenomena with their contexts.

### FINDINGS

The study found that establishing legitimacy as perceived by the leaders interviewed is best accomplished through experience, education and training, skills, and traits. A consensus perception (based on the codes) appeared to affirm these were the most important characteristics.

#### **Experience**

Experience was the most frequent reason interviewees gave for subordinates viewing them as legitimate leaders. Experience was identified 23 times. Working “from the ground up” has provided them opportunities to serve in many positions and take on many responsibilities. “The main thing that legitimizes you as a leader is your current experiences with the guys you work with,” said one leader.

Four leaders identified longevity and/or seniority as important. One saw his career as “a path of consistent progression and promotion.” Another said, “I believe being in a position for months and/or years allows for a greater understanding of the position’s responsibilities and

## PERCEPTIONS OF LEGITIMACY

objectives.” Another added that through experience he has “been able to accrue heavy and complex responsibilities [leading to] an authoritative positional role in the process.” A fourth indicated that having done the job of those she now leads is important in legitimizing her as a leader.

Two leaders indicated that their experience made them competent leaders and two said their experience gave them understanding. One fire chief indicated that “the experiences he carries with him have helped give him a deep understanding and appreciation for the work of his firefighters.” Another leader said, “I have shown by my past experience that my judgment is sound.” Another added, “When people know that you have been around for a while, they look to you for answers.”

Experience and reflection has allowed them to learn from other leaders. One administrator said experience and reflections allowed him to see what he liked and did not like in other leaders and to observe the type of values others demonstrated that had importance to him. This reflective process made him more aware of some of his personal qualities, as well as his strengths and deficiencies. One fire chief indicated: “I learned from my old leader’s inadequacies. One lieutenant was not the leader of the crew. The engineer was the unofficial leader. It was a difficult process to learn.” He added appreciatively, “I had a captain who was a strong leader and helped me to develop my own leadership skills by counseling and heart-to-heart talks.”

### **Education and Training**

While experience teaches leadership skills, formal education and training also help to legitimize administrators in the emergency services as leaders. Eight interviewees identified education and training as important. Education is often defined as the formal studies taken at

## PERCEPTIONS OF LEGITIMACY

colleges or universities which help someone to think critically and problem solve. Training on the other hand, is more practical and often done in context.

One leader offered his view on the relationship between experience and education. “Even with my experience I am learning new methodologies and believe that education is the key in maintaining good leadership.” Another added, “I have proven skills and training that echoes through my leadership. I believe that is why others are drawn to my leadership.” Another said, “People look to well-educated people to know the answers to ... problems.”

### **Skills**

Skills are often distinguished from traits because they are learned rather than inherited (Northouse, 2013), however they may often overlap. Fourteen interviewees identified vital skills they thought important in legitimizing them as leaders. The following skills were identified by the interviewed leaders/administrators: *communication and listening (8), problem solving and decision making (5), and technical expertise (1)*.

Communication and problem solving were identified as skills the leaders use on a daily basis. Good listening skills are critical, according to one leader. “By listening to team members who have different levels of experience and expertise, [a leader] can learn and [get] more understanding and [build] relationships,” he said. The result is greater success in accomplishing the overall goals and objectives of the unit. Another said, “Legitimate leaders are understanding and willing to listen.... Having the ability to listen is critical and not taking offense when someone has different ideas.” A fire chief emphasized the importance of listening in decision making. “I rarely make a decision without the input of a least a few other members of the department at the combat level,” he said.

### **Traits and characteristics**

## PERCEPTIONS OF LEGITIMACY

Numerous traits and characteristics were identified as legitimizing leaders. Perhaps most important was honesty and integrity (identified by 14 leaders). Personal integrity combined with experience develops follower trust. “Doing the right thing is important,” said one leader.

“Choosing the difficult right over the easy wrong goes right back to your character,” said another leader.

Trust is crucial in the emergency services when a person’s life or death may depend on the decisions of leaders. “You can’t follow someone you don’t trust,” said one leader. Another said he let his personal characteristics guide his actions and he gained the trust of his subordinates. “The guys totally trust me in all aspects of the decisions we make,” said another leader.

One leader focused on the importance of example in building trust. “I do what I say I will do. I live the mission, vision and values of our company. Employees know me. I am visible.” Another said, “I think my deputies know that what I say and what I do is the same thing. I’m never going to ask them to do something I haven’t done before or aren’t willing to do myself.” Another added, “Following the rules, whether you agree with them or not is important to your reputation. You follow the rules because that’s the job.”

Another critical trait identified is the willingness to learn from subordinates and be flexible in decision making. One leader, reflecting back on his first appointment as a leader in the police force said, “Gradually I saw that my ideas were not the only ones and were not always the best ones.” Another said, “Humble leaders tend to be more successful in connecting with their employees.”

Leadership philosophy seemed important as well. Caring about, helping, and mentoring subordinates was identified by three interviewees. Fairness was identified as an important trait

## PERCEPTIONS OF LEGITIMACY

and other leaders also felt it was important to lead by example. “Maturity plays a huge role in my leadership style as well as my employees. Mature employees, who know what needs to be done just do it. Newer employees need guidance and direction,” said one leader. “You can’t lead from behind and push your employees; you have to lead from the front and encourage them to follow,” another added. “My greatest success is helping others to succeed themselves,” said another.

Five interviewees indicated goal setting and vision were important in legitimizing them as leaders and similarly others felt that task orientation and working hard were also important. “To bring others together to work together, to achieve a common goal, and the ability to establish that common goal” are important characteristics that one interviewee identified as legitimizing him as a leader.

A student interviewer summed up the personal characteristics of the leader he interviewed. “He never really did anything different to make himself stand out from his peers other than working hard, being honest, and always acting mature and showing respect.” Only one interviewee identified his appointment (job authority) was important in legitimizing him as a leader.

The following chart summarizes the characteristics interviewees felt subordinates viewed as important in legitimizing them as leaders.

## PERCEPTIONS OF LEGITIMACY

**Chart 1. Characteristics that legitimize leaders**

### DISCUSSION

Only one leader indicated his legitimate power was based on the traditional definition “associated with having status or formal job authority” (French and Raven, 1959). All leaders saw their legitimacy more in terms of experience, education and training, skills and traits. This fits better Maxfield’s (2012) definition of legitimacy which is “developed through the leader’s work, experience, education, and attention to detail.” It also corresponds better with personal power (Northouse, 2013), which is the authority that followers attribute to leaders, based on referent or expert power. Subordinates identify with the leader based on the perception that he or

## PERCEPTIONS OF LEGITIMACY

she is competent and knowledgeable. This study is limited in its scope because of its methodology and the size and nature of participants. The interview approach provides qualitative rather than empirical data. Twenty-eight leaders limited to the emergency services field were interviewed and answers were based on one open-ended question: “What personal characteristics or background do you have that your subordinates would say legitimize you as a leader?”

### CONCLUSIONS

The findings of this study suggest two conclusions (or propositions).

- More emphasis is placed by emergency services leaders on experience and working relationships than on formal appointment and job position.
- Trust is more important in the emergency services than a command and control structure. Personal integrity combined with experience lead to trust.

This study appears to affirm the value of the LEAP model as applied to the emergency services and may have application in any leadership context. Leaders can confirm their legitimacy through work experience, education and training, the development of skills and leadership traits. The paper seems to assert that curriculum for leadership development should be developed to introduce and reinforce the development of skills and attributes of legitimacy. By developing courses for reality-based, experiential (ontological) educational experience, students will be able to apply the principles of legitimacy that exceed positions power (French and Raven, 1959).

While this study did not examine the Ethical, Affective, and Persistent aspects of the LEAP model, these characteristics appear to build leadership legitimacy as well as trust. While some of the identified components of legitimacy were traits, most were characteristics and/or skills,

## **PERCEPTIONS OF LEGITIMACY**

which could be developed or refined through attention, reflective practice, and experimentation.

We believe that legitimacy in the eyes of the followers is much more than appointed authority, but rather developed characteristics of the leader/administrator, hence the difference between manager and leader, and as such, should be taught in higher education courses.

# **School-Family interventions conducted by elementary teachers to prevent school drop out in the near future**

by

**Joelle Duval, Ph.D.<sup>1</sup> and Catherine Dumoulin, Ph.D.<sup>2</sup>**

<sup>1</sup>Psychopedagogy Education Sciences Faculty

University of Montreal

<sup>2</sup>Education Sciences Department

University of Quebec in Chicoutimi

## **Abstract**

Scientific literature notices that dropping out from school or more commonly known as ‘stall school’, is a long process that is detected as soon as elementary school, as well it notices that the family issue is a risk factor well associated with stall school. However, to prevent this, collaboration of school-family (SF) would be a privileged means to prevent ‘stall school’. However, the responsibility would mostly rely on the teachers to organize SF collaboration interventions. Since the enforcement of the SF collaboration is very little mentioned in scientific writings, this research wished to palliate the lack of knowledge, this is the reason why two research objectives have been set as a target: 1) list SF interventions that consider family factors, conducted by teachers of elementary school; 2) describe the interventions’ enforcement conditions. The qualitative method has therefore been used to describe and understand this phenomenon that has been very little explored in scientific writings. To do this, 10 elementary teachers (that have been teaching for at least 2 years) from the Saguenay-Lac-St-Jean and the Laurentian regions’ in Quebec, Canada, have been recruited. Firstly, the teachers answered a questionnaire on ‘stall school’ and on the SF collaboration interventions. Next, a ‘semi-directed’ interview was conducted, the interview guide was stemming from a conceptual frame and from the questionnaire analysis that was answered previously. Then, the general inductive analysis of the qualitative data directed by the researcher, allowed to clear the SF collaboration interventions, as well as the conditions to be pursued and to be established for them to be applied. Afterwards, the interview permitted to note that despite the fact that the teachers were able to identify the students that were at risk of dropping out of school in the near future, (keeping in mind that these teachers fully understand that they do have a role to play in the prevention of ‘stall school’), in general, these teachers do rarely make collaboration interventions in SF in connection with the family factors associated to SF. Actually, only 2 of the 14 family

factors see frequent or occasional interventions, i.e. more than once per year, while the other 12 are rarely the subject of interventions, namely once or twice per year. Some recommendations arise from the results of the interpretation: 1) training and research propositions on SF collaboration, the prevention of 'stall school' and the mentor role with regards to SF collaboration so that a paradigm change may occur, where the professional culture could recognize the parents' role and as well would facilitate their participation; 2) the proposition to include the community with an extracurricular approach that would combine itself to the school approach already in existence so that the SF collaboration and the prevention of dropping out of school could be optimized. It is therefore ultimately desirable to obtain a paradigm shift so that the professional school culture can influence the teachers' self-sufficient feeling, as well as their comprehension of the role they have to play in the SF collaboration in link with the prevention of school drop out.

1. Title: Understanding and Assessing Young Readers Comprehension Strategies with a Stimulated Recall Method

## Abstract :

Strategies students use to understand what they read are difficult to identify since reading is generally a quiet activity. To develop a better knowledge of strategies used by different profiles of readers, many methods are based on reported strategies (survey, open-ended interviews, etc.), which does not describe the context or the reasons readers use the strategies they report. This study aims to develop a better knowledge of diverse young readers in asking them to explain how they proceed to understand two different written texts. By using a stimulated recall method, 20 students aged 10-12 years old revealed their reading strategies while watching themselves reading and answering comprehension questions. To preserve the natural context of reading and prevent cognitive overload, they described their own actions and reflections while seeing themselves on a video recording.

The results show that students could be classified in 3 different profiles according to the variety and complexity of the reading strategies they describe. Students in the first profile have a very limited knowledge of strategies. They do not control their comprehension strategies enough to be able to evaluate and readjust their actions. Students in the second profile are less at-risk because they use certain types of efficient reading strategies. However, their repertoire is limited and their ability to question their action varies in different reading contexts. The third profile describes effective readers who use a combination of pertinent strategies to understand different kind of texts. These results will be discussed and illustrated by students' reading performance and comments of their strategies. The contribution of such a method will also be presented along with limits and implications for practitioners.

# **POSSIBILITY OF APPLYING THE ELECTRONIC MANAGEMENT AT SANA'A UNIVERSITY**

Dr.Mohammed Abdullah Humaid

Ass.Prof. of Educational Administration

Hajjah University- Yemen

Email: dr. [humaid2010@gmail.com](mailto:humaid2010@gmail.com)

## **Abstract**

This research aims to identify the importance of applying of Electronic Management at Sana'a University, And trying to know the obstacles that facing the application, As well as the most prominent mechanisms that can overcome the obstacles to applying of Electronic Management at the University of Sana'a, In addition to knowing the impact of the research variables: (type, qualification, actual occupation, years of experience, training courses of computers.

To achieve the objectives of this research, the analytical and descriptive method is employed, and research sample consists of (161) Administrative Officer at Sana'a University, and search tool consists of two parts, including the first section of public information, and includes Section II questionnaire questions. Researcher has been using appropriate statistical techniques including arithmetic means, and the standard deviation and variance analysis and Shefee test.

The results of the research show that the individuals of research sample think it is importance to apply the electronic management at Sana'a University, there are obstacles to apply the electronic management at Sana'a University; in addition to that the research sample confirms the need for the existence of mechanisms to overcome obstacles of applying electronic management and There are statistically differences concerning all areas of the questionnaire attributing to the scientific qualification in benefit of those who got the master degree.

Moreover, the study recommends that the necessity of providing the internet for all departments that follow the general administration at Sana'a University, and the necessity of encourage the employees in the field of management and qualifying them for the transformation towards the electronic management through destination systems for rewards.

**Keywords:** Possibility, Electronic Management, University

## **Introduction:**

The human enters twenty-first Century, and becomes depending on information and communication technology which is one of important pillar for modern management.

And the communications and information revolution becomes have an impact on the management of change crucially and it becomes now available employ available information In order to achieve the objectives of the institution. This revolution carries the most important changes it is the technological and communications revolution, and the tendency to the formation of large economic entities.

In light of this scientific progress and the emergence of the so-called digital or electronic, It is necessary for the countries of the world that is moving towards the utilization of this technology in all fields including administrative areas. This technique is introducing a digital technique in electronic commerce as well as in the field of electronic management and government administration. So the countries seeking to apply the electronic management of all its dealings, to get rid of traditional management, among these countries, the Republic of Yemen, which seeks to apply the electronic management in a number of government and private institutions.

And the life activities begins, converting from traditional activities to electronic activities to benefit from the advantages of these new activities that it is called electronic management in order to reduce the cost of government actions, through the provision of these processes and procedures electronically, thereby increasing the efficiency of the administrative work whether through its dealings with individuals or organizations, the ease of dealing with these techniques in light of the evolution of its software, and these days it is considered progress standard for any country is the ability this country to follow the information revolution and understanding the reality of inevitability (Nermeen AL- Saadi,2004,p.70).

So many countries have begun to focus clearly on the introduction of Management Information Technology in their institutions, and the announcement of the application of electronic management according to the drawn plans.

Among these countries the Republic of Yemen, In particular, the Ministry of Higher Education in Yemen has begun in the interest Electronic Management, because the qualification of human resources in any other educational or non-educational is the basic foundation for any development, so this research is trying to sheds light on an attempt possibility of applying the Electronic Management at Sana'a University.

### **Statement of the problem:**

We can formulate the research problem in the following main question:

### **What is possibility of applying electronic management at Sana'a University?**

This main question branches into the following sub questions:

- 1- What is importance degree Applying Electronic management at Sana'a University?
- 2- What is Obstacles that Facing Application Electronic management at Sana'a University?
- 3- What is the main Mechanisms Which Can Overcome to applying Electronic management Obstacles at Sana'a University?
- 4- Are there statistically differences between the individuals of the research sample regarding the possibility of applying the electronic management that attribute to the following demographic changes: (Scientific qualification, actual occupation, years of experiences, and courses of computers).

### **Research objectives:**

The objectives of the research are as follows:

- 1- To identify the extent of importance of applying the Electronic management at Sana'a University.
- 2- To know the obstacle that hind the application of Electronic management at Sana'a. University.
- 3- To know the most Mechanisms that can overcome to applying Electronic Management Obstacles at Sana'a University.
- 4- To determine statistically differences between the individuals of the research sample regarding the possibility of applying the electronic management that

attribute to the following demographic changes: (Scientific qualification, actual occupation, years of experiences, courses of computers).

**Limitations of the research:** this research is limited to:

- General managers, directors of administrative and heads of departments in Public Administration at Sana'a University , because they are on top of the administrative work and more university staff interested in developing work and more impact on the decision-makers. And Field study has been applied in the academic year 2011 – 2012.

**Significance of the research:**

This research is derived in the vitality of its subject and its importance, which addresses the theme of electronic management at Sana'a University.

The importance of this research is in dealing with electronic management as it one of important topics that can be developed the administrative performance of universities.

**Terminology of the Research:**

The definitions will display of the search term, and the adopted definition by the researcher for this term as follows:

**Electronic Management:**

Electronic Management is defined as integrated electronic Organization depends on information and communication technologies to convert administrative work to manual work by implementing the techniques of modern digital(Tariq Amer,2007,p.28).

And Saad Yasien defines Electronic Management as Business system and activities that are performed electronically across networks and it is a function of doing works by using systems and electronic means(Saad Yasien,2005,p.22).

The definition of Electronic Management As the term indicates, E-Management, like E-business refers to the electronic management using technology to improve and facilitate the governing process besides maintaining electronic records for the best performance and results of the work flow integration of information.

Francis Ohanyido first coined this term as a part of the new evolving concepts around e-Governance. E-Management is about accomplishing the governmental goals and objectives through getting people linked together. This kind of management is no difference from the concept of Management as it includes planning, organizing, staffing leading and finally directing and controlling by supervision. E-management's goal as well does not differ from the management objective, which is accomplishing the overall organizational objectives, specifically, through applying ICT and managerial concepts that are stated previously. [http://wiki.answers.com/Q/What is the definition of Electronic Management](http://wiki.answers.com/Q/What_is_the_definition_of_Electronic_Management).

And (Noun) eManagement refers to electronic management . It was coined by Francis Ohanyido as part of the new evolving concepts around eGovernance. It is about the process of getting people together to accomplish desired goals. E-Management comprises planning, organizing, staffing, leading or directing, and controlling an organization (a group of one or more people or entities) or effort for the purpose of accomplishing a goal through the deployment of ICT and manipulation of human resources, financial resources, and natural resources. <http://www.definition-of.com/eManagemen>

Through previous definitions it can be said that Electronic Management Is a quick and easy way to simplify the administrative procedures and implemented efficiently and submitted in less time and effort.

**Researcher** defines electronic management procedurally through this search as the use of information and communication technologies electronically in guiding the policies and procedures the work of the university in order to achieve its objectives and provide the necessary flexibility to respond to changes internally and externally.

### **Previous studies:**

The researcher has organized the previous studies according to the newer:

#### **- S.Vijayarani and Radjamanogary(2013):**

Employees are treated as assets in the organization. In a competitive business environment, one of the key elements of an organization success is their employees' intellectual capability to improve the organizational performance by way of reducing cost, new product development, generate new ideas related to product, process and other areas of management. The employees are find novel ideas and proposed these ideas to management through suggestion system.

Suggestion system is technique which is motivating the employees to participate in decision making process and improve the organization performance. The primary data was collected through structure questionnaire based on convenience sampling method. This research paper focus on employee creativity and its impact on suggestion system and the aims of this article are to find an answer for two questions: 1. what are the factors motivating employee creativity? and 2. What is the impact of creativity on employee suggestion system? Finally this article conclude that both organizational factors and individual factors influencing creativity and there is a positive relationship between employee creativity and suggestion system.

- **Helaiel Almutairi (2011):**

**Aim.** The purpose of the study is to understand the impact of personal and professional factors on Kuwaiti public managers' information behavior.

**Method.** Data were gathered using a questionnaire sent to a total of 400 staff in eighteen ministries. A response rate of 80% was obtained. Data were collected on six person-related variables: age, sex, education, management level, job experience and information system use, and three information behavior dimensions: information characteristics, information types, and information sources.

**Analysis.** The statistical analysis package, SPSS, was used to carry multivariate analysis of variance, analysis of variance, and multiple comparisons with the Scheffe test.

**Results.** The study's findings indicated that age, education, and information system use are the only contextual variables that make a difference in the three information dimensions. The three independent variables were further subjected to a more detailed analysis to understand which of the subgroups' means differ significantly from the others and what direction the differences (positive/negative) take.

**Conclusion.** The general finding is that there are subgroup differences in terms of the impact on information behaviour of age, educational level and information system use.

- **Erwin J. Rooze(2010):**

ICT is used to support and automate case management practices of courts. This use of ICT is here referred to as electronic case management systems. These systems can be applied at different levels of sophistication, on different types of caseflows and with different components. This article introduces the term "differentiated electronic case management systems", since the development and

deployment of these electronic systems differs widely in level of sophistication and provided functionality and since these systems are capable of supporting the contingent use of differentiated case management. An overview of functionality of electronic case management systems found in research is given, using a distinction in four components. The lens of the contingency theory is used to discuss what relevance the different types of case flows, components and levels of sophistication have for the differentiated use and development of electronic case management systems. Also discussed is what courts can do to harvest potential benefits of electronic case management systems.

- **Hamoud Al-ameeri (2008):**

This study aims to identify at provided requirements (administrative, technical, and physical, financial, and human) that encourages the use of e-management at University, and the researcher uses the descriptive method, the study sample consists of all the deans, vice deans and heads of departments of colleges at Umm Al-Qura University in Makkah and they are (190) Individuals, and used a questionnaire consisting of (46) Phrase, The study finds several of the most important results: The degree of availability of laws and regulations for applying the Electronic Management, the degree of availability of ports, communication lines to the Internet and- the degree of availability of financial incentive to push workers to Convert towards the use of e-management at University are few.

- **Abdullah AL- tamam (2007):**

This study aims to identify the reality the application of electronic management in technical colleges in Saudi Arabia from the standpoint of the educational and training faculty and the extent to which the application of electronic management to improve the management level of technical colleges, and a questionnaire is designed by the researcher and the study uses the descriptive analytical survey method and is used stratified random sample consists of members of the training teaching staff at technical colleges. . One of the main findings of the study as follows: Technical colleges apply electronic management moderately; the application of electronic management contributes to improving the level of management of technical colleges and That there are differences between the reality of the application of electronic management and the level of their contribution in improving management of technical colleges.

**Fousia Bakhsh(2007):**

This study aims to identify how to apply the electronic management in develop of colleges of education for girls in Saudi Arabia, in the light of contemporary transformations, the questionnaire has been used as a tool to gather information and the study sample consists of (205) dean ,vice dean, and heads of departments at colleges of Education in the Kingdom. And the analytical method has been used at this study. The most important results of this study following are: the most prominent application of the requirements of the electronic management in: prepare a strategic plan, investment techniques of human and material and reinforcement the organizational climate in college to work as a team.

**- Mehmet Acikalin and Erdinc Duru(2005):**

Nowadays, the use of technology in education has become more popular. Special attention has been given to the adaptation of computer technology into teaching-learning process for effective learning and increasing students' achievement. In recent years, it has been realized that there is an immense benefit in applying computer technology in the social studies classroom.

The first purpose of this study is to review computer - and Internet-supported instructional strategies in the social studies classroom. The second purpose of the study is to investigate the degree of application of these strategies in the social studies classroom. Thus, based on the literature review, the results of the research regarding computer technology in the social studies classroom are summarized, and educational implications are discussed.

In addition, some suggestions for further research were offered.

**- Thomas Groenewald (2004):**

This case study serves as exemplar regarding what can go wrong with the implementation of an electronic document management system. Knowledge agility and knowledge as capital, is outlined against the backdrop of the information society and knowledge economy. The importance of electronic document management and control is sketched thereafter. The literature review is concluded with the impact of human resource management on knowledge agility, which includes references to the learning organization and complexity theory. The intervention methodology, comprising three phases, follows next. The results of the three phases are presented thereafter. Partial success has been achieved with improving the human efficacy of electronic document management; however the client opted to discontinue the system in use.

The researcher has acquired the following benefits from the previous studies:

- 1- Structural of the theoretical study.
- 2- Identifying the items of the study.
- 3- Finding the suit method for descriptive analysis.

**Methods of the research:** The research depends on the descriptive analytical methods.

**Research society:**

It consists of all employees at the University of Sana'a (1545) Employees, according to Statistical Yearbook issued by the Department of Statistics at the University of Sana'a. (Statistical Yearbook 2010, p 263).

**Research Sample:**

Due to the large size of the research community, the researcher chooses a stratified random sample of (224) employees of general managers, departmental managers, and department heads in Public Administration at Sana'a University , who are on the job, rate (14.49%) of the original community.

**Research tool:**

The researcher has used a closed questionnaire as a research tool and that after reviewing the educational literature, and previous studies related to the subject matter, and then drafting the questionnaire which include the basic components and dimensions and consists of (53) terms according to the following way: (5) I fully agree, (4) I agree, (3) I agree to a certain extent, (2) I do not agree (1) I do not agree at all. As the questionnaire were classified into three Interlocutors: the degree of importance of the application of electronic management (15 sentences).Obstacles facing the implementation of electronic management (20 sentences).The main mechanisms by which to overcome the constraints of the applying electronic management (16 sentences).

### **Tool Validity:**

To make sure of the validity of the tool, the researcher uses content validity by Specialize in the field of educational administration and psychology to judge the validity and sincerity of the questionnaire items In the light of amendments instrument specialists the tool appears in the final image So it includes (53) paragraphs under three fields.

### **Tool reliability:**

The researcher uses in the calculation of the stability of the tool Cronbach alpha reliability coefficient for internal consistency, table (1) shows the reliability coefficients for the tool and areas of research.

Table (1)

Reliability coefficients for the search tool and fields

No.	Field	Number of paragraphs	Cronbach's alpha
1	Importance	15	0.89.4
2	Constraints	20	0.89
3	Mechanisms	16	0.90
Total score		51	0.95

Shown in Table (1) that the stability of the areas of the questionnaire ranged between (0.89-0.90) while the overall stability (0.95) so the tool becomes suitable for the purposes of scientific research.

### **Application search tool:**

the search tool has been applied to the research sample totaling (224) employees of public administration at the University of Sana'a .The table(2) shows Distribution of questionnaires to a sample search and the number and rate of return and the unlikely ones, and table (3) shows the distribution of the research sample by variables and percentages after application.

Table (2)

Distribution of questionnaires to a sample search

Statement	Research sample	Questionnaires returned		excluded Questionnaires		Completed questionnaires	
		Repetition	%	Repetition	%	Repetition	%
Public administration workers at Sana'a University	224						
		32	14.28	31	13.89	161	71.87

Table (3)

Distribution of sample by variables and the percentage

Variable	Category	Repetition	Percent %
Type	Males	124	77
	Females	37	23
	Total	161	100
Qualification	High School	36	22.4
	Diploma	18	11.2
	Bachelor	78	48.4
	Master	29	18.0
	Total	161	100.0
Current Work	Heads of Departments	20	12.4
	Heads of administrative	41	25.5
	General managers	100	62.1
	Total	161	100.0
Years of Experience	Less than 5 years	51	31.7
	From 5 to 10 years	92	57.1
	More than 10 years	18	11.1
	Total	161	100.0
computer training courses	There is no training course	40	24.8
	One training course	4	2.5
	Two	58	36.0
	Three or more	59	36.6
	Total	161	100.0

### **Research results:**

- The individuals of research sample think it is importance to apply the electronic management at Sana'a University.
- The individuals of research sample think that there are obstacles to apply the electronic management at Sana'a University; in addition to that the research sample confirms the need for the existence of mechanisms to overcome obstacles of applying electronic management.
- There are no statistically differences concerning all areas of the questionnaire attributing to the gender.
- There are statistically differences concerning all areas of the questionnaire attributing to the scientific qualification in benefit of those who got the master degree.
- There are statistically differences concerning the obstacles of applying the electronic management attributing to the actual occupation in benefit of general manager.
- There are no statistically differences concerning all areas of the questionnaire attributing to years of experience.
- There are statistically differences concerning all areas and the total score of the questionnaire attributing to the courses of computer in benefit of those who have not computer courses.

### **Research recommendations:**

- The necessity of providing the internet for all departments that follow the general administration at Sana'a University.
- The good planning to prepare the qualified employees and holding the required training courses and workshops to apply the electronic management.
- The necessity of encourage the employees in the field of management and qualifying them for the transformation towards the electronic management through destination systems for rewards.
- All obstacles should remove for applying of the electronic management at the University of Sana'a.
- Prepare a special guide to the concept of the electronic management and its goals, and its importance in the fields of University work in order to contribute to the dissemination of wide culture for electronic management, and helping to remove the fears of the ambiguity of the concept of electronic management.

**Research suggestions:**

- Studies on the challenges and obstacles that may face the application of e-governance in various other educational levels.
- Depth Studies on the impact of the system of material and moral incentive for Sana'a University staff in particular and the public sector employees in general.

## **Proposal for Hawaii Conference 2014**

### **TechTeach, an American intensive clinical experience in teacher education: Perspectives from Vietnamese educators**

#### **1. Statement of the Problem**

Clinical experience in Vietnamese colleges of education is having a lot of criticism from the educators. The purpose of this paper is to investigate the Vietnamese educators' opinions about the feasibility of TechTeach program, an intensive clinical experience that is being applied at Texas Tech College of education to improve the quality of teacher education preparation program in Vietnam.

#### **2. Theoretical framework**

In a research about the clinical experience in a college of education in the South of Vietnam, Nguyen (2008) pointed out some of its shortcomings. Firstly, the time that students learned the knowledge about pedagogy was so far from the clinical practice, teacher candidates tended to forget the theory to apply into practice. Secondly, the objectives of clinical experience were not clear hence there were contrasting ideas whether the current length of the clinical experience was enough. Thirdly, the rubric assessment in the clinical experience did not get positive responses from both teachers and candidates.

Huynh (2012) stated the two outstanding difficulties that candidates encountered were the pedagogical knowledge and communication with students and teachers at school. Tran (2012) added classroom management, especially with unobedient students as the most concern from candidates. According to Do Van Dung, Vice President of College of Technical Education, the challenging resulted from the unrespecting of many colleges of education in Vietnam. He suggested making more research about this field to find out what is good to improve the current situation. Most interestingly, Ms. Truong Thi Viet Lien, deputy head of early childhood education in Ho Chi Minh said the alarming number of teacher quitted this job since they all encountered "reality shock", (Tuoitre Online Newspaper, 2013), which is also found in Weinstein research (1989). Weinstein noted that teacher candidates create a vision of an idealized career for themselves as teachers and frequently possess a sense of unrealistic optimism. Ms. Truong suggested increasing the time of clinical experience and having a career orientation so that candidates understand their career better.

The TechTeach program included a full year of clinical experience with the same mentor teacher and students. Candidates and mentor teachers received training on the TAP (The System for Teacher and Student Advancement) rubric and on co-teaching. This assessment rubric got much support from Eckert et al (2009) and National Institute for Excellence in Teaching (2012) as a way to improve teaching effectiveness and to grow ongoing profession. Candidates were observed by a university supervisor six times during the two semesters. They were given

equipment to video capture their lessons. The videos were uploaded to a web site, enabling the lessons to be reviewed by the candidate and others. The placements for the year-long student teaching experience were selected by a planning committee consisting of representatives from the school district and the university.

TechTeach program was piloted in Texas Tech college of Education in 2011 and is now fully applied in all levels. This program got positive feedback from teacher candidates, mentor teachers and site coordinators. This paper will ask for opinions from Vietnamese educators to see how this program can be adopted or adapted in Vietnam.

### **3. Background of the study**

Currently, clinical experience in the colleges of education in Vietnam follows the same guidelines from Ministry of Education and Training (MoET). Candidates will spend 6 weeks at school and will teach around 15 periods.

Candidates' performance is assessed by a school mentor teacher. The mentor uses the same framework for the rubric but the details in the rubric will vary from colleges to colleges. Site coordinator (professor at college make no assessment toward candidates' clinical experience result. Both candidates' teaching and classroom management skills are evaluated by mentor teacher.

TechTeach model provides one year opportunity for candidates to apply what they have learned. Their performance is video captured and assessed by TAP rubric. The researcher will make some recommendations from the feedback of Vietnamese educators.

### **4. Methods and Data Sources**

The information about TechTeach Program was provided to Vietnamese educators. Five professors and two administrators at college of education participated in the interview. The data collected from these data sources were analyzed using qualitative methods. The analysis provided the researcher perspectives from the Vietnamese educators about the implications of TechTeach program.

### **5. Results**

Three themes emerged from the data sources. Firstly, the Vietnamese educators talked about the advantages and disadvantages of one year clinical experience in Vietnam. Secondly, they shared their opinions about TAP rubric as a good reference to evaluate candidates' performance in Vietnam. Thirdly, they showed their concerns in the expense of technology use in the clinical experience.

## 6. Significance of the study

The result suggests that learning the intensive clinical experience from an advanced country is necessary. However, much adaptation must be made to apply it successfully in the Vietnam context. This study provides initial attempts to adapt a clinical practice model to improve the current quality of teacher education preparation program in Vietnam.

***Endless Horizons: A Native Hawaiian Education Initiative***

**Presentation Abstract**

**Title:** *Endless Horizons: A Native Hawaiian Education Initiative*

*Endless Horizons* is an innovative after school program that provides culturally relevant academic interventions in reading and mathematics through a *blended learning model*, which integrates academic and cultural lessons. The overall program enhances students' academic and social performance by combining *Pearson Learning / Success Maker 5 Software Technologies*, with Native Hawaiian language, history, and traditional cultural values.

The thrust of this presentation is to share the most current information that supports youths' understanding and retention of native culture and values along with boosting their Literacy and Math skills. As such, the presentation addresses the program's academic and cultural program components, students' progress in reading and mathematics, professional development for teachers and cultural specialists, and parental involvement.

***Endless Horizons: A Native Hawaiian Education Initiative***

**Introduction**

*Endless Horizons*, is a three year project funded by the US Department of Education / Native Hawaiian Education program. The project, which is housed at Tutor Hawaii in Honolulu, Hawaii, is under the leadership of Robert Allen, Project Director and David Laeha, Project Co-Project Director. The overall goal of the *Endless Horizons* initiative is to improve academic outcomes for all students, including high percentages of Native Hawaiian youth, who attend some of Hawaii's lowest performing elementary schools across the state.

The project addresses students' academic performance in Reading and Mathematics, and incorporates Native Hawaiian cultural values through activities implemented during A+ after school program sessions. A+ personnel participate in professional development designed to enhance their sensitivity to students' unique needs related to culture and poverty. They acknowledge that poverty is broader than economics and encompasses youths' cognitive, social, emotional, physical, and spiritual requirements. Youth participants engage in culturally relevant academic interventions through a *blended learning model* that links evidenced-based learning in Reading and Mathematics with Native Hawaiian language, cultural traditions, and local history.

*Endless Horizons* provides high quality educational opportunities to students who may be overlooked currently in public school settings due to budget restrictions, high poverty levels, and/or lack of family support for education. Moreover, existing after school programs do not include evidence-based academic interventions. Thus, it is difficult to demonstrate success in academic and enrichment programming.

**Student Demographics and Related Issues**

Program participants are at high risk of academic failure, juvenile delinquency, dropping out of school, unemployment, and reliance on public assistance as adults. Students live in high poverty areas, face economic barriers to accessing academic interventions that impact learning in a positive manner, and often live in families that may not support education. *Endless Horizons* allows youth to participate in A+ after school programs where teachers and cultural specialists share responsibility for students' academic, social, and cultural development.

The targeted school communities consist primarily of Native Hawaiians who have low education levels and high unemployment rates. Program participants' eligibility for free or reduced priced school meals typically is 10% - 20% higher than the overall student population across the state.

A closer look reveals that program participants are primarily of Native Hawaiian ancestry, and live in communities and attend Hawaii Department of Education schools ranked lowest according to poverty and achievement levels, as follows:

<b>Elementary School</b>	<b>Location</b>	<b>Hawaii DOE Rank</b>	<b>% Native Hawaiians</b>
Makaha	Waianae, HI	171 / 180	84.7%
Hilo Union	Hilo, HI	172 / 180	81.9%
Honowai	Waipahu, HI	175 / 180	86.6%

**12<sup>th</sup> Annual Hawaii International Conference on Education  
Honolulu, Hawaii  
January 5 - 8, 2014**

***Endless Horizons: A Native Hawaiian Education Initiative***

Waipahu	Waipahi	176 / 180	81.7%
Keonepoko	Pahoa, HI	179 / 180	97.6%

A related concern is the potential detachment between community elders who grew up in completely different worlds than today's youth. This separation increases communication barriers between generations, and creates a climate alien to a community once steeped in tradition, veneration, and oral history. The Native Hawaiian language and traditional culture values are disappearing in an increasingly modern world.

Finally, after school youth development programs provide safe and supervised environments that focus on homework assistance. Staff training is restricted to health and safety issues. There is little professional development that ties Native Hawaiian language and cultural traditions to classroom learning. Cultural programming is rare, and yet, crucial for youths' academic success because it increases their performance on academic assessments in reading and mathematics.

**Program Highlights**

**Academic Development:**

Students participate two hours weekly in Tutor Hawaii's *blended learning* evidence-based academic intervention model, which focuses on reading and mathematics. The instructional program relies on *Pearson's Success Maker 5 Software Technologies*. Pearson Learning Reading and Mathematics activities include students' participation in differentiated, personalized web-based instruction tailored to their individual learning needs. Initial instructional experiences begin with assessments designed to identify starting points that complement students' current knowledge levels and skills in the subject area. Instruction then progresses to subsequent levels based on youths' performance progress and ever-changing learning needs.

Students receive incentives to move forward to subsequent skills. They spend a minimum of one hour in individualized computer-based assessment and instruction and participating in face-to-face follow-up instruction, and at least 15 minutes per session addressing Native Hawaiian *cultural values and activities*

**Overall Program Success / Students' Progress - Reading and Mathematics**

**Reading Performance Measure - Mean = 450 Students**

Level Data				Usage			Instructional Performance			Mastery		
Assigned Course Level	Current Course Level	IP Level	Gain	Time Spent	Total Sessions	Exercises Correct	Exercises Attempted	Exercises % Correct	Skills Assessed	Skills Measured	Skills % Mastered	% Students w/ AP
2.56	2.39	2.26	0.13	3:20	14.11	89.88	121.92	66.35%	5.64	4.40	58.31%	35.33%
1.82	1.72	1.73	0.11	3:29	14.18	142.65	179.86	20.89%	6.42	5.78	39.26%	Standard Deviation

**12<sup>th</sup> Annual Hawaii International Conference on Education  
Honolulu, Hawaii  
January 5 - 8, 2014**

***Endless Horizons: A Native Hawaiian Education Initiative***

\* AP = Acceptable Performance (75% Skills Mastery) = 35.33% of 450 students attained 75% skills mastery in Reading (N = 158.98 students)

According to the above table, an estimated 35% of students (N=159) attained acceptable levels of performance in Reading, based on an average of 3 hours and 20 minutes participation in the Pearson Success Maker 5 Program

**Mathematics Performance Measure - Mean = 442 Students**

Level Data				Usage			Instructional Performance			Mastery		
Assigned Course Level	Current Course Level	IP Level	Gain	Time Spent	Total Sessions	Exercises Correct	Exercises Attempted	Exercises % Correct	Skills Assessed	Skills Measured	Skills % Mastered	% Students w/ AP
2.55	2.81	2.63	0.18	3:18	17.41	113.48	162.49	68.96%	27.38	26.73	95.23%	47.96%
1.81	1.62	1.69	0.18	3:16	18.31	136.28	195.48	15.38%	26.40	25.86	17.40%	Standard Deviation

\* AP = Acceptable Performance (75% Skills Mastery) = 47.96% of 442 students attained 75% skills mastery in Mathematics (N= 211.94 students)

According to the above table, an estimated 48% of students (N=212) attained acceptable levels of performance in Mathematics, based on an overall average of 3 hours and 18 minutes participation in the Pearson Success Maker 5 Program

An anecdotal example of student academic success may be illustrated by program implementation at Hilo Union Elementary School, where the Academic Specialist, who is also a teacher at the school, works closely with students, parents, and teachers to ensure students' successful program participation. She established a rewards system for students whereby they receive ribbons of different colors in recognition of academic success and attaining various performance levels. For example, about 38% of students (N=30/79) at Hilo Union Elementary School achieved acceptable performance levels (i.e., 75% skills mastery) in Reading. Similarly, an estimated 71% of students (N=63/89) at the same school have achieved acceptable performance levels (i.e., 75% skills mastery) in Mathematics.

**Cultural Development:**

Students begin each lesson with a Native Hawaiian Chant (*Na Oli* and *Na Mele*), which offers excitement and calmness to help unify and focus their attention before academic lessons.

Students also participate in other cultural activities, that emphasize the importance of *Ohana*, (i.e., family and extended relationships) and address traditional values of cooperation, humility, love, respect, honesty, graciousness, responsibility, working hard, and seeking knowledge, among other ethical principles.

The cultural specialist at Makaha Elementary School developed a cultural booklet to facilitate youth's understanding of the traditional cultural values including

**12<sup>th</sup> Annual Hawaii International Conference on Education  
Honolulu, Hawaii  
January 5 - 8, 2014**

***Endless Horizons: A Native Hawaiian Education Initiative***

• <i>Ohana</i>	Family
• <i>Laulima</i>	Cooperation / Partnerships / Community
• <i>Kuleana</i>	Responsibility
• <i>Lokahi</i>	Harmony / Balance
• <i>Pono</i>	Righteousness / Propriety / Goodness
• <i>Olu'olu</i>	Pleasantry
• <i>Ha'aha'a</i>	Humility
• <i>Ahonui</i>	Patience
• <i>Na'auaao</i>	Knowledge
• <i>Akahai</i>	Graciousness
• <i>Kokua</i>	Helpfulness
• <i>Malama</i>	Caring / Consideration
• <i>Pa'ahana</i>	Industriousness

The Cultural Specialist also designed activities to help explain the meaning of cultural values.

**Professional Development:**

The project leadership created two videos to facilitate the professional development of A+ YMCA and *Kama'aina Kids* program personnel and youth development specialists. The first video, is six-hours long, details program goals and activities, poverty issues and cultural considerations, and addresses some of the following program content:

- Positive academic and behavioral outcomes for students facing generational poverty
- Strategies to promote family involvement in educational activities
- Evidence-based academic software to promote increased classroom performance
- Strategies to integrate Native Hawaiian traditions and customs into enrichment programming
- Strategies to implement parent involvement *Digital Media* program

Anecdotal examples regarding success of the professional development activities may be evidenced by unsolicited comments from personnel, which indicate that the videos help them to better plan program activities. For example, one A+ teacher said, *'it was very, very informative and I am so excited . . . that I now have a better view of Tutor Hawaii and what is expected and, am motivated to make next year's program even better. I was so impressed that I shared what I learned with my Staff in our meeting and gave them . . . a sense of pride, as we are builders in making a difference in the lives of the children . . . THANK YOU VERY MUCH!!!!'*

Another A+ teacher said, *"The poverty section . . . was very good. It hit close to home as I was brought up in a home that was strict . . . our livelihood considered very minimal under the poorest conditions . . . I always felt that . . . my upbringing . . . helped me to understand more fully the children I work with that are really in those poverty levels. Having seen the video, . . . I am more equipped to teach, supervise, and role model in a more uplifting way that will benefit not just the child in question, but my entire program and staff. Thank you . . . This is a "must-see" training"*

**12<sup>th</sup> Annual Hawaii International Conference on Education  
Honolulu, Hawaii  
January 5 - 8, 2014**

***Endless Horizons: A Native Hawaiian Education Initiative***

The second video, which is designed for Cultural Specialists, is two-hours long and provides an overview of the project's cultural components. Moreover, the Cultural Specialists rely on this content to provide on-the-job instruction about cultural traditions and values to a range of four to six A+ personnel at each school campus.

**Parent Involvement:**

Parental participation was designed to foster the development and implementation of a *Digital Media* summer program component. It hoped to (a) bring families together in multigenerational groups, (b) afford enjoyable learning experiences for parents and children, and (c) generate ideas for parent involvement in education. The program anticipated offering a minimum of two *Digital Media* workshops at each school during summer months. Unfortunately, parents' previous commitments did not enable them to accept the invitation to participate in the *Digital Media* activity.

**Lessons Learned**

Students' actual participation varied significantly among the schools. The time slot for the A+ after school program is from 2:30 PM to 5:30 PM. Yet, many parents may retrieve their children prior to the scheduled close of the A+ after school time period, thereby diminishing the expected time children participate in the program. Moreover, many A+ after school programs offer scheduled activities in which all children must participate (e.g., homework completion, snack time). Thus, it is often difficult to ensure all children's participation in the *Endless Horizons* program as planned originally.

Currently, acceptable academic performance levels are based on students' attainment of 75% skills mastery in the respective subject areas of Reading and Mathematics. In the future, it may be appropriate to calculate youths' academic growth based on (a) academic and cultural specialists' levels of involvement with children, (b) time on academic tasks, and (c) exposure to cultural activities in relationship to students' gains.

Regrettably, parent participation in program activities was minimal. Therefore, it is critically important to initiate parental involvement strategies 'sooner than later' to ensure their ongoing involvement in project implementation and support for their children's education

**Conclusion**

The *blended learning model* helps to promote statistically significant gains in reading and mathematics as well as positive behavioral outcomes for economically disadvantaged and Native Hawaiian students who may face generational poverty. Attainment of these accomplishments relies on collaboration and building professional relationships with colleagues in various organizations is crucial to the success of the *Endless Horizons* project.

Program leadership personnel wish to acknowledge the support of the following partners in program implementation:

## Abstract

*This paper assesses acquisition of entrepreneurial skills by polytechnic students in Osun State, Nigeria. It identifies courses through which entrepreneurial skills could be acquired; examines availability of training facilities; determines whether or not polytechnic students do the mandatory industrial training or students' industrial work experience scheme, and find out attitudes of students to entrepreneurial skills acquisition. Survey research design was used. The population comprised all the polytechnic students in Higher National Diploma (HND). The sample comprised 300 participants from purposefully selected three government-owned polytechnics. Descriptive and inferential statistics were used to analyze data gathered through structured questionnaire. The results showed that there were over 50 entrepreneurship-based courses offered in polytechnics in the State. Availability of relevant skills training facilities was lacking. Both the industrial training and students' industrial work experience scheme positively contributed to acquisition of skills. Students' attitudes towards entrepreneurial skills acquisition were poor. Relevant workable recommendations were suggested.*

**Key Words:** polytechnic, acquisition, entrepreneurial skills, training facilities

## **Introduction**

Several attempts have been made by successive government in Nigeria from time immemorial to empower the youth with employable skills with a view to alleviating unemployment and poverty. For instance the establishment of National Poverty Eradication Program (NAPEP) 2000/2001, Structural Adjustment Program (SAP) 1988/89, and National Directorate of Employment (NDE) 1986, among others are government efforts towards eradicating joblessness, unemployment and poverty among the people. However, all these programs and government interventions seem not to address the real foundational problem which is hidden in the Nigerian education system and its products. The Polytechnic education in Nigeria is established to impart the youths with practical and employable skills. Regrettably however, contrary seems to be the situation. Teaming number of polytechnic graduates are unemployed and jobless. This scenario is not far-fetched from the fact that they were ill-equipped with entrepreneurial skills in the course of their education. Thus there is need to assess acquisition of entrepreneurial skills by prospective students of polytechnics in the State of Osun, Nigeria with a view to finding out the strengths or weaknesses of polytechnic education in equipping the Nigerian youths with necessary and relevant employable skills. Hence, this study becomes very germane.

The polytechnic education in Nigeria as in other parts of the world is established with a view to imparting relevant and necessary work skills in prospective students. Every course of study in Nigeria polytechnics has potential for entrepreneurship. It is, however, regrettable that most Nigerian youths, who attend polytechnics, lack entrepreneurial skills which could make them to be employable or self-employed/self-reliant after their graduation from school. Kitzer (2007) defined entrepreneurship as a process in which individuals pursue opportunities, fulfilling

needs and wants through innovations, together with the attendant risks. According to Klaipeda Business School (2009) Entrepreneurship is defined as the main skill necessary in order to conform to the conditions of the ever-changing knowledge and information society. Nwanaka and Amaechule (2011) are of the view that Nigeria's social and economic problems will be drastically reduced if students are given adequate vocational training in skills, raw materials, machineries and equipment. According to Maigida, Saba & Namkere (2013), the modern world economy requires innovation, training, reinventing in vocational education and entrepreneurship training that will significantly favor the youth. World over, there is always job for the skilled. Dhenak (2011) laments that though there is abundant labor supply there is generally scarcity of skills at all levels of socio-economy. There is no doubt that joblessness and unemployment continue to grow unabated in Nigeria due to poor acquisition of entrepreneurial/vocational skills. According to Osemeke (2012), a skill implies an ability which can be developed, not necessarily inborn, and which is manifested in performance, not merely in potential. In Europe, according to Klaipeda Business School (2009), all participating institutions in entrepreneurship training have come to a common decision that the entrepreneurial skills the students are able to acquire during their regular study process are not enough for a common European (labor) market. Thus, it is imperative that polytechnic graduates must possess demonstrable work skills.

Nwanaka and Amaechule (2011) emphatically states that it is only with skilled men that materials can be harnessed, manipulated and transformed into products. Likewise, Maigida, Saba & Namkere (2013) believe that entrepreneurship is the practice of consistently converting goods and ideas into productive and profitable commercial ventures. Entrepreneurship is an ability to think creatively and become an effective problem solver (Maigida, Saba & Namkere, 2013). Comfort and Bonaventure (2012) consider entrepreneurial skills as business skills which one

acquires to function effectively in the turbulent business environment as an independent or self-employed person in order to improve one's economic status and the society at large. Maigida, Saba & Namkere (2013) explain that entrepreneurship is a special type of labor that requires the assembling of all factors of production: capital, land and labor and tries to ensure optimum utilization of them to ensure maximum profit. There are resources, materials and potentialities lying fallow unexplored; these are only waiting for the skilled, who will explore, harness, manipulate and transform them into saleable products.

According to Nwanaka and Amaechule (2011) there are three stages in skills acquisition: theoretical, practical and exposure to challenges. An important factor in skills acquisition process is exposure to practical situations where these skills are displayed and utilized. It is thus essential that polytechnic students be given the required practical skills, which they need to cope with emerging challenges of the modern world. In order to expose polytechnic students to real work situations, they are mandated to go for one year industrial training (IT) or students' industrial work experience scheme (SIWES) in job areas relevant to their courses of study after their first two years (Ordinary National Diploma – OND), before proceeding for their Higher National Diploma (HND). The following, according to Comfort and Bonaventure (2012), are the objectives of Students' Industrial Work Experience Scheme (SIWES):

- i. To provide an avenue for students in institutions of higher learning to acquire industrial skills and experience in their courses of study.
- ii. To prepare students for the industrial work situations they are to meet after graduating.
- iii. To expose students to work methods and techniques in handling equipment and machinery that may not be available in their institutions.

- iv. To make the transition from school to the world of work easier and enhance students contacts for later job placement.
- v. To enlist and strengthen employers' involvement in the entire educational process and prepare students for employment in industry and commerce.

Regrettably, Comfort and Bonaventure (2012) found out that the objectives of SIWES were not realized due to lack of seriousness on the part of some students, deployment of some students to offices that have nothing to do with their areas of specialization as well as the insensitivity of their respective institutions in approving placement for students in offices not related to their field of study. These, according Comfort and Bonaventure (2012) adversely affected their level of exposure to practical experiences required for self-reliance, self-employment, and the general employability in public and private sectors of the economy. They believe that students need exposure to areas that will benefit them based on their areas of specialization.

Polytechnic students should be encouraged and made to do their SIWES in workplaces relevant to their courses of study to enable them gain productive and profitable entrepreneurial skills. Comfort and Bonaventure (2012) concluded that one of the major ways students can gain the right experiences is when they are posted to the right offices with the right equipment and facilities; monitored closely and supervised effectively by both the institutions and industries-based supervisors. The youths need exposure in practical entrepreneurial work experience in order to be proficient in their chosen career and be useful to themselves and the society. Entrepreneurship which is a planned effort undertaken by an individual or individuals, institutions or agencies to develop the required competencies in people can easily be addressed through exposure to vocational options. Abubakar (2010) exemplified educational institutions

and workplace as different contexts in which learning experiences may occur. Oziengbe (2009) also identified technical colleges and trade centers as two places where teaching of skills takes place in formal sector. In these centers, individuals are provided with needed skills that will enable them become proficient in both the public workplace and private employment. The principal criterion of skillfulness must be effective action under varying conditions (Maigida, Saba & Namkere, 2013).

Skills can be cultivated or developed (Osemeke, 2012). Therefore to develop entrepreneurial skills in polytechnic students they need to be attached to workplaces for practical orientations. Osemeke (2012) identified conceptual skills, human skills, and technical skills. Technical skills, according to him, imply an understanding of, and proficiency in, a specific kind of entrepreneurial activity, particularly one involving methods, processes, procedures, or techniques. Technical skills involve specialized knowledge, and technical ability within that specialty, and facility in the use of tools and techniques of specific discipline – Osemeke (2012). Polytechnic students must be trained in handling work tools for their self-reliance. Maigida, Saba & Namkere (2013) view that entrepreneurship is a special type of labor that requires the assembling of all factors of production: capital, land and labor and tries to ensure optimum utilization of them to ensure maximum profit.

According to Adeyemo (2009), skill is thought of as a quality of performance which does not depend solely upon a person's fundamental, innate capacities but must be developed through training, practice and experience. Skills represent particular ways of using capacities in relation to environmental demands (Adeyemo, 2009). He further emphasizes that entrepreneurial skills are the basic skills necessary to enable one starts, develops, finances, and succeeds in one's enterprise. He, therefore, identifies the conditions which promote acquisition and the change that

will occur when the skill is acquired as two fundamental issues that must be considered when new skill is to be acquired. Adeyemo (2009) reiterates that a learner of a new skill does not jump into operation without first receiving the necessary verbal instruction. The instruction, perhaps given in bits, units, modules or stages, according to him, must be fused together to form a skillful/skilled performance. It is, however, pathetic that education being received by Nigerian polytechnic students today is nothing more than only verbal instructions without any practical orientations to actualize what is instructed. According to Gumbari (2009), there is no issue that should be addressed as a matter of urgent national importance than that of skills acquisition by the youth considering the failure of our basic education to yield the expected positive results with its attendant consequences such as armed robbery, militancy, kidnapping, abduction for ransom and a lot of others.

According to Araba (2013) entrepreneurship is important as a diffusion mechanism to transform scientific inventions into new product and service innovations. Consequently, Araba (2013) counsels that institutions of higher education should offer chance to develop knowledge intensive high-growth enterprises from all academic disciplines, not just technical ones. He believes that higher education institutions should create an environment that fosters entrepreneurial mind-sets, skills and behaviors across organizations. Lending credence to IT/SIWES, Araba (2013) emphasizes that it is important to involve stakeholders inside and outside of higher education institutions in entrepreneurial skill training. He therefore recommends that if the polytechnic graduates are to enter the business world and entrepreneurship it is necessary to involve business people and entrepreneurs in the academic education process.

In conclusion, importance of entrepreneurial skills acquisition in job/employment creation cannot be overemphasized. Gumbari (2009) says that if third World countries especially Nigeria must be economically self-reliant, they must necessarily diversify their economies and as well encourage the youth to embrace self-employment through appropriate favorable policy environment that would facilitate skills acquisition, entrepreneurship and self-reliance.

### **Purpose of the Study**

The general purpose of this study is to assess acquisition of entrepreneurial skills by polytechnic students in the State of Osun, Nigeria. Specifically, the study sought to:

- i. identify courses/programs from which entrepreneurial skills could be acquired by polytechnic students;
- ii. examine availability of relevant teaching/training facilities with which entrepreneurial skill could be acquired by polytechnic students;
- iii. determine whether or not polytechnic students do their industrial training (I.T) or Students' Industrial Work Experience Scheme (SIWES) programs in job areas related to their course of studies; and,
- iv. find out attitudes of polytechnic students towards acquisition of entrepreneurial skills.

### **Research Questions**

- i. What are the courses/programs from which entrepreneurial skills could be acquired by polytechnic students?
- ii. Are there relevant teaching/training facilities with which entrepreneurial skills could be acquired by polytechnic students?

- iii. Do polytechnic students do their Industrial Training (I.T)/Students Industrial Work Experience Scheme (SIWES) programs in job areas related to their courses of studies?
- iv. What are the attitudes of students of polytechnics towards acquisition of entrepreneurial skills?

### **Hypotheses:**

- i. There will be no significant relationship between the department of students and availability of teaching/training facilities with which entrepreneurial skills could be acquired by polytechnic students.
- ii. There will be no significant difference between the sex of students of polytechnics and their attitude towards acquisition of entrepreneurial skills.
- iii. There will be no significant difference between the year of program of student and whether they do their IT/SIWES in job areas related to their course of studies.

### **Methodology**

A descriptive survey research design was adopted for the study. In a typical survey the researcher selects a sample of respondents and administers a standardized questionnaire to them. The survey design is appropriate for this study, since the study is not truly experimental. Descriptive survey can provide information on the attitudes or other characteristics of a particular group. It is good in collecting information, demonstrate relationships and describe the world as it exists.

The population for this study comprised all the Polytechnic students running their Higher National Diploma (HND) in the State of Osun, Nigeria. There are 5 (five) Polytechnics in the State of Osun 3(three) public owned and 2(two) private owned. These are: Federal Polytechnic

Ede, Osun State Polytechnic Iree, Osun State College of Technology Esa-oke, Interlinks polytechnic Igbajo, and The Polytechnic Ile-Ife. The sample for this study consisted of 300 Higher National Diploma [HND] Polytechnics students drawn from 3 [three] government-owned polytechnics, these are: Federal Polytechnics Ede, Osun State Polytechnics Iree, and Osun State College of Technology Esa-Oke. Purposive and stratified random sampling techniques were employed. The three 3 polytechnics were purposively selected due to the fact that they run many more courses/programs than the private-owned ones, and they have many more accredited courses by the National University Commission [NUC] Than the private-owned Polytechnics. One hundred students were randomly selected from each of the three 3 polytechnics. Each 100 was stratified into 20 students per course/programs at the HND level. The rationale for limiting the sample to HND students is due to the fact that they have had the opportunity to go for the mandatory Industrial Training (I.T) or Students Industrial Work Experience Scheme (SIWES).

The research instrument was a structured/open-ended questionnaire which was divided into two sections: Section A comprised socio-demographic data of the participants, Section B consisted of a 21-item which elicited relevant information from the participants based on the pre-set objective of the study. Participants' responses were based on a four-point rating scale: [1] Agree [2] Strongly Agree [3] Disagree [4] Strongly Disagree. Both the face and the content validity were done with a view to ensuring that items on the questionnaire measure what they are meant for. Data was analyzed using descriptive and inferential statistical method. The data collected were tabulated and grouped according to questions relating to the research questions to which answers are being sought.

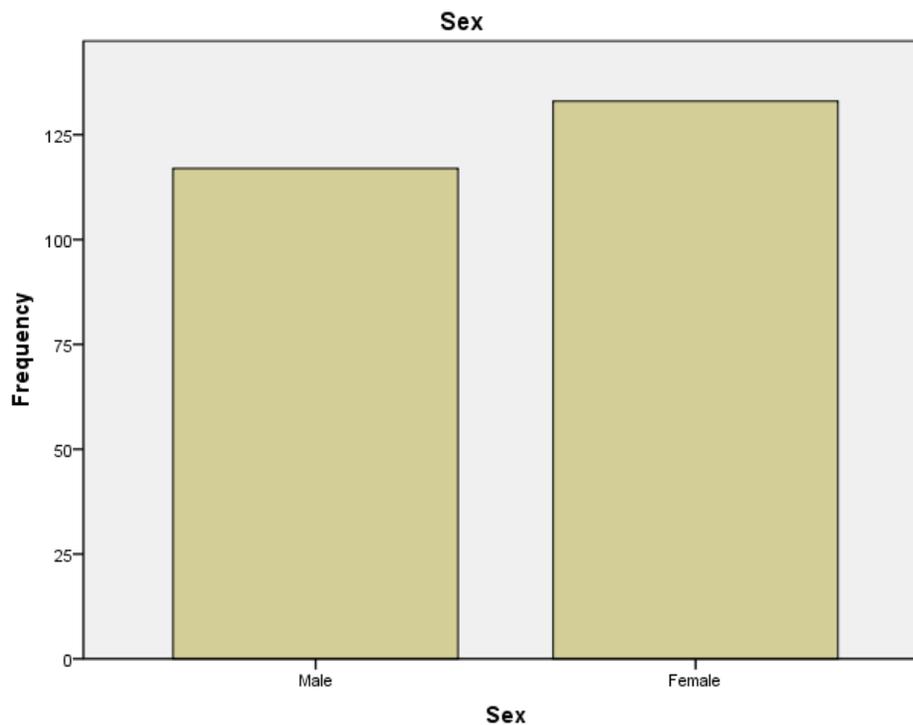

## Data Analysis

The data collected were analyzed using descriptive and inferential statistics involving frequency counts and percentages. Out of the 300 questionnaire administered, 250 were returned and analyzed. The analyses are presented in the following Tables:

## Data Analysis and Discussion of Results

**Table 1: Sex Distribution of the Respondents**

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid Male	117	46.8	46.8	46.8
Female	133	53.2	53.2	100.0
Total	250	100.0	100.0	

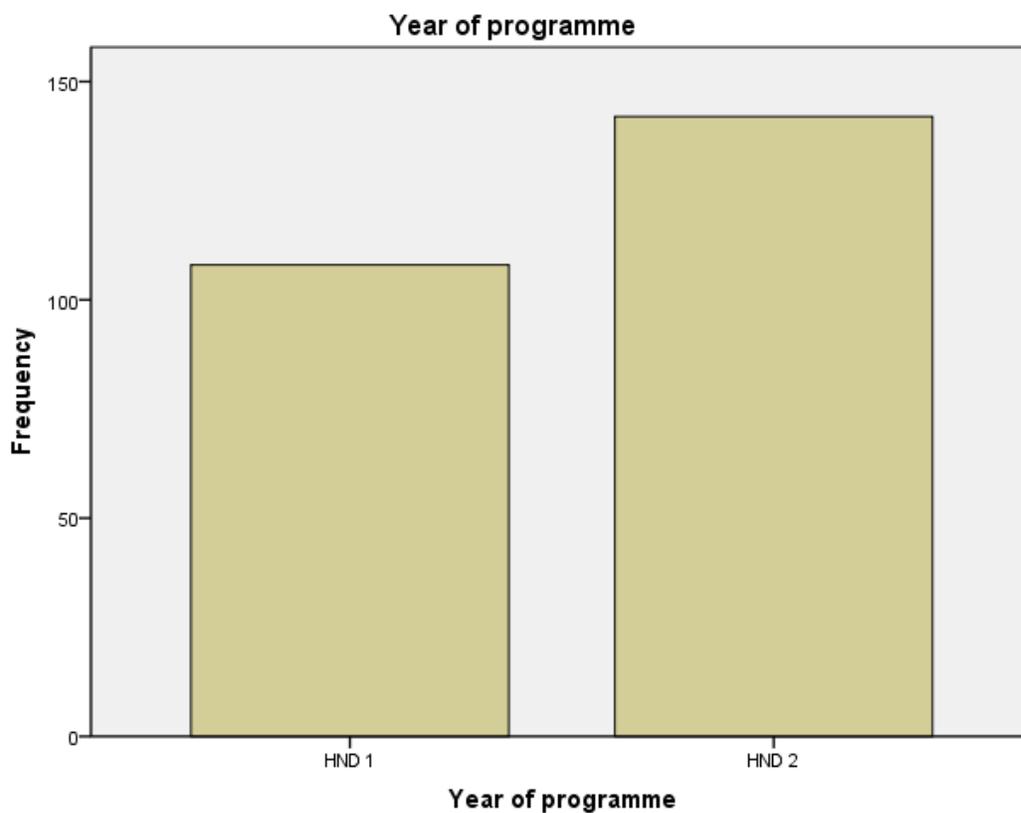

**Figure 1: Sex Distribution of the Respondents**

The analysis on Table 1 and as graphically depicted by Figure 1 shows that 117 (46.8%) and 133 (53.2%) of the participants were males and females respectively. This clearly shows the randomization as per the gender of the participants. Sample was not stratified by gender. However, female respondents are the majority.

**Table 2: Distribution by Year of Program**

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid HND 1	108	43.2	43.2	43.2
HND 2	142	56.8	56.8	100.0
Total	250	100.0	100.0	

**Figure 2: Distribution by Year of Program**

Table 2 and Figure 2 show that 108 (43.2%) respondents are in HND 1 while 142 (56.8%) are in HND 2 of their program.

Research question 1: What are the courses/programs from which entrepreneurial skills could be acquired by polytechnic students?

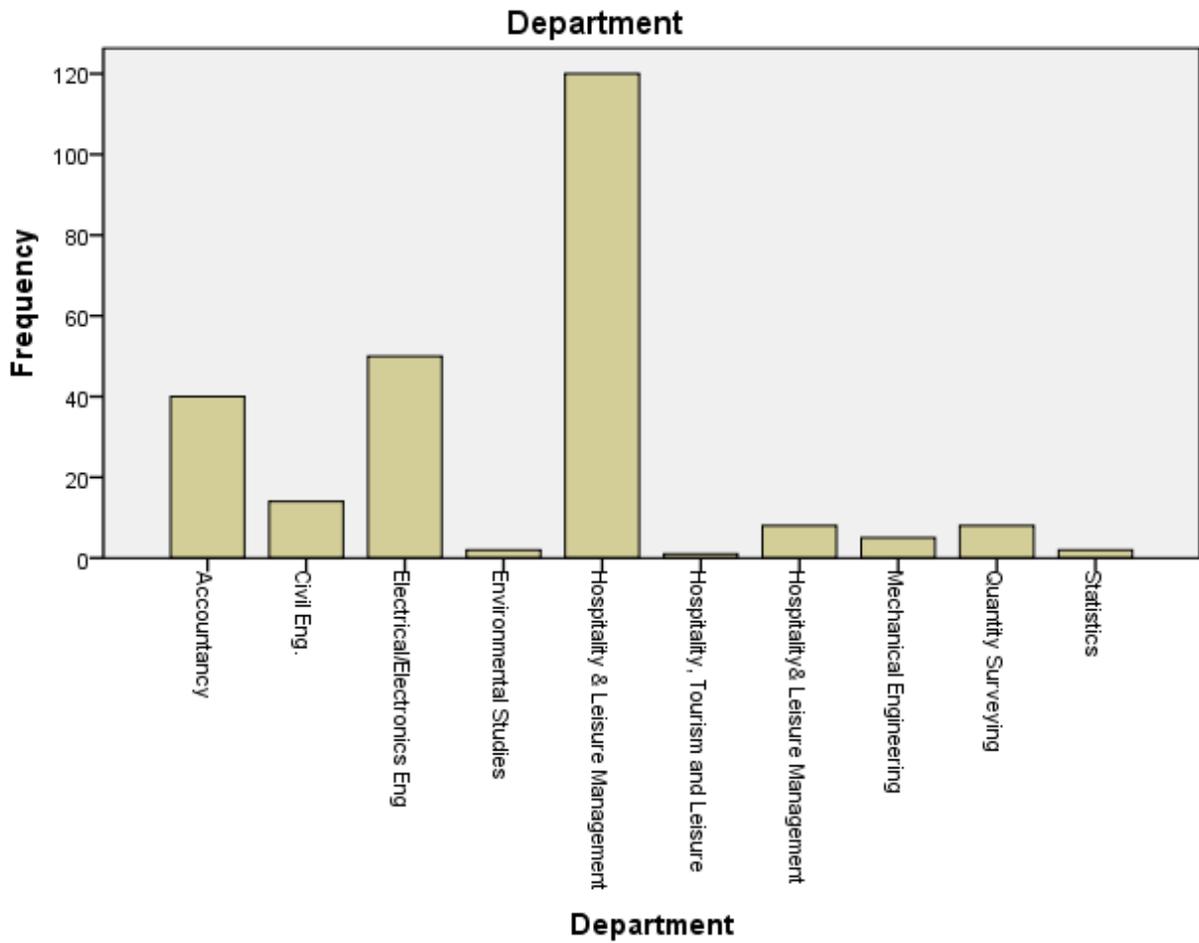

As it earlier been said, all courses being offered in Nigerian polytechnics have entrepreneurial potential which prospective polytechnic students could explore. The available courses in Nigerian polytechnics as contained in the Joint Admissions and Matriculation Board (JAMB) brochure 2011 pages 459-504 are listed hereunder:

Agricultural engineering/technology, animal health and production technology, architectural technology, art and design, banking and finance, building technology, business administration and management, chemical engineering technology, civil engineering technology, computer science, cooperative economics and management, computer engineering, aircraft engineering technology, dental technology, dental therapy, electrical electronics engineering, estate management, fashion design and clothing technology, food technology, forestry technology, fisheries technology, foundry technology, hospitality management, glass/ceramics technology, geological technology, insurance, library and information science, social development, mass communication, mechanical engineering technology, mechatronics engineering technology, metallurgy, mineral resources engineering technology, nutrition and dietetics, printing technology, quantity surveying, polymer technology, science laboratory technology, leather technology, office technology and management, textiles technology, leisure and tourism management, urban and regional planning, wood and paper technology, music technology, surveying and geoinformatics, welding and fabrication technology, community health, health information management, environmental health, and pharmaceutical technology among others.

The polytechnic education in Nigeria has the responsibility of equipping prospective polytechnic students with relevant entrepreneurial skills from the above listed courses with a view to making them possess employable skills as well as self-reliant and self-employed potentials. It is, however, highly disappointing that majority of the polytechnic graduates are still in the job markets years after their graduation from school. The respondents' responses as per the departments and courses they offered in polytechnics are analyzed on Tables 3 and 4 as well as Figures 3 and 4.

**Table 3: Distribution of Respondents by Department**

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid Accountancy	40	16.0	16.0	16.0
Civil Eng.	14	5.6	5.6	21.6
Electrical/Electronic Eng	50	20.0	20.0	41.6
Environmental Studies	2	.8	.8	42.4
Hospitality & Leisure Management	120	48.0	48.0	90.4
Hospitality, Tourism and Leisure	1	.4	.4	90.8
Hospitality & Leisure Management	8	3.2	3.2	94.0
Mechanical Engineering	5	2.0	2.0	96.0
Quantity Surveying	8	3.2	3.2	99.2
Statistics	2	.8	.8	100.0
Total	250	100.0	100.0	

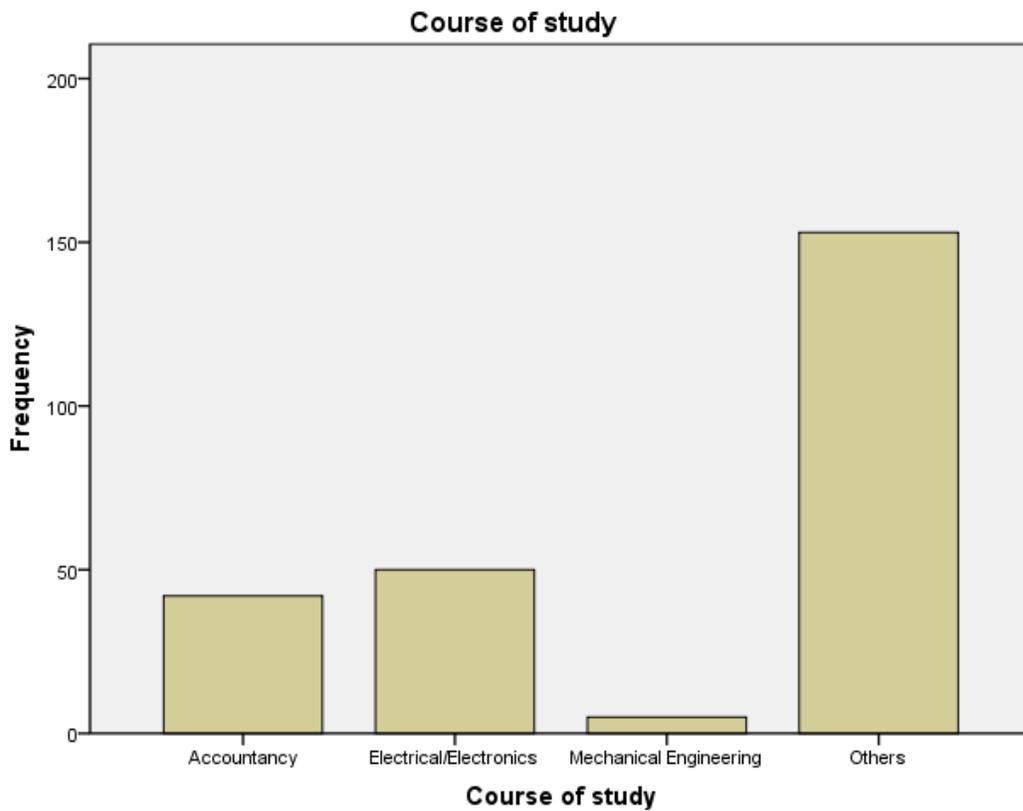

**Figure 3: Distribution of Respondents by Department**

According to Table 3 and shown by Figure 3, 40 (16.0%) respondents study accountancy, 14 (5.6%) study civil engineering, 50 (20.0%) study electrical/electronic engineering, 2 (0.8%) study environmental studies, 128 (51.2.0%) study hospitality & leisure management, 5 (2.0%) study mechanical engineering, 8 (3.2%) study quantity survey while 2 (0.8%) study statistics.

**Table 4: Distribution by Course of Study**

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Accountancy	42	16.8	16.8	16.8
	Electrical/Electronics	50	20.0	20.0	36.8
	Mechanical Engineering	5	2.0	2.0	38.8
	Others	153	61.2	61.2	100.0
	Total	250	100.0	100.0	

**Figure 4: Distribution by Course of Study**

Table 4 and Figure 4 shows that 42 (16.8%) respondents study accountancy, 50 (20.0%) study electrical/electronic engineering, 5 (2.0%) study mechanical engineering while 153 (61.2%) study other courses.

Research question 2: Are there relevant teaching/training facilities with which entrepreneurial skills could be acquired by polytechnic students?

**Table 5: Distribution by Availability of Relevant Teaching/Skill Training Facilities**

Variable	Agree	Strongly Agree	Disagree	Strongly Disagree
Relevant training equipment are available for my course of study	69 (27.6%)	5 (2.0%)	11 (4.4%)	165 (66.0%)
The available training equipment are not enough to cope with the number of students	46 (18.4%)	53 (21.2%)	130 (52.0%)	21 (8.4%)
I always have access to using the equipment during practical training	45 (18.0%)	17 (6.8%)	28 (11.2%)	160 (64.09%)
The available equipment are not in good state	125 (50.0%)	55 (22.0%)	69 (27.6%)	1 (0.4)
There is always power supply to power the machines during practical training	156 (62.4%)	46 (18.4%)	20 (8.0%)	28 (11.2%)
The available equipment are obsolete	114 (45.6%)	55 (22.0%)	81 (32.4%)	-
There are experts (technologists) to set and use the equipment to train me during practical training	16 (6.4%)	48 (19.2%)	172 (68.8%)	14 (5.6%)
Though equipment are there but I was never trained with it	157 (62.8%)	6 (2.4%)	85 (34.0%)	2 (0.8%)
There are adequate training/working equipment where I did my IT/SIWES	42 (16.0%)	47 (18.8%)	33 (13.2%)	128 (51.2%)
I had opportunity of using equipment which I did not have access to in my school during my IT/SIWES	43 (17.2%)	176 (70.4%)	7 (2.8%)	24 (9.6%)

Table 5 shows that 69 (27.6%) respondents agreed that relevant training equipment are available for their course of study, 5 (2.0%) strongly agreed, 11 (4.4%) disagreed and 165 (66.0%) strongly disagreed. Also, 46 (18.4%) respondents agreed that the available training equipment are not enough to cope with the number of students, 53 (21.2%) agreed strongly, 130 (52.0%) disagreed and 21 (8.4%) disagreed strongly. Forty-five (18.0%) respondents agreed that they always have access to using the equipment during practical training, 17 (6.8%) agreed strongly, 28 (11.2%) disagreed while 160 (64.0%) disagreed strongly. Likewise, 125 (50.0%)

respondents agreed that available equipment are not in good state, 55 (22.0%) agreed strongly, 69 (27.6%) disagreed and 1 (0.4%) disagreed strongly. One hundred and fifty-six (62.4%) respondents agreed there is always power supply to power the machines during practical training, 46 (18.4%) agreed strongly, 20 (8.0%) disagreed and 28 (11.2%) disagreed strongly; while 114 (45.6%) respondents agreed that the available equipment are obsolete, 55 (22.0%) agreed strongly and 81 (32.4%) disagreed. sixteen (6.4%) agreed that there are experts (technologists) to set and use the equipment to train them during practical training, 48 (19.2%) agreed strongly, 172 (68.8%) disagreed and 14 (5.6%) disagreed strongly; 157 (62.8%) respondents agreed that they were never trained with equipment though available, 6 (2.4%) agreed strongly, 85 (34.0%) disagreed and 2 (0.8%) disagreed strongly. Forty-two (16.8%) respondents agreed that there are adequate training/working equipment where they did their IT/SIWES, 47 (18.8%) agreed strongly, 33 (13.2%) disagreed and 128 (51.2%) disagreed strongly; 43 (17.2%) respondents agreed that they had the opportunity of working with relevant equipment which they did not have access to in their school during IT/SIWES, 176 (70.4%) agreed strongly, 7 (2.8%) disagreed and 24 disagreed strongly.

Research question 3: Do polytechnic students do their Industrial Training (I.T)/Students

Industrial Work Experience Scheme (SIWES) programs in job areas related to their courses of studies?

**Table 6: Distribution by Going on IT/SIWES**

Variable	Agree	Strongly Agree	Disagree	Strongly Disagree
Going on IT/SIWES after my OND was essentially compulsory	135 (54.0%)	85 (34.0%)	5 (2.0%)	25 (10.0%)
I may not go on IT/ SIWES provided I get someone to give me certificate of attendance even without attending	144 (57.6%)	19 (7.6%)	58 (23.2%)	29 (11.6%)
It does not matter whether or not I do my	137 (54.4%)	56 (22.4%)	15 (6.0)	42 (16.8%)

---

IT/SIWES in job areas related to my course of study, what is important is just to do it anywhere				
I did my IT/SIWES in job area related to my course of study	186 (74.4%)	32 (12.8%)	20 (8.0%)	12 (4.8%)
I could not get a place in my course of study to do my IT/SIWES but I did it in some other place	13 (5.2%)	50 (20.0%)	153 (61.3%)	34 (13.6%)
I prefer to do my IT/SIWES where I would be paid than a place related to my course of study without payment	149 (59.6%)	26 (10.4%)	47 (18.8%)	28 (11.2%)
My primary assignment where I did my IT/SIWES was directly related to my course of study	165 (66.0%)	56 (22.4%)	4 (1.6%)	25 (10.0%)
I acquired relevant skills during my IT/SIWES program	44 (17.6%)	169 (67.6%)	32 (12.8%)	5 (2.0%)
I sought someone who signed my logbook and issued me certificate of attendance of IT/SIWES because I could not get a place to do it	3 (1.2%)	35 (14.0%)	170 (68.0%)	42 (16.8%)

---

From Table 6, 135 (54.0%) respondents agreed that going on IT/SIWES after their OND was essentially compulsory, 85 (34.0%) agreed strongly, 5 (2.0%) disagreed and 25 (10.0%) disagreed strongly. One hundred and forty-four (57.6%) respondents agreed that they may not go on IT/SIWES provided someone could give them certificates of attendance without attending, 19 (7.6%) agreed strongly, 58 (23.2%) disagreed and 29 (11.6%) disagreed strongly; 137 (54.8%) agreed that it does not matter whether or not they do their IT/SIWES in job areas related to my course of study, what is important is just to do it anywhere, 56 (22.4%) agreed strongly, 15 (6.0%) disagreed while 42 (16.8%) disagreed strongly. Also, 186 (74.4%) respondents agreed that they did their IT/SIWES in job areas related to their courses of study, 32 (12.8%) agreed strongly, 20 (8.0%) disagreed and 12 (4.8%) disagreed strongly. Thirteen (5.2%) respondents agreed that they could not get a place to do their IT/SIWES in places related to their course of study, 50 (20.0%) agreed strongly, 153 (61.2%) disagreed while 34 (13.6%) disagreed strongly;

149 (59.6%) respondents agreed that they prefer to do their IT/SIWES where they would be paid than a place related to their course of study without payment, 26 (10.4%) agreed strongly, 47 (18.8%) disagreed and 28 disagreed strongly.

In the same vein, 165 (66.0%) respondents agreed that their primary assignment on IT/SIWES was directly related to my course of study, 56 (22.4%) agreed strongly, 4 (1.6%) disagreed and 25 (10.0%) disagreed strongly; while 44 (17.6%) respondents agreed that they acquired relevant skills during IT/SIWES program, 169 (67.6%) agreed strongly, 32 (12.8%) disagreed and 5 (2.0%) disagreed strongly; and, 3 (1.2%) agreed that they sought someone who signed their logbook and issued to them certificates of attendance of IT/SIWES because they could not get a place to do it, 35 (14.0%) agreed strongly, 170 (68.0%) disagreed and 42 (16.8%) disagreed strongly.

Research question 4: What are the attitudes of students of polytechnics towards acquisition of entrepreneurial skills?

**Table 7: Distribution by Students' Attitudes towards Acquisition of Entrepreneurial Skills**

Variable	Agree	Strongly Agree	Disagree	Strongly Disagree
I may not go on IT/ SIWES provided I get someone to give me certificate of attendance even without attending	144 (57.6%)	19 (7.6%)	58 (23.2%)	29 (11.6%)
It does not matter whether or not I do my IT/SIWES in job areas related to my course of study, what is important is just to do it anywhere	137 (54.4%)	56 (22.4%)	15 (6.0)	42 (16.8%)
I prefer to do my IT/SIWES where I would be paid than a place related to my course of study without payment	149 (59.6%)	26 (10.4%)	47 (18.8%)	28 (11.2%)

Analysis on Table 7 reveals that 144 (57.6%) and 19 (7.6%) agree and strongly agree respectively to not going on IT/SIWES provided there is some to issue certificates of attendance to the students. On the other hand, 58 (23.2%) and 29 (11.6%) disagree and strongly disagree respectively. Also, 137 (54.4%) and 56 (22.4%) felt that they could just do their IT/SIWES anywhere whether or not it related to their courses of study. Disappointingly, 149 (59.6%) and 26 (10.4%) respectively agree and strongly agree to do their IT/SIWES where they would be paid though it might not relate to their courses of study rather than doing it where it relates to their courses of study but without payment. This is negative attitude and portends danger for employment prospects of polytechnic graduates having this kind attitude.

## Tests of Hypotheses

### Hypothesis One

The hypothesis states that “there will be no significant relationship between the department of students and availability of teaching/training facilities with which entrepreneurial skills could be acquired by polytechnic students”.

Course of study \* Relevant training equipment are available for my course study Cross-tabulation  
Count

		Relevant training equipment are available for my course study				Total
		A	SA	D	SD	
Course of study	Accountancy	42	0	0	0	42
	Electrical/Electronics	7	2	4	37	50
	Mechanical Engineering	1	2	2	0	5
	Others	19	1	5	128	153
Total		69	5	11	165	250

### Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	16.228 <sup>a</sup>	9	.000
Likelihood Ratio	18.965	9	.000
Linear-by-Linear Association	8.331	1	.000
N of Valid Cases	250		

$\chi^2$  table = 16.919,  $\chi^2$  calculated = 16.228, df = 9, p = 0.05.

Since table value (16.919) is greater than calculated value (16.228) at 0.05 level of significance, the hypothesis is accepted.

### Hypothesis Two

The hypothesis states “there will be no significant difference between the sex of students of polytechnics and their attitude towards acquisition of entrepreneurial skills”

Sex \* I prefer to do my IT/SIWES where I would be paid than a place related to my course of study without payment Cross-tabulation

Count

		I prefer to do my IT/SIWES where I would be paid than a place related to my course of study without payment				Total
		A	SA	D	SD	
Sex	Male	32	14	43	28	117
	Female	117	12	4	0	133
Total		149	26	47	28	250

### Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	10.843 <sup>a</sup>	3	.000
Likelihood Ratio	12.728	3	.000
Linear-by-Linear Association	10.467	1	.000
N of Valid Cases	250		

$\chi^2$  table = 7.815,  $\chi^2$  calculated = 10.843, df = 3, p = 0.05.

Since calculated value at 0.05 level of significance is less than table value ( $7.815 < 10.843$ ), the hypothesis is rejected and restated as “there will be significant difference between the sex of students and of polytechnics and their attitude towards acquisition of entrepreneurial skills”

### Hypothesis Three

The hypothesis states that “there will be no significant difference between the year of program of student and whether they do their IT/SIWES in job areas related to their course of studies”.

Year of program \* I did my IT/SIWES in job area related to my course of study Cross-tabulation

Count

		I did my IT/SIWES in job area related to my course of study				Total
		A	SA	D	SD	
Year of program	HND 1	97	6	5	0	108
	HND 2	89	26	15	12	142
Total		186	32	20	12	250

## Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	2.570 <sup>a</sup>	3	.000
Likelihood Ratio	3.105	3	.000
Linear-by-Linear Association	2.201	1	.000
N of Valid Cases	250		

$\chi^2$  table = 2.570,  $\chi^2$  calculated = 7.815, df = 3, p = 0.05.

Since the calculated value (2.570) at 0.05 level of significance is less than the table (7.815), the hypothesis is accepted.

## Findings

The results showed that there are well over 50 different courses from which polytechnic students could acquire entrepreneurial skills. It, therefore, becomes the responsibilities of both the lecturers and the students to explore entrepreneurial skills in these courses with a view to imparting the polytechnic students. The analysis of the data in Table 3 indicated Hospitality and Leisure, Electrical and Electronics, and accountancy have the highest number of 120 (48%), 50 (20%) and 40 (16%) of students respectively. Availability of relevant teaching/skill training facilities was lacking. From the analysis of the data on Table 5, about 176 (70%) disagree and strongly disagree having relevant training equipment for various courses of study being undertaken in polytechnics. Also about 188 (76%) disagree and strongly disagree always having access to using equipment for skills acquisition while in school. About 169 (67%) agree and strongly agree that the available skills acquisition equipment are obsolete. Also, 186 (75%) said that there were no technologist to guide them through using the available training equipment during their practical training, while about 164 (65%) said that they were never trained with any

of the available equipment. All these are not good enough as it only makes the form of education acquired by polytechnic students not to differ from liberal education devoid of entrepreneurial vocational skills.

Both IT and SIWES positively contributed to entrepreneurial skills acquisition by polytechnic students. About 220 (88%) considered going for IT/SIWES essentially compulsory. Also, about 215 (86%) said that they did their IT/SIWES in job areas related to their courses of study. Majority, 203 (85%) confessed acquiring relevant entrepreneurial skills during IT/SIWES. Nevertheless, the attitudes of the polytechnic students towards entrepreneurial skills acquisition could be seen as negative and not encouraging as evidenced from the analysis on Table 7. For instance, about 163 (65%) considered IT/SIWES unnecessary if they could get someone to give to them certificate of attendance even without attending. Also, about 193 (76%) believed that they could just do their IT/SIWES anywhere regardless of whether or not it related to their courses of study. Their attitudes also revealed prioritizing receiving wages over and above acquisition of entrepreneurial skills as about 175 (70%) agree and strongly agree to do their IT/SIWES where they would be paid than a place though related to their courses of study without payment. This attitude is bad and calls for urgent attitudinal re-orientation for polytechnic students.

## **Conclusions**

From the results of this research, the following conclusions could be drawn:

1. There are sufficient and enough courses of study from which polytechnic students could acquire entrepreneurial skills if adequately explored.

2. Adequate availability of relevant equipment that could be used for practical training in entrepreneurial skills acquisition was lacking as well as technical personnel to guide polytechnic students through using the available training equipment.
3. IT/SIWES has positively impacted on entrepreneurial skills acquisition among polytechnic students and should be kept up.
4. Polytechnic students have poor and negative attitudes towards acquisition of entrepreneurial skills.

### **Recommendations:**

Consequent upon the forgoing, the following suggestions are made in respect of subject of this research:

1. Acquirable entrepreneurial skills should be imbedded in all courses of study being offered in polytechnics.
2. Training without relevant equipment will only lead to frustration. All stakeholders in polytechnic education should spare no efforts in ensuring availability of entrepreneurial and vocational skills acquisition facilities in polytechnics.
3. More incentives should be provided for both the students and proprietors/proprietresses of workplaces where prospective polytechnic students could do their IT/SIWES.
4. Drastic and conscious change and attitudinal reorientation of polytechnic students towards IT/SIWES is urgently needed. Prospective IT/SIWES candidates should be given thorough supervision during their IT/SIWES program to ensure total compliance to modus operandi.

# **A Study on the Factors that Influence and the Change of Junior High School Size in New Taipei City**

Ching-Fen Liao, Ming-Kuei Tsai, Yen-Mei Lee, and Yu-Yun Wu

National Cheng-chi University, Taiwan, ROC

National Taipei University of Education, Taiwan, R.O.C.

**Abstract.** The purpose of this study is to investigate the change in junior high school sizes as well as the related factors that influence the change within the past ten years (2001~2010). A survey was conducted with a total of 57 school principals, 559 teachers, and 59 parents were sampled from a public junior high schools located in New Taipei City. The authors analyzed these data with descriptive statistic, one way ANOVA, Chi-square test and made following conclusions.

**Keywords:** Junior high school, school size, school effectiveness, Parent education option

## 1. Introduction

Over the past several years, we can see the total student enrollment for both the public junior high and elementary schools in our country has been decreasing due to the low birth rate. Most families tend to avoid having more children than the families of the last generation. Therefore the school size has been reducing to a smaller organization. To face the impact brought by the changing of our school organization, the Department of Education has to invite related scholars and experts as well as the representatives from both county and city governments to have a conference on discussing about the proper school size and to create the strategies on how to transfer the changing of school organizations during this period. However, is the low birth rate the only cause to result in reducing the school size? Take a look at the schools in New Taipei City. For some areas, the population decreased because the people who used to live there kept moving out. It turned out that the schools in these areas had fewer classes due to low birth rate. On the contrary, the population increased instead of decreasing in some areas of New Taipei City. It turned out that new schools had been being built to meet the increase of the new enrollment because a large amount of new residents had been moving in and bringing their children to go to schools here, along with the children whose families had already settled down in the same school districts. Therefore it is necessary to do a research on the related factors to influence the changing of our school organizations so we can find a method to improve the situation.

(1) Impact due to more and more families with fewer children

Low birth rate in our country has already impacted our educational circumstances. The amount of registered students in lots of schools is gradually decreasing. Many small rural schools can only choose to combine with other schools, transfer their schools or stop operating the schools. According to the data from the Statistics Division of the Department of Education, up to twenty two public elementary schools were reorganized from the school year of 89 to the school year of 92. After several times of reorganization, the smaller size schools increase instead of decreasing. In the 93 school year, there were five hundred thirty five small schools with students under one hundred at each school. In the 94 school year, the amount of this kind of small school increased to five hundred sixty six.

According to “The Report of Prediction and Analysis for the Number of Students in a Citizen’s Education Period” (2009), during the six school years of 88 and 93, the number of student enrollment for public elementary schools reduced five thousand each year, from about three hundred nineteen thousand (319,000) down to two hundred eighty nine thousand (289,000). However for the previous six years (from the school year of 81 to 87), the number of the enrollment increased about five hundred each year. It is predicted that the future new enrollment will reduce about thirteen thousand (13,000) students each year from the school year of 93 to the school year of 100, and the student number will reduce from two hundred eighty nine thousand (289,000) in the 93 school year down to two hundred three thousand (203,000) in the 100 school year. The total number for all elementary students will reduce from the number of about one million eight hundred forty three thousand (1,843,000) down to the number of one million five hundred twenty eight thousand (1,528,000) during the school years of 94 to 100. The total new enrollment for all first grade students was two hundred forty two thousand six hundred fifty six (242,656) in the 97 school year. Comparing to the number of all first grade students in the 96 school year, which was two hundred seventy five thousand three hundred fifty two (275,352), there were thirty two thousand six hundred ninety six (32,696) less students. The number of the total classes for all new first grade enrollments was nine thousand five hundred forty six (9,546). Comparing to the number for the 96 school year, which was ten thousand one hundred sixty eight (10,168), there were six hundred twenty two less classes. The total number for all students from the first grade to the six grade in the 97 school year was one million six hundred seventy seven thousand three hundred and three (1,677,303). Comparing to the number for the previous school year, which was one million seven hundred fifty three thousand five hundred ninety one (1,753,591), there were seventy six thousand six hundred forty eight (76,648) less students. The reducing rate per year was 4.37%, which was the highest rate since the 82 school

year and such rate even broke the record. The number of the total classes for all elementary schools was sixty thousand six hundred twenty three (60,623) in the 97 school year. Comparing to sixty one thousand six hundred forty nine (61,649), which was the number of the total classes for the previous school year, there were one thousand twenty six (1,026) less classes. The total number of the teachers was one hundred thousand one hundred eighty two (100,182). Comparing to one hundred and one thousand three hundred fifty two (101,352), there were one thousand one hundred seventy (1,170) less teachers.

In the trend that the student number has been reducing year by year in our country, how have the schools been changing in size? Did all the schools become smaller because the total number of the students has been reducing? Were there any big differences in changing among the schools? Did any school grow into a bigger one instead of decreasing in size? How many schools were there changing in different ways and how were they categorized? This research will study on the schools in New Taipei City. There were differences among the schools from the different school districts. Some schools had difficulties to get enough new students so these schools became to have more teachers than what they really needed. However for those popular junior high schools, they had to set up a limit to control the total number of new enrollment at the beginning of every school year. Students from other school districts were not allowed to be enrolled. What has caused this situation that some schools have been worrying they are not going to have enough new enrollments while some other schools have to control the overwhelming students and reject students from other school districts by setting up a tolerant limit?

## (2) High urban population density

To balance the development between the urban and rural areas is one of the policies that Department of Education has been making an effort to improve for years. Due to the development of economics, there were more industry and business job opportunities in metropolitan areas. (Sun, De-Xuong, Zhang, Min-Zheng 1992) Eighty percent of the population in Taiwan was concentrated in the five main cities on the west plain areas of Taiwan. The people who used to live in rural areas keep moving into urban areas. The development in rural areas slows down to negative growing. The number of the students in the metropolitan areas kept growing due to the high urban population densities. The school size kept expanding. On the contrary, the students in rural areas have been leaving and the school size keeps reducing. It made a great difference between a city and a village. The investment in educational expense turned out to be a waste. (Chen, Shun-Xian, 2000) Therefore the metropolitan development shall not be

neglected because it will affect the education circumstances. It should be taken into consideration in the planning of school development in the future.

### (3) Parents' rights to education choices

The education choices for parents include school choice, educational pattern choice, educational course choice and the future planning such as career choice. School choice means every parent of a student has the freedom and right to select a school. What is implemented in Taiwan now is the school district system. In principle, parents have no right to select a school in Taiwan. Parents' rights to education choice have been implemented in advanced countries such as the United Kingdom and the United States for many years and such rights are still expanding. This tide wave of educational reform in advanced countries has been making an impact on the educational system in Taiwan. The "General Consultative Report"(1996) on education reform, which was published by the Executive Branch of the Government of Taiwan contains a recommendation that parents' rights regarding children education may be strengthened in the aspects of education pattern choice and participation in decisions relevant to education. After 1996, two laws were passed by the government to offer parents the right to education choice with legal protection. These two laws are "The Basic Law of Education" (passed in 1999) and "Citizen Education Law" (passed in 2001).

Human dignity and value were emphasized by the political and social philosophies after the democratization of politics and society in Taiwan. The political and sociological assertions emphasize that the government shall play a role of promoting freedom, rather than a role of being an intimidator. In reality, freedom provides assurance for the quality of both physical and spiritual life of humanity. Since parents' right to education contains an element of reinforcing freedom, it can often promote the mental or spiritual quality of activities in the education system. It increases people interactions in educational activities and provides more aids or assistance to the education system.

The primary system used for enrolling a student into a public junior high school is the school district. Since the school in an assigned school district did not show the educational standard that could meet parents' expectation on the quality of education for their children, some parents had chosen to change household registrations so that their children might be allowed to study in a different school belonging to a different district. The phenomenon of cross district enrollment has existed for a long time. Research papers about the effectiveness of cross district enrollment and related issues have been published since the 1980's. Research regarding cross district enrollment

continued during recent years. We can see that a parent's selection of a desired school has already obviously influenced our education circumstances, though so far our government does not have any promotion plan yet to encourage every parent's right to school choice, which we can see some foreign government already did. Since parents' right to education choice is a trend of modern time, shouldn't schools respond to parents' needs by improving the quality of education?

If the basic assumption for parents' school choice is based on "rules of the market", "competition in the market" (Armor & Peiser, 1998), or what is known as "quasi market pattern" (Schneider, Teske & Marschall, 2000), the manufacturers (the schools) must respond to consumers' liking and needs by changing or improving their services. (The market here refers to the condition that consumers express what they like by selecting other or alternative products or services.) Hence, the change in the sizes of the different types of schools may result from the differences in their characteristics.

## 2. Types of junior high schools in New Taipei City after the changing of school patterns and operations over the last decade

According to the change of school size, the junior high schools in New Taipei City can be grouped into five types that are recessive school, stable school, expanded school, increases after first- reduces school and reduces after first-increases school. The recessive schools have the majority of all schools.

## 3. Factors which affect the changing of the school size

The five types of school sizes are different in some of the input factors. The expanded school type has superiority in school buildings and government grants; while, the recessive school type has inferiority in school buildings, government grants and parents subsidy.

The five types of school sizes are different in some of the process factors. The expanded school type has superiority in principle leadership and the numbers of subject teacher and the budget of developing school-base curriculum.

The five types of school sizes are different in some of the outcome factors. The expanded school type has superiority in school reputation and community relationships; while the recessive school type also has superiority in student behavior routines.

The five types of school sizes are partial different in context factors. There are

more and more populations in expanded schools district and get more and more transfer students in; on the contrary, the recessive schools district get less and less populations and more and more student transfer out.

#### 4. The current situation of the changing of the junior high schools in New Taipei City

(1) To further discuss how the school has been changing when the first grade new enrollment has been reducing in New Taipei City, the new schools built after the 90 school year are here temporarily considered as expanded schools because these schools showed great increases during the first five years after they were ready to accept new students. It is not time yet to comment on their changing rate. Among the recessive schools, the reducing rate exceeding 40% happened to five schools. The highest reducing rate was 48%. That means the total classes at that school in this school year were only the half of the classes that the school had ten years ago. Seven schools had reducing rate between 31% and 40% and another seven schools had reducing rate between 21% and 30%. Reducing rate between 11% and 20% happened to nine schools. There were 28 recessive schools, which shared 37% of all the schools. This rate has exceeded 30%.

(2) The changing rate between minus ten percent and ten percent happened to sixteen schools, which were grouped into stable schools. In the 100 school year, five schools of this type of school were announced as quantity control schools. It means the schools were already full. Among these five schools, three of them were Municipal Complete Middle School (Xiu-Feng, Hi-Shan, Yong-Ping). The stable schools shared 21% of all the schools in New Taipei City.

(3) The expanded schools shared 22%. There were great differences within this type of school. Most of them had growth rate around 11% to 40%. Four of them had super growth rate between 51% and 100%. These four schools were Zhong-Ping Junior High School and Chong-Lin Junior High School in Xin-Zhuang district, Shen-Keng Junior High School in Wen-Shan district and Zhu-Wei Junior High School in Dan-Shui district. The growth rate was 51% for Zhong-Ping and 79% for Chong-Lin. Shen-Keng had 67% growth rate. Zhu-Wei had 97% growth rate, which means the current total classes at this school have doubled the classes that the school had ten years ago. Zhu-Wei was the fastest growing school in New Taipei City.

(4) For the school type of reduces after first-increases, the reducing size schools include Ba-Li Junior High School in Xin-Zhuang district (minus 10%), Lu-Jiang Junior High School in San-Chong district (minus 12%), and Zhang-Shu Junior High

School in Seven Star district (minus10%). The growing type schools include Xi-Kun Junior High School in Banqiao district (11%), Yu-Lin Junior High School (6%) and San-Xia Junior High School(31%) in San-Ying district.

(5) For the school type of increases after first-reduces, the reducing size schools include Tu-Cheng Junior High School in Banqiao district (minus twelve percent), Xin-Tai Junior High School in Xin-Zhuang district (-17%), Lu-Zhou Junior High School in San-chong district (-4%), Jian-shan Junior High School in San-Ying district (-12%) and Ming-De Junior High School with minus fourteen percent. The growing type schools include Yong-He Junior High School in Shuanghe district (9%) and Yi-Xue Junior High School in Xin-Zhuang district (5%).

## 5. Conclusion

Based on the study findings, some suggestions were made as follows:

(1)The government should pay more attention to the equity of resource allocation, and try to avoid discrimination.

(2)The recessive schools should pay more attention to get more resource in order to slow down the student loss.

(3)The stable schools should develop in situation, and pay more attention to educational process and outcome factor.

(4)The expanded schools have superiority in school effectiveness factors and context factors. These schools should go on working hard to keep superiority, and share their experience with other schools.

(5)The increases after first- reduces school and the reduces after first- increases school have to find out the reasons for increases or reduces. Adopting the improvement strategy change the reduced present situation or maintains superiority which increases.

According to the study findings, the author made some suggestions to further research as follows. The purpose of the study should make further discuss and expand object of study and scope. The purposes of the study are multi-dimensional. Regarding the family background factors and community society factors have not be considered but were influenced more by them during the research. For example, the student of native Taiwanese or immigrant residents occupies the majority schools may consider to join the study.

Teachers who “beat the odds” in early literacy instruction: Video tape and survey evidence from classroom teachers with high “value-added”

David Heistad, Ph.D., Executive Director  
Research, Evaluation and Assessment  
Bloomington Public Schools

**Introduction**

Much of the discussion in recent years regarding value-added analysis has focused on high stakes personnel decisions (Rothstein, et al., 2010, Goldhaber & Hansen, 2010, Croft, M. et al, 2011 ) Uses of value-added information for program improvement or professional development have received far less discussion (Braun, H., 2010). This paper summarizes value-added analyses in two Minnesota School Districts where early elementary “teachers who beat the odds” were identified through value-added analysis and studied through survey and video tape collection of literacy instructional practices.

The purpose of this paper is to provide background information for the presentation of survey and video tape evidence of early literacy interventions presented at the Hawaii International Conference on Education on January 6, 2013. Study 1 was conducted from 1997 to 1999 provides example of survey results correlated with teacher value-added. Study 2 collected data during the 2004-05 school year and was designed to identify Kindergarten Teachers with high value-added in early literacy so that video tape evidence of their interventions could be shared with other teachers at the district and state level. Both of these studies were conducted in Minneapolis (MN) Public Schools. Study 3 was conducted in Bloomington (MN) Public Schools during the 2011-12 school year as a replication of Study 1 but with video tape evidence in place of survey data.

**Study 1: Teachers who beat the odds in grade two literacy**

This study was designed to establish a measure of teacher effectiveness in reading and to investigate the degree of stability of that measure over time. A second purpose of the study was to investigate teacher philosophy, opinions and instructional behaviors associated with effective early reading instruction. Methodologically, this study was designed to isolate teacher effects from other sources of achievement variance so that instructional variables associated with reading achievement would be identified while controlling statistically for student characteristic differences. Teacher effectiveness in this study was operationally defined as the individual teacher "value-added" (Meyer, 1996) fixed effects regression coefficient  $\eta_s$  in the following general equation:

$$\text{PostTest}_{iS} = \gamma + \theta \text{PreTest}_{iS} + \alpha \text{StudChar}_{iS} + \eta_s + \varepsilon_{iS}.$$

where  $i$  indexes individual students and  $s$  indexes teachers;  $\text{PostTest}_{iS}$  and  $\text{PreTest}_{iS}$  represent student reading achievement for a given student in second grade and first grade, respectively;  $\text{StudChar}$  represents a set of individual and family characteristics assumed to determine growth in student achievement growth;  $\varepsilon_{iS}$ , the error term, captures the unobserved student-level determinants of achievement growth;  $\gamma$  is a constant;  $\theta$  and  $\alpha$  are model parameters that must be estimated; and  $\eta_s$  is

the teacher effect that must be estimated. Teacher effects, calculated through this equation, represent the contribution of a given teacher to growth in student achievement after controlling for all student-level factors. California Achievement Tests "Total Reading" normal curve equivalent (NCE) scores were used as the pretest (spring grade 1) and posttest (spring, grade 2).

Student characteristics in this regression equation are defined as follows:

$\alpha_1$  = Free or reduced price at the time of the posttest; "0" for full price lunch.

$\alpha_2$  = Resides with - coded "1" for lives with two parents; "0" for other living arrangements including single mother, single father, relative, by self;

$\alpha_3$  = Limited English Proficient (LEP) - coded "1" enrolled at the time of posttest in Limited English Proficiency Programs; "0" non LEP;

$\alpha_4$  = Special Education - coded "1" for current individual education plan (IEP) at the time of the posttest; "0" for no current IEP;

$\alpha_5$  = African American - coded "1" for enrolled as "African American" for; "0" enrolled as Asian, Hispanic, White or American Indian;

$\alpha_6$  = American Indian - coded "1" for enrolled as African American; "0" enrolled as Asian, Hispanic, White or American Indian.

$\alpha_7$  = Resides in a high poverty zip code (from census)

$\alpha_8$  = Gender – "1" for male; "0" for female

This study was conducted with approval from Minneapolis Public Schools (MPS) central office personnel and the president of the Minnesota Teacher's Federation, Local 59 which represents MPS teachers in collective bargaining. In accordance with this agreement, all teacher names were kept strictly confidential. Several sources of information were used to verify teacher assignments to homerooms during the three years of the study. Teacher rosters collected from every school were cross-referenced with the district staff directory of teachers assigned to each school. For Year 2 and Year 3, the homeroom field coded on the standardized testing data tape received from the test publisher was used as a third source to verify these data.

A three-part teacher survey was constructed to assess reading instruction strategies, general philosophy of reading instruction, and use of test preparation activities for teachers who instructed second grade students during the school year. The first page of this survey was adapted from a reading study conducted by Doug Marston, a Minneapolis School Psychologist. The 26 items on the original survey were examined with a factor analysis and found to have two main factors: one with direct-instruction/phonics type items (i.e. initial guided practice, individual oral reading, explicit phonics instruction, frequent & direct progress monitoring, present material in small steps, development of word attack strategies, develop sight vocabulary); and the other was a whole language & reading/writing process factor (i.e. shared book experiences, journal writing, emphasize meaning during

reading, encourage prediction during reading, literature extension activities, share published books/projects, collaborative writing). Four items from the original survey were eliminated because they correlated equally with the two main factors. The final survey was formatted for scanning with an electronic scanning machine.

The second page of the survey dealt with general reading instruction practices and philosophy. These items were filled out with the whole class in mind and the teacher was asked to mark each response on a line 100 centimeters long to questions related to instructional grouping practices, degree of teacher direction, and philosophy of reading instruction. Following this section, 3 questions regarding use of test preparation materials were asked. On the third page of the survey, each teacher was asked what, if any, published test preparation materials were used prior to the previous year spring achievement testing. One purpose of this study was to determine the stability of teacher effectiveness in second grade reading instruction. A value-added regression coefficient was calculated for each teacher for each of three consecutive years. Unstandardized regression coefficients for the pre-test and demographic variables are presented in Table 1. These coefficients are in nce units which have a mean of 50 and standard deviation of 21.06 in the standard normal distribution.

**Table 1. Unstandardized regression coefficients for all three study years**

Variable	Year 1	standard error	Year 2	standard error	Year 3	standard error
Constant	16.14	1.15	16.88	1.15	15.24	1.30
Total Reading pre-test	0.73	0.01	0.74	0.01	0.72	0.01
African American	-4.37	0.66	-4.79	0.65	-3.01	0.72
American Indian	-3.73	1.10	-5.19	1.09	-3.26	1.28
Gender	-1.92	0.50	-0.96	0.48	-2.86	0.52
Lives with 2 parents	0.80	0.61	0.12	0.58	0.55	0.63
Free/reduced price lunch	-4.07	0.67	-5.00	0.67	-3.92	0.72
Resides in High Poverty Zip	-0.67	0.62	-0.78	0.65	-1.50	0.71
Limited English Proficiency	-6.59	1.17	-4.95	0.98	1.08	1.08
Special Education	-3.69	0.89	-5.09	0.78	-5.97	0.94

Pearson product moment correlation coefficients were calculated for all three combinations; Year 1: Year 2, Year 2: Year 3 and Year 1: Year 3. Stability coefficients increased with the size of classroom cohorts, as noted in Figure 1. The median stability coefficient for 132 classrooms with at least 7 students in the pre-post classroom cohort for both years was .449 [ $t_{(131)} = 5.46$ ;  $p < .001$ ]. The median stability coefficient for 87 classrooms with at least 12 students in the cohort for both years was .519

[ $t_{(86)} = 5.62$ ;  $p < .001$ ]. A generalizability study (G-study) was conducted on the 101 teacher effects for classrooms with at least 7 students in each of the three study years. With teacher as the facet of differentiation and occasion as the random facet, the generalizability coefficient (similar to Cronbach's Alpha) was .737.

**Correlates of Teacher Effects:**

Teacher effects for the 101 classrooms with at least 7 students in each of the three study years were used to categorize teachers in the top 20%. Teachers who appeared in the top 20% all three study years (6), and teachers who were in the top 20% two of three years (12), were termed "exceptional." These coefficients were matched with the file of returned surveys to form a file of 68 teachers: 11 "exceptional" teachers, and 57 "other" teachers.

**Table 2. Differences Between Exceptional and Other Teachers on 22 Specific Reading Strategies for Low-Achieving Students.**

Variable	Exceptional Teacher Mean Rank	Other Teacher Mean Rank	P value <sup>1</sup>
Begin a lesson with a short review	32.5	34.9	.69
Shared book experiences	30.3	35.3	.41
Have student visualize while reading	36.0	33.7	.71
Independent reading	40.0	33.4	.28
Modeling of reading for student	30.3	35.3	.38
<b>Development of word attack strategies</b>	<b>45.5*</b>	<b>32.4</b>	<b>.03</b>
Present new material in small steps	33.9	34.6	.90
Student reads non-fiction material.	41.0	33.3	.20
Student shares own published books	31.6	35.1	.59
<b>Individual student oral reading</b>	<b>43.9</b>	<b>32.7</b>	<b>.06</b>
Choral reading	33.8	34.6	.29
Journal writing	40.2	33.4	.27
Emphasize meaning during reading	37.5	33.9	.55
<b>Guide student during initial practice</b>	<b>44.6*</b>	<b>32.6</b>	<b>.04</b>
Encourage prediction while reading	36.1	34.2	.75
Develop sight vocabulary	40.4	33.4	.25

<sup>1</sup> Results of Mann-Whitney sum of ranks statistics and approximate t-test

Spelling homework and spelling assessment	39.5	33.5	.32
Whole language approach	35.9	34.2	.78
Collaborative writing	40.4	33.4	.25
<b>Explicit and direct phonics instruction</b>	<b>44.5*</b>	<b>32.6</b>	<b>.05</b>
Monitor student reading progress directly	38.2	33.8	.46
Literature extension activities	30.9	35.2	.49

Teachers identified as exceptional also reported using systematic motivational strategies 82% of the time while 51% of “other teachers” reported using systematic motivational strategies (see Table 3). This difference was statistically dependable [ $t(66)=2.22$ ;  $p=.04$ ].

**Table 3. Difference between “exceptional teachers” and “other teachers” on use of systematic motivational strategies (coded 1 = yes, 0 = no).**

Variable	Number of Cases	Mean	SD	SE of Mean
MOTIVATION				
Other teachers	57	.5088	.504	.067
Exceptional teachers	11	.8182	.405	.122

Mean Difference =  $-.3094$

The survey variables which dependably distinguished “exceptional teachers” from “other teachers” included the following:

- more small group reading instruction,
- more guidance of student during initial practice,
- more use of systematic motivational strategies.
- more development of word attack strategies,
- more explicit and direct phonics instruction, and
- more use of individual student oral reading

### **Study 2: Kindergarten Teachers Who Beat the Odds**

A fixed effects regression analysis was conducted on student assessments in Kindergarten in Minneapolis Public Schools using the MPS Beginning of Kindergarten Assessment (BKA) in the

fall and MPS End of Kindergarten Assessment (EKA) in the spring to identify teachers who had very high value-added estimates in literacy.

The BKA and EKA assessments have been validating with longitudinal analysis of predictive and construct validity (Betts, J., Pickart M. & Heistad, D., 2009). These measures include items from the University of Minnesota Individual Growth and Development Indicators (IGDI), the Illinois Assessment of Early Literacy (ISEL, see Illinois State Board of Education, 2013) and Minneapolis Curriculum Based Measures (Marston, D. et al, 2007). Areas of literacy assessed by the BKA and EKA include the alphabetic principle (letter names and letter sounds), phonological awareness (alliteration and rhyming), picture vocabulary, listening comprehension and concepts of print. In the spring oral reading of a simple first grade text is included. Predictive validity between the BKA and EKA was .81; correlation with spring grade 1 oral reading (1.75 years later) was .74; and correlation with the Measures of Academic Progress (MAP, 2.75 years later) was .70.

Similar predictors to study 1 were used, however the magnitude of gender, poverty and ELL effects varied from the Grade 2 analysis (see Table 3). Receiving ELL services was a positive predictor for reading fluency and gender was a much larger effect than free or reduced price lunch.

**Table 3. Kindergarten Beat the Odds Regression Coefficients with Oral Reading Fluency as the Dependent Variable.**

Model		Coefficients <sup>a</sup>				
		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	30.699	1.935		15.864	.000
	falltotlit	.334	.009	.683	37.622	.000
	Free or reduced price lunch dummy code	-1.031	1.578	-.013	-.654	.513
	ell2003	6.521	1.750	.070	3.726	.000
	African American Dummy Code	-6.580	1.549	-.079	-4.247	.000
	American Indian Dummy Code	-3.543	3.272	-.018	-1.083	.279
	Male = 1	-6.489	1.248	-.082	-5.199	.000
	sped status	-8.546	2.366	-.057	-3.613	.000

a. Dependent Variable: AverageWordsPerMinute

For this study teachers were identified based on the beginning and end of year kindergarten assessments from 2003-2004 school year. A value added analysis was completed to see which teachers made better than expected growth with their students on early literacy measures. The top 10 kindergarten teachers were interviewed and videotaped. Video tapes lessons demonstrated many of the critical literacy development skills highlighted in the National Reading Panel ( see <http://www.nichd.nih.gov/publications/nrp/findings.cfm>).

Beat the Odds Teachers shared common characteristics in the areas of behavior management, instruction and continuous professional development (see videos on-line at [http://rea.mpls.k12.mn.us/uploads/teachers\\_who\\_beat\\_the\\_odds.pdf](http://rea.mpls.k12.mn.us/uploads/teachers_who_beat_the_odds.pdf))

### **Behavior Management**

- Positive and consistent feedback
- High expectations for all students
- High percentage of student time on task
- Materials are organized and readily available
- Students Know the Daily Routine
- Models appropriate classroom behavior
- Establishes welcoming environment

### **Kindergarten Literacy Instruction**

- Utilizes small flexible group instruction based on progress monitoring data
- High expectations for academic achievement
- Structures time and materials to maximize student learning
- Makes connections to previous learning
- Uses variety of instructional approaches
- Uses writing activities to support other literacy instruction

The cost of this initiative was approximately \$50,000/year including development of beginning and end of Kindergarten literacy assessments in the areas of oral language comprehension, concepts of print, phonological awareness, alphabetic principle, and reading fluency (end of kindergarten only); administration of assessments fall, winter and spring with a cadre of retired elementary school teachers; and collection of teacher behaviors using structured interviews and videotaping.

A matched sample analysis of reading gains one year after the initial study (Heistad, 2005) found that statistically significant reading fluency gains were maintained by students of the “beat the odd” kindergarten teachers.

### **Study 3: Teachers who beat the odds in grade two literacy replicated in Bloomington Public Schools, MN**

This study was designed to replicate the statistical model used in Study 1 with a different population of students in a suburb of Minneapolis. The Measures of Academic Progress (MAP, NWEA, 2013) reading scale score was used as the pretest at the beginning of Grade 2 in fall and the post-test was the spring grade 2 reading scale score. Three consecutive cohorts of student scores (i.e., school years 2009-10, 2010-11 and 2011-12) were collected in fall and spring. As is study 1, student demographics and teacher

dummy codes were analyzed with a fixed effects regression model. Coefficients for the pretest and demographics are presented in Table 4.

**Table 4. Unstandardized regression coefficients for all three study years**

Variable	Year 1	standard error	Year 2	standard error	Year 3	standard error
Constant	85.19	4.36	82.89	5.19	115.09	1.30
MAP Reading pre-test	0.63	0.02	0.64	0.02	0.48	0.01
African American	-2.53	1.02	-2.77	0.65	-1.73	1.09
American Indian	-1.95	3.85	1.10	4.42	-3.26	1.28
Hispanic	-2.94	1.29	-1.50	1.26	-0.24	1.35
Asian	-2.62	1.15	-0.73	1.21	-0.24	1.37
Gender	-0.56	0.66	.66	1.02	-0.98	0.73
Free/reduced price lunch	-1.50	0.85	-0.17	0.87	-3.92	0.72
Limited English Proficiency	-0.48	1.09	-3.45	1.09	-4.93	1.19
Special Education	-5.73	1.26	-7.07	1.21	-5.97	0.94

Comparing these coefficients from Bloomington grade 2 students to Table 1 with Minneapolis Public Schools (MPS) students, it appears that Special Education, LEP and Free/reduced lunch are important predictors in both districts but the racial/ethnic and gender predictors are more powerful correlates in the large urban setting of MPS.

Teacher value-added estimates were generated in two stages using the linear regression package in SPSS. In the first step the multiple regression, with pretest and all demographics, was performed with teacher dummy codes and the residuals from the regression were saved in the data file. These residuals were averaged for all 2<sup>nd</sup> grade teachers. The teacher with mean residuals closest to zero was chosen as the contrast teacher for dummy coding. A teacher dummy code (i.e., “0” for not in the class, “1” for in the class) was created for each classroom except the contrast teacher. Teacher dummy codes were then entered into the full regression with all predictors included. A sample of the output is presented in Table 5.

These teacher coefficients were averaged across all three years of the study weighted by the number of students. Coefficients for 36 second grade teachers were generated across the three years of the study. The teacher with the highest weighted mean was identified for “beat the odds” second grade literacy instruction. An early literacy expert in Bloomington Public Schools interviewed the teacher and took video tape of a typical one hour literacy session. This teacher presented a synopsis of her literacy

instruction to the curriculum department and presented at recent School Board meeting. She emphasized the use of embedded vocabulary instruction and a collaborative approach to lesson preparation with her grade level team (Amber Geehan, Oct 14<sup>th</sup> found at <http://www.youtube.com/watch?v=4ec57PQNUK0>, starting at minute 40).

**Table 5. Truncated output for 2010-11 Grade 2 Teacher Level Value-added**

Coefficients <sup>a</sup>						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	82.894	5.190		15.973	.000
	CALT Reading Fall 2010 Scale Score	.644	.024	.732	26.380	.000
	frlunch	.175	.868	.006	.202	.840
	American Indian	1.104	4.421	.006	.250	.803
	Asian	-.729	1.207	-.015	-.604	.546
	Hispanic	-1.496	1.262	-.036	-1.185	.236
	African American	-2.777	1.065	-.072	-2.608	.009
	ESL	-3.445	1.089	-.092	-3.165	.002
	SpEd	-7.073	1.212	-.134	-5.834	.000
	T107	1.000	2.535	.011	.395	.693
	T114	-2.322	2.442	-.029	-.951	.342
	T124	-3.296	2.925	-.033	-1.127	.260
	T127	-.506	2.444	-.006	-.207	.836
	T128	-.390	2.685	-.004	-.145	.885
	T130	-.459	2.725	-.005	-.168	.866
	T136	-1.187	2.529	-.014	-.469	.639
	T137	1.806	2.740	.019	.659	.510
	T141	3.689	2.600	.041	1.419	.156
	T147	-7.240	2.642	-.080	-2.740	.006
	T148	-1.416	2.532	-.016	-.559	.576
	T163	-2.375	2.414	-.031	-.984	.326
	T164	-.261	2.666	-.003	-.098	.922
	T164	8.943	2.960	.085	3.021	.003

As in Study 1, Pearson product moment correlation coefficients were calculated for all three combinations; Year 1: Year 2, Year 2: Year 3 and Year 1: Year 3. The median stability coefficient for classrooms with at least 7 students in the pre-post classroom cohort for both years was .475. With teacher as the facet of differentiation and occasion as the random facet, the generalizability coefficient for three occasions (similar to Cronbach's Alpha) was .626. Stability coefficients of this magnitude reinforce the need to average teacher coefficients over three years.

## Discussion

Formative use of value-added analysis including correlations with instructional surveys and video tape evidence on “beat the odds” teachers can be an effective tool for school districts to highlight the most effective instruction in a particular discipline. In this paper three studies of early literacy growth in standardized test scores were briefly summarized that provided this type of information to two school districts in Minnesota. The value-added models identify teachers with exceptional literacy growth while controlling for prior learning and student demographic characteristics. It is a more equitable way to identify exceptional teachers than student proficiency or simple growth models (Meyer, R., 1996). Teacher value-added effects are moderately stable across time (Sass, 2008; Loeb & Candelaria, 2012) and offer the possibility for highlighting the “most decisive factor in student achievement” (Gates, 2011). Using value-added to identify exceptional teachers and then observing, video-taping, doing correlational or experimental research using these teachers, follows in the tradition of discovery of expert pedagogues captured by David Berliner (1986). In his presidential address to AERA that year he said the following:

“We will continue our pursuit of the expert pedagogue. If we ever feel really secure that we have found a few of these elusive beasts, we will study them in great depth and share those findings with those who also await their capture. Like the search for the Yeti and for Bigfoot, we expect to have a good many false sightings and a good deal of fun along the way” (op cit, p. 13)

\*\* Adult Education Department, University of Ibadan, Nigeria  
[Omobola.adelore@yahoo.com](mailto:Omobola.adelore@yahoo.com)

This study investigated the influence of literacy level, age. And income factors on women participation in National Programme on Immunization (NPI) in Ogun state, Nigeria.

The study adopted descriptive survey research design. Stratified and Random sampling techniques were used to select two hundred respondents. The major instrument used from data collection was a 4-pont scale questionnaire. The instrument was validated through consultation with specialist in health education, adult education and community development. The reliability co-efficient of 0.82 was obtained through test-retest method. The target population for this study consist of women of childbearing age (15-50 years) who have given birth to at least a child in the last five years and participated in immunization programme. The descriptive statistics, correlation and regression analysis were employed for data analysis and hypotheses testing. The descriptive statistics revealed that most respondents (51%) fall within the range of 25-34 years with 92.5% of them being married. The household size ranged from 3-13 with the average of 5 members per household. The correlation analysis showed that age of women had a significant positive correlation with the level of participation in immunization ( $r = 0.144$ ,  $p < 0.05$ ). The study further established a significant relationship between literacy level and participation in immunization ( $r = 0.212$ ,  $p < 0.01$ ). The regression result revealed that the income of the respondents was a major factor that contributed to women participation in immunization. The study recommended among others, that income generating activities, women literacy and empowerment programme should be provided by both government and non-government organization

Keywords: Literacy, Income, Age, Participation

## **Introduction**

Health is something that concerns every citizen of the world for one reason or the other. This is significant because the United Nations (UN) through its agency World Health Organization (WHO) had set a target for achieving health for all by the year 2000. This was interpreted differently by each country in the light of its social and economic characteristics, health status and mortality patterns of its population, and the state of development of its health system. In 1988, the World Health Assembly – the governing body for the World health Organization – set a target for WHO to eradicate polio from the world by the end of year 2000 (since extended to 2002). This followed the successful eradication of small pox diseases globally. This showed that polio eradication is technically feasible. Nigeria as a world health assembly member signed to implement this resolution by adopting national health policy and strategy to achieve health for all and this was based on primary health care; one of the components is immunization against major infectious diseases.

The National Programme on Immunization (NPI) was then put in place to protect all children age 0-5 against six deadly childhood diseases: measles, tetanus, whooping cough, poliomyelitis, diphtheria and tuberculosis. Between 1991-2000, the targeted annual coverage for children in Ogun state was 84.8% (NPI) Report (2004). This near full coverage was attributed to intensification of health education and enlightenment programmes for the communities through the mass media and various methods of information dissemination such as the television, market places, Expanded Programme on Immunization (EPI) clinics (Babtunde, 2001). Despite the targeted annual coverage of 84.8% some of these diseases such as polio myelitis measles and tuberculosis are still prevalent among children in Ogun state.

The persistence of the childhood killer diseases among children of 0-5 years serves as health risk and affects the health status of children in the community. There have been five hundred and twenty-two recently confirmed wild polioviruses (WPV) in Nigeria with 75% of

the wild polioviruses below 3 years of age and 74% of the cases have received less than three doses of oral polio vaccines(OPV) (WHO, 2005). The report further showed that Nigeria is one of the countries with poor health infrastructure and hundreds of reported polio cases. To ensure that the health status of children is improved, most especially, at this crucial time when Nigeria is very desperate at stopping poliovirus transmission and other childhood killer diseases, it is very important to critically examine the influence of literacy level, age and income on women participation in National Programme on Immunization (NPI) in Ogun State, Nigeria because women are charged with the responsibility of bringing their children to the immunization centres.

This study therefore provides answers to the following research questions.

1. To what extent does literacy level of women affects their participation in National programme on immunization (NPI)
2. What is the influence of income level on women participation in Immunization?
3. To what extent does age affects women participation in NPI?

### **Objectives of the study**

The study is designed to:

1. examine the influence of literacy level on women participation in National programme on Immunization in Ogun State
2. assess the influence of age on women participation in immunization programme
3. determine the impact of income level on women participation in NPI in the study area
4. Offer policy recommendations based on the research findings

### **Hypotheses**

H<sub>01</sub>: There is no significant relationship between the literacy level of women and participation in immunization programme

H<sub>02</sub> There is no significant relationship between age of women and participation in National Programme on Immunization

H<sub>03</sub>: There is no significant relationship between income level of women and participation in NPI

### **Methodology**

This study is a descriptive survey of non-experimental type. This method was adopted because it describes systematically the facts, qualities and characteristics of a given population, event or areas of interest as factually, and accurately as possible.

The target population of this study consists all women of child bearing age (15- 50 years) who have given birth to at least a child in the last five years and have participated in the National Programme on Immunization.

The children are the main target group for immunization regimen while the mothers are the relevant population since it is the group that are mostly entrusted with the care of the children and also responsible for bringing the children for immunization.

Random sampling technique was employed to select the respondents from the selected local governments. Abeokuta North, Abeokuta South and Odeda Local Governments were purposively selected because they have been participating in Immunization programme since inception.

From each of the three local governments eighty respondents were randomly selected to give a total of 240 respondents involved in the study. A total of 200 copies of questionnaire were returned and used for analysis.

### **Instrumentation**

The instrument for collecting data from the respondents is a structured questionnaire. This was supplemented by interview, observation and past records. Section “A” contains demographic variables of the respondents while section “B” consists of variables under study.

The instrument examined the influence of literacy level, age and income factors on participation on immunization programme. The structured questionnaire was validated through consultation with experts in adult education, community development and health education. The reliability index of 0.82 was obtained through test-retest method using Pearson r formula.

The statistical tools employed for data analysis include frequency distribution and percentage analysis, correlation and regression analysis.

The socio-economic characteristics of the respondents were describes using descriptive statistics such as frequency table, percentages, etc while correlation was used to test the hypotheses at 0.01 and 0.05 level of significance.

## Analysis of data

This section analyses data collected and discusses the results as follows

**Table 1 Distribution of respondents by Age**

Age (years)	Frequency	Percentage (%)	Cumulative (%)
15-24	26	13	13
25-34	102	51	64
35-44	68	34	98
45-54	4	2	100
Total	200	100	

Table 1 above shows the age distribution of respondents. The modal age bracket was 25-34 years containing 50% of the total respondents. The 35-44 years was the next to the modal category containing 34%, this is followed by 15-24 years which constitutes about 13%. The respondents whose age falls between 45 – 54 years constituted the least (2%). The implication of this is that women no longer produce children to the age of menopause as economic hardships starve them on their face. Consequently, the mean age of the respondents was 33 years showing that majority of the mothers were in their active reproductive age. The dominance of the active reproductive aged mothers shows the valid state of the expected responses for the study

**Table 2 Distribution of Respondents by Educational Status**

<b>Educational Status</b>	<b>Frequency</b>	<b>Percentage (%)</b>	<b>Cumulative (%)</b>
No Formal education	12	6	6
Arabic	1	0.5	6.5
Primary	26	13	19.5
Secondary	55	27.5	47.0
Technical college	-	-	-
NCE/OND	40	20.0	67.0
HND/BSc.	53	26.5	93.5
MSc/Ph.D	13	6.5	100
Total	200	100	

Table 2 shows the educational qualification of the respondents. The result indicated that those who did not have any formal education accounted for 6%, 13% had primary education while 27.5% had secondary education which constituted the highest represented group. However, the least represented group was Arabic education with 0.5% while 20% indicated that they had NCE/OND qualification. The remaining 33% had academic qualifications ranging from BSc. –PhD level.

This high literacy level is expected to have a positive impact on mother's attitude to immunization. The high level of awareness about NPI may not be unconnected with this high level. It made it possible for most of the respondents to read posters and leaflet in respect of NPI.

**Table 3 Distribution of Respondents by income level**

<b>Income (₦)</b>	<b>Frequency</b>	<b>Percentage (%)</b>	<b>Cumulative (%)</b>
1,000- 10,000	84	42	42.0
11,000-20,000	49	24.5	66.5
21,000-40,000	37	18.5	85.0
41,000-100,000	24	12.0	97.0
> 100,000	6	3.0	100.0
Total	200	100	-

The monthly income generated by majority of respondents (42%) fall into ₦1,000-₦10,000 income bracket while 24.5% generated income of ₦ 11,000- ₦ 20,000. It is also evident that 18.5% had monthly income of ₦ 21,000- ₦ 40,000. Also, only 3% had monthly income above ₦100, 000. The amount of average monthly income of the respondents was ₦22,095.48. Increase in income is expected to have positive influence in the use of NPI in the study area. This might be due to the fact that mothers with relatively middle or high income would be able to afford the cost of transportation to the immunization centre.

**Table 4 Distribution of respondents by marital status**

<b>Status</b>	<b>Frequency</b>	<b>Percentage (%)</b>	<b>Cumulative (%)</b>
Married	185	92.5	96.5
Divorced	3	1.5	98
Separated	12	6	100
Total	200	200	-

Table 4 above shows the analysis of the marital status of the respondents. It can be seen that 92.5% of the respondents were married, 1.5% were divorced while only six were separated.

The largest percentage of the respondents were married and as such, valid subjects for the study.

**Table 5 Distribution of respondents by Household size**

<b>Family size</b>	<b>Frequency</b>	<b>Percentage (%)</b>	<b>Cumulative (%)</b>
3-4	104	52.0	52.0
5-7	79	39.5	91.5
8-10	15	7.5	99.0
11-13	2	1.0	100.0
Total	200	100	-

Table 5 above shows the household size ranged from 2-13 with an average of 5. Most of the respondents (52%) had family size of 3-4. Family size of 5-7 also accounted for 39.5%. about 7.5% of the respondents resided in household as large as 8-10 persons, very few of them had a family of more than 10.

The increase in household size portends a worsened poverty situation since it impinges adversely on the declining income, feeding ability and living conditions of the household. However, large family size may ensure availability of enough helpers in taking care of young children.

### **Test of hypotheses**

#### **Correlation Result**

Correlation analysis was used to test hypotheses one and two. The results are presented in tables 6 and 7 below

H<sub>01</sub> There is no significant relationship between literacy level of women and participation in immunization.

**Table 6 Correlation between the literacy level of women and participation in immunization**

Variable	N	$\bar{X}$	SD	r	p	Remark
Literacy level of women	200	13.1100	5.3574	0.212	0.003	Significant $p < 0.01$
Participation in immunization	200	5.1950	2.1704			

Table 6 reveals that a significant relationship exists between mother's participation in immunization and their level of education ( $r = 0.212$ ;  $p < 0.01$ ) and as a result, the null hypothesis one which says there is no significant relationship between literacy level of women and their participation in immunization programmes is rejected. The positive relationship shows that with increase in the years of education of mothers, their level of participation in immunization will also increase. The possible reason for this is that more years of education enable mothers to acquire, process and utilise relevant information effectively. It is also an avenue through which knowledge is imparted. Education also helps mothers in objective analysis of problem and the right decision to proffer solution to it. This is not surprising as most of the respondents interviewed explained that they were aware of their children being vulnerable to the childhood killer disease and this has increased their innovation in getting themselves and their children immunized. The data revealed that more than 70% of the mothers interviewed had received tetanus toxoid immunization during pregnancy though they did not complete the five doses but they were immunized at least twice before delivery.

This is not unconnected with high level of literacy and awareness on immunization programme, which has been reported earlier in this study. This is consistent with the findings of Caldwell (1984), Jegede (1995) who reported that educated women were more receptive to Expanded Programme on Immunization than uneducated mothers.

They asserted further that schooling enhances a woman's knowledge of modern health care facility. This increases the value she places on good health results in heightened demand of modern health care services. It has also been widely argued by scholars that education modifies women's beliefs about disease causation and cures which influence domestic health care practices and the use of modern health care services.

One can therefore conclude that, modification of women's beliefs about causes of diseases and cure is a function of the type of health education received. Most educated mothers have access to health magazines and can easily read and comprehend health information through posters and handbills posted around the community.

H<sub>02</sub> There is no significant relationship between age of mothers and Participation in Immunization

**Table 7: Correlation between age of respondents and participation in immunization**

<b>Variable</b>	<b>N</b>	<b><math>\bar{X}</math></b>	<b>SD</b>	<b>r</b>	<b>p</b>	<b>Remark</b>
Age	200	32.72200	7.2244	0.144	0.042	Significant p< 0.05
Participation in immunization	200	5.1950	2.1704			

Table 7 shows that there was a significant relationship between age of respondents and their participation in immunization programme (r = 144, p <0.05%).

This result reveals a low positive correlation between mother's age and their level of participation in immunization. The positive correlation shows that with increase in the age of mothers, their level of participation in immunization also increases. The implication of this is that there is an increase in the use of immunization resource, as the mothers grow old. This is probably due to the fact that as the mothers grow in age they might have gathered information about the importance of immunization based in their past experience through interaction with community health workers. In other words, if the vaccination they had received for their first

child was found effective, they would be encouraged to vaccinate other children they have even as they grow old age.

Another factor that could be responsible for this is the comprehensive programme on immunization embarked upon in the study area. In Abeokuta metropolis, there are functional outreach programmes, which bring the service to the door step of users. This made immunization to be community driven and it encourages both old and young mothers to participate. This could also be attributed to the fact that as mothers advance in age they must have debunked misinformation or fallacies attached to immunization at their early stage of life. For instance, some of the respondents interviewed articulated their fear on whether OPV contains family planning contraceptive.

Although, uninformed individuals, groups, and/or the media who have not received facts about vaccination and campaigns and/or who are critical or suspicious of government run programmes and the public health system, often disseminate these false rumours. This serves as evidence that some mothers will not want to believe immunization at their early stage of child bearing except the right health message is given.

This position is in contrast with the findings of Jegede (1995) who asserted that the higher the age of mothers, the lower the use of EPI.

H<sub>03</sub> There is no significance relationship between income level of women and participation in Immunization.

### **Regression Result**

Regression analysis was undertaken to determine the influence of certain socio economic characteristics on the level of participation in immunization in the study area. The seven factors considered are age, household size, income, distance, occupation, education and prevalence of diseases.

The linear multiple regression result presented in Tables 8a, 8b, and 8c below

**Table 8a: Regression summary of influence of independent variables on participation in immunization**

Multiple R	0.311
R-Square (R <sup>2</sup> )	0.10
Adjusted R-Square (R <sup>2</sup> )	0.064
Standard Error (S.E)	2.0997

**Table 8b: Analysis of Variance**

Source of variation	Sum of square	Df	Mean square	F-ratio	Sig.
Due to regression	90.889	7	12.984	2.945	0.06*
Due to residual	846.506	192			
Total	937.395	199			

\* Significant at 10%

**Table 8c Parameter estimate of the relative contribution of independent variables on participation in immunization**

Variable	Variable description	B	Standard Error	Beta	T-ratio	Sig.
1	Age	0.02331	0.024	0.074	0.942	0.348
2	Household size	0.2446	0.087	0.021	0.283	0.778
3	Income	1.858E-02	0.000	0.187	2.225	0.026*
4	Distance	-0.0335	0.050	-0.093	-1.360	0.175
5	Occupation	-0.334	0.363	-0.077	-0.920	0.358
6	Education	0.0578	0.038	0.143	1.540	0.125
7	Prevalence of disease	-0.310	0.501	-0.043	-0.619	0.537

Table 8a reveals that the coefficient of determination,  $R^2$  is 0.10. this indicates that the independent variables considered accounted for 10% of the participation in immunization while 90% of the participation was explained by other factors such as religion, cultural belief government policy, environmental factors level of awareness, political instability, leadership style, attitude of health officials among others (not included in the regression)

The performance of analysis of variance in table 8b that F-ratio of 2.945 was significant at 0.10 alpha level. This provided the evidence that a combination of all the independent variables had joint impact on the level of participation in immunization.

Table 8c shows the regression coefficient, the standard error of estimate, the t-ratio and the level at which the t-ratio is significant for each independent variable. The table shows that the beta weight ranged from -0.093 to 0.187. Distance (Variable 4) had the least beta coefficient of 0.187.

The beta coefficient shows that out of the seven variables considered the income of respondents was most important. This is followed by age, education, household size, prevalence of disease, occupation and distance in the determination of the level of participation by the respondents.

Also evident from Table 8c is that the values of t-ratios that are associated with each independent variable showed that out of seven independent variables considered only the income of respondents was significant at 0.05 alpha level. The result shows that there is a positive relationship between the level of income of mothers and the level of participation in immunization programme. This implies that with increase in the income level of respondents, the number of time a child is immunized will also increase. The possible reason of this is that with a higher income level, respondents will be able to afford the transportation cost and other cost associated with child immunization.

This is not surprising as many of the respondents interviewed submitted that in view of the high cost of transportation they could not visit health centres regularly to immunize their children.

Though not significant, the signs of the coefficients of distance and education corroborate the findings obtained from correlation analysis. The negative relationship between the distance and the number of times a child is immunized shows that with a kilometre increase in the residence of a respondent will cause the participation level to decrease by 0.33 times. This scenario reveals the difficulties a participant is likely to face if she lives far away from the immunization centre.

However, the participation level will increase if a mother lives very close to the immunization centres. The rationale behind this is the reduction in the transportation cost to the centre in view of the short distance. This position was strongly supported by Okafor (1984) and Eugenia *et al* (1989) who reported that mothers who live close to EPI facilities used it more than those living far away. They further observed that the cost of transport had serious implication on use of health care services.

Similarly, the result shows that with increase in the years of education of respondents the level of participation in immunization will increase. This may be due to increase in the level of awareness on the importance of immunization.

## **Conclusion**

This study examined the influence of literacy level, age and income factors on women participation in National Programme on immunization in Ogun State Nigeria. Descriptive research design was adopted for the study. The population comprised of all women of child bearing age who have given birth to at least a child in the last five years.

The mothers were interviewed and information was collected through the aid of well-structured questionnaire. The data collected were subjected to analysis using descriptive

statistics, correlation and regression analysis. The findings obtained from the study revealed that there is a significant relationship between literacy level of women and their participation in National Programme on Immunization. Similarly, there is a significant relationship between age of women and their participation in immunization programme.

The multiple regression result showed that the level of participation was significantly determined by the income of respondents ( $p < 0.05$ ) The implication of this is that increase in immunization coverage for prevention of childhood killer diseases can therefore be enhanced through improved participation. However, participation can be increased if the policy recommendations are implemented.

### **Recommendations**

1. This study revealed positive contribution of education to community participation in immunization. Therefore, community education on the importance of immunization programme should be given adequate attention.
2. Adult literacy centre should be established by both government and non-governmental organization in order to educate and empower non-literate women in the community
3. Community leaders should help to mobilize their members during national immunization days for effective participation
4. It is evident from the study that income is one of the major determinants of mothers' participation in immunization. Therefore, income generation activities and women empowerment programme should be provided in the study area by both the government and non-governmental organisation. This will increase women's income and their participation in the national programme of immunization.
5. It is equally reported that some villagers were not reached during the last NIDs due to transportation problem. This is not unconnected with the problem of bad road. Efforts should be made by the government to tar or grade the existing rural roads to make them memorable.

Also, vehicles should be provided to convey health workers to rural area during the national immunization days (NIDs). Similarly, immunization units should be established in rural area of the state for routine immunization of their children.

A Forgotten Master: Louis Spohr.  
The Exciting Research and Publication of his Songs

Music Education

Workshop

Professor Susan Owen-Leinert will present a workshop regarding her exciting research and re-discovery of the complete 105 *Lieder* (art songs for one or two voices with piano accompaniment) by the German romantic composer Louis Spohr (1784-1859), now published in 12 volumes for the first time in a critical edition with detailed prefaces and introductions in both German and English (Dohr Publisher, Cologne). The workshop includes musical examples from CD recordings of famous singers.

## A Forgotten Master: Louis Spohr. The Exciting Research and Publication of his Songs

The German romantic composer Louis Spohr (1784–1859) forged a significant contribution to the development of the German *Lied* (art song) through his compositions for voice and piano. These contributions to the vocal music of the 19<sup>th</sup> century have until now been largely neglected in music history and by researchers of German *Lied*. The intention to rectify this inadequacy in the study of music history and literature was the main objective of my research. Throughout a time period of more than 50 years Spohr dealt with the art form *Lied*. The result is 105 one and two voiced songs with two- or four-handed piano accompaniments. The research of Louis Spohr's *Lieder* was extremely difficult due to the situation of unclear sources. The traditional preservation of the composer's autographs is incomplete and direct commentaries from Spohr about his *Lieder* are conveyed only in a few cases. The International Louis Spohr Society located in Kassel, Germany lost the largest part of its valuable holdings, systematically gathered since the year 1908, through confiscation in 1933 and one year later the mayor of Kassel ordered that they be destroyed. The distribution of the Spohr inheritance in the year 1860 contributed to the fact that his estate in the truest sense of the phrase was "scattered to the far ends of the earth".

Following the information on each composition found in Folker Göthel's "Thematisch-Bibliographisches Verzeichnis der Werke von Louis Spohr" [trans. *Catalog of the works of Louis Spohr*] it was my goal to find the existing manuscript or first editions of each song, edit the musical and textual inconsistencies and publish them into a collection that would be appropriate for musical study and performance. Quickly realizing that the text authors were sometimes designated as "unknown", the project also included extensive literary investigation.

My research began with finding and collecting originals or copies of all song manuscripts and first editions discovered in the assemblage of private collectors, musical societies and organizations as well as libraries around the world. Remarkably I was able to discover the ten songs that were reported to be lost forever and are now for the first time accessible. Perhaps due to the fact that Spohr's daughter Emilie immigrated to the United States, some rare manuscripts of her father were discovered in libraries in New York and Washington. For the first time in over 170 years the complete songs are presented together in a critical edition published by the Dohr Verlag, Cologne, Germany.

A detailed literary research of poets and texts was necessary due to Louis Spohr's selection of texts for his musical compositions. More interested in the quality of the poem than the author, he sometimes neglected to record the poet's name. This unforeseen additional research project resulted in an amazing literary story of the poets, the historical times and the composer. Many mistakes could be corrected in both the musical notation and the texts by comparing sources. The edition contains an expansive section of critical notes. Every individual song is prefaced with historical facts and interpretive guidance, creating a scholarly as well as artistic advice.

This critical edition of the complete *Lieder* of Louis Spohr has filled an important void in the history of song literature. The study of German *Lied* is now more complete and the performance materials are printed in modern notation and format. First presented at the *Musikmesse* Frankfurt,

the Frankfurt Book Fair and the Leipzig Book Fair, the edition has received positive and enthusiastic reviews. The 12 volume edition has been procured by libraries world-wide on five continents (see: [www.worldcat.org](http://www.worldcat.org)). Several universities and music conservatories in Germany have invited me for master classes concerning the composer Louis Spohr and the performance practice of his *Lieder*. The songs are important for vocal study as they include works of varying levels of difficulty. From simple strophic forms with lyrical melodies to challenging extended song forms with complex chromatic harmonies, the teacher and the singer have a large variety of music to explore. Due to the extensive research conducted for the first academic and critical edition of the complete one and two-voiced *Lieder* of Louis Spohr, many factual errors found in previous Spohr research materials could be corrected. This concerns the history of the works, their dates, and various authors of the *Lieder* texts. Therefore commendable standard works of various authors will have to be revised.

Based on these musical scores, compact disc recordings have been newly released, containing songs and duets never before recorded. Further interest in the vocal music of Louis Spohr has been inspired and more of his choral and operatic works are being performed. Great *Lied* composers such as Robert Schumann, Felix Mendelssohn and Johannes Brahms considered him a master and were influenced by his compositional techniques. During Louis Spohr's lifetime he was greatly appreciated and his music widely performed. He is worthy of our attention today.

The proposed workshop will be an exciting musical journey through the 19<sup>th</sup> century acquainting the audience with the "forgotten master" Louis Spohr.

## Supplemental Material

Gesamtausgabe der Klavierlieder  
in zwölf Bänden – Edition Dohr

**Complete Edition of Louis Spohr's *Lieder* in 12 vols.**

**Review of the first complete SPOHR LIED EDITION (12 vols.)  
in the British music magazine THE SINGER June/July 2011**

**"An example of the efforts made to rehabilitate Spohr is a new first scholarly Lied Edition.... more than 100 songs are included... the critical commentary on each number is excellent".**

**Review Neue Musikzeitung 5 / 2012**

**Mit steigender Leidenschaft, wehmütig ...  
Romantische Literatur für Singstimmen und Klavier**

The largest German music magazine, "neue music zeitung" wrote a detailed, positive review in the May, 2012 issue about the first complete Louis Spohr Lied edition.

Johanna Erbacher-Binder describes Spohr's Lied compositions as "magnificent", "versatile" and "rich with ideas". Concerning the edition by Susan Owen-Leinert and Michael Leinert she praises the prefaces, critical report and the detailed commentary (in German and English) as being "very insightful".

Her conclusion: "With this complete edition, the life and work of Louis Spohr receive a new point of interest, a new color."

**Louis Spohr: Complete Lieder for Voice and Piano:  
 volume 3: Op. 101 and Op.105**, for voice and piano (solo and  
 duet), edited by Susan Owen-Leinert and Michael Leinert, published by  
 Verlag Dohr, E.D. 29953 (2011) ISMN M-2020-1953-5 78pp £32.95

Spohr's long life (1784-1859) made him a contemporary of Beethoven, Schubert, Schumann and even the young Wagner. In his lifetime he was certainly very highly regarded, both as a conductor and violinist, and received very positive reviews for many of his songs, but unfortunately this popularity has not been maintained during the intervening centuries. From *Leiderheft* op.25 in 1809 to *Sechs Gesänge* Op. 154 in 1856, Spohr produced over a hundred songs and the editors of this Complete Edition maintain that he 'can be accepted as a path finder for an unmistakable and original type of German Lied style that Robert Schumann, Johannes Brahms and Hugo Wolf further developed'.

Op. 101 is unusual in including three songs with piano duet accompaniment, *Sangeslust*, *Trostlos* and *Gondelfahrt*. Three of the poems of Op. 105, *Der Rosenstrauch* (Ferrand), *Das Ständchen* (Uhland) and *Mädchens Klage* (von Schweizer), are on the theme of early death, perhaps a response to the death of Spohr's youngest daughter in 1838 at the age of 20. The conversation between the mother and her dying child in *Das Ständchen* is reminiscent of that between father and son in Schubert's *Erlkönig*, although here it is the song of angels that the child hears. However, the remaining songs offer appropriate contrast, with lyrical expressiveness in *Die Himmelsbraut* (Kerner), intense passion in *An \*\*\** (Koch), and a simpler strophic response to thoughts of loving, kissing and drinking, in the anonymous final song, *Warum nicht?*

All the notes on the songs are given in English translation, placing poems and poets in their literary context. Here is a rich repertoire resource that is yet to be fully exploited – I do hope that you are tempted!

Beethoven, Weber, Clapison, Coucune, Bordèse, et Thalberg.  
Boulevard Poissonnière N°16 m.l.

The unpublished song WoO 139 *Jüngst hörte ich, welch süßen Lohn* is definitely a version of the Lied WoO 92 *Was treibt den Waidmann in den Wald* (1825), however with a different text and without the obligato Horn part [See also: Dr. Martin Wulfhorst "Identifying Five Spohr Items" Spohr Journal, The Magazin of the Spohr Society of Great Britain XVI Summer 1989 pp. 2 – 6]. Both works are in the key of A-flat major and have the exact same number of measures. Since it is without question a composition from Louis Spohr, and appears also in a new French version (*Amour et courage*, words from Bélanger) published by S. Richault in Paris (1838 - 41?), the Lied WoO 139 will be presented in the complete Owen-Leinert Lied edition [E.D. 29960 Vol. 10 Einzellieder I].

Hill invited both Spohr and Mendelssohn to conduct, however neither of them could accept, sending letters of acknowledgement instead. Both were later made honorary members of the Philharmonic.**

[www.owen-leinert.com/Spohr\\_Society.htm](http://www.owen-leinert.com/Spohr_Society.htm)

**Susan Owen-Leinert** joined the University of Memphis, Rudi E. Scheidt School of Music, in 2005 after enjoying over 20 years of performing opera and concert internationally. She made her European debut with an invitation from Maestro Daniel Barenboim to the Staatsoper Unter den Linden in Berlin, where she sang *Senta* (Der Fliegende Holländer) and *Helmwige* (Die Walküre). Ms. Owen has sung major roles in guest engagements at the Deutsche Oper Berlin, Semper Oper Dresden, Deutsche Oper am Rhein and Opéra de Nancy et de Lorraine, France. Her interpretation of the title role of *Elektra* by Richard Strauss was hailed in the press as the "Singer-Discovery of the year 2000", a role she performed at Staatstheater Darmstadt, Aalto Theater Essen, Antikenfestspiele in Trier, Theater Münster and Staatsoper Hannover. As a full-time ensemble

member of Staatstheater Kassel (1995-1999) Ms. Owen sang *Brünnhilde* (Wagner: Der Ring des Nibelungen) with great critical acclaim at Staatstheater Kassel. Complete live recordings of *Die Walküre*, *Siegfried* and *Götterdämmerung* were successfully released on CD by Ars Produktion, Germany. As *Brünnhilde* she was a guest in numerous opera houses in France, Italy and Germany, as well as concert performances in Taipei and Tokyo.

At Staatstheater Darmstadt she was a full-time ensemble member from 1999 – 2002 where she sang major parts in operas by Janacek, Wagner and Strauss. Her career includes many engagements in the USA, for instance with the Palm Beach Opera, the Austin Lyric Opera and with the Opera Orchestra of New York.

Highlights of her performances on the concert stage include the Mahler *8th Symphony* (Soprano 1) at the Beethoven Festival in Bonn and Cologne, *La Terre for soprano, piano and orchestra* by Zygmunt Krauze for Radio France in Paris, Schoenberg's *Gurrelieder* in both Darmstadt and Bratislava, Wagner's *Wesendonck-Lieder* as well as the *Vier letzte Lieder* by Richard Strauss.

Receiving her Bachelor of Music Degree from East Carolina University and her Master of Music Degree from the University of Texas at Austin, Ms. Owen captured the attention of the opera world when she was a winner of the 1990 Metropolitan Opera National Council Auditions and in 1991 the Opera America Award.

Associate Professor of Voice Susan Owen-Leinert (Division Head of Vocal Arts) founded the *Memphis Opera & Song Academy*, a summer academy for opera singers on the verge of international careers. She is the General Manager of The Chamber Opera of Memphis which since 2007 has successfully produced contemporary opera productions such as *The Medium* by Sir Peter Maxwell Davis which was invited to Germany for guest performances. In 2009 Susan Owen-Leinert was the recipient of the *CCFA Dean's Creative Achievement Award*. She has been a guest lecturer, recitalist and given master classes in the United States, Germany and Cyprus.

As the President of the *Louis Spohr Society of the United States*, Ms. Owen-Leinert is the editor of the first critical edition of the complete Lieder by Louis Spohr in 12 volumes with the German Publisher Dohr in Cologne.

### Abstract

This paper explores the methodology and application of standards-based grading practices. In particular, it illustrates the principles and implications of standards-based grading practices in comparison to those of other grading practices commonly employed at the elementary, secondary, and post-secondary levels of education. This paper examines and responds to issues and challenges inherent in modern grading practices, and provides a review of relevant research, literature, and studies in support of standards-based grading practices. This paper places all comparisons and evaluations in the context of Tomlinson and McTighe's 2006 publication, *Integrating Differentiated Instruction and Understanding by Design*, identifying the basic tenets of standards-based grading practices.

*Keywords:* standards-based grading, formative assessment, point-based grading, summative assessment

### The Benefits of Standards-Based Grading:

#### An Overview and Critical Evaluation of Modern Grading Practices

Standards-based grading, also known as formative assessment, is an innovative and highly controversial grading practice gaining momentum at the elementary, secondary, and post-secondary levels of education. The process is most concisely described as a grading system in which students are evaluated based on their proficiency in meeting a clearly-articulated set of course objectives (Tomlinson & McTighe, 2006). Standards-based grading differentiates from traditional point-based grading in that it focuses on larger outcomes; rather than inferring a student's progress based solely on how many points the student has accumulated from attendance, or from the completion of individual assignments, standards-based grading concerns itself with the cohesive body of knowledge that the student gains as a result of the course. It does so by prioritizing the *final result* of the student's participation, instead of relying on a summation of grades awarded at various stages of the student's learning process—an intrinsically flawed method of evaluation which often produces a snapshot inconsistent with the true outcome of the student's efforts in the course.

To truly understand the differences between these two grading practices, it must be noted that standards-based (formative) assessment and points-based (summative) assessment serve two different—and often conflicting—purposes. In his book *How to Grade for Learning, K-12*, teacher and researcher Ken O'Connor (2009) identifies the separate purposes of each method, stating,

It is essential that teachers distinguish clearly between formative and summative assessment...Formative assessment should be used primarily to give feedback to students (and teachers) on the progress of learning, whereas summative assessments are

used to make judgments about the amount of learning and so are included in grades.  
(p. 116).

In short, the former focuses on providing students with feedback, with the expectation of improvement, while the latter is predicated upon judgment of what the student has already managed to achieve. The same concept is illustrated in Figure 1, which depicts the effect of swapping summative for formative assessment; instead of defaulting to previously recorded

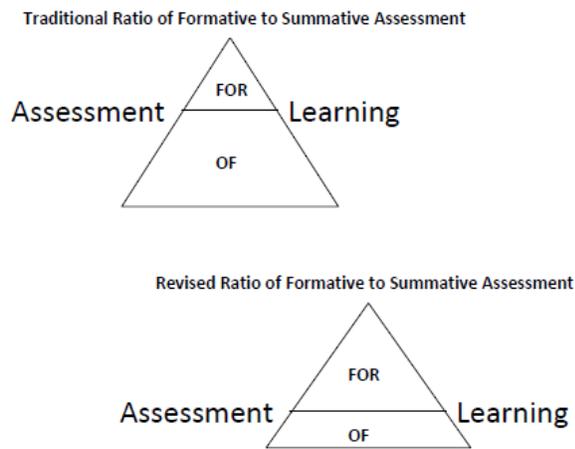

Figure 1: Breakdown of formative vs. summative assessment

a student's ability to meet a clear set of standards, typically designed to reflect thorough, end-of-course comprehension of the subjects taught, standards-based grading not only holds students accountable to their progress, but eliminates the discrepancies implicit in attempting to turn point calculations into an accurate representation of a student's achievements. Thusly, a teacher using a standards-based system of evaluation is better able to determine a student's grade based on the single most important aspect of education—how well the student comprehends the content of the course.

This hotly debated grading practice takes aim both at mediocrity in the classroom and inaccurateness in the gradebook, attempting to reinvigorate elementary, secondary, and post-

<sup>1</sup>Spokane Public Schools, 2009, p. 13

grades, and calculating a final grade from the resulting accumulation of points, formative grading assesses in the *present tense*, seeking to verify not simply that a student has completed a certain amount of assignments, but that a student is armed with the tools necessary to succeed in future assignments. By emphasizing

secondary education by forcing teachers to implement more accurate methods of evaluation—methods that hold students accountable not for earning points, which often do not represent learning achievements so much as students’ ability to follow a set of rules, but for actual mastery of the subjects taught to them. Though applicable to all fields of study, this method of evaluation is particularly relevant to the liberal arts, whose academic objectives lend themselves less to test scores (points) and more to the general betterment of students’ abilities to think and write critically, comprehending and contributing to the world around them in a manner that projects, as the phrase suggests, a measure of “liberation.”

An examination of grading systems used within the field of liberal arts, applied to such disciplines as the study English or writing, reveals that standards-based grading is not merely an improvement upon traditional point-based grading; it is a system entirely fit to replace point-based practices, but that requires of those who use it a keen understanding its methodology, and a commitment to education that transcends and even defies many current expectations set forth by school administrations. With a general emphasis on liberal arts classes, this report will illustrate the benefits of standards-based grading through a review of relevant literature, research, studies, and—perhaps most centrally—actual grading practices employed at the elementary, secondary, and post-secondary levels of education.

### **Literature Review**

In order to truly appreciate the deficiencies of point-based grading, we must understand not only the ways in which standards-based grading is superior to points-based grading, but also what characterizes a “superior” education; we must determine the goal, and evaluate each method of grading based on how well it serves that aim. For the purpose of this study, let us identify and reaffirm the objectives of academic, liberal-arts based education.

**Standards-Based Grading and the Liberal Arts**

In his essay, “Statistics in Liberal Arts Education,” researcher Gudmund R. Iverson (1985) investigates the learning objectives of college-level liberal arts classes, stating that English, in particular, is taught “because training in English enables us to think more critically and to communicate our thoughts,” and continuing on to say that “similar comments can be made about most subjects taught as part of a liberal arts curriculum” (p. 17). Achievement of objectives such as critical thinking and communication necessitates that students are able to apply what they learn in the limited context of the classroom to what they experience in the greater context of the world, a purpose Iverson reaffirms when he states that “after acquiring such a background in the liberal arts, a person’s natural next step is to acquire the necessary skills needed for a profession” (p. 17). This task is naturally obscured by points-based grading, in that there is no clear way to apply the acquisition of points to anything other than a gradebook. A better system would make it a priority to clarify for students the practical correlation between achievements inside and outside of the classroom.

Numerous researchers support the necessity of establishing such connections, such as college English instructors Holly Hassel and Jessica Lourey (2005), who state in their essay, “The Dea(r)th of Student Responsibility,” that “instructors have reason to believe that their students are out of touch with what their grades really symbolize, why they are even in college, and what responsibilities they have as students” (p. 2). Standards-based grading engenders a learning environment prime for clarifying the broader implications of coursework, due to the fact that evaluating student progress by anything other than a pre-established point system requires instructors to interact more closely with students and their work—to engage students in establishing goals, and then help students apply their work to those goals. Under a standards-

based system, teachers must provide detailed and meaningful assessments of student material, thusly affording both student and teacher a chance to work together to demystify learning objectives and establish critical connections.

Iversen (1985) further aligns the study of liberal arts with “higher ideals of human life,” and identifies the content of a well-rounded liberal arts education as “less a list of subjects and more a general learning process that develops a person and makes that person an active, contributing member of society” (p. 17). Given this description, the overarching aim of liberal arts education is to grow and refine students’ capacity for learning, providing them with a base of knowledge by which they might acquire a better understanding of themselves, their peers, and—as previously mentioned—the world beyond the classroom. Moreover, the above description makes clear that providing students with an exemplary liberal arts education does not default to rote instruction of itemized “subjects,” but requires the facilitation of an active and evolving process by which students learn to navigate the intricacies of the society toward which they aspire.

Additionally, let us consider the phrase “higher ideals of human life”; it conjures, in particular, ideas of self-worth and empathy, placing implicit value on the critical, moral and social development of the human mind. For a number of reasons, achievements or deficiencies in such categories cannot responsibly be qualified by an amount (or lack) of points. In order to accurately identify and respond to accomplishments and impediments in a learning process that emphasizes such broad goals as cognitive development, individualized attention must be given to the student in question. His or her particular situation must be acknowledged and dealt with by a teacher who understands the importance of clarifying the larger implications of the student’s progress, lest that student lose sight of the relevance of continuing to make said progress. An

individual grade of 99 out of 100 points fails to reinforce overarching learning objectives as well as a written page of evaluative response, or a personal conference detailing what exactly the student did so well. Similarly, if a teacher hands a student a failing assignment, that student will not know where the need for improvement originates unless the teacher makes an effort to explain the grade, providing the student not only with a clear set of standards to meet, but a plan for meeting that set of standards.

**Benefits of standards-based grading to student-teacher communication.** O'Connor (2009) weighs in on the above line of reasoning, reinforcing that language, rather than numbers, should be the central tenet in student-teacher communications: "The basic principle at work [in standards-based grading] is that words open up communication, whereas numbers close it down—prematurely at that" (p. 123). Premature conclusion of student-teacher dialogues creates gaps in the learning process, making it especially vulnerable to impediment; given that it is the nature of the learning process (and any other process, for that matter), to exist in a constant state of flux, absorbing the features of its environment, it is essential that teachers catch and correct problems before they are manifest. Progress must be monitored outside the parameters of points-assignment, in order that deficiencies and successes are not overlooked, having been inaccurately transfigured by numbers in a gradebook. Teachers cannot achieve this without transcending the comfortable distances of points-based assessment, into the sometimes uncomfortable realm of communicating with students directly and often about the particulars of their academic circumstances.

### **Analysis of Practice**

An examination of any class in which a typical point-based grading system is used reveals a notable discord between intended and actual learning outcomes; despite that the

addition and subtraction of points is meant to reward or penalize students for the quality of their performance in a class, theoretically making them more accountable to their academic responsibilities, students whose progress is evaluated on a point scale tend *not* to develop the same sense of personal responsibility toward their work as their formatively evaluated peers. This is due to the fact that points, especially when awarded for achievements that do not directly reinforce overarching learning objectives, such as attendance and extra-credit, have the ability to mask learning deficiencies. This deflects attention from potential learning impediments, making it difficult both for students to engage with course material, and for instructors to identify and meet student needs. In the following excerpt from her article, “Seven Reasons for Standards-Based Grading,” high school teacher Patricia Scriffiny (2008) attests to the ability of point-based grades to mask actual levels of comprehension, obscuring the learning process:

I once thought it was essential to award points to students simply for completing homework. I didn't believe students would do homework unless it was graded. And yet, students who were clearly learning sometimes earned low grades because of missing work. Conversely, some students actually learned very little, but were good at “playing school.” Despite dismal test scores, these students earned decent grades by turning in homework and doing extra credit. (p. 71)

Scriffiny's testament raises several key problems associated with point-based grading, the first being that awarding points “simply for completing homework” is a prime way to engender student laziness. In an environment that prioritizes points, students are quick to identify and isolate easy methods of attaining those points, regardless of whether or not the activities they complete to get them are actually beneficial to the learning process. This has the practical effect of replacing cognitive learning goals with the acquisition of points, as an assignment completed

strictly for the purpose of attaining points is an assignment lost to all broader course objectives. It is alienating to the student in that it separates successful grades from successful learning, and alienating to the instructor in that it never provides a truly accurate representation of how successful his or her teaching methods are.

The passage also makes apparent that a points-based grading system encourages a formulaic disregard of learning objectives. Sciffiny's experience showcases the detriment of consistently awarding points to students whose work is *less* than satisfactory, but is completed and turned in on time. Such a practice not only prioritizes the acquisition of points more than it does the comprehension of material, but it also suggests to the students that the *constancy* of their work is more important than the *quality* of their work. As researcher Charles Martell (1974) explains, "Predictability in academic performance is rewarded. What then do we have? A social institution that has substituted means for ends. Grades are paramount, and education is only secondary" (p. 113). When points are awarded simply for turning assignments in on a regular basis, even if the work does *not* reflect actual completion of learning objectives, students forget that the learning objectives even exist, focusing instead on meeting the rote requirements of a system that is guaranteed to issue points in exchange for compliance.

Allowing points to dominate the learning environment stymies academic development in other, more insidious ways, as well, such as by allowing for the development of inaccurate trends in the gradebook. Sciffiny's aforementioned testament describes a situation in which, under a point-based system, subpar students were able to earn decent grades simply by turning in work on a regular basis, while students who were "clearly learning" were so heavily penalized for missing work as to negate the merits of their actually comprehending the material. Figure 2 illustrates a comparison between point-based (traditional) grading and standards-based grading

Traditional Grade Book			
Name	Homework Average	Quiz 1	Chapter 1 Test
John	90	65	70
Bill	50	75	78
Susan	110	50	62
Felicia	10	90	85
Amanda	95	100	90

Standards-Based Grade Book			
Name	Objective 1: Write an alternate ending for a story	Objective 2: Identify the elements of a story	Objective 3: Compare and contrast two stories
John	Partially proficient	Proficient	Partially proficient
Bill	Proficient	Proficient	Partially proficient
Susan	Partially proficient	Partially proficient	Partially proficient
Felicia	Advanced	Proficient	Proficient
Amanda	Partially proficient	Advanced	Proficient

that speaks to this issue, highlighting the inconsistency of point-based grades. Susan may have a higher homework average than her peers, due to consistently completing and turning in homework assignments, but her quiz and tests scores are substantially lower than her peers, suggesting that she lacks fundamental comprehension of course

Figure 2: Traditional vs. standards-based grade book <sup>1</sup>

material. Conversely, Felicia may have a low homework average, but her test scores reflect that she comprehends the material. Despite this, Susan’s earned points will amount to more than Felicia’s, resulting in a higher final grade. Any grading-system that allows for this kind of contradiction has failed the test of integrity. If a grading system is unable to determine a failed from a successful learning objective, it is in need of substantial and immediate revision.

Another issue Scriffiny (2008) raises is that of student motivation, admitting that she was compelled to assign a point value to every piece of homework out of fear that students would not otherwise complete the assignments. Her fear illustrates that she was aware her students had succumb to equating academic progress solely with the acquisition of points, and that a change was necessary in order to reprioritize the achievement of learning objectives. After adapting a standards-based system in which points were replaced with “systematic and extensive feedback on assignments,” Scriffiny (2008) noted no decrease in homework completion rates, and an *increase* in students’ overall comprehension of subject matter (p. 72). Conclusively, offering students feedback in place of points is an effective way to emphasize “that they can and should

<sup>1</sup>Scriffiny, 2008, p. 72

do homework as practice,” and that learning is more important than receiving points (Scriffiny, 72).

Scriffiny’s decision to depart from a point-based grading system is a model for other teachers struggling to reconcile performance and grades. Once it is understood that points neither reflect comprehension nor encourage students to learn, an instructor may lessen his or her reliance upon them, and focus that attention on means of evaluation more helpful to the student (and more likely to produce the kinds of results the instructor desires to see).

### **Application of Research**

I received encouraging results after testing this methodology on students in my own college level basic composition class. Like Scriffiny, I once believed that awarding points for individual homework assignments was the only way to bait my students into completing the work. Moreover, I relied upon those points—almost exclusively—to track student progress between major projects. The practice provided me with a level of structure that was downright comforting. It was so *easy* to check off assignments, record points, and total grades: five points here for a worksheet, ten points there for a reading log. I told myself that providing my students with such a surplus of opportunities to earn points was a benefit to them; if they failed in spite of my efforts, it was because they weren’t trying hard enough. When a student received an especially poor grade at midterm or the end of the semester, I would stew over it, revisit that student’s assignments, and re-tally the earned points with a generous eye—and when the grade ultimately remained the same, I would conclude once more that the onus was, and had always been on the student, to provide me with higher quality work. I had done my part.

This practice, however, though functionally sound, soon revealed itself not to be the neatly-wrapped, multipurpose solution I had taken it for. The periodic teacher evaluations I had

my students anonymously complete started to reflect sentiments along the lines of, “Great class—but the homework assignments don’t really do anything for me,” and more specific feedback, such as “I would rather focus my attention on the larger projects than waste time on all these homework assignments.” Initially, I was taken aback by their comments. I had carefully designed nearly every homework assignment either to reinforce comprehension of important material, or prepare students for larger projects—projects accounting for substantial portions of their final grades. Surely, their inability to glean valuable knowledge from my carefully constructed homework assignments originated in laziness.

The following semester, in spite of my reservations, I decided to try something different. I provided this new group of students with the exact same homework assignments, but absent the point-rewards. I still took note of whether or not students were turning in their assignments, but I no longer attached any numerical value to the work. Instead, I facilitated an alternative system of evaluation, aimed at ramping up levels of communication between myself and my students. I provided students whose work ranged from satisfactory to excellent with written feedback, explaining what was working well, and what could still use some improvement. I required the few students whose work was consistently subpar—or simply missing—to attend individual conferences with me, so that we could identify and work through learning issues together. Above all, I emphasized overarching learning objectives, painstakingly reiterating that while individual homework assignments were not graded, ability to demonstrate proficient comprehension of course material by the end of the semester *was*.

These changes were inspired by a line of thinking suggesting that in order to achieve comprehensive learning in the classroom, a teacher must help his or her students understand that learning is not at full potential *unless* it is comprehensive. Subsequently, a teacher cannot hope to

grade comprehensive learning with any amount of accuracy by using a system that is not itself comprehensive—that does not respond to multiple facets of the student’s learning experience.

Robert J. Marzano (2010), a highly respected researcher in the field of standards-based grading, uses the following analogy to help us understand the concept:

“Think of a baseball card—when you looked at Mickey Mantle’s card, it didn’t say an A on the back. It included his fielding average, hitting average, homeruns—then you know why he’s a good player. Why would we give a student just one grade? (“Bangor Township”)

I stopped using points to grade my students’ homework assignments because points prevented me from looking deeper—from determining my students’ learning profiles, and responding to them with individualized attention. Additionally, the points appeared to be alienating my students from the actual content of the homework assignments; points were taking precedence over comprehension of the material, and therefore disrupting the coherence of the learning objectives I had set for the class.

## **Results**

The improvements I saw upon applying standards-based principles to my formerly uninspiring homework assignments were immediate and invigorating. The practical effect of eliminating the point distraction was that students began to regard the homework assignments as what they actually were: learning tools, meant to serve the practical purpose of helping them achieve a standard. Once the assignments stopped representing points and started representing attainable knowledge, they became not only relevant, but necessary. Students were quick to figure out that lack of attention to individual homework assignments typically resulted in a knowledge and skill deficit that prevented them from excelling at larger, more comprehensive

assignments, such as essays and presentations. Not wanting to disadvantage themselves, and without the cushion of knowing that a missed homework assignment could simply be absorbed and forgotten in the course of points acquisition, students completed and turned in homework assignments at high rates, with seemingly much clearer an understanding as to the purpose of the assignments.

### **Model Example of Standards-Based Grading**

The brand of standards-based grading illustrated above repurposes existing activities so that they better reinforce learning objectives, and does so in part by eliminating distractions. Conventions that are clearly disconnected from broader goals, and that dilute the learning experience—such as point-incentives—are subtracted from the learning environment, clearing the way for standards to be met. Exemplifying this methodology at the elementary and secondary levels is the district known as Spokane Public Schools (SPS), which now restricts all grading criteria to categories that are directly relevant to academic success. SPS explains, in a purpose statement meant to orient teachers unfamiliar with the standards-based system, that “when we include things like effort, participation, or adherence to school rules in grades, grades are essentially broken” (“A Teacher’s Guide,” 2009, p. 4). This statement highlights that if grades are indeed meant to reflect *academic* progress, academic standards must be the *only* standards upon which the grades are based.

### **Common Concerns**

There is a complication, however, in adapting this system at the elementary and secondary levels of education; a parental and societal expectation exists that schools monitor and encourage adolescents’ social and work habits in conjunction with their academic progress. Anticipating this concern, SPS recommends that teachers continue monitoring students’

nonacademic development, but that they report it separately from students’ grades, in a manner that does not interfere with academic assessments (“A Teacher’s Guide,” 2009, p. 8).

WORK HABITS & SOCIAL DEVELOPMENT CRITERIA

Figure 3: Example of nonacademic development report <sup>1</sup>

3, excerpted

from SPS’ grading handbook, models a section of gradebook dedicated entirely to the reporting of nonacademic development, and that does not intersect at any point with the reporting of academic grades. This too is a standards-based system; work habits and social development are each assigned their own set of criteria, and a student’s progress in achieving these criteria is reported according to levels of satisfaction, as either a “one,” “two,” or “three.” This is a clean, effective way for elementary and secondary school teachers to continue reporting important nonacademic developments without skewing academic standards, and therefore distorting academic grades.

**Evaluation criteria.** SPS also acknowledges that in order to successfully operate and maintain a standards-based grading system, there must exist an exceptionally clear model of criteria by which to evaluate students’ academic advancements within that system. Attention to

<sup>1</sup> Spokane Public Schools, 2009, p. 10

criteria, after all, is what separates standards-based grading from other forms of grading; criteria are what help teachers determine whether or not standards are being met. Because there is often no practical definition or application of statewide academic standards, which tend to be unduly reliant upon point-based test scores, many forward-thinking districts and

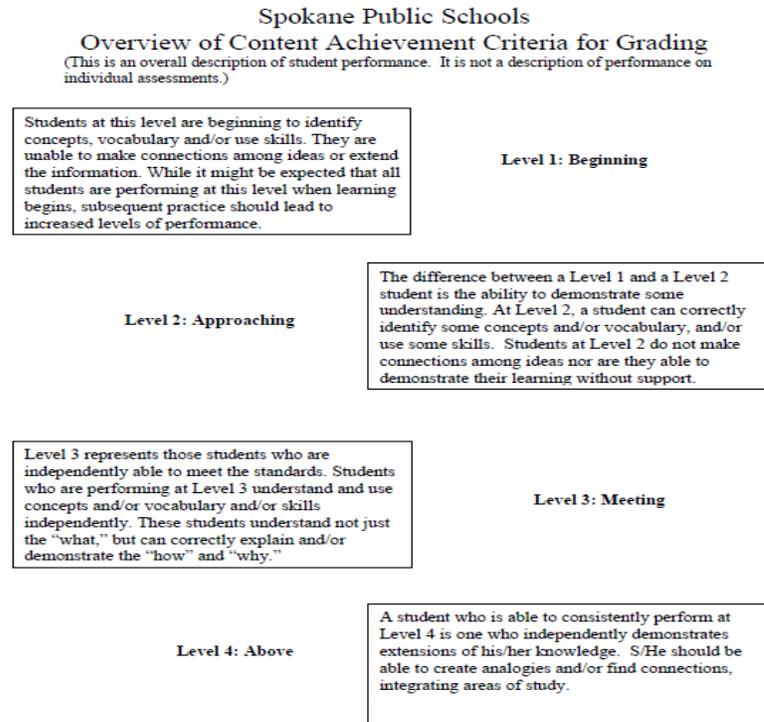

Figure 4: Model set of standards <sup>1</sup>

institutions find themselves in the position of needing to establish and implement: first, their own set of standards, and second, their own criteria by which to measure how well their students achieve those standards. SPS and other likeminded education providers take noteworthy initiative in forging their own district- or institution-wide standards and criteria.

Figure 4, an additional excerpt from SPS’ grading handbook, illustrates a model set of standards. Academic proficiency is broken down into four different levels, reflecting standards of achievement at various stages of the learning process. The headings corresponding to each level— “Beginning,” “Approaching,” “Meeting,” and “Above”—refer to a student’s progress in relation to the end-of-course standard, which is described in Level 3 (“Meeting”). The availability of such a rubric lends essential clarity to the process of standards-based grading.

The absence of a widely-implemented set of grading criteria, such as the one shown in Figure 4, can lead to serious inconsistencies in the way individual teachers within an institution

<sup>1</sup> Spokane Public Schools, 2009, p. 8

or district evaluate and grade their students. Researchers Robert J. Marzano and John S. Kendall (1996) warn that inconsistency in grading standards can engender “a situation in which grades given by one teacher might mean something entirely different from grades given by another teacher even though the teachers are presiding over two identical classes”—a discrepancy undesirable in any education system that strives to cultivate the same levels of academic success in each member of its student body (p. 10). Such discrepancies only result when, in the absence of a universal set of standards, teachers *improvise* by creating their own grading criteria; one teacher might prioritize attendance and classroom participation, while another is more concerned with quality of homework. Each teacher places more importance—typically expressed in amounts of available points—on his or her preferred category, and grades accordingly. Such individually crafted standards disservice students in that they are applicable only in the limited context of that particular teacher’s class. In the eyes of the student, the purposes of these standards may be a complete mystery outside of the teacher’s classroom.

Mysteries in the evaluation rubric, resulting in questionable grading practices, critically disadvantage any student, parent, administrator, or government representative attempting to navigate the education system. In his book, *Making Standards Work: How to Implement Standards-Based Assessments in the Classroom*, Douglas B. Reeves (2004) discusses this issue:

"Whether Congress and state legislatures are analyzing the performance of millions of students or a third-grade teacher is evaluating the work of a single child, the principle of fairness demands that the definition of success be clear. Student achievement in a fair system stems from meeting a standard rather than wading through mysterious and changing expectations." (p. xiv)

The operative word in the above passage is “fair.” Attempting to facilitate a class in the absence

of standards and criteria is tantamount to professional recklessness. Variant grading criteria not only confuse and hinder students, but also impede any attempt to determine the strengths and weaknesses of a student body as a whole, as they allow no reliable frame of reference by which to evaluate success. Conclusively, a clear set of standards is necessary in guiding both students *and* teachers toward desirable educational outcomes.

**Countering the teacher-centered classroom.** Additionally, standards-based grading helps ensure that a class does not become disproportionately teacher-centered. Teacher-centered learning has, until recently, largely dominated classroom settings. Traditionally, teachers conduct classes from a position of power, functioning as distributors of information rather than as facilitators of learning. Teachers are the core around which the classroom orbits; they set the rules, administer the course content, and ensure that the rules are not broken during students' acquisition of the course content. In theory, this approach to teaching provides students with the structure and direction necessary for effective learning. In practice, however, this type of environment may stifle otherwise motivated learners, in that it prevents them from moving out from beneath the teacher's wing. Charles Martell (1974) discusses the paradox:

“The teacher's power to influence the direction and possible outcome of a student's future has an impact at once reassuring and forbidding. Constant reinforcement of the teacher's importance leads, more often than not, to an unquestioning attitude on the part of the student.” (p. 112)

As teachers, we should want our students to question. Valuable learning experiences often begin with questions. Confusion is clarified via questions. And, perhaps most relevant to this essay, connections between coursework and learning objectives are made via dialogues initiated by questions. When the teacher is installed as an authoritarian figure, he or she essentially takes the

place of a parent or guardian, and it becomes difficult for a student to question information issued from that authority. If teachers want students to take responsibility for themselves not just as students of a particular class, but as *learners*, developing learning strategies that will serve them both inside and outside the classroom, we must provide for the asking and answering of questions—some of which may even challenge us, and our teaching habits, in unanticipated ways.

In order to more fully understand the negative implications of exclusively teacher-centered learning, and the ways in which standards-based systems mitigate these effects, let us further examine common

<b>Comparison of Teacher-centered and Learner-centered paradigms</b> <small>(Learner-Centered Assessment on College Campuses by Huba and Freed 2000)</small>	
<b>Teacher-Centered Paradigm</b>	<b>Learner-Centered Paradigm</b>
Knowledge is transmitted from professor to students	Students construct knowledge through gathering and synthesizing information and integrating it with the general skills of inquiry, communication, critical thinking, problem solving and so on
Students passively receive information	Students are actively involved
Emphasis is on acquisition of knowledge outside the context in which it will be used	Emphasis is on using and communicating knowledge effectively to address enduring and emerging issues and problems in real-life contexts
Professor's role is to be primary information giver and primary evaluator	Professor's role is to coach and facilitate Professor and students evaluate learning together
Teaching and assessing are separate	<b>Teaching and assessing are intertwined</b>
Assessment is used to monitor learning	<b>Assessment is used to promote and diagnose learning</b>
Emphasis is on right answers	Emphasis is on generating better questions and learning from errors
Desired learning is assessed indirectly through the use of objectively scored tests	<b>Desired learning is assessed directly through papers, projects, performances, portfolios, and the like</b>

Figure 5 <sup>1</sup>

components of the teacher-centered approach. In her essay, “Teacher-Centered versus Student-Centered: Balancing Constraint and Theory in the Composition Classroom,” researcher and English teacher Donna J. Kain (2003) discusses the methodology behind the practice, stating, “Most critically, in teacher-centered approaches, judgments about appropriate areas and methods of inquiry, legitimacy of information, and what constitutes knowledge rest with the teacher” (p. 104). The central flaw of this design is that it fails to cast the student as an active participant in

<sup>1</sup>Huba & Freed, 2000, p. 98

the development of his or her own education; the student exists in the classroom setting as an *observer* of the teacher's knowledge, confined to the peripheries of the learning experience.

Given the evidence suggesting that teacher-centered learning is deeply flawed, we must ask ourselves: Why is it still practiced by an overwhelming majority of education providers? The answer is that the most popular antidote to teacher-centered learning—student-centered learning—is not without flaws of its own. Kain (2003) describes this alternative in relation to the highly-prescriptive teacher-centered approach: “By contrast, student-centered approaches derive from constructivist views of education, in which the construction of knowledge is shared and learning is achieved through students’ engagement with activities in which they are invested” (p. 104). Superficially, the above philosophy appears to solve many of the issues associated with teacher-centered learning. It involves students in the learning process through sharing of knowledge, rather than administration of information; and participation in activities, rather than subjection to long-winded lecture. It redistributes unequal power dynamics, encouraging teachers and students each to take a similar stake in classroom productivity. It lacks, however, the highly-defined set of standards afforded by teacher-centered learning, which, in its rigidity, succeeds at least in providing students with clear expectations (however arbitrary those expectations may be).

The question then becomes, “How can a teacher combine the clear expectations of teacher-centered learning with the interactive and accommodating nature of student-centered learning?” The answer is to apply the principles of standards-based grading to the model of a student-centered learning environment, thereby creating an environment in which standards are well-defined, students are engaged, and the teacher is accessible. These respective methods of evaluation and instruction not only complement each other, but are in certain ways reliant upon

each other. An activity conducted in the philosophy of student-centered learning may lack direction if it is not designed to reinforce a particular standard; similarly, a standard may present itself as arbitrary if its achievement is not facilitated through engaging activities and lively dialogues. Ideally, students should neither be shut out of their own education, helpless to influence the content or course of the experience, nor should they be without guidance, and a set of objectives to reference in moments of uncertainty. Using standards-based grading practices to evaluate progress within a student-centered learning environment helps teachers achieve this ideal.

### **Conclusion**

In conclusion, modern grading practices are rife with complexity and contradiction. They are remnants of archaic conventions, and hybrids of newer methodologies not yet tried by time and application. They are student or teacher oriented, inaccessibly rigid or unhelpfully absent of structure and definition. Amid these distinctions, point-based grading reveals itself as an objective failure, insufficient in meeting the needs of any student focused on attaining a comprehensive, impactful education, and any teacher concerned with identifying and meeting the needs of his or her students.

The most effective teaching and grading methodologies refrain from extremes, combining useful features from a number of partially-successful practices, in order to create a premium system of education capable of adapting to the requirements of those who use it. Standards-based grading emerges from the study of these methodologies as a system worth advocating; neither intransigent nor unstructured, it accommodates different learning styles, sets attainable goals, and provides teachers with the opportunity to meet students wherever they are in the process of achieving those goals. Perhaps most importantly, standards-based grading

separates and elevates the advent of learning from points and numbers in a gradebook, lending new inspiration to the ages-old pursuit of education.

EXPLORING THE READING ACHIEVEMENT OF ENGLISH  
LANGUAGE LEARNERS WHO PARTICIPATED IN THE  
RESPONSE TO INTERVENTION MODEL

## **ABSTRACT**

The purpose of this study was to determine if English Language Learner (ELL) reading achievement scores could be related to the group's participation in Response to Intervention (RTI). RTI addresses the challenges many public schools face as they seek the best methods for teaching reading and language while facing a nationally significant growth in the population of ELLs. The results of this study indicated that RTI was a beneficial practice for ELLs since there was a significant relationship between participation in RTI and reading achievement.

**Key Words:** *English Language Learners (ELLs); Response to Intervention (RTI); California Standardized Test (CST)*

The reauthorization of the Individuals with Disabilities Education Act (IDEA, 2004) and the No Child Left Behind Act (NCLB) of 2001 made the Response to Intervention (RTI) process a widely used model in schools around the country. As an alternative to the IQ-achievement discrepancy determination of identifying students with specific learning disabilities, IDEA specifies that local governments may use a process that determines if a child responds to scientific, research-based intervention as part of an evaluation procedure. “Both IDEA and NCLB call for improving the outcomes for all students by using scientifically based instructional practice” (Cummings, Atkins, Allison & Cole, 2008, p. 24). The processes of identifying students in need of special services through RTI requires a paradigm shift as schools examine contextual issues of quality of instruction and shift focus from identifying students with deficits to identifying students at risk (Ardoin, Witt, Connell, & Koenig, 2005).

The availability of special education services and language support instruction in public schools has been reduced, which has increased the demand for schools to transition ELLs to primarily unsupported English language instructional programs as quickly as possible. RTI was presented to teachers as an alternative to the “wait to fail” model for special education that requires a discrepancy to exist between student achievement and potential. The RTI model allowed schools to address the problems of disproportionate numbers of children qualifying for special education that is, ELLs were overrepresented in special education with fewer classrooms in which large numbers of students could be serviced. RTI addresses the challenges many public schools face as they seek the best methods for teaching reading and language while facing the national significant growth in the ELL population. The intent of RTI is for general education teachers to service students with special needs within the general education classroom without referring them to special education. RTI is used for entire classes of students or school

populations. Rather than benefitting only students with special needs within a classroom or school, RTI addresses the reading intervention needs of all students.

Many ELLs are placed in special education settings due to their lack of the English language skills, especially in places where the quantity of non-English speakers is very limited (Orosco & Klinger, 2010). In this context especially, RTI plays an important role in reducing the number of individuals in populations that are over represented in special education. IDEA 2004 emphasizes that the disproportionate number of culturally and linguistically diverse students in special education has to be diminished (McMaster, Kun, Han, & Cao, 2008).

One of the most difficult tasks in assessing ELLs who are having academic difficulties is identifying the cause of the difficulties. The problem could be English proficiency or an unidentified learning disability. The RTI model provides an additional source of information during the special education referral process, using data with scientifically based instruction. RTI has also set procedures in place to assist schools in identifying students who truly need special education services and distinguishing between the needs of the student with special needs and the needs of an ELL (Rinaldi & Samson, 2008).

Mellard (2004) of the National Research Center on Learning Disabilities states that “RTI is a valuable model for schools because of its hypothesized utility in identifying students with [learning disabilities] and preventing academic failure among all students” (p. 1). The process of RTI hopes to prevent academic failure among all students by providing a close match of students’ current skills and ability levels with the instructional and curricular materials provided in the classroom (Mellard, 2004). Students who do not learn at the same rate as their peers and do not demonstrate commensurate growth through standardized test scores are identified and provided appropriately tailored intervention instruction. “Identifying students who are not

achieving at the same level and rate as their peers and providing appropriate interventions are two features that RTI advocates emphasize” (p.1). RTI emphasizes strong core curriculum and intervention for all students. To be successful, the model should be formally in place throughout a school (Berkeley, Bender, Gregg, Saunders, & Saunders, 2009). Formal implementation of the RTI model ensures that components of the RTI model can be implemented with fidelity, rigor can be built within instruction, and student achievement can be monitored in a standardized fashion.

Within the general population of a school, there are ELLs, gifted students, and students who perform proficiently. While RTI is generally thought to address the needs of at-risk readers, there has been little research on its effectiveness for ELLs (Brown & Doolittle, 2008; Newman Jacobs, 2009). Currently, ELLs are grouped with English Only (EO) students in reading intervention groups and, as such, have not been studied separately. Additionally, after ELL students have taken the California English Language Development Test (CELDT) and qualified for designation, as Re-designated Fluent English Proficient (RFEP) students they are categorized as proficient English language students. Students with RFEP designations are included in the ELL subgroup for CST scores until the RFEP student demonstrates proficiency three times after being reclassified. When data are disaggregated, new RFEPs are considered part of the ELL population. This study included RFEPs as part of the ELL population. Because the guidelines for RTI implementation are broad, school districts have a great deal of freedom with which to interpret the relevance for at-risk readers (Orosco, 2008).

Healy, Vanderwood, and Edlston (2005) assumed that students benefit from the structured intensive instruction provided by the RTI model. Therefore, it is important to determine whether an ELL benefits from an English phonological awareness intervention. It is

also instrumental in understanding ELL reading achievement to know whether determining the students' assessment scores facilitates the identification of those students most in need of additional services. Lack of response to a high-quality intervention is intended to provide the individual educational plan (IEP) team with data indicating whether the student may have a disability and, if need is established, is eligible for special education.

RTI was implemented in response to the disparity in achievement between students who do and do not need accommodations or modifications (Lovett et al., 2008). Research on RTI implementation in public schools has generally focused on the achievement of students with special needs in the general education classroom (Newman Jacobs, 2009; Siegel, 2009). It is important that teachers understand how implementation of the RTI model affects ELLs since language and reading needs present a unique instructional challenge within the RTI model. This understanding of ELLs in RTI necessitates further research, as there is a gap in current research literature. Further, school leaders need more information regarding how curricular changes such as RTI affect the educational experience for ELLs.

The design of intervention for ELLs in RTI unifies the use of best teaching practices while considering language acquisition and knowledge as it relates to reading acquisition and skill (Lovett et al., 2008). Researchers found that ELLs and other struggling readers demonstrated a correlation between oral language delay and reading difficulty (Lovett et al., 2008). The language difficulty often demonstrated by ELLs during the early years of English language acquisition was not a sufficient predictor for reading difficulty. The language acquisition rate of struggling students was addressed through the RTI model with small-group phonics and language instruction.

Since the authorization of NCLB many schools have adopted the RTI model as it measures students' need in relation to performance relative to quality instruction and valid assessment rather than the previously and widely accepted deficit model used in the past for special education consideration. Schools with high percentages of ELLs must begin with an examination of the teaching practices used for the population and the history of results gathered for the EL population from past intervention methods. Valid assessment is critical in evaluating successful RTI implementation for ELLs (Orosco & Klingner, 2010). Previous studies examining intervention models for ELLs have had high degrees of researcher control; therefore, district monitoring of EL progress is necessary in order to determine the effectiveness of RTI implementation.

Rinaldi and Samson (2008) speak specifically to the misidentification of many ELLs as either struggling readers or students with special needs and how this has affected achievement results in reading for the ELL populations participating in reading interventions. Since RTI is an alternative intervention intended to move away from the previously used discrepancy model for special education identification, screening and monitoring of ELLs' participation in RTI must also reflect the alternative nature of the intervention.

Currently, most standardized assessments do not measure reading achievement until the end of second grade. By this time, two or three years of reading instruction have passed before standardized indicators reveal that a student is in need of remediation. It is the unique reading instruction needs of the ELL that fit within structured alternative intervention models such as RTI (Fien et al., 2011). For ELLs, their dependence on effective and differentiated instruction is key to understanding their success in relation to reading acquisition. In order to measure the effectiveness of reading instruction by measuring student-reading achievement within the

alternative model (RTI), assessments must also employ an alternative to traditional methods. With proper assessment tools, the RTI model allows for the placement and monitoring of ELL progress as well as instructional practices. Monitoring progress and practice allows for student response to drive reform within an intervention model; nevertheless, how the monitoring is utilized is highly dependent upon the experience and leadership of school personnel.

Approximately 50% of teachers in the United States with one or more ELLs in their classrooms do not have the proper certification to teach ELLs (Brown & Doolittle, 2008). This is problematic when considering teacher certification in relation to the research on ELLs and reading acquisition. Factors such as teacher fidelity to research-based teaching practices and the use of foundationally sound cultural and linguistic practices in RTI instruction are necessary for effective reading instruction for ELLs. Haager, Calhoon and Linan-Thompson (2007) assert that ELLs respond best to direct reading instruction. Haager et al. (2007) discuss the success of ELLs who participated in additional balanced literacy activities within the RTI intervention model. English Language Learners who consistently participated in multiple tiers of RTI had greater reading success and lower rates of referral to special education.

RTI is composed of results-oriented assessments that are systematic and repeating. In order to properly assess the effectiveness of something as multidimensional as reading achievement, a school must use multiple measures to assess the efficiency with which they reach their ELLs and under-performing students. In addition to the instructional and assessment consideration outlined above, consideration must also be given to elements of the RTI model that can assist all struggling readers, including ELLs and under-performing readers. Research indicates that with effective instructional practices and early, targeted assessment, RTI is a successful reading intervention for ELLs (Brown & Doolittle, 2008). When ELLs receive

support, as well as intensive small-group support, that incorporates best practices, language support, and remediation, their reading success is greater than if they had received instruction within the regular education classroom in the way a non-ELL would. In a synthesis of reading and special education research that spans 20 years, Wanzek, Wexler, Vaughn, & Ciullo (2010) assert that reading instruction for at-risk and struggling readers must incorporate foundational skills as well as higher level reading tasks while focusing on vocabulary and reading comprehension. In order for the kind of instruction Wanzek et al. (2010) suggests taking place, a school would need to adopt an instructional model like RTI in order to accommodate regular and specialized instruction.

Adjustments to the typical teaching model have proven successful in addressing the unique needs not only of ELLs but also of all struggling readers. Teaching practices have changed with RTI implementation. McMaster et al. (2008) assert that the identification model and teaching found in the RTI model offer little difference from the old model of identification and remediation, since RTI instruction is heavily dependent on quality instruction by teachers who understand the reading needs of ELLs and at-risk students. Students are no longer separated because of language ability issues that arise during reading instruction. Therefore, RTI has eliminated a school cultural factor of reading shame since the model incorporates all students within a school into the RTI intervention model. This inclusion results in an enhancement of teacher skills in reading instruction. As a result of RTI, teachers deliver a greater amount of scientifically-based reading instruction that addresses the specific needs of the population they serve (Xu & Drame, 2008).

The purpose of this study was to examine the relationship between RTI and the reading acquisition of ELLs. Specifically, this study examined RTI and its effectiveness and

appropriateness for ELLs in a general classroom setting. In addition, this study examined teacher pre-service programs in relation to how teachers are prepared to meet the needs of ELLs in settings where targeted reading instruction is expected. By examining the RTI model used as a means to remediate lower achieving readers of all language designations, this study explored the possible relationships between the rate at which ELLs acquire grade-level reading skills and their participation in RTI. Schools typically implement RTI to address the needs of learners with special needs falling within the special education categories; however, this study considered the ELL population of a school district as an independent population requiring special support for reading instruction (Fien et al., 2011; Haager, 2007). The research questions that this study investigated are:

1. What is the relationship between RTI and ELL reading achievement scores?
2. What are the differences in reading progress for ELLs versus EOs who received the same RTI instruction over the same duration?

## Method

### *Setting*

The research was conducted in an urban K-8 school district in the greater Los Angeles area. The district was composed of seven elementary schools and two middle schools that housed 4,900 students. Of these students, 24% were ELLs and 69% were from low-income families. The population located within this district was 67% Latino, and nearly 10% of the families lived at or below the poverty level. All teachers employed by this district were considered highly qualified as reported on the School Accountability Report Card (SARC). The research focused on two of the seven elementary schools in the district, with a total population of

368 students, of whom 89 were ELLs and 279 were EOs. The two schools studied were chosen for their similar student populations and size. The two schools represented in this study were not the same as other schools in the district as they both housed smaller than average student populations within the district.

### *Participants*

Only those schools with similar demographics, population size, and RTI implementation methods were chosen for this study. Nevertheless, each school site offered variations in student-grouping criteria for RTI groups, materials used for instruction, and criteria for placement and movement among the RTI groups. Such variations were minimal, however, and the overall implementation followed specific grouping and instructional ideals consistent with tiered-intervention models. In general, both schools studied used reading assessment data from CST and teacher-administered reading assessments to determine grouping for ELLs and EOs. Because students in kindergarten through fifth grade participate in RTI, all primary grades were included in the study. Students chosen for participation were designated as either ELL or EO. Students of varying degrees of ELL proficiency and EOs, regardless of grade, were included in the study. Students who were designated as Fluent English Proficient (FEP) or Re-designated Fluent English Proficient (RFEP) were excluded from the study as a separate group. This exclusion was based on the inclusion of these groups in the ELL population once being re-designated. That is, students designated as RFEPs are included in the ELL group until three years of proficiency is demonstrated in English Language Arts on the CST. The anonymity of school sites and participants was protected. They were not described in any way that would allow internal or external personnel to identify either.

### *Instrumentation and Data Collection*

The study used a repeated-measures design with English proficiency as the one between-groups factor, and California Standardized Tests (CST) as the one repeated-measures factor with three levels. The CST examination is given one time per year and is administered within a two-week window at the end of each school year. The examinations are used to measure growth over time in a particular core subject. The CST reading tests are composed of questions written by professional testing companies and administered under highly secure circumstances. Grade-level teachers, who administered the assessments on the same day so as not compromise the validity of the assessment, administered the assessments within a two-week window at each school site within the district.

California Standards Test (CST) data for English Language Arts were acquired from the database housing multiple data for ELLs and EOs: *Data Director*. The data were collected over the course of two school years. The data collection for this study included the collection of state (CST) scores for both ELL and EO students over the course of two years. The population and sample size was first decided by determining the number of students at each of the two schools and next by determining how many ELL students were a part of the population at both schools. The data were collected for each assessment and then student scores were separated according to the language designation of the student earning the score.

### *Data Analysis*

The data were managed in SPSS and were stored on a password-protected computer. The data were compiled for each trimester. Archived data for each studied group were compared once all data were collected over the course of one school year. The collected data were analyzed through a repeated-measures design in General Linear Model. A repeated-measures

design can reveal differences between groups at each repeated-measure level or for each repeated measure. It also can reveal any differences between the three levels of repeated-measures variable and interactions between the subjects and repeated-measures variable.

Data were collected one grade level at a time (i.e., at the time of the CST). Next, individual student scores were disaggregated to remove all data for individuals who had not participated in RTI for an entire school year. These data were eliminated as anomalies and representing students who were transient during a school year. Additionally, ELL and EO data were separated into two categories, and each group's data were coded. The data for each grade level in a single year were then combined for the ELL group and the same process was repeated for the EO group and then repeated for the next year's data. Further, a color code was created for data that showed an increase, decrease, or stagnation in reading achievement scores for subsequent data collections that occurred after the initial collection.

## Results

This study was conducted to explore the relationship between English Language Learners' (ELL) reading achievement and their participation in the Response to Intervention (RTI) model. Two years of standardized test data were examined to determine if there was a causal relationship between ELL reading achievement and students' participation in the RTI model. The intent of the study was to determine if test scores suggested a relationship between ELL reading achievement and students' participation in RTI. The results revealed a significant relationship for ELL students who had participated in RTI. Additionally, the data for English Only (EO) students revealed a significant relationship between standardized reading test scores and students' participation in RTI. When examined as an entire group with grade level

eliminated as a factor, there was a significant relationship between a students' reading achievement and their participation in RTI. However, when data were disaggregated and grade levels were used to separate the students, there were no significant relationships noted between a student's reading achievement and the student's participation in RTI.

The data were analyzed using SPSS. A repeated measures in General Linear Model (GLM) was used with statistical significance considered to be  $p < .05$ . The data were collected from an independent third-party database service that stores all test data for the district studied. The data were retrieved from the database and filtered.

When filtering data for the study, only students who had participated in RTI for more than one school year were included. Furthermore, the data were filtered by language designation for each student. ELLs and EOs) were coded to distinguish them within the data. Redesignated Fluent English Proficient students (RFEPs) were included in the study. The students were included with the ELL group. The rationale behind including RFEP students coincides with current California law that requires RFEP students be counted in the ELL population when calculating API (Academic Performance Index) and AYP (Adequate Yearly Progress) until they demonstrate three years of proficiency on the California Standards Test (CST). Since students are typically re-designated after third grade, all students included in the data for this study would also be included in the calculations for the schools' API and AYP score. Of the 296 students included in the study, 22 students, or 7.5% of the total population, were RFEP students. Students who entered the schools mid-year or had not completed a full year of RTI were considered an anomaly and were removed from the collected data.

### *Demographic Information*

The participants from which test data were examined to include in the study were selected based on language designation and a minimum of one year's participation in RTI. In this

quasi-experimental process, convenience samples were collected from naturally formed groups; random sampling was not used. The approximately 296 participants were identified by grade level (i.e., year in school) and language designation. Participants attended two separate school sites; however, scores from both schools were combined and included in the participant group for this study. Consideration was also given to the amount of time a student spent participating in RTI. Students were sorted by number of years participating in RTI.

Although the participant data were combined for all grade levels, the participant group consisted of students who had either participated in RTI starting with the first implementation year, had at least two consecutive years of RTI instruction, or had participated in RTI throughout their time in school. Thus, the matching of participants was reliant upon the criteria of language designation and participation rate in RTI. This type of participant selection ensured control of subgroups and categories such as grade level and language designation through factors. The analysis and impact of these factors are detailed in subsequent sections of this chapter. Since School 1 and School 2 demonstrated a decline in enrollment commensurate with district enrollment rates, the studied population had 61 fewer students in 2011-2012 than in 2010-2011. See summary of data sorted by school and language designation in Table 1.

To determine the existence or lack of existence of a relationship between ELL participation in RTI and reading achievement, a general linear model was used ( $Y=XB+U$ ) incorporated within the model of analysis of variance (ANOVA). The model allowed for multiple measures ( $Y$ ) within the design matrix ( $X$ ) that consisted of parameters ( $B$ ) and accounted for possible errors ( $U$ ). The variability of achievement scores was calculated between groups and within groups. Both the between and within groups designs were discussed when analyzing each research question.

When examining the reading achievement of ELL students who participated in RTI, the variability of achievement scores was calculated within groups. That is, the scores of ELL students were examined for each grade level and each year of CST administration (i.e., 2010-2012).

The average CST English Language Arts (ELA) score for each student was sorted in descending order for each grade level and further disaggregated by grade level and then by language designation. Data from two consecutive school years were examined to determine if a relationship existed between RTI instruction and ELL reading achievement. That is, scores were examined to determine if there was a consistent rise in scores for ELL students based on CST proficiency rates. (For the purposes of the study, consistent was defined as three out of the four grades included in the study.) This study examined CST data for all students who participated in RTI. Student data were used to determine if there was a relationship between RTI participation and reading achievement and to examine the progression of grade-level groups. Continuing the within-group design, the data for ELL students were examined to determine if CST scores demonstrated an increase for the same group of ELL students over time. That is, grade 2 ELL student scores from the 2010-2011 school year administration of the CST were examined in comparison to grade 3 ELL scores in 2011-2012 school year. The within-group design remained consistent with demographic selection (i.e., language designation) and participation in RTI. The design was not meant to serve as a measure of an increase in performance due to an identical repeated measure. In this study, the CST was used to assess if reading achievement as measured by the grade level standards would show a rise in proficiency over time while ELL students simultaneously participated in the RTI model. Students who take the CST are scored on a 600-point scale. Students must earn a minimum score of 350 points in order to be considered

proficient. Therefore, students who score 58% or higher are considered to have demonstrated proficiency on the CST.

Of the test scores collected for students at School 1 and School 2, each grade level showed a different rate of reading achievement when the CST scores were compared within groups. For the purposes of this study, the scores for School 1 and School 2 were combined to create a larger sample in addition to creating a context for the relationship between RTI and reading achievement of ELLs in general. For the analysis of these results from this within-group design, the ELL Grade 2 population for the 2011-2012 school year were excluded, since there were no test data for the 2010-2011 school year. In California, CST is administered for Grades 2-11; therefore, data gathered for Grade 2 students for the 2011-2012 school year was the first achievement data for the subgroup. The within-group design data showed that 2010-2011 Grade 2 students demonstrated a decline in CST scores (M=59%) as Grade 3 students in 2011-2012. However, in 2010-2011 Grade 3 students demonstrated a significant increase in reading achievement scores (M=35.5%) from data gathered for the 2011-2012 CST. That is, Grade 4 ELLs demonstrated increases in proficiency from Grade 3 scores in 2010-2011 and Grade 4 scores in 2011-2012. Grade 5 ELLs demonstrated an increase in reading achievement scores between the 2010-2011 and 2011-2012 school years. Grade 5 ELLs demonstrated an increase from 39% to 66.5% for a total increase of 27.5% in ELL reading proficiency scores.

Scores for CST Grade 2 ELLs showed a consistent score for reported for EO students for the 2010-2011 school years (M=66.5%). Scores for ELLs in Grade 2 showed a mean score that was relatively similar to the EO population of participants (M=69.5%). Thus, more than half of all Grade 2 participants regardless of language designation demonstrated proficiencies on the CST in ELA. Grade 3 CST ELA scores for ELL participants demonstrated a significant decline

for both the 2011 and 2012 CST administrations. Grade 3 ELLs demonstrated an overall decline of 59% in reading achievement scores. ELL student scores for Grades 4 and 5 increased after the Grade 3 decline. That is, the ELL mean score for CST ELA did not fall below the initial Grade 3 declines for the 2011 and 2012 school years. Grade 4 ELL scores for the 2011 and 2012 school years demonstrated a significant increase in proficiency rates (M=35.5%). Grade 5 ELL scores for the 2011 and 2012 school years demonstrated a higher rate of achievement than the initial decline in Grade 3; the data reflect a second increase in proficiency (M=27.5%) for ELLs for the CST ELA administered for 2011 and 2012. Figure 1 shows the participant reading achievement data.

A between-subjects design was used to examine data to determine if CST reading achievement scores were comparable for both the English Language Learner (ELL) and English Only (EO) groups. RTI instruction in the participating school district was delivered within a model that serviced K-5 students regardless of language designation. And all students, regardless of language designation begin taking the CST in Grade 2. In general, EO scores remained consistent from 2010-2012. As shown in Figure 1, Grade 2 students performed about the same from year to year as did students in Grades 3, 4, and 5 with little or no significant change in reading achievement scores for the group as a whole. Grade 2 EO scores for the 2010-2011 and 2011-2012 CST were similar to ELL scores in that there was an insignificant difference between the groups' reading achievement scores. EO students' scores also declined in Grade 3 for both the 2010-2011 and 2011-2012 CST. The data revealed a less significant decline in reading achievement scores for EO students than for ELLs (M=29.5%).

EO students demonstrated a more substantial rebound for subsequent years of reading achievement scores after Grade 3. When considering the difference in scores from Grade 2 to

Grade 3, EO students demonstrated a decline with a mean difference of 29.5%. In comparison, ELLs showed a consistent decline in reading achievement scores from Grade 2 to Grade 3 (M=59%). During each administration of the CST, EO students demonstrated a higher reading achievement rate than did ELLs. The data does, however, reveal a consistent pattern of ascents and declines much like that of ELLs with a final and unique rise in Grade 5 scores for ELLs. Following the above-mentioned decline in the demonstration of reading achievement, EO students demonstrated a significant increase in reading achievement scores. CST data show a mean increase of 37% from Grade 3 to Grade 4 for EO students. This increase in reading achievement scores is nearly identical to the increase revealed in the data for ELLs. Students in the ELL population demonstrated a mean increase of 35.5% from Grade 3 to Grade 4. From Grades 4 to 5, EO data revealed a slight decline in reading achievement scores similar to the data for ELLs. A mean decrease of 7.5% in reading achievement scores was revealed in the data for EO students. Grade 5 ELLs, however, did not show the same type of decline from Grades 4 to 5 as did the EO students. In fact, Grade 5 ELLs demonstrated a 27.5% increase in CST reading achievement scores. Variance and error were estimated within ANOVA and a significant (less than 0.5) correlation does exist between RTI participation and reading achievement scores between groups [ $F(1,216) = 7.40, p < 0.5$ ]. In accounting for the factors of RTI participation and repeated CST reading achievement scores, it can be concluded that there was a significant relationship between the factors of RTI participation and reading achievement scores within groups. While ELL and EO participants participated in RTI for the same amount of time, the reading achievement scores did not demonstrate the same rate of reading achievement for both groups. Table 2 shows the general linear model between group data.

When accounting for the data demonstrating a decline in proficiency and therefore reading achievement, the EO students showed a larger percentage of recovery at a faster rate than did ELLs. That is, though both groups' data showed a decline in Grade 3, EO students showed higher scores, yet ELLs showed larger gains in scores. Therefore ELLs demonstrated a larger increase in the number of students demonstrating reading achievement in a shorter amount of time in Grades 4 and 5. This can be accounted for in the pattern of ascents and declines the EO students demonstrated consistently throughout test years and grade levels. Though the EO and ELLs began their CST reading achievement with relatively similar scores and demonstrated a similar pattern of declines and increases in scores, the EO population outscored the ELL population in each grade level for both the 2010-2011 and 2011-2012 school years. However, the results of this study indicate that though the EO population received an overall higher score, the ELL scores grew significantly faster as ELLs spent more time participating in RTI. The interaction between factors for the between groups design qualifies the notion that reading achievement is modified by language designation and participation in RTI. See figure 2 for data between groups design.

## Discussion

The Response to Intervention (RTI) model was and is designed to assist all students, identify learning disabilities early, and prevent the failure of struggling learners. Studies have shown that schools that formally implement RTI do so with fidelity. RTI emphasizes a strong core curriculum and intervention for all students. To be successful, the model should be formally in place throughout a school (Berkeley et al., 2009). There are relatively few studies that show a

relationship between RTI and English Language Learners (ELLs). The purpose of this study was to examine the relationship between students' participation in the RTI model and ELL reading achievement.

Because the ELL population was over-represented in special education, and ELLs were often incorrectly identified as needing special services rather than differentiated teaching or intervention, RTI was presented as a solution to this problem (Ross & Begeny, 2011). Linan-Thompson and Ortiz (2009) describe RTI as an alternative to special education for ELL students. As an alternative, RTI provides all students with necessary intervention or enrichment instruction that works to promote student success (Haager, 2007; Orosco & Klingner, 2010).

The RTI model attempts to meet the target for effective instruction by providing a comprehensive school-wide system that encourages early intervention for those students who experience difficulties in learning to read, regardless of their language background or school history (James, 2004). With RTI as the school-wide intervention model, schools began shifting their focus from one teacher's results with one group of students to the success of all students being taught through a collaborative effort by all teachers. Through these efforts, evidence of a systematic attempt at narrowing the achievement gap and increasing students' chances for long-term success emerged (Fien et al., 2011).

RTI significantly impacts schools on multiple levels. Schools have been economically impacted in the fulfillment of both the staff development and supply accrurement demands that are posed by such an intervention (Murawski & Hughes, 2009). Federal regulations require RTI to function as a step between the general education classroom and the special education classroom. Schools that use the RTI model and provide intervention to students had to face

several changes to institutionalize practices and make curricular adoptions, including implementing and sustaining the model (Murawski & Hughes, 2009).

The results revealed the relationship between reading progress for ELLs and their participation in RTI. Scores for students were collected over the course of two years. The CST scores were then examined for each individual school. The overall combined scores were also examined. The results for ELL and EO students were reported separately in this study to provide a context for relationships between RTI participation and ELL reading achievement revealed by the data collected.

Review of the CST scores for ELLs over two years indicated a significant relationship between ELL student participation in RTI and reading achievement. Scores for ELLs demonstrated different results at the two schools participating in this study. English Language Learners demonstrated the same pattern of declines and increases at both schools, and when the scores for ELLs at both schools were combined, the results showed a significant relationship between ELL participation in RTI and reading achievement. ELLs at both school sites demonstrated a high rate of reading proficiency with the first administration of the CST in Grade 2. The second administration of the CST showed a steep decline in reading proficiency for Grade 3 ELLs. A similar pattern for Grades 4 and 5 showed that ELLs recovered from the decline in Grade 3 reading achievement scores; however, scores for ELL reading achievement never returned to the initial high rate of reading proficiency scores in Grade 2.

It was hypothesized that ELLs would demonstrate a faster rate of reading achievement than ELLs who did not participate in RTI. The district that participated in this study did not have a school population that did not have RTI instruction. RTI instruction in the participating school district was delivered within a model that serviced K-5 students regardless of language

designation. Although this study did not include students who did not participate in RTI, this study demonstrates reading achievement results that exceed current research on ELL reading achievement. According to Genesee, Leary, Saunders, and Christian (2005) ELL students take several years (at least 3-5 years) to acquire the language necessary to be literate. The study by Genesee et al. (2005) also provides a correlation between ELL academic language acquisition and the demonstration of reading proficiency.

The schools studied adopted identical semi-scripted programs that focused on academic vocabulary acquisition. A significant relationship between ELL reading scores and participation in RTI can be identified from the data in this study. ELL proficiency scores for Grade 2 students in both the 2010-2011 and 2011-2012 school years were scores belonging to students who had also received RTI instruction for at least two full years. This group of students demonstrated an overall proficiency rate of 69.5% in English Language Arts. The high proficiency rate combined with the differentiated and targeted instruction provided by the RTI model demonstrated a relationship between the two factors for Grade 2 students.

Contrary to the findings of Genesee et al., the Grade 3 students did not demonstrate a growth in reading proficiency, though they received an additional year of RTI instruction using the same model with the same curricula as all groups included in the study. Despite acquiring an additional year of reading intervention focused on vocabulary, the Grade 3 ELL group demonstrated the most significant decline in reading achievement of any of the ELL groups included in the study.

Research has shown that this type of decline in reading coincides with the fact that in grades kindergarten through Grade 2, students *learn to read* and in Grades 3 and beyond, students *read to learn*. In California, students in Grade 2 have portions of the test read to them

by the teacher or proctor. While the Grade 2 administration of the CST is the students' first exposure to a standardized test, reading skills are put in to practice by individual students through vocabulary application and comprehension skills that must be demonstrated by answers provided individually. The extra scaffolding in Grade 2 for standardized testing, and the drastic change in Grade 3 where students must read the entire test on their own, accounts for the drastic decline in reading achievement proficiency scores.

The results for CST administrations during the 2010-2011 and 2011-2012 for Grades 4 and 5 ELLs indicated that students recovered from the initial decline in third grade. After participating in the RTI model from five to six years, ELLs demonstrated a high rate of student achievement. In Grades 4 and 5, students demonstrated a rate of reading proficiency that was higher than Grade 3 reading proficiency. By Grade 5, students demonstrated a rate of proficiency that was within 3% of the Grade 2 rate of proficiency. The reading achievement by ELLs demonstrated a reading proficiency rate that was similar to the Genesee et al. (2005) study, in that it demonstrated the highest rate of reading achievement with the most difficult reading contained within the CST for Grades 2 through 5. ELLs who have had the most academic support for acquiring reading skills demonstrate a reading achievement rate of 66.5%. With more than half of the study's population included in demonstrating reading growth, the results can be considered significant.

Overall, students designated in both the ELL and EO student groups demonstrated a similar pattern of increases and declines in reading achievement. Though the patterns were similar and the EO group began with the Grade 2 administration of the CST demonstrating a 66.5% of proficiency, the results for EO students were not the same as those for ELL students.

It was hypothesized that ELLs who participated in RTI would show a lower rate of reading improvement than their EO counterparts. Though language acquisition is often an indication for reading achievement, ELLs did not demonstrate a slower rate of achievement to acquire a score on the CST that demonstrated reading achievement (Genesee et al., 2005). EO students also demonstrated a significant decline in test scores in Grade 3. In spite of this decline, like the ELL population, the EO population showed a recovery in scores for Grade 4. The EO population, however, did not demonstrate a faster rate of reading achievement because the EO group of students did not continue to consistently increase reading achievement scores after Grade 3. The EO group showed a consistent pattern of increases and declines that did not mirror that of the ELL population. Therefore, with consistent increases in reading achievement, ELL students demonstrated reading achievement while participating in the RTI model at a faster and more consistent rate than their EO counterparts. EO students ultimately earned higher scores in each grade level. This can be attributed to their advantage of learning in their primary language. Whereas, ELLs often acquire vocabulary and ability of thinking skills as well as meta-cognition first to their learning before demonstrating proficiency.

### *Limitations*

Because this study was conducted in a district that served a largely homogeneous community, when discussing ELL achievement, this study addresses students with Spanish as a first or native language. There is room for future study regarding students from various language backgrounds. The relationship between ELL speakers and their participation in RTI has not yet been widely researched as a study that categorizes the relationship by native language and differences in acquiring language.

Further limitations of this study included the size of the district that participated in this study. The study was conducted in a district comprised of only seven elementary schools, however, only two schools were selected for participation in this study. The geographic area served by the district contains a relatively homogeneous population, with little variation in socioeconomic status. Students with special needs and middle school ELLs, although receiving reading intervention outside of the RTI model, were not included in this study. The ELL population studied was limited to general education, native Spanish speakers in the primary grades. Students with RFEP language designations were included in the ELL population for this study because their CST scores are counted as part of the ELL subgroup for approximately three years after being reclassified. Excluding RFEP students from this study could yield a different depiction of reading achievement for both ELL and EO students. Because the focus was on reading, other subjects commonly addressed in RTI, such as math, were not studied. These limitations affect the generalizability of the findings. Limitations also include examining the relationship between RTI and ELL reading achievement over a period of two years. A greater length of time is needed to monitor changes in achievement, trends, and patterns in CST reading scores for ELLs.

### *Implications*

Students who are English Language Learners and also participants in the RTI model demonstrate a relationship between their participation in RTI and reading achievement. ELLs consistently showed reading progress in the grade levels that participated in RTI and measured for progress by the CST. The results of this study suggest that ELLs who participate in RTI involving target literacy instruction focused on vocabulary acquisition, acquire proficient reading skills at a rate commensurate with or more quickly than the three-to-five-year time period

indicated in previous research (Genesee et al., 2005). School administrators can use the results of this study to guide their RTI model implementation. To support effective implementation practices for RTI, school administrators can use the descriptive data found in this study to consider possible RTI implementation options. Furthermore, administrators can refer to this study when evaluating the consistency of school-specific reading interventions and determine if consistency is effectively influencing ELL instruction.

The results of this study indicated that RTI was a beneficial practice for ELLs. Further study is needed to address the decline in test scores for both ELL and EO students in Grade 3. District administrators can use the results of the study to address curricular needs for ELLs during the first year of schooling between the scaffolded Grade 2 administration of the CST and the independently read Grade 3 administration of the CST.

#### *Recommendations for Practice*

Based on the findings of this study, it is apparent that many more years of research are needed to examine the effects of RTI. This study covered the span of two school years. There was and is clearly a need for longitudinal data on reading achievement for ELLs participating in RTI. By conducting the study during a lengthier frame of time, more data would be provided. With longitudinal data, administrators could examine changes within test scores over time to determine whether existing patterns could inform teaching practices.

Two schools were selected to participate in this study. Though the participants in this study could be considered marginalized for a variety of reasons, further study is needed. Further study of RTI could better inform teaching practices of ELLs if a consistently implemented RTI program were established and studied within a larger school district or a larger number of schools. By examining a larger sample from a larger number of schools, a slightly less

homogeneous population might be studied. This study included participants who were of the same race and socio-economic background with little difference in demographics. Including a more diverse sample from a variety of schools will allow researchers to reduce bias in a study. A study of a more diverse sample would also inform school administrators about how RTI affects different groups of varying backgrounds. Although ELLs are considered a marginalized population, further study on RTI could include students in special education classroom settings and exclude RFEP student performance. Students with RFEP designations, as mentioned previously, though no longer considered ELLs, are monitored and counted in the ELL population for three years when it comes to CST test scores. Including data from students in special education and excluding RFEP students would allow school administrators to evaluate the relationship between the tier system and student progress.

A further study of RTI could examine the relationship between reading achievement and participation in RTI and older students. This study included only participants from a K-5 school setting. Reviewing the reading achievement scores of middle school students would provide more data on RTI participation and the possible effects on reading achievement with middle school students. Currently, most research on RTI focuses on early intervention in the primary grades. The need for RTI, however, exists beyond the elementary school setting and could inform school leaders by providing a longitudinal understanding of reading intervention for all students.

The acquisition of literacy skills in primary grades is a complex process; therefore, teaching knowledge and strategies should be acquired and implemented in a way that captures the variation and intricacy of skills required for these complex tasks. As noted by Adams (1990), there should be a systematic approach to reading instructional practices if our goals as researchers, educators, and parents are to improve reading skills and develop long-lasting interest in reading for students. Since the passage of the No Child Left Behind Act of 2001, appropriate reading instruction to alleviate reading deficits in primary grades has been the main focus of reading research studies (Fehr et al., 2012; McMaster, Fuchs, & Fuchs, 2007; Meisinger, Bloom, & Hynd, 2010; Mesmer, 2005; Morrow, 2001; Morrow, 2012; Pullen, Lane, Lloyd, Nowak, & Ryals, 2005; Simpson, 2005; Stichter, Stormont, & Lewis, 2009; Thames et al., 2008; Yeh, 2003). An early report of the National Research Council (1998) identified three fundamental problems in the acquisition of required reading skills in primary grades: (a) difficulties in understanding and using phonics to gain fluent and accurate word reading skills, (b) a failure to obtain early literacy skills and needed strategies for the comprehension of written text, and (c) the absence of the initial motivation to read. Based on thirty years of research, the National Reading Panel (2000; 2012) currently supports five strands of effective reading instruction (phonemic awareness, phonics, fluency, vocabulary, and comprehension) to address these three fundamental problems. These five strands are known collectively as the *Big 5 Ideas*.

In 1997, the National Reading Panel (NRP), comprising a group of reading experts, was called upon by the United States Congress to closely examine the necessary elements of effective literacy instruction in response to increasing reading deficits in primary grades (NRP, 2000; 2012). As a result, the NRP agreed upon and finalized five strands of effective reading instruction: (a) phonemic awareness, (b) phonics, (c) fluency, (d) vocabulary, and (e)

comprehension. First, phonemic awareness involves the ability to focus on and manipulate individual sounds in spoken words. As suggested by Burke, Burke, and Crowder (2006), phonemic awareness instruction should be emphasized in kindergarten and first grade. By the middle and toward the end of first grade, students should be able to read connected text. Second, phonics refers to the ability to match sounds to letters and use this knowledge in reading. Third, fluency involves the ability to read connected text with speed and accuracy. Fourth, vocabulary refers to the ability to understand and use words. Olson and Gee (1991) concluded that young readers usually have difficulties understanding daily reading because of their lack of word recognition in print. Fifth, comprehension involves the ability to acquire meaning from text.

First grade teachers play a critical role in shaping the foundation for early literacy skills acquisition of primary students. Past research studies have indicated that primary students whose teachers followed the *Big 5 Ideas* to teach reading had higher reading abilities when compared to other students. The purpose of this current research was to address a gap in the literature by examining first grade teachers' perceptions of the *Big 5 Ideas*, their levels of knowledge of the literacy concepts, the frequency with which these teachers use their knowledge of the *Big 5 Ideas*, and the possible influence of the use of the *Big 5 Ideas* on their routine reading instructional practices. A mixed methodology of cross-sectional and observational design was used in this research, which consisted of two phases. Phase One was conducted using a developed questionnaire that was composed of necessary components of the *Big 5 Ideas* in reading instruction to be completed by the 780 selected first grade teachers. Quantitative data were collected through an established online survey company (Qualtrics) and analyzed using descriptive statistics, one-way multivariate analysis of variance (MANOVA), and one-way analysis of variance (ANOVA). Phase Two was completed using a developed observational

checklist and visual analysis (i.e., five research assistants observed and collected qualitative data from five selected first grade classrooms).

The findings related to Phase One of this research indicated: (a) universal agreement on the importance of implementing the *Big 5 Ideas* in daily reading instruction, (b) relatively adequate levels of knowledge of the *Big 5 Ideas* of all first grade teachers, (c) relatively high percentage of implementation of the *Big 5 Ideas* during daily reading instruction, (d) no statistically significant differences between first grade teachers' perceptions of the *Big 5 Ideas* and their degree types, number of years teaching, or types of licensure, (e) statistically significant differences in first grade teachers' implementation of the *Big 5 Ideas* based on the number of literacy courses taken during teacher preparation programs for phonics, vocabulary, and fluency, and (f) no statistically significant differences in first grade teachers' implementation of the *Big 5 Ideas* based on the number of literacy courses taken during teacher preparation programs for phonemic awareness and comprehension.

The findings related to Phase Two of this research revealed that there were strong relationships between the observed first grade teachers' (e.g., teacher one and teacher five) perceptions of the *Big 5 Ideas* and their actual implementation of the *Big 5 Ideas*. Conversely, there were weak relationships between these teachers' (e.g., teacher two, teacher three, and teacher four) perceptions of the above five strands of effective reading instruction and their daily observed reading instructional practices.

During this poster presentation, the presenter will briefly discuss with conference attendees the study entitled "*First Grade Teachers' Perceptions of the Five Strands of Effective Reading Instruction and Their Possible Influence on Daily Instructional Practices*". During the session of this poster presentation, the attendees will be provided with handouts and able to

discuss the results of this study with the presenter on: (a) first grade teachers' perceptions of the *Big 5 Ideas* in effective reading instruction, (b) first grade teachers' levels of knowledge of the *Big 5 Ideas*, (c) the frequency of first grade teachers' implementation of the *Big 5 Ideas* during their actual daily teaching practices, (d) the difference in first grade teachers' perceptions of the *Big 5 Ideas* based on degree types, number of years teaching, or types of licensure, (e) the difference in first grade teachers' implementation of the *Big 5 Ideas* based on the number of literacy courses taken during their teacher preparation programs, and (f) the relationship between first grade teachers' perceptions of the *Big 5 Ideas* and their actual implementation of the *Big 5 Ideas*.

## **A Question of Identity: Mirrors as a Tool for Self-reflection**

**Presented by Dr. Susan Ridley**

This study was a starting point to clarify or (re)discover adolescent's sense of self identity. The question of identity is fundamental to everyone and informs values, decision making, and quality of life. For adolescents, who are negotiating the developmental growth from childhood to adulthood, it is especially important to gain a sense of self, and direction in life. How can expressive arts therapies connect to one's spiritual self; to the inner core of one's being? Can the creative process transform negative life experiences into life affirming opportunities for high school students? *The Mirror Project*, which utilized mirrors as a tool for self-reflection, was a qualitative study on the question of identity, "Who am I?"

This fundamental question has been pondered through the centuries by enquiring minds searching for answers to the meaning of life. Exploration of these concepts is vital in dealing with activities of daily living and are essential components of psychological well-being, and determining factors in the formation of coping skills and resiliency to life's challenges. A strong foundation and belief in one's identity, meaning and purpose in life, as well as spiritual convictions may help turn negative experiences into opportunities for growth (Ryś, 2009). Adolescents who have a strong sense of self can be a protective factor in resisting peer pressure and involvement in unwanted behaviors such as bullying, vandalism, or self harm (Guerra & Bradshaw, 2008). The addictive pleasures of alcohol, tobacco, and other drugs are less likely to attract those with a clear idea of who they are (Griffin et al., 2001).

In philosophy, the concept of self-realization extends back to the Hellenic tradition of eudaimonism, most notably presented in *Nichomachean Ethics* by Aristotle (trans. 1999). In eudaemonist philosophy, the daimon or *true self* refers to the unique potentialities of each person, the realization of which represented the fulfillment of one's destiny (Norton, 1976). A search for identity was an effort to identify those potentials that corresponded to the real self (Waterman, 1993). Self-realization was also central to the work of Spinoza and the existentialists, such as Heidegger and Sartre (Stevenson & Haberman, 1998; Waterman, 2004) and in psychology, self-realization was conceptualized by a number of personality theorists including Horney (1950) who wrote of the real self "as the central inner force...which is the deep source of growth" (p. 17). Erikson (1994) believed that the final task of human development was an understanding of all one's achievements and experiences resulting in integrity of the self. He wrote that "In the social jungle of human existence, there is no feeling of being alive without a sense of identity" (Erikson, 1968, p. 38).

In *The Mirror: A History* (2001), Melchior-Bonnet felt that "The mirror, 'matrix of the symbolic,' accompanies the human quest for identity" (p. 4). Mirrors have been featured in folklore, religion, magic, science, art, and literature. They have appeared in a myriad of forms and usage that have included revealing, hiding or distorting reality, as a communication device, weapons of war, to search the stars, to ward off evil spirits, for divination, or as a treasured possession in the after-life (Giles & Joy, 2007; Melchior-Bonnet, 2001; Pendergast, 2003). The proliferation of mirrors as metaphors abound in therapeutic literature, philosophy and psychoanalytical texts implying that the reflected image, either real or imaginary, may provide insight in a clinical context (Gormley, 2008; Weinberg, 2004). For Haglund (1996), "Part of the

power of the mirror metaphor is that the single image captures many aspects of human development and human experience” (p. 226). Shengold (1974) believed that the mirror was a metaphor for the mind which reflected the image of self and others. Pines (1984) described mirroring in group psychoanalysis as a process of objective self-reflection. In western philosophies, the psyche is seen as a mirror of reality, while in Buddhism, it is the world that mirrors back who we are in all aspects of our lives (Bolen, 2005; Nhat Hanh, 2006).

This paper will focus on the results of a high school freshman survey ( $N = 337$ ) of an exhibition of mirrors that were created in expressive arts therapy groups around the question of identity, who am I? Several themes emerged from the data collected from the freshman survey including (a) expressing oneself, (b) inner feelings, (c) the social norm, and (d) hope for the future. An analysis of the high school freshmen surveys indicated that the majority of participants viewing the mirrors found that reflecting on the question of identity in the exhibition was helpful and that students felt connected to others on sensitive issues and concerns. Teens often feel that they are alone in their suffering and this exhibition was intended not only to help students pause and reflect on their identity, but to show that others felt the same way. Results indicated that mirrors have the potential to bridge the metaphysical barrier and connect us to our most inner thoughts. This clarity of vision can assist in creating the foundations for identity, meaning and purpose in one’s life.

There is a wealth of research on the therapeutic use of mirrors in cognitive, emotional, and physical therapies as well as a proliferation of mirrors as metaphors in therapeutic literature, philosophy, and psychoanalytical texts. Although there is no research data on the specific use of mirrors as a self-reflection tool, the results from this limited study indicated that mirrors can be used to connect to ones inner thoughts and feelings on the topic of identity not only during the creation process, but also as a reflection for those viewing the mirror exhibition. This result is similar to Waterman’s (2004) study that concluded that personal expressiveness had a strong association to identity formation, and the development of one’s potential and purpose in life. Waterman also felt that these activities were likely to involve connection to others and lead to better identity options.

Title: The Practicality of Using Movies and TV series to Motivate Learning  
Autonomy in an English Speaking-Listening Class

Topic area: ESL/TESL

Presentation format: Paper Session

Description: The presentation will start with the small-scale study in terms of how I carried out the study and what students were expected to do during the period of study. Following that, I will focus on the results of pre-test and post-test and two questionnaires, and discuss the findings of the study and the shortcomings of the research design. The presentation is open to participants' suggestion and comments.

## **Abstract**

The notion of collaborative learning and teaching in foreign language education has been popular for decades. The learners are believed to learn best if they learn through the conscious or unconscious internalization of their own or observed experiences which build upon our past experiences or knowledge. There is an assumption that the learning that can result from the experience, if the activities are manifested ‘properly’ (Moon, 2001). Within this concept, the role of teachers as collaborators in the teaching and learning process represents a change to traditional educational patterns. Moreover, increasing numbers of instructors are realizing the importance of motivating learning autonomy among students in EFL (English as a Foreign Language) classrooms. In this small-scale study, students were asked to watch a movie and a TV episode every week for ten weeks and write reflection sheets. A pre-test and a post-test were applied to analyze students’ English attainment. Two questionnaires were used to explore students’ reflection on learning autonomy and learning attainment. In this paper, attention is first paid to consider to what extent the concept of a teacher as a collaborator can be applied to the university EFL classes in Taiwan, and how to motivate EFL learners’ autonomy. Then, the theoretical grounding of the concept and the characteristics of a teacher as a collaborator is discussed. Following this, the English education contexts in Taiwan is highlighted in order to consider how far this concept can be achieved. Finally, conclusions will be drawn from this small-scale exploration.

ABSTRACT

This paper discusses the findings of a phenomenological study regarding methods of successful transition of students from the classroom to the workplace. Results of interviews from working managers and college graduates include information on what specific skills are required, what learning environments are appropriate, and the cognitive skills that result in creative and innovative thinking. Seeking opportunities to transfer the learning that occurs in schools into companies require that teachers and managers collaborate to create a bridge for postsecondary students.

## ABSTRACT

**INTRODUCTION** Extensive research has established the importance of physical activity and its role in the prevention of lifestyle-related diseases. Further, the workplace can be an effective arena for health behavior change, like increasing physical activity time. Limited research has investigated the effects of university worksite wellness programs on perceived stress and physical activity levels. The purpose of this study was to examine perceived stress scores and physical activity levels of university faculty and staff before and after a 4-week walking competition sponsored by the university.

**METHODS** The research study was a pre/post design. Before the start of the walking competition, 47 participants completed the Perceived Stress Questionnaire (PSQ), and the International Physical Activity Questionnaire (IPAQ). Following the 4-week competition, 45 participants returned and completed both the PSQ and IPAQ. **RESULTS** The results indicated that there was no significant difference ( $p > .05$ ) in perceived stress score before ( $M = 0.24 \pm 0.30$ ) and after ( $M = 0.18 \pm 0.26$ ) the walking program. There were significant differences ( $p < .05$ ) in days of moderate physical activity per week before ( $M = 2.34 \pm 2.00$ ) and after ( $M = 3.08 \pm 2.22$ ) the competition. There were significant differences ( $p < .05$ ) in vigorous activity days per week before ( $M = 2.11 \pm 1.91$ ) and after ( $M = 2.82 \pm 2.30$ ). There were also significant differences ( $p < .001$ ) in walking days per week before ( $M = 4.37 \pm 2.31$ ) and after ( $M = 5.87 \pm 1.74$ ) the competition. **CONCLUSION** Overall, a 4-week walking competition had no effect on perceived stress. However, it was effective in increasing physical activity levels among university employees. Areas for further researcher would include evaluating a worksite health promotion program of longer duration and its effect on perceived stress levels.

## **Assessing Curricular Alternatives: Graded Readers and EFL Learning Motivation in Non-English Majors**

### **Abstract**

This study set out to evaluate the impact of instructional materials on the English as a Foreign Language (EFL) learning motivation of a specific population of learners. More specifically, it sought to evaluate how the use of graded readers, used in conjunction with online learning and The Moodle Reader Module, impacted the EFL learning motivation of Japanese engineering majors. Following a semester-long online course, a questionnaire consisting of four scales adapted from Keller's (2010) Instructional Materials Motivation Survey (IMMS), and open-ended items, was administered to a sample of 230 learners. Results revealed positive endorsement of attention, relevance, confidence, and satisfaction scales. The open-ended items also revealed an overall positive endorsement of graded readers and were valuable in providing descriptive insights into the results of the IMMS. The study concludes by summarizing possible implications of using graded readers with this particular population of learners, and suggests avenues for future research.

### **Introduction**

In today's globalized world, English as a Foreign Language (EFL) instruction has expanded commensurate with the increasing perceived importance of English as the international language of business and commerce (Crystal, 2003; Mok, 2006). One result of this expansion has been an increase in English

instructional hours across all educational levels in countries such as Japan (Fujimoto-Anderson, 2006). In terms of tertiary education in that country, this has resulted in a rising number of EFL classes across all majors and fields of study. For learners pursuing advanced degrees or licenses in areas such as engineering, such foreign language requirements can be perceived negatively; as an unwelcome burden that distracts from primary academic goals (Jacques, 2001; Koga, 2010; Kuwabara, Nakanishi, & Koma, 2005). In such instances, mandatory English education can be perceived as adversarial, and therefore may not be willingly embraced by learners. This outlook, combined a number of cognitive and affective variables observed to contribute to demotivational states in Japanese tertiary EFL learners (Berwick & Ross, 1989; Burden, 2002; Falout & Maruyama, 2004; Saito, 2007), represents a particular challenge to EFL educators teaching engineering and science majors in Japan.

While a great deal of research has been conducted into the characteristics of Japanese learners' EFL learning motivation (see Johnson, 2009), little inquiry has been directed toward how particular curricular interventions can influence and affect learners' motivational states. One area which holds significant potential, and which instructors have some degree of control over, is the content of instruction. Instructional content, particularly instructional materials, has been identified as having potentially motivating and demotivating influences on learners (Chambers, 1998, Falout & Maruyama, 2004; Gorham & Millete, 1997; Peacock, 1997). The demonstrated importance of this classroom variable suggests that its augmentation might provide a possible direction for instructors seeking to improve motivational engagement in learners.

It is particularly difficult for educators to find instructional materials that are consistently motivating and effective for a wide range of learners. The recent development and expansion of graded readers series and extensive reading resources, and the plethora of research that has accompanied their increased use (see Day & Bramford, 1998 and Krashen, 2004 for summaries), have rendered these materials and approaches reliable and proven options for foreign language instruction. The use of graded readers in extensive reading environments has

demonstrated that they not only improve learners' reading speed and proficiency (Bell, 2001; Constantino, 1995; de Morgado, 2009), but are an efficient means for implicit acquisition of vocabulary and grammar structures (Horst, 2005; Horst, Cobb, & Meara, 1998; Waring, 2009; Webb, 2005). In addition to these language learning outcomes, learners' attitudes towards, and degree of enjoyment and interest in, reading have been shown to improve when using these materials and approaches (Al-Homoud & Schmitt, 2009); Cho, & Krashen, 2001; Dupuy, 1997). Similar positive results have been observed with Japanese learners using graded readers and taking part in extensive reading programs (Critchley, 1998; Forrest, 1997; Hayashi, 1999; Iwahori, 2008; Mason & Krashen, 1997; Powell, 2005; Robb & Susser, 1989; Tanaka & Stapleton, 2007).

### **Motivation and extensive reading**

In addition to the benefits discussed above, ER has also been identified as contributing to motivation in learners. Motivation has been identified as an important individual difference in language learners (Dörnyei, 2006; Oxford, 1992; Skehan, 1991), and appears to play a particularly important role in L2 reading (Brantmeier, 2005; Gee, 1999; Grabe, 1991). In terms of extensive reading, an early study by Elley (1991) reported that motivation appeared to accompany improvement in reading proficiency and attitudes in "book flood" programs in Fiji. She observed that an increase in intrinsic motivation appeared to stem from learners' experiences selecting and sharing picture books with others. A high state of intrinsic motivation, or "flow", was also observed in readers by McQuillan and Conde (1996) who reported that texts that were perceived to be interesting, or to have personal or intellectual value, were particularly effective in promoting optimal engagement in learners. In a study expressly examining the motivational and attitudinal impact of extensive readers in Tunisian EFL students, Maamouri Ghrif (2003) revealed that ER was particularly effective in promoting initiating motivation in learners. However, the interest value of reading resources and program structure were important factors in sustaining motivation over a five-semester reading program. In a more recent study, Arnold (2009) observed

motivation accompanying an increase in confidence in learners reading in a modified ER program for German as a FL in the United States. Interviews with readers participating in the study revealed that some became motivated to read independently outside of class assignments. A similar outcome, with ER affecting learners positively in terms of motivated autonomous learning, was revealed in Hitosugi and Day's (2004) examination of JFL learners' in the United States.

Extensive reading has also been demonstrated to positively affect language learning motivation in Japanese EFL students. Yamashita (2007), in an examination of the effect of L1 to L2 reading attitude transfer in Japanese university students, revealed that while reading attitudes do in fact transfer from L1 to L2, reading abilities and strategies do not. An implication of these findings was that motivation could be positively affected by positive attitude transfer and accompanying proficiency gains, while students with poor L1 reading attitudes would be harder to motivate. In a qualitative longitudinal case study examination of two Japanese middle school students taking part in an ER program Nishino (2007) demonstrated the dynamic nature of reading motivation. Specific causes of fluctuations in motivation were identified as: achievement, the pleasure or flow of reading, confidence, independence orientation, content interest, preferences in terms of authentic texts, and other academic pressures (such as entrance exams). Nishizawa, Yoshioka and Fukuda (2010), in examining the effects of a four-year ER program on students at a national technical college, reported that ER lead to significant improvement in English proficiency only after 2-3 years of reading simple stories, demonstrating a minimum threshold of 300,000 words for improvement. The participants, who were described as "reluctant readers", were shown to be motivated by reading graded readers they perceived to be interesting and easy.

### **Study overview**

The demonstrated value of ER in improving reading proficiency and promoting learner motivation resulted in it being selected in a modified form for trial in the EFL reading course being examined in this study. The institution in

which this study took place was an engineering university in Japan where students were perceived to be reluctant EFL learners in need of more motivationally stimulating curricular content. The trial course was structured around the use of graded readers in conjunction with the Moodle Reader Module; an optional add-on to the open-source Moodle course management system consisting of quizzes for thousands of graded readers from all major ELT publishers. In this semester-long trial EFL reading class students were required to check graded readers out of the school library, and then take quizzes on a weekly basis in the school's computer lab. Students were evaluated on the total number of words read from quizzes that were successfully passed. The present study describes the results of a formal retrospective evaluation of the materials used in the course. It was hoped that this formal evaluation would provide insights into the value of such a program, and into how it might be improved in the future. The following research questions are reflective of these overall goals:

RQ1: How did the use of graded readers and the online evaluation system affect learner motivation?

RQ2: How did learners generally perceive the use of graded readers and the online evaluation system?

RQ3: How did the characteristics of specific graded readers affect their appeal to students?

## **Methods**

### **Data collection and analysis**

Data collection for this study was carried out with a questionnaire comprised of an adapted version of Keller's (2010) Instructional Materials Motivational Survey and additional open-ended items (see Appendix 1). The IMMS was originally designed to measure attitudes, relevance, confidence, and satisfaction components of instructional materials according to Keller's ARCS

model of motivation. Since its creation, the instrument has proven to be flexible enough to be adapted and used to evaluate instructional materials across a wide range of settings and disciplines (Bollinger, Supanakoorn, & Boggs, 2010; Corbalan, Kester, & Van Merriënloer, 2009; Jakobsdóttir & Hooper, 1995; Pittenger & Doering, 2010; Rodgers & Winthrow-Thorton, 2005). The questionnaire designed for the current study retained the four main variables of the original IMMS, but the items were rewritten and scales adjusted to better assess the specific characteristics of graded readers. This adapted version of the IMMS was piloted with a sample of thirty ( $n=30$ ) students at the same institution where the main study was targeted to take place. Cronbach's Alpha for each scale indicated good internal reliability (Confidence:  $\alpha=.75$ , Attention:  $\alpha=.76$ ; Relevance:  $\alpha=.78$ ; Satisfaction:  $\alpha=.81$ ) according to the .70 threshold suggested by Dörnyei (2003). Due to its satisfactory internal reliability, the IMMS portion was used without further revisions. An additional section of open-ended items was added to the questionnaire in order to obtain learner feedback on their impressions of graded readers and the online system, and the specific characteristics influencing perceptions of graded readers. An open-ended format was chosen for these items due to the range and variability of responses it can elicit. It was hoped that such data would provide deeper insights into the range of impressions and characteristics that contributed to learners' experiences using the graded readers and the online evaluation system.

The questionnaire was administered in the final week of a fifteen-week semester and required approximately ten minutes to complete. A total of 230 questionnaires were collected, of which 219 ( $N=219$ ) were retained for analysis. Questionnaires that were discarded were those that were either incomplete or not appropriately filled out. Of the questionnaires retained for analysis, all had completed IMMS sections, while open-ended items were filled out selectively by participants. IMMS results were then entered into Predictive Analytics Software (PASW) version 18 to derive descriptive and inferential statistics. Open-ended item responses were translated into English, and responses to each item were coded and separated into themes. Following first round coding, themes were

revised and re-organized with input from a colleague.

## Participants

All participants were second-year Japanese engineering majors with specialties in chemical and mechanical engineering. A total of 230 (n=230) students filled out questionnaires, although the data represents responses from 219 (N=219) completed questionnaires. The participants were of mixed English ability, although the majority was at a low intermediate reading level. The reading class represented one of eight mandatory EFL classes students were required to complete as part of their general humanities requirements for their Bachelor of Engineering degrees.

## Results

### IMMS scales

Results of the IMMS indicated positive overall endorsement of the four scales used in the questionnaire. The most highly endorsed scale was Satisfaction (SAT), with a mean of 3.41 derived from the five-point Likert scale items. This was followed by Confidence (CON) (M=3.32), Attention (ATT) (M=3.29) and Relevance (REL) (M=3.20). The Cronbach's alpha for each scale (CON  $\alpha$ =.667; ATT:  $\alpha$ =.78; REL:  $\alpha$ =.78 and SAT:  $\alpha$ =.79) indicated good internal reliability for each. While SAT was the most highly endorsed overall, its average range of 2.86 to 3.86 indicates a range of variability in responses.

Table 1: Graded reader IMMS scale summary

	n of items	n	$\alpha$	m	min	max	range	variance
CON	7	219	.667	3.32	3.04	3.61	.571	.053
ATT	10	219	.807	3.29	3.04	3.61	.580	.044
REL	7	219	.784	3.20	2.71	3.45	.744	.056
SAT	6	219	.792	3.41	2.86	3.83	.968	.143

Results of individual IMMS items are provided in Table 2. The two most highly endorsed items were from the SAT scale (SAT5 m=3.83; SD= .99; SAT 6

m=3.75; SD=.98), this was followed by the confidence item CON4 (m=3.61 SD=1.01) and the attention item ATT5 (m=3.61; SD=0.97). The four least endorsed items were REL3 (m=2.71; SD=.95), SAT2 (m=2.86; SD=1.06), ATT8 (m=3.03; SD=0.81) and CON2 (m=3.04; SD=1.02).

Table 2: Graded reader IMMS item summary

	n	M	SD	var.	item response frequency (%)

### Correlations between scales

The direction and strength of relationships between scales was investigated using Pearson product-moment correlation coefficient. Results indicated positive correlations between all scales (Table 3), with correlations falling between the  $r=.50$  to  $r=1.0$  range being indicative of a strong positive

relationship (Cohen, 1988). These findings reflect the high correlational relationships between IMMS scales observed in other studies (Keller, 2010).

### Open-ended item results

#### Overall impressions of graded readers

The first open-ended question was: “How did you feel about using graded readers?” A total of 196 responses were received for this item. The majority of responses were positive (74%: n=149), while 27, or 13.7%, were negative. The remainder of responses were either mixed (n=12: 6.1%), with students expressing mixed positive and negative feelings, or ambivalent (n=8: 4%), with such participants expressing that they had no particular feelings using graded readers.

The overwhelmingly positive results produced a number of specific reasons why graded readers and the online reading course were perceived positively by learners. The most frequently (n=22) cited positive reason was the level of improvement students experienced. Sample responses from this category included: “It was very difficult at the beginning, but I got better at reading from the middle of the semester” (S63). This was followed by the selectivity aspect of the course (n=21), where learners expressed positive feelings about being able to choose their own books. An example of this kind of response was “I thought it was good, choosing books that matched my interest and level” (S110). Receiving the same number of responses (n=21) was “enjoyment”, with learners stating that using the graded readers was an enjoyable experience. A sample of this type of

response was “It was really fun, I enjoyed reading the books, all the different kinds of stories” (S59). The next most frequent positive response category was “confidence” (n=18) where participants described increasing confidence the more they read, and in some cases, the more quizzes they passed. Two examples of this type of response were “I had absolutely no confidence in English, but this class really made me feel I can read because I could read a lot at my level. My confidence went up” (S20), and “It was difficult at the beginning, but I gained confidence the more I read. Passing the quizzes gave me confidence” (S73). These examples indicate that both reading and taking the online quizzes positively influenced learners’ confidence. The novelty factor of the online reading class was also a positive factor for learners, with fourteen (n=14) describing this style of class as a new and unique experience. An example of this sort of response was, “it was a new style class, I really haven’t had the chance to read English books, so I thought this was a good experience for me” (S80). The next most frequently provided response was “other transformation” (n=13), which describes other types of personal transformation that occurred in learners beyond the changes in improvement and confidence described above. Such transformations included an increased interest in reading: “I tried hard to get the word count I needed, but I found I became more and more interested in the books and reading the more I read” (S179), or an increase in interest in English in general: “At first I didn’t want to do it, but after reading some books, now I feel I’m more interested in English” (S44). The next most frequent response was “learning appeal” n=12, with learners describing a positive impression of how the class appealed to their learning style preferences. An example of this type of response was: “I thought this was a good way to learn, on my own and naturally” (S185). Similar, but more focused on the general class organization, were responses in the “class style” (n=10) category. A sample of this kind response was: “Reading on my own and taking tests, and passing the tests online, was really interesting”(S32). Some students positively perceived the value of texts in promoting specific skills (n=8), as seen in this response from Student 78: “I saw words I didn’t know over and over so I thought I learned them well”. The tenth most frequent response type was “opportunity”

(n=8). This category included responses that described using graded readers as an opportunity or chance to learn English through reading. This sort of response included: “I’ve wanted to read more in English, so this was a good opportunity for me experience reading and learning English in a different way” (S162), and “I like reading, so this was a good chance for me to study English while reading” (S79). A number other positive responses (n=22) were provided, including the ability to read exclusively within one’s range of interests, the perceived utility of reading for general English abilities, and the inherent challenge posed by words count goals.

Table 4: Open-ended item 1: Summary of positive & negative responses

<b>Positive (n=149)</b>	<b>Negative (n=27)</b>
improvement n=22	Difficult n=15
level choice n=21	Didn’t like class styles: n=7
enjoyment: n=21	No interested in, don’t like, English 5
confidence: n=18	
novelty n=14	
personal transformation n=13	
learning appeal n=12	
class style n=10	
promote specific skills n=8	
opportunity n=8	
other positive responses n=22	

There were comparatively fewer negative responses (N=27) to the first item. The most common type of negative response came from those who found the graded readers difficult (n=15). Examples of this sort of response included “I’m not interested in reading in English so it wasn’t interesting for me, reading those books was difficult” (S110), and “It was too difficult to read every week” (S135). The second most frequent (n=7) type of negative response came from those who didn’t like the class style. An example of this type of response was, “This kind of class was a pain, I’d prefer a normal class more” (S22). The third type of negative response came from those who had no interest in, or disliked, studying English (n=5). These feelings extended into the use of graded readers, as seen in this response from Student 27, “I don’t really like English so I didn’t like doing it (*reading and the online quizzes*) at all”.

## Preferred graded reader types

The second open-ended item asked students which types of books they preferred using. Participants identified readers they liked according to their particular content features, genre, structural or lay-out characteristics, and publisher type or series (see Table 4). The five most frequent responses from each category will be discussed below.

The most frequently identified type of reader preferred was that with content features that appealed to learners. Students particularly liked books that they perceived to be easy (n=38). Students also identified readers that matched their personal interests (n=28) as being particularly appealing. Students mentioned graded readers with stories or themes involving such topics as soccer, opera, chess, and airplanes as being particularly appealing due to their appeal to their specific interests. The third most frequently cited content feature that appealed to learners was familiarity in terms of story content (n=22). With such responses learners mentioned particularly liking reading stories they already knew such as Huckleberry Finn or Sherlock Holmes as it was easier for them to self-monitor their understanding of the story. The next most frequently cited content features liked by learners were daily life (n=7) and understandability (n=7). Regarding the former, daily life content was described as stories which describe day-to-day activities such as work or school in other countries. The latter, understandability, described storylines, particularly character interactions, that were easy to follow.

Table 5: Open-ended item 2: Attributes of preferred readers

<b>Content features (n=124)</b>	<b>Genre (n=79)</b>	<b>Characteristics (n=36)</b>	<b>Publisher (n=11)</b>
easy (n=38)	movie (n=20)	pictures (n=13)	Foundations (n=7)
matched interests (n=28)	fiction (n=12)	short (n=6)	MacMillan (n=2)
familiar (n= 22)	mystery (n=11)	word count (n=5)	Penguin (n=2)
daily life (n=7)	non-fiction (n=8)	long (n=4)	
understandable (n=7)	biographies (n=5)	variety (n=4)	
famous (n=6)	fantasy (n=4)		
dialogues (n=5)	traditional (n=4)		
moving (n=5)	history (n=4)		
funny (n=4)	Japanese (n=3)		
good flow (n=2)	thriller (n=3)		
	science fiction (n=3)		
	romantic (n=2)		

Genre was the second most frequently cited attribute of graded readers contributing to their likability. Movie-related graded readers (n=20) were the most popular with students, with a number indicating that they liked being able to check comprehension and compare movie-based graded readers with movies they had previously watched, or alternatively, to watch movies after reading to check their comprehension. The second most frequently cited genre was fiction (n=12), with students explaining that they liked following stories and their plots. This was followed by mystery-themed graded readers (n=11), about which learners expressed a keen interest in trying to solve the mystery as they read. The fourth most popular genre was non-fiction (n=8). Within this category learners described books about real places, businesses and events as particularly valuable in providing knowledge. The fifth most preferred genres was biographies (n=5). Learners expressed interest and excitement in reading details about famous people's lives. Like non-fiction books, biographies appeared to appeal in terms of their inherent interest as well as their general knowledge value.

Participants also described preferred graded readers in terms of their specific layout or design features, classified here as "characteristics". A number of students (N=13) identified pictures or illustrations as playing an important role in influencing their degree of enjoyment with readers. Student 87 even went as far as identifying what he perceived to be the optimum number of pictures a graded reader should have, "...if there were pictures every two pages or so, it really made the book more interesting; I could use the pictures to imagine the story". Another important characteristic was length, with both short (n=6), and long (n=4), books appealing to different students. Those who liked short books liked being able to reading them quickly and effortlessly, and being able to complete their quizzes easily on the Moodle Reader system. Those who preferred longer readers described enjoying following the flow and development of more drawn out stories and characters. A number of participants (n=5) also identified the printed word count on the backs of books as a characteristic that contributed to their enjoyment of graded readers. Such students explained that choosing books according to their word count allowed them to set weekly goals and read according to their own

schedules. A final characteristic positively affecting students' impressions of readers was their variety (n=4); that is their distinct visual appeal and presentation from book to book, series to series, and publisher to publisher. Students who identified this characteristic described enjoying going to the library and choosing from a wide variety of book covers and surveying the layout, content and presentation of readers prior to selection.

A number of students also identified preferred books by specific publishers. The most popular books type in this category were those in the Cengage Foundations series (n=7). Graded readers from other publishers specifically identified by learners were those from MacMillan (n=2) and Penguin (n=2). Where graded readers from these specific publishers were identified, participants did not add any explanatory insights into why such series were preferred, although it is likely that such books represented the preferred content features, genres and characteristics identified above.

### **Disliked graded reader types**

The third open-ended item asked participants what types of graded readers they disliked. The same three categories as above emerged, although with a slightly different order of frequency: content features (n=54), reader characteristics (n=34), and genres (n=24). The content characteristic most frequently cited as having a negative effect on learners' perception of graded readers was "hard to follow" (n=20). Learners explained that readers with storylines that were difficult to follow, had too many characters, or dialogue that was hard to attribute to specific characters, contributed to negative impressions of particular readers. The second most cited disliked reader characteristic was "difficult" books (n=17). A number of learners explained that they didn't like books that were more difficult than they anticipated, and felt frustrated when this difficulty resulted in them not being able to pass the reader's online quiz. Another content characteristic that negatively influenced learners' impressions of particular graded readers was their perceived degree of "darkness" (n=7). Dark stories were described those as being violent, morbid, or depressing. An equal number of participants (n=7) disliked readers they perceived to be "uninteresting". Such

students explained that both readers that did not match their own interests, as well as those seemed dull, were particularly disliked. Unfamiliarity was another characteristic that negatively influenced learners' perception of particular readers. Students explained that a lack of familiarity with particular stories and situations made it more difficult to contextualize and follow some stories.

Table 6: Open-ended item 3: Attributes of disliked graded readers

<b>Content Features (n=54)</b>	<b>Characteristics (n=34)</b>	<b>Genre (n=24)</b>
hard to follow n=20	insufficient pictures n=9	biographies n=5
difficult n=17	short / low level n=9	history n=4
dark n=7	long n=8	non-fiction n=4
uninteresting n=7	tight layout n=7	mystery n=3
unfamiliar n=3	too many pictures n=1	traditional n=3
		horror n=3
		romance n=2

Learners also disliked graded readers with particular layout or design characteristics. Within this category the most disliked feature (n=9) was a lack of pictures or illustrations. Participants who disliked such books explained that they were harder to engage and follow without pictures related to the story. Receiving the same number responses (n=9) were graded readers which were too easy or too short. Students who disliked this kind of graded reader explained that such books were so underdeveloped, and had such low word counts, that they were perceived to have essentially no real value. A similar number of students (n=8) identified long books as being among those they disliked. Reasons cited for this were the difficulty in staying focused over their length and in passing their online quizzes. A further characteristic of books that was evaluated negatively was “tight layout”; these were described as readers with lines that were too close together. Participants explained that pages with a tight layout were hard on their eyes and difficult to read.

Participants also described a dislike for graded readers of particular genres. The most frequently cited disliked genre was biographies (n=5), which some learners described as not being as well-developed or interesting as fiction. These same reasons were also cited by a number of students who disliked historical (n=4) and non-fiction (n=4) genres. In both cases several learners also

described a preference for fiction. Other genres identified as disliked were mystery (n=3) due to the difficulty of following some of the stories, traditional stories such as fables and folk tales (n=3) due to their uninteresting stories, and horror stories (n=3) due to their dark or unsettling content.

## **Discussion**

The first goal of this study was to evaluate how the use of graded readers and the Moodle Reader module affected learner motivation. The overall positive endorsement across each of the adapted IMMS scales indicated that the readers and the online graded reader course were viewed positively by participants. As these scales represent major cognitive variables contributing to motivation, this result is a positive indication that learners' motivation likely benefited from using these instructional materials and this course design. A particularly encouraging finding within the scales was the high endorsement of the confidence items. This endorsement, combined with students' strong preference for easy books as revealed in the open-ended item results, suggests that self-selection of books according to self-perceived ability supported students' learning confidence. Self-efficacy is a key component for initiating and sustaining learner motivation in that learners who think they will be successful are more likely to initiate and carry through with positive learning behaviors (Pintrich & Schunk, 2002). Self-selected graded readers appear to engender confidence in learners, and for this reason alone should be recommended for use with this group of learners. As a number of studies have indicated low levels of confidence in Japanese EFL learners (see Johnson 2009), this finding represents an important direction in facilitating more positive attitudes and behaviors in the EFL classroom.

The second goal of this study was to identify how learners perceived using the graded readers and the online evaluation system. Speaking directly to this question, the results of first open-ended item indicated that almost three quarters of learners perceived the course positively. While a variety of explanations were provided for these positive impressions, the most frequently cited reasons were improvement, level choice, enjoyment, and novelty. Learners felt they improved in reading, or in their overall English ability, through taking

this course, a positive outcome that aligns with other studies (Bell, 2001; Constantino, 1995; Horst, 2005; Horst, Cobb & Meara, 1998). Other students cited the self-selection of reader level as a positive aspect of the course. This is important as learners appear to feel more comfortable with the proficiency level of self-selected instructional materials, and the selection process stands to potentially increase learners' sense of investment, or stake, in the learning process. Students additionally cited a general feeling of enjoyment as a reason for liking the course. Such responses suggest that graded readers may be a means for promoting more intrinsically-oriented motivation in learners. Particularly considering Japanese engineering students more extrinsic, instrumental or utilitarian orientations towards English studies (Kimura, Nakamura & Okumura, 2001), this finding may indicate that specific types of instructional materials might have a positive influence on expanding motivational orientations. A further attraction of the course cited by learners was its novelty appeal, with a number of learners citing the uniqueness of this learning experience as appealing. As most of the learners' prior EFL learning experiences were characterized by traditional teacher-centered classrooms, their willingness to embrace a more student-centered and autonomous learning approach is an encouraging finding.

The final goal of this study was to identify which types of graded readers learners liked and disliked using. The number of types of graded readers identified as being "liked" was over twice as many as those "disliked". This finding provides some important insights into learner preferences. First, the range of responses, with 30 specific types identified across four thematic areas, speaks to the variability of preferences in learners. This range demonstrates that EFL programs utilizing graded readers need a wide selection of titles in order to meet the varying interests and learning style preferences of learners (Day & Bamford, 1998; Murphy, 1987). Regarding the specific types of graded readers learners liked and disliked, it was observed that content, genre and layout characteristics were important in determining learner preferences. In both positive and negative evaluations, content types were cited most frequently, with "easy" books being liked, and "hard to follow" or "difficult" books being disliked. This general

preference for easier books aligns well the general goal of extensive reading approaches, which is to have learners embrace books that are easy to read and which are effortlessly assimilated (Day & Bramford, 1998). Additionally, returning to the discussion of confidence above, reading easier books is a good way for Japanese EFL learners to regain, or develop, confidence in English learning. The findings above speak to the importance of providing learners with guidance in selecting graded readers appropriate to their level; participants voiced displeasure with inadvertently chosen books that turned out to be too difficult, or in some cases too easy, for them. More specific directions on how to choose appropriately-leveled readers would likely promote confidence and lessen such frustration in learners.

Learners also identified preferred graded readers by genre. The range of genre types liked (n=12), and disliked (n=7), which were at times conflicting, are yet another indicator that a broad range of readers need to be acquired to meet the array of preferences in learners. This is also true of learner preferences in regard to graded reader types characterized by their layout characteristics. Learners variously identified preferences and dislikes of reader types according to their having pictures or not having pictures, being short or too short, and easy or too easy. These conflicting preferences and dislikes suggest that a wide range of graded reader series with different layout characteristics from a number of different publishers is necessary to appeal to the differing preferences across learners.

## **Conclusion**

This study revealed a number of benefits associated with the use of graded readers in conjunction with the Moodle Reader Module. The overall positive endorsement of GR-IMMS satisfaction, confidence, relevance, and attention scales indicated that the use of graded readers and the online evaluation system appealed cognitively to learners in a manner that supported motivational engagement. The open-ended items supported these findings with learners expressing satisfaction with the improvement they achieved in the course, greater

confidence from using self-selected readers according to perceived proficiency levels, increased perceived relevance derived from the selection of content congruent with personal interests and learning style preferences, and heightened attention due to a combination of factors including the novelty of learning and engaging English in new manner. Combined, these findings suggest that graded readers and autonomous online evaluation provided this sample of Japanese engineering students with a motivating EFL learning experience.

Despite these positive findings, the limitations of this study need to be acknowledged. The situation-specific nature of evaluating learners' motivational orientations toward a particular set of instructional materials or a specific course design may limit the generalizability of the results. For more generalizable findings, a broad multi-institutional study would need to be conducted. Those interested in examining how their own learners might respond to a similar course would be urged to pilot a course and conduct an independent retrospective evaluation of the materials and course design used.

The benefits of using graded readers and autonomous online evaluation systems such as the Moodle Reader Module provide a ray of hope for those in search of curricular alternatives for reluctant EFL learners such as Japanese engineering students. Through expanded use and further empirical inquiry it is hoped that these materials and approaches will demonstrate their potential as a source for motivating EFL learners.

## Appendix 1

### **Part1: Graded Reader IMMS Items and Scales**

#### Confidence

CON1: When I looked at the books, I had the impression that they would be easy.

CON2: The books were more difficult than I would like.

CON3: The more I read, the more confident I became with reading in English.

CON4: I could not understand many of the books I chose.

CON5: Choosing books at my level gave me confidence.

CON6: Reading the books gave me confidence in my overall English ability.

CON7: Passing the quizzes gave me confidence.

#### Attention

ATT1: The books are eye catching.

ATT2: The content of the stories helped hold my attention.

ATT3: The books were so difficult to understand it was hard to keep my attention.

ATT4: The books were dry and unappealing.

ATT5: The leveling of books helped me focus my attention.

ATT6: The content of the books helped stimulate my curiosity.

ATT7: There was not enough variety in the books available.

ATT8: I learned something interesting while reading.

ATT9: The variety of books helped keep my attention.

ATT10: Choosing books that interested me helped focus my attention.

#### Relevance

REL1: The content of the books were relevant to my interests.

REL2: The graded readers are worth reading.

REL3: I could relate the content of the books to things I have seen, done, or thought about in my own life.

REL4: The English content of the books will be useful for me.

REL5: I learned some valuable things reading the books.

REL6: The books were not relevant to my needs.

REL7: The content of the books is valuable.

#### Satisfaction

SAT1: Completing the books gave me a feeling of satisfaction.

SAT2: I enjoyed the books so much I would like to read more in the future.

SAT3: I really enjoyed reading the books.

SAT4: It was a pleasure using the online learning system.

SAT5: It was satisfying watching my word count rise.

SAT6: Passing the quizzes gave me a feeling of satisfaction.

### **Part 2: Open-Ended Items**

1. How did you feel about using the graded readers in this class?
2. What types of books did you enjoy reading? Why did you like them?
3. Where there any types of books you did not enjoy reading? Why did you dislike them?

**AVAILABILITY AND USE OF INFORMATION AND COMMUNICATION TECHNOLOGY  
FACILITIES FOR COUNSELING UNIVERSITY UNDERGRADUATES IN SOUTH – WEST  
GEO – POLITICAL ZONE, NIGERIA.**

**ABSTRACT**

*The study investigated the availability and use of Information and Communication Technology facilities for counseling university undergraduates in South West Universities, Nigeria. The respondents comprise of 19, 500 undergraduates drawn from the thirteen (13) universities in the South – West Geo Political Zone, Nigeria. The instrument used for data collection for the study was validated by two experts in Guidance and Counseling; One from Osun State University, Osogbo and the second one from University of Lagos, Akoka, Lagos State. A test – re – test method was used to determine the reliability of the instrument, reliability co – efficient of 0.79 was obtained. Data collected were analyzed using simple percentage and mean scores. The findings of the study revealed that information and Communication Technology (ICT) facilities for counseling are not adequate in the Universities in South – West Geo – political Zone of Nigeria. The finding also shows that the level of information and Communication Technology usage in the Universities in South – West, Nigeria is very low. Based on the findings of the study, it was recommended that University Management should create counseling laboratories; Government should make provision for*

*ICT facilities in the Counseling laboratories in order to curb/eradicate social vices among undergraduates and to help facilitate counseling and learning.*

**Key words:** Availability, ICT, Counseling, University, Undergraduates, South – West, Nigeria.

## INTRODUCTION

Onwumere (2008) defined information and communication technology as “the collection, storage, processing, dissemination and the use of information in a more scientific manner” Ezekoka (2007) believes that “ICT is an intermingling of Information and Communication Technology”. While information can be seen as ideas conceived by the human mind, information technology is the storing of such ideas that need to be communicated with the use of science products. Counseling is designed to provide an interacting relationship where the counselor is attempting to help a student to better understand him/herself in relating to his/herself present and future decisions or problems (Makinde 1983). And according to Blocher (1974), counseling is helping an individual to become more fully aware of himself and the ways in which he is responding to the influences in the environment.

Counseling involves interaction between counselor and clients or group of clients; therefore, for any meaningful interaction to take place there is need for information dissemination and effective communication. With the advent of information technology in the world, a new dimension of information processing and communication modes were embraced in counseling especially now that the world has become a global village through the use of information and communication technology facilities. The internet has become the easiest way for information accessment and dissemination among youth. Vanttornx Myrick (2001) suggested that the work of counselors in the areas of distance learning, college and career searching, counseling interventions, training and supervision, networking and support systems, and information retrieval and dissemination is affected by technology.

Nowadays people live in a technology driven society in which advance technology continues to influence all aspects of peoples' in the schools, at home and in the field of work. Internet and electronic mail are widely used by people in the world especially the youth for collection and dissemination of information .Information technology has been accepted by many societies as the way the world is going (D1, 200, Onuora, Oguno & Nyuykenge 2010). Information Technology become the pillar of development and

interaction and the whole world become a global village today with high invention of technology tools, high speed networks, and fast paced digital exchanges are more an intricate part of our society than ever before (Friedman, 2005).

Information and communication technology facilities make interactions easier and facilitate productivity. According to Januszewkix Molenlda (2008), information and communication technology is the practical offshoot of education technology which by definition is the study and ethnical practice of facilitating learning and improving performances by creating, using and managing appropriate technological processes and resources.

Counseling as an educational process used in solving problems of learner requires the use of information and communication technology facilities to make counseling more effective and productive among the undergraduates that are versatile in the use of different ICT facilities and social networks. Based on this, the use of ICT based counseling will go a long way to enhance the interaction between counselors and undergraduates. Rai (2006) believed that technologies are the tools that people use to share, distribute, and gather information to communicate with one another, one on one or in groups, through the use of computer and interconnected computer networks. This shows that, for interaction to be more meaningful these days there is need to make use of ICT facilities.

Green, Lawson and Getz (2005), and Patrick and Flanagan, (2008) believed emails can aid correspondence between counselor and client; web searches and internet sites can provide client additional information a problem; while employment counselors can expand client's job searches by searching on the internet.

Leach and Moon (2002) summarized the importance of ICT to include: critical thinking, information handling skill, problem solving, the refining of understanding, the giving and receiving of prompt feedback; collaborative task, joint decision making and reflection; higher level of conceptualization; complex group interaction.

The main challenges of the various channels of counseling these days is the selection of appropriate channel of communication which delivers clearly, accurate and quality

information as desired by the counselors without any distortion (Okopi,2010). Sabella and Broker (2003) suggested that using technology may have many potential advantages, such as the ability for information to be instantaneously updated and received by all stakeholders in cost effective manner, enhance collaboration capabilities and the ability to present visually appealing, informative and creative presentations. This study is pertinent especially in the wake of increasing need for making ICT based counseling available and accessible to the undergraduates who are still in their youthful age.

To guide the conduct of the study, the following research questions were raised:

1. Do undergraduates in South- West Universities have access to ICT based counseling?
2. Do undergraduates in South- West Universities have adequate knowledge of ICTs based counseling?
3. Do counselors in South -West Universities use ICT facilities for counseling undergraduates?
4. How do undergraduate perceive ICT based counseling in South- West Universities?

Method:

Design: This study adopted the mixed methods research approach. Mixed method is defined as the class of research where the researcher combines qualitative and quantitative techniques into a single study (Johnson & Onwugbuzie 2004). Both qualitative (interpretivism) and quantitative (Positivism) approaches were used to advantage in this study. The study's research questions comprised both the "what" (Positivist) and "why" (interpretivist) questions. The questions which were asked to establish undergraduates' accessibility to ICT based counseling were purely objective and hence positivist. However, the questions "to what extent do you perceive" were subjective in nature due to the fact that participants had to express their perceptions about the efficacy of ICT based counseling and also Justify their perceptions, participants have to express their views, opinions as well as their feelings about ICT based counseling in the university.

**Participants and setting:** The population of this study comprised all undergraduates in the south-west Geo political zone in Nigeria. The study participants comprised 19,500 randomly selected undergraduates from the thirteen (13) universities in South-West Geo political zone in Nigeria. The sample was stratified on the basis of gender, age and class level.

**Instrument:** The participants completed the ICT based Counseling Questionnaire which consists of two sections. Section A, sought demographic information of the respondents while section B was geared towards eliciting information from the respondents on their accessibility to ICT based counseling, their ability to use the computer, whether ICT based counseling is available in their institution and their perception to utilization of ICT based counseling in their institution.

Requesting experts in their related field of study to vet the instrument established content validity. The reliability of the instrument was established through Cronbach alpha reliability technique with a co-efficient value of 0.74. This lends credence to the suitability of the instrument for the study.

**Procedure for data collection:** A combination of administered questionnaire and focus group discussions (FGDS) was used for data collection exercise. The questionnaire consisted of a combination of close and open-ended questions. Focus group discussions produce descriptive data about peoples' own written or spoken and observable behaviour.

**Ethical Considerations:** The researchers were available to explain the purpose of study, the consent and voluntary nature of the study, the intended use of the findings, including reporting through publications and other methods and the necessary steps that the researcher will take in maintain the participants' confidentiality.

**Method of Data Analysis:** The data that was both quantitative and qualitative in nature. The two main procedures were, therefore, applied in the analysis of the data in line with mixed research approach adopted for the study. Quantitative data gathered from the close-

ended questions were subjected to NCCS 2007 quantitative method of data analysis. (NCCS can perform a variety of data analysis and presentation functions, including statistical analysis and graphical presentation of data).

The qualitative were subjected to content analysis. This involved sorting, categorizing and tallying the data which were mainly additional information to or justification of response given to the close-ended questions, in line with the mixed-model design. For some of the questions, the presentation was then done in narrative form.

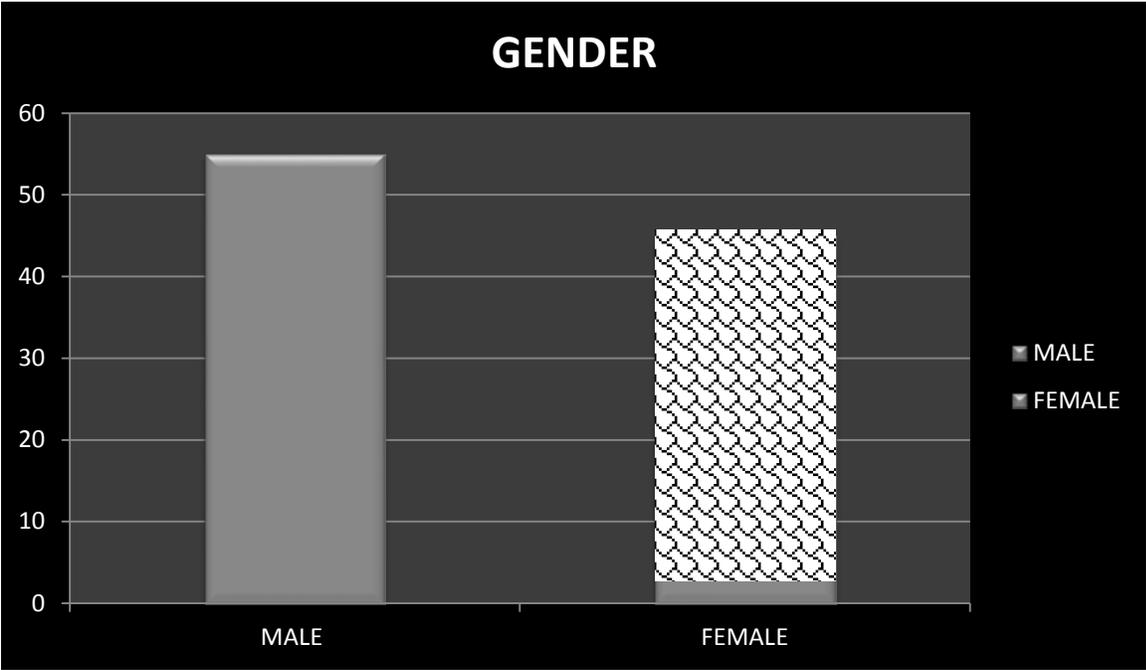

#### Results:

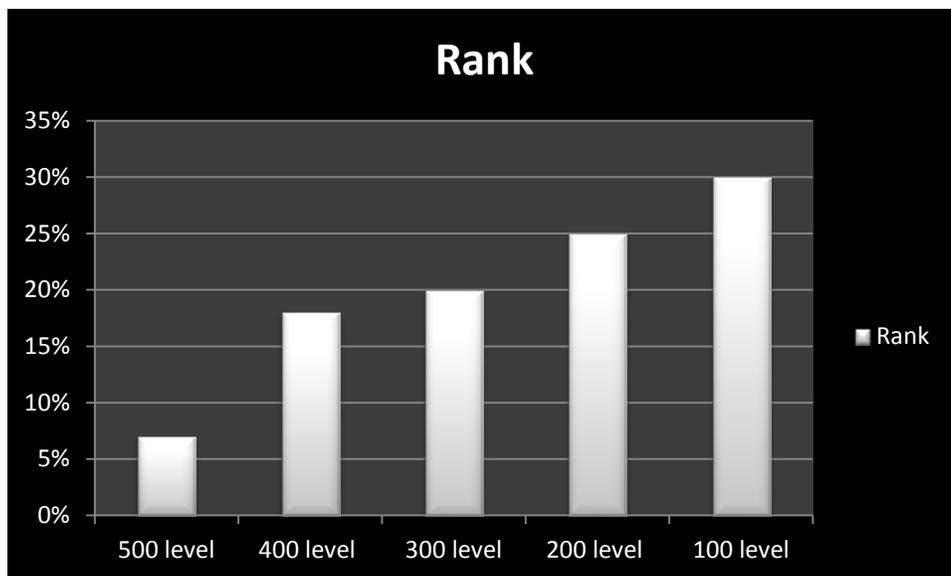

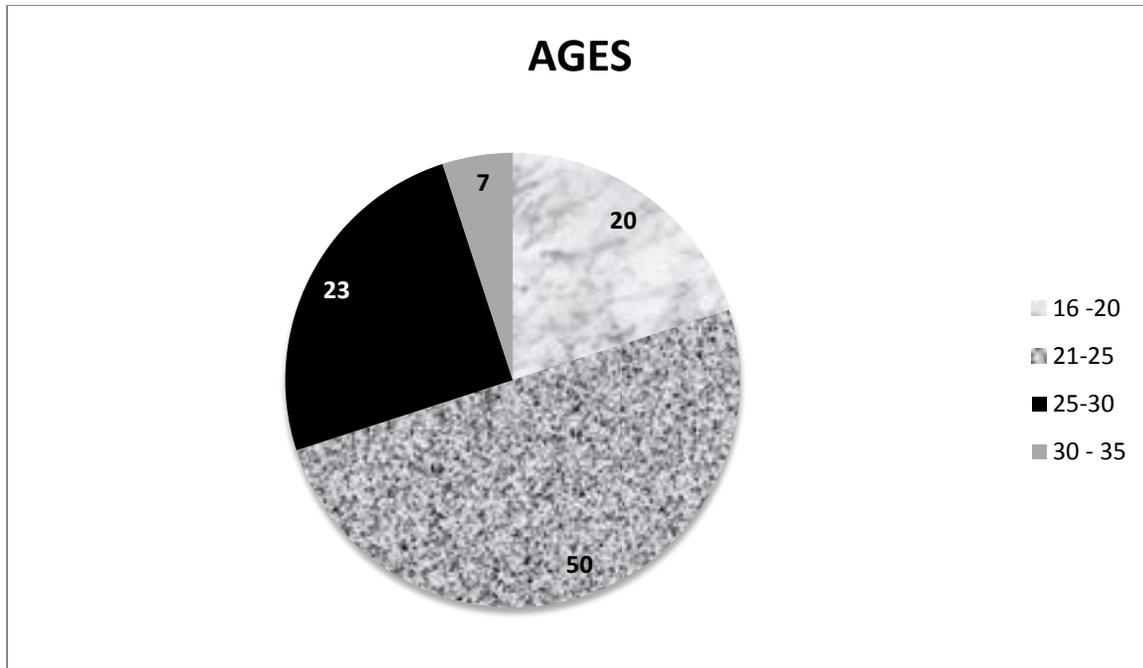

The demographical characteristics of the respondents are presented first before the presentation of findings related to the problem of the study.

Table 1: Distribution of the Respondents on the Basis of Gender, Age and Rank.

Variables	Frequency	Percentage
Gender		
Male	10,725	55%
Female	8,775	45%
Age		
16-20	3,900	20%
21 – 25	9,750	50%
25 – 30	4,875	25%
30 – 35	975	5%
Class Level:		
500 Level	1,365	7%
400 Level	3,510	18%
300 Level	3,900	20%
200 Level	4,875	25%
100 Level	5,850	30%

Table 1 represents the demographic characteristics of the respondents in frequency counts and percentage. It shows that 55% of the study samples are males while 45% were females. Fig 2 shows that respondents who fall within age of 21 – 25 years age bracket constituted 50% of the total sample. 500 level students who participated in the study formed 7% of the sample while 400 level and others constituted 43% of the total sample. The bar and pie chart represented described the demographical data of the respondent for the study.

**Question 1:**

**Do undergraduates in South-West Universities have access to ICT based Counseling ?**

**Table 2: Undergraduates ICT's based Counseling Accessibility index in frequent count and percentage.**

S/N	What access do you have to ICT's based counseling?	Frequency	Percentage

1	Cell phone	4,100	21%
2	Personal Laptop And modem	2,440	12.5%
3	Friends Laptop And modem	1,002	5.2%
4	ICT Laboratories in school	518	2.6%
5	School internet facility	2050	10.5%
6	Cybercafé	500	2.6%
7	None	8,890	45.6%

Table 2 Presents Undergraduates accessibility to ICTS based counseling. The Table shows that 54.7 of the respondents had one access or the other to computer based counseling. A breakdown of this figure shows that 21% of the respondents have access to ICT based counseling through cell phone, 12.5% has ICT counseling through personal laptop and modem, 5.2% have access to counseling through friends laptop and modem, 2.6% through ICT laboratories in school, 10.5% have access to ICT based counseling through school internet facility, 2.6% have access to ICT based counseling through cybercafé. 45.3% of the respondents said they have no access to ICTS based counseling. Figure 4 further demonstrates this result thus:

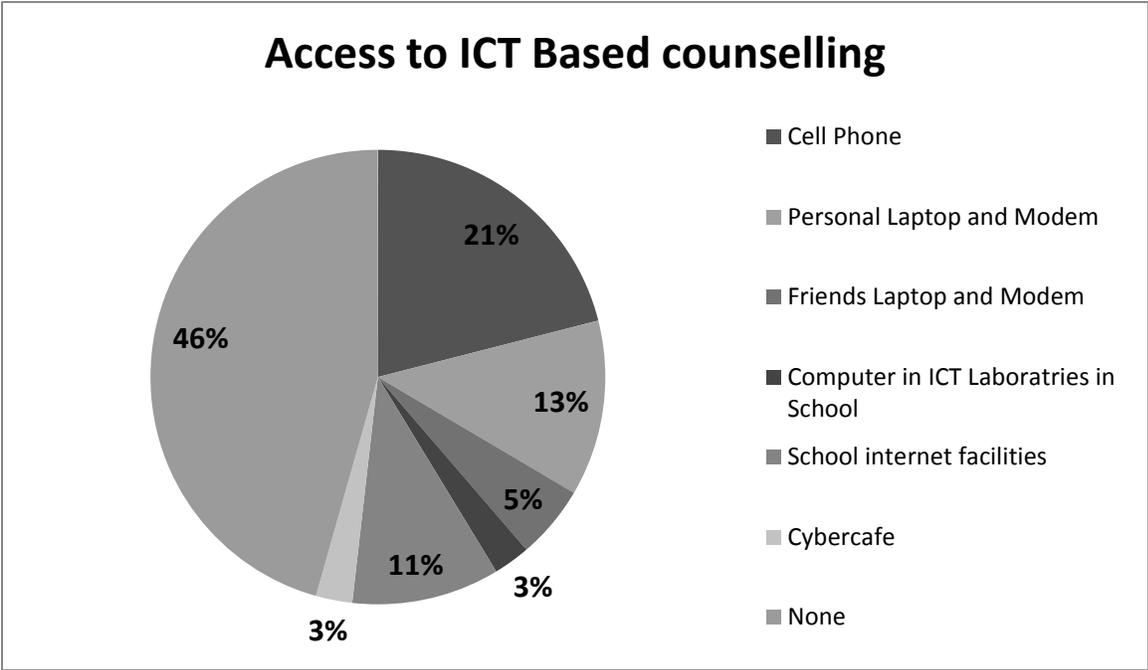

Figure 4: Percentage Distribution of Respondents' ICT Based Counseling Accessibility.

**Question 2:** Do undergraduates in South-West Universities have adequate knowledge of ICT based Counseling?

**Table 3:** ICT Based Counseling Usage Index in Frequency Count and simple percentage.

S/N	How will you rate usage of ICT based Counseling in your institution?	Frequency	Percentage
1	Very High	6,825	35%
2	High	5,850	30%
3	Moderate	3,900	20%
4	Low	1,950	10%
5	Very Low	975	5%

Table 3 Shows the Frequency of the responses by the students indicating their ability in the use of ICT base Counseling. It is interesting that high number of respondents 6,825 (35%) out of 19,500 respondents have very high ability in the use of ICT based counseling 5,850 representing (30%) of the sample size have high ability. 20% of the respondents has moderate ability while only 15% of the total sample has either low or very low ability. Figure 5 further demonstrates this result.

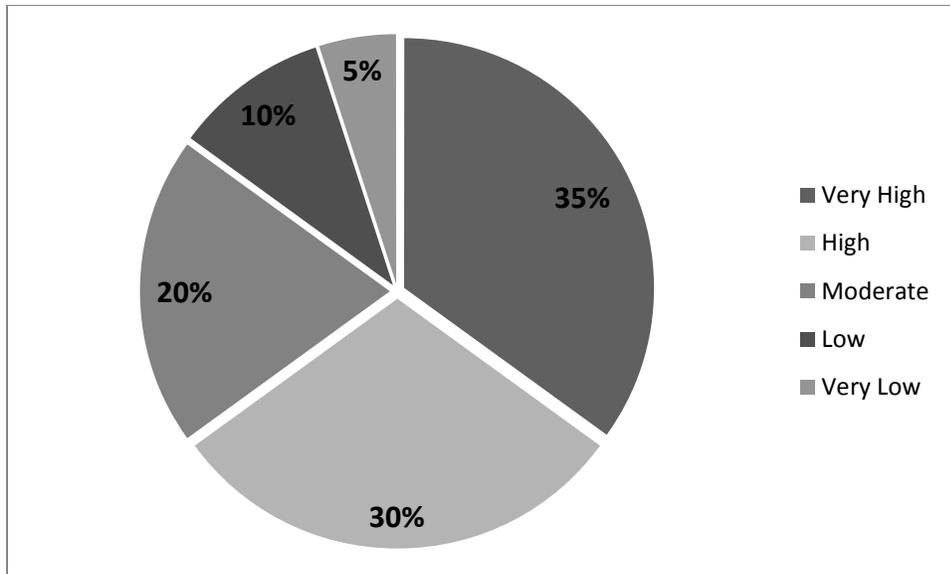

Figure 5: Percentage Distribution of Respondents' Computer Usage Index

**Question 3:**

Do Counselors in South-West Universities employ ICT facilities for counseling undergraduates?

Do you normally receive ICTS based Counseling from Counselors?	Frequency	Percentage
Yes	9,395	48%
NO	10,105	52%
Total	19,500	100%

Table 4 shows that (52%) of the respondents do not receive ICT based Counseling. Only 9,395 Undergraduates representing 48% of the sample have access to ICT based Counseling. Figure 6 depicted the result.

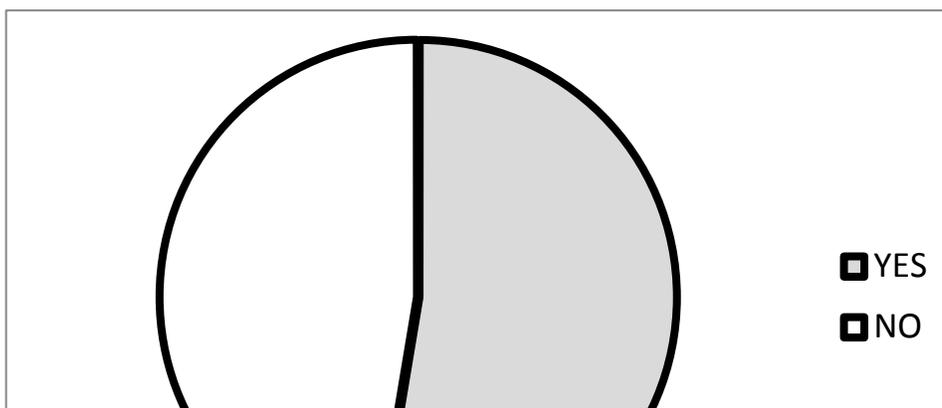

Figure 6: Percentage Distribution of Counselor Employment of ICT Based Counseling.

**Question 4:**

How do you as a student perceive Information Communication Technology based counseling availability in your university?.

Interviews and focus group discussion revealed diverse opinions concerning ICT based counseling in South – West Universities. Some of the undergraduates were of the opinion that ICT based counseling does not exist in their schools; while some said on – line counseling was only meant to give information to new students.

*One respondent remarked.*

*“I have never heard of ICT based Counseling my school, the only counseling office I am aware of the one attached to students’ affair office and I have not visited the place for anything.”*

*Another respondent added.*

*“I am aware of online counseling in my university, but I don’t have anything to do with it because there are always difficulties of connectivity.”*

Yet another added

*“I would have loved ICT based counseling if it is available and counselor will keep whatever we discussed between us- i.e. confidentiality”*

*Other responses include*

*“Even if there is ICT based counseling in my school there is no regular power supply to access it”*

*“Counselors are too busy with lectures than thinking of helping anyone out of challenges face to face. I don’t think they will ever have time for ICT based counseling”.*

*“How do you expect me to start chatting or discussing my problem with counselor on – line or through internet when I have my assignment to do”*

*“When there is no counseling laboratory in my school where do you expect me to get ICT – based counseling”.*

*“If my school can make ICT based counseling available this may curb or reduce yahoo plus in my school”.*

## Discussion

The emergence of information and communication technology has transformed our society to an information society. The results of this study revealed that 30% of the respondents have very high ability in the use of computer including use of different social networks for sending and receiving information. 30% have high ability, while 20% have moderate ability. 10% have low ability and only 5% have very low ability in the use of computer. This finding supported the fact that the youth are versatile in the use of computer and social networks in processing information. This latest finding corroborates that of Friedman (2005), who found that information Technology has become the pillar of all development and interaction and the whole world become a global village today, with high invention of technology tools, high speed networks and fast paced digital exchanges are more intricate part of our society than ever before.

The result of the study may be due to the fact that youth are good in exploration and they get better skill in computer usage.

Counseling as a helping relationship is expected to provide information to people in order to facilitate growth, development and positive change. ICT will help counselor to give responsible counseling that often requires information to be transferred quickly, it will

increase students' depth of understanding and exposure to materials in the school, career awareness, and classroom instruction.

The results of the study also revealed that 45.3% of the respondents do not have access to ICT based counseling due to lack of ICT facilities. This finding is very discouraging bearing in mind the importance of counseling as platform for providing a holistic development of students, coupled with the way internet has become an indispensable aspect of the contemporary knowledge – based society, in the area of communication and information dissemination.

## CONCLUSIONS AND RECOMMENDATIONS

The role and importance of information communication and technology in a globalised world has challenged tertiary institution in Nigeria, and in particular South – West Universities to fully embrace the provision of ICT – based counseling in order to curb social malaise among youth and to provide useful information to make them useful to themselves and society at large. It has been observed that there is a lack of ICT facilities in higher institutions of learning. It is recommended that full attention must be given to the availability of ICT facilities in tertiary institution. Regular internet services at school will boost online interaction between counselors and students. Therefore, recommendations were made that:

- Government should provide ICT facilities for students, counselors and lecturers of higher institutions of learning.
- As being agitated for by Association of Academic Staff (AASU), Government should provide good infrastructural material in higher institution of learning to facilitate teaching, learning and counseling.
- The university management should make provision for functioning counseling laboratories with ICT facilities that will facilitate ICT – based counseling.
- Counselors should improve their ICT skills to meet the ever increasing needs/demands of the students.
- National University Commission should be making periodic visit to monitoring the adequate provision of counseling to students of higher institutions of learning.

6. Abstract

An Exploration of How Artistic Pedagogical Technologies Influence Interaction, Social Presence, and Community in the Online Post-Secondary Classroom

The purpose of this study was is to explore how artistic pedagogical technologies (APTs) influence interaction, social presence, and community in the online post-secondary classroom. This paper reports on phase 2 of a three year study. Online educational opportunities are growing at an exponential rate. Advances in Internet-based technology have changed the social and pedagogical perspective of online learning. The value of interaction, social presence, and community in the post-secondary online classroom is supported by many studies. To date there is less research exploring specific innovative teaching technologies that presume to help create interaction, social presence, and community in online education. Existing research on online teaching strategies focuses on philosophical stances and more traditional technologies such as collaborative software and computer-mediated conferencing. This project aimed to provide practical and theoretical outcomes that help to address this gap. Specifically, it offers educators,

researchers, and students additional theoretical understanding regarding how APTs influence the online undergraduate and graduate classroom. The study also provides practical teaching strategies that can be adapted and used by online educators. Phase I of the study involved the development, testing, and evaluation of three original, research-based, teaching technologies that can be adapted to a variety of disciplines. The APTs developed (and studied in Phase II) include conceptual quilting, photovoice, and parallel poetry. We define APTs as those founded in the arts, specifically literary, visual, musical, or drama mediums.

This was an exploratory qualitative research study using qualitative and quantitative research methods. The general research question was *how* do artistic pedagogical technologies stimulate interaction, create social presence, and facilitate the development of community in online, post-secondary, undergraduate and graduate classrooms? To address the extent to which APTs stimulate interaction, create social presence, and facilitate the development of a sense of community in the online post-secondary classroom, quantitative data were collected on these variables. To address the participants' experiences with these variables qualitative data were collected.

Participants included a convenience sample of 20 graduate students who had completed one of several online courses on teaching health care professionals in 2011. The courses were offered by one online university and taught by three different instructors although the course curriculum was the same for all offerings of the course. Students were recruited through an email sent to them individually by the research assistant (RA) after the final grades for their course were official. The RA continued to recruit participants via follow-up email invitations until a sample of 20 respondents consented to participate. In phase I on this study the data collection instrument and the focus group processes were trialed and refined. Phase 2 used these refined

tools/processes. Phase 2 involved data collected using an online survey (constructed using SurveyMonkey) and telephone focus groups. Those who consented to participate were contacted via e-mail by the RA and invited to complete the online survey which was based on the *Social Presence Scale* (Richardson & Swan, 2003) and the Sense of Classroom Community Index (Rovai, Lucking, & Cristol, 2001). The survey was available on secure website developed for this study. This survey examined students' perceptions of the effect of the APTs on interaction (including interaction between students and course materials, students and students, and students and the teacher), social presence, and the culture of community. Demographic data, Likert type items to assess the students' overall perceptions of course, and indicator statements related to interaction, social presence, and culture of community resulting from the artistic based teaching strategies were included on this survey.

At the conclusion of the online survey participants were asked to check a box if they would be willing to participate in a telephone focus group. A randomly selected group of those who were willing to participate in the focus group were contacted via email by the RA and invited to participate. The focus group data collection strategy provided data to illuminate the findings, and to add context in terms of the *how* the study technologies influenced the participants' experiences of interaction, social presence, and community. Participants were questioned regarding perceived links (if any) between these factors. Three focus groups (with 3 participants each) took place via teleconference. The moderator (the RA) of the online focus groups introduced the purpose of the group, laid the ground rules, initiated the discussion by posing general questions, and provided probes as necessary. The questions used to initiate and guide the focus group(s) were refined during phase 1 focus group experiences. The focus group conversations were recorded and transcribed.

In terms of data analysis, quantitative data from online survey were analyzed using correlations. Qualitative data from the open-ended questions on the online survey and data collected during the focus groups (transcripts) were saved to a word processing program and systematically analyzed using a process similar to narrative analysis. Specifically, the participant's narrative comments were read several times by each team member; fragments of sentences or groups of sentences expressing a key idea were highlighted; and these were grouped to identify core themes. The discovery of the themes was aided by using three points of reference; recurrence of ideas within the narrative data (ideas that have same meaning but different wording); repetition (the existence of the same ideas using the same wording); and forcefulness (verbal or nonverbal cues that reinforce a concept). NVivo10 was also used to manage data and assist with data analysis of the qualitative data.

The study found that interaction, social presence and the sense of community was enhanced in courses in which the specified APTs were used as teaching strategies. These outcomes were achieved through stimulating innovation and creativity, modeling risk-taking, personalizing interactions, developing a trust and conveying respect, and promoting learner control over learning. These findings were the major themes identified during data analysis. Findings suggest that for some course content and student populations adding APTs to the repertoire of pedagogical technologies may have positive benefits for graduate students as interaction is enhanced, the experience of social presence increased, and a culture of community is facilitated in the online post-secondary classroom.

Title: Working with paraprofessionals: Perspectives of physical educationalists about their experiences with paraprofessional support.

Submission ID Number is 143

Area: Teacher Education

**Abstract**

In Australia more and more students with disabilities are being included in physical education classes. Without adequate staffing and/or training this might be a daunting task for physical educators who teach in inclusive settings. The purpose of this study was to explore how Australian PE teachers utilize paraprofessionals when teaching SwD in inclusive environments. PE teachers ( $N=14$ ) completed an online questionnaire inquiring how paraprofessionals are being used and the strategies they are using to develop working relationships with paraprofessionals. Paraprofessionals appear to be doing well in supporting SwD in inclusive PE considering their lack of appropriate training and curriculum knowledge, and PE teachers believe they are utilizing them well. They provide a level of support that is generally to the satisfaction of PE teachers in charge of the class however the PE teachers' consistently provided areas in which the paraprofessional could improve. PE teachers too can do more to better utilize the fantastic resource that is paraprofessionals. It was found that this fundamentally comes down to communication with the paraprofessional about the SwD, assigning specific tasks for completion with the SwD throughout the lesson and professional development on how to better utilize paraprofessionals in PE.

## **Introduction**

In Australia an increasing number of students with disabilities (SwD) are being included in physical education (PE) classes (Department of Health and Ageing, 2006). This change in policy means that PE teachers have to increase their knowledge and pedagogical tools to create an environment appropriate for optimal learning for all students. Without adequate staffing and training this can be a daunting task for inclusive physical educators. Paraprofessionals, or teaching assistants who provide direct instructional services to SwD under the general supervision of a certified teacher, can be the means of success in a program for inclusion (Thompson & Edwards, 1994); and while classroom teachers have historically worked in tandem with paraprofessionals when teaching SwD, PE teachers typically have less experience in utilizing this valuable resource (O'Connor & McCuller, 1997).

Paraprofessionals are typically the least qualified, least respected, and the lowest paid of the teaching staff, yet they are expected to support and provide instruction to the most challenging of SwD (Giangreco & Broer, 2005). Pickett (1993) highlighted the importance of communication between the teacher and paraprofessional in the classroom, and the need for the attitudes and feelings of both teachers and paraprofessionals to be known, respected and understood. Thus, the aim of this descriptive inquiry into the perceptions of Australian PE teachers' use of paraprofessionals in an inclusive PE environment is not only timely, but to the knowledge of the authors, the only Australian investigation into this area.

With the new Australian teaching standards pushing towards inclusive education for all students (Australian Institute for Teaching and School Leadership, 2011), PE teachers will face new and different challenges (Smith, 2004). Hodge, Ammah, Casebolt, Lamaster, and O'Sullivan (2004) who queried PE teachers on the impact of inclusion on their pedagogy found that participants believed that not being able to give individualized attention and quality time to SwD, especially with a large class, adversely impacted their effectiveness.

Teachers also expressed concern at a lack of support (e.g., no paraprofessional assistance) when teaching inclusive PE. In particular, this lack of support made it more difficult to assist SwD when the rest of the class also required monitoring. Considering SwD learn better in PE with a 1:1 ratio or in small groups (Houston-Wilson & Lieberman, 1999), it is important to recognize that paraprofessionals can underpin successful PE inclusion if they are used effectively. These findings suggest that the support of a paraprofessional when teaching inclusive PE may increase teacher self-efficacy associated with teaching SwD and thereby improve the PE experience for SwD.

Despite all states in Australia now having educational policies that support inclusion, there is little Australian literature that describes the roles and responsibilities of paraprofessionals in the PE classroom. The use of paraprofessionals in PE settings has been well described for the North American educational system (Tews & Lupart, 2008; Causton-Theoharis & Malmgren, 2005; Horton, 2001; Stilwell, 1995; Thompson & Edwards, 1994; Vogler, French, & Bishop, 1989; Trame, 1982; Hardy, 1980). Yet, most of this understanding is derived from research that has explored the perceptions of the paraprofessionals, SwD, and their parents. The only study, that we could find, dedicated to examining the perspective of PE teachers on the use of paraprofessional in PE was a postgraduate thesis by Maurer (2004). In this research Maurer reported that the PE teachers he sampled from upstate New York were unaware of how to successfully utilize paraprofessionals within their curriculum. These PE teachers were described as professionals who thought paraprofessionals were not required in general PE because they demonstrated a lack of initiative, were incapable of assisting in this environment, and generally did not know what to do. They reported that their paraprofessionals often felt that they weren't required to assist; or felt they were employed to assist SwD in more academic areas, and that PE was their break time. Unfortunately for the SwD these negative opinions more than likely resulted in a negative impact on their inclusive

PE experience. Thus, considering the recent push in Australia to include all students in the general PE curriculum, an exploratory investigation into the mind of Australian PE teachers' about their use of paraprofessionals within the PE classroom is timely. This exploratory study had three aims: (1) to describe the Australian PE teachers' perceived level of need for paraprofessionals to assist them during inclusive PE, (2) to define how Australian PE teachers use their paraprofessionals in inclusive PE settings, and (3) to gather strategies employed by Australian PE teachers to develop positive working relationships with their paraprofessionals. The exploration of these three themes was underpinned by self-efficacy theory (Bandura, 1997) in an effort to descriptively explain the findings.

## **Method**

### *Participants*

Primary and secondary PE teachers from Tasmania ( $N=450$ ) were sent an invitation email through the Tasmanian Australian Council for Health, Physical Education and Recreation listserv to participate in this study. Tasmanian PE teachers were chosen due to their demographic location in relation to where the research team was based. Additionally, Tasmania has a mixture of both urban and rural schools, and while it is on a smaller scale, it was viewed as an appropriate representation of other Australian states' education systems, particularly as the state moves towards incorporating the national curriculum (Department of Education, 2011). The only inclusion criteria stated in this email was that the PE teacher must have taught SwD in inclusive PE with the assistance of paraprofessionals within the last year. A low response rate was recorded (6%) but further information indicated that there were low numbers of PE teachers who had access to paraprofessional help. Twenty-nine respondents volunteered to participate by electronically signing a university ethics committee approved consent form. Of the 29 respondents 16 participants started the survey with only 14 ( $n = 8$  female,  $n = 6$  male) completing the survey, which took an average of 15 minutes to complete.

All data were stored electronically on the chief investigator's computer, with identification information removed to maintain participant anonymity.

The research sample ( $N = 14$ ), taught in a mixture of urban and rural primary and secondary schools. Overall, participants had a mixture of teaching experience with six participants having less than 15 years of teaching experience teaching PE, and the remainder ( $n=8$ ) having more than 15 years experience. The six less-experienced participants had received adapted PE training in the form of one adapted PE unit as undergraduates at university. The more-experienced participants had no formal training in adapted PE during university. Only one participant indicated that their paraprofessionals had received training to assist in PE, while the remaining 13 were either 'unsure' or stated 'no'. The one participant indicated that the school funded an after-hours workshop for the paraprofessionals, but the change in performance and outcome when supporting the PE teacher in PE was only 'somewhat helpful'. The sample was also asked to report on what types of student disabilities they had taught in the past year. All teachers reported having taught students with ADHD ( $n = 14$ ) and students with autism ( $n = 14$ ); whereas only a proportion of the teachers had taught students with speech/language impairment ( $n = 12$ ), specific learning disability ( $n = 9$ ), other health impairments ( $n = 6$ ), hearing impairments ( $n = 6$ ), visually impaired ( $n = 6$ ), cerebral palsy ( $n = 4$ ), multiple disabilities ( $n = 4$ ), spina bifida ( $n = 4$ ), Down's syndrome ( $n = 3$ ), mental retardation ( $n = 2$ ), traumatic brain injury ( $n = 2$ ), and deafness ( $n = 1$ ).

### *Instrument*

*The Paraprofessionals in PE Settings survey (PPE)*: The survey used in the current investigation was based on an adaptation of Maurer's (2004) survey. The PPE contained 29 items divided into four categories; teachers' sense of self-efficacy of paraprofessionals, the need for paraprofessionals in PE, utilization of paraprofessionals, and strategies to develop positive working relationships with paraprofessionals. The survey was a mixture of Likert

scale, frequency, rank, and open ended questions. Modifications to items centered on redrafting of text to reflect an Australian context.

*Section 1. Teachers' sense of efficacy of paraprofessionals skills scale (TSPS):* The TSPS measured PE teachers' self-efficacy levels associated with their paraprofessionals' ability to assist in inclusive PE. This scale contained 13 items adapted from Hoy's (2000) classroom teachers' self-efficacy inventory. Single items assessed participants' sense of efficacy for each role associated with teaching by paraprofessionals. Each item was prefaced with the stem, "What level of confidence are you that your paraprofessional can..." The ending of these 13 statements can viewed in table 1. Efficacy was measured using Likert-scale choices including 5-A great deal, 4-Quite a bit, 3-Some, 2-Very little, and 1- No.

*Section 2. Need for paraprofessionals in inclusive PE:* The PE teachers' perceived need for paraprofessionals to assist during inclusive PE was explored through three items. First, participants responded to the stem "How competent do you feel teaching SwD in PE" on a 4 point Likert-scale (1-Very competent, 2-Competent, 3-Unsure, or 4-Not competent). Participants then responded to the stem "How satisfied are you with the level of support you receive from paraprofessionals in inclusive PE" (1-Very satisfied, 2-Satisfied, 3-Somewhat satisfied, 4-Not very satisfied, or 5-Unsatisfied). Finally, participants were asked to elaborate on these responses in an open-ended section.

*Section 3. Utilization of paraprofessionals in PE:* In this section, participants were asked to report how often their paraprofessionals performed nine typically assigned PE-related tasks during inclusive PE. Each item began with the stem, "The paraprofessionals I have worked with are capable of..." to which nine tasks were listed, including: (1) carrying out lessons or tasks set by the PE teacher, (2) providing one-on- one PE instruction for a SwD, (3) modifying curriculum choices and adapting equipment under the guidance of the PE teacher, (4) setting up materials and equipment for PE activities, (5) physically assisting

SwD to move through an activity, (6) assisting in behavior management for SwD, (7) administering assessments adapted specifically for SwD, (8) planning learning activities for SwD, and (9) recruiting students without disabilities to peer model for SwD. Participants responded to each using a 5 point Likert scale (1-Always, 2-Often, 3-Rarely, 4-Never, or 5-not applicable). Participants were then asked to rank each of these nine items for importance as to what paraprofessionals should be capable of completing in their inclusive PE setting. A ranking of one represented the most important task while a ranking of nine indicated the acknowledgment that the task was least important. Finally, PE teachers were allowed to indicate anything else they would like paraprofessionals to do in PE to support SwD and/or the PE teacher. This section allowed for the identification of how PE teachers viewed paraprofessional tasks, and thus how they most wanted the paraprofessionals to assist during inclusive PE.

*Section 4. Strategies to develop positive working relationships with paraprofessionals:* Participants were first asked who they thought was responsible for training paraprofessionals about their responsibilities' as an assistant in the inclusive PE setting, either the PE teacher, paraprofessional, special education teacher, or the paraprofessional should not be trained in a PE context. This was followed by an open-ended question to allow the participants to elaborate on the choice of strategies they would use to improve inclusive PE delivery. Finally, participants were asked if the paraprofessionals had taught them anything about teaching SwD through reciprocal communication.

#### *Data analysis*

A Cronbach's alpha coefficient to assess reliability of the survey's items yielded high reliability ( $\alpha = 0.82$ ) for the survey used in the current investigation. Considering the exploratory nature of this research study, several forms of descriptive statistics were used to capture the meaningfulness of the numerical data. These included means and standard

deviations for the Likert-scale responses, number ( $n$ ) of participants who selected a particular response, frequency ( $f$ ) counts of tallied responses, and ordinal group data reported as the top three and bottom three responses. The latter technique enabled most common and least common responses to be explored and highlighted areas for discussion. Quantitative data were also reported as a function of teaching experience where applicable. All quantitative data were calculated using SPSS Version 21 software.

In terms of analytic method, we used a typological analytical approach (Lincoln & Guba, 1985) because we drew upon literature to guide the development of questions and categories and the way in sorting of the data. Notwithstanding as researchers in the area, we were aware of other quantitative and qualitative outcomes associated with the research area, so there was a degree of inductive-generating subjective processing in the formation of emergent themes. Data were analysed using the NUD\*IST software program (Richards, Richards, McGalliard, & Sharrock, 1992). Using this program to store, manage and analyze data enabled the researchers to realise the exploratory and explanatory purposes of the study. Important concepts that emerged from the data were labeled, categorized, and coded (Patton, 2002). The transcripts were independently read and re-read by the three researchers and ideas about evidence to support each of the main categories noted. Once the researchers had completed initial coding the research team met where codes were compared and disagreements were discussed. Peer examination guards against bias and enhances the robustness of the findings (Burnard, 1991).

## **Results and Discussion**

### *Section 1: Efficacy*

Overall using the TSPS portion of the PPE, physical educators reported low efficacy levels ( $M = 2.98$ ,  $SD = 0.63$ ) for paraprofessionals to complete the 13 tasks associated with teaching inclusive PE. A review of individual items associated with various tasks indicated

that for some tasks and roles the participants reported having moderate levels of efficacy related to paraprofessionals' skills (Table 1). Participants reported highest confidence in paraprofessionals' skills in being able to make PE a safe place ( $M = 3.88, SD = 0.34$ ), making PE enjoyable ( $M = 3.68, SD = 0.48$ ), and being able to control disruptive behavior ( $M = 3.56, SD = 0.63$ ). Nonetheless, the lowest levels of confidence for paraprofessional assistance was reported for connecting with students ( $M = 2.11, SD = 0.62$ ), promoting learning ( $M = 2.35, SD = 0.72$ ), and motivating students ( $M = 2.68, SD = 0.70$ ). This order of importance was the same for the more-experienced PE teachers; however the less-experienced PE teachers had a slightly different order at the top and bottom of the scale. These teachers placed keeping students on task ( $M = 3.33, SD = 0.82$ ) as a more important task than controlling student behavior. On the other end they thought expressing their views task ( $M = 2.50, SD = 0.55$ ) was not as important as motivating students. Perhaps the adapted PE training they received at university prepared them more to control classroom behavior and they did not think this was the responsibility of the paraprofessionals. Moreover, their training may not have prepared them to consider the paraprofessionals as a viable source of input to improve service delivery. Considering the lack of data to make comparative analyses with, these speculative results suggest that these findings can serve as starting points to be addressed by pre-service teacher training programs in Australia. Increasing PE teacher self-efficacy in this capacity could result in successful utilization of paraprofessionals as teacher tools. This might allow PE teachers to spend more time on whole class instructional strategies, while appropriately utilized paraprofessionals could support SwD during the lesson as intended.

### *Section 2: Need*

In terms of participants' feelings of competency only 37.5 per cent of the more-experienced teachers reported feeling 'competent' about teaching PE to SwD, compared to 70

per cent of the less-experienced participants (no one in our sample scored ‘very competent’). Notwithstanding, it stands to reason that university training in this area of specialty should increase competence, as well as attitudes towards teaching PE to SwD (Folsom-Meek, Nearing, & Kalakian, 2000). This trend of having low to moderate levels of competency associated with teaching SwD in PE was also reflected in the open-ended data. Several of the more-experienced participants expressed the need for paraprofessionals existing because of a lack of their own adapted PE training. Common was the expression of trying to provide a quality learning experience to SwD and the necessity of the paraprofessional. One more-experienced physical educator wrote, “I have had no training in adapted PE, so I rely a lot on the paraprofessional. I regularly ask the paraprofessionals about behavior management techniques that worked well with specific SwD.” Thus for our sample, even though they were paid professionals, there was a collective sense of low competency for being able to deliver a satisfactory inclusive learning experience, without the aid of paraprofessionals. This is not surprising given the recent changes to school enrolments and the lack of professional development offered to teachers in Australia.

In terms of participants’ sense of satisfaction with the paraprofessional support when teaching SwD in PE, the majority of PE teachers either reported being ‘satisfied’ ( $n = 7$ ) or ‘very satisfied’ ( $n = 5$ ). This is understandable given the previous findings related to competency. Although, if PE teachers express low competency levels associated with teaching SwD in PE, the question could be raised as to their competency to judge the work of paraprofessionals. Participants frequently described the sense of commitment evident in paraprofessionals work with SwD in PE settings. This commitment was directed at ensuring that SwD had an enriching learning experience. Moreover, it seemed that without the paraprofessionals, participants perceived that SwD learning experiences would be of lesser quality. One experienced physical educationalist noted:

As I can only give a limited amount of personalized time to each student in the class, in any one lesson, SwD would not be able to get the most out of the lesson. These students require extra and repeated instructions to be able to complete tasks. The SwD would feel more comfortable and secure with their aid and more likely to become more involved. These are all skills that the paraprofessionals that I have worked with have demonstrated. They have always been supportive of my program and helpful in carrying it out.

Another less-experienced physical educationalist from an urban school wrote, “By having support available during the lesson the SwD are gaining the best possible outcome from an activity that is not necessarily planned or suitable for their level of ability.” Thus for participants who feel a lack of competency associated with SwD in a PE context, the paraprofessionals provide much needed support to ensure a quality learning experience. Nonetheless, participants indicated a level of ambivalence towards the inclusion of SwD into the PE curriculum. The challenges faced by PE teachers when teaching inclusive PE to SwD is well documented (e.g., Obrusnikova & Dillon, 2011). The theme of ambivalence present in our study was related to the impact of SwD on the learning experiences of general PE students. In some respect, the attitude reflected a behavior of integration of SwD, but not inclusion. In this sense, it appears that for some PE teachers, the SwD had to fit into the existing curriculum without modification. Participants indicating that they had not adopted curricula content that would allow SwD participate regardless of the presence of paraprofessionals. Thus, if paraprofessionals were not present, participants indicated that they would exclude the SwD in favour of ensuring a quality learning experience

for the general students. A less-experienced physical educator wrote:

Without the paraprofessional in attendance general students would be adversely affected in a group situation. No matter how patient and kind they are. Without a paraprofessional present, someone must miss out on teacher time, the child with the disability or the class.

Similar sentiments were expressed by an urban-based, more-experienced physical educator who noted:

The presence of the paraprofessional provides a constant for the student. Due to noise, tantrums, frustrations, defiance or whatever, behaviors are exhibited by the student at the time, the aide needs to remove him/her to benefit the learning opportunities of the class and to optimize safety for all.

Negative attitudes and behaviors towards SwD occur for many reasons, but SwD might internalize these negative attitudes if they experience being excluded because the paraprofessional is not present during their PE class. Such internalization can negatively affect SwD behavior, social relationships, education and health. Understanding the presence of negative attitudes held by PE teachers might be evident in the previous result of a lack of competency for teaching SwD. That is, PE teachers might feel overwhelmed by having to include SwD into their classroom and do not have a full understanding of the appropriate pedagogical techniques to ensure quality of learning. This rational has support with some participants indicating that paraprofessionals needed to upgrade their knowledge about creating and developing learning opportunities for SwD within the realm of the PE setting. A

more-experienced physical educator wrote, “The paraprofessionals that we have are excellent in every way but there is always room for more support and guidance/funding to making learning opportunities even more valuable for SwD and learning difficulties.” Thus, rather than the PE teacher seeking out professional learning so as to develop a better learning environment for SwD in PE, the participant PE teachers placed the onus onto the paraprofessional.

### *Section 3: Use*

Participants were asked to indicate how often their paraprofessionals completed nine separate tasks that paraprofessionals might typically perform in an inclusive PE setting. Furthermore, they were asked to rank these tasks based on their importance within the curriculum. For the most part participants were agreeable (‘often’ was the most frequent response) with the regularity in which their paraprofessionals completed these PE-related tasks. Nonetheless, tasks such as setting up materials and equipment ( $f= 8$ ), administering tests ( $f= 12$ ), and planning learning activities ( $f= 13$ ) were the three tasks that received negative responses of ‘rarely’ and ‘never’. Perhaps if paraprofessionals received training in PE during their professional development they could contribute to these areas and foster a more inclusive PE environment for SwD (Hardy, 1980).

In terms of ranking the importance of these tasks the ability to use guidelines set by the PE teacher was the highest ranked role ( $n = 7$ ), followed by physically assisting SwD ( $n = 4$ ), and providing 1:1 instruction ( $n = 4$ ). These rank orderings were further described as a function of years of teaching experience. The more-experienced PE teachers expressed that having paraprofessionals follow guidelines they set was the most important, while the less-experienced teachers noted that providing 1:1 instruction to the SwD was of most value. The bottom three ranked tasks reported by the sample were planning learning activities ( $n = 12$ ), administering tests ( $n = 10$ ), and setting up materials and equipment ( $n = 9$ ). These lower

three rankings were reported the same regardless of teaching experience. Taken collectively these data indicate that the PE teachers recognize that the paraprofessionals, who are not trained in PE, do not have much to contribute in ways of PE-specific responsibilities. They are more likely to use these individuals as an 'extra set of hands' to perform tasks that are more closely related to those of a care-taker, rather than those of an educator.

In their open-ended responses, participants identified other roles that paraprofessionals fulfill in PE settings. PE teachers frequently commented that paraprofessionals helped SwD integrate with the general students. A more-experienced physical educationalist wrote:

The paraprofessionals assist SwD to combine well with general class students especially in group activities. Paraprofessionals lead SwD through daily PE activities or provide the child with an alternative activity. For example, paraprofessionals will continue with daily bike riding skills, first taught by the PE teacher.... then passed onto the paraprofessionals to continue once skills were established.

In this case, the communication of responsibility between PE teacher and paraprofessional was an effective strategy for aiding in the skill development of the SwD. This demonstrates the proper use of paraprofessionals as an educational assistant to successfully implement inclusive PE.

#### *Section 4: Strategies*

Participants presented a variety of different strategies used to develop working relationships with paraprofessionals. These strategies centered on increasing paraprofessionals' knowledge about teaching PE and providing support in PE classrooms. Some expressed a desire for individualized or school-based training for paraprofessionals. For example, one more-experienced participant wrote:

There should probably be some general training but everyone works slightly differently and students' needs vary so the teacher and the paraprofessional need to work together to decide how best to operate for the success of the students. I believe it comes down to our 'Advanced Skills Teacher' or 'Assistant Principal' in arranging professional learning time to train in this area.

Alternatively, others felt that the PE teacher should be responsible for this training. This is an interesting theme as the majority of participants felt they were not competent to teach SwD. One more-experienced participant noted:

I personally feel I train the paraprofessionals to do what I think is the right thing to do, however I think I just use a common sense approach, which may not necessarily be right. With appropriate PE teacher training it is probably their job to help the aide to teach in the way they want, however a professional body to do the job would be best.

Regardless of the variety of responses, the lack of an identified training process for paraprofessionals and PE teachers for teaching SwD is evident. This lack of a training process suggests that teacher registration boards need to give more direction to teacher training programs and schools about inclusive PE.

When asked if their paraprofessionals had taught the physical educators anything about teaching SwD, 11 out of 14 participants indicated 'yes'. In terms of what was taught, participants wrote about learning appropriate behavior management strategies for SwD, ways of connecting and communicating with SwD, as well as individual characteristics of certain disabilities. One participant noted:

One of our paraprofessionals has worked with the same boy since kindergarten (now in grade 11) so she knows his cues and medical needs better than just about anyone and has excellent advice for ways to try things and go about activities such as the verbal and non- verbal cues that can be used, particularly those on the autism spectrum.

This last piece evidence indicates that a successful working relationship will not only benefit the paraprofessional and the PE teacher, but most importantly the SwD. For example, in terms behavior management the most successful strategy is a consistent one that can be applied throughout the course of the school day. Since the paraprofessionals are typically with the SwD throughout the day, they can effectively communicate the behavior management plan to the PE teacher. This would allow for a working relationship to blossom; and ultimately compel the PE teacher to respect the paraprofessional as an integral part of the service delivery model for SwD.

## **Conclusion**

In this exploratory study it was our aim to provide a snapshot of how Australian PE teachers describe their working relationships with paraprofessionals when teaching. It should be noted that the interpretation of these data should be done with caution as our sample size was limited. This was reflected by our low response rate which may have been attributed to negligence of this area of inquiry on the part of the population, or perhaps do to a lack of support in terms of having paraprofessionals in some school districts. Regardless of their level of teaching experience or university training, none of the physical educators in our sample felt very competent in teaching PE to SwD. Thus, there was a strong theme of needing paraprofessionals for PE settings when SwD were present. This theme is not

reflected of Maurer (2004), who noted that American PE teachers believed paraprofessionals were not required in general PE because they demonstrated a lack of initiative, they were incapable of assisting, and they did not know what to do. Our sample, while supportive of the use of paraprofessionals in PE, showed an ambivalent attitude towards inclusion, with an attitude that paraprofessionals needed more professional development to improve the quality of the learning experience for SwD.

Evident in our study, is a lack of confidence in PE teachers to deliver quality learning experiences to SwD in a PE setting. Moreover, it seems that there is a heavy reliance on paraprofessionals to do the heavy lifting in terms of teaching SwD in PE. A major concern for paraprofessionals about their role in PE has been their lack of training and knowledge of the PE curriculum (Horton, 2001). Thus, planning learning activities and administering tests appropriate to curriculum standards and SwDs' ability have been identified as posing problems for paraprofessionals, and the current participants have highlighted this.

Paraprofessionals appear to be doing well supporting SwD in Australian inclusive PE settings considering their lack of appropriate training and curriculum knowledge, and PE teachers believe they are utilizing them well. Paraprofessionals provide a level of support that is generally to the satisfaction of PE teachers in charge of the class. Nonetheless, PE teachers' consistently provided many areas for improvement in paraprofessionals' skills and knowledge. Physical educators too can do more to better utilize the needed resources of paraprofessionals when teaching SwD in PE classrooms. This fundamentally comes down to communication with the paraprofessional about the SwD, assigning specific tasks for the paraprofessional to complete with the SwD throughout the lesson or unit and specific training on how to better utilize the paraprofessionals in PE.

Additionally, PE teachers need to work on strategies to improve their professional relationships with paraprofessionals to better the PE experience for SwD. Future implications

of this research could be the development of appropriate training courses for paraprofessionals highlighting the specific target areas of assessment in PE and developing appropriate learning activities for the SwD in PE. Training may include ways to more successfully communicate with PE teachers regarding SwD needs, the problems and pitfalls associated with learned helplessness and dependence on the paraprofessional (Goodwin, 2001), how to facilitate SwD interaction with their peers to help them foster social situations (Causton-Theoharis & Malmgren, 2005), to help SwD avoid social isolation by facilitating peer interaction time (Tews & Lupart, 2008), and to enhance their level of understanding of PE content and requisite physical abilities that SwD might encounter throughout a specific lesson. PE teachers and paraprofessionals alike need to take on more responsibility when it comes to providing SwD a PE, something that could greatly improve the quality of life of SwD. Because as SwD get older, self-reliance and increased levels of self-dependence should be a tenable goal that can be fostered through PE development (Natterlund, Gunnarsson, & Ahlstrom, 2000).

The vast majority of literature pertaining to paraprofessionals in PE is presented from an American viewpoint, where education of SwD is somewhat different to education of SwD in Australia. United States legislation employs a 'least restrictive environment' policy, in which SwD are placed in inclusive PE on a continuum, depending on the severity of their disability (Block & Krebs, 2011). Australia's PE for SwD is somewhat dichotomous; it is either segregated, or inclusive and the severity of the child's disability and degree of social maladjustment have both been identified as important factors in determining the segregated or inclusive placement of individuals (Thomas & Loxley, 2001). Hence, with limited Australian literature on paraprofessionals to use as a foundation for the study and no definitive national curriculum model or policy that facilitates inclusion the need for

expansion in this area of research inquiry is imperative to facilitate successful inclusion practices in PE in our nation.

**Abstract**

Researchers used a purposive sample of pre-service physical education teachers ( $N=56$ ) from two different Universities to explore differences in perceptions of teaching to children with ADHD and autism in physical education. A modified version of The Physical Educators' Attitudes Toward Teaching Individuals with Disabilities-III (Rizzo, 1993) instrument was used for data collection. Attitude differences were examined as a function of participants' gender, course work preparation, and experience teaching individuals with disabilities. Findings indicate that course work preparation was the only factor to moderate attitudes towards teaching students with autism and ADHD. Pre-service teachers' who received more training in adapted physical education had more favorable attitudes towards teaching students with autism and ADHD compared with the cohort who received less training. Discussion of the implications of this research for pre-service teacher training and development are explored

**Introduction**

Current Australian legislation indicates that students with disabilities (SwD) are to receive equal levels of physical education (PE) as their peers (Australian Human Rights Commission, 2008; Board of Studies New South Wales, 2008a; Board of Studies New South Wales, 2008b). Over the last five years, Australia has moved towards a more inclusive curriculum for SwD. This move has resulted in SwD attending inclusive schools and participating in the general curriculum. Despite paraprofessionals for SwD transferring to these schools, existing PE staff have received little or no training on how to appropriately include these students into the PE curriculum. There is paucity of literature within Australia dedicated to the intentions that pre-service PE teachers have towards including SwD in PE programs (Martin & Kudlacek, 2010). This disparity in research drives the necessity for further investigation into the adequate preparation of pre-service PE teachers to include SwD within the Australian teaching system.

**Background**

This dearth of literature is incomprehensible given the amount of adapted PE literature generated from and sourced in the United States of America regarding this topic (Casebolt & Rizzo, 2004; Folsom-Meek, Nearing, & Groteluschen, 1996; Folsom-Meek, Nearing, Groteluschen, & Krampf, 1999; Folsom-Meek & Rizzo, 2002; Hodge & Jansma,

1999; Hodge & Jansma, 2000; Hodge, Davis, Woodard, & Sherrill, 2002; Kowalski & Rizzo, 1996; Martin & Kudlacek, 2010; Rizzo, 1984; Rizzo & Kirkendall, 1995; Rizzo & Vispoel, 1991; Rizzo & Vispoel, 1992; Rowe & Stutts, 1987; Stewart, 1990). This research has investigated several independent variables to help understand the factors that influence PE teachers' (practicing and pre-service) intentions towards including SwD in a general PE class. Examples of variables include gender (Rowe & Stutts, 1987), perceived competence (Hodge et al., 2002), practicum type (Rowe & Stutts, 1987; Hodge & Jansma, 1999; Hodge et al., 2002), amount of practicum experience (Hodge & Jansma, 1999), severity of disability (Folsom-Meek & Rizzo, 2002, Rizzo & Vispoel, 1991, Rizzo & Vispoel, 1992), teaching experience (Rowe & Stutts, 1987) and types of academic preparation (West, 2009). Two of these variables have produced robust findings: the amount of pre-service teacher training and the severity of student disability. Thus, utilizing the theory of planned behavior (TPB: Ajzen, 1991) these two independent variables were the focus of this inquiry into Australian pre-service PE teachers. The hypothesis for this investigation was that a more comprehensive exposure (academic work plus practicum experience) to SwD training for pre-service PE teachers' will result in significantly more favorable intentions towards teaching SwD. It was also of interest to the authors to learn if the pre-service PE teachers' intentions were affected by the severity of student disability.

## **Method**

### **Participants**

The sampling design was purposive. The criteria established for an Australian university to be included in the study were: a) offer a PE degree b) offer an introductory adapted PE course with a corresponding practicum component c) a unit coordinator willing to ask students involved in the introductory adapted PE course to participate, and d) a unit coordinator willing to aid in the distribution of surveys. Two Australian universities were

found suitable for this study. Participants were 56 pre-service PE teachers enrolled in an introductory adapted PE unit from either the University of Tasmania (UTAS) or Latrobe University at Bendigo (LUB). The LUB participants ( $n=25$ : female=14, male=11) were in their third and fourth year of teacher education, and UTAS participants ( $n=31$ : female=13, male=18) were in their third year of their teacher education. Each participant provided informed consent in accordance with the University Human Ethics Committee procedures.

### **Academic preparation for teaching SwD**

The two cohorts of participants were both undertaking an introductory adapted PE unit at university. However each cohort received different education in terms of their academic preparation. During their adapted physical activity unit the UTAS cohort received lecture content (13 hours) on disability sports, pedagogical styles and strategies through participating in developmentally appropriate games, assessment in the motor and fitness domain, behavior management, and adapted aquatics. Moreover, these students were exposed to specific disability content concerning autism spectrum disorders, intellectual disabilities, sensory conditions, and neuromuscular conditions. The UTAS cohort also underwent a five hour practicum experience at a segregated school for SwD, This included observational learning and teacher-assisted learning. Assessment for the unit included responding to a case study vignette about a hypothetical SwD, producing an annotated bibliography of a specific disability, and a comprehensive final exam.

The LUB cohort also had completed a unit in adapted physical activity. During this class they experienced 13 hours of lecture content consisting of labelling theory, development of an individual program, program support group strategies, medical and safety considerations, understanding the child with a disability, individual program goals, and modifying participation. The following disabilities were incorporated into the coursework: physical disability, visual impairment, severe behavior disorder, hearing impairment,

intellectual disability, and autism spectrum disorder. The LUB pre-service teachers participated in a 40 hour practicum located at both segregated and inclusive PE classes around the community. Pre-service teacher responsibilities included observational learning, assisted teacher learning, one-on-one instruction for a SwD in the class, and lesson development for this student. Assessments involved in this unit were a presentation and a reflection of their practicum experiences. The presentation involved the participants presenting an adapted PE lesson for their SwD. The lesson included a warm up, skill development, and a group game. The second assessment, the practicum experience reflection, involved the LUB cohort to plan, implement, and evaluate a PE unit including SwD within their school practicum setting. The characteristics, cause, etiology, prognosis, implications for PE, recommended activities, effective teaching strategies, and positive behavior management strategies were all included in this assignment.

### **Instrument**

To test the hypothesis in this study a modified version of the Physical Educators' Intention Toward Teaching Individuals with Disabilities (PEITID) survey was used (Tripp & Rizzo, 2006). The TPB (Ajzen, 1991), an extension of the theory of reasoned action (Ajzen & Fishbein, 1980), was the foundation of this survey. That is, intentions of the participants were measured by a six factor construct: behavioral beliefs (BB), attitude toward the behavior (ATB), normative beliefs (NB), subjective norm (SN), control beliefs (CB), and perceived behavioral control (PBC). The survey contained 35 belief statements which individually loaded on one of these factors. Participants responded to each belief statement by demonstrating their level of agreement using a 7-point Likert scale (1 = strongly disagree to 7 = strongly agree). The original survey measured participants' intentions towards teaching PE to a student with attention deficit hyperactivity disorder (ADHD). To determine if severity of student disability played a role in the intentions of pre-service PE teachers a vignette

portraying a student with autism was added to the survey. The autism vignette was kept to the same structure and outline as the ADHD vignette. Therefore, participants were asked to respond to the same 35 Likert-scale belief statements for both disability vignettes, the less severe disability (ADHD) and the more severe disability (autism). These data were subject to data analysis according to the six factors, instead of the 35 belief statements.

### **Procedures**

During a pre-determined class time the participants were handed an information sheet and told about the nature of the study. Once informed consent was obtained from each participant, the unit coordinator distributed the survey. For those students who were absent the day of data collection, a copy of the information sheet, consent form, and survey was sent to each student with a stamped return envelope. The overall response rate for this data collection was 82 per cent. All participants were notified that participation was completely voluntary and all responses would remain strictly confidential. The survey took approximately 30 minutes to complete.

### **Data Analysis**

#### ***Reliability***

Reliability correlation coefficients were calculated for the original Likert scale responses and the six factor structure (ADHD vignette) to measure consistency and accuracy of the PEITID. Furthermore, this was calculated for the modified version of the survey (autism vignette) to test the reliability of this revised portion. Cronbach's alpha coefficient was used as an index of overall reliability, as it is the recommended measure of consistency for attitude scales (Thomas & Nelson, 2001). Alpha for the responses to the 35 ADHD vignette belief statements was 0.84, and was 0.71 for the summative six factors. The 35 autism vignette belief statements revealed an alpha coefficient of 0.83, and 0.75 for the

summative six factors. These coefficients are similar to past reports of reliability using the PEITID to measure intentions for teaching SwD in PE (e.g., Oh et al., 2010).

### ***Inferential Statistics***

Independent samples t-tests were run using group (UTAS, LUB) as the independent variable for each of the six TPB factors (BB, ATB, NB, SN, CB, and PBC) separately for the ADHD and autism portions of the survey. This allowed us to statistically analyze our hypothesis concerning the academic preparation and its effect on the intentions of our sample. The effect of the severity of disability on intentions was inferred by comparing the number of statistical findings between the two versions of the survey (ADHD and autism). Alpha was set at 0.05 with a Bonferroni adjustment for multiple t-tests (Keppel, 1991). All statistical procedures were carried out utilizing SPSS software (version 21). Given the use of a 7-point scale to measure attitudes, intentions, and beliefs, and the guidelines for assessing the meaningfulness of effect sizes between groups in educational settings (Coe, 2002), we set an *a priori* effect size of 0.80 or above as a limit for meaningfulness (47% non-overlap). This effect size was based on the costs associated with adding training into curriculums for pre-service teachers.

### **Results**

For the original version of the survey (ADHD vignette) effect sizes between cohorts across all factors ranged from 0.29 to 0.90. Only one of the factors, ATB, significantly distinguished between the two groups (Table 1). The LUB cohort reported a significantly more positive attitude,  $t(54) = 3.27, p < 0.05$ , toward teaching a student with ADHD than the UTAS cohort. In terms of effect size for this factor, the LUB's mean score for ATB of teaching a student with ADHD is approximately equal to the 70<sup>th</sup> percentile for the UTAS cohort. Apart from the BB factor, all other effect sizes between the cohorts were deemed to lack meaningfulness.

Table 1. Theory of Planned Behavior Factors for the ADHD Vignette\*.

	UTAS ( $n=31$ )	LUB ( $n=25$ )	Effect (Cohen's $d$ )
Behavioral beliefs	4.61 (0.96)	5.03 (0.67)	0.84
Attitude toward behavior	5.63 (1.12)	6.45** (0.62)	0.90
Normative beliefs	5.61 (1.05)	6.01 (0.82)	0.42
Subjective norm	4.77 (0.59)	4.95 (0.62)	0.29
Control beliefs	3.88 (0.93)	4.19 (0.78)	0.36
Perceived behavioral control	5.53 (1.10)	6.04 (0.82)	0.52

\* Values are represented as means (SD).

\*\*Indicates the LUB was significantly higher than the UTAS cohort ( $p < 0.05$ ).

For the autism version of the survey, effect sizes between cohorts across all factors ranged from 0.17 to 0.84 (Table 2). Although two factors (BB and ATB) were significantly different between the cohorts, the ATB factor,  $t(54) = 2.45$ ,  $p=0.02$ ,  $d=0.67$ , did not reach our *a priori* effect size ( $d=0.80$ ) cut off. The LUB cohort had significantly more positive BB,  $t(54) = 3.15$ ,  $p < 0.05$ , about being able to teaching a student with autism than the UTAS cohort. Apart from the BB factor, all other effect sizes between the cohorts were deemed to lack meaningfulness.

Table 2. Theory of Planned Behavior Factors for the Autism Vignette\*

	UTAS ( <i>n</i> =31)	LUB ( <i>n</i> =25)	Effect size (Cohen's <i>d</i> )
Behavioral beliefs	3.98 (0.78)	4.64** (0.78)	0.84
Attitude toward behavior	5.33 (1.28)	6.07* (0.86)	0.67
Normative beliefs	5.47 (1.07)	5.72 (0.93)	0.24
Subjective norm	4.79 (0.63)	4.90 (0.63)	0.17
Control beliefs	3.41 (0.78)	3.74 (0.79)	0.42
Perceived behavioral control	4.89 (1.08)	5.47 (1.03)	0.54

\* Values are represented as means (SD).

\*\* Indicates the LUB was significantly higher than the UTAS cohort ( $p < 0.05$ ).

## Discussion

The purpose of this study was to investigate if Australian pre-service PE teachers' beliefs, attitudes, and intentions about teaching inclusive PE to SwD was influenced by the amount of academic preparation they received during their PE pre-service teacher training. In this study we compared two university cohorts with differing amounts of pre-service teacher training associated with SwD and found that both groups in general had favorable dispositions towards teaching SwD. Nonetheless, the university cohort who received more intensive pre-service training in teaching SwD had more favorable beliefs, attitudes, and intentions than the less-trained cohort.

For the ADHD scenario, both groups reported favorable attitudes but the LUB cohort had significantly more favorable attitudes towards teaching SwD than the UTAS cohort. This finding is interesting as attitude toward a behavior (ATB) is determined by the total set of accessible behavioral beliefs (BB) linking the behavior to various outcomes and other attributes, yet we found no significant difference associated with any other factor for this disability. Our result suggests that a more comprehensive pre-service training experience in

adapted PE can lead to more favorable attitudes towards teaching SwD, which in turn is theorised to influence intention, and finally actual behavior. This finding supports previous work in this area (Kowalski & Rizzo, 1996; Rizzo, 1984; Rizzo & Vispoel, 1991; 1992), which purports that it might be a combination of teaching experience and academic preparation that affect attitudes towards teaching SwD. We believe this to be true of our sample.

In comparison to the students from UTAS, the LUB cohort received more practical experience during their pre-service training. More specifically, not only did these students have more practicum time learning and teaching in inclusive settings, they were also required to present to their university classmates a suitable lesson for SwD that they used while on their practicum, thus providing an opportunity for application and meaning to their learning. Furthermore, they were required to develop specific activities and teaching strategies for one of the SwD in their practicum. Moreover, the LUB pre-service teachers had to work closely with this student throughout their practicum experience. This type of learning strategy potentially helped the LUB pre-service teachers learn about the abilities and needs of SwD, while not being overwhelmed with the responsibility of teaching an entire inclusive class. This progressive introduction to adapted PE might have benefitted the LUB pre-service teachers' attitudes towards the behavior of teaching an inclusive PE class.

Similar as to the ADHD scenario, both university cohorts reported favorable attitudes, intentions, and beliefs associated with teaching a student with autism. Notably BB and ATB significantly differed in this scenario. Nonetheless, the effect size for the factor of ATB did not reach our criteria to be meaningful. Regarding the BB factor the LUB cohort had significantly more favorable beliefs towards teaching a student with autism. This result might be attributed to the more comprehensive exposure to SwD training experienced by the LUB cohort. Our conclusions are congruent with previous research (Oh et.al., 2010), who reported

that BB were influenced by a more comprehensive training program which included additional special education coursework and practical experience teaching SwD. This was evident in the training of the cohort from LUB, but not the case for the cohort from UTAS. It was noted that the training received by the UTAS cohort was based on a theoretical approach as opposed to more experiential learning. This could have contributed to their lack of confidence when confronted with a scenario of having to include a child with a more severe disability, such as autism. Therefore based on their training the UTAS cohort might have perceived they were inadequately prepared to teach SwD of a more severe nature. Thus we believe that to improve pre-service PE teachers' intentions towards teaching students with severe disabilities, such as autism, requires a more comprehensive undergraduate training program.

Taken collectively, the findings of the present study suggest that a more comprehensive pre-service PE teacher training program is warranted in Australian universities. These results suggest an increase in the amount of adapted PE practicum and additional academic preparation might positively influence pre-service PE teacher's intentions towards teaching a SwD, which in turn can have a positive effect on the inclusive PE curriculum representative of 21<sup>st</sup> century schools. Notwithstanding there were limitations to this research. For example, the small sample was purposive and not random; therefore questions about the representation of the population persist. Generalisations of these data should be used in caution due to this confounding variable. Nonetheless, the data collected from the current research study has the potential to add to the paucity of adapted PE literature emanating from Australia. For one, further data analysis techniques could be applied to this data set and to future data from similar samples in terms of correlations and forward stepwise multiple regression procedures to describe relationships between demographic variables, and

to predict and analyse the interaction of pre-service teachers' intentions towards teaching SwD, respectively.

In conclusion, the results from this study have the potential to fill several gaps in the professional preparation adapted PE literature, and more importantly they might help to demonstrate the need for training Australian physical educators how to appropriately include SwD in inclusive PE classes. This might catalyse educational leaders to change policy pertaining to hiring of personnel professionally prepared to include SwD in inclusive settings. Furthermore university faculties of education that now must contend with the inclusion movement could benefit from this research as it evaluates the current accepted Australian curriculum and identifies needed professional learning areas. Ultimately the resulting university curriculum might more effectively support pre-service teachers and fulfil their requirements. Therefore, SwD might directly benefit from the projected increase in teacher training, skill level, and their confidence.

## **Abstract**

Record keeping is a strong instrument for keeping an organization alive and healthy. It is the only veritable tool for keeping the government and the nation informed as to the need or otherwise of further investment in education and other economic subsectors. It provides the direction as well as the dimension of such investment. Education has not been adequately utilized to effect national transformation and social reconstruction in the third world nations due to poor record management in the educational sector. Management, administrative, teaching and non-teaching staff need to be groomed in area for excellent education. The study examined qualitative record management skills for effective service delivery in Nigeria tertiary education system. A descriptive survey design was employed. Two hundred respondents (100 senior lecturers and 100 deputy registrars) from five institutions out of the thirty-six tertiary institutions in the South – East Geo-political zone of Nigeria were used for the study. Four research questions guided the study. Forty-three item structured questionnaire built on a 4-point scale was used for data collection. Three experts in Educational management and Educational measurement and evaluation validated the instrument. Reliability index value of 0.86 was obtained using Cronbach alpha technique. Mean and grand mean were used for data analysis. Findings revealed that the expected statutory records are available to high extend, status inadequate and obsolete, personnel possess the expected record management skills to a low extent and way forward was identified. Recommendations include regular record management workshops for both the senior academic and administrative staff.

Keywords: Records, Management skills, Service delivery, Tertiary education, Qualitative and Educational system.

## **Introduction**

Records and its management are not only essential to the existence of man but very crucial to the well-being of nations, educational system and its good performance. In spite of the cruciality of quality record management on the capacity of the nation's education ministries, boards, commissions and agencies in the successful planning and administration of education and effective resources management, it has become a problem area in the management of education, not only in Nigeria but in other developing nations. This perhaps is because of apathy, capacity gap or lack of proper understanding of record life cycle on the part of those saddled with the responsibility of records management. Those saddled with these onerous tasks are all personnel involved in the administration of educational organization. The educational administrators, administrative officers and teaching staff who are involved in one activity or the other are expected to be well equipped in records keeping skills and records maintenance culture skills. They are expected to have good knowledge of what records are, purposes of keeping records, skills for keeping and retrieving records, modern methods and technologies of managing same, the implications on the school and the educational system as a whole. The management of school organization should ensure that these skills are regularly updated in line with modern labour market. The e-record management skills are not left out.

## **What is Record?**

Records according to Obi (2010) are documental proofs of a transaction. The record can be a written document where the activities of a school or educational agency are written. Educational institutions are charged with the responsibilities of teaching, researching and provision of learner's friendly environment. In the discharge of these functions, many activities are involved and these must be recorded and properly managed for future reference and utilization. Ajayi and Oluchukwu (2011) define record management as the process of arrangement records, careful recording of the vital information in the records and retrieval when need be. Record management is therefore, the application of systematic and scientific control to all the recorded information that an organization needs to do and improve business.

## **Types of Records**

Those involved in record management must be conversant with two major types of records vital for efficient and effective national education system. There are records that are required by law in every institution and there are ones not required by law but are essential to be kept by school administrator. The records required under law are known as statutory or mandatory or obligatory records. While those not under law but are kept for efficiency and effectiveness of the school system are called non-statutory or non-mandatory or non-obligatory records.

### **Statutory**

Admission list records  
Students class attendance records  
Diary of work  
Time – table  
Lesson Notes/Plan  
Teachers Class attendance records  
Continuous assessment records  
Log book  
Punishment records  
Transfer records  
National policy on Education  
Teachers Service Manual  
Student handbook  
Staff records  
Staff condition of service

### **Non-Statutory**

Record of physical development.  
Inventory  
Stock records  
Minutes  
Schedule of duty  
Health records  
Movement books

The operation of education system in Nigeria both at the federal, state or local government levels is guided by law. The education law provides basis for statutory records.

### **Attributes of a Good Record**

Record management skills demand for good knowledge of attributes or qualities of a good record. A good record possesses the following attributes.

Easy storage	Comprehensive
Easy retrieval	Systematic
Easy understanding	guidance oriented samples
Easy interpretation	Cumulative
Easy Location	Objective
Easy access	information classification
Well packaged	Modern and up to date action taken oriented

Well packaged complete information about an event must be capable of generating further information necessary for appropriate action taking (Okolo, 2011).

### **Status of School Record Maintenance in Nigeria Educational system:**

In the three major levels of education in Nigeria, both the statutory and non-statutory records are still mainly manually maintained and are stored as hard copies. Okafor (2010) reports that one of the glaring problems facing the management of education in Nigeria is lack of maintenance culture. This is still so, even when government makes funds available for the provision of school facilities, learning and teaching resources. Examples are inadequate number of cabinets, stationeries, file jackets, computers etc. Only in H.O.Ds Deans, Directors and key administrative officers' offices are these facilities available. The available ones are in bad shapes due to poor handling and management. Adedeji (2006) laments on the negative impact of poor status of records in achieving excellent Nigerian educational system

Some of problems associated with Record Keeping in Nigeria educational system depict the status the status records include:

Incomplete and unreliable sources of data

Improper entries

Inaccurate entries

Incorrect entries/documentation

Poor/inadequate storage facilities

Unnecessary duplication of records

Organized falsification of data

Lack of training on school record keeping skills

Ignorance on the part of heads of institutions to see the need of record keeping

Non-standardized or seldom standardized documents for record keeping

Increasing retention of useful but outdated records

Lack of safe guards, on the confidentiality and accuracy of the record

Poor record classification skills (Igwe, 2004).

### **Qualitative record management skills**

Knowledge and information are modern tools for empowering individuals and groups.. School administrators need adequate knowledge and information on record management. Their professional competence should be judged by both leadership style level as well as record management skills. No one tree can make a forest. They alone cannot keep and manage records within the institutions. They should, therefore, ensure that their staff are regularly updated and enabled to acquire the new skills for record management effectiveness. Akpakwu (2012) is of the opinion that the record management updating skills should reflect.

1. filing systems – cabinet, drawers and shelves
2. use of computers and ICT technologies
3. avoiding mutilation of the records
4. classification of records
5. ensuring that top secret files are kept etc.

### **Expected Computer- Assisted- Record Management Skills**

There is no gain saying that a computer system is a useful tool for fast data processing. Computers are very dependable, versatile, secured, and modern tool for solving modern challenges. In the modern world, computer literacy helps staff to keep records electronically. Lecturers can package their lesson note in software (softcopies) and make them available as synchronous or asynchronous learning tools. Admission activities and issues should be best done online for security reasons and means of easing stress and congestion. Internet services and online activities reduce stress on administrative activities. It makes records portable and easily transferable. It also promotes accurate data, speed, and good status.

Tertiary institution being superior to the other levels is expected to take the lead in managing records for quality service delivery in the three levels.

The problem of the study is that records are not adequately being managed in three levels of education in Nigeria. Records are not adequately available and accessible at the point and time of need. Available ones appear to be in bad shapes. Unreliable data and information kept about the school system appear misleading and seem to be responsible for poor service delivery-educational system in majority of third world nations.

The paper, therefore, examined qualitative record management skills for effective service delivery in tertiary education institutions in Nigeria. Specifically, perceptions of senior lecturer and deputy registrar cadres in tertiary institutions were sought.

### **Research Questions**

1. To what extent are the statutory records available in Nigerian tertiary education institutions?
2. What are the status the records in tertiary in institutions in Nigeria?
3. To what extent does the teaching and non-teaching staff possess record management skills for quality service delivery in Nigerian tertiary education?
4. In what ways could the skills of managing records in tertiary institution been enhanced for quality service delivery in Nigerian educational system?

## Method

The study adopted a descriptive survey design. Simple random sampling technique was used to select ten institutions from a total of thirty-six public tertiary institutions in the south east geopolitical zone in Nigeria. Ten senior lecturers and deputy registrars were sampled from each of the schools using simple random sampling technique. This gave a total sample size of 200 respondents made up 100 senior lecturers and 100 deputy registers.

Researchers' self-structured 43-item questionnaire built on 4-point rating scale was employed for data collection. The instrument was subjected to content and face validity by experts and reliability index values of 0.88, 0.822, 0.80 and 0.85 were obtained. With the help of 5 trained research assistants, the researchers administered 200 copies of the instrument to 200 respondents and 100% return was made. This was used for data analysis. Mean and grand mean were used for the analysis of data.

**Table 1: Extent of availability of statutory records in tertiary institutions in Nigeria**

S/N	Item	Lecturers	Deputy Registrar	Decision
1	Admission records	3.88	4.00	HE
2	Students' progress & withdrawal records	3.06	3.35	.E
3	Staff personal records	3.25	3.22	HE
4	Log book	3.45	3.56	ETE
5	National policy on education	2.10	2.37	LE
6	Student Hand Book	4.00	4.00	HE
7	Staff conditions of Service handbook	3.86	3.95	HE
8	Payment records	4.00	4.00	HE
9	Lesson note	3.97	3.25	HE
10	Physical plant record	2.44	2.30	LE
11	School time table	4.00	4.00	HE
12	Continuous assessment records	3.64	2.55	
13	class attendance records	2.76	2.84	HE
14	NUC Minimum standard record	4.00	4.00	HE
	Grand mean	2.97	3.39	

Table 1 revealed grand mean of 2.97 and 3.39 opinion rating scores of senior lecturers and deputy registrars respectively on extent of availability of the enumerable statutory records for quality service delivery in Nigeria tertiary education. Only three out of the fourteen items scored below the 2.50, the weighted mean, indicating that the 12 items are kept and are available for quality service delivery in Nigeria tertiary education.

**Table 2: Status of records in tertiary education institutions in Nigeria**

		Lecturers	D. Registrars	Decision
1	Records are often kept in shelves/ drawers	4.00	4.00	Agree
2	Records are kept mostly in cabinets	4.00	4.00	Agree
3	Records kept depict mostly incorrect entries	2.76	2.63	Agree
4	Records are rarely electronic	3.32	3.40	Agree
5	Records are most often -falsified	3.10	3.17	Agree
6	Records are most often not mutilated	2.44	3.22	Agree
7	Records are most often accurate	2.58	2.61	Agree
8	Records are mostly in hard copies	4.00	4.00	Agree
9	Records are rarely in soft copies	3.23	3.15	Agree
10	Records are rarely accessible to users	2.88	2.73	Agree
	Grand mean	3.23	3.29	

Grand means of 3.23 and 3.29 for the senior lecturers and deputy registrars respectively indicate general agreement with the ten items as the present status of record documentation in tertiary institutions in Nigeria. The implication is that records management status is still very poor and archaic. It is characterized by inaccuracy, mutilations and absence modern tools.

**Table 3: Extent of possession of the Record management skills vital for quality service delivery in tertiary institution by staff**

S/N	Item	lecturers	Deputy Registrars	Decision
1	Skill of filing (cabinets drawers and shelves)	3.06	4.00	High Extent
2	Computer literally skill	2.19	2.41	Low Extent

3	ICT tool literacy skill	2.25	2.37	Low Extent
4	Use of audio and video cassettes skills	1.00	2.06	Low Extent
5	UBE flash or CD rom skills	2.33	2.56	Varied opinion
6	Avoiding mutilation of records skills	2.44	2.25	Low Extent
7	Skill of quality classification	2.05	2.41	Low Extent
8	Skill of keepi9ng non falsified records	2.52	2.58	High Extent
9	Skill of maintenance culture	1.76	1.33	Low Extent
10	Skill of updating records.	2.22	2.39	Low Extent
	Grand mean	2.06	2.44	

Result in table 3 revealed grand means of 2.06 and 2.44 for the two respondents. The grand means fall below the weighted mean, indicating that the staff of tertiary institutions in Nigeria possess the ten items on record management skills to a low extent. This indicates low extent possess of the skills vital for effective service delivery in the educational system.

**Table 4: Way forward for enhancing staff record management skills**

S/N	Compulsory	Senior lecturer	Deputy .registrar
1	Computer literacy education.	3.60	3.98 agree
2	ICT tool literacy education	3.70	3.86 agree
3	Sponsorship of staff attendance to conference working for the skills acquisition	4.00	4.00 agree
4	ICT centers in every institution	3.09	3.38 agree
5	Free access and utilization of ict centers	3.88	3.95 agree
6	Possession of laptop as a pre-requisite for employment	3.60	3.03 agree
7	Possession of laptop as pre-requisition for student admission	2.95	2.80 agree
8	ICT technical instructors in every department.	3.09	3.15 agree
9	Encouraging e-records	3.91	3.77 agree
	Grand mean	3.54	3.19

The results in table 4 above revealed senior lecturers and deputy registrars mean scores on a way forward to ensuring qualitative record management skills. The nine items enumerated scored above 2.50 for both senior lecturers and deputy registrars. The indication is that all the 9 items could serve as a way forward in achieving qualitative record management skills for effective service delivery in Nigeria tertiary education system.

### **Discussion**

The study revealed availability of a good number of statutory records in tertiary institutions in Nigeria. The implication is that management of tertiary institution are very conscious and obedient to education laws with respect to record keeping. The findings are in line with Igwe, (2004) that identified various relevant records that must be kept in Schools for efficiency and effectiveness. Ajayi and Oluchukwu (2002) emphasize that non-availability of these records has legal implications on both staff and the students.. Some of these records are admission list, students and staff records etc.

The findings that senior lecturers and deputy registrars perceive the ten items investigated as being the status of record keeping and record management level is not surprising. The status is described as very poor and inadequate because all the items scored above 2.50. It was observed that records are not readily accessible as at when need be, records are still mainly in hardware/copies indicating not moving with modern trends. There are still great indication of high rate of mutilation of data, and falsification of data. Records keeping are still mainly by analogue approach. No wonder Ajayi and Oluchukwu Lamented that record keeping in Nigerian educational system is mainly by the use of cabinet, shelves and drawer. Adedeji (2006) frowned at poor status of record in Nigeria educational system. He emphasized on the negative implication on effective service delivery.

Both senior lecturers and deputy registrars were of the opinion that qualitative management skills elements identified for effective service delivery are still absent. Eight items out ten items scored below the acceptable mean, implying low extent possession of the skills. The only two skills possessed by the staff to high extent are the drawers/shelves/cabinet filing system and keeping records in hardcopies. Okolo (2011) are of the opinion that both teaching and non-teaching staff need these skills in their daily activities in educational sector. He also lamented that inadequate record management skills have led to falsification of information

and mutilation hence unreliable data for quality decision making. Present day staff appears to lack the right mind and conscience as record management skills for maintaining unadulterated and impeccable records.

The findings in table 4 revealed nine strategies as well as a way forward towards qualitative record management skills needed by academic and non-academic staff for effective service delivery in tertiary education institutions. Some of these strategies include compulsory computer literacy skill, compulsory ICT tool literacy skill, and skill of owning of a laptop as a pre-requisite for academic and administrative duties. These will of course promote skills and interest in e-records. These findings are confirmation of recommendations of Ememe, Egu and **Njoku (2009)**, who identified some of the above factors as means of improving records management for effective service delivery in junior secondary schools. These also agree with the findings of **Okolo (2011)** that staff adequacy in ICT tools literacy and new technologies skills are paramount in moving with trends in promoting excellence in national education.

### **Conclusion**

Records keeping skills and maintenance culture are basic in achieving qualitative record management for effective service delivery in education system. The study examined the concept of records, types records that must be available in educational institutions at all cost. The status of record management was found grossly inadequate. Their management skills imperative for achieving effective service delivery were identified and the extent of possession of the skills were found inadequate. Solutions for attaining the needed skills were proffered as strategy or way forward.

### **Recommendations**

Based on the findings:

The management of tertiary institutions should ensure that teaching and non-teaching staff are empowered to acquire basic computer literacy skills and record management skills for quality processing of basic information, recording of every activity that relates to teaching and learning for effective service delivery.

E-records documentation of every aspect of tertiary institution activities recommended.

Government should ensure that every tertiary institution has a befitting data base and ICT centers. These should be made very accessible to both teaching and non-teaching staff including students.

Staff attendance to workshop on record management should be encouraged by making available to them sponsorship fund.

Record management skills should be part of annual appraisal items.

Every office of senior lecturers and deputy registrars should be adequately furnished with basic ICT tools necessary for encouraging e- documentations.

### **Abstract**

Youths' healthy personality development is a veritable instrument for achieving and maintaining national political and socio-economic sustainable development. Home economics education programme has been accepted and reflected in education curricula at the three major levels of education in developing nations like Nigeria. It is aimed at fostering the youths' healthy personality development for total transformation of citizens and the nation. Home economics education programme can only perform this vital role if the necessary strategic components capable of stimulating healthy personality development are adequately reflected and implemented during the teaching and learning of the subject or course. The study examined managing strategic components of home economics education programme and strategies for enhanced youths' healthy personality development in secondary schools in Nigeria. The study employed a descriptive survey technique. Four hundred and forty two respondents (407 Classroom home economics teachers and 35 Home economics zonal officers) from public secondary schools in Abia State of Nigeria were purposively selected and used for the study. Two research questions and two null hypotheses guided the study. A 4-point rating scale of researchers' made questionnaire with 35 items was used for data collection. Reliability coefficient values of 0.80 and 0.86 were obtained using Cronbach alpha technique. The data collected were analyzed using mean and t-test statistical tool at 0.05 level of significance, for the research questions and hypotheses respectively. Findings identified eight strategic components and seven integrated strategies in home economics education that could be utilized to enhance youth healthy personality development. Recommendations included: that Home-economics education programmes curriculum of secondary education in Nigeria should be reviewed to reflect the eight identified strategic components for healthy personality development of the Youths. Parents, Non-governmental organizations should partner with the government to provide learners friendly environment for implementation of identified components and strategies.

## **Introduction**

An individual personality is usually described by a set of traits, behaviours and patterns that build character and individuality. Robert & Robbins (2004) defines personality as those images, concepts, values, behaviours, attitudes, dispositions and perceptions which a person displays in facing the challenges of life. It is a construct through which individuals make effort to maximizing their understanding of the world around them, and use such understanding to re-shape and modify them for a better healthy living in a society. The importance of a healthy personality in the life of an individual cannot be over-emphasized. Adepoju (2007) is of the opinion that a healthy personality leads people to actualize unique and fully functioning individuals. Karen (2007) observes that a healthy personality promotes optimal adulthood growth and intellectual development which ensures one's usefulness in the society.

Research reports of Karen (2007) and Macdonald (2007) recommend that personality development should be fostered through effective strategies. These strategies must be result focused action. Karen insisted that such strategies should also be result-oriented affirmative action's intended to improve existing situations. Significantly, observation and research reports of Karen (2007) made deliberate efforts to analyze several research findings and posited that personality development programmes must be based on strategic components such as educational, economic, social, career, multicultural, family, religious, sexuality, time management, personal health practices, etc. Macdonald (2007) stresses the urgency for integration between schools and government; inter-linkage networks of schools, parents, communities, private sector and students in fostering the development of healthy personality among citizens with special reference to youths. The implication is that acceptable strategies for fostering personality development must be capable of spelling out the components and integrated strategies for effective youths' personality development. Of all subjects taught at secondary education level, Home-economics education appears more appropriate.

Home-economics education is a tool for achieving in youth, the healthy personality development skills. It is one of the compulsory pre-vocational and vocational subjects taught at Junior and Senior Secondary schools in Nigeria. As a vocational subject, it does not only equip students with salient live-long skills for parenthood and economic empowerment but also ensures proper health and personality development. These qualities and skills are very exigent in the present day youths. The essence is to secure good healthy personality of tomorrow leaders for sustainable development. Okoye (2004) discovers that home-economics is a practical oriented discipline designed to equip learners with survival skills that are vital

for self-reliance and paid employment. Home-economics Education is therefore a veritable instrument for fostering healthy personality development of members of a nation through quality healthy youth development. Dibenditto (2004) identifies six combination of classroom and non-classroom action focused home-economics components that could be of good use in achieving youth personality development. These are:

- i. Multidisciplinary components
- ii. Physical environment
- iii. Social environment
- iv. Community partnership
- v. Personal skills and
- vi. Integrated services

Non- Classroom based activities appear to be stronger in youth health personality development. DiBenditto (2004) argues that non-classroom based actions produces better outcomes for students than through a traditional approach using only the in-classroom home-economics education curriculum. It should be noted that integrated and quality content- based health personality development programmes are very cost-effective. The programme requires students to be trained and educated in a number of areas in addition to class based curriculum implementation. For example, the development of appropriate sexual health practices, financial management, learning entrepreneurial skills, enhancing the social environment, linking with relevant community agencies and non-governmental organizations (modebelu and Modebelu, 2011). The importance of home economics in achieving youth personality development for sustainable national development is even more crucial in this present prevalence of youth's unruliness, militancy, Boko Haram issues, kidnapping syndrome and other horrible social ills that are menacing the entire nations with special reference to the third world nations. Anagbogu (2004) reports of many incessant cases of youth's contradictory and conflicting life value.

The issues are that present day youths in Nigerian in particular appear to be living below standards and there are high rate cases of teenage pregnancy, sexual misconduct and lots of financial conflicts. Onu (2008) observes that youths' inability to manifest, adequate entrepreneurial and resource management skills are contributory to these social ills. Other causes of youth prevalent involvement in social vices include poor academic performance, inadequate learning, sexual misconduct, mismanagement of family finance and resources, unskilled work, bribery and corruption, violence in school, work place and in families etc. (Kareen, 2007). Social ills (kidnapping, human trafficking, parents battering, fighting,

bullying, stealing, cultism promiscuity, drug abuse, excessive smoking and alcoholism which are acts of indiscipline, deviant behavior and anti-social have led to monumental loss of economic benefits, lives and property in the nation. This issue has remained a source of concern to various governmental and non-governmental bodies. Various strategies have come up, such included:

- Establishment of model secondary schools
- Formation of youth clubs
- Formation of youth empowerment centres
- Reformation of curriculum to include life skills acquisition programmes
- Training and posting of counsellors to schools
- Regular students' leadership training and seminars.

All these have been put in place to counteract among other things, youth problems in the nation. Despite these efforts, the strategies seem to have insignificant impact, probably because such are inadequate for the healthy personality development.

There is need for subject based approaches that can easily be engineered and re-engineered down to more age-appropriate citizens at secondary schools. Secondary education institutions are where majority of these teens are distributed and home economics is done in the majority of secondary schools. Home economics education programmes seem more appropriate as one of the school subjects for addressing this issue. In this case, home economics education must be made very prescriptive, preventive, and developmental delivered on a regular basis in schools.

In addition to educational seminars and committees held, budget and security system have to greet extent been fortified and severe punishment meted to culprit.

The problems put in question form is what strategic components of home economics education programme should be utilized to foster youth's healthy personality development in secondary schools in Nigeria.

The study aimed at identifying viable strategic components of home-economics education programme for enhancement of youths' health personality development in secondary schools in Abia state of Nigeria.

### **Research Questions/Null hypotheses.**

1. What are vital strategic components of home economics education programme that could utilize as strategies for fostering youth healthy personality development in secondary schools?

2. To what extent have these identified components been utilized to for youths personality development (YHPD) on secondary schools in Abia State.
3. What other integrated strategies could be applied to achieve youth healthy personality development skills through home economics education programme.

**HO<sub>1</sub>:** Mean ratings of home economics education teachers did not significantly differ from zonal home economics officers on strategic components needed to be emphasized in teaching and learning home-economics for YHPD in secondary schools in Abia State.

**HO<sub>2</sub>:** Mean ratings of home economics education teachers did not significantly differ from zonal home-economics officers on the integrated strategies development components.

## **METHOD**

The study adopted a descriptive survey design. It collected information from both teachers and zonal home economics officers concerned with teaching and learning of home economics at secondary education in all the 23 local government areas of the 7 education zones in Abia State of Nigeria. The data collected was meant to identify some strategies for fostering youth health personality development.

The population of the study consisted of 442 respondents (40.7 classroom teachers and 35 education officers) from 251 public secondary schools in Abia State.(source: Abia State management Board 2010). All the 442 respondents were selected and used for the study because the population was small. This helped to reduced errors and bias hence there was no sampling. Researchers' self-developed structured questionnaire titled Youths Enhanced Healthy Personality Development Strategies (YEHPDS), built on 4 point Likert –type scale was used for data collection. Part A of the questionnaire sought information on respondent's job location and status while Part B has 39 items (section A with 24 items on home economics education strategic components for youths healthy personality developments and section B has items on the integrated strategies for achieving YHPD. The instrument passed through face and content validity under two experts from Home Economics Education, Guidance and Counseling and Educational Measurement and Evaluation from Michael Okpara University of Agriculture, Umudike. Suggestions were reflected in the final draft. Cronbach alpha coefficient technique was used to test the for reliability of the instrument. Copies of the instrument were distributed to 15 teachers and 10 zonal officers of home economics respectively from 5 schools and Zonal Education Authority in Enugu State of Nigeria.

Their responses were coded and subjected to statistical analysis. Alpha Coefficient values of 0.81, 0.74 and 0.80 were obtained.

The researchers with the help of two trained research assistants administered 447 copies of the instrument to 447 respondents within five days in a week. 100% return was made and used for data analysis.

Mean computation and student test statistical tool were to answer the three research questions and test the two null hypotheses at 0.05 level of significance respectively. The decision rule for interpreting the mean scores of the items for the research questions was 2.50 and above for regarding an item agree or acceptable strategy for youth's healthy personality development. Mean score below cut off point of 2.50 indicates disagree or rejection of the item as strategy. Accept the null hypothesis if t-critical value is greater than the t-calculated value and visa vice.

#### Results.

Table 1: Mean ratings of Home Economics Education teachers and zonal officers on the strategic components for youth healthy personality development.

S/N	ITEM	TEACHERS	ZONAL	REMARKS
		$X_1$	OFFICERS $X_2$	
1	Family Planning	2.08	1.89	Disagree
2	Family resource management	3.00	3.05	Agree
3	Entrepreneurial skills	3.98	3.86	Agree
4	Careers and life management	3.77	3.42	Agree
5	Time management	3.81	3.92	Agree
6	Environmental hazards management	3.10	3.00	Agree
7	Societal values/norms	2.76	3.20	Agree
8	Stress management	2.05	1.00	Disagree
9	Dietal practices and eating habit	2.83	2.57	Agree
10	Personal hygiene	3.25	3.41	Agree
11	Sexuality Management	4.00	4.00	Agree
12	Drug/substance abuse	3.55	3.42	Agree
13	Dating practices	1.84	2.25	Disagree
14	HW/AIDS education	3.57	3.04	Agree
15	Body management	3.49	3.26	Agree

Result in table 1 reveals mean scores above 2.50 for 12 out of the 15 items indicating classroom teachers and zonal officers' general acceptance of the 12 items as strategic components to be emphasized in home economics education for youth's healthy personality

development in secondary schools in Abia State. The only three items that scored below 250 are stress management, family planning and dating practices. The implication is that the three items should not serve as strategic components for youth personality development.

**Table 2:** Extent of application of these components in Home Economics for fostering youth healthy personality development.

S/N	ITEM	TEACHERS	ZONAL OFFICERS	REMARKS
		X <sub>1</sub>	X <sub>2</sub>	
16	Family Planning	2.33	2.26	Low extent
17	Family resource management	2.41	2.08	Low extent
18	Entrepreneurat skills	3.45	3.20	High extent
19	Careers and life management	3.63	3.84	High extent
20	Time management	1.67	1.71	Low extent
21	Environmental hazards management	2.13	2.23	Low extent
22	Societal values/norms	2.00	1.89	Low extent
23	Stress management	2.44	2.15	Low extent
24	Dietal practices and eating habit	2.88	2.76	High extent
25	Personal hygiene	3.56	3.56	High extent
26	Sexuality Management	2.08	2.32	Low extent
27	Drug/substance abuse	4.97	2.22	Low extent
28	Dating practices	2.34	1.88	Low extent
29	HW/AIDS education	2.21	2.00	Low extent
30	Body management	2.14	2.00	Low extent

Table 2 above reveals mean responses of classroom teachers and zonal officers on extent of application of the 15 enumerated strategic components through Home Economics. Except four items all the rest of 11 items scored below 2.50 indicating the items low extent application through Home-economics education for youths healthy personality development. The only 4 items accepted to be applied to a high extent are entrepreneurial skills, careers and life management, dietal practices and eating habit and personal hygiene.

**Table 3:** Mean rating of home economics teachers and zonal home-economics officers on integrated strategies for a youth health personality development.

S/N	ITEM	TEACHERS $X_1$	ZONAL OFFICERS $X_2$	REMARKS
31	Consulting with cooperate organization to organize home economics based seminars and talents hunts for students	3.83	3.90	Agree
32	Working closely with class prefects to identify students with behavioral problems during home economics lessons	3.65	3.86	Agree
33	Close cooperation with home economics teachers, form teachers and counselors in providing guidance services on personality development to students	3.56	3.66	Agree
34	Using inter class debates to empower youth to argue about home economics based social and healthy issues.	3.63	3.76	Agree
35	Using students focused activities (i.e. Assembly presentation by home economics students role play)	3.68	3.36	Agree
36	Integrating external services (experts in food & nutrition, clothing etc) into schools home economics programme.	3.50	3.48	
37	Using local community a resource to provide speakers to both students and teachers about home management etc.	3.86	3.91	

In table 3. All the 7 items scored above 2.50. this implies that all the respondents (teachers and zonal officers agreed with the items on proposed integrated strategies for achieving youths healthy personality development in students in secondary schools in Abia State of Nigeria.

**Table 4:** t-test Analysis summary on mean ratings of Home-Economics education teachers and zonal officers mean scores on the components for effective youth healthy personality development.

Group	N	X	sd	t-calc	df	t-crit
Home economics teacher	407	3.10	1.70	0.04	440	1.94
Home economics zonal officers	35	3.02	1.48			

In table 4, the calculated t-value of 0.04 is lower than decision from table 4 reveals null hypothesis was upheld, indicating no significant different between home economics teachers.

In table 4, the calculated t-value 0.04 is lower than the critical value of 1.94 at 0.05 level of significance. The null hypothesis was upheld indicating no significant difference between home economics teacher and zonal officers on the strategic components for youth's healthy personality development of youths in secondary schools.

**Table 5:** t-test Analysis summary on mean ratings of Home-Economics education teachers and zonal officers on the integrated strategies for youth healthy personality development.

Group	N	X	sd	t-calc	df	t-crit
Home economics teacher	407	3.48	1.52	0.03	440	1.94
Home economics zonal officers	35	3.45	1.164			

Result in table 4 reveals a calculated t-ratio of 1.94 at 0.05 significance level. The null hypothesis accepted. This indicated that there is no significant difference between the mean ratings of the teachers and zonal officers on the integrated strategies for effective healthy personality development through home economics education programme. Discussion

The study identified twelve strategic components of home economics education that would be of great relevance in youth personality development through home economics education programmes. Some of these vital components are: Family resources management, entrepreneurial skills careers and life management, time management environmental hazards management, societal norms / values, vital practices and eating habits, personal hygiene, sexuality management drug abuse, HW/AIDS education and body management. These is in confirmation of Okoye (2004) that observed that home economics is a practical –oriented discipline for equipping the learners with survival skills for self – reliance. There is no doubt that entrepreneurial skill, family resource management skills etc. are lifelong skills for healthy personality development. These skills are very vital in molding the personality of Nigerian future hope and leaders. Modebelu and Modebelu (2011) emphasize the importance of sexuality and moral development of Nigerian adolescents. The implication is that national whose Youths have adequate healthy personality is likely to manifest self-reliance, less extreme poverty and hunger as Millennium development Goals aim, such nation will enjoy healthy responsible citizenry, high level economics development etc.

The findings of the study recorded these strategic components of home economics education recommended for youths' healthy personality are applied to a low extent in secondary schools in Nigeria. The low application could be due to non-recognition of the identified

components as being relevant to personality development by education curriculum planners as well as classroom teachers who apply the components to a low extent in the process of teaching and learning of home economics education. This could also be responsible for so many social ills in the developing world such as Nigeria. Any nation with majority of its citizens lacking healthy personality will be prone to incessant undesirable social – political and socio –economic activities. In support of the above Onu (2008) and Anagbogu (2004) report, that many youth in Anambra state of Nigeria were living with contradictory and conflicting values and standard. Anagbogu observes in addition a high rate teenage pregnancy social misconduct, low personal hygiene etc. Onu discovers that these youths manifested lack of entrepreneurial and resource management skills. There is urgent need to emphasize the inclusion of these components in the curriculum as well as effective implementation in the teaching and learning of such lifelong health personality development skills.

Null hypothesis one showed that there is no significant difference in the opinion of home economics teachers and home economics zonal officers in the various zonal offices of Abia state Education commission on the identified strategic components relevance in achieving Youths healthy personality development. This agreed with Modebelu & Modebelu (2011) who reports that inclusion of these components in the management of sexuality adolescents and moral issues will enhance healthy personality development of youths across the nation.

Null hypothesis two also indicates no significant difference in the opinion of the teachers and zonal officers. In line with this finding, Mamman, and Joel- Pweden (2007) were of the view that healthy personality development should not be left you counselors a lone but should receive the support of home- economics teachers, government, parents, non-governmental associations, students themselves and corporate bodies.

The findings of study also identified seven items that could serve as integrated strategies in utilizing home economics to foster youth's healthy personality development in secondary schools in Nigeria as well as other developing nations. The identified strategies agreed with MacDonald (2007) who stresses the urgency for integration between schools and government, inter-linkage networks of schools, parents, communities, private sectors, and students in the achievement of youth's healthy personality. The seven identified integrated strategies included consultation with cooperate organization to organize home economics based seminars / talent hunts or students, utilizing students focused activities such as morning assembly presentation or role play by students etc. The integrated strategies from the study

also in line with the suggestion of DiBenditto (2004) which comprised of classroom and non-classroom active focused components such included: Multidiscipline any components, physical environment, personal skills etc.

### **Conclusion**

Home- economics education is a tool for achieving the youth healthy personality development skills through effective utilization of strategic components and integrated strategies. The twelve vital strategic components that must be emphasized in the teaching and learning of home-economics have been identified in this study. The components were utilized to a low extent presently in secondary school in Abia state of Nigeria. Seven integrated strategies were also identified. Effective application of these identified components and strategies will go a long way to enhance Nigerian Youths healthy personality towards national sustainable development.

### **Recommendations**

Based on the findings of the study, the following recommendations were made:

Home-economics education programmes of secondary schools in Nigeria should be reviewed to include the twelve identified strategic components that promote healthy personality development of Youths.

Government, Parents, Non-governmental organization should partner to provide learners friendly environment for implementation of identified components and strategies.

Teacher preparation institution should be re-positioned to equip Homeec teachers with the necessary technical skills of making healthy personality development in schools, skills oriented.

Home economics teachers should endeavour to emphasize multiple concepts such as sexuality management, body image family resource management etc.

Regular sponsored workshops / conferences / seminars for home economics teachers should be encouraged by various stake holders in education.

Home economics teachers should endeavour to haise with media houses to present value focused jingles debates etc. They should also work with cooperate organizations to organize seminars and talent hunts for students.

6. This case study researched a comprehensive high school with an enrollment of 2300 students and 120 teachers and staff members was conducted. Investigating school communities and how to build an effective community relationship between schools and the school community members. Questions posed by this case study included: What do we mean by communities? Why is it important that communities connect with schools and schools with communities? How does the community history affect schools in that community. Findings proved efforts to improve academic achievement must be accompanied by efforts to improve community involvement and Community Building of the social conditions in which they live. Providing leadership from community officials and the local school board will be of critical importance to the collaboration movement.

## **Engaging Students in the Science and Engineering Practices of the Next Generation Science Standards (NGSS) with Computer Supported Collaborative Science (CSCS)**

### **I. SUBJECT / PROBLEM**

In 2012, The National Research Council, representing the National Academies of Science, Engineering, and Medicine, published “*A Framework for K-12 Science Education: Practices, Crosscutting Concepts, and Core Ideas*” as the first step in a process to create national standards for K-12 science education. Through a collaborative, state-led process science standards are being developed that will be based on the *Framework*. It is anticipated that the vast majority of states will adopt the *Framework* and the standards, currently known as the *Next Generation Science Standards (NGSS)*.

The National Research Council states that “The overarching goal of our framework for K-12 science education is to ensure that by the end of 12th grade, all students have some appreciation of the beauty and wonder of science; possess sufficient knowledge of science and engineering to engage in public discussions on related issues; are careful consumers of scientific and technological information related to their everyday lives; are able to continue to learn about science outside school; and have the skills to enter careers of their choice, including (but not limited to) careers in science, engineering, and technology.” In addition, the NRC states that “Currently, K-12 science education in the United States fails to achieve these outcomes, in part because it is not organized systematically across multiple years of school, emphasizes discrete facts with a focus on breadth over depth, and does not provide students with engaging opportunities to experience how science is actually done. (NRC, 2012).

The *Framework* recommends that science education be built around three dimensions: (1) scientific and engineering practices, (2) cross cutting concepts that have common application across fields, and (3) core ideas in four disciplinary areas: physical sciences; life sciences; earth and space sciences; and engineering, technology, and applications of science. The *Framework* draws upon ideas set forth in earlier reform documents such as *Project 2061* (American Association for the Advancement of Science, 1993), and the *National Science Education Standards* (NRC, 1996) but is destined to be more influential

since most states have already adopted the *Common Core Standards* (National Governors Association, 2012) in mathematics and English and have expressed interest in adopting the *Next Generation Science Standards* as well. The *Framework* and *Next Generation Science Standards* will provide a roadmap for reforming science education and will create a need for new teaching strategies to traverse this map. Fortunately, recent advances in collaborative cloud-based computing have provided the technological tools which allow the implementation of new teaching methodologies by which many of these goals can be reached more effectively than previously possible.

## **II. DESIGN**

*Computer Supported Collaborative Science* (CSCS) is a teaching methodology that uses collaborative web-based resources to engage all learners in the collection, analysis, and interpretation of individual data in the context of whole-class data. CSCS fosters scientific inquiry by using collaborative online resources to assess prior knowledge, collect and analyze student ideas, data, and comments, and provides instructors the opportunity to perform continuous formative assessments to inform and reform their own instruction. CSCS turns hands-on classroom activities into more authentic scientific experiences -- shifting the focus from cookbook data collection to thoughtful data analysis.

The CSCS model engages all students in learning science and provides experience in how science is actually done. The CSCS model provides a pedagogical framework for science teachers seeking to implement the goals of *Framework*.

- **Prior Knowledge and Student Engagement.** Often, science lessons ignore prior knowledge and cultural influences, complicating the challenge of teaching in a diverse classroom (Brown, 2004). CSCS uses online surveys to assess students' initial understanding of new topics. This allows teachers to learn about preconceptions to be addressed and helps students to become aware of their naïve conceptions. Students remain engaged when they are regularly asked to commit responses to formative assessment. (Herr et.al, 2012)
- **Collecting large data sets.** In traditional classes, lab groups collect data independent from other lab teams. By combining data sets online, students recognize patterns that are only visible when students pool their data. Students compute averages, plot data together and gain firsthand experience for what it means for an experiment to be repeatable.
- **Focusing on interpretation.** In verification labs, experiments stop once data are collected because the results are known before they start. In CSCS, students post collaborative lab reports online linking to relevant data and graphs. Shared conclusions allow for further discussion and the consensus building that is essential for inquiry (Berland & Reiser, 2009). Automated graphing of data using CSCS tools can reduce the load on working memory, allowing for more cognitive resources to be devoted to data analysis (Hmelo-Silver, Duncan, & Chinn, 2007).

## **III. ANALYSIS & FINDINGS**

The following example from Mr. Arias' biology class illustrates how the CSCS model can transform an existing classroom laboratory activity into a student-centered collaborative learning experience. Students are exploring the function of enzymes by performing a classic hands-on lab using liver (which contains catalase) and hydrogen peroxide. The lab is conducted before enzymes are fully explained, providing an opportunity to explore the characteristics of enzymes.

On the first day, students begin by discussing in groups what they believe are the function of enzymes in the human body. They brainstorm variables they can explore in the chemical reaction (e.g. temperature, pH, volume, etc.). As teams, they use laptops to

post their suggestions using an online spreadsheet. Each student then ranks the suggestions using instant online survey. After consulting the survey results, each team chooses three variables to investigate and discusses the best procedure for making measurements, eventually posting their procedure to the class wiki. Mr. Arias asks students to make predictions about which variables they think are most likely to affect enzyme activity. Rather than calling on individual students to share their ideas in the class discussion, he makes them all commit their predictions to an online survey form. As teams conduct the experiment, they record data in an online spreadsheet side-by-side with other lab teams. Using cloud-computing tools like Google Docs, all teams can edit the file simultaneously from different computers throughout the room. The bell rings and students must leave.

Even though the activity itself has been interrupted, students return to their stored work the next day. Their predictions, procedures, and data are all well organized online and Mr. Arias begins the day's discussion by displaying class data using a web-based graphing tool. Immediately, students recognize that certain data points are outliers. Students turn to the team responsible for contributing the outliers and ask them to explain their protocol for collecting their data. The entire class speculates about causes for variations. They record their ideas in a threaded online discussion forum. Following the discussion, each lab team writes a lab report that explains their data, how it connects to the class data set, and generates conclusions about enzyme activity. Mr. Arias reminds students how scientific findings rely on finding patterns in data as he highlights how their contributions to the class spreadsheet have allowed them to evaluate a larger data set.

The third day's quiz (another online form) asks students questions about the function of enzymes taken from their collaborative online lab reports. Mr. Arias then explains how enzymes work and enhances his explanation with a few short video demonstrations of how certain variables such as temperature affect the breakdown of catabolites such as hydrogen peroxide. He directs students to an online simulation of catalase activity to see how different variables affect the reaction. Students are then asked to compare their current understanding of enzymes to what they initially thought on day 1 through an online form. Mr. Arias monitors student responses as they are submitted, formatively assessing student understanding so that he may plan his next steps to insure student understanding.

Note: Fifty middle and high school science teachers have participated in a two-week intensive CSCS workshop at California State University Northridge. These teachers will be implementing CSCS activities in Fall 2013. We have employed an external evaluator to investigate the effectiveness of the CSCS model in addressing Dimension 1 of the Next Generation Science Standards (NGSS) and plan to present our findings at the NARST meeting, if our paper is accepted.

#### **IV. CONTRIBUTION**

The CSCS model provides a mechanism for engaging students in the scientific and engineering practices that are common to all aspects of science, technology, engineering and mathematics (STEM) education, listed in *Dimension 1* of the *Framework for K-12 Science Education* (NRC, 2012):

**(1) Asking Questions and Defining Problems** – Secondary students struggle to develop researchable questions for inquiry activities or science fair projects. Fortunately, teachers can guide students through this process with much greater efficiency using the CSCS model. For example, a teacher can solicit research questions surrounding a particular phenomenon. Students enter their questions into a blog and simultaneously see the ideas of their classmates. The teacher then highlights specific questions and illustrates how they may be refined into researchable questions. Students are then asked to post suggestions for their peers. The teacher monitors all activity and further clarifies the process of formulating researchable questions and defining researchable problems. Students learn by seeing numerous examples edited and

refined in the collaborative environment of the blog.

**(2) Developing and using models** – A key difference between novice learners and expert learners is that “experts notice features and meaningful patterns of information that are not noticed by novices.” (Bransford et. Al., 1999). The NRC recognizes the significance of pattern recognition by placing it as the first *cross-cutting concept* in *Dimension 2* of the *Framework* (NRC, 2012). Novice learners become expert learners by modeling the metacognitive strategies of experts. Novice learners gain metacognitive skills as they watch teachers describe their use of pattern recognition in the development of models and hypotheses. Collaborative cloud-based documents allow students to see patterns in class data as well as patterns in the way their peers develop models.

**(3) Planning and carrying out investigations** – In *America’s Lab Report*, The National Research Council states that “Laboratory experiences provide opportunities for students to interact directly with the material world (or with data drawn from the material world), using the tools, data collection techniques, models, and theories of science.” (NRC, 2006b). According to the NRC, “The quality of current laboratory experiences is poor for most students.” The NRC concludes that one reason for poor laboratory experiences is insufficient time to plan and carry out investigations. The CSCS model makes planning and conducting investigations simpler by instantly aggregating all student data. In a traditional student laboratory experience, a lab group of 2-3 students must complete all aspects of investigation by the end of the period and the grade they earn will be directly dependent upon their ability to accomplish this. Students get little experience planning investigations because teachers must design them so they may be completed within the allotted time. By contrast, the CSCS model allows investigations to be conducted using whole class data. Students complete an investigation by examining entire class data. Using the CSCS model, teachers can divide data collection tasks among various lab groups so that the class can collect the necessary data even if individual lab groups are unable to do so.

**(4) Analyzing and interpreting data** - The CSCS model excels in teaching students how to analyze and interpret data. D’Alessio and Lundquist (2012) found that after using frequent CSCS activities, even students with limited science background begin to see data like experts see it. Students “made significant gains in data interpretation skills compared to a control group that did more traditional laboratory activities without the public comparison of data that defines CSCS.”

**(5) Using mathematics and computational thinking** - The CSCS model provides numerous opportunities to encourage the use of computational thinking. Rather than viewing an isolated set of data, students must use statistics to evaluate whole class data. Teachers include column headers in electronic quick-writes to perform basic computations on student input. (An electronic quick-write is a collaborative cloud-based spreadsheet in which columns represent individual questions and rows represent individual responses to those questions. (Herr et.al., 2012)) For example, if the teacher asks students to input their resting pulse rate, designated cells instantly report the maximum, minimum, and average pulse rates for the class while pre-defined graphs plot these statistics in a corresponding worksheet. Students learn to perform spreadsheet calculations by entering their own formulae in cells as prompted by their instructors. Rather than walking around the class to see student calculations, the teacher simply scans the spreadsheet and formatively assesses the computational reasoning of their students.

**(6) Constructing explanations and designing solutions** - Historians argue that Thomas Edison’s greatest invention was not the incandescent light bulb, motion pictures, recorded music, nor any of the other 1090 inventions for which he held patents, but rather the modern research laboratory in which he assembled top scientists and engineers to collaborate in the design and development of new products. Edison did not invent all of the items for which he received patents, but rather created an environment in which top scientists and engineers could collaborate to design solutions (Mintz, 2012). In a similar fashion, CSCS creates an environment where students work simultaneously on collaborative online lab reports, drawings,

spreadsheets, diagrams, photo albums, concept maps, presentations, wikis, and websites to construct explanations and design solutions.

**(7) Engaging in argument from evidence** - CSCS highlights the significance of evidence in learning science (d'Alessio, 2012; Herr et. al., 2010a, 2010b, 2011). In a traditional science classroom, students argue only from their own data, but in a CSCS classroom, students examine entire class data before generating hypotheses or making conclusions. Students learn to discern good data from bad data (d'Alessio, 2012) and learn the importance of patterns, trends, statistics, and outliers. Just as professional scientists evaluate their results in light of evidence from other laboratories, so CSCS students evaluate their results in light of evidence from other students.

**(8) Obtaining, evaluating, and communicating information** –CSCS creates an information-rich environment in which students work. Unlike a traditional classroom in which a single student is called upon to answer a question asked of the class, CSCS students are expected to answer all questions posed by the teacher all of the time. Rather than raising hands, students input their answers to the collaborative spreadsheet that both teachers and students read. Collaborative online documents provide the opportunity for the teacher to perform continuous formative assessments of student understanding (Herr et.al, 2012) while allowing students to see the input of their peers. As students respond to teacher prompts, they communicate not only to the teacher, but also to their peers. CSCS students respond in writing to each classroom question, and are also asked to evaluate the information communicated by their peers.

## **V. GENERAL INTEREST**

The National Research Council has stated that current science education in the United States “does not provide students with engaging opportunities to experience how science is actually done.” (NRC, 2012). The CSCS model, employing new collaborative web-based document technology, provides students and teachers the opportunity to readily collect and analyze large sets of data from multiple lab groups and class sections. Such resources may be used to create an environment that more closely resembles the collaborative environment of a professional scientific community in which researchers develop hypothesis and explanations in light of their own findings and those of their colleagues. The CSCS Model emphasizes scientific inquiry in an evidence-rich, collaborative environment that places greater emphases on interpretation, evaluation, and explanation. The CSCS model replaces traditional “cookbook” verification activities in which students work in isolated lab groups with discovery activities using student-generated procedures working in collaboration with multiple lab groups. The CSCS model provides an opportunity for students to experience how science is actually done by engaging in the scientific and engineering practices advocated in Dimension 1 of the Framework, namely (1) Asking questions (for science) and defining problems (for engineering) (2) Planning and using models

investigations

computational thinking

solutions (for engineering)

evaluating, and communicating information.

Engaging in argument from evidence

(3) Planning and carrying out investigations

(4) Analyzing and interpreting data

(6) Constructing explanations and designing solutions

(8) Obtaining, evaluating, and communicating information.

## Using Cloud-Based Collaborative Resources to Conduct Continuous Formative Assessment

**Abstract:**

Workshop participants will learn how to use free cloud-based collaborative online documents to perform continuous formative assessments of student understanding during instruction.

**The need for better formative assessment**

Schools and universities have been encouraged to develop a “culture of assessment” to provide evidence on the effectiveness of instructional programs (Weiner, 2009). Although our “culture of assessment” has produced a wealth of literature, legislation, initiatives, reforms, and professional development, the vast majority has focused on assessment *of* learning (summative assessment) rather than assessment *for* learning (formative assessment). Formative assessment has been defined as “a process used by teachers and students during instruction that provides feedback to adjust ongoing teaching and learning to improve students’ achievement of intended instructional outcomes” (Popham, 2008). “What makes formative assessment formative is that it is immediately used to make adjustments so as to form new learning” (Shepard 2005).

Formative assessment is not a new concept, and any teacher that adjusts his or her teaching during instruction on the basis of evidence of student understanding and performance is employing formative assessment. Most teachers would agree that formative assessment is very important, but how does one accurately assess student comprehension and performance during a science class session?

Educators have adopted a variety of techniques to perform formative assessments. A group of physics educators introduced the modeling method for physics instruction in which students diagram physics problems on miniature whiteboards and hold them up for their teacher and peers to critique (Wells et. Al, 1995). Others advocate quick-writes (Rief, 2002; Clidas, 2010), science notebooks (Clidas, 2010; Roberson, 2010), and the use of audience response systems (Kay et. Al., 2009). All these techniques have their merits and provide opportunities for teachers to check for understanding and adjust their instruction accordingly, but all have significant limitations. The modeling technique is excellent, but once students erase their boards, the record of their understanding vanishes. Quick-writes and science notebooks provide a log of student understanding and performance, but it is not possible for teachers to see all quick-writes or notebooks as they are written, and therefore any adjustment to instruction is postponed until the subsequent day. Audience response systems have the advantage of providing immediate feedback, but student input is generally limited to true/false and multiple-choice responses. If science teachers are to adjust instruction to meet student needs, they must collect and analyze student responses as they are made. Fortunately, synchronous collaborative documents provide opportunity to do just that.

### **Continuous Formative Assessments (CFA) in science instruction**

The authors have developed a teaching technique that employs synchronous collaborative web-based documents to perform continuous, real-time formative assessments of student understanding so that science teachers can adjust their instruction to address the immediate needs of their students. The technique provided in this workshop has the potential to engage *all* learners *all* of the time as they provide feedback, data, quick-writes and analyses in response to instructor prompts. Using our model, teachers have the opportunity to observe all student contributions as they are made.

Our continuous formative assessment (CFA) model has been made possible by the development of free collaborative web-based spreadsheets, documents, presentations, and drawings (Herr et. al., 2010a,b; 2011a,b, 2012). Using the CFA model, teachers develop online documents and share editing privileges with their students. Teachers provide prompts to which students simultaneously respond on the same document. For example, using an online spreadsheet, teachers enter student names in column one and pose a question in the header of column two. The cells in column two become highlighted when students start to enter their responses, providing the teacher with information regarding which students are composing answers and which need more time. Once the teacher has determined that there has been a sufficient response, he or she asks students to press the “enter” key, and instantly the cells are populated with student responses. Color-coding and roll-over names identify those who have made contributions and deters students from entering data in cells other than their own.

As the students enter their responses, teachers scan the developing response table to assess student understanding and adjust instruction accordingly. For example, if few students provide an adequate written response, a teacher may pose a new question in a simpler format such as multiple-choice. By programming the spreadsheet appropriately,

the teacher obtains statistical data to indicate the percentages of students that understand or have specific misconceptions. The teacher freezes the name column (row header) and the question row (column header) and opens a new column next to student names. This insures that each current response is adjacent to the student's name while simultaneously storing previous responses in columns to the right. The teacher opens a new worksheet for each day and tracks student performance and understanding by tabbing through worksheets from previous lessons.

Preliminary data suggests that the CFA model using collaborative documents to make formative assessments significantly enhances student engagement and understanding. Professors who have used this model in teacher preparation programs report greater student engagement in lessons and greater personal satisfaction with assessments of student progress. Bandura (1997) and Zimmerman (2002) suggest that formative assessments permit students to express themselves and develop a sense of self-efficacy, a key requirement for the development of autonomous learning strategies. Polanyi (1967), Schön (1987), and Rogoff (2001) emphasize the formative and reflective purpose of student discourse and encourage an open community of learners where ideas and opinions are exchanged so that students can co-construct their understanding. The CFA model provides an environment where such discourse can take place, but unlike a traditional science classroom where certain students dominate, all students are on an equal footing since all have access to the same document for their contributions. In this session we provide hands-on experience with the CFA approach to using collaborative online documents to enable continuous formative assessment.

### **Value of workshop activities**

New collaborative web-based document technology provides the opportunity to instantly collect and analyze large sets of data from multiple students, groups and class sections with speed and accuracy. Teachers can learn to use tools like Google Docs & Sites to turn traditional classroom activities into student-centered inquiry and discussion. CFA helps teachers create a classroom environment that mirrors the collaborative environment of a professional learning community. Teachers will create classroom activities in which students analyze whole-class data using wikis and collaborative spreadsheets, and work with peers to reach consensus and produce collaborative reports on their conclusions. These activities help students gain an understanding that the learning enterprise requires collaboration, independent verification, and peer review. In this workshop, participants are introduced to a range of collaborative web-based activities in which they continuously monitor student ideas and input so that they can adjust their instruction to meet student needs. Those who participate in this workshop will leave with an ability to use free cloud-based collaborative tools to perform continuous formative assessments of their students so that they can adjust their instruction accordingly.

### **Workshop Activities -**

During this ninety minute workshop, participants will learn how to use the CFA model by participating first as a student and then as the instructor. We will use collaborative documents to collect data from various inquiry activities. Participants will then analyze the entire data set collaboratively. We will discuss the best practices of collaborative

inquiry as well as professional development strategies. We will conclude by having participants brainstorm ways the CFA model can be used to help teachers improve formative assessment of all learning activities.

**ABSTRACT**

*The purposes of this study were to investigate the teaching competencies acquired and those not acquired by science teachers-in-training after exposure to teaching practice. The investigator used a fifty-six item questionnaire, labeled as Perception of the Acquired Pedagogical Knowledge and Skills Scale (PAPS), to elicit information from two hundred and ten pre-service science teachers in south-west geo-political zone of Nigeria. A panel of (5) science educators determined the content validity of the questionnaire. The sample of science education undergraduates were drawn from three (3) randomly selected universities using stratified random sampling technique. The pre-service teachers were required to rate their performance level on each teaching competence on a five-point Likert scale ranging from "high performance level" to "no performance level" with "average performance level" as the pivotal point of the scale. Following that, the mean of each competence item were computed. Any competence statement that had a mean rating of less than 3.00 was considered to be of low performance cadre, since the mean value of the scale was 3.00. The findings of the study indicate that most of the teaching competencies that teachers-in-training have not acquired fall under theme 1 (planning instruction), theme 2 (implementing instruction), theme 3 (evaluating instruction), and theme 7 (integrating technology and media in the classroom). The study also revealed that pre-service science teachers demonstrated proficiency in reinforcing learning, managing classroom, building professional links with colleagues and understanding learners' development. Based on the findings of this study, it was recommended that the principle of collaborative approaches for teacher learning should be incorporated into the teacher training program and that regular follow-up workshops aiming at developing Pedagogical Content Knowledge (PCK) of pre-service science teachers should be scheduled as needs arise.*

## **Abstract**

With the growth of technology in online education, Learning Management Systems are now seen as a forum for students to undertake discussions regarding their teaching and learning. However, the effectiveness of the use of this learning technology can be debatable. The aim of this descriptive study was to explore student nurses' use of online discussion forums in an undergraduate nursing research unit. Two sources of data were collected. In Phase one of the research, a descriptive survey consisting of demographic data and closed and open-ended questions were used. This provided both quantitative and qualitative data. Phase two was concerned with the collection and content analysis of students' discussion forum postings. This involved analysing the qualitative data for themes as well as analysing statistical data relating to forum use.

A key finding of this study was that participants identified a lack of facilitation and instruction as a major factor in their use of the discussion forums. Responses indicated that the educator did not encourage or participate in the online discussions. Participants felt that they had inadequate information on how to use the discussion forums, and a few were not even aware that they existed. The evidence suggests that the students felt that educator involvement had been minimal, with a large proportion of the students dissatisfied with tutor feedback. The results from this study showed that the factor that had the most influence on student use of online discussion forums was instructor facilitation. In particular, ineffective instructor facilitation was associated with a lack of student participation and a poor understanding of how to use the discussion forums. These results have practical implications for planning, designing and facilitating online discussion forums to improve the learning experience for student nurses.

**Keywords:** Online learning; Discussion forum; Facilitation; Facilitation of discussion forums

## **Introduction**

Over recent years, there has been a tremendous growth in the use of technology in teaching and learning. A vast number of online resources, activities and events are now available to students with online learning now being firmly entrenched in contemporary nurse education. The development of online Learning Management Systems (LMS) has seen the introduction and on-

going use of student discussion forums in education. (Garrison & Anderson, 2003) (Berman et al., 2008).

The challenge for educators however, is to manage these forums in a way that promotes learning through facilitation and intervention (Salmon, 2004). Instructors must motivate, challenge, complement and also encourage participants to contribute further to discussions. (Salmon, 2004; Xin & Feenberg, 2006). This role can prove quite challenging and complex particularly when it comes to gauging and monitoring educational activities and the design of the online experience. The aim of facilitation is to encourage quality contributions that are both productive and purposeful, as well as encourage higher order learning and critical thinking (Garrison & Anderson, 2003).

### **Rationale and aim of the study**

The aim of this descriptive study was to explore student nurses' use of online discussion forums in an undergraduate nursing research unit and to provide guidelines for nurse educators to assist them with effective facilitation of online discussion forums.

### **Literature review**

Two key terms were identified in the literature: Online Learning – Learning Management Systems and the facilitation of discussion forums.

### **Online Learning – Learning Management Systems**

One of the most recognised learning systems currently used in tertiary institutions is the LMS, Blackboard (Bradford, Porciello, Balkon, & Backus, 2007). The creators of Blackboard (BASv8) see their vision as providing a secure, easy accessible, user-friendly platform for academics to manage course activity and integrate applications and data for online learning (Bradford et al., 2007; Christopher, Thomas, & Tallent-Runnels, 2004). They also believe that educators can better manage their course materials, communicate with students and evaluate their performance when using Blackboard (Bradford et al., 2007). Blackboard provides an environment that allows users to post information, view documents, upload assignments and take part in asynchronous online discussions. This refers to the leaving of online messages for users to access and read at their convenience. Interaction is delayed, rather than 'real time' as in synchronous discussion.

Users have the convenience and flexibility to post messages at different times without having to be logged into the system at the same time as their peers (O'Neil, Fisher, & Newbold, 2009; Servonsky, Daniels, & Davis, 2005; Young & Paterson, 2007). Within BASv8 educators can set up, monitor, manage and facilitate discussion forums.

One limitation associated with LMS is that staff and students can find it challenging when learning how to use it (Bradford et al., 2007). A study by Pospisil, Aspinall, Matthews and Reid (2007) concluded that there were several issues and problems with using Blackboard for learning which included reluctance of academic staff to change, difficulty with supporting staff with poor information and technology skills and increased student expectations of using computer mediated technology and online learning. Clearly whilst the Blackboard LMS has been a powerful innovation in the world of distance education, there is little evidence to show that facilitators understand how to use it as a learning resource (Bradford et al., 2007; Xin & Feenberg, 2006).

### **Facilitation of discussion forums**

The level of instructor participation is central to discussion forums (Garrison & Anderson, 2003). The encouragement of social presence, connection and students' critical thinking is fundamental to ensure its success (Salmon, 2004). Garrison and Anderson (2003) acknowledge that facilitating is highly influential in promoting participation. Garrison and Cleveland-Innes (2005) and Baker and Woods (2005) agree with this, they believe that active and visible involvement of instructors is crucial in discussions. The instructor's role can be quite challenging when it comes to facilitating online discussions, particularly when it comes to gauging and monitoring educational activities (Garrison & Anderson, 2003). The aim is to encourage quality contributions that are both productive and purposeful, as well as to encourage higher order learning and critical thinking (Garrison & Anderson, 2003). McConnell (2006) suggests that not all learners are enthusiastic about engaging online. Furthermore, Murphy, Mahoney, Chen, Mendoza-Diaz and Yang (2005) argue that some learners lack the skills required to work collaboratively in an environment such as an online discussion forum. Still, teaching staff are often responsible for a number of discussion forums, so tracking student activity and being actively involved in all of them can be difficult (Brace-Govan, 2003). However, students have an expectation that the teacher will take on a leadership role to direct activity in the forums (Paz

Dennen, 2005). Rovai (2007) says that discussions which lack process or are poorly structured result in students becoming confused or losing interest. Garrison and Cleveland-Innes's (2005) support this claim and highlight the need for structure and leadership to establish and maintain deep and meaningful learning. They found that without explicit guidance from the instructor, students primarily communicated through serial monologues rather than messages that exhibited quality critical discourse (Garrison & Cleveland-Innes, 2005).

Wharrad, Cook, and Poussaet (2005) also found that contact and online support with academic staff was infrequent in an online discussion forum in a nursing course. They used focus groups and questionnaires through which they found that tutors lacked confidence and skills in online discussion, there was irregular tutor participation and tutors did not have first-hand experience of using online learning themselves.

Christopher, Thomas and Tallent-Runnels's (2004) evaluation of graduate student thinking levels in online discussions found that when the instructor did not participate in the online discussion lower levels of thinking and discourse were evident in the students. On the other hand, Mazzolini and Maddison (2007) found that student participation rates, perceptions and length of discussion threads (structured online conversation between participants responding to comments or questions in an asynchronous environment) were influenced by the timing, nature and frequency of instructor postings. Surprisingly, these authors found that student postings were more infrequent and discussion threads shorter when the instructor posted more often and played out a more prominent or domineering role. Garrison and Anderson (2003) address this issue emphasising the importance of instructors maintaining a balance of control when facilitating discourse to achieve purposeful goals as well as cognitive development. In contrast, Mazzolini and Maddison (2007) and Xin and Feenberg (2006) suggest that there is a need for instructors not to overdo their role in facilitation and to avoid taking over in the process to prevent stifling student participation. It is the view of these researchers that a balance of the right level of instructor participation is necessary to stimulate discussion and to aid learning, but not so much that it stifles participation (Mazzolini & Maddison, 2007; Xin & Feenberg, 2006).

## Methodology

This study was a descriptive non-experimental design using mixed methods of data collection that included two phases. In Phase one of the research, a descriptive survey consisting of two parts: demographic data (Part A) and closed Likert Scale items, and open-ended questions (Part B) were used to collect both quantitative and qualitative data. The intention was to explore student nurses' use and perceptions of online discussion forums in an undergraduate nursing research unit. Phase two was concerned with the collection and content analysis of students' discussion forum postings. This involved analysing the data for themes relating to forum use including instructor facilitation. Figure 1 show the research methods of data collection and the process of data analyses that the researcher adopted.

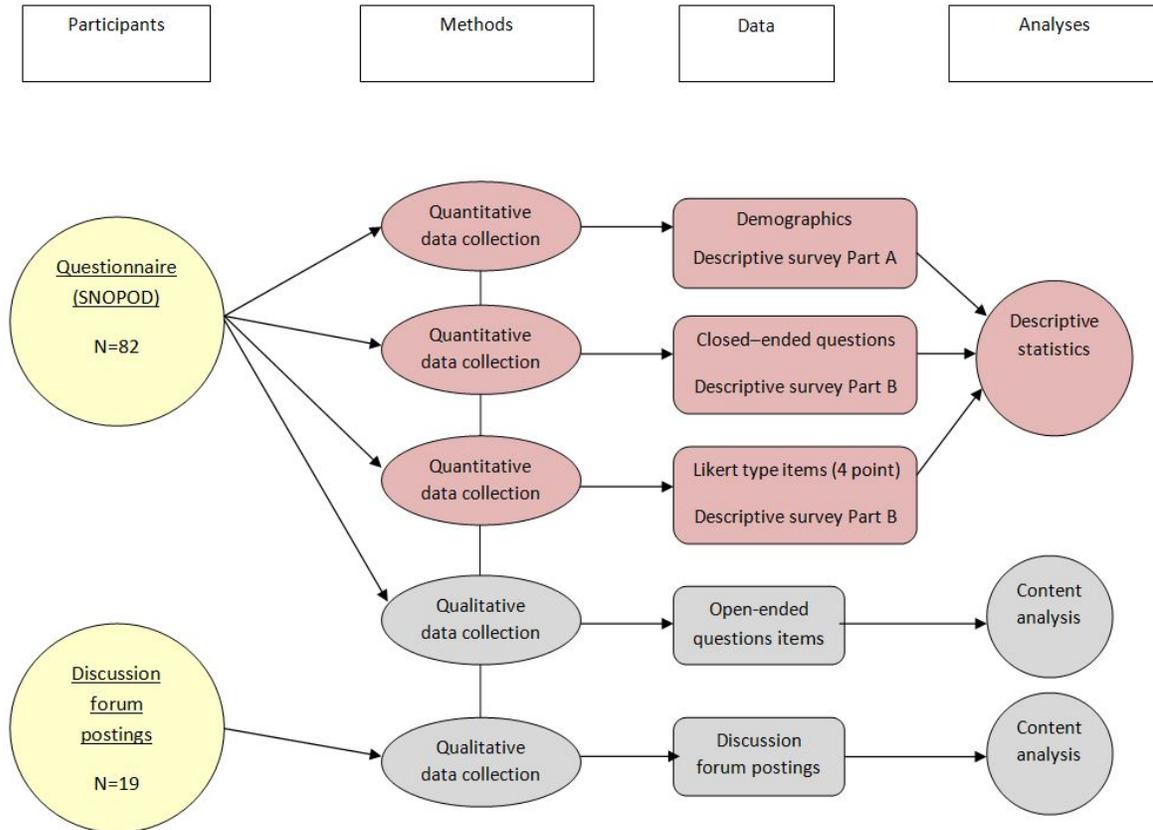

Figure 1 Methods and analysis procedures used in the descriptive study

## **Participants**

The study took place during a single teaching period in 2010 (January – July), targeting a sample consisting of undergraduate student nurses enrolled in the research unit as part of their nursing degree at a School of Nursing in a Western Australia University.

The sample inclusion criteria set by the researcher was that students must be part-time or full-time students enrolled in their final year of their Bachelor of Science (Nursing) undergraduate degree at a Western Australian university.

To obtain participants for this study, the researcher used convenience sampling. In addition, convenience sampling was considered inexpensive and less time consuming than other sampling methods. The sample therefore comprised of sixty off-campus students and one hundred and twenty on-campus students, giving a total of one hundred and eighty students. For the purposes of this study the sample size was deemed appropriate as the researcher believed that it would provide sufficient data to address the broad scope of the research question (Polit & Beck, 2010).

## **Results**

### **Responses**

In February 2010, when the study took place, a total of 337 students were enrolled in the research unit. This comprised of 84 students enrolled in the off-campus mode with a total of 253 students enrolled in the on-campus mode. Following a verbal explanation of the study during the students designated lecture, the questionnaires were distributed to the 172 students who were present. In addition, all of the 84 students undertaking the off-campus mode were mailed a postal questionnaire. Only 69 out of the 172 questionnaires distributed to the on-campus students were returned. A total of 13 out of 84 off-campus students returned the questionnaire. A total of 82 students consented to take part in all parts of the study (the survey and agreement to another educator downloading the consenting students' posts)

### **Instructor facilitation**

The results of the study showed that the participants identified a lack of facilitation and instruction as a major factor in their use of discussion forums. This was evident from both the quantitative and qualitative data with responses indicating that the educator did not encourage or

participate in the online discussions. Participants also felt that they had inadequate information on how to use the discussion forums.

### Quantitative data

The quantitative data obtained from the three Likert scale items in the survey relating to instructor facilitation showed a general trend between each of the items, with the majority of participants agreeing that the level of instructor facilitation had been acceptable. These items included adequacy of instruction (Table 1) on how to use the discussion forums, tutor encouragement and participation (Table 2) and feedback during online discussion (Table 3). Despite this, the results also showed that just under half the students felt they had not been adequately informed about how to use the discussion forums.

Table 1 Adequate instruction was provided on how to use the discussion forums

Item	Likert responses						Mode
	SD N (%)	D N (%)	A N (%)	SA N (%)	NR N (%)	Total N (%)	
	Total D		Total A				
Adequate instruction was provided on how to use the discussion forums	3 (4%)	30 (36%)	39 (47%)	7 (9%)	3 (4%)	82 (100%)	<b>Agree</b>
	33 (40%)		46 (56%)				

Table 2 The tutor encouraged and participated in online discussions

Item	Likert responses						Mode
	SD N (%)	D N (%)	A N (%)	SA N (%)	NR N (%)	Total N (%)	
	Total D		Total A				
The tutor encouraged and participated in online discussions	5 (6%)	24 (29%)	44 (54%)	5 (6%)	4 (5%)	82 (100%)	<b>Agree</b>
	29 (35%)		49 (60%)				

Table 3 The tutor provided adequate feedback during online discussions

Item	Likert responses						
	SD N (%)	D N (%)	A N (%)	SA N (%)	NR N (%)	Total N (%)	Mode
	Total D		Total A				
The tutor provided adequate feedback during online discussions	4 (5%)	24 (29%)	45 (55%)	5 (6%)	4 (5%)	82 (100%)	<b>Agree</b>
	28 (34%)		50 (61%)				

### Qualitative data

The evidence from the analysis of the qualitative data from the open-ended survey questions uncovered lack of instruction by the educator as being one of the main issues highlighted by the students. Students were either not aware that there were discussion forums or did not know how to use them. For example, students stated:

I was never really aware of the forums. It was not really discussed by the lecturer. Perhaps it was mentioned at some stage, but it certainly was never mentioned again.

I did not participate as not many students were using it. The forums need to be more encouraged and students need more exposure.

I find it a disjointed and difficult format to follow. I have yet to work out how to post an entry or response.

I was not really aware of a forum. It was not really discussed by the lecturer. Perhaps it was mentioned at some stage, but it certainly was not mentioned again.

These comments mirror the quantitative findings from the survey where almost half of the participants felt that they had been inadequately informed on how to use the discussion forums.

## **Discussion**

A key finding of this study was that the participants identified a lack of facilitation and instruction as a major factor in their use of discussion forums. Responses indicated that the educator did not encourage or participate in the online discussions. Participants felt that they had inadequate information on how to use the discussion forums, and a few were not even aware that they existed. This suggests that the educator needed to create an awareness of the existence of the discussion forums and to provide instructions to students in order to facilitate use of the discussion forums.

These findings are comparable with research by Rovai (2007), who argued that students will lose interest in online discussions that lack process and structure. This is mirrored by DeWever (2006) who found that meaningful discourse and higher levels of knowledge were achieved when the collaborative process was well structured, scaffolded and adequately supported in online discussions. Garrison and Anderson (2003) further argue that the educator's role in promoting online discussion and participation is highly influential when it comes to facilitating online discussions.

In this study, with regards to instructor participation in the online discussions students commented that instructor involvement was minimal. This finding is consistent with the findings of Wharrad et al (2005) who found that online contact with students and support by academic staff in the discussion forum of a part-time nursing course was infrequent. Possible explanations put forward could be that the educators involved were lacking in confidence and skills and were inexperienced with online learning. This is supported by Salmon (2011) who stresses the need for educators to be aware of best practice and pedagogy in online teaching and learning to provide students with the interactivity in discussion forums. Other studies lend support to the

idea that student perceptions of online discussion are influenced by the nature and frequency of instructor postings. For example, Mazzolini and Maddison (2007) found timing, frequency and nature of instructor postings affected student participation and the quality of postings in online discussion. Similarly, Christopher et al (2004) found dialogue in online discussion was of lower levels of thinking when instructor participation was lacking.

When considering the adequacy of tutor feedback, this study found that a third of the students were dissatisfied. This inadequacy is addressed by Balaji and Chakrabarti (2010), Hew and Cheung (2008), Rovai, (2007), Yeh (2005) and Aragon (2003) who argue that there is a need for students to feel acknowledged and valued for their online discussion contributions and for feedback. They stated that failing to provide feedback will result in students feeling their contributions are unappreciated and undervalued.

## **Recommendations**

The following recommendations, although not exclusive to this study, are suggested to assist educators with the effective facilitation of online discussion forums.

- *Ensure all participants know how to use the discussion forums:* Students need to know how to troubleshoot problems and where to go to for assistance from the educator. Students should also be encouraged to use peers support.
- *Be present and contribute to online discussions:* Educators need to be present in online discussions by intermittently interacting with students and responding to their postings in a timely manner. Ideally, this should be done early on to encourage students to contribute, share opinions and their experiences. There should be a balance between facilitation and direct instruction.
- *Provide regular feedback:* Students need reassurance on how they are progressing in the online discussion activity as suggested by Aragon (2003). Student feedback should be

personalised rather than to the entire class. This will go some way to not only encourage participation, but also to promote social presence within the forums.

- *Motivate and encourage students to actively participate:* This can be done by educators establishing and explaining ground rules at the start of their unit and by encouraging students to actively participate
- *Make discussion engaging:* If students are to remain focused it is important to ensure that online discussion topics are both authentic and relevant to both the unit content and practical aspects of the course. Design discussions that encourage critical and creative thinking, promote social interaction and self-reflection.
- *Staff should develop confidence and skills in using online discussion forums:* It is beneficial for educators to have been online learners themselves so that they have had a good insight into the dynamics of online discussion forums.

In summary this study has explored the role of the facilitator in learning management systems in an undergraduate nursing research unit in relation to the context of a particular university in Western Australia. It is hoped readers from beyond this context will be encouraged to consider the application of this research to their own situations.

## **Conclusions**

Based on the findings from this study it is evident that a lack of facilitation and instruction was seen to be a major factor in discussion forum use, with many students feeling inadequately informed on why to and how to use the discussion forums. The evidence suggests that the students felt that educator involvement had been minimal, with a large proportion of the students dissatisfied with tutor feedback.

The results of this study have practical implications for planning, designing and facilitating online discussion forums to improve the learning experience for student nurses. It is evident that students can see that discussion forums need to have effective instructor facilitation in order to create and sustain online discussions. It should be acknowledged that for educators the challenge of managing online discussion forums is not always easy. However, if students are to benefit

from using online discussion environments it is imperative that instructors learn how to successfully plan, design and facilitate online discussions. This study provides support for advocating change in the way that online discussion forums are facilitated by educators. It is clear that with a better understanding of the factors relating to the use of discussion forums, educators may be better placed to understand how to effectively facilitate online discussions, thus providing a more collaborative learning environment and learning experience for students.

## **Hawaii International Conference on Education**

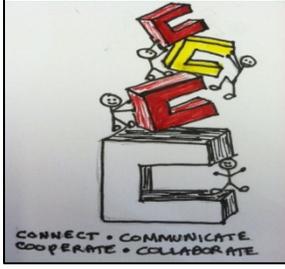

**From Tri-Cultural Conflict to Tri-Cultural Connection: How Successful Urban Science Educators Become Culturally Connected**

### **Abstract**

While the challenge to retain highly competent teachers affects all schools, the crisis is critical in urban high needs districts, which historically suffer from high teacher turnover of qualified educators. This high turnover is especially problematic in the content area of science. Through in-depth phenomenological interviews I document the teaching experiences of veteran urban science teachers and how they navigated pathways to successful teaching careers in high needs districts. Results focus on how the cultural levels of teacher socialization (personal, institutional, and societal) shaped their induction into the teaching profession. In addition, the analysis of the data suggests that teacher preparation programs need to be reconceptualized to include a specific focus on culturally relevant and responsive pedagogy, teacher identity development, and how to develop community networks and connections. This restructuring is key for novice urban teachers to either increase their cultural sensitivity, or align their own cultural belief systems in-order to develop the necessary skill set to become successful science teachers in urban high needs districts.

## Abstract

The purpose of this project is to provide compelling information, along with effective strategies in order to be able to connect, communicate, cooperate, and collaborate to better understand the role physical activity plays in education. We know that being physically active is important in combating hypokinetic diseases and certain types of cancer (United States Department of Health and Human Services USDHHS, 1996-present). We can now add to the long list of benefits of physical activity; increased cognition, focus, and overall readiness to learn. According to Ratey, (2008) exercise is like “Miracle Grow” for the brain (AAHPERD, Keynote address, San Diego, 2011). Researchers suggest that what we now call thinking is really evolutionary, internalization of movement and that play helps shape the brain, opens imagination and invigorates the spirit (Blaydes, 2000; Jensen, 2000; Lengel & Kuczala, 2010). This information is really not new, it is old news that is being revisited by leaders in the field of education and neuroscience, and rightfully so. We are finally coming together to shed new light on an age old story (Groppel, AAHPERD, San Diego, 2011)! It is the intent of these authors to help all educators understand and be able to feel comfortable using the powerful tool of movement to enhance students’ physical, emotional, spiritual, and cognitive fitness.

**Connect, Communicate, Cooperate, & Collaborate**

2013-2014

This document is intended to gather information on your school’s best practices in regards to being considered a “physically active school system.” It will be compiled and used as research for our book, P.A.S.S: A Guide to Creating Physically Active School Systems. Your participation is completely voluntary and very much appreciated. If you would be so kind as to share this information with Carol Ciotto or myself you can e-mail either one of us at [Ciottocaj@mail.ccsu.edu](mailto:Ciottocaj@mail.ccsu.edu) or [Fedem1@southernct.edu](mailto:Fedem1@southernct.edu). Thank you again for your time and effort on this project.

Sincerely,

Marybeth H. Fede (SCSU) & Carol Ciotto (CCSU)

School: \_\_\_\_\_ Town: \_\_\_\_\_

Grade Level: \_\_\_\_\_

Please respond to the following 3 questions:

1. How do you actively connect your curriculum with the Physical Education Program in your school? \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_
2. How do you collaborate/cooperate in order to bring physical activity into the classroom(s)? \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_
3. How do you communicate/advocate for Physically Active Learning with parents and/or in the community in general?  
\_\_\_\_\_

## Future Recommendations:

The mission of education needs to include the whole child and their basic right to move! How do we get people to value and become advocates for a physically active lifestyle? Groppe, (2011) suggests that people need the right tools in order to complete the mission. Americans have a million excuses not to be physically active, with the number one reason being not enough time. Other barriers to full engagement include but are not limited to technology, multi-tasking, denial, self deception and it's easier not to! Educators need to understand the barriers and that it is not the stress that is bad, but rather the lack of recovery time that we don't allow ourselves or our students. We need to get students fully engaged. Stress is not the enemy, it is how we grow, get stronger, and produce energy. It is only when we fail to manage the recovery period properly that problems arise (Groppe, 2011). In this day and age of smart phones, I-pads, and information at our fingertips, we are so busy multi-tasking and trying to handle multiple stimuli; that we never really fully disengage. This is what is hazardous to our health and well-being. Making excuses and telling ourselves the wrong story may give us meaning and significance, but it prevents real change, becoming fully engaged and disengaged.

The best tool to implement change is our ability to CONNECT, COMMUNICATE, COOPERATE & COLLABORATE! You can make a difference one student at a time by understanding the barriers to full engagement. Including Gardner's (1999) eight multiple intelligences, and Glasser's (1998) five basic human needs in your teaching is a great way to reach all the very different individuals that make up your classes. Furthermore, Lengel & Kuczala's (2010) framework for movement in the classroom, Blayde's, (2000) action based learning, Katz's (2010) ABC's for fitness, brain breaks in the classroom, Gilbert's (2000), brain dance, the powerful connection between brain and body that Ratey (2008) makes, and before and after school programs which lead to community involvement, are all available tools that can help achieve the mission. We need to arm ourselves with these tools, reframe the story, collect data, communicate the findings, cooperate & collaborate with faculty and staff, administrators, board of education members, parents and most importantly our students; one at a time in order to educate the WHOLE child.

| ● + HDL cholesterol           | - Behavior issues  |

# P.A.S.S

## *Creating Physically Active School Systems*

---

### ***HOW DO I GET STARTED?***

#### **Steps for implementation**

- Make a Commitment to become a Physically Active School System
- Collaborate with the stakeholders (administration, faculty/staff, students and community)
- Develop an action plan
- Develop motivational techniques to engage stakeholders
- Promote physical activity initiative/P.A.S.S. Kick-off: This will signify the start of the implementation phase

**Needs Assessment Plan**

**Opportunities for Implementation**

**What physical activities are you doing now?**

**If collaborating, with whom?**

**What would you like to add in the future?**

*Before/After School*

*During School*

*Recess/Lunch*

*Physical Education*

*Family/Home*

*School/Community Events*

**For each opportunity for implementation, identify in the box provided what if any physical activity you are currently doing, who you might be working with and what you might want to consider incorporating in the future.**

#### Abstract

Presenters will share their analysis of the integration of part-time faculty in teaching and learning initiatives in the School of Education at Brandman University Chapman University System. Decide whether the strategies are currently transferable to your institution. You will leave with the knowledge to make recommendations to your faculty. Enlist your faculty in developing plans to integrate adjunct faculty through course mentorship, membership in campus advisory boards, school program reviews, use of virtual meetings, and assignment rubric calibrations.

**12<sup>th</sup> Annual Hawaii International Conference on Education**  
**Abstract**

**Title: Muslims – as Scientists & Mathematicians, not Terrorists!**

Islam is one of the fastest growing religions of the world with about a billion adherents - a fifth of the world's population. Approximately 8 million Muslims reside in the United States (Lorraine Ali, 2008). Historical records reveal that Muslims (the followers of Islam) have been in this country since the time of Columbus as many of the slaves brought to this country from Africa were of Islamic faith (Gomez, 1994).

Currently Islam has become a highly misunderstood religion in the United States (Meacham, 2009; Ayers & Reid, 2005) with many of us having negative perceptions about Islam and Muslims (Gollnick & Chinn, 2013). Such misunderstandings about Islam have not been based entirely on reports about the unfortunate events of September 11, 2001, or the wars of Afghanistan and Iraq, the Texas Fort Hood shootings, or Boston bombing. Much of the negative perceptions have stemmed from the misinformation and stereotypic portrayal of Islam by the popular media, as well as by some religious/political leaders (Meacham, 2009).

For many educators addressing issues pertaining to any religion may become a challenge. For example, an educator might find himself incorporating his own viewpoints when discussing a religion. Educators also have to be cognizant of the First Amendment issue pertaining to the separation of religion and state. The First Amendment does not however, prohibit teaching about religion as long as it is not in the form of indoctrination. Taking all these factors into account may become somewhat of a balancing act for

educators. There are however, some informative and non-bias ways that can be utilized to initiate the concept of Islam in a classroom.

The intent of this presentation is to provide teachers and educators with some information, strategies, and resources for teaching about Islam and Muslims. It is the hope of this presenter that by using these tools educators will be able to eradicate the prevailing stereotypes and replace them with true appreciation and understanding about Islam and its believers.

**12<sup>th</sup> Annual Hawaii International Conference on Education**  
**Abstract**

**Title: Immigration: How should we teach beyond Elise Island?**

Immigration is an important topic in the curriculum from elementary to the college level. Since US is a nation of immigrants, there is no dispute that immigration is an integral part of US history. In recent years this topic has become part of national discussions that extend far beyond the classroom. The ramification of such discussions/debates has impacted students in the classroom at all levels. The recent passing of immigration laws in various States put this topic at the fore front of the national dialogues. However, these dialogues generated many misconceptions about immigration and put educators across the country in a dilemma of how to address this without stirring up controversy. It is also important to note that many educators in the classroom may not be familiar with the core immigration issues or its processes and may have some of the same misconceptions like that of their students.

Many educators teach “immigration” from the Ellis Island perspectives. Most of these units usually have some common elements: where are our forefathers came from; asking children in the classroom to interview their grandparents to find authentic information about the place of origin where their grandparents or greate grandparents came from; watching a vedio on Ellis Island; taking a virtual tour of Ellis Island called “An Interactive Tour of Ellis Island: An Immigration Activity” published by Scholastic; and role playing the experiences the students’ grandparents or greate grandparents had at the Ellis Island. The units also includes books about Ellis Island and life of immigrants

here in the United States. If one observes these educators teaching immigration through Ellis Island perspective, one can easily get the impression that “immigration” happened only in the past and treated it as a historical event. However, immigration still happens and will continue for many years to come. Today’s immigration process is far more complex than the time of Ellis Island period. Therefore, this topic must be addressed not only from historical perspective but also through current perspective.

The intent of this presentation is to provide educators with some information, strategies, and resources for teaching about immigration. It is the hope of this presenter that the educators will be able to use these tools to address immigration in a positive and informative way in their respective classrooms.

## Conference Proceedings

1. Title: Contributing Factors to an Aboriginal Student's Successful Teacher Candidate Internship
2. Margaret Leslie Martin
3. PhD Candidate in Educational Administration, Department of Educational Administration, College of Education, University of Saskatchewan, Saskatoon, SK
4. Margaret Leslie Martin, 737 University Drive, Saskatoon, Saskatchewan CANADA
5. [Martinl@siit.sk.ca](mailto:Martinl@siit.sk.ca)
- 6.

### **ABSTRACT**

To increase the educational success of Aboriginal students and work towards a just society, it is essential for more Aboriginal teachers to enter into school systems. My research aim is to discover factors that may assist Aboriginal teacher candidates to have a successful internship that inevitably may guide them into a teaching career. Kanu's (2007) research has determined that the integration of Aboriginal cultural knowledge and perspectives in student learning outcomes, instructional methods and resources, and as part of the philosophical underpinning of the curriculum results in positive outcomes. An increase of Aboriginal teachers within the school systems will infuse cultural knowledge, worldviews and an understanding that will assist in learning for all.

In the discovery of success factors, part of my research explores the areas of social and political justice. These areas may be uncovered by examining a school's or classroom's prevailing worldview. Hermes (2005) wrote that 'more powerful than (teacher's) knowledge of cultural differences is their knowledge of the big picture – the context of socioeconomic and

cultural oppression of Native Americans'. The participant's and participating school's knowledge of Aboriginal socioeconomic and cultural oppression will be investigated to reveal any influencing elements within a classroom structure. Examining these areas may uncover a 'habitus of education' within a school that inevitably affects the teacher candidates (Shields, 2004). Understanding this larger picture and the elements that create the prevailing worldview and the effects that they have on the teacher candidate's experience will be part of the research study.

Type of Session: **full 90-minute workshop**

Description of workshop:

**Proportional reasoning is a key mathematical idea in middle school mathematics. It is displayed when a student multiplicatively attends to quantities and operations.**

**Multiplicative thinking, however, is not natural for students. We have found that a “copies of” model can help develop this multiplicative understanding. In this workshop, participants will experience professional development activities that enhance instructional techniques to address the lack of students’ ability to make sense of proportional reasoning.**

Authors/Presenters:

## **Multiplicative Thinking: Making “Copies of” Proficient Practitioners and Persistent Pupils**

Proportional reasoning is a key mathematical idea in middle school mathematics (National Governors Association, 2010). It is the cornerstone of the elementary mathematics curriculum and the capstone of the high school mathematics curriculum (Post, Behr, and Lesh 1988).

Proportional reasoning is not necessarily observed when a student sets up a proportion; cross multiplies, and produces an answer. Rather, proportional reasoning is observed when a student recognizes a multiplicative relationship between quantities and is able to reason multiplicatively to solve a problem. Students’ development of multiplicative reasoning is difficult and slow (Clark & Kamii, 1996). We believe this is in large part due to a general lack of curricular focus on supporting students’ ability to make sense of big mathematical ideas through powerful ways of thinking. Sadly, students typically learn to *do* procedures but they lack conceptual understandings for those procedures and they lack an understanding of why the procedures are important to learn (Schoenfeld, 1994). In this article, we discuss activities and structures from our own professional development projects that we utilized to help teachers develop new ways of thinking about proportionality.

### **Focus on Student Thinking and Problem Solving**

We believe teachers must shift their focus and curiosity to provide opportunities for students to develop powerful ways of thinking in order to help them to solve problems and to determine how to attack a problem that they have not seen before. We have found the professional development activities described in this article support teachers ability to attend to students’ thinking by providing teachers the opportunity to reflect on their own students’ misconceptions and poorly formed conceptions. The philosophy guiding the professional development activities used by the author team is also predicated on the belief that student achievement can be improved by improving teachers’ mathematical content knowledge and re-centering teachers’ focus on student

thinking and problem solving. More specifically, if the participating teachers develop ways of thinking about mathematics, develop a profound understanding of the fundamental mathematics that they teach, and develop strategies for effective problem solving, then these same mathematical practices will begin to develop in the students that they teach. Our experiences have led us to believe that teachers with such a grasp of these mathematical practices and habits of thinking believe strongly that their students must also develop the same mathematical practices and habits of thinking.

### **Problem-Solving Schema**

As is clearly evident in the Common Core Standards for Mathematical Practice (National Governors Association, 2010), training students to solve challenging and unique problems is an important emphasis now being placed upon American mathematics students and teachers. In the professional development model we are implementing, middle school mathematics teachers are trained to provide opportunities for students to develop the type of problem-solving that requires accessing various “tools” and heuristics. Instructional techniques, such as paired-board work (Vicich, 2007), that support students’ development of deep, well-connected conceptual understandings in a student centered-classroom are modeled by facilitators in our workshops. Teachers come to learn that in their classrooms the mathematics itself is to be the final authority to the “correctness” of proposed solutions and not simply the teacher stating such. Productive problem-solving behaviors are developed using appropriate content. Specific development of problem-solving is focused on:

- Initial Engagement (underlining the givens and goal(s));
- Planning & Conjecturing;
- Strategy Selection;
- Monitoring of Progress (metacognitive reflection);
- Verification;

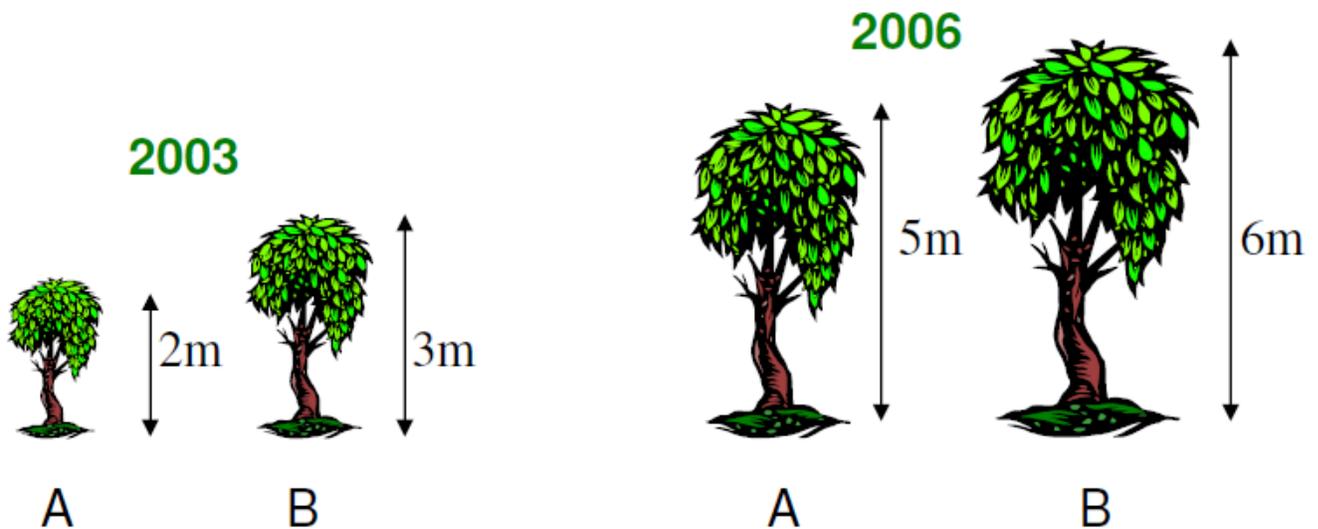

- Productive Belief System.
- Creating Productive Classroom Discourse

The Diagnostic Instrument (see appendix 1) is used by teachers to analyze the problem-solving behavior of others. Repeated practice with implementing problem solving strategies develops skills to help students with their problem-solving abilities but also increases teachers' awareness of their own problem-solving behaviors.

### Learning Activities

As an example of the kinds of activities that are implemented in the professional development workshops with the goal of developing the mathematical practices, habits of thinking, and problem-solving strategies listed above, consider the situation shown in Figure 1 (Lamon, 2005).

**Figure 1: The Tree Problem**

Which tree grew more, Tree A or Tree B?

Without any prior discussion or instruction, participants typically share that neither tree grew more since each tree grew an additional 3 meters from 2003 to 2006. However, a minority of participants will indicate that Tree A grew more since its height in 2006 is 2.5 times its height in 2003 while Tree B's height in 2006 is only 2 times its height in 2003.

This example opens up a powerful way of thinking called *multiplicative reasoning* (Confrey, 1994; Kieren, 1994; Sowder et al., 1998; Vergnaud, 1994) that most teachers have not explicitly or consciously been aware of in their own ways of thinking. Also, the Tree Problem provides a clear example of how multiplicative reasoning can be contrasted with *additive reasoning*. Initially, most workshop participants recognize that each tree grew by an additional 3 meters. Often, this is all they see. Their initial thinking reveals their impoverished ability to reason mathematically since one can also compare the heights of the trees multiplicatively.

Multiplicative reasoning is the capstone of the elementary school curriculum and the cornerstone of high school mathematics and science (Lesh, Post, & Behr, 1988). Consider the following courses where multiplicative thinking plays a foundational role:

- Algebra – e.g. constant rate of change (slope), linear functions, exponential functions
- Geometry – e.g. measurement, scaling, similarity
- Probability and Statistics
- Trigonometry – e.g. trigonometric ratios
- Calculus – e.g. instantaneous rate of change and average rate of change
- Differential Equations – e.g. autonomous differential equations

Because multiplicative reasoning is ubiquitous in all mathematics and science courses and is a critical aspect of making sense of foundational ideas, our professional development efforts focus

on developing multiplicative reasoning. We then leverage this development in order to build other important mathematical ideas.

Returning to the example with the growing trees, it is important for teachers and students to be aware of their thinking. In a given situation at a given time, are the students thinking additively or multiplicatively? Is it appropriate to do one or the other? Can both be legitimate ways of thinking? How might we describe the situation both additively and multiplicatively? Sometimes, workshop participants are bothered that this problem does not have a “correct” answer. They are eager to answer the question “which tree grew more?” with a specific response. In this case, depending on whether one is reasoning additively (the trees both grew by an additional 3 meters) or multiplicatively (Tree A grew by 2.5 times as much while Tree B grew by 2 times as much), the question does not have a single “correct” answer. Rather, the question is designed to make one aware of divergent ways of thinking and encourages the ability to be aware of one’s thinking.

This is not the end of the work that can be done with the simple example of the growing trees. What makes the situation so powerful is that workshop participants can be pushed further to express the relationships between the histories of the heights of the trees. During the activity, when the workshop facilitator feels that the group is ready to move on, participants are encouraged to express the relationship between the old height and the new height of each tree in a multiplicative way. With some prodding and encouragement, participants eventually agree with the following statements:

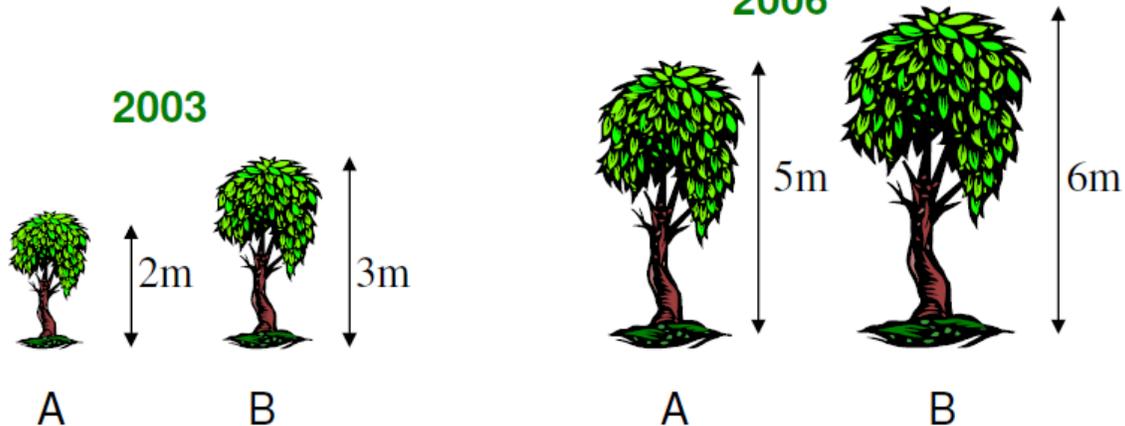

- The height of Tree A in 2006 is 2.5 times its height in 2003
- The height of Tree A in 2003 is  $\frac{2}{5}$  times its height in 2006
- The height of Tree B in 2006 is 2 times its height in 2003

- The height of Tree B in 2003 is  $\frac{1}{2}$  times its height in 2006

It is important for teachers and students to be flexible in how they compare the heights of the trees. While the fact that the height of Tree A in 2006 is 2.5 times its height in 2003 is relatively easily seen. However, the fact that the height of Tree A in 2003 is  $\frac{2}{5}$  times its height in 2006 comes as much more of a challenge for the workshop participants. To help with this understanding, participants are encouraged to imagine that Tree A in 2006 is segmented into 5 equal parts (with respect to height). Each part has a height measurement of 1 meter (since the entire tree is 5 meters in height) and therefore, each part is  $\frac{1}{5}$  times the height of the entire tree. It takes 2 *copies* of the  $\frac{1}{5}$  (1 meter) parts of the tree to have an equivalent height of the 2003 tree. Participants begin to see fractions using a “partitioning” and “iterating” model (Steffe & Olive, 2010; P. W. Thompson & Saldanha, 2003). That is, the entire tree height is partitioned (cut) into 5 equal lengths. We need to iterate (copy) this length twice in order to create the height of the tree in 2003. That is, we have 2 copies of  $\frac{1}{5}$ , we have 2-one-fifths, we have  $\frac{2}{5}$ . To see the fraction  $\frac{2}{5}$  as two copies of  $\frac{1}{5}$  is to view the fraction in a multiplicative way and is very helpful when learning to add, subtract, multiply, and divide fractions. As Thompson and Saldanha (2003) state, “When students understand the numerical equivalence of measuring and partitioning they understand that any measure of a quantity induces a partition of it and that any partition of a quantity induces a measure of it” (p. 30). Our goal is to push the boundaries of teachers’ thinking so that they build a flexible conception of partitioning and measuring as a multiplicative activity.

To further practice and develop the ways of reasoning multiplicatively addressed so far, the following extension question (Figure 2) is given.

**Figure 2: The Tree Problem...Revisited**  
**2006**

Focus on the 2006 situation. How much taller is Tree B than Tree A?

To answer this question, one can reason that Tree B is 1 meter taller than Tree A (additive reasoning). Or, one can reason that Tree B is  $\frac{6}{5}$  times as tall as Tree A. When encouraged to examine their thinking and to articulate how it makes sense that “Tree B is  $\frac{6}{5}$  times as tall as Tree A,” participants often (with confidence) fall back on the partitioning and iterating model for thinking about fractions. That is, if Tree A is cut up into 5 equal parts, each part representing  $\frac{1}{5}$  the height of Tree A, 6 copies of  $\frac{1}{5}$  or  $\frac{6}{5}$  of Tree A are needed to create a height that is equivalent to the height of Tree B.

This is just one activity that is used in the workshops to accomplish several goals related to our philosophy of professional development.

- The problem is a simply worded and understood situation that can engage all participants and opens up an opportunity to examine the way in which we think.
- The problem allows for both additive and multiplicative reasoning. This allows the opportunity for us to be aware of the different ways of reasoning and to be cognizant of which way we are reasoning while grappling with the problem.
- The problem allows for connections to previous ideas, namely the idea of fraction.

- The problem sets the stage for other activities designed to further develop teachers' ability to think multiplicatively that allows them to make sense of other mathematical ideas.

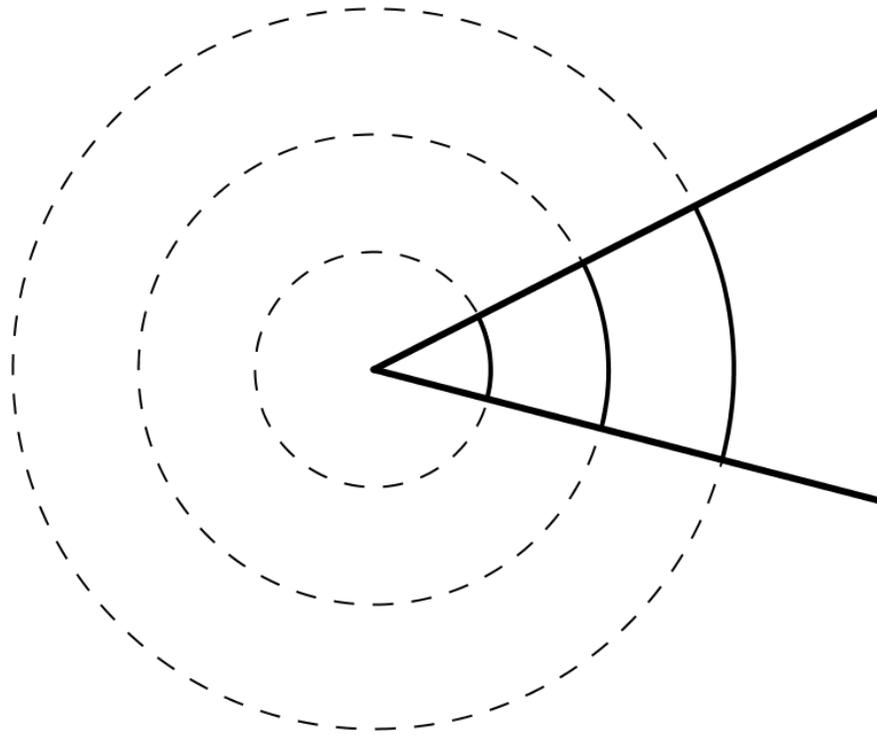

Imagine that multiplicative reasoning is now a well-developed norm for the teachers.

Assuming this, we now consider how multiplicative reasoning is used as a foundational way of thinking for the purpose of developing other mathematical ideas.

Reasoning multiplicatively about “copies of” or “times as large as” also leads to powerful thinking about measurement (P. W. Thompson & Saldanha, 2003). Teachers typically believe they understand the concept of measurement and how to measure using non-standard units. They know, for instance, that they can use paperclips to measure length. But do they really understand the mathematics of this idea? To check, we ask them to measure an angle using something other than degrees. We even give them freedom to select a manipulative object. At this point the teachers must focus on the *attribute* they are measuring. And this is no small task. They must agree on that attribute, find another object with the same attribute, and compare the two multiplicatively. That is, they must be able to say that this object is  $x$  times as large as (or  $x$  copies of) this other object. The teachers are challenged but they see the need to solve the problem.

Eventually some teachers will realize that there is a built-in unit of measure. Someone will notice that no matter the size of a circle centered at the vertex, the portion of the circle subtended by the angle is the same fraction of the whole circle. Additionally, that portion of the circumference is some “copies of” or is some “times as large as” the radius of the circle *regardless of the size of the circle* (Moore, 2010; P.W. Thompson, 2008). The teachers then uncover a useful tool for measuring angles that is built into every circle: the radius (Figure 3).

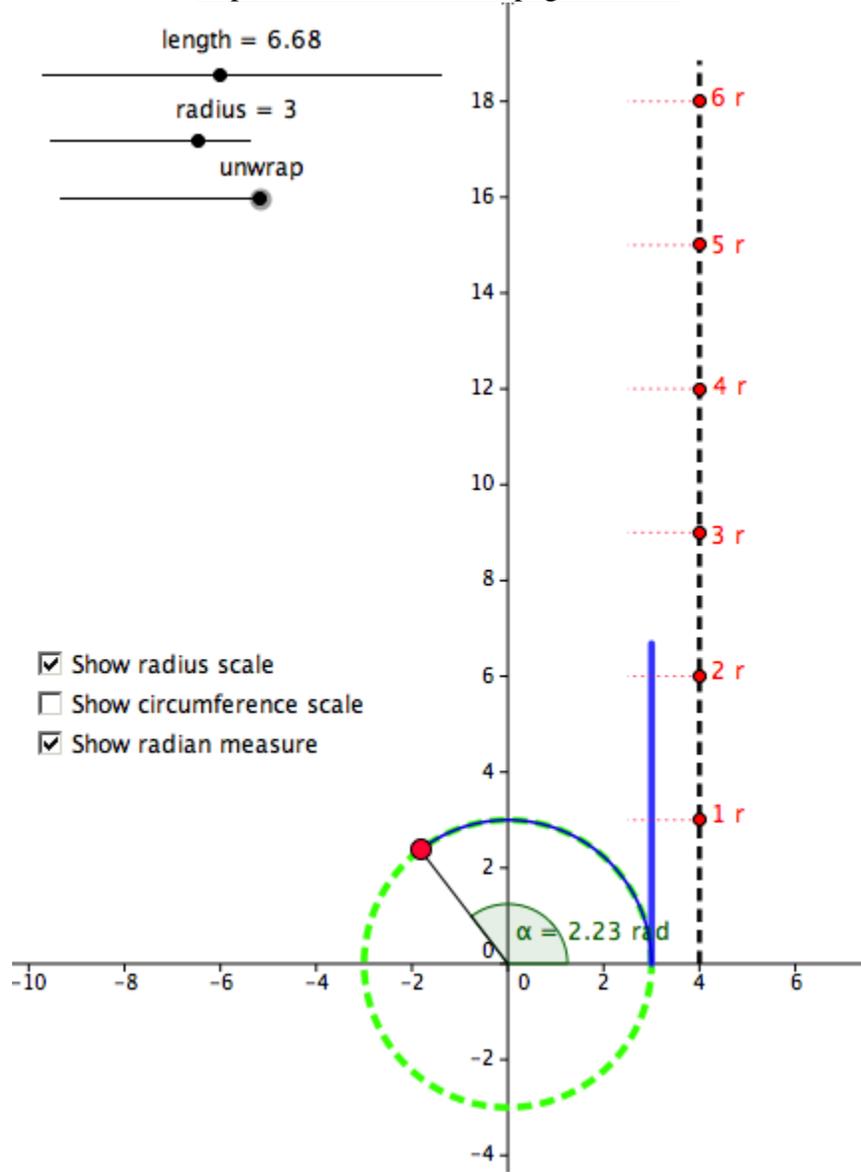

**Figure 3**

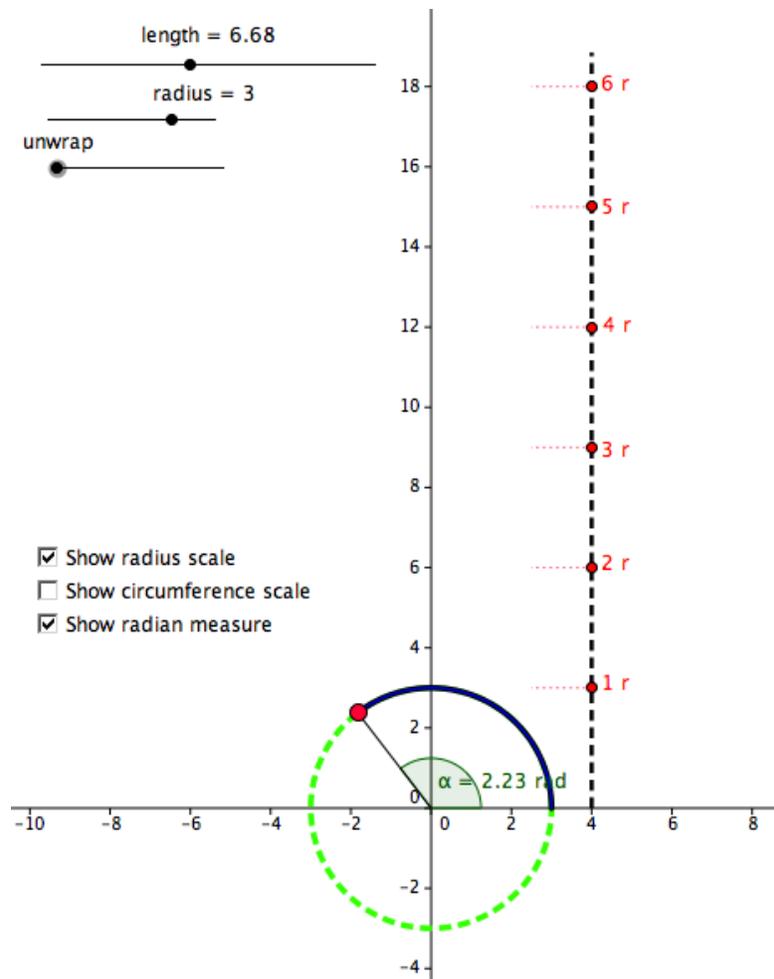

This new understanding unlocks powerful applications in other parts of the curriculum. The formula for the circumference of a circle is now viewed as a measurement. When we say we are really talking about how the full circumference of the circle is roughly 6.28 times as large as the radius of the circle. That is, we measure the circumference in radius units. The images below illustrate an “unwrapping of a circle” that shows how the arc length of a circle can be measured in terms of radius units (radians) on the vertical scale. For the example shown below (Figure 4), we can think multiplicatively about the arc length by reasoning that the arc length is 2.23 times as large as the radius. This way of thinking leads to a meaningful understanding of radian measure.

### Figure 4: Unwrapping a Circle

[http://tedcoe.com/math/?page\\_id=144](http://tedcoe.com/math/?page_id=144)

Similarly, when we say we mean that the area of a circle can be measured in terms of  $r$ -squared units. And, it takes roughly 3.14 copies of those  $r$ -squared units to cover the area of the circle.

We also extend the multiplicative reasoning to similarity, proportionality, and the right triangle trigonometric functions. Proportionality provides an interesting exploration, as it is more than two fractions set equal to each other. We start by asking the teachers to explain what they mean when they say two quantities are proportional.

### Classroom Implementation

All middle school mathematics teachers participating in our professional development program participate in content-based workshops/institutes and enter together into a Collaborative Community of Learners (CCOL) facilitated by community college faculty. The CCOLs are

designed to support the emergence of an intimate collaborative between the CCOL facilitator and the middle school teachers. The primary outcome of the CCOLs is for teachers to make their teaching practice public. The CCOL name was adopted because its emphasis on "learner" suggests that each member of the collaborative is both learning *with* and learning *from* other members of the community for the purpose of enacting a shared research-based vision of effective learning experiences for students.

Our CCOLs are designed to enhance teacher collaboration by building communities within schools to support teacher practice and increase teacher retention. The CCOL design draws from the body of literature on professional learning communities (Cox, 2005; DuFour & Eaker, 1998; Hord, 1997), as well as our experience through the NSF-funded *Project Pathways* and *TPC2* projects. Research findings from *Pathways* have revealed the importance of a strong CCOL facilitator who has deep and connected understandings of key mathematical concepts. Each CCOL consists of one facilitator and a group of teachers ( $n < 6$ ) meeting 30 hours per year.

During the first semester, each CCOL articulates its own shared vision and goals, identifying content areas and standards where students typically struggle. The CCOL will define learning goals for students focusing on (1) prior knowledge needed, (2) what it means to understand those ideas and (3) what it sounds like when students understand. One or more teachers in the CCOL will implement a collaboratively designed task with observers collecting data and focusing on student learning. Afterwards, the CCOL members reflect on their own learning and their students' learning.

Teachers have begun to regard their CCOL as an important element of their professional practice. CCOL facilitators and middle school teachers form collaborative teaching teams to embrace and create an environment for public-openness of teaching. CCOL facilitators serve as

instructional coaches by observing teachers during classroom instruction and providing them with feedback. On occasion, the facilitator teaches middle school classes so that classroom teachers can observe the facilitator as teacher in the middle school setting.

## **Conclusion**

Focusing on the development of big ideas, such as multiplicative reasoning, can impact student development of sense making, reasoning, and problem-solving skills. Students who are able to flexibly and powerfully reason and problem solve will be prepared to succeed in this ever changing, complex world. We encourage teachers to consider how they can change their teaching practice, their beliefs about mathematics, and their curriculum so that students are encouraged to persevere in the study of mathematics. The combined approach to professional development described here with content enhancement and the formation of a supportive collaboration of teachers in CCOLs has been a powerful tool for growth in many middle school teachers.

## Appendix 1

### Diagnostic Instrument for Problem-Solving Behaviors

(Adapted from Geiger & Galbraith, 1998)

#### Engagement

Problem is read	Key words underlined	Givens and goals established	Givens and goals represented symbolically

#### \*Executive Behaviors

\*Planning: Did you make a *plan* or “jump into” this problem? Did you make any *conjectures regarding the answer or possible solution path*?

--

#### \*Monitoring/Control

Recognition that a solution pathway will lead to a dead end	Changing from one solution pathway to a different solution pathway

#### \*Heuristic Strategies

Appropriate strategy initially selected	Data organized	Multiple Strategies used to make progress or clarify	No heuristic used

#### Verification

Checked if answer was reasonable	checked correctness of answer	Checked for errors in solution	No verification used

#### Mathematical Practices and Habits: Solution (is)

Based on reason/logic	Thorough/Complete	Neatly organized	Attended to Precision	Correct

#### Resources: Knowledge is

Complete	Sound with minor errors	Some but significant faults appear	No knowledge

#### Beliefs and Attitudes: Problem Solver Exhibited

Persistence	Confidence	Curiosity

# DEVELOPING SKILLS FOR A GLOBALISED WORLD THROUGH COMPUTER BASED SCIENCE INSTRUCTION

By

O. E. Ogunseemi

Integrated Science Department, College of Education, Ikere- Ekiti  
[fruitbearers@yahoo.com](mailto:fruitbearers@yahoo.com) ; 08168398303, 08058481498

## Abstract

The benefit of the computer, which is the most influential technology of the last millennium, has been widely acknowledged in education and as a powerful agent of globalization. Computers have fundamentally changed the ways in which we measure, handle data and access information. This has made it necessary to provide computer supported environments in higher institutions of learning with the expectation that the nation will become well positioned to be part of a "New Global Economy powered by Technology, fuelled by information and driven by knowledge". The emergence of this new global economy implies that Teacher education institutions must produce teachers who will ensure future generations are effectively equipped with the scientific and technical literacy, knowledge, skills and confidence to compete in the global economy. In this quasi- experimental study, two computer based learning tools , Microsoft PowerPoint presentations and the internet were used to actively involve pre-service science teachers in a college of Education in Nigeria in learning selected science concepts. The study answered three research questions relating to the efficacy of both learning tools in improving teachers' science knowledge, computer skills and their confidence to learn with technology. Participants, who were randomly assigned to the two experimental groups and the control, were involved in carrying out science projects using these tools. Data was collected using a science achievement and skills test and an attitude to computer questionnaire. Both descriptive statistics and analysis of variance were used to analyze data. The findings and their implications were discussed.

**Key words:** Computer, PowerPoint, Internet, Pre-service Teachers

## Introduction

One of the many challenges facing developing countries today is how to prepare their society for globalization and the information and communication revolution. Policy-makers, business executives, NGO activists, academics, and members of society are desperately concerned with the need to make their societies competitive in the emergent global economy. Many international organizations such as United Nations Development Project (UNDP), Asia-Pacific Development Information Project (APDIP) and many more shares the belief that with enabling information and communication technologies (ICTs), countries can face the challenge of this age. Globalization and technological change have accelerated in tandem over the past fifteen years which created a new global economy that has serious implications for the nature and purpose of educational institutions.

As the half-life of information continues to shrink and access to information continues to grow exponentially, schools cannot remain mere venues for the transmission of a prescribed set of information from teacher to student over a fixed period of time. Rather, schools must promote 'learning to learn', i.e. the acquisition of knowledge and skills that make possible continuous learning over the life time. Tinio, (2011) concluded that the illiterate of the 21<sup>st</sup> century will not be those who cannot read and write but those who cannot learn, unlearn, and relearn. She buttressed, that concerns over educational relevant and quality coexist with the imperative of expanding educational opportunities to those who have been made vulnerable by globalization especially the developing countries in general, low-income groups, girls and woman, and low - skilled workers in particular. Global changes also put pressure on all group to constantly acquire and apply new skills. The international labor organization (ILO) defines the requirement for education and training in the global economy simply as 'Basic Education for All', 'Core Work Skill For All' and 'Life Long Learning For All'.

Nkanga, (2007) submitted that In Nigeria, there are several initiatives geared at accelerating development through the technological platform in the polity though concluded for Nigerians to align in a globalized economy, the government must adopt the computer as a major working and playing equipment which he wrote it is the only way to make Nigeria a

global participant in the emerging global economy. This also is to start from the nation educational system and make the study of it compulsory from the nursery and primary to tertiary level. When the institutions of learning in the country are made to adopt it wholly, the drive to make Nigeria compliant will be effective because the seed of the adoption of the computer that will translate to a revolution would have been sown. If the present educational system is 100% equipped to produce globally competitive graduate, the future development of Nigeria will be guaranteed. Jekayinoluwa and Ojo, (2010) argued that with the increase in technological drive and the need for efficiency, accuracy and speed necessary to enhance success in industries and commerce, and the inevitable roles of ICT in every facet of our society, much attention has been focused on the use of computerized equipments in educational institutions.

Computer, According to Roblyer (2003) is “a set of devices designed to work together to accomplish input, processing, and output functions in order to accomplish tasks desired by a user”. Thus, the computer operates on the basis of input-process-output. And with the current trends in the educational sector, modern day teachers are expected to learn and be able to do so many things as a societal expectation on them are increasing daily. They are not only expected to be sound in their subject area and basic pedagogy, but also expected to model higher order thinking processes, work in interdisciplinary terms and demonstrate leadership and communication skills. According to Jekayinoluwa and Ojo (2010) the functions of teachers in education process is considered prominent especially when we consider teaching and learning process as acquisition of knowledge and skills by individual to enable them become useful members of the society.

Computer based science Instruction will not only provide means to fulfilling curriculum needs, but will also offer a unique opportunities to extend work in the science classroom. Just in line with Wisner and Olson (2003) who categorized it as “anytime anywhere learning” especially the presentation of teaching material on a large screen coupled with the Internet and many more which offers a means to enhance whole class interaction and participation. When used well, Computer affords insight, possibilities and efficiencies that are difficult to achieve in

fixed term as in conventional classroom. According to Gbadamosi, (2006) the contemporary traditional teacher training approaches are simply not equipped to deal with all these new expectations and majority of our teacher trainers are also known to be too pessimistic in their perception and attitude to change. This is particularly so when it comes to playing key roles in allowing computers technology to permeate their professional practice and development without dwelling on the low level of connectivity, low ratio of personal computer per house hold, and many more others that influence greatly their level of readiness to join the global coach most especially in Science subjects of which recordings of practical experiments, observations and demonstration are made in both formal and informal text.

To prepare student for the globalized age, a complete exposure to a variety of computer tools and computer based applications such as use of power point presentations and the World Wide Web is very necessary in all teacher training institutions in Nigeria. Roblyer, (2003) defined the internet as the mother of all networks because it is a network of networks which enables people to communicate between or among networks. A major benefit of the internet system is the wide range of information available and services provided. Once connected, users can use it to exchange messages and files among themselves and with others anywhere in the world and information can be used to locate virtually any place in the world. The internet is widely available, easy to use and highly visual and graphic with searching resources including web browsers, search engines, Gophers and digital resource centre. While communicating in writing on the internet involves e-mail, list servers, Bulletin board, Chat rooms, and instant messaging.

This work illustrates how computer based Science instruction can make a distinctive contribution to teaching of Science, Its use to plan lessons that take advantage of computer to promote better learning. As a tool used by today's Scientists, the use of Computer and the Internet with relevant skills reflects the direction of Science in the 21<sup>st</sup> Century. It is furthermore a tool for learning which extends students' ability to exercise choice, work independently and make connections between their studies and the wider world.

## **Statement of Problem**

This study sought to determine the possible effects of two computers based learning tools, Microsoft PowerPoint presentation and the internet on pre-service science teacher achievement in learning selected science concepts. From this main problem, the following research hypotheses were generated to guide the study;

**Hypothesis 1.** There a significant difference between the Science concepts achievement of computer based instructional groups (power point and internet) and that of conventional teaching method .

**Hypothesis 2.** There a significant difference between the Science concepts achievement of those who combine PowerPoint and internet and those who learn with either of the two separately

**Hypothesis 3.** There is no significant difference between the Computer Skill of Computer based Instructional group and that of Conventional Teaching Method.

**Hypothesis 4.** There is no significant difference between the Computer Skill of those who Combine PowerPoint and Internet and those who learn with either of the two separately

## **Research Method**

The population consisted of all Basic Science pre-service teachers in part one, 2011/2012 session of the College of Education Ikere-Ekiti Nigeria. The study sample consisted of sixty(60) pre-service science Teachers, Who were randomly selected and assigned to four groups I, II, III and IV in a quasi-experimental study ( see table1 ). From a total of ninety six (96) pre - service teachers, this set of students was chosen for the experiment because as fresh

students in a teacher training institution they have not been previously exposed to the topics used for study.

**Table 1:** Frequency distribution of subjects for the study

Groups	Experimental Groups			Control Group	Total
Treatment	I	II	III	IV	
	Microsoft PowerPoint	Internet	Microsoft PowerPoint/internet	Conventional	
Subjects	10	10	10	30	
Total	30			30	60

Groups I, II and III were made experimental groups while group IV was made the control group.

### Research Instruments

Three research instruments were used for the study

1. A validated, researcher designed computer based science instruction guide (CBSI) treating two Basic Science Topics in the Nigeria Certificate in Education (NCE) curriculum i.e. matter and Energy.
2. A – 40 item multiple choice science concept achievement Test (SCAT) on matter and energy, designed by the researcher which gave a reliability index (Kr 21) of 0.88 when tested on a sample of forty subjects.
3. A Self Reporting Questionnaire tagged Computer Usage Competency Tool (CUCT) with YES or No format was generated by the researchers to assess the Computer Skills of the respondents. This was based on simple Computer operations gathered from experiences

and best practices over the Years and it comprises of a total of five (5) factual items tailored towards investigating the students' competence in usage of Computer.

### **Data Analysis**

A pretest- post-test control group quasi-experimental design was used for the study. The four groups were given the SCAT as a pre-test in order to be sure that they all have the same entry for the topics chosen.

### **Group Description**

**Group I:** subjects were made to learn science concepts with computer using Microsoft power point presentation and the internet. Members of this group were able to view and interact with the concepts as teacher made power point presentations on a large screen as well as interact with their computers sourcing information from the internet and making their own power point presentations.

**Group II:** subjects were made to learn the science concepts with computer using the internet. Members of this group own their personal computers and were provided with internet access for the sake of this study. They were required to source for information on the topics from the internet and to organize such as study notes.

**Group III:** subjects were made to learn science concepts with the computer using Microsoft power point presentation both teachers made and their personal presentations. Members of this group were able to view the topics treated on a large screen.

**Group IV:** subjects were not allowed to use computer at all. They were made to use their textbooks and then listen to their lecturer talk while they copied notes from the chalkboard during the four weeks of the experiment. They merely served as the control group.

The pre-test administration took place long before the treatment (about four weeks) to avoid carry over, memory and transfer effects. The groups were treated for four weeks, two weeks for each topic. After the treatments, all the subjects were given the same SCAT as a post-test. In addition, students also responded to Self-Reporting Questionnaire

Two lecturers from the Basic Science Department assisted in the study that had been trained and assigned to monitor the groups and to ensure that the right kind of environment was maintained for both experimental and control groups, particularly for the Microsoft power point presentation group and the internet group.

### Results and Discussion of Findings

The post – test scores of the subjects in the four groups were processed for analysis.

**Table 2:** Summary of post-test scores of experimental and control groups

Group	N	Mean	S.D.	ΣX
I	10	15.12	1.18	302
II	10	11.70	3.12	234
III	10	12.08	1.56	242
IV	30	9.64	1.48	578

The grand mean of (experimental) group I, II, and III was compared with the mean of control group IV subjects, using a T – test of significance which is presented in the table below.

**Table 3:** t – test analysis of science concept Achievement of Experimental and Control groups.

Group	N	Mean	S.D.	T. Cal	T. Crit	Remarks
Computer Instruction	30	12.96	1.95	5.27	0.99	Sig.
conventional Instruction	30	9.64	1.475		P<0.05	

Result significant at 0.05 levels.

The result indicates that there is a significant difference between the post-test scores of computer based Instructional group.

The Computer Based Science Instructional groups (I, II and III) performed significantly better ( $X = 12.96$ ) than the Conventional Instruction group ( $X = 9.64$ )

To test the second hypothesis, the post test mean scores of groups I, II and III were subjected to Analysis of variance (ANOVA) test. The summary of the test and the result is presented below.

ANOVA test of Groups I, II and III (Computer Based Science Instructional groups)

**Table 4:**

Source of variation	SS	df	Ms	F.cal	F.crit.	Remark
Between group	188.21	2	94.11	7.42	1.25	Sig.
Within group	361.7	55	6.58			
Total	549.91	57				

Result significant at 0.05 level

From the table,  $f$ . calculated = 7.42 and is greater than  $f$ . critical = 1.25. This result is significant.

Thus, there is significant difference in the mean of post-test scores of the three groups. The combined group using power point presentations and the internet recorded the highest mean score (Group I =15.12) followed by the PowerPoint presentation group (Group III =12.08 ) while the internet group recorded the lowest mean score (Group II=11.70).

**Computer Usage Competencies Analysis of Students**

**Table 5.**

Point scored out of 5 items	Computer based science instructional groups						Conventional Instructional Group	
	Combined group I		Separated group II		Separated group III		Group IV (CONTROL)	
	N	%	N	%	N	%	N	%
<b>Rom chips stores information permanently in the computer memory</b>	5	50%	7	70%	4	40%	3	10%
<b>Keyboard is an output device</b>	7	70%	6	60%	8	80%	4	13.33%
<b>CD-ROM is not an optical storage device</b>	4	40%	3	30%	4	40%	2	6.66%
<b>Software devices are of 3 types</b>	8	80%	2	20%	7	70%	2	6.66%
<b>Power point is not a system software</b>	6	60%	5	50%	2	20%	1	3.33%
<b>TOTAL POINTS</b>	30	60%	23	46%	25	50%	12	8%
<b>N</b>	10		10		10		30	

**Note: Only Scores below three (3) is categorized as low Competence while Scores from three (3) and above is regarded as high Competence.**

**Contingency Table Comparing Computer Competence of Computer Based Science Instructional groups and Conventional Teaching Method group**

**Table 6.**

**FREQUENCY DISTRIBUTION**

<b>GROUP</b>	<b>YES</b>	<b>NO</b>	<b>X<sup>2</sup> Calculated</b>	<b>X<sup>2</sup> Table</b>	<b>D f</b>
<b>Computer based science instruction</b>	<b>78</b>	<b>72</b>	<b>99.72</b>	<b>3.84</b>	<b>1</b>
<b>Conventional teaching method</b>	<b>12</b>	<b>138</b>			

**\*Significant at 0.05 levels.**

From the Table, X<sup>2</sup> Calculated =99.72 is greater than the Table value =3.84. This result is significant and consequently, the stated Null hypothesis that there is no significant difference between the Computer Skills of Computer Based Science Instructional groups and that of Conventional teaching method is rejected.

**Contingency Table Comparing Computer Competence of those who Combine PowerPoint and Internet and those who learn with either of the two separately.**

**Table 7.**

**FREQUENCY DISTRIBUTION**

GROUP	YES	NO	X <sup>2</sup> Calculated	X <sup>2</sup> Table	Df
I	30	20	2.11	3.84	2
II	23	27			
III	25	25			

\*Significant at 0.05

From the table, X<sup>2</sup> Calculated =2.11 is less than the Table Value =3.84 indicating that the Null hypothesis stated that there is no significant difference between the Computer Skills of those who Combine PowerPoint and Internet and those who learn with either of the two Separately is not Rejected.

**Discussion of Findings**

The result of the analysis of collected data indicated that computer based instruction is more effective than the conventional instruction. The difference between the two groups is significant from the calculated value = 5.27 > Table value = 0.99. Therefore, computer based Instruction is an effective method of teaching (and in particular) science concepts though this could be generalized to other school subjects. The effectiveness of the computer based groups could be attributed to the general attributes of computers in ensuring active involvement of students in tasks and the specific nature of the computer applications used (internet and

PowerPoint presentations). This is reflected in the Computer Competencies analysis table of 52% by computer based science instructional groups against 18% by Conventional Instructional group

A good understanding of the internet and its efficacious use paves the way for lifelong learning a view supported by Delors et al (1999) who maintains that the internet provides opportunities for acquiring the four major forms of learning outlined by UNESCO which involve learning to know, learning to do, learning to live together and learning to be. Learning to know relates to the acquisition of a broad area of knowledge relevant to different areas of life, learning to do relate to the acquisition of skills both occupational and general as well as other competencies necessary to operate in diverse situations. Learning to live together involves an individual being able to develop an understanding of other people and the interdependence of human beings, while learning to be addresses the issue of personal development of individuals in terms of rationality, personal responsibility and ability to act with greater independence Delors (1999). These areas of learning are vital for teachers to acquire if their training is to be relevant in a global context and this relevant knowledge, skills and dispositions can be acquired through interaction with situations and information on the internet. It has also been suggested in research that the use of power point presentations helps students learn more difficult and challenging content Nouri and Shahid (2005). These presentations equip users with the ability to receive, organize and display their knowledge in novel ways thus empowering them to take charge of their learning which is an advantage for teachers in this information and technology age.

This is a reflection of the submission of Tinio (2003) that Technologies such as Computers and the Internet have been touted as potentially powerful enabling tools for educational change and reform. When used appropriately, different computer based instruction are said to expand access to education, strengthen the relevance of education to the increasingly digital workplace, and raise educational quality by, making teaching and learning an engaging, active process connected to real life. This is also established in the result of the one way ANOVA test which indicated that there is a significant difference between the mean scores of the three experimental groups (f. calculated. = 7.42 > f. table. = 1.25). Consequently the three groups of computer based instruction were not found to be equally effective. It was found that using power point with internet mode of computer instruction was most effective than when they are considered individually. This was shown in the means of 15.12 by group I, 11.70 by group II and 12.08 by group III in computer based Science Instruction.

### **Conclusion of study**

The use of the internet and other computer applications like PowerPoint presentations has changed the concepts of place and time for education, as education has now been moved outside the school, so teachers can seek, evaluate, organize and share information with others all over the world. They can also be privy to knowledge and competencies outside their traditional subject domains. This ability to source for information, access, organize and share such defines the hallmark of an individual who is ready and fully equipped to function effectively in this era of globalization.

## **The Implications of this Study**

This study suggests to policymakers to define a framework for the appropriate and effective use of computer in their educational systems by first providing overview of the potential benefits of computer use in education and the ways by which different computer based instructions have been used in education thus far. Also to reckon with the basic challenges of its integration in education while making decisions. This include; educational policy and planning, infrastructure, capacity building, language and content with financing.

Teachers who should be in the fore front of innovations in education must not be left out while teacher education programs must be continuously revised to make them viable for the ever changing scenery of National and international life.

Abstract

The case subject is a 57-year-old female whose diagnoses include organic brain disease, profound mental retardation, seizure disorder, and dysphagia. She has experienced pneumonia twice over a period of six months and has difficulty eating solid food. Her present situation has been reviewed to identify causes and to make recommendations for her future health care.

*Keywords:* organic brain disease, profound mental retardation, dysphagia, health care.

### Problem/Situation Definition

*Symptoms requiring immediate attention.* My sister, Ann, has had two hospitalizations for bilateral pneumonia within the last six months. Following the last bout of pneumonia, she exhibited unusual breathing and choking sounds. Her ability to chew and swallow solid food has reached the point where the food falls out of her mouth. Minimal exertion causes her to weaken. She is no longer able to stand on her own during transfer from her bed to her wheelchair; a lift is required. She experienced a ten pound weight loss over a period of one month.

*Basic issues causing symptoms.* My sister, Ann, is a 57-year-old who has organic brain disease, profound MR, seizure disorder, and dysphagia.

According to the University of Maryland Medical Center (2008), “organic brain syndrome (OBS) refers to diseases (usually not psychiatric disorders) that cause decreased mental function.” During her birth at home, my parents report that the doctor used forceps to correct her breech position. In 1952, doctors faced with emergency situations in private homes did not have access to currently prescribed treatment. My parents report that dents on the side of her head were visible for a very long time, but, they did not recognize that anything was wrong for the first year. At the time, Ann was the youngest of nine children, and, the small house was in a constant state of noise and confusion with its 11 residents.

Currently, the following information is well known regarding breech birth (American Pregnancy Association, 2007):

In some cases, a breech vaginal birth may be possible, although the American College of Obstetricians and Gynecologists (ACOG) recommends that breech babies be turned by external cephalic version or delivered by planned c-section. A large study found that

breech babies delivered through the vagina had an increased risk of problems. This is, in part, because an infant who delivers feet- or butt-first can get its head stuck in the birth canal. The infant's body does not stretch the birth canal wide enough for the head to pass through, and the baby's skull cannot compress or mold to the birth canal as it does during a headfirst passage. This can cause a prolonged labor and fetal distress.

Although most breech babies are born healthy, Ann had problems from birth. Birth defects are slightly more common in breech babies and a birth defect *may be* the reason the baby does not move into the right position before birth. The disorder associated with OBS that Ann has is brain injury caused by trauma. Her profound mental retardation (PMR) is reflected by her cognitive ability level of about six to nine months; she has never had the ability to talk. She has had tonic-clonic seizures and petit mal epilepsy (absence seizures) since birth and they are controlled by medication.

Ann's dysphagia is a condition that causes a person to have difficulty swallowing and the person may also experience pain while swallowing. Eating may become a challenge which prevents the person from taking in enough calories and fluids to nourish the body. Another possible consequence is that a patient may aspirate foreign matter/bits of food into the lungs that may cause pneumonia. Bear in mind that a brain injury may affect the gag reflex which in turn can cause aspiration.

#### Justification for Problem Definition

The sources of information that I have used are Ann's chart review, staff consultation, and personal observation. Ann's chart indicates that her diet orders require a high-sided plate (placed close to her chest), hard plastic cup for liquids, and that the wheelchair armrests be under the table to allow her to be as close to the table as possible. She is supposed to remain upright

for 60 minutes after each meal. According to the various aids who work with Ann, they feed her when she is too lethargic and weak to feed herself.

I had the opportunity to observe Ann during both of her bouts of pneumonia in a hospital setting and in the long term, residential care facility where she resides. Ann sits upright in her wheelchair when she eats. Her spoon is attached to her hand to enable her to maintain “control.” She is able to drink from a plastic cup if someone places it in her hand and if it is removed from her hand, when she finishes drinking, and is placed back on the table.

According to my mother, she was notified via telephone that Ann was going to be given an influenza shot approximately eight months ago. Several weeks later, an anonymous staff member called my mother, late at night, to tell her that Ann was very sick and that someone needed to come and check on her. Shortly after that, a nurse called to say that Ann had a diagnosis of pneumonia. When my sister from Virginia and I went to the center, we observed that Ann was very weak and unresponsive to us for the first three days. By the end of the two weeks that we were in South Carolina, Ann seemed to have improved.

Several months later, my mother received notification that Ann was scheduled to have a regular, health test performed. On the morning of the test, a staff member called to say that Ann was very weak, having trouble breathing, and that she had been receiving breathing treatments for a week. They were going to send her to a local hospital emergency room. Again, my sister from Virginia and I reached the hospital within an hour of her arrival and subsequent admission as a patient.

We observed that Ann was having great difficulty breathing, her lips were extremely swollen, and she was not responding to touch or sounds from us. An aide had been sent with her from the residential facility where she lives. However, the aide seemed to be reluctant to answer

any questions that we posed. So, we began to question the nurses and hospital aides. According to the nurses, they had assumed that her grossly swollen lips were their normal size. When I mentioned that her labored breathing was similar to that of another family member when he had pneumonia, the nurse dismissed my suggestion as unfounded. Interestingly enough, a physician diagnosed Ann with bilateral pneumonia the next morning.

My sister and I both asked if Ann could have Benadryl or some medicine for her swollen lips because we believed that she was having a reaction to some unknown medication. We were finally able to find out that her lips had begun to swell when she was given the pre-meds for the unknown test.

Ann's inability to talk and her functioning level results in her level of care being determined by whoever is observing her or tending to her personal needs. The aides' reluctance to speak out does not serve Ann well. According to the head nurse on duty each day, the primary source of information for treatment for patients, such as Ann, at low functioning level is visual observation.

#### Alternative Courses of Action

Prevent future episodes of pneumonia – Aspiration issues?

Diet order and adaptive dining equipment – Consult with dietitian and Speech

Pathologist.

Maintain weekly contact with nurse and social worker and ask for progress reports via telephone and E-mail.

#### Evaluate Alternatives

Proper bed positioning will most likely address apenic episodes and prevent pneumonia.

Pureed food and honey thick liquids can be swallowed without choking and spillage. This might eliminate the possibility of particles of food going into her lungs. Use of hard plastic cups will eliminate the possibility of her breaking the cups that she uses.

#### Choice of Action

We will consult with the social worker who represents us at meetings regarding Ann to request the following:

Prevent possibility of Ann having future episodes of pneumonia caused by food particles going into her lungs by bed positioning and remaining upright for an hour after eating.

Continue diet order and adaptive dining equipment approved by dietitian and speech pathologist.

Call and visit frequently to monitor that she is propped up when she is in bed so that she has less likelihood of choking.

Maintain weekly contact with the head nurse and social worker and ask for progress reports.

#### Implementation of Alternative

Prevent pneumonia – consultation with pulmonologist due to indication of possible aspiration

Prevent apenic episodes – pulmonologist and physical therapist consultation to assure positioning protocol for bed and wheelchair.

Diet order from speech pathologist – puree diet texture, no bread, no grits, and honey thick liquids. Thickener used by staff to thicken thin puree food

#### Conclusion

My mother is elderly and unable to travel back and forth on a regular basis. We will request E-mails from Ann's social worker with updates on the alternatives that we are

requesting. We have updated the contact list for phone calls and E-mails. Basically, my sister who lives in Virginia and I will receive E-mails and phone calls will go directly to my mother. The progression of illness for Ann correlates to those referenced by Woods, et al. (2008) in *Palliative Care for People with Persistent Mental Illness: A Review of the Literature*. Staff members at her facility try to avoid any reference to terminal issues at all times. Consistently, telephone reports have not correlated to Ann's actual health condition that we observe when we arrive at the facility. So, we know that we have to be her advocates and monitor her condition so that we can make informed decisions about our involvement in her health care.

## **Parent Perspectives and Experiences of Their Children with Asperger Syndrome at School**

Jo-Lynne Jack  
PhD student  
Victoria University of Wellington  
Faculty of Education  
Educational Psychology and Pedagogy  
Wellington, New Zealand 6147  
jo-lynnne.jack@vuw.ac.nz

**Abstract:** Parents of children with Asperger syndrome, a condition on the autism spectrum, are more likely to undergo serious distress than parents of children with other disabilities. In the school environment, their children struggle to fit in socially, are at increased risk from being bullied, and can experience severe anxiety and depression. Research on the perspectives and experiences of parenting children with Asperger syndrome is a developing field in special education and this paper advances a more informed understanding of parental experiences during their child's schooling years. Semi-structured interviews were conducted with 19 families in New Zealand, and preliminary themes identified include a lack of awareness and understanding in schools regarding Asperger syndrome, specifically in the areas of vulnerability to bullying, reluctance for written work, and the potential for sensory overload. The struggle to secure appropriate academic, social and transitional support for their children was perceived as a major stressor. Parents developed strategies and positive adaptations with the potential for informing educational interventions. The emerging themes highlight current issues in education regarding safe schools, achievement gap, building on children and young persons' strengths, and parent involvement.

### **Introduction**

Parents of children with autism spectrum disorders (ASD), including Asperger syndrome (AS), are more likely to experience serious psychological distress than parents of children with other disabilities (Abbeduto, Seltzer, Shattuck, & Krauss, 2004; Bromley, Emerson, Hare, & Davison, 2004; Luther, Canham, & Young Cureton, 2005; Meadan, Halle, & Ebata, 2010; Ministries of Health and Education, 2008; Sivberg, 2002). This paper is drawn from the early analysis of a study gathering the experiences of parents having a child/children with Asperger

syndrome. The study aims to identify the stressors for parents of children with Asperger syndrome and their contributing factors, as well as explore opportunities for timely family support. This paper focuses on the challenges their children faced at school, one of the principal factors of stress identified by the families. Factors contributing to their children's stressful school experiences included school staff's lack of familiarity with Asperger syndrome, and the appropriate classroom interventions to deal with bullying, written tasks, and sensory overload. Limited school support was noted as a significant obstacle to academic and social learning, as well as for coping with transitions.

## **Background**

In May 2013, the American Psychiatric Association removed Asperger syndrome as a separate diagnosis and placed it within autism spectrum disorders. Asperger syndrome shares the triad of difficulties in reciprocal communication, social interaction and social imagination with other autism spectrum conditions (Gillberg, Nordin & Ehlers, 1996). There are problems with a theory of mind or the inability to recognise other people's thoughts, feelings and intentions (Frith & Happé, 2005). People with Asperger syndrome may also have the following characteristics: intense interests in a particular subject area or topic; strong desires for predictability and routine; formal language choice and patterns; odd voice tonality; non-verbal communication difficulties; and motor clumsiness (Attwood, 2008; Gillberg & Gillberg, 1989). Repetitive mannerisms and sensory sensitivities are common, and obsessions and compulsions may emerge (Attwood, 2008). Frith and Happé (2005) note a "strikingly uneven profile of abilities and difficulties" (p. 789) and there is general consensus around a diverse range of functioning. Depression and ADHD have high comorbidity rates with AS (Attwood, 2008; Ghaziuddin, Weidmer-Mikhail & Ghaziuddin, 1998). Lasser and Corley's (2008) research lists six positive characteristics of people with AS: "remarkable memory, superior academic skills, visual thinking, recognizing order, passion and conviction, and comfort with adults" (p. 338). Attwood (2008) describes people with AS

attending to fine detail, being honest and possessing a strong sense of social justice.

School aged children with Asperger syndrome experience bullying at a four times higher rate than their peers (Little, 2002). Zablotsky, Bradshaw, Anderson, & Law (2013) found from a study of over 1000 parents of children with ASD that the majority of their children had experienced bullying and that children with Asperger syndrome that had attended public schools or were in a general education population were at the greatest risk of being bullied in the past month. Poor social and communication skills, inability to imagine what others are thinking, and inaccurately reading facial expressions and body language puts them at heightened risk for bullying (Attwood, 2004; Sofronoff, Dark, & Stone, 2011). Children with AS can be blunt when commenting on the faults of others, interrupt their peers during conversations, speak at length about their special interests, and interpret conversations literally. They make poor eye contact and can appear aloof. Their difficulties in making friends or joining in with others creates isolation. Since Asperger syndrome is “invisible” as such, peers and school staff might consider these children rude, insensitive and odd.

There is a critical need for school supports to protect children with AS against bullying, and the appropriate social skills taught for successful interaction (Attwood, 2008; Winter, 2011). Jordan (2005) echoes the importance of teaching a social curriculum to compensate for what does not come intuitively to children on the spectrum. Further research is needed to study the strategies, adaptations and accommodations children with AS need in educational settings.

### **Prevalence and Diagnosis**

The number of children being diagnosed with an autism spectrum disorder is growing faster than any other developmental disability (Troy, Connolly, & Novak, 2007). There are conservative estimates of two to six children out of every 1,000 children identified with AS, with three to four times more boys than girls (NINDS, 2012). In New Zealand’s population, the incidence of ASD is considered to be approximately 1 in 100 (MOE, 2011). According to Attwood (2008), only half of the children with AS are being detected at the

present time if using the Gillberg criteria. Asperger syndrome is rarely brought to the attention of clinicians before the ages of 5–6 years, with a diagnosis usually occurring between 7–8 years, though in retrospect, difficulties with communication, social interaction and behaviour were noted as being present (Gillberg et al., 1996; Ghaziuddin, 2010).

## **Methodology**

Narratives offer rich, multi-layered descriptions of psychological and social phenomena (Jossleson, 2006) that contextualises how the parent, as a narrator, is experiencing the stressors within their family life. Cotton and Griffiths (2007) state:

The point is not to tell some universal truth about the world, but rather to tell particular truths in order to allow us all, tellers and hearers, to reassess what we understand of the world and so of our own possible actions within it. (p. 550)

A qualitative approach to gathering data on parent perspectives and experiences allows for an in depth analysis of the complex factors involved and examine adaptation occurring over time.

This study involved 19 families with a child/children diagnosed with Asperger syndrome currently living at home. The participants were drawn from the greater Wellington region in New Zealand and included 19 mothers, six fathers, and one grandmother. The participants were recruited online from two parent support organizations with the study receiving ethical approval through Victoria University of Wellington. The majority of the parents were from New Zealand, with nine parents born overseas (Australia, South Africa, U.S. and Britain). The children included four girls and 16 boys with Asperger syndrome, diagnosed between three and half years old and shortly before the age of 15. The current ages of the children were evenly spread from five to 22 years of age. In the study there were a set of twins with one twin having AS; a set of siblings both

diagnosed with AS; and one set of siblings diagnosed with AS and the other autism. Four of the mothers were divorced and 15 were living with partners, with three of those mothers in relationships where the father traveled extensively. Other comorbid diagnoses disclosed in the interviews included anxiety disorder, attention deficit and attention deficit hyperactivity disorder, depression, dyslexia, epilepsy, oppositional defiant disorder, and sensory processing disorder.

The parents participated in a semi-structured interview lasting for approximately one hour, and these usually took place in their home. Most parents were interviewed individually, but some preferred to be interviewed together. The questions were broad in nature with allowance for the stories to unfold naturally. Parents were encouraged to share experiences about their child or children that stood out for them. These stories usually included the diagnostic process, school experiences, when support was or was not received, and hopes for their child's future.

The transcripts were examined for events and circumstances that were noted by the parents as challenging or stressful, and the contributing factors from the parent's perspective identified. Coping strategies and positive adaptations being utilized by the parents were identified as well. General categories were coded during initial readings and then condensed in relation to similar sub-concepts before assigning a theme (Miles & Huberman, 1994). Detailed notes and a reflexive journal were used and referred to throughout the process of this preliminary data analysis (Creswell, 2007).

## **Theoretical Framework**

Positive adaptations to a challenging situation are supported with the theoretical underpinnings of stress theory. This theory was originally developed by Hill (1949) in his book *Families Under Stress* and was described as the ABCX model of stress. Hill hypothesizes that a family's stress is determined by (A) the event (B) their resources (C) their perceptions of the event's significance and then (X) their reaction to it. McCubbin and Patterson (1983) developed a Double ABCX model that incorporated multiple events (Aa), additional resources (Bb),

altered perceived contributions (Cc), as a result of the family's reactions (X). Later, McCubbin, Thompson, and McCubbin (1996) conceptualized the resiliency model of family stress, adjustment and adaptation. This model outlines an adjustment phase, such as when ASD is diagnosed. Reframing, or seeing the situation with a different view or understanding, may occur during this phase.

Family resilience theory captures the constructs of stress, coping and adaptation within the family unit considering both social, relational and developmental contexts and the adaptation processes that eventuate within families (Patterson, 2002). Walsh (2003) challenges the deficit-based approach to families as damaged or broken when faced with adversity to one that acknowledges parental strengths. It presents a family's experience as having common and unique features, with different strategies utilised to meet new challenges as they arise.

## **Findings**

The difficulty of their children adapting to school emerged as an area that caused considerable stress for the parents in this study. According to the parents' perspective, a lack of awareness and understanding on behalf of schools became problematic in the areas of bullying, written tasks and sensory sensitivities. Parents identified limited academic, social and transitional support as a major obstacle to their children's ability to learn. Strategies and positive adaptations developed by parents were noted throughout the interviews.

### **Lack of Awareness**

A lack of awareness about Asperger syndrome in schools was a factor identified by many parents as impediment for the necessary accommodations their children needed to adapt to the school environment. John, the step father of 22-year-old Max, said "it was almost Groundhog Day year in year out" because his son's teachers would say at the beginning of the year "Oh, he's a happy little kid and just seems to be getting on like all the others, and then, six months later they're going, oh yeah, Max is a bit different." Tessa, the mother of 13-year-old Zack, shared a similar story, "You have to go through the same things every year,

I go in I make the profile book up and half the teachers don't even read it, so you go to all that effort and you go in and try and make it successful."

**Vulnerability to bullying.** School staff's lack of awareness about their children's susceptibility to being bullied was an area of deep concern for parents. They noted that their children were vulnerable due to their limited social and communication skills, and inability to build and maintain friendships. Tessa related the following:

He's very polite, very interested in facts, has very big trouble with social things. He struggles heaps at school, we've had a very hard schooling time and still do. He has quite a few melt downs and quite bad anxiety, it got worse once he hit intermediate and the first year was so hard and so they treated that and then diagnosed anxiety disorder and now he's with [service agency]. He's just, as he said, his favorite friend is Sheldon Cooper, if everybody was like Sheldon Cooper it would be a great world. He's quite funny, he's come a long way learning with jokes and stuff, but he is very obsessional, very routine orientated, we've come to realize we've had terrible bullying at school.

Tessa explained further:

It actually turned quite nasty to a point where the kids told him he should go kill himself and then we had a real bad one at the end of last year with his confidence and everything and why do people want me dead and they took his pencil case to wind him up and the teacher moved him out of his group and we tried to say don't move him, and he took a padlock to school and padlocked his desk and chair so the teacher couldn't move it and refused to move.

Tessa said when Zack was six years old "these kids gave him a thing they called a spy button, they said if you pull your pants down you will be in our spy club, so

of course, he was pulling his pants down..." and another more recent incident when his classmates were lining up to slap him at lunch each day:

He came home and I said to him over a week or so 'Why is your face so red?' but he had allergies so I thought that, but no nothing, he was getting angrier going to school, I would have to wrench his hands off the gate, he was doing half days by then, I would come and pick him up half days most days and I couldn't understand this red thing kept being on his face, ended up these girls had decided that they were going to have turns at slapping him, he was supposed to be in a music group learning a guitar, [the school] told me they would put a teacher aid with him, so that was successful, which never happened, so they decided that they could all gang up on him, so not only that, some boys, so 7 children over 7 days where having turns slapping his face...

Tessa assumed that looking at the school's printed resources and programs it appeared the school had never had more than a "broken leg" to deal with, and she felt like she was an outlier and troublemaker by bringing up the issue of bullying. After her son experienced repeated physical bullying she eventually withdrew him. Several parents related stories of their children being bullied physically, verbally and covertly. When parents reported bullying, they felt that the school would downplay the seriousness of it. For example, when Tessa reported that children were taking turns slapping her son, she said the school's leaders had replied, "It's not bullying, kids just do dumb things." Often, the onus was on the parent to prove that bullying was happening at their schools, which was complicated by their children's struggles to effectively communicate what had happened. Tessa explained, "when stuff happens he doesn't know how to explain it, he just shuts down and starts crying." Due to not understanding social rules, some of the children had come to expect physical and emotional abuse at the hands of their peers and subsequently experienced severe anxiety and depression. Parents often remarked that school leaders were not proactive when it came to bullying, and were reluctant to consider school wide programs that could address it.

**Difficulties with written tasks.** A repeating theme throughout the parent interviews was the difficulty their children had with written work. Parents felt that if teachers were aware that fundamental motor coordination is often challenging for children with Asperger syndrome, they would understand that writing assignments and tests by hand is cumbersome and time consuming. In addition, their children's desire to "do things right" would cause anxiety and frustration when their handwriting was not perfect. One mother explained, "He has really bad writing and he normally uses the computer, but you have teachers who think they can fix that and it's the anxiety that goes with it." In the parents' view, written tests became two tests for them, with the time restrictions making their children's anxiety acute. John and his wife Kathryn, expressed their frustration when Max was in secondary school:

*Kathryn:* He's hyper intelligent but he can barely write, he reads really well but he doesn't like reading, you know he only reads facts, you know, he's, but at the end of the day he's got intelligence tests that...

*John:* Absolutely, so again that sort of just came down to well there are going to be kids like this, so we tend to teach them a little bit more differently than this way, this is how they learn.

*Kathryn:* But as far as the school was concerned because he couldn't write he wasn't capable of doing very much, that's the problem.

*John:* So if you saw his writing, if you didn't know the boy and I put you, even his writing today, and you looked at it you would go gosh he's probably maybe a 12 year old, but his comprehension is above his age level, so this is the complete mismatch between his ability to actually physically write and his ability to comprehend, so again people start making judgments and assessment and they get it completely wrong...

Kelly, the mother of 17-year-old Daniel, said her son's teachers would hint at her son being lazy due to his reluctance to write anything down. After Daniel was finally diagnosed in high school, Kelly said she came to the following realization:

I found for Daniel that just having that diagnosis changed him in that it was almost okay, so now I know who I am, what's wrong with me, but now I have a, the label thing that came back to me, the headmaster who had said to me we don't want to put labels on it but I had seen from all the school reports that the teachers had put a label on it, they may not have written it out but they all thought he was lazy and that was the wrong label, I would rather he'd had that label way back then and had the right label than this lazy bright kid who doesn't want to do anything.

Parents perceived that their children's struggles with writing fluently by hand prevented them from demonstrating competence at school and there were strong misconceptions about their unwillingness to do it.

**Sensory sensitivities.** A need for awareness and understanding of the sensory sensitivities that a child with Asperger syndrome struggles with was a dominant theme for parents, especially with noise, peers in close proximity, and large halls and assemblies. Abbie, the mother of 15-year-old Thomas, shared this:

Obviously his disruptive behavior would cause a few problems at school, like exam time, they had exams then at the end of every year, anxieties around exams would be big, they tried to put him in a big hall with lots of people, which he couldn't cope with. He says it's like a symphony, all the pens on paper, he said I can hear it all and it's like a whole musical instrument all coming together at different speeds, so we decided maybe better a separate room, so then he'd be bullied because he was in separate accommodation, there was a whole load of stuff around the whole thing...

Parents identified sensory sensitivities as a significant challenge for their children to cope with throughout the day. Several of the parents shared stories of

their children experiencing sensory overload at school and then their children trying to hide or lash out. Parents overall spoke of a need for principals, teachers, and staff to be aware of this particular aspect of Asperger syndrome to better understand their children's behavior.

### **Increasing Learning Opportunities**

There was a strong sentiment from several parents that it should not be a question of how much support is necessary for school success, but rather what kind, even though the disorder is viewed as 'mild' in nature. The concept of mild was even seen as a disadvantage in parents' eyes – because of their child's intelligence, they felt that others considered their child's difficulties as easily surmountable and did not take it seriously. A few parents pointed out that Asperger syndrome is still a part of the autism spectrum and 'mild' meant their children were more successful at masking the more obvious characteristics than others more severely affected. Tessa explained "most people don't even see it because he is so good at hiding it now." There were several stories of teachers questioning parents about whether the child actually had Asperger syndrome or downplayed the problems.

Many parents thought that a better understanding of autism spectrum disorders would provide a stable foundation to work from and eliminate the need to fight for increased awareness and acceptance. Tessa described supportive teachers this way:

The teachers are what we call ASD believers, because at the end of the day they either believe it, who they are, or they try to fix them, that's how we feel, at least they have listened at the school and we've tried.

**Academic support.** Parents reiterated that their children needed help focusing on what was important, making sense of instruction, and organizing their work. The parents of the older children talked about the gap between their children's intellect and their school output becoming more noticeable as they advanced through the primary years until it reached a crisis point in secondary.

Most of the parents worried that their children would not be able to reach their full potential, and whether the schools their children were attending were the best match for their child. This worry was pervasive for the families interviewed since their children were scoring below average on the national standards and their intelligence was above average. Some parents started to alter their ideas of success, saying they were happy if there were no phone calls home for behavioral problems or when their child finished a test within the time requirements. Abbie explained:

He hadn't had a good year necessarily academically, but it was his best year ever in terms of attendance, of not being stood down, me never being called, it was a really successful year, but they base the success on credits and not on the bigger picture.

Sandy, the mother of David, aged 12, shared this when she asked him about a math test after school:

'I got it all finished', just the way he said it, and whether he got them all right or all wrong it didn't matter, he was just so confident when he came home, I don't think he ever finished a test his whole life in the time they've been given. I still don't know the results from that but to me that was a pass.

**Social skill support.** Parents conveyed a need for school support in the area of friendship building and social skill development. Most parents said their children had few, if any friends. In primary school, they described their children either as domineering and insisting on playing game repeatedly or a certain way, or wanting to play with children much younger. Later on, the stories involved their children being easily taken advantage of or becoming reclusive. They might make one friend, but if that friend moved away they were at a loss. The majority of parents shared the disappointment of their children not being invited to birthday parties or sleepovers. Kelly said about Daniel:

He doesn't have any friends, doesn't seem to really want to make friends. I think because he has tried in the past and been knocked about with it, abused a bit he has backed off, it is not worth the effort...

Parents identified support as essential to head off troublesome behaviors, such as hitting or losing tempers, as well engaging children not participating. After observing her son at a school event, one parent told her son's teacher, "it's almost like he is invisible." He had never qualified for funding support "because he was an angel at school, he just sat there, he didn't open his mouth and he was just quiet." Sandy described David at school this way:

He's struggling so hard because he's one of these kids that sits in the back of the class, and doesn't put his hand up so that's why the teachers think he's good. He sits there and doesn't have a clue sometimes what's going on.

**Transition support.** Most parents commented on the need for support during transitions, especially during the beginning of the new school year. Another problematic time identified was when there were staff changes at school. Routines go "belly-up" for the student when there are different teaching styles and expectations. Parents suggested a briefing packet for the interim person or the new hire, so problems could be averted beforehand and the transition less painful for the student and parents. One mother was grateful for a specialized program that included designing a comprehensive, individualized plan with parents and staff, "but then the next year gone...nobody transfers it to the next year." Having a chance to visit the teacher and classroom before a child moved to the next class made a big difference. A father said the children "come in and meet their teacher, put their stuff away in their classroom...that's amazing and the difference it made unbelievable." The parents who had access to transition funding from kindergarten to school or primary to middle school reported a more positive start. When a bad year followed a good year, Abbie said "I feel quite aggrieved about it because he'd had a really good year," or another

mother said “we think we are getting so far, we turn a corner and then his behavior just always goes back.”

In the search for the appropriate support, several parents had moved their children to different schools, hoping for a fresh start at another public school or sacrificing family resources to enroll their child in a smaller, private school. One parent told of interviewing staff at nine different schools before she bought her home in the school district that would be best for her son. Some parents chose alternative school placements or decided on home schooling after their son or daughter experienced severe bullying. Parents that had not decided to home school wondered aloud if they should have, saying in the same breath that it would be difficult to teach as well as parent a child with challenging needs and behaviors. Parents employed private tutors at home and paid for teacher aides at school, went over the assignments repeatedly at home, supplemented instruction with both remedial and advanced computer programs, and arranged for private diagnostic assessments for reading and math, especially if there were accompanying problems with dyslexia. Some parents expressed guilt about requesting extra funds for support, and did not envy the schools trying to juggle with their limited resources.

**Strategies and positive adaptations.** Parents had a strong desire to focus on what the child could do. Both Abbie and Tessa spoke of hearing an enormous amount of negative feedback that had a “roll on effect” on their families. Strategies that focused on the positive eased the stress that came with parenting a child with Asperger syndrome. One mother said:

Well mostly our home life is quite harmonious really because we, I think we’ve just learned to sort of work around his quirks. It’s more the outside world that’s a challenge for him. So at the moment we just, as a parent, I’m just sort of feeling my way through things that work for him and things that don’t and trying to accentuate the positive.

**Relationship building.** From many parents’ perspective, teachers that established a trusting relationship had a significant degree of influence over the

child's anxiety levels and their ability to function well at school. If teachers and school staff engaged with their children in a sensitive manner and established a rapport, these parents said it was possible for their sons and daughters to gain confidence, take risks and persevere. A mother stated, "if he forms a bond with someone he can progress." This connection came from an informed awareness of the challenges children on the spectrum faced. Tessa mentioned that a strong relationship with a teacher would help during a crisis time, as her son would trust and respect that person.

A few parents commented positively when their child's teacher capitalized on their child's special interests, which helped to establish a rapport as well. One mother told of her son's passion for protecting endangered animals and his class working with him to raise money for a conservation project. Oftentimes the child knew extreme amounts of information about their special interest, and could be called on to give reports or set up an informative corner in the classroom for the other students.

***Written tasks.*** Problem solving how children can demonstrate competence in a subject with minimal writing by hand went a long way towards managing anxiety and increasing motivation. A few parents said if teachers knew how hard it was for their children to write and finish tests on time it would allow alternative ways of showing mastery. These parents commented that the daily handwriting tasks in the classroom created a barrier for their children to demonstrate their knowledge. Being open to implementing accommodations, such as using laptops, oral presentations, and making allowance for more time on timed tests were mentioned. Kelly said that Daniel "struggled on without any help right through high school and I think it was his third year there, somebody had mentioned to him about the idea of using a laptop..."

***Sensory overload.*** Having an action plan in place was a wise approach when children did reach a boiling point so other children and staff could remove themselves from the vicinity quickly and limit interaction. Some of the parents related stories of the importance of all the school staff, especially playground staff and relievers, knowing the plan. When children with Asperger syndrome

are upset they have great difficulty processing words, so removing others from the area had a better success ratio than trying to negotiate.

There were some stories where parents reported that teachers and schools staff had put themselves in physical danger when they tried to restrain or remove their upset child. When their children were cornered and became distraught they lashed out, and then suspended because of school policies regarding hitting.

It was heartbreaking, I felt really bad for the teacher but she penned my son into a corner and got into an altercation with him over pushing and shoving with a basketball, 'Just walk away be the adult, walk away and deal with it when he's cooled down,' she went for his back, she moved a desk to get to him... He just couldn't control it and you could see it in his face, you, we never let things get to that point, but he's now learnt that it's not okay to hit no matter what and he's meant to walk away.

Some parents explained that when their children had meltdowns they were equally as terrified, and seem as perplexed about the sudden rise in emotion as the adults were. There were some stories of children hitting after being provoked, and expressing regret at home.

Some people are obviously more attuned to what the kids need than others but overall they make allowances but you can't make allowances when your kid hits somebody else, I wouldn't be happy if one of mine got hit, so there's the two sides, but it's not the way that you bring them up and you know why these things happened and it's the heat of the moment and that when everything has calmed down [my son] will know immediately that he has done the wrong thing and he will be remorseful and he will be angry and upset with himself but it is too late, the damage has been done and it doesn't necessarily mean having been through all that that it won't happen again in the next rush of blood to the head, that's really hard.

Being proactive at school was the best solution to help head off violent episodes by monitoring any changes in routine, excessive noise in assemblies, and noticing the anxiety and frustration that built up throughout day. Several stories illustrated how quickly their children could “lose the plot” and how difficult it was to converse with them after this happened. Two parents told of the importance for playground supervisors to know their children were on the autism spectrum and their propensity for being overwhelmed. Creating a less threatening scene and allowing time for the child to recover before any instruction was given was essential.

A few of the parents in this study thought it was much better to put supports in place throughout the day so that their children could let off steam by running or doing something physical. One parent said her son’s saving grace was being the PE monitor. He was allowed to move the PE trolley out before every break and get all the balls ready for morning and lunchtime play, and if anything needed to be carried during the day he was asked to do so.

To cope with sensory overload at school, one mother said her son would pick up a highlighter pen to say he needed a moment and the teacher would let him could go out of the classroom and do something different for ten minutes, such as walking around on the track. It was important that this quick transition was easy and doable for the child and did not entail bringing extra attention to him. This parent said no child likes to be singled out or put in a ‘special’ place so that teacher can keep an eye on him, so the strategy needed to be subtle and respectful. Parents said it would also be wise for teachers to incorporate checks throughout the day to determine how their children are managing.

***Ecological modifications.*** The majority of the parents related experiences pointing to environmental adjustments as easier and more sensitive solutions than ones that centered on changing their children. One school assigned a short-term teacher aide to observe a child’s classroom and playground surroundings that helped identify the triggers for his anxiety and compulsions. This was a change from teacher aides he had previously that concentrated on modifying his behavior. Another parent said that just changing her young daughter’s desk in the classroom helped:

[The specialist teacher] had lots of good ideas, like ask [my daughter] where she likes to sit in the classroom, that made a tremendous difference because where [she] had been sitting the children were looking in her eyes, so just by altering her chair it was suddenly better, giving her a buddy to do things, like to go the toilet with a buddy, go to the office with a buddy, just having a buddy made a tremendous difference.

Many parents expressed frustration when school staff held onto the notion that the responsibility to rectify the problems resided with their child instead of considering the school environment itself.

***Fostering communication.*** Coordination between home and school, when it occurred, created a positive working partnership between parents and school staff. Tessa said Zack “had a male teacher last year that was good for some things but I found the communication really hard, he wasn’t communicating, his teacher this year rings me, texts me and that has just been amazing, that has made a big difference.” Good communication systems were important so parents had a way to tell teachers when the morning did not go well before school and teachers could monitor accordingly. Likewise, when teachers communicated with parents about concerns early or when tests and assignments were coming up, parents said they could support their children academically better at home.

Special attention needed to be given to briefing relief or substitute teachers and up skilling the following year’s teacher so they were adequately prepared. One daughter became very anxious when she did not know which teacher would be hers the following year, and her school prohibited students from knowing beforehand. Eventually, the child’s anxiety rose to such a level her mother withdrew her. Letting children know about their next teacher allowed for smoother transitions.

Instructions and expectations that were stated in a brief and concise manner were more likely to be understood and followed. One mother put it this way: “Less is best kind of thing, really direct, not too many words.” A few parents mentioned if explanations for tasks had a short rationale, then their children

more readily complied; they could understand the logic for the assignment. Reinforcing with visual sequencing helped as well.

## **Discussion**

The initial analysis showed parents appraising their children's difficulties at school as a major stressor for their families. Parents experienced distress when their children were bullied at school, in addition to coping with their children's anxiety and depression. Their children's social difficulties were identified as contributing factors and needed support to develop. The gap between their child's intelligence and actual work output was concerning for them, and written tasks were an ongoing obstacle in this regard, as well as the lack of targeted learning support for breaking down instruction and organizing assignments. Transition times were pinpointed as problematic.

The emerging themes are comparable with the findings from Lasser and Corley's (2008) qualitative study on parenting children with AS, for example, child-environment mismatch, building on strengths, and a need for support. Accommodations and strategies sensitive to the child's needs and developmental levels are necessary to manage the challenging aspects of AS and provide opportunities for learning. Parents had encountered a lack of awareness regarding Asperger syndrome in schools, and limited insight into their child's behavioral response to stress. It is vital to understand how a child with Asperger syndrome is affected at school so the necessary supports can be put into place, especially for social skill facilitation and during times of transition (Brewin, Renwick, & Fudge Schormans, 2008). Parents working as knowledgeable partners with school professionals, invested in seeing their children reach their full potential resound with issues in education regarding parent involvement (Bronfenbrenner, 1986; Comer & Haynes, 1991).

The parents in this study expressed a strong desire to be seen as partners with the school rather than troublemakers. They shared many stories of trying to communicate what they knew worked well for their children. Their coping skills and perspectives have increased over time (Gray, 2002), and they have accumulated a wealth of knowledge that could help children adapt and learn.

This study is a small sampling of participants from a specific locale. However, there are implications evolving for improved teacher training and professional development to address the needs of children with an autism spectrum disorder more effectively.

### **Conclusion**

“He’s always very bright and very capable, but all of the things around it seemed to have squashed his academic ability, there’s so much else to deal with that he hasn’t been able to flourish.” This parent’s perspective on school represents the central dilemma for the parents in this study, that is, their children were not able to successfully adapt to the school environment. There were no stories from parents in this study that described their children thriving at school.

All the parents believed that their children needed and would greatly benefit from academic, social and transitional support at school, however, it seemed as if this support only came as a result of constant requests and justification and many parents expressed frustration at being viewed as troublesome, neurotic or overly anxious. One mother explained “it’s like you’re a helicopter parent, it makes it very difficult to engage with the system, and it’s the system that has this effect on the child, on the Asperger’s child.” Further exploration of the optimal learning environment for a child with Asperger syndrome is warranted.

**Research** : The Awareness of Buddhist Beliefs Regarding Merit and Sin of  
LoeiRajabhatUniversity Students

**Researcher** : Dr. SakhornPhromkhot (pongmmc@yahoo.com)  
Humanities and Social Sciences, LoeiRajabhat University

### ABSTRACT

The purposes of this research were aimed 1) to study the level of the awareness of Buddhist Belief Regarding Merit and Sin Of LoeiRajabhat University students 2) to compare the awareness of Buddhist Belief Regarding Merit and Sin Of LoeiRajabhat University students, classified by their gender, faculty and grade level. This research is a survey research; Samples were 379 undergraduate students semester 2, 2553 of LoeiRajabhat University which used Multi-Sampling. The research instrument was rating scale. All reliabilities were .95 the statistics in this research were used by percentage, means, standard deviation and t-test, and One way anova, in case of found the difference test by using scheffe.

#### The findings were as follows:

1. LoeiRajabhat University undergraduate students, both males and females have the awareness of Buddhist Belief Regarding Merit which is no different. Males have belief more than female.

2. LoeiRajabhat University undergraduate students, different faculty have belief regarding merit which is different. When we considered, is found that giving is different and precept is also different too.

3. LoeiRajabhat University undergraduate students, different grades have belief regarding merit which is different. When we considered, is found that precept and praying is different.

4. Rajabhat University undergraduate students, different faculty have belief regarding merit which is no different.

5. LoeiRajabhat University undergraduate students, different grades have belief regarding merit which is no different.

**Keyword(s):** Buddhist Beliefs, Merit and Sin, Buddhism.

## 1. Significance of the study

The word “merit” is one of the cores of Buddhism. The definition of “merit” is a good trail for a behavior like physical, speech and mind, also referred to as “wholesome”. According to the text “Punna” is called “rising” which means the symptoms of spiritual rise. It turns out to be a joyous rapture. This joyous rapture as a symptom of mental well known as “Happiness”. By the reason of the Buddha is said to a group of priests that “Merit is a name of happiness”. A state of mind as opposed to the merits of this condition is sin. It is a wretched miserable condition called “suffering”. The condition that mention to merit must be within the spirit of the wholesome. It is a mercy and wisdom. This recognizes that a charity will dress up and cook a gorgeous body, speech and mind. Buddha compared a person who has the mind as it is a wholesome like a flower mechanic to pick out a different colored flowers arranged together into a beautiful garland. The spiritual and charitable deeds would be both physically and mentally as a person verbally spectacular. These are the deeds and charitable causes; a factor of each other apart is not. Thai people called “to do merit, to do wholesome”. In Buddhism is the several doctrines to ignore sin and to do merit for creating live together in peace in this world and the supplies in the next world, such as the three admonitions, wholesome course of action, base of meritorious action etc... (กาญจนา จิตต์วัฒน์ และศยาม ราชวัตร.2550:1)

Thailand society has believed in Buddhism for a long time. Lifestyle allies to Buddhism. Especially believe in merit which considered being a major lifestyle and activities of Thailand always relate to Buddhism, mention about merit of the action until become a ritual. We can stay that from birth to death is associated with philanthropy, like shaved hair, name, marriage, ordination, new home, anniversary of age, funeral. All these have ritual of merit for the pass to the charity's own life and family. The merit is holding a belief ingrained in the lives of Thailand together with confidence that Philanthropy to benefit both in this world and the next. A person who makes a merit will go to the heaven as opposed to a person who makes a sin will go to hell. Each man gets what he deserves. Thai people who a deeply religious will adhere to this motto and always conduct themselves in accordance with such beliefs.

When Thailand passes globalization on society, it will become multiculturalism. Thailand is not only the trend of the social and religious beliefs only, but there are many beliefs occur.

Especially the trend of modern science with the empiricism reasons to believe that the truth must be something that can be proven to be. Thailand is a Buddhist youth society currently is in the trend a wide variety of concepts and practices will continue to be a good Buddhist or not. Particularly belief in merit and sin which is valuable that in the past has upheld by Thailand Buddhist heritage.

Researcher is interested to study that students in Thailand have been changed from the agriculture to industry age and forward to the information age across the whole world. Then Thai society remains belief in merit and sin or not. How is it now? This study seeks to delve into the teen youth group Buddhist in Thailand. In This research, the researcher has chosen to represent a sample of young adolescents. Set out by undergraduate students which are representatives to study the merit and sin in Thailand as mentioned above.

## **2. Purpose of the Study**

1. To study of the level of belief in merit and sin in Buddhism of Undergraduate students at LoeiRajabhat University.
2. To compare of belief in merit and sin in Buddhism of Undergraduate students at LoeiRajabhat University, classified by sex, faculty and class.

## **3. Benefit of Study**

1. To know the doctrine of merit and sin in Buddhism as a source of social belief in Thailand nowadays.
2. To know the doctrine of merit and sin in a group of undergraduate students, classified by sex, faculty and class at LoeiRajabhat University. And it can be the information to improve learning and teaching about merit and sin more appropriately.
3. To be guideline for student affairs division at LoeiRajabhat University to provide student ethics activities.

## **4. Research Methodology**

The study of this research that belief in merit and sin in Buddhism of undergraduate students at LoeiRajabhat University. The researcher has preceded the following steps.

1. Populations and sampling

1.1 Populations were undergraduate students at semester 2 of the academic year in 2010 of LoeiRajabhat University, 7,178 persons.

2.1 The sampling was undergraduate students at semester 2 of the academic year in 2010 of LoeiRajabhat University, 379 persons, obtained by using multi-stage sampling.

Number of sampling was calculated from Taro Yamane amount 379 persons as follows

$$\text{Formula } n = \frac{N}{1 + N(e^2)}$$

When  $n$  = sampling of research

$N$  = populations

$e$  = error

Represent

$$n = \frac{7,178}{1 + \left(7,178 \times .05^2\right)} = 379$$

When get the number of sampling then take the sampling compare to the proportion of the population, gender, faculty and grade level, as the number of population and sampling are shown in table 1-2

Table 1 shown population of the research

2. Forms of research is research survey

3. Tools of this research was a questionnaire of the Awareness of Buddhist Beliefs

Regarding Merit and Sin of LoeiRajabhat University Students. This was created by using a Likert scale which is rating scale of 5 levels are absolutely belief no doubt, belief but doubt, Not sure, no belief but not sure, absolutely not belief. This adapted from PhramahaSinsamutraPhonkhan amount 85 items by classification is as follows.

1. Belief in merit and sin amount 50 items is charity 25 items, precept 10 items and development 15items.

2. Belief in merit and sin amount 35items is body false 15 items, speech false 11itemsand mind false 9 items.

#### 4. Process of creating the tools

The researcher conducted a questionnaire about the Awareness of Buddhist Beliefs Regarding Merit and Sin of LoeiRajabhat University Students as follows

4.1 Study the concepts, principles, theories and research related to the creating the questionnaire and beliefs about merit and sin in Buddhism.

4.2 Create a questionnaire about belief in merit and sin in Buddhism of rating scale was divided into three parts.

Part 1:Personal Profile of respondents

Part 2: Belief in merit in Buddhism

Part 3 :Belief in sin in Buddhism

Evaluation criteria of the level are 5 in 2-3 of questionnaire as follows.

5represent Absolutely belief no in doubt

4representBelief but in doubt

3representNot sure

2representNo belief but not sure

1representAbsolutely not belief

4.3 Take questionnaire to prove construct validity by specialist. The specialists are as follows

1. Asst. BoonyawatBoonthawong, Lecturer department of Social Development, faculty of Humanities and Social Sciences, LoeiRajabhat University.

2. Dr. KanlayaYodkhamlue, Lecturer department of Public Administration, faculty of Humanities and Social Sciences, LoeiRajabhat University.

3. Dr. SuraphonPhromkul, Lecturer department of Political Science, faculty of Humanities and Social Sciences, Mahamakut Buddhist University, Chumpae campus.

4.4 The questionnaire was revised according to the recommendations of experts. Questions in the questionnaires are all the IOC 1.00.

4.5 Take the questionnaire about the Awareness of Buddhist Beliefs Regarding Merit and Sin of LoeiRajabhat University Students to use with students in each grade level (Grade 1-4) of the two persons (5 faculties, each grade level 10 persons) semester 2 of 2010 at LoeiRajabhat University in total 40 persons which is not a sampling group then take data was analyzed for the discrimination. By finding item total correlation ranged from 0.21 to 0.65 and take to analyze of the reliability of all questionnaires were .95 by using  $\alpha$  – Coefficient

4.6 publish to set of questionnaires about the Awareness of Buddhist Beliefs Regarding Merit and Sin of LoeiRajabhat University Students to use the sampling group in order to further research.

## 5. Data collection

This research was collected data manually

5.1 Present proposal of research and questionnaire about the Awareness of Buddhist Beliefs Regarding Merit and Sin of LoeiRajabhat University Students to rector of a university for approval to proceed.

5.2 The researcher explained the purpose of the research to sampling group.

5.3 The researcher took questionnaire about the Awareness of Buddhist Beliefs Regarding Merit and Sin of LoeiRajabhat University Students to the sampling group were student 1-4 years of 5 faculties, semester 2, 2010 of LoeiRajabhat University amount 379 persons to answer questionnaire.

5.4 The researcher collected data from questionnaire about the Awareness of Buddhist Beliefs Regarding Merit and Sin of LoeiRajabhat University Students.

5.5 Took questionnaire to examine the accuracy and completeness together with supplied coding and check the code by the researcher.

5.6 Took data from the answer of questionnaire of sampling group to analyze by using social science program.

## 6. Analysis

6.1 The researcher was conducted as follows.

Part 1 : analysis personal profile of respondents by using percentages.

Part 2 : analysis about the Awareness of Buddhist Beliefs Regarding Merit and Sin of LoeiRajabhat University Students. holistic approach and individual aspect by using the mean and standard deviation (SD), classify by variable.

2.1 The Awareness of Buddhist Beliefs Regarding Merit and Sin of LoeiRajabhat University Students.

2.2 The Awareness of Buddhist Beliefs Regarding Merit of LoeiRajabhat University Students.

1. Overall image

2. Giving

3. Precept

4. Development

2.3 The Awareness of Buddhist Beliefs Regarding Sin of LoeiRajabhat University Students.

1. Overall image

2. Body false

3. Speech false

4. Mind false

2.4 Classified by sex.

1. Belief in merit and sin

2. Belief in merit

3. Belief in sin

2.5 Classified by faculties.

1. Belief in merit and sin

2. Belief in merit

3. Belief in sin

2.6 Classified by grade level.

1. Belief in merit and sin

2. Belief in merit

3. Belief in sin

Part 3 : Comparison of the Awareness of Buddhist Beliefs Regarding Sin of LoeiRajabhat University Students, classified by sex, faculties and grade level, holistic approach of people and individual aspect by using One-way Anova, when results were statistically significance. Test by Scheffe's method.

7. The statistics used in data analysis

1. The statistics are used to check the quality of questionnaire as follows.

1.1 Test the quality of questionnaire by experts (IOC)  
(SomnuekPhatthiyathanee, 2001: 219-221)

1.2 To find discrimination of questionnaire by correlation analysis between item-total correlations (BoonchomSrisaard, 2003 : 81)

1.3 To find reliability of the questionnaire by using  $\alpha$  - Coefficient of Cronbach (Luan Saiyod and AngkhanaSaiyod, 1997 :107-108)

2. Basic statistics were used to analyze the data

2.1 Percentage

2.2 Mean

2.3 Standard Deviation

3. The statistics used to compare the Awareness of Buddhist Beliefs Regarding Sin of LoeiRajabhat University Students, classified by sex, faculties and grade level, holistic approach

and individual aspect by using One-way Analysis of Variance, when results were statistically significance. Test by Scheffe's method.

## 5. Result of research

1. Detail of respondents from the number of sampling 379 persons, the researcher collected the questionnaire returned, and then selects the complete questionnaire for using data analysis. The questionnaires were 379 sets of 100 percentages. Most of them were female, percentages were 65.20, study in faculty of education 32.25 percentages and first year were 43.46 percentages.

2. Analysis the Awareness of Buddhist Beliefs Regarding Sin of LoeiRajabhat University Students.

2.1 Undergraduate students of LoeiRajabhat University have belief in merit and sin by holistic approach have belief in the level of belief but in doubt equal ( $\bar{x}=4.01$ ) when considered separately as each topic is found that students have belief about merit in the level of belief but in doubt equal ( $\bar{x}=4.02$ ) when considered individual aspect is found that students have belief in the level of belief but in doubt every side by ascending order of the mean from high to low that were development equal ( $\bar{x}=4.20$ ), giving equal ( $\bar{x}=3.94$ ) and precept equal ( $\bar{x}=3.94$ ). Students have belief in sin of the level of belief but in doubt equal ( $\bar{x}=3.98$ ) when considered every side is found that students have belief but in doubt every side by ascending order the mean from high to low that were speech false, body false and mind false which was the mean of 4.01, 3.99 and 3.95 respectively.

2.2 Undergraduate students of LoeiRajabhat University, male and female have belief in merit and sin, holistic approach was belief but in doubt. It is believed by males than females equal ( $\bar{x} = 4.04 > \bar{x} = 3.99$ )

When considered separately as each topic is found that belief in sin, males believed more than females ( $\bar{x} = 4.05 > \bar{x} = 4.01$ ) which is the level of belief but in doubt too. When considered separately as individual aspect is found that males believed the level of belief but in doubt every side by ascending order the mean from high to low were development, precept and giving which was the mean equal 4.19, 4.01 and 3.98 respectively. But females believed the level

of belief but in doubt every side by ascending order the mean from high to low were development, giving and precept which was the mean equal 4.21, 3.92 and 3.91 respectively.

The belief in sin, it is believed by males than females ( $\bar{x} = 4.03 > \bar{x} = 3.96$ ) which was the level of belief but in doubt too. When considered separately as individual aspect is found that males believed the level of belief but in doubt every side by ascending order the mean from high to low were speech false, body false and mind false which was the mean equal 4.07, 4.01 and 4.00 respectively. But females believed of the level of belief in doubt every side by ascending order the mean from high to low were speech false, body false and mind false which was the mean equal 3.98, 3.97 and 3.92 respectively.

2.3 Undergraduate students of LoeiRajabhat University, classified by faculty have belief in merit and sin of the level of belief in doubt every faculties by ascending order the mean from high to low were faculty of management, faculty of industrial technology, faculty of education, faculty of humanities and social sciences and faculty of science and technology which was the mean equal 4.11, 4.09, 4.06, 3.97 and 3.89 respectively.

When considered separately as each topic is found that belief in merit. All Students of faculty have belief the level of belief but in doubt by ascending order the mean from high to low were faculty of management, faculty of education, faculty of industrial technology, faculty of humanities and social sciences and faculty of science and technology which was the mean equal 4.14, 4.11, 4.11, 3.97 and 3.86 respectively. When considered separately of faculties of each side is found that 1) Students of faculty of education have belief in the level of belief but in doubt every side by ascending order the mean from high to low were development, precept and giving which was the mean equal 4.26, 4.05 and 4.04 respectively. 2) Students of faculty of science and technology have belief in the level of belief but in doubt every side by ascending order the mean from high to low were development, precept and giving which was the mean equal 4.06, 3.78 and 3.77 respectively. 3) Students of faculty of humanities and social sciences have belief in the level of belief but in doubt every side by ascending order the mean from high to low were development, precept and giving which was the mean equal 4.22, 3.88 and 3.86 respectively. 4) Students of faculty of industrial technology have belief in the level of belief but in doubt every side

by ascending order the mean from high to low were development, giving and precept which was the mean equal 4.27,4.05 and 4.04 respective. 5) Students of faculty of management have belief in the level of belief but in doubt every side by ascending order the mean from high to low were development, giving and precept which was the mean equal 4.25, 4.11 and 4.04 respectively.

But belief in sin, all Students of faculty have belief the level of belief but in doubt by ascending order the mean from high to low were faculty of management, faculty of industrial technology, faculty of education, faculty of humanities and social sciences and faculty of science and technology which was the mean equal 4.08, 4.06, 3.98, 3.97 and 3.93 respectively. When considered separately of faculties of each side is found that 1) Students of faculty of education have belief in the level of belief but in doubt every side by ascending order the mean from high to low were body false, speech false and mind false which was the mean equal 4.02, 4.01 and 3.89 respectively. 2) Students of faculty of science and technology have belief in the level of belief but in doubt every side by ascending order the mean from high to low were body false, speech false and mind false which was the mean equal 3.95, 3.93 and 3.88 respectively. 3) Students of faculty of humanities and social sciences have belief in the level of belief but in doubt every side by ascending order the mean from high to low were speech false, mind false and body false which was the mean equal 3.98, 3.98 and 3.96 respectively. 4) Students of faculty of industrial technology have belief in the level of belief but in doubt every side by ascending order the mean from high to low were speech false, mind false and body false which was the mean equal 4.12, 4.10 and 3.98 respectively. 5) Students of faculty of management have belief in the level of belief but in doubt every side by ascending order the mean from high to low were speech false, mind false and body false which was the mean equal 4.16, 4.09 and 4.01 respectively.

2.4 Undergraduate students of LoeiRajabhat University, classified by grade of level have belief in merit and sin of the level of belief in doubt every level by ascending order the mean from high to low were second year, fourth year, first year and third year which was the mean equal 4.07, 3.99, 3.98 and 3.95 respectively.

When considered separately as each topic is found that belief in merit. All Students of grade level have belief the level of belief but in doubt by ascending order the mean from high to

low second year, third year first year and fourth year which was the mean equal 4.14, 4.00, 3.97 and 3.93 respectively. When considered separately of grade level is found that 1) Students of first year have belief in the level of belief but in doubt every side by ascending order the mean from high to low were development, giving and precept which was the mean equal 4.12, 3.90 and 3.89 respectively. 2) Students of second year have belief in the level of belief but in doubt every side by ascending order the mean from high to low were development, precept and giving which was the mean equal 4.33, 4.09 and 4.04 respectively. 3) Students of third year have belief in the level of belief but in doubt every side by ascending order the mean from high to low were development, giving and precept which was the mean equal 4.19, 3.93 and 3.91 respectively. 4) Students of fourth have belief in the level of belief but in doubt every side by ascending order the mean from high to low were development, giving and precept which was the mean equal 4.20, 3.84 and 3.75 respective.

But belief in sin, all Students of grade level have belief the level of belief but in doubt by ascending order the mean from high to low fourth year, first year, second year and third year which was the mean equal 4.08, 4.01, 3.97 and 3.87 respectively. When considered separately of grade level is found that 1) Students of first year have belief in the level of belief but in doubt every side by ascending order the mean from high to low were mind false, speech false and body false which was the mean equal 4.04, 4.03 and 3.98 respectively. 2) Students of second year have belief in the level of belief but in doubt every side by ascending order the mean from high to low were body false, speech false and mind false which was the mean equal 4.04, 3.99 and 3.84 respectively. 3) Students of third year have belief in the level of belief but in doubt every side by ascending order the mean from high to low were speech false, body false and mind false which was the mean equal 3.92, 3.86 and 3.82 respectively. 4) Students of fourth have belief in the level of belief but in doubt every side by ascending order the mean from high to low were speech false, body false and mind false which was the mean equal 4.15, 4.05 and 4.04 respective.

3. Comparison of the Awareness of Buddhist Beliefs Regarding Merit and Sin of LoeiRajabhat University Students

### 3.1 Belief in merit and sin of holistic approach

3.1.1 Undergraduate students of LoeiRajabhat University, male and female have belief in merit and sin in Buddhism, holistic approach was not different. Undergraduate students of LoeiRajabhat University study in different faculties have belief in merit and sin in Buddhism, holistic approach was not different. Undergraduate students of LoeiRajabhat University study different grade level have belief in merit and sin in Buddhism, holistic approach was not different.

### 3.2 Belief in merit.

3.2.1 Undergraduate students of LoeiRajabhat University, male and female have belief in merit in Buddhism which was not different.

3.2.2 Undergraduate students of LoeiRajabhat University study in different faculties have belief in merit in Buddhism which was not different.

3.2.3 Undergraduate students of LoeiRajabhat University study in different grade level have belief in merit in Buddhism which was not different.

### 3.3 Belief in merit of giving.

3.3.1. Undergraduate students of LoeiRajabhat University, male and female have belief in merit of giving in Buddhism which was not different.

3.3.2. Undergraduate students of LoeiRajabhat University study in different faculties have belief in merit of giving in Buddhism which was different in statistically significance at the level of .05 when comparing the different result of the pair of mean is found that Undergraduate students of LoeiRajabhat University, faculty of education and faculty of science and technology, faculty of management and faculty of science and technology have belief in merit of giving in Buddhism which were different in statistically significance at the level of .05 and other were not different.

3.3.3 Undergraduate students of LoeiRajabhat University study in the different grade level have belief in merit of giving in Buddhism which was not different.

### 3.4 Belief in merit of precept.

3.4.1 Undergraduate students of LoeiRajabhat University, male and female have belief in merit of precept in Buddhism which was not different.

3.4.2 Undergraduate students of LoeiRajabhat University study in different faculties have belief in merit of precept in Buddhism which were different in statistically significance at the level of .05 when comparing the different result of the pair of mean is found that Undergraduate students of LoeiRajabhat University, faculty of education and faculty of science and technology have belief in merit of precept in Buddhism which were different in statistically significance at the level of .05 and other were not different.

3.4.3 Undergraduate students of LoeiRajabhat University study in the different grade level have belief in merit of precept in Buddhism which was not different.

3.5 Belief in merit of development.

3.5.1 Undergraduate students of LoeiRajabhat University, male and female have belief in merit of development in Buddhism which was not different.

3.5.2 Undergraduate students of LoeiRajabhat University study in different faculties have belief in merit of development in Buddhism which was not different.

3.5.3 Undergraduate students of LoeiRajabhat University study in the different grade level have belief in merit of development in Buddhism which were different in statistically significance at the level of .05 when comparing the different result of the pair of mean is found that Undergraduate students of LoeiRajabhat University, second year and first year have belief in merit of development in Buddhism which were different in statistically significance at the level of .05 and other were not different.

3.6 Belief in sin.

3.6.1 Undergraduate students of LoeiRajabhat University, male and female have belief in sin in Buddhism which was not different.

3.6.2 Undergraduate students of LoeiRajabhat University study in different faculties have belief in sin in Buddhism which was not different.

3.6.3 Undergraduate students of LoeiRajabhat University study in the different grade level have belief in sin in Buddhism which was not different.

3.7 Belief in sin of body false.

3.7.1 Undergraduate students of LoeiRajabhat University, male and female have belief in sin of body false in Buddhism which was not different.

3.7.2 Undergraduate students of LoeiRajabhat University study in different faculties have belief in sin of body false in Buddhism which was not different.

3.7.3 Undergraduate students of LoeiRajabhat University study in the different grade level have belief in sin of body false in Buddhism which was not different.

### 3.8 Belief in sin of speech false

3.8.1 Undergraduate students of LoeiRajabhat University, male and female have belief in sin of speech false in Buddhism which was not different.

3.8.2 Undergraduate students of LoeiRajabhat University study in different faculties have belief in sin of speech false in Buddhism which was not different.

3.8.3 Undergraduate students of LoeiRajabhat University study in the different grade level have belief in sin of speech false in Buddhism which was not different.

### 3.9 Belief in sin of mind false.

3.9.1 Undergraduate students of LoeiRajabhat University, male and female have belief in sin of mind false in Buddhism which was not different.

3.9.2 Undergraduate students of LoeiRajabhat University study in different faculties have belief in sin of mind false in Buddhism which was not different.

3.9.3 Undergraduate students of LoeiRajabhat University study in the different grade level have belief in sin of mind false in Buddhism which was not different.

## 6. Discussion

The study of The Awareness of Buddhist Beliefs Regarding Merit and Sin of LoeiRajabhat University Students can be summarized as follows.

1. Undergraduate students of LoeiRajabhat University have belief in merit and sin, holistic approach was belief but in doubt. When considered separately as each topic is found that students have belief in merit which was the level of belief but in doubt, they believed in development ( $\bar{x} = 4.20$ ), giving ( $\bar{x} = 3.94$ ) and precept ( $\bar{x} = 3.94$ ) and students have belief in sin the level of belief but in doubt every side by ascending order the mean from high to low which believe

in speech false, body false and mind false respectively. This may be students are Buddhist. They are implanted in merit and sin in Buddhism since childhood from parents or senior relatives as well as receive training from various institutions, to make belief in merit and sin the level of belief but in doubt. This is consistent with the research of PhramahaSinsamutraPhonkhan (2001, abstract) that has done research in the topic of "Belief in merit-sin in Buddhism of high school education in Loei Province by multistage sampling from high school education, department of general education, 2000, a sampling of 405 persons. The result of the research found that the majority of students had belief in merit and sin in Buddhism which was the level of belief but in doubt. They believed in merit in precept, giving and development and believed in sin in mind false, speech false and body false which was the level of belief but in doubt.

However, Undergraduate students of LoeiRajabhat University have belief in merit and sin of the level of belief but in doubt by sort of the mean which arrange according to the most belief of first three as follows.

1. To help parents or senior relatives through take care of them and obey their teaching was extremely fortunate ( $\bar{x} = 4.55$ )

2. To provide the love, loving-kindness, non-violence or human rights abuser was a good thing and should be followed ( $\bar{x} = 4.41$ )

3. To ordain a Buddhist monk as spiritual beliefs was extremely wholesome and found a brightness, cleaning and truly purification ( $\bar{x} = 4.34$ )

4. A person who believes in merit-sin hell-heaven good-evil came into existence and lives of faith and was located in diligence so they could be happy in life ( $\bar{x} = 4.34$ )

For the belief of sin, Undergraduate students of LoeiRajabhat University have belief in sin of the level of belief but in doubt by sort of the mean which arrange according to the most belief of first three as follows.

1. Who kill parents, Buddhist saint or hurt Buddhist saint or instigate to division among Buddhist monk was a serious sin. They must be unhappy in this world and next ( $\bar{x} = 4.26$ )

2. To be trick woman into prostitution was a sin ( $\bar{x} = 4.18$ )

3. Speech false to damage others, to slander others or to talk to people outraged was a sin ( $\bar{x} = 4.17$ )

4. Broker fraud workers to work abroad was also a sin ( $\bar{x} = 4.17$ )

2. Comparison of beliefs in merit and sin in Buddhism of Undergraduate students of LoeiRajabhat University, classified by sex

Undergraduate students of LoeiRajabhat University, male and female have belief in merit of giving in Buddhism which was not different. This is not according to the hypothesis because the students are Buddhist. The belief of merit and sin has a way of living with the environment of Buddhist. When consider in merit is found that Undergraduate students of LoeiRajabhat University, male have belief of the level of belief in doubt every side by ascending order the mean from high to low were development, precept and giving respectively but female have belief in merit of the level of belief in doubt every side by ascending order the mean from high to low were development, giving and precept respectively. About sin is found that males have belief of the level of belief in doubt every side by ascending order the mean from high to low were speech false, body false and mind false respectively but females have belief of the level of belief in doubt every side by ascending order the mean from high to low were speech false, body false and mind false respectively. This is probably because as holistic approach or in merit and sin. Male and female were cultivate about Buddhism from family which is similar to the Buddhist society. So the knowledge, understanding and beliefs in sin are not different. This is consistent with the research of PhramahaSinsamutraPhonkhan (2001, abstract) that has done research in the topic of "Belief in merit-sin in Buddhism of high school education in Loei Province by multistage sampling from high school education, department of general education, 2000, a sampling of 405 persons. The result of the research found that male and female have belief in merit in Buddhism both holistic approach and every side is not different and believe in sin in Buddhism of holistic approach and speech false with mind false are not different. But male and female have belief in body false which is different in statistically significance at the level of .05 which is just only one that is inconsistent with the result of the research is found. Beside it is also consistent with the research of SiripornSiriwiwat (1983:151) that has done research "A comparative study of Buddhism beliefs in high school education, the

infiltration of communist terrorist's area, Ubonrajthani province. The sampling of 333 students in two schools, the result of the research is found that male and female have belief in Buddhism which is not different and is consistent with the research of Sompornchan-ud (2006: 86) that has done the research "Belief in merit and sin according to Buddhism of prison inmate, Mahasarakham province. She did with prison inmate of Mahasarakham province of population of 546 persons. The sampling was 450 persons. Males were 364 persons and females were 86 persons. The result of the research is found that prison inmate male and female had belief in merit and sin which was not different.

3. Comparison of beliefs in merit and sin in Buddhism of Undergraduate students of LoeiRajabhat University, classified by faculties.

Undergraduate students of LoeiRajabhat University study in different faculties have belief in merit in Buddhism which was not different. This is not according to the hypothesis because the students studied in the institute which classified in faculty in each of faculty are all featured on the life according to the basic moral precepts such as five precepts.

When consider in merit is found that Undergraduate students of LoeiRajabhat University study in different faculties. All faculties have belief in merit in Buddhism and in development in Buddhism were not different. But in giving in Buddhism were different in statistically significance at the level of .05 when test on the difference of the mean is found that Undergraduate students of LoeiRajabhat University, faculty of education and faculty of management have belief in merit of giving in Buddhism rather than Undergraduate students of LoeiRajabhat University, faculty of sciences and technology. In precept of Buddhism was different in statistically significance at the level of .05 when test on the difference of the mean is found that Undergraduate students of LoeiRajabhat University, faculty of education have belief in merit of precept in Buddhism rather than Undergraduate students of LoeiRajabhat University, faculty of sciences and technology. Because the quality of Undergraduate students of LoeiRajabhat University, faculty of sciences and technology are reasonable, could simply not believed, found the knowledge by themselves. This knowledge wisely is learned rationally not convinced because of any reason in 10 ways: 1) listening consecutive 2) held by tradition 3) rumor 4) by citing texts or scriptures 5) logic 6) implication 7)

bureaucracy as the reason 8) already studied with the theory 9) seen appearance as possible 10) respected as a teacher. These means were low and different from others.

But belief in sin, Undergraduate students of LoeiRajabhat University study in different faculties. All faculties have belief in merit in Buddhism of holistic approach and every side are body false, speech false and mind false which are not different. Because all students are cultivated according to the thought in sin since young from family and institute before.

4. Comparison of beliefs in merit and sin in Buddhism of Undergraduate students of LoeiRajabhat University, classified by grade level.

Undergraduate students of LoeiRajabhat University study in the different of grade level have belief in merit and sin in Buddhism was not different. This may be because the concept of merit and sin is a belief, faith which comes from mind. Not from the teaching or learning of the cultivation

When consider in merit is found that Undergraduate students of LoeiRajabhat University study in different of grade level have belief in merit in Buddhism and in giving in Buddhism and in precept in Buddhism were not different. But in development in Buddhism were different in statistically significance at the level of .05 when test on the difference of the mean is found that Undergraduate students of LoeiRajabhat University, second year have belief in merit of development in Buddhism rather than first year. Because this may be second year have an experience in training of mediation, development from the plan of LoeiRajabhat University rather than first year.

But belief in sin, Undergraduate students of LoeiRajabhat University study in different of grade level. All grade level have belief in merit in Buddhism of holistic approach and every side are body false, speech false and mind false which are not different. Because all students have an experience, they are cultivated which are not different from institution. Not only from family, has educational institution but the temple or Dhamma retreated.

STEAM Powered: The Arts Effect on Higher Education

Topic Area: Higher Education-Visual and Performing Arts  
Presentation Format: Paper Session

The Arts is a form of education that provides students with the ability to create meaningful imagery from the theoretical knowledge that is taught in a classroom setting. Today, with the primary focus being on Science, Technology, Engineering and Math (STEM), the Arts have become child's play rather than a critical part of the engaging learning component of education. This research is to present the importance of infusing the Arts into STEM as STEAM.

## STEAM POWERED

### Abstract

This research examines the influence of infusing the arts into STEM-based curricula within a higher education institutional setting. Current undergraduate students will be the subjects of this study with three goals in mind. The first (1) will be to understand if students feel that the arts play a vital part within the higher education experience with both quantitative and qualitative approaches. The second goal (2) is to determine if the infusion of art into STEM studies enhances college fulfillment for students whose primary focus is in the sciences. The third and final goal (3) is to identify what role student affairs plays in the academic success and holistic experience of undergraduate students. Exploring these goals will assist educators as curriculum is developed for STEM programs. Developing the Arts component will also assist as a means to bring life and promote the learning experience from a more creative and engaging approach. It is the goal of this research to reveal the Arts' influence on undergraduate students' ability not to merely develop innovative technology, but also to create the innovative technology that captures the attention of a world market. The use of grounded theory as a methodology will present an inclusive understanding of undergraduate student perceptions of the function of the Arts in STEM fields. It is believed that this study will positively influence the matriculation of undergraduate students by exposing them to the creative aspects of the scientific world. This research will be conducted using a survey/questionnaire in which participants will record their perceptions of the importance of incorporating the Arts into their holistic experience as STEM undergraduate students.

# **SERVAIS PINCKAERS' VIRTUE ETHICS APPROACH: A BASIS FOR CONCEIVING AN ENVIRONMENTAL VIRTUE OF BEFRIENDING THE EARTH**

## **Abstract**

The study considered the holistic approach to virtue ethics of Servais Pinckaers as a more appropriate tool for possible articulation of relevant environmental concern. In pursuing the holistic stance of Servais Pinckaers, the study considered both an ethic of action, principle, and rule---one that provides guidance regarding what we ought and ought not to do to the environment; and an ethic of character and virtue---one that provides guidance on what attitudes and dispositions we ought and ought not to have regarding the environment.

To integrate the study into an environmental issue, this study proposed the virtue of befriending the earth as a relevant environmental virtue that offered a helpful framework, among others, for encouraging Christians to take seriously the issues of their friendly existence on earth where God as a Friend is profoundly present in all things. Given this vision, humans therefore could find their roles on earth not as dominators and passive spectators but as friendly partners with God in caring and sustaining the world's integrity, stability and beauty.

**Key words:** virtue, virtue ethics, friendship with God, befriending the earth

## **Introduction**

On January 28, 1998, the Catholic Bishops' Conference of the Philippines issued a pastoral letter entitled "What is Happening to Our Beautiful Land?" which outlined and suggested concrete responses for individual persons, churches, and government agencies to become involved in social action for the protection and care of our beautiful land (CBCP, 1998). In 2004, the CBCP also presented in a book entitled *Compendium of the Social Doctrine of the Church: Pontifical Council for Justice and Peace* where Chapter Ten gives intensive information and challenge that care for the environment is a matter of a common and universal duty. This call is accompanied by a growing sense of moral responsibility as well as an effective way to change mentality and lifestyle (CBCP, 2004). The bishops posed a challenge to theologians and academes to develop and formulate an environmental ethics responsive in protecting the integrity and justice, and safeguarding the environment.

With this challenge, Filipino Christians are now calling for a more urgent and sustainable articulation of Catholic environmental ethics. The researcher feels that this ethics must examine how human beings should and ought to relate in harmony with the environment (Palmer 1997). However, it seems that most of the solutions have been mainly focusing on the question of how one ought to act to address the environmental crisis. The concern is concentrated so much on "What sort of actions can be appropriately taken to respond on the ecological crisis in the country" (Peschke 1987). He observed that none of the majority of moral actions has addressed the question of what we should be as person in the midst of such crisis. The solutions have focused much on what we ought to do and yet the environmental destructions are becoming worse.

Moreover, Alasdair MacIntyre claims that there is “disintegration” occurred because ethicists depersonalized ethics. It is because the focus on contemporary ethics is so much confined on the ethics of action and not of character, virtue, or being. If action follows being (*agere sequitur esse*), where was being? Without the ethics of being, ethicists are left only to comment on isolated actions (Harriton & Keenan, 2002). As what is happening in doing ethics in the country, there is a narrowing of the focus because of its dominant action-based ethics. Most of the time, ethicists here are so much inclined on the decision making and problem solving and not on the formation and transformation of the moral agent. There is a big gap between the moral agent and the doing. Consequently, there is a lack of clarity and political will on the part of the agent who are subjects of passions, emotions, affections, faith convictions and principles, to respond to certain rules and laws. In concentrating so much on action based ethics, the program is there but no concomitant character that appreciates the issue. Thus, there is a need to reconnect the two in order to have a holistic ethics. What I mean is that, this study does not disregard the human actions being done by committed Filipino Christians such as action plans, policies decisions, and agenda to protect the environment, but to broaden the domain of moral response in covering more than how people should do and therefore to consider too the character traits it is good for the persons to have to address the environmental crisis. This approach actually is one of the oldest ways in doing ethics which is known as virtue ethics. The primary focus of this approach is on “what sort of person one should try to be. Thus, one of the aims of this approach is to offer an account of the sort of characteristics a virtuous person has” (Sandler 2007).

With such paradigm that is emerging in the environmental ethics, there is an urgent need to shift the focus not so much on the *actions* but on *ourselves* now. From this perspective,

therefore, this approach in doing ethics sees that threat that tends to abuse the environment is connected to the problem within the traits on character of the human community. What people are experiencing now comes mainly from the ethical question about what sort of people they ought to be in the midst of ecological crisis.

Sallie McFague has pointed out that this ongoing destruction of the earth, when perceived through the lens of moral theology, bears the mark of deep sinfulness (McFague 1993). It is through *injustice*, *greed*, and *self-interest*, human beings are violently bringing destruction to the species and ecosystems, which are meant to reflect the glory of God but instead end up destroyed. The said factors are considered vices (a bad habit, bad conduct, defect) of the human beings. These vices are definitely the main reasons for the depletion of non-renewable resources and the production of waste, and these bring about ecological imbalance.

*Injustice* is happening in the different communities as long as there is much hunger and suffering on the earth while individuals or small groups control and use more than their share. The present injustices are increasing between the haves and the have-nots, between the First and Third world countries. These scenarios are manifested not only in political, economic matters but also in terms of the substandard environmental conditions in which the poor are forced to live.

*Greed* on the earth is present due to the excessive consumption of the few elites, wealthy people both in the developed and developing countries. The greedy people are those who are accumulating and profiting most from controlling the resources of the earth while the poor are left hungry and deprived of material goods. These people are justifying their status quo in arguing that the problem is being exaggerated. They use a number of arguments that human

beings have the right to exploit the earth, and the earth has probably more resources than we realize, and that human ingenuity will find a way to deal with the problem. Hence for them, it is legitimate to exploit and use the earth excessively for their personal enjoyment and satisfaction.

Whereas *self-interest* is visible in the ecological community because of the wrong attitude towards subordination, (Warren 1995) wherein human beings dominate over nature and therefore have rights to manipulate it for their own advantage. Even the classical moralists are often too anthropocentric in their approach. They are also concerned, and cared about persons but often they do not reach out beyond their comfort zones. They might condemn the growing violence and injustices in the community, and yet they show little awareness or concern about the violence being done daily to the ecosystems upon which human life depends. Self-interest always prevails when people care only of their comfort, convenience, and pleasure but unaware and passive of the environmental price paid for such personal advantages. Even the list of sins did not include polluting rivers, wasting natural resources especially those non-renewable, and the destruction of living things most especially those that are going extinct other than humans. Only contemporary moralists begin to be alarmed and realized our serious moral responsibility to care for the earth and its resources (Hill 1998). With this line of thinking, the researcher will definitely use and analyze these contemporary moral insights in the process of developing an active role of human persons in the area of ecology.

Some women theologians, on the other hand, pointed out that the abuse of the earth is connected with *self-interest* of some men over women. They insist that the sort of logic of domination used to justify the domination of humans by gender, racial, or class status is also used to justify the domination of nature (Adams 1993). Eliminating a logic of domination is part of an ecofeminist critique. It is indicative of our manner as moral beings to treat women fairly.

Consequently, if *self-interest* of people prevails then ecological disaster is highly possible too. For the reason that the same treatment is manifested to the earth, for the earth symbolizes women.

With vices mentioned above, the researcher wants to consider the virtue ethics approach of Servais Pinckaers in order to develop an environmental ethics that involves a consideration what types of characters or attitudes one could develop and about the people one could become in the midst of ecological crisis in the country. In other words, what disposition must one have to live a good human life in relation to the natural world. The researcher considers Pinckaers' ethics because he is more fascinated in the virtue-oriented approach which dominates Thomas Aquinas' work, where the pursuit of the good, happiness and excellence prevail. With his moral stance, Pinckaers' works become an important source for the revival of interest in virtue-oriented moral theology in recent years.

## **Methodology**

This study is descriptive and explanatory in nature. It only seeks to describe and obtain explanation of the virtue ethics approach of Pinckaers in relation to environmental concern. To arrive at some concrete ideas concerning Servais Pinckaers' virtue ethics approach and its implication to environmental concern, the following basic methodology is employed.

1. The researcher focused on the major books of Pinckaers in the area of moral theology, namely, *The Desire for Happiness* (1998), *Sources of Christian Ethics* (1995), *Morality: The Catholic View* (2001). These books are characterized by a return to the importance of the virtues and offer a constructive Thomistic moral theology. They also bring the treasures of the past into

the present by using the importance of Scripture, the Fathers of the church, and the great medieval masters of the theological enterprises as Pinckaers' primary sources in doing moral theology. The researcher chose these books because they contain the most extended explanation of Pinckaers' virtue ethics approach.

2. He highlighted the important concepts in the works of Pinckaers. (Data collection)

3. He tried to summarize Pinckaers' concepts and identify the fundamental approach in his theology.

4. He consulted secondary sources related to Pinckaers to gain deeper understanding of his concepts and counter check the initial description developed by the researcher.

5. He developed an integrated ethics based on Pinckaers' concepts in relation to environmental concerns.

## **Discussion of the Study**

This study discusses the approach used by Servais Pinckaers in developing his virtue ethics in relation to environmental concerns.

### **A. Pinckaers' Holistic Approach to Virtue Ethics**

Pinckaers's approach is holistic in the sense that he disapproved of the moral systems which are much constraints of the ethics of obligations. Pinckaers, in his book entitled *The Sources of Christian Ethics*, briefly reviews the advent of the moral theory of obligation. He writes that the rise of nominalism (Ockham 2007), with William Ockham in the 14<sup>th</sup> century, initiates the moral theory of obligation (Pinckaers 1995).

With his nominalist views, Pinckaers notes that Ockham rejects the universal essence of reality. Ockham believes that "only individual realities exist. They are unique in their singular

existence. Universals are simply convenient labels having no reality in themselves but nominal value (Pinckaers 1995).” As regards moral aspects, everything is confined to individual decision of the free will. This kind of freedom proposes that individuals are free in spite of their natural inclinations to happiness and goodness. This “freedom of indifference” as coined by Pinckaers, affirms the inclination to happiness existing within one’s self. However, for Ockham, as for Aristotle and Aquinas, one can choose the means to achieve ultimate happiness. But in addition, for Ockham, unlike Aristotle and Aquinas, one can choose whether to will that ultimate happiness. According to Ockham, the natural orientation and tendency toward that happiness is built in: One could not do anything about that. Still, one can choose whether or not to act in order to achieve that happiness. Man is entirely free to choose it or not.

Pinckaers sees this moral system which is based on obligations as a problem to be overcome and he suggests that there is a need to address such feature of doing ethics which became the domain of obligations and legal imperatives as the effect of nominalism. Though the concept of obligation is obviously important one in moral theory as Pinckaers said, “it would be unthinkable to attempt the construction of any kind of moral system emptied of obligations and duties (Pinckaers 1995).” There must be some elements of rules and obligations to have an adequate moral system. However, the problem Pinckaers wanted to emphasize here is that the idea of obligation is not central and basic at the very heart of Catholic morality. The problem lies on the predominant and excessive emphasis on obligation that most of the time could overlook what lies beyond and above obligation. For instance, this concept of morality that focuses excessively on obligation could overlook “the life-giving principles of the Gospel such as the power of love to animate all of a Christian’s actions (Pinckaers 1995).” What Pinckaers is trying to convey here is that there is something far beyond mere obligation. Great Christians and

saints were able to live a holy life driven by a certain spiritual impulse not just out of obligations (Pinckaers 1995).

With this background, what is needed, according to Pinckaers, is to eliminate the harmful effects of nominalism and to re-emphasize the patristic and Thomistic understanding of the natural inclinations of the individuals. There is a need to appreciate again that human beings, by nature, are endowed with a basic set of constructive inclinations or impulses which incline them to certain goods. Such natural inclinations serve as the foundation for individuals' rights and obligations.

With regard to moral theology, the study of St. Thomas's teachings particularly of using the texts of the *Summa Theologiae* regarding happiness and virtues is important for Pinckaers for he is able to escape the categories of the manuals that have become tied to the ethics of obligations. He is also able to recognize the narrowness of the systematization of theology introduced by the casuists of the seventeenth century. He is also able to compare the two perspectives in fundamental moral theology:

the manuals exclude the treatises on happiness, the virtues, the gifts, the New Law, and grace – reducing the moral part of theology to four treatises: the treatise on human acts (considered a cases of conscience); the treatise on law (based on natural law); a treatise on conscience (replacing the virtue of prudence), and the treatise on sin (constructed in view of the sacrament of penance and taking the place of the virtues) (Pinckaers 1999: 914).

It shows that the perspective of the manuals reduces moral theology entirely to the domain of legal obligations and rules. Pinckaers recognizes that the theology of St. Thomas and that of the manuals constitute two different moral systems, both of which have their own inner logic. That is why to renew moral theology from the domain of obligations, Pinckaers returned to St. Thomas who represents the best of the tradition nourished by the Scripture and the Fathers

of the Church (Pinckaers 1999). The operative paradigm of Pinckaers is essentially Thomistic and the history of the development of moral theology through the Middle Ages is valuable to him. However, Pinckaers does not neglect the recent contributions of positive sciences such as anthropology, psychology, sociology and philosophy in the process of doing ethics. He noted that,

Moral theory, in turn, needs the positivist sciences. They promote a better understanding of the many social, psychological, historical, and cultural factors involved in any concrete action. These must be taken into consideration as far as possible if an adequate moral judgement is to be formed... In spite of their differing viewpoints, therefore, moral theory and the positivist sciences can complement each other in fruitful collaboration. (Pinckaers 1995: 73)

Following this holistic approach of Pinckaers in doing ethics, the next section specifically retrieves the prime place of the virtue of charity in the classical Christian morality.

#### Pinckaers' Virtue of Friendship with God in relation to Environmental Concern

Pinckaers retrieves several themes in ancient and medieval moral thoughts that have disappeared from the modern ethics because of the latter's emphasis on the concept of obligation and duty. First, there is the theme of beatitude or deeper happiness. Happiness then is considered the highest human good toward which human activity is aimed. The question of life's meaning and goal is consistent essentially with the question of happiness. Philosophy and then theology defined happiness as man's final end and highest good. Happiness is the final object of all human actions. It is the final end that motivates mankind and gives them meaning, value and wholeness. The quest for happiness or the good life is the principal concern of morality before. Pinckaers cites examples:

Aristotle devotes the first and last books of his *Nicomachean Ethics* to the study of happiness. St. Augustine, countering Manichean heresy, did not hesitate for an instant about the reasonableness of his opening thesis: “Everyone wants to be happy. There is no one who will not agree with me on this almost before the words are out of my mouth.”...St Augustine in three words answered the difficult question about what we should ask of God: “*Ora beatam vitam*” – “Ask for the happy life” (Pinckaers 1995: 73).

St. Thomas also gives priority to the question of happiness in his treatise on beatitude. He actually accepts the teleological character of Aristotle’s philosophy, that is, human beings always act freely for an end which they perceive to be good. Moreover, their final good which brings them happiness lies in the contemplation of truth and in living virtuously.

There is also the theme of friendship which Aristotle introduced as “absolutely indispensable. Even though possessed of every other good thing, without friends a person would have no desire to live (Aristotle 1986)”. The concept of harmonious relationship in the concept of friendship is a prerequisite to be personally happy. Even in the political sphere, friendship is a prominent theme among the Greeks. In fact, according to Aristotle, “the whole point of law and the political life, over and above justice, was to provide for friendship among citizens (Pinckaers 1995).” This theme of friendship “reached its climax in St. Thomas who defined charity as friendship with God and described the work of the Holy Spirit in the world as a work of friendship (Aquinas 1947).”

Pinckaers sees that such theme has completely disappeared from modern morality because friendship could hardly be considered an obligation. He argues that “friendship can create obligations, but the inverse is not true (Pinckaers 1995).” Friendship is a natural inclination that human is inclined to unite with one another in love. This inclination can be demonstrated and be found in its first realization in family affection, and eventually extended to

others. This inclination comes naturally to us because of our spiritual nature for communion. It is a distinct aspect of human nature since we are social beings. The inclination to befriend others is strengthened and developed by the virtues, particularly benevolence. As David Hume reiterates that benevolence is natural sentiment which is not acquired through education but exists in everyone. Benevolence is the virtue proper to friendship. It is shown when one wills what is good and actively works, supports and seeks the good for the sake of everyone.

Pinckaers views friendship as not only important for moral happiness but also as part of what makes life worth living. Therefore, even though an ethics of obligation discounts friendship as a moral issue, Pinckaers testifies that it is a vital ingredient of a good and happy life.

Servais Pinckaers also maintains that human as spiritual being has a natural inclination or gift to love God and others in pursuit of happiness. He writes that,

if a person is capable of true, unselfish love for God and neighbor – the love of friendship of which St. Thomas speaks – then the desire for happiness can lead that person to be open to God and neighbor and to become generous. Can we love others truly without wanting their happiness? In the same sense, St. Thomas, in defining charity as friendship, sees a sharing in God's beatitude as charity's foundation (Pinckaers 1995: 21).

Pinckaers reiterates that this is the desire of happiness that the Fathers envisioned when they do their moral theology: the open, generous desire that characterizes friendship. That is why to be a friend of God does not merely connote that we are to love God in any way but in friendship. All friendship is love, but not all love is friendship. Friendship is a special kind of love. It is the reason why Thomas Aquinas defined charity as not only love but also a certain friendship with Him. Aquinas has in mind a distinctive relationship between God and humans. Human beings are not simply called to love God, they are to love God as friend (Wadell 1992).

To be God's friends is to be open to God and neighbour and to become generous in sharing God's happiness. In other words, if a human sincerely loves God as friend, he/she must also love and share the happiness of God to His neighbour and to the rest of God's creation at the larger extent.

It has been taught that the virtue of charity as friendship with God ought to be extended to everyone and to everything that is willed and loved by God. If the human sincerely loves God, he/she must also love God's friends and everything that is loved and cherished by God. This is the inclination one must practice in loving one's neighbour and equally with the rest of creatures of God. This is the moral obligation/principle of every individual to practice friendship with God specifically in relation to environmental concern. This argument is the organizing idea of the author in his proposal to articulate a relevant environmental ethics from the perspective of virtue ethics. It is considered as a foundation of our fraternal love and equally for our love and care for nonhuman beings in the environment. As regards to environmental concerns, humans' love and care of environment is grounded in their friendship with God. This love would realize itself through appreciating their calling - that is to share God's happiness to others and to the rest of His creation (Pinckaers 1995).

#### B. Conceiving the Virtue of Befriending the Earth

To see the earth as a community to which humans belong, one can promote friendly attitudes of love, respect and admiration towards them. Moreover, humans are dependent and benefited in return to the ecological system in which they are inextricably embedded, that is why to preserve harmonious relationships between them is proper. Humans should friendly participate reciprocal concern with other members of the land community.

To practice this virtue of befriending the earth, the researcher proposes respect (ecological sensitivity), and benevolence as crucial in the midst of environmental issue today. These virtues can and do motivate people to act as good friends of the earth.

### 1. Respect

Science tells people today that they are derived from the Big Bang explosion and their bodies are made out of stardust. It implies that their bodies are related to all the other product of this explosion, including stars, animals, plants, and the land itself. Humans are made from the same particles that make up the rest of the universe. Humans are members of the earth's community in the same way as individuals of other species. The human community is not isolated from the environment, but part of it. There is inter-connectedness between humanity and the rest of creation. If humans are intimately related to the earth, they need to consider not only what is best for them, but also what is best for the ecological community of which they are all part. Moreover, since humans are closely related to nature, abusing and destroying anything of the earth is one way of destroying themselves (Berry 1998).

Respect for biosphere and ultimately the ecosystem equates with a respect for them with intrinsic value and purpose. Each creature has its own intrinsic value and purpose in this vast web of reality. It cautions humans that environmental entities are not merely a commodity for satisfying their wants and needs. The well-being of the ecological community must take in consideration. One can also observe the order and balance of nature. Although the disruptions and unpredictability are also present in nature because of physical and man-made calamities, and of predatory aspect of nature, nature seems ultimately to return to harmony and order. It is observable that

the cycle of life and death in nature is one with ours; in the end, all living things are born and die. The death of one reality brings new life to

another, and this cycle is the same in both the natural and supernatural dimensions of reality. In all of this there is a goodness and beauty that reflect the goodness and beauty of the Creator. There is a tranquility in all of reality that can resonate in our inner selves and draw us toward it (Hill 1998: 288).

Thus, to befriend to the ecological community individuals need to see themselves as part of an immeasurably large, dynamic process of change and unfolding. The earth in which humans are related is fruit of an expansive process, which includes many billions of galaxies. The earth is not an inert and passive planet (Hill 1998). As the organic model indicates, the earth is a living organism, vital, sensitive and responsive. This idea is in contrast with the mechanistic paradigm that emerged in the sixteenth and seventeenth centuries with the development of science and technology, which views matter as lifeless, in the organic model everything in nature is permeated with life (Frangomeni 1994). Thus, the earth is something to be respected on the ground of its vitality and sensitivity. The earth is not only a living, sensitive organism in the organic model, but she is also nurturing and beneficent. Like a caring and kind mother, the earth provides everything for human's need and survival. In this model, one can see the harmony between nature and human beings. Nature is kind and generous to human beings by providing them with the stuff of existence, and they are to be kind to the earth, caring and respecting for it and being grateful for the abundance of its gifts (Frangomeni 1994).

## 2. Benevolence

Good friendship wants and seeks what is genuinely best for the friend/s. This is the benevolent spirit of true friendship, where friends are working actively and joyously for another's good. There is no intention to use and manipulate others for self vested interest.

The purpose of one's friendship here is not only wishing his/her friends well, but actively working for their well being and happiness. This is what it means to be benevolent to another – to wish nothing but the best for them. This is the joy of friendship when individuals do something fine for the person they love. Paul Wadell also says,

Friendship is the love whose whole trust and energy toils for the good of the other. It is a love whose very activity is to cultivate the well-being and flourishing of the other, not because the one who loves has no good of his own, but because what he loves and sees as his good is the good of his friend. Benevolence implies not only that the friend is loved for herself, but also because she is loved the active seeking of her good is the sustaining project of the friend's life. To love with the benevolence proper to friendships means not only that one hopes for the good of the other, but also that one consecrates his energy to seeking and upholding her good. That is what friendship is – devotion to the good of the one we love (Wadell 1992: 66).

The same is true with one's friendship with the earth. One can practice benevolence as a virtue of befriending the earth by seeking and doing that makes her stable, integrated and beautiful. In this challenge, one must be guided by benevolent dispositions and practices that have tended to preserve the integrity, stability and beauty of ecosystem. One should must embrace a benevolent dispositions and practices that is not self-serving that brings benefits to humans but harm to everything else in the earth.

Moreover, for the person of faith, benevolent dispositions and practices are shown by means of treating the earth as God's friend as Pinckaers mentioned. Then, the earth is a reflection of the goodness and love to be cared for, and gratefully sustained. In this image, the entire earth community is seen as a dynamic, vulnerable, visible reflection of the invisible God. The sacramentality of God's beautiful creation indicates a way of perceiving the natural world that evokes a special kind of appreciation – reverential appreciation. It is a kind of aesthetic appreciation where reverence is not given not to natural things but also to God whose active

presence and character is manifested by them. With these examples, one can only deduce that if the earth, the rainforest, the sea, the stream, and the valley are all manifestations and representations of God; then, their destruction is also a repudiation of one's friendship with God. The massive extinction of species in our times is not only an offense against nature but also a sin against one's friendship with God. This kind of faith conviction also affirms what Thomas Berry has said, "We should be clear about what happens when we destroy the living forms of this planet. The first consequence is that we destroy modes of the divine presence forever" (Berry 1998).

### C. Conclusion

One can see how Pinckaers presented his holistic approach in doing ethics. He provides a holistic understanding of the moral theory that includes the question of moral obligation and virtue. For him, the concept of obligation is an essential ingredient in moral theory and it is impossible to construct a kind of moral system emptied of obligations and principles. He is merely critical of casuistry and the traditional moral manuals because they misled the whole discipline of Christian ethics into an improper preoccupation with law and obligation and neglected the moral life in terms of happiness and virtue.

The researcher affirms the classical mentality as discussed by Pinckaers, that to live in friendship with God is to will what God wills, to seek what God seeks and to love what God loves. Friendship with God illumines and guides our obligation with others including the rest of God's creation. This moral argument becomes the author's basis to link friendship with God and the environmental concerns today. The virtue of charity as friendship with God becomes a chief inspiration to the individual's moral friendship with the earth. This is the challenge of

becoming friends of God wherein it teaches individuals to be concerned about something other than themselves. It obligates them to be attentive to the needs and well-being of others including befriending the earth.

One can see how important friendship is with regards to one's relationship with others, with the natural environment and with God. It is through friendship that one can transcend oneself from the realm of self-interest for the sake of the other, most especially to the vulnerable ones. Friendliness is a positive disposition that has something to offer in relation to the ecological community.

With all of this, this paper shows that a virtue of befriending the earth is itself a liveable environmental virtue. While this study is in one sense theoretical, it is in fact intensely practical, for the virtues should, after all, not merely to be studied and analyzed but to be put into practice. As Aristotle reminds the readers in his own book of ethics, "Surely, as the saying goes, where there are things to be done the end is not to survey and recognize the various things, but rather to do them; with regard to virtue, then, it is not enough to know, but we must try to have it and use it" (Bouma-Prediger 2001). This is one important contribution of virtue ethics based on Pinckers' approach in which the day to day lifestyle or character is given importance which is also an essential component of solving the environmental problem.

The call to befriend the earth is an environmental virtue that can contribute something for us to live well both personally, and socially. The environmental virtue of friendship indeed is a wonderful disposition, if rediscovered and given the right attention, has something to offer in the field of holistic environmental ethics.

**Yoko Ono Would Be Referred to as *Ono Yoko* in English Textbooks in Japan:  
The Shadow of the Textbook Authorization System in Japan**

Katsuhiko Yabushita

Department of English  
Naruto University of Education  
Naruto, Tokushima 772-8502, Japan  
yabuchan@naruto-u.ac.jp

**Abstract:**

In international communication scenes in English, Japanese names are mostly expressed in the order of given name and family name as is the practice of not only English speaking countries but the majority of the world. However, somewhat surprisingly, Japanese names are rendered with the opposite order in English textbooks in Japan. The current study will argue that the adoption of the “unnatural” order is due to the textbook authorization system in Japan.

As of now, there are two ways of expressing Japanese names in English with regards to the order among given name and family name; that is, the order of given name first and family second and that of family name first and given name second. (The coexistence of the two orders is understandable given that in Japanese, Japanese names are said/written in the order of family name and given name.) However, a moment of reflection is enough to see that the situation is confusing in terms of communication; that is, given a two-part Japanese name in English, it cannot be definitely determined which part denotes which name, given name or family name. In the full paper, it will be formally demonstrated that the probability of a name being transmitted correctly in a situation with the two ways available is at best  $\frac{1}{2}$ .  $\frac{1}{2}$  is a probability of “by chance”; thus, you have no control over the outcome, which is totally unacceptable for a convention of transmitting information. However, once one strategy is recognized as “dominant” over the other in the sense that the former is more likely to be used than the latter, the probability of transmitting a name correctly using the dominant strategy shoots up to over  $\frac{1}{2}$ . Again, this proposition is formally presented in the full paper. The answer to the question, which strategy, or order is dominant over the other is obvious

considering the current international communication in English at large. It is indisputably the order of given name-family name that is dominant. Given that, it is rational to adopt the order of given name-family name when presenting a name in English, irrespective of whether the person is Japanese or the introduction is taking place in Japan or not. Then, the obvious question here is why on earth English textbooks in Japan have adopted the dominated, or “irrational” strategy.

I will argue that is due to the textbook authorization system in Japan and more specifically, a report submitted in 2000 by the Japanese language council to the Ministry of Education, Culture, Sports, Science and Technology, entitled “Kokusai shakai ni taioo suru nihongo no arikata” (What Japanese ought to be in keeping up with the globalization of the society). In the report, there is a section specifically concerning the issue under consideration here, i.e., the issue of order between given name and family name for Japanese in English. The council in effect endorsed the order of family name and given name for Japanese names when they were conveyed in English, as they said that (i) In general, it is desirable that individuals will be introduced or described in the fashion that the unique forms of their names are preserved, (ii) It is desirable that when Japanese names are represented in Roman alphabet, they will be written with family name first and given name second, and (iii) It is hoped that the above two points will be practiced in teaching English at schools. It was when the new textbooks were authorized after the issuance of the report that all the English textbooks adopted the order of family name and given name for Japanese names while only a couple of them had adopted the order before the report. From which, it is clear that the adoption of the order was motivated by the presence of the report under the textbook authorization system in Japan.

# **The Not-so-Accidental Tourist: Intentional and Premeditated Travel for Transformation**

**Topic:** Transformative Education (Adult Education)

**Presentation Format:** Paper Session

**Description of the Presentation:**

This paper weaves together three travellers' experiences of the world, written and pictorial reflections, understanding of self, and critical and theoretical analyses. We aim to find ways to make learning through travel intentional and premeditated, as opposed to an incidental or unintentional outcome of the travel experience, offering a set of practices that will enhance various types of travel from a simple walk in the forest to more exotic journeys.

## ABSTRACT

Aristotle once said: “The world is a book. Those who do not travel read only one page.” Such was his peripatetic view of learning – the notion that we wander, meander, and walk about, experiencing life through the senses, talking, making meaning, ultimately arriving at a new intellectual state. Aristotle firmly believed that “Nothing is in the intellect that was not first in the senses” (Peripatetic Axiom found in *De veritate*, q. 2 a. 3 arg. 19), and ultimately this was how and what he taught. This being said, we do not believe that this happens in isolation without deliberate, focused, even exquisite attention to possibilities for learning and transformation. This paper weaves together three travellers’ experiences of the world, recorded in both pictorial and linguistic journals, replete with our reflections on the experience, our developing understanding of self, and a critical and theoretical analysis. We investigate how, we, as researchers and educators can bring together our experiences of people, place, and time with what we know about teaching and learning, in an effort to understand the educative and transformative value of travel, both from formal and informal perspectives.

We consider travel as more than tourism, more than reading a book, more than looking at a picture, more than viewing a video, more than what can be experienced in the comfort of one’s home. We consider travel as transformative experience, just on the edge of our comfort zones. Travel, for us, is a planned and deliberate opportunity for transformation and enhanced understanding of self, others, and world. We aim to, through our own experiences and key learnings, find ways to make our learning through travel intentional and premeditated, as opposed to an incidental or unintentional outcome of the travel experience (Mitchell, 1998), ultimately offering a set of practices that will enhance various types of travel from a simple walk in the forest to more exotic journeys.

## Abstract

With a population of 121 crore at the last count and 325 million people to reach working age by 2020, India is also a fast growing economy. With an unemployment rate at 9.4 percent for the year 2010 and 71 percent job seekers registered with the employment exchanges at less than 29 years of age during 2003, educated job seekers from standard X and above, constitute 75 percent of the total job seekers registered with the employment exchanges in India during 2003 as per a report from the Planning Commission, Government of India (2006). A society with an entrepreneurial outlook that challenges, exposes, and satisfies the aspirations of the young; both in rural and urban India are the need of time. Entrepreneurship education when exposed to the students at the secondary school stage and higher secondary stage of education helps the impressionable minds understand entrepreneurship as an exploratory foundation at an early phase of their life.

Entrepreneurship Education at the Secondary School Stage and Higher Secondary Stage of  
Education: An Indian Perspective.

---

“Indians claw their way to the top in an extremely competitive environment. Just as nobody helped them, nobody tried to pull them down either,”

- **Kanwal Rekhi, MD, Inventus Capital Partners and Serial Entrepreneur (2103, May 23). Times of India.**

The Indian economy grew at its slowest pace in a decade in 2012-13 and the data released by the Central Statistical Organization (CSO) on 31<sup>st</sup> May, 2013 showed that the economy grew 5% in 2012-13, compared to 6.2% expansion in the previous year. What has been most disappointing is that industrial output growth in 2012-13 has been a mere 1%, posing a threat to job creation and overall growth.

- **(2013, June 1). Times of India.**

Skills and knowledge are the driving forces of economic growth and social development of any country, and the economy becomes more productive, innovative, and competitive through the existence of more skilled human potential

- **Planning Commission (2006), Government of India.**

Being one of the most populated countries in the world, India is also a fast growing economy. There is tremendous scope for growth considering the growing Indian population, which stood at 1.21<sup>1</sup> Billion (121 Crore) on the last count (Census 2011). With a work force of

---

<sup>1</sup> Office of the Registrar General and Census Commissioner, Government of India, 2011

440 million, the need for employment opportunities has also increased drastically.<sup>2</sup> The unemployment rate for the year ended 2010 was at 9.4<sup>3</sup> percent and by 2020, 325 million people in India will reach working age and India will have the largest working population in the world.<sup>4</sup> The census projection report shows that the proportion of population in the working age group between 15 to 59 years is likely to increase from approximately 58 percent in 2001 to more than 64 percent by 2021.<sup>5</sup> The number of job seekers registered with the employment exchanges in India was 40.3 million as on 31.12.2005 and 71 percent job seekers registered with the employment exchanges are less than 29 years of age during 2003 (Planning Commission 2006, Government of India). Out of an estimated 397 million employed, about 122 million are poor, i.e. living below the poverty line and one of the main reason for such a situation; growth rate of labour force being higher than the growth rate of employment (Planning Commission 2006, Government of India).

Forty-five percent of the developing world's population lives in households involved in agriculture and 27 percent in smallholder households, and most depend on agriculture for their livelihoods. The agricultural sector generates on average 29 percent of gross domestic product (GDP), employs 65 percent of the labour force in agriculture-based countries, and is the key to generating an overall growth.<sup>6</sup> Bulk of the employment in India is concentrated in the agriculture sector and in rural areas agriculture constitutes up to 68 percent of the total rural employment.<sup>7</sup>

Growth of a nation depends not only on the industrial sector but also on the Human

Development. India stood at 127<sup>th</sup> rank for the year 2003 on the Human Development Index (HDI) rank and Human Development Index value stood at 0.602<sup>8</sup> and in nearly a decade, nothing has improved and India currently ranks 136<sup>th</sup><sup>9</sup> among 187 countries in the global Human Development Index for 2012 and the Human Development Index value stood at 0.554<sup>10</sup> for 2012.

### *Education Scenario*

In India, the combination of classes for different levels of school education / school stages differ from state to state; primary school stage comprise classes I-IV / I-V, upper primary school stage comprise classes V-VII / VI-VII / VI-VIII, secondary school stage comprise classes VIII-X / IX-X, and higher secondary stage comprise classes XI-XII.<sup>11</sup> Majority of the children in India attend primary education with great difficulty. With the nation allocating its resources towards education as a fundamental right<sup>12</sup>, healthy growth is expected in the number of elementary level students passing out. Universalization of Elementary Education (UEE) is a constitutional provision and a national commitment in India and with the expansion of enrolment at the primary level of education, the pressure for expansion of the upper primary level of education has increased (Varghese and Mehta, 1998). Gross Enrolment Ratio (GER) increased in 6-14 age groups to 114.61 in 2007-08 from 96.3 in 2001-02 at the primary level and to 77.50 in 2007-08 from 60.02 in 2001-02 at the upper primary level.<sup>13</sup> The mean years of schooling were

<sup>12</sup> The Right of Children to Free and Compulsory Education Act (2009), Ministry of Law and Justice, Government of India

<sup>13</sup> Annual Report 2009-10, Department of School Education and Literacy, Government of India

4.4<sup>14</sup> for 2010 and the expected years of schooling was 10.7<sup>15</sup> for 2011. According to the Seventh All India School Education Survey (AISES) conducted with reference date as September 30, 2002 there were 2, 18, 88,898 children enrolled at secondary stage and 1, 14, 37,883 children were enrolled at higher secondary stage, and in comparison to the Sixth Survey, the enrolment had increased by 43.82 percent and 50.52 percent for secondary stage and higher secondary stage respectively.<sup>16</sup> According to the latest data available from the provisional statistics of the Eighth AISES as on 30.09.2009, the percentage increase in the enrolment from the 7<sup>th</sup> AISES (2002) for India were 5, 28, 41, and 66 percent for classes I-V, VI-VIII, IX-X, and XI-XII respectively.<sup>17</sup> Substantial increase was seen in the provisional 8<sup>th</sup> AISES (2009) for enrolment to classes IX-X and XI-XII at 41 percent and 66 percent respectively in comparison to classes I-V and VI-VIII.

As per estimates of the National Sample Survey Organization, there were about 90 lakhs people totally unemployed in 1999-2000, out of which about 55 lakhs were educated with secondary and higher education levels (Planning Commission 2006, Government of India). Educated (standard X and above) job seekers constitute about 75 percent of the total job seekers registered with the employment exchanges in India during 2003 (Planning Commission 2006, Government of India). The secondary education curriculum does not provide the knowledge or skill sets required for present day job opportunities for nations like India. In many developing and transition countries, however, the secondary education curriculum often remains abstract and

<sup>15</sup> Human Development Report 2013, UNDP

<sup>16</sup> <http://www.ncert.nic.in/>

<sup>17</sup> <http://www.aises.nic.in/>

unconnected to social and economic needs.<sup>18</sup> It is largely driven by the high-stakes public examinations introduced in many of these countries by the colonial powers that still hold the key to university access and to elite professional jobs.<sup>19</sup> The shift towards knowledge-based economies makes the renewal of the educational foundations urgent and challenging, more particularly for developing countries like India.

### ***Vocational Training***

Vocational training has been devised primarily as a tool for employment. It has been tried and is continued in many parts of the world, but the reach and participation are not satisfactory, and the effects of this process are not encouraging as the experiences across nations show. In India, the National Vocational Training System (NVTs) has evolved only during the last five decades. Some of the weakness of NVTs; there is a mismatch between skills requirement of the world of work and skills produced by NVTs, inadequate involvement of stakeholders in the design and implementation of the training programmes, and the emphasis over the years on quantitative rather than qualitative aspects (Planning Commission 2006, Government of India).

Many a times, the training methods, tools, and processes are outdated and not relevant to the current employment needs. Employers look for skill sets in potential employees to be put in use at the earliest, with minimal training and orientation from their end. Assessments have shown that employers are not satisfied with the quality of vocational education and training.<sup>20</sup> In particular, they complain of the low quality of training schemes, trainees' lack of practical skills,

<sup>19</sup> 'Expanding Opportunities and Building Competences for Young People: A new Agenda for Secondary Education', Washington, DC: World Bank.

<sup>20</sup> Innovation Policy: A guide for Developing Countries (2010), Washington, D.C., The World Bank

and inappropriate training content.<sup>21</sup> In India, for example, only 3 percent of rural youth and 6 percent of urban youth have received vocational training (Froumin and Others, 2007). Out of an estimated 397 million employed in India, about 122 million are poor, i.e. living below the poverty line and one of the main reasons for such a situation; labour force being inadequately skilled (Planning Commission 2006, Government of India).

### ***Entrepreneurship; Employment, Economic Growth, and Sustainable Development***

Providing employment is not sufficient and efforts must be made at creating employment opportunities. Small business researcher David Birch reports that over a recent five-year period, the largest companies in the United States shed 2 million jobs; during the same period, small businesses created 10 million jobs (Martin, 2003). Every year, American entrepreneurs launch more than 850,000 new businesses, and the level of interest in pursuing entrepreneurship as a career remains high among people in all age groups (Price, 2006). Eighty-four percent of those who launch businesses are doing so for the first time (Dennis, 1999). One of the most comprehensive studies of global entrepreneurship, conducted by the Global Entrepreneurship Monitor (GEM), shows significant variation in the rate of new business formation among the nations of the world when measured by the total entrepreneurial activity, or TEA and the study found that 11.3 percent of the total adult population in the United States – roughly one in nine people – is working to start a business, and nations in Americas – North, South, and Latin – led the world in entrepreneurial activity, with Asian countries posting the lowest levels of entrepreneurship (Zimmerer, Scarborough with Wilson, 2009). The study also concluded that these different rates of entrepreneurial activity may account for as much as one-third of the variation in the rates of economic growth among these nations (Global Entrepreneurship Monitor

---

<sup>21</sup> Froumin and others (2007); Larsen, Kim, and Theus (2009)

2004, and London Business School, 2005). Entrepreneurial actions create employment opportunities, and in the process, may well ease the burden of the governments considerably in employment generation, and help alleviate unemployment to an extent. This is possible when there is an environment conducive and sustainable for entrepreneurship.

The role of agriculture in sustainable development and poverty reduction for the vast majority of developing countries cannot be overemphasized (Larsen, Kurt, Kim and Theus, 2009). The rising agricultural productivity can also encourage broad entrepreneurial activities such as diversification into new products, the growth of rural service sectors, emergence of agro-processing industries, and expansion into new markets.<sup>22</sup> India being an agrarian economy, farmers with no formal education surprise all with their perseverance, innovation, dedication, ingenious marketing methods, and demand capitalizing abilities as far their farm produces are concerned. They ably exploit the markets without any formal exposure to management jargons or practices; like discounting the perishable products when time progresses, taking advantage of a place and availability to price the products, and in using ingenious marketing tools effectively. This could be seen among small farmers in the rural markets on farm, agricultural, and dairy produces. The rural population and the agricultural communities need to explore, and exploit the opportunities available and with no exposure to education in entrepreneurship, they may not be able to identify and take advantage of opportunities constructively.

### ***Entrepreneurship Education***

Youth entrepreneurship programs prepare young people to be responsible, enterprising individuals who become entrepreneurs or entrepreneurial thinkers and contribute to economic

---

<sup>22</sup> Diao and others (2008), IFPRI Discussion paper 835, International Food Policy Research Institute, Washington, D.C

development and sustainable communities.<sup>23</sup> Entrepreneurship education provides opportunities for youth to master core entrepreneurial knowledge, skills, and attitudes, including recognition of opportunities, generation of ideas, creation of ventures, and critical thinking.<sup>24</sup> Entrepreneurship education for youth<sup>25</sup> may be described as a process that seeks several specific goals like providing opportunities for youth to start and operate appropriate enterprises, generating an understanding of a variety of industries, portraying the relationship between risk and reward, and providing opportunities for young people to understand basic economic concepts such as savings, interest, and supply and demand.<sup>26</sup>

A new approach to provide entrepreneurship education at the secondary school stage and higher secondary stage of education in the curriculum is the need of the hour. Introduction to basic economic concepts such as savings, interest, supply and demand, different types of industries, and brief biographies of successful entrepreneurs in story format (with more emphasis on the hardships they encountered) at the secondary school stage of education and exposure towards core entrepreneurial knowledge, skills and attitudes, recognition of opportunities, generation of ideas, creation of ventures, critical thinking, generating an understanding of a variety of industries, portraying the relationship between risk, and reward at the higher secondary stage allows the classrooms a structured system of delivery on these important points on entrepreneurship to the young, impressionable, and raw audience. These entrepreneurial classrooms during the normal course of education from classes IX till XII help understand, grasp,

<sup>23</sup> Innovation Policy: A guide for Developing Countries (2010), Washington, D.C., The World Bank

<sup>24</sup> Innovation Policy: A guide for Developing Countries (2010), Washington, D.C., The World Bank

<sup>25</sup> see <http://www.entre-ed.org>

<sup>26</sup> Innovation Policy: A guide for Developing Countries (2010), Washington, D.C., The World Bank

exhibit, and challenge the creative forces of the young students towards entrepreneurship and in the process help create better awareness on entrepreneurship to these students.

### *Conclusion*

An education system that includes entrepreneurship education at the secondary school stage and higher secondary stage of education could ignite the minds of the young students towards entrepreneurship at a later date as an alternate to employment and thus, helps cast the net far and wide for potential entrepreneurs; both in rural and urban India. With shrinking jobs and rising unemployment figures, entrepreneurship education can create confidence in the youth and encourage individuals to look at entrepreneurship as an accepted career option. Hence, it is imperative that entrepreneurship education is introduced compulsorily at the secondary school stage and higher secondary stage of education. This in effect allows the students to inculcate this fundamental discipline of entrepreneurship at an early stage as an exploratory foundation and in turn, helps expose these impressionable minds with the methods and processes of entrepreneurship.

Entrepreneurship education when introduced early in the education system, as it helps healthy participation by students due to social compulsion, invites curiosity among some of them that ultimately could lead to action by a few in them. The exposed minds could thus take advantage of such education and exposure to further enhance their knowledge and confidence. Advantages of the government programmes such as grants, loans, subsidies, and financial assistance can reach the right target group with the informed mind aware of such schemes and programmes, exploiting these schemes and resources ably. Sustained exposure towards entrepreneurship from the secondary stage of education helps achieve an informed support base

among family, friends, and society in the times to come. This in turn could help create a strong eco system for entrepreneurship and change the perception of Indian society positively towards entrepreneurship for everyone's benefit.

## PROCEEDINGS SUBMISSION

**Title:** Finding Self in Places, and Places in Self

**Author:** Linda Hegland

**Affiliation:** Faculty of Education, Simon Fraser University

**Address of Author:** 1642 Robertson Avenue

Port Coquitlam, British Columbia

V3B 1E1 Canada

**Email:** [hegland@sfu.ca](mailto:hegland@sfu.ca) OR [lindahegland@icloud.com](mailto:lindahegland@icloud.com)

### **Abstract:**

My proposed research focuses on the relationship between personal narrative, sense of place and art making. Within the framework of autobiography, inquiry, and writing, I propose to ask: How do 'place' and 'sense of place' influence the narratives we tell and help us to story ourselves, and serve to impact on our art-making? How do artists articulate their understanding of 'place' and 'sense of place' in general and in relation to their art? And how can this be cultivated in classrooms across the country? What is the impact for education?

My objective is to explore/discover/seek, and to understand if narrative inquiry, if story, can be recognized as a 'place', in and of itself. A story that people can first come from, and acknowledge – be they teachers, community leaders, parents. The objective is to seek to find meaning of not only a person's artwork but of their lives.

To allow an opening in the heart and in the mind by exploring life and lived experience through narrative inquiry.

The methodology is an exploration of the idea of place within family, within community, where we are in place and where we place ourselves. We need to understand our sense of place in all of these aspects to understand ourselves as humans, and to understand what the art that we create means. In addition to my own experience and narrative, I will also incorporate that of other artists. I intend to meet with and, through the process of conversation and dialogue, interview artists in regard to the focus of this research. I wish to experience their experience(s), reflect upon it, and speak to it.

The way finding – my journey – will serve as a template for understanding others. The elements and the essence and how others experience the world. This research will add to the literature base on narrative inquiry, poetic inquiry, and the impact of lived experience and self-realization on art-making and on educative practices involving all learners. This research is important in that it is in the spirit of honouring. Between us all and between all lived experiences are interplaces. Within those inter-places yet more stories are seeded. Inter-places and interspaces, contributing to an intricate network, braiding/blending/blurring, connection and communication, like a galaxy.

**Abstract:** How do you combine existing student services with new ideas in support of incoming and continuing students? Services are intended for at-risk, transitioning, and academically successful...ALL undergraduate students! This paper will address:

- Charge of the university-wide, presidentially appointed committee – identification of potential committee members,
- Politics of integrating Academic Affairs, Student Affairs, and existing programs that may operate in isolation,
- Development of initiatives and the role of assessment,
- Final recommendations of the committee

## **Overview**

Institutions of higher education often respond to student support on an “as needed” basis. As populations grow, shift and change, the support needs of various constituencies become more critical. Witness the growth in disability support, veterans outreach and minority affairs over the past decades. In many cases, support programs develop organically to meet the changing needs and are outgrowths of one specific office or department because of their affiliation with the group in need – e.g. tutoring programs developed within an academic department.

While many institutions do an admirable job of supporting their students, this type of program development often leads to a confusing maze of offices working in isolation, duplicating and or competing for scarce resources and overburdening of certain staff while leaving students with even more confusion as to where to turn for help. Who hasn't heard horror stories of students being sent from office to office trying to get help with what should be a simple problem to solve.

This paper discusses the process used at Indiana University of Pennsylvania (IUP) to develop a more centralized approach to academic support for our students. The result was the Academic Success Center (ASC@IUP) that coordinates a number of offices across campus currently offering academic services. The center was designed to focus on meeting the needs of students in transition, at-risk students, and undecided majors, with the following definitions:

- Students in Transition – those seeking to change major, those coming from others campuses, or those transitioning from non-high school settings such as veterans and adult learners.
- At-Risk Students – those with an overall GPA below a 2.0.
- Undecided Majors – those selecting the UNDC major designation which is available in any of the six academic colleges.

This paper will discuss the process used from inception to development, to finalized proposal in developing the center. For each step, the process that was followed at IUP is described and also additional considerations to replicate this process at other institutions are presented.

## **Background**

While there is a long history of student support at IUP, including a short-lived “Student Success Center” initiated and run by the Division of Student Affairs, this most recent project was initiated by the arrival of a new president. To understand the process which was used to develop the final proposal for a center, it is necessary to understand the structures that were in place when the project began.

Indiana University of Pennsylvania is one of 14 state funded schools forming the Pennsylvania State System of Higher Education (PASSHE). It is a doctoral institution serving approximately 13,000 undergraduates and 2,300 graduate students. The university has a main campus, and two small regional campuses, one of which is residential. The main campus is primarily residential, with new suite-style residence halls housing more than 3,200 students organized into living/learning communities. All students are required to live on campus their first year. The university is organized into six academic

colleges and a graduate school with the Division of Academic Affairs headed by a Provost. The institution has other divisions including a Division of Student Affairs overseen by a Vice President/Dean of Students. Student support is distributed throughout the institution (Table 1).

While advising at IUP is the purview of the unionized faculty, probation and academic recovery of academically at-risk students are overseen by Assistant and Associate Deans. Undecided students are directed into and advised by the college that most closely fits their interests. The Department of Developmental Studies, housed in the College of Education and Educational Technology, oversees various developmental courses, some centralized tutoring, and advising of a population of under-prepared students identified in the admissions process. The Office of Advising and Testing coordinates Disability Services and is overseen by the Division of Student Affairs. Additional tutoring is run by individual academic departments. Veterans outreach is handled by a variety of offices on campus including Financial Aid, Student Affairs, a Veterans Outreach Group and Enrollment Management.

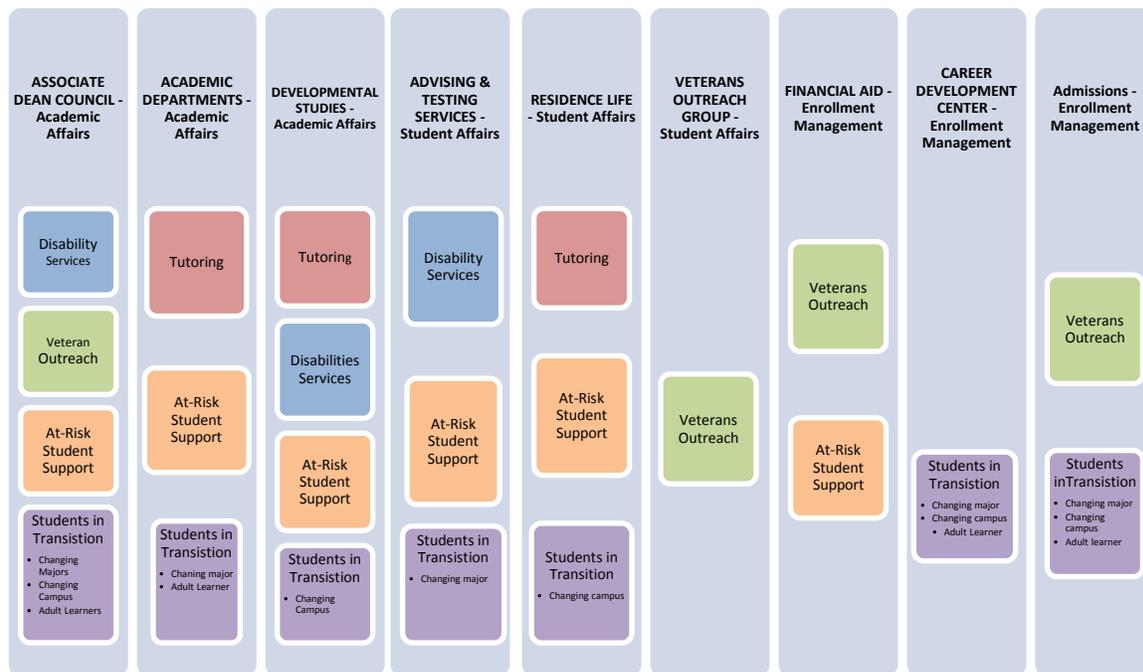

Table 1 Distribution of Student Support Services

As is common in universities, as the institution grew and times changed, priorities changed, resource availability changed, and offices were moved, realigned and reassigned to fit the changing budgets and priorities. Most recently, PASSHE has placed higher priority on measuring the success of its universities by measuring their success with students. Specifically, a portion of PASSHE Performance Funding is determined directly from comparative measures of student retention and graduation rates. This initiative led directly to an examination of what services IUP provides for its students' success and how easily students can take advantage of those services, which in turn has led to a proposal to develop a centralized "clearing house" or "one-stop shop" that will serve as an Academic Success Center for the

university. The rest of the paper will outline the steps taken in the development of the center and address the major issues that need to be considered in the design and implementation of such a center.

### **Initial steps**

Once the idea is proposed, assemble a small preparatory team to do some groundwork. At IUP, the new president requested that the Associate Dean Council investigate the development of a student success center. The Associate Deans assembled a small team of colleagues, familiar with the university, to explore the concept of a center. This team brainstormed ideas including what a center would look like; what services it would offer, and evaluating what services already exist. Additional considerations included what populations might the center serve; who should be involved and who would possibly object if not consulted; what tasks would need to be done? This team submitted a proposal to the President, requesting seed money and resources to begin their work.

After the initial brainstorming, the preparatory team assembled a list of service providers to include in the planning. A larger action team was then selected from this list. At other institutions, there are a number of factors to consider in choosing this larger group. The first is, how large should the team be? An overly large makes scheduling meetings unwieldy. An overly small team limits points of view and can cause problems with buy-in down the road if certain groups of service providers feel excluded. A second consideration is how the team members are selected. In some cases it may be more efficient to hand pick members known to the team as successful collaborators. In others it is best to ask that a representative be appointed. Since the IUP faculty is unionized and advising is one of the contractual roles of the faculty, the action team sought appointments from the union representatives. A third consideration in team selection is the diversity of the groups represented. There needs to be representation from faculty, staff and administration; there needs to be mix of academic affairs and student affairs. When choosing faculty, consider including established faculty who know how to navigate the system, and newer faculty who might not be as weighed down with past baggage, but rather might expose the group to new ideas and opportunities. The team will need representatives from the offices that provide services that the center will address. Consideration must also be given to the make-up of the team across gender and equity lines and will need representatives who understand the needs of the minority populations on campus.

Given those considerations, at IUP a team of 11 members was chosen as a task force. The make-up of the IUP team included three Assistant/Associate Deans, five faculty members, two administrators, and the Director of Social Equity and Diversity. The decision was made not to include student representation on the task force, but rather to solicit student input through surveys, focus groups, and other existing data.

### **The Action Team: Preliminary Research**

With the team assembled, the first step was to continue the brainstorming that was started by the preparatory team in a more comprehensive manner. Utilizing a SWOT analysis, the team developed the following questions for consideration:

1. What groups within the student population need to be served by an academic success center (ASC@IUP)? In general, there are many ways of “slicing” the student population by their needs or by their characteristics. The list that was compiled at IUP included: students with disabilities, students on academic probation, honors students, graduating students, undecided majors, veterans, nontraditional students, commuters, students of color, lgbt students, etc. It became clear that every group on campus could be served in some way by an ASC.

2. What services are currently being offered, and to which groups? As noted above, many offices at IUP already provide services needed by students. In consideration of this, the ASC@IUP was envisioned to be more of an “information hub” and resource center. The intention of the center is not to duplicate existing services, but rather to coordinate efforts and centralize outreach. To catalog existing services, the team sent the following request to all offices on campus:

*Dear Colleagues,*

*We are members of a new presidential task force to examine the possibility of starting a center to expand support for students and faculty at IUP in their pursuit of academic excellence. As part of this effort, we are making a holistic attempt to identify support services that are already available to our students.*

*We are aware that many support services already exist within our colleges, departments and the university, and we are asking for your help in identifying these services. We would appreciate it if you would respond to this e-mail and provide a list indicating the student support services currently offered by your college/department/office. Examples of the types of services we are interested in learning about include, tutoring, counseling, peer mentoring, career advising, workshops, websites etc. Please include, as well, services that may not “traditionally” be termed “support” but which you feel provide such.*

*Thank you for your assistance in identifying these important student resources so that we may add this to the inventory of existing services on campus. We would appreciate your response by June 19th.*

In general, it will likely be the case at any institution that numerous offices and programs are already in place to help students. This survey of existing services becomes critical in identifying resources and avoiding duplication. In addition, by determining what services are already available to students, it becomes easier to identify what services are missing.

3. What are the needs of our students? A subcommittee was assigned the task of developing a needs assessment for the student population. They were able to use some existing data because the university already participates in the National Survey of Student Engagement (NSSE) and conducts an annual living/learning survey of on-campus students. Most institutions will have similar data available. However, surveys for specific groups of students not represented by the existing data could be developed and administered.

4. What are other institutions doing? There is a wealth of information about best practices, high impact practices, model programs, etc. (See Recommended Readings/Resources). To inform their efforts,

another subcommittee gathered information on best practices and latest trends from current literature and institution websites. The team also travelled to other PASSHE institutions to visit existing student support centers and meet with relevant staff at each school. In addition, members of the team attended a PASSHE statewide conference focused on retention and participated in a webinar entitled “Who Owns Student Success, a Case for Institution-wide Engagement to Drive Retention.” Each year, there are national and regional conferences dedicated to student retention and success that can provide a wealth of resources.

### **Developing the Proposal**

With the preliminary analysis done, there was a clearer sense of the where our needs were greatest, what groups were currently being served, and what groups needed to be the focus for the evolving academic success center. The team categorized students with the highest needs into three major groups: students in academic difficulty (on academic probation), undecided majors, and students in transition (changing major, changing campuses.)

With the focal groups and the existing resources identified, the team began to concentrate on the operational details of the center to be included in the proposal. The following are the key questions that the group considered and that would need to be addressed in any proposal:

1. Space: Will the center have a physical location, or will it be a virtual presence? Many service offices already exist on campuses; it is often impractical to move or consolidate them physically. One solution is simply to provide better directions as to how to access them. However, if space is available, centralizing services should be a top priority. At IUP, the library is a central location on campus. A proposed renovation of the library building provided space for a central meeting place and offices for some of the new functions of the center. It was decided that two of these functions would be advising for undecided majors and coordination of tutoring services. Existing tutoring programs could make use of the new centralized space. Additionally the proposal moved the existing Writing Center to the same library space. Other current services will stay where they are, but the library will become a central “kiosk” where students could go to be pointed in the right direction.
2. Staffing: Who will run the new center? Will there be a coordinator? Will there be clerical support? If there is a virtual presence, who will maintain the information? If a faculty member is given this duty, is this done through release? Will there be a new position or expansion of duties for an existing position? Are there student work-study positions or graduate assistantships available to staff the center? At IUP, the center will need a person to staff the information desk. For the undecided students at IUP, the proposal provides for release time for faculty who will specialize in the advising of undecided students and students who are changing majors. For academically at-risk students, tutoring services and the Writing Center are currently staffed with existing funding. In addition IUP has a program that utilizes graduate students from a variety of applicable graduate programs as Academic Recovery Assistants who meet with students on academic probation to support their success. The proposal strongly supports an increase in the staffing for veterans outreach programs.

3. Current resources: What is the best way to link existing offices and services to this new initiative? As has been mentioned, it is often impractical to move all existing resources and services to one central location. The question then becomes, how does the center direct students to the correct service providers? At IUP, in addition to a staffed information desk, the central location in the library will feature information boards, flyers and pamphlets, and a directory of the offices on campus. The ASC@IUP will become the central hub where students report to get their direction. The center will solicit information from existing service providers to develop a central repository of programming information and resources. In general, campuses that do not have a physical location for a center should develop an active virtual presence that includes a dedicated information coordinator. Communication between the information coordinator and decentralized service offices would need to be developed.

4. New resources: What are the resource needs and funding sources for new initiatives? In conducting a SWOT analysis and surveying existing resources, an institution is bound to find gaps in their services that need to be addressed. It is likely the largest expense will be in staffing – whether it is clerical, released faculty, student work-study or a full-fledged administrator. Any proposal must also consider the incidental costs for additional services; there are costs in programming, copying, advertising, etc. A proposal must outline how these costs will be covered.

5. Visibility & Marketing: Are campus markers clear? How are offices and services advertised? Are staff and faculty aware of the services provided? How will students, faculty and staff be advised of the existence of the new center? At IUP, the library is already a place where students gather. Locating the ASC@IUP in the library will make it naturally visible and easy to find. Appropriate signage and markers will alert students to its location. There are a number of established avenues for advertising. IUP has a student newspaper, a student-focused daily electronic newsletter, a faculty and staff daily electronic newsletter, a dedicated cable channel in the residence halls and electronic bulletin boards throughout academic buildings. All of the key stake holders that provide services to students will be alerted so that they can begin directing students to the center.

6. Assessment plan: How will the organization know its initiatives have been successful? The success of any project must be measured by the extent to which it meets its goals and objectives. The assessment tools should be tailored to the specific intended outcomes. At IUP, the initial over-arching goal of the ASC@IUP is to improve the retention, graduation rates and overall satisfaction of three primary groups of students: undecided majors, academically at-risk students, and students in transition. The key measures to be considered in assessment of the center will be: satisfaction surveys of students who use the services, monitoring of retention, graduation and academic success of the targeted populations. The services offered to these target groups are designed to be available to the entire student population as well. Additional assessment of the center will include: headcounts of students who access the center, counts of hits on the center website, comparisons between existing and future NSSE and Living Learning surveys.

### **Finalizing the Proposal**

The answers to the above questions formed the framework for the proposal. An initial draft was produced by members of the action team, and reviewed by all. The team then sought input from the various stakeholders and service providers on campus. The final proposal was then submitted to the president during the Fall 2013 semester, with final approval anticipated in early spring of 2014.

### **Summary**

All in all, the process was an enormous amount of work, but provided a valuable opportunity for collaboration between many different areas of the university. The resulting center will be an important bridge between Academic Affairs, Student Affairs and Enrollment Management. It will provide much improved support for the targeted student populations; while serving the entire university community as a central hub through which they can navigate the complex network of offices and service providers that work so tirelessly for the success of our student body.

### **Abstract:**

**Background.** The Community Health Project (CHP) is a unique educational program that partners medical, pharmacy practice, public health and other allied health students with community-based social service and public health agencies. **Methods.** To assess the program's impact on interns, pre/post surveys were administered to measure the effects of the CHP experience on public health knowledge, attitudes, and skills related to working with populations served by social service and public health agencies. In addition, agency mentors completed a multi-item questionnaire regarding the benefits of the intern's involvement to the agency. **Results.** Examining intern participation over a three year period, 54 intern surveys indicated that the CHP summer experience significantly improved public health knowledge scores, changed attitudes towards public health, and enhanced behavioral intentions to refer future patients to social service and public or community health agencies. Parallel surveys from 25 mentoring agencies indicated that the majority felt that the intern's project provided educational tools for patients/clients; helped to provide education/training to their staff; helped to assess the needs of their agency; and enhanced their ability to attain the agency's mission. Mentors also indicated that the interns helped to serve more clients; provided needed information for seeking extramural funding; and determined what agency services need to be upgraded and/or restructured. **Conclusions.** CHP has proven to be a very effective interprofessional service-learning experience for students. Evaluation data demonstrate the mutually beneficial impact of the intern's involvement on the agencies' services and clients. The CHP model for academic-community partnerships illustrates how student's engagement in the public health and social service sector can benefit all involved.

### **ABSTRACT**

The standard undergraduate business degree typically includes at least one compulsory unit in business statistics. Despite the importance of statistical literacy in business decision making a challenge remains to motivate students who wish to major in other areas. This paper explores a case of using a problem based learning approach to teach the core concepts of statistical sampling and the central limit theorem. The problem for students is in the design of the Australian Football League fantasy sports competition – the AFL Dream Team competition. In this competition player scores are used to measure the performance of fantasy teams. To broaden interest the design is to make the game attractive to people without a strong interest in football via selection of random teams. This provides a strong motivation of a ‘real’ problem in which to study statistical sampling in the creation of random teams. In addition the data is non-normal (a build-up of zero player scores) and positively skewed (a small number of very high performing players) thus allowing an analysis of how repeated sampling of random teams of different sizes can be used to illustrate the key concepts in the central limit theorem. The real nature of the data set enables the students to consider a range of problems that would not be present in simulated data which is likely to have a smoother and more continuous distribution. The paper presents details of how this case is used in the teaching program.

# Experience Abroad: Developing an Enhanced Study Abroad Program

---

**ROSS MILLER**

*Otemon Gakuin University*

## **ABSTRACT**

Studying abroad has increasingly become a part of many universities' curricula. Such a program needs to be more inclusive than simply sending students out of the country to study. A truly enhanced program should encompass the three time frames involved in every program: pre-departure, "in country," and post-return. To maximize the learning that can take place while students are abroad, schools should ensure that adequate pre-departure training is provided. Then, while "in country", students should be required to record data about different aspects of their daily lives. Finally, upon their return to their home countries, they should be given the opportunity to reflect on the experience they had. This paper addresses these time frames, and provides concrete ideas to be explored, issues to be covered, and activities that can be assigned, all of which will help enhance any study abroad program, allowing the students to make the most of their time abroad.

## **1.0 INTRODUCTION**

Contrary to what might be expected, the number of Japanese students who travel abroad for the purpose of study has seen a steep decline over the last few years. Project Atlas®, developed by the Institute of International Education, shows 60,225 Japanese students studying abroad in 2006. By 2010, that number was down to 40,487. Considering the Japanese government's ongoing focus on the importance of English and the development of more globalized citizens, these numbers are quite surprising. Matsumoto (2012) cites both the worldwide economic crisis and the fact that many Japanese college students must spend so much time job-hunting as possible reasons for this decline. Hosoki (2013) further points out that the current generation of Japanese students does not have the same level of attraction to the west as in previous generations. Despite this trend, or perhaps because of it, Japanese universities are developing more exchange programs, and placing more importance on them. As a result, many educators now find themselves working, at least in part, to help develop and support study abroad programs for their students. In a previous paper, Miller and Thorpe (2010) focused solely on the importance of pre-departure training. However, as a result of ongoing participation in study abroad programs, this author has come to realize that pre-departure training is only one aspect that can help students truly take advantage of their time abroad. There are two further steps that can be taken. This paper will discuss ideas and issues that can enhance a study abroad program during three different time frames: prior to departure, while "in country", and upon the students' return.

## **2.0 THE BENEFITS OF PRE-DEPARTURE TRAINING**

Studying abroad gives students a chance not only to increase their language proficiency, but also to become familiar with a foreign culture through personal experience. It gives them a chance to become more globally aware and become more emotionally mature (Ishino et al. 1999, Grove, 1989). However, unless properly prepared, sudden and total immersion in a foreign culture can become just as shocking and unpleasant an experience as falling into the pool can be to someone who can't swim. In order to make the most of their overseas experience, students need to be prepared such immersion before they ever leave their home country.

In writing on the Trends & Insights section of the NAFSA website ([www.nafsa.org](http://www.nafsa.org)), M. Green (2012) remembered the words of another:

As one international educator put it, it is difficult to teach intercultural understanding to students who are unaware they, too, live in a culture that colors their perceptions. Thus, awareness of the world around each student begins with self-awareness. Self-awareness also enables students to identify with the universalities of the human experience, thus increasing their identification with fellow human beings and their sense of responsibility toward them.

(para. 6)

Only by being self-aware at home, can students truly notice the similarities and differences they will find abroad. This idea is echoed by Whalen (1996), who warned against teaching students to forget about their own culture, and immerse themselves in their new one. He felt that the knowledge and experience students have of their home countries would only add the ability students would have to be both culturally aware and self-aware while abroad.

## **3.0 THE GOALS OF PRE-DEPARTURE TRAINING**

Depending on the school, pre-departure training can be anything from non-existent to a full semester program. When it comes to preparing students for any kind of a study abroad program, the advantages of having a multiple pre-departure training sessions are obvious, but even a single afternoon session can provide an opportunity to give students the tools and awareness that will help them handle a wide variety of situations, and thus take full advantage of their time abroad. For most students, studying abroad will be so far out of the realm of their own experience, they will not have a true understanding of what to expect or how to prepare. They often won't know what questions to ask that might help them prepare. Therefore, it is necessary to provide information the students might not even be aware they need. Because study abroad involves much more than just language study, pre-departure training should be focused in three core areas: Communication Skills, Cultural Matters, and Practical Matters.

### **3.1 COMMUNICATION SKILLS**

The most obvious challenge of a study abroad program is that students will be totally immersed in a foreign language. As a result, it is often the students' biggest concern

that they will not be able to communicate effectively in the host country. One way to combat this concern is to make students aware that there are certain conversations they will most likely have. By preparing in advance to answer questions they will most likely be asked on subjects such as themselves, their families, their universities, their hometowns, their free time activities, and the popular culture of home, they can easily create content that will facilitate communication in the host country and allay fears that they won't be able to speak.

One way to prepare students for such conversation topics is to utilize a project called the "poster book" in pre-departure training. These poster books provide students an opportunity to communicate in class and also help to foster communication while abroad, thus helping students with their confidence. To make a poster book, several sheets of A3 paper can be folded in half, and bound in the center, making it a convenient A4 size. Students are assigned topics such as the following:

1. About Me
2. About My Family
3. About My University
4. Life as a (19) year old
5. About Japan

For each topic poster they produce, students are encouraged to use pictures, drawings, and colors in addition to writing text. In developing these posters, students have the chance to reflect on their lives as Japanese, and by doing so, they develop more self-awareness of their own culture. Once completed, they can then practice talking about these subjects in class, and by bringing the poster books with them, students can use them as a jumping off point for conversations with teachers or host family members. They can refer to the posters as they speak. As the posters are somewhat image based, there is no script to be read, but rather subjects to both talk about and be asked questions about. In this way, the communication is more meaning based. Another advantage of the poster book is that in the case of a student doing a homestay, it can be a nice gift to present to the host family. See Appendix 1 for an example of a finished poster book.

In addition to the conversation topics listed above, there are also certain specific situations where students will be expected to communicate in the target language. If asked to think about it, students can usually come up with a long list of these situations on their own: ordering food in a restaurant, asking for directions, talking to a doctor, to name just a few. The benefit of having them think of such situations is that they can begin the process of predicting the language that they will encounter when abroad, and thus prepare. For the sake of immediate reference though, the creation of a series of "situation cards" can provide students with concrete examples of target language and provide them with opportunities for practice while still in their home country. While students can come up with these topics on their own, a colleague and I have developed a series of mini samples of speech in the following categories: family, university, eating out, health, airport, hotel, shopping, and general. Each card contains the situation (in both English and Japanese) on one side, and an example of what might be said on the other. If time is available in class, these cards can be used as starters for student generated conversations. This allows the teacher to monitor the output to see if the exchange truly follows its expected course. Feedback

given to students can then help them more accurately understand the context of a given situation. Appendix 2 shows an example of the front and back of a situation card.

While this kind of preparation can be a great help to students, and a confidence booster, it is impossible to prepare them for every speaking event they might be exposed to. Therefore, it is also important that they understand various communication strategies that they can use to help negotiate meaning. By teaching them how to ask for clarification, how to get someone's attention, and how to keep a conversation from coming to a dead stop when they don't understand, students will be more able to participate in a wide variety of speaking opportunities. Furthermore, especially with Japanese students, who often have a binary attitude about communicating in a foreign language (understand = continue conversation vs. not understand = say nothing), it can be very helpful to teach students the importance of using their imaginations when trying to communicate. Imagination might help them strive for a new way to communicate something they can't say directly, and help them guess on the meaning of unknown words. By using their imaginations, students come to understand that a lack of understanding does not necessarily have to be the end of a conversation. An example of an activity that can help with developing this skill might be along the lines of the teacher saying, "Please answer the following question: blah blah blah blah **brother** blah?" In this situation, all of the words but one are gibberish. The intended lesson for students is that even if they can only pick out just one word from a question, they can use their imaginations to guess what was being asked, and then form an answer:

"I have an older brother."

"My brother's name is Kenichi."

"I don't have a brother."

"My brother is 21 years old."

If the answer is right, great, but what students are often unaware of is that even if the answer is wrong, that is also great. By saying nothing, the conversation is likely to stop, but if they give the wrong answer, the questioner is likely to either repeat the question, or initiate a new conversation based on the previous answer. Another question that is fun to practice in class is, "blah blah blah blah blah blah blah?" That can lead to many interesting conversations!

### 3.2 CULTURAL MATTERS

The term "culture shock" is often bandied about, and while its meaning is generally understood, students often have only a vague idea of what "culture" actually is. For the most part, their preconceptions are usually generalizations and stereotypes. It is important to emphasize to students that culture encompasses all aspects of a people, their daily lives, and their interactions, not just easily visible things like traditional dance or clothing. One way to get this message across is to use the visual of an iceberg to explain that culture goes much deeper than just what can easily be seen on the surface. The importance of examining connections between surface and deep culture will help students in the process of crossing cultures. As they will be experiencing this culture first hand, it is hoped that they will be aware of the small details of deep culture and be fully able to appreciate that not only groups of people, but also individuals in those groups have their own unique culture. The poster books mentioned above can be used to help drive this point home. When students examine

their own lives and environment, they can come to see how much of what they experience is influenced by their own Japanese culture.

That said, before departure, students should be made aware of the more obvious social do's and don'ts. Making them aware that norms involving acceptable clothing, eating habits, bathing habits, smoking habits, etc., could be quite different from "back home," could help them better fit in upon arrival, or more important still, not cause offense. While they should try to learn about these things before they go, it is also important that they learn how to observe others. "When in Rome, do as the Romans do" only works when one actually observes what the "Romans" are doing. Games like *Barnge* (<http://www.thiagi.com>) and *Bafa Bafa* (a Google search for *Bafa Bafa* will provide many examples) can provide good training for both communication strategies and cultural awareness.

Another area of consideration is that of Pop Culture. Things like current movies, tv shows, music, and celebrities are often the conversation topics of "today." By having students research who and what is currently popular, they can become more familiar with what they will likely be exposed to in the foreign country. Students should be encouraged to take advantage of websites such as YouTube to expose themselves to such pop culture. By acquiring this type of background knowledge before arrival, they will be more able to participate in a wider variety of social interactions.

While one of the goals of pre-departure training is to allay student fears, an important subject to cover is that of personal safety. It is sad to say, but in the world we live in, there are some who will prey on a foreign student's lack of awareness of cultural norms. One aspect of culture that can leave students particularly vulnerable is that of touch. Japan is a society where there is usually little to no physical contact between family members. This is often different from many families in western countries where hugs and other forms of physical touch among family members are quite common. Although it might seem like common sense, students are often unaware of what kinds of touch might be considered acceptable or unacceptable. In order to minimize, or more hopefully, completely avoid such problems, different kinds of hugs or caresses should be demonstrated. Students should never be in a situation where they are being touched, and they think, "This is kind of weird, and I don't really like this, but perhaps this is the culture of this country/family, and I don't want to be rude by saying 'stop.'" They need to know that if they think a touch is "uncomfortable" or "weird", that they should trust their instincts, say, "stop it," and then tell someone in a position of authority. Do to the uncomfortable nature of the subject, students are more likely to confide and seek advice from their friends or classmates. Unfortunately, friends or classmates often don't know how to respond because they too are not native to the culture. I know of one case where after continually being touched inappropriately, a student consulted with her friend for almost a week before the friend finally told her to talk to someone in authority. In the event that students ever need help in such a situation, make sure they know who to contact, and how to contact that person. This information cannot be stressed strongly enough.

### **3.3 PRACTICAL MATTERS**

This area of preparation encompasses the types of questions that students might have about the concrete aspects of their trip. In this area, the focus tends to be on departure and arrival procedures, money, transportation, local geography, and problem solving.

Preparing for departure can be a very stressful situation for even the most seasoned of travellers. For my students, many of which have never been away from their families, let alone traveled to a foreign country, this can be a particularly rough time. Therefore, suggestions on preparation can be especially helpful. Basic tips such as creating a packing list: deciding exactly what to bring, and checking it off the list as it is packed can help make this process a smooth one. Also, explaining airline baggage rules, carry-on restrictions, and other airport procedures such as check in, immigration, boarding, customs, transportation to and from the airport will take some of the fear out of the unknown.

Another big concern of students is money, especially the question of how much they will need. While the answer to this question has many variables, for the most part, in the programs I am involved with, their program fee has covered room, board, and education. By explaining that they will always have a roof over their heads, and food in their bellies, the question of money becomes less of a major concern. If possible though, it is beneficial to survey students who have previously participated in the study abroad program to see how much money they used, and in what ways they used it, and then inform the current students. In some cases, students might benefit from a little advice in how to spend their money. In a recent program, I had one student who told me she was thinking about renting a portable wi-fi hotspot device. I pointed out that the price of using such a device would be the equivalent of about 30% of the money she planned on taking. When asked if she really needed to be connected to the internet 24/7, or if she would rather have more money to spend on activities and other things while abroad, she decided free wi-fi would suffice.

Though short term study abroad students might not have to concern themselves with opening a bank account in the host country, long term students might. Therefore, they should be made aware of the difference between a savings account and a checking account. For my students, it is recommend that they open a bank account in their home country (in this case, Japan) that is affiliated with an international ATM system such as Plus or Cirrus. This gives them the ability to withdraw cash in the local currency directly from their Japanese bank accounts. It also provides an easy way for family back home to add more money to the account in case a student runs low on funds.

When it comes to money, students should also be made aware of how money is used in the host country. This includes teaching them about the different denominations used (including the names of the coins and bills), how to handle money safely, and expectations of change, etc. Students are most likely unaware of the fact that they might meet with some resistance if they try to use a \$100 bill to pay for a \$1 bottle of water at the local convenience store. An explanation of the tipping culture of the host country should also be included in pre-departure training when money issues are being covered.

If possible, transportation and local geography should also be explained in pre-departure training. Looking at maps of the target area will help students quickly

orient themselves when they arrive. Western addresses that use sequential numbering and street names might be a new concept to many students. Map reading tips, and learning how to use cross streets and intersections as reference points can help students when asking for and receiving directions. Getting lost is a real fear, but in actuality, being totally lost is a very rare occurrence. If students can learn certain main reference points (this street runs to the harbor, which is to the east, or that street passes the big shopping center, etc.), they can develop an awareness of an area that does not require them to be able to pinpoint their location at any one time. Most students have smart phones, and while they might not be connected to the internet while abroad, they can still serve a useful function. In their home country, have students access maps of the place they will be going. They can then take screen shots of that place at various degrees of scale, and thus, always have a map when needed.

When it comes to getting around, examining how the public transportation system works and the hours it runs will help students quickly adapt. Informing students about fares and fare rules, and whether or not they should buy monthly passes, ticket books, or individual tickets can help them prepare mentally (and financially) for getting from Point A to Point B. Furthermore, showing them how to identify different buses or bus stops allows them to know what to expect when they are ready to ride. Teaching them to use Google maps (<https://maps.google.com/>), which at least in North America, can give precise instructions on getting around town using public transportation, is another great tool.

While there are many other practical matters that could be covered, it is impossible to predict, let alone cover them all. Therefore, perhaps the most important skill to teach is that of problem solving. Students can be expected to face a number of crises while abroad, and a little instruction prior to their departure can help them solve many of these problems before they become major issues. It is important to teach students that many problems can be avoided by preparation, and others can be overcome if they remember to be communicative, assertive, flexible and understanding. Students should be fully aware that if they have a problem, they never have to suffer alone, and that by talking to teachers, friends, or their host family most of their problems can be solved.

#### **4.0 THE BENEFITS OF “IN COUNTRY” TASKS**

When studying abroad, students often have different expectations and ideas of what they will do once in the host country. And of course, the type of program they are participating in will shape the students' experiences. In my case, the program I am most involved with is that of sending a group of students abroad for one month. Group size usually ranges from 25 to 30 students. These are students with almost no experience of travel, and absolutely no experience of independently exploring a new place, therefore, they will often fall into the familiar patterns of home. Students can miss a lot when they bring the culture of university life in Japan with them, instead of being more open to experiencing the foreign culture of the new country of study. In the first week of one program, students were hesitant to spend \$30 to see a local landmark, but had no problem spending \$50 for a sushi dinner. Therefore, to help them prioritize better ways to use their time and money, it can prove beneficial to assign them experiential tasks beyond their daily language studies.

## **5.0 THE GOALS OF “IN COUNTRY” TASKS**

Even Einstein once commented on that peculiar aspect of time, in which it seems to pass all too quickly when one is having a good time, and usually, thankfully, students have a fantastic time when they are abroad. However, when they return to their home country, students are often left with an overall impression of “that was great,” but as time passes, they have no clear evidence, or even clear memories of what it was they experienced. The goals of assigned “in country” tasks are two-fold:

1. Require them to experience a certain threshold of new activities.
2. Record and reflect on these activities.

It is hoped that by completing these tasks, students will be able to preserve clear timeline of their experiences while abroad.

### **5.1 “IN COUNTRY” TASK: RECORDING A DAILY MEMORY**

The goal of this task is not to create a diary, but rather record one clear memory every day while abroad. Students are told that every single day must have one happening that is worth preserving. This happening can be anything from an event, “I went to a party today,” to a feeling, “I was really nervous today.” The point is to record enough details of that occurrence to paint a vivid picture of it so that others can understand it as well. In my case, the students are of extremely low English level, so I have them write down this memory in a notebook in Japanese. This will form source material for the project I have them work on upon their return to Japan. (See Section 7.1) The reason I have them write in Japanese is that I don’t want to make this part of the project too difficult. By writing in Japanese, this task should not take more than 10 or fifteen minutes a day, if that much.

### **5.2 “IN COUNTRY” TASK: SUPPLEMENTAL NOTES**

In addition to the daily memory, students are also given different short answer questions throughout the program. Some of these questions are “time sensitive”, such as: What was your first impression when you met your host family? As with the daily memory, it is the details that make this answer interesting, so this question must be asked/answered the day of arrival. Again, students are allowed to write in Japanese because at that point in time, it is the information that is important, not the language it is recorded in. Other questions might be along the lines of:

- What was your most interesting lesson this week?
- What was your biggest challenge during the first week?
- What is the biggest difference between studying English here vs. in Japan?

Students are also required to keep a record of where and how much money they are spending from week to week. In addition to preserving information, this can task can also help students be more aware of just how much and how quickly they are spending their money. Important knowledge when one has limited funds.

### **5.3 “IN COUNTRY” TASK: ACTIVITY CHECKLIST**

(see Appendix 3)

In order to push students to try new things, and reflect about them, students are required to record data about their experiences with the following subjects:

- Food

- Sightseeing
- Shopping
- Things to Do (other activities that are not necessarily included in the above)

For each of these topics, students need a record of such information as the name, location, ticket prices, menu items, other related information, and of course, their own impression of the place or activity. As my program is 4 weeks long, I assign eight listings for each category (or 2 per category per week). As most of this information can be preserved with a few photos (photos of restaurant name, menu, interior, and food can provide the required details for 1 food experience), it is not necessary for the students to write all of that down in their notebooks. Rather when they have the information recorded, they may simply check it off of the checklist. The notebooks/checklist are also used for students to record information about public transportation, observations of cultural differences, and a list of at least 2 new vocabulary words/phrases per day.

## **6.0 THE BENEFIT OF ADDING POST STUDY ABROAD ELEMENT**

The chance to study abroad is a wonderful opportunity for students. While abroad, they have improved their language skills and truly immersed themselves in the culture and daily lifestyle of a foreign country. But what happens to them upon their return to their home country? All too often, they are welcomed back to their home universities, and simply re-enter their usual classes. Unfortunately, they rarely get the opportunity to formerly reflect on their experience or produce anything tangible that shows what they accomplished during their time abroad. Without such an opportunity, any emotional growth or sense of expanded global awareness is likely to fade from the students' minds. The benefit of adding a post study abroad element is that it allows students critically reflect upon the time they spent abroad.

## **7.0 THE GOAL OF A POST STUDY ABROAD ELEMENT**

As stated above, students rarely have the opportunity for a formal debriefing upon their return to their home country. The goal of a post study abroad element is to give students the opportunity to do so. By producing a comprehensive document that covers all aspects of their experience, students are able to fully account for their time abroad. When done well, this document can serve three purposes and three different audiences. For the teacher, it can show that students truly exposed themselves to different aspects of the foreign environment, and can show how culturally aware they were. For the students themselves, this project documents their time abroad, and whenever they happen to glance at it, even years later, it can serve as a time capsule of sorts. The third audience it serves is that of future students preparing to study abroad. This document can give such students some insight as to what to expect when they are abroad. It can give them ideas of places to go and things to do, and by seeing how much money previous students spent, they can be better informed when planning their own budgets.

In the program I am associated with, students have a required class in the spring that serves as a full semester of pre-departure training. They then spend 4 weeks of the summer abroad. In the fall semester, they have another required class that is based on their time abroad. Past experience has shown me that attention, effort, and attitude peak in the pre-departure sessions and while abroad, and then, upon their return to

Japan, rapidly dwindles with every passing week. Students can see the necessity and benefit of the pre-departure training, but lose interest after the event. In order to make the fall class meaningful to the students, it is critical that it be tied to the experiences they had while they were abroad. This is where the “in country” tasks come into play. Unless students have recorded the data required while in the foreign country, they will be unable to complete the post-study abroad project.

## **7.1 POST-STUDY ABROAD PROJECT**

As stated in the discussion on “in country” tasks (Section 5), students are required to keep a notebook where they record a daily memory and answer questions about different aspects of their experience. Furthermore, they are required to collect data and make observations about a variety of things. No English was required in the collection of that information. It is in this class where they are tasked with putting all of that information in English.

To keep the students focused on the task at hand, and to make sure all of the students will produce a finished product in the same format, I have produced an MS Word template that the students work from. See Appendix 4 for an abridged version of this document. All students receive a copy of the template, and then spend the semester filling in the different sections. The advantage of producing a template is that students do not need any particular skill with computers in general, or MS Word specifically. Aside from clicking to choose where they will input text, the only other skills they need are the ability to copy and paste photos.

Including a cover page and a table of contents, the template I produced is 49 pages long. It is divided into 8 sections as follows:

### **Part I: Homestay**

- 1) First Impression of Homestay Family
- 2) Description of homestay family
- 3) Five things I really liked about my homestay experience
- 4) Five things I didn't really like about my homestay experience

### **Part II: Simon Frasier University**

- 1) First Impression of Simon Frasier University
- 2) My weekly schedule
- 3) Description of my favorite class at SFU

### **Part III: My Calendar**

- 1) Detailed description of daily memory
- 2) List of my BEST 5 memories

### **Part IV: Money**

- 1) Week by week account of money used
- 2) List of things I bought for myself
- 3) List of things I bought for friends and family

### **Part V: Getting around**

- 1) Bus

- 2) Seabus
- 3) Skytrain

#### Part VI: Life in Vancouver

- 1) My favorite things
- 2) Surprising Canada

#### Part VII: Travel Guide

- 1) Food
- 2) Shopping
- 3) Sightseeing
- 4) Other Activities
- 5) Useful Vocabulary

#### Part VIII: Back in Japan

- 1) My feelings about returning to Japan
- 2) The things I did when I got back to Japan

A schedule is made for the 15-week semester, and every week, and as homework, students work on specific sections. And the end of each class, they do a **SAVE AS *Name Date.docx***, and submit the files electronically. This way, the teacher can keep track of students' progress throughout the semester in addition to being able to provide feedback.

Once completed, the document can end up being 60 or 70 pages long. It is well formatted, and in addition to recording students' thoughts, memories, experiences, etc., it is also filled with a variety of photos, making it colorful to look at. Students really feel a sense of accomplishment after producing a file that long. When printed and bound, it can be placed on a bookshelf at home as a permanent record of their time abroad.

A note to teachers who might incorporate this project: As the weeks progress, and students add more and more photos, it is important to pay attention to file size. I have seen files grow to over 100 megabytes. Once a file exceeds a certain size, MS Word will save it, but once closed, it will refuse to re-open it. Reducing the file size of the inserted photos can easily solve this problem. Also, as students should be saving different versions of the file every week, in the event there is a problem with the current file, it should be possible to access the previous weeks' file.

## **7.2 POST STUDY ABROAD PRESENTATIONS**

By default, the project mentioned above is based on writing. In order to incorporate a speaking element to the class, students are also required to make presentations about their time abroad. This is a relatively simple task to prepare: students are told to make a PowerPoint file consisting of 11 slides. One slide is the title slide, and the rest of the slides are made up of a heading and a single photo. The only requirement is that of the 10 photos, the student making the presentation can only appear in one of them. Without that caveat, at least in Japan, students tend to choose 10 pictures of themselves gesturing "peace". In terms of PowerPoint, the file takes very little time to make. As it is an assignment, all students are required to submit the PPT file at the

same time. Then, throughout the semester, 2 or 3 students are chosen each class to make their presentations. They are to tell the story of the photo: where, when, what, etc., and the audience is then encouraged to ask the presenter questions about his or her activities.

## **8.0 CONCLUSION**

With this paper, it is hoped that educators will come to realize that a study abroad program should involve much more than just providing students with the opportunity to spend time studying in a foreign country. Pre-departure training in communication skills, cultural matters, and practical matters can help students be better prepared to smoothly acculturate. “In country” data collection assignments can provide students with the incentive to go out and try new things. Furthermore, having to record that data, as well as information such as a daily memory, and cultural differences will force them to reflect on their time and experiences outside of their language classes. Using the information the students collect while abroad in a final project to be developed after they return to their home countries can help condense and codify the experience and the memories into one document, which can serve as a treasured memory for the student who went, as well as serve as a kind of tool to help future students prepare for their own programs abroad. By enhancing a study abroad program in such a way, students can do much more than simply study. They can open their eyes, and truly experience being abroad.

## **ACKNOWLEDGEMENT**

The author would like to offer his heartfelt thanks to Professor Todd Thorpe of Kinki University. He was my co-author on an earlier paper on improving study abroad programs. And over the years, his keen insight and passion for teaching have helped me further develop and refine the enhanced program presented before you today.

## Abstract

Based on research conducted at the elementary and middle school levels, a University teacher education preparation program, a University counselor education preparation program, as well as experience working in various individual, organizational, and governmental areas of conflict resolution, this panel of presenters will provide an interactive session focusing on innovative teaching for collaborative systems; conflict coaching for cooperative learning and effective problem solving; and, constructive engagement in a global society. A framework of skills and strategies will be provided to work in a variety of educational settings.

The research conducted by Dr. Lane at the elementary level has demonstrated a parents' desire to have their children engage in conflict resolution as part of the transition into kindergarten. Parents were generally satisfied with their engagement in the transition process and the introduction into formal schooling; however, parents indicated a significant desire for both social and behavioral support of firstborn children as they transition into formal schooling. Nearly a third of parent participants responded they would have liked more information on both academic and behavior expectations prior to school. An open ended question to see how to better meet the needs of future parents as they transitioned a child into school indicated that the majority of participants would like information on how to teach pro-social behaviors and instill conflict resolution strategies in their children. Thus, the desire to instill cooperative learning skills and build constructive engagement in a global society is evident in families and in our youngest of students.

Additionally, Dr. Lane's work in educating teacher candidates in both Educational Psychology and Interpersonal Relations in the schools demonstrates that pre-service teachers' greatest fears rarely come in content knowledge or one's ability to teach, but rather productively working with various stakeholders in the education realm. Students, parents, colleagues, administration, and the greater

community pose many opportunities either gained or lost through communication. Providing educators with conflict coaching and innovative skills and strategies to work with a variety of individuals seems imperative to an educator's success in the field. Opportunities for an overall reduction of conflict, reduced student bullying, along with greater teacher retention and longevity seem feasible if we empower educators with the tools they seek to be stronger problem solvers creating collaborative systems.

Dr. Frost's research of prevention programs used to reduce school violence at the middle school level has found bully prevention programs are not achieving the desired effect. This research project surveyed 231 schools with 122 responses returned. The schools provided information with regard to the type of prevention programming, how the programs were administered, and how many times per year the programming was delivered and by whom. The only significant finding related to schools that had a counselor to student ratio of less than 1:500. These schools reported significantly fewer out-of-school suspensions (injury and non-injury) than those schools with a counselor to student ratio of more than 1:500.

As an educator of school counselors, Dr. Frost feels it is important to look at the role counselors play in delivering prevention programs and to use their time effectively to deliver services that truly make an impact. The need for additional prevention programming is recommended to provide life skills in the area of conflict resolution, which will enhance what the current bully prevention programs are teaching. Conflict dynamics are important for the teen population to understand and learn to better facilitate the building of problem solving skills within relationships and for future professional interactions as they move into the work force beyond their formal schooling. Preparing students to work in a global society requires the ability to see issues from different perspectives and work effectively in collaborative systems.

Considered a “pracademic,” McCants’ work is dedicated to the theoretical understanding of conflict in conjunction with the attention to skills, intervention, and practice of managing conflict constructively. She draws from several pedagogical insights when creating space for collaborative efforts among individuals and groups of people both domestically and internationally. Each individual’s manner in which they engage in conflict is developed over a lifetime and is influenced by individual differences, skills, competencies, and, culture and group identity. Learners at all levels need to be both supported and challenged as they embrace processes of collaboration. Learning conflict resolution cannot simply be about attaining a subject matter, but rather needs to include an experiential learning component in order for behavioral and attitudinal change to take place. Conflict-competent leaders, team members, family members, and global citizens also need practice and space in which to reflect on their choices and feedback for improvement. The elementary frames of collaborative processes need to be broad enough to share across systems, and yet allow for the more ethnic frames relating to context. Finally, it is critical to provide environments in which new skills can be fostered, coached, and practiced – it is simply inadequate to make the learner aware of what they don’t know or what they can’t do – they must take the path of mastery.

The goal is to have open dialogue with other educators and practitioners in the field to learn from one another and improve upon what is currently being done in the school environment, but also to look beyond the school environment to improving communications more globally.

## UP AND OVER: A NEW RESOURCE TO GUIDE EARLY CAREER HIGHER EDUCATION TEACHERS

Cath Fraser and Judith Honeyfield

Bay of Plenty Polytechnic, Tauranga, New Zealand

### Abstract

*Increasingly, the landscape of higher education today is peopled by teachers who run the gamut of career academics to those recruited for their expansive research, commercial, industry and technical expertise – regardless of teaching experience. Casualization and contracting of sessional educators is a further cause of delayed access to formal preparation for higher education teaching. In New Zealand, this is particularly prevalent in polytechnic/community college and vocational education environments. The same sector is also characterised by massification and a highly diverse student body, incorporating first-in-family, second chance and other non-traditional learner groups. Academic leaders and faculty developers charged with preparing effective early career educators for the challenges of the twenty-first century learning environment require professional development tools that deliver practical and useful guides. Goalposts is a newly developed resource which aims to distil the complex theories and practices that underpin the pedagogy of higher education teaching. It is arranged as a series of ten one-page summaries of commonly agreed principles, supported by a glossary and examples of practical implementation. This presentation will share the six year journey which has developed first, a resource we call Signposts which outlines learning and teaching strategies, and now, Goalposts, which focuses more on the scholarship of teaching and learning. These resources were commissioned by our National Centre for Tertiary Teaching Excellence, are freely available through their website, and have been among their most downloaded products. An important feature of the resource is its positioning in New Zealand's unique dual heritage culture and society. We explain how using Goalposts will support faculty developers and new teachers: design effective learning activities underpinned by theory; offer a resource for reflecting on and developing practice; and provide a starting point for further reading and study about learning and teaching.*

### Introduction: Why the need?

In New Zealand, higher education has many faces. Our eight universities, the youngest of which was established as recently as 2000, account for 33 percent of our post-secondary students. The remaining two thirds are dispersed between 18 institutes of technology and polytechnics (ITPs), two colleges of education, three wānanga (a publicly owned tertiary institution that provides education in a Māori cultural context) and an ever-changing array of private training establishments (PTEs), with 604 registered at the time of writing. Clearly there will be a correspondingly wide range of subject, level and quality within the courses on offer.

This diversity is further compounded by the lack of a formal qualification, accreditation or registration framework for higher education professionals. Although primary and secondary teachers in our compulsory sector are required to successfully complete programmes in educational theory and practice, tertiary teachers have no such legal requirement, the only constraints being an organization's policies and procedures. It is increasingly common therefore, for our classrooms and lecture theatres to be addressed by newly recruited educators who may have a wealth of subject-matter expertise, but little or no background in lesson planning, classroom management, or other pedagogical knowledge.

Teaching has a reputation as one of the more stressful professions. Forty-one per cent of teachers report high levels of occupational stress compared with 31 per cent of people in nursing, 29 per cent in managerial jobs and 27 per cent in professional and support management occupations (Milburn, 2011). In a recent Australian study (Richardson & Watt, as cited in Milburn, 2011) it was found that between 25 and 40 per cent of teachers leave the profession within five years of starting, and "Poor pay is not the reason they're giving for leaving the profession: it's the workplace issues of highly stressful, poor working conditions" (p. 1). Further, many of the teacher recruits planning to quit were people who had experience in other professions. The same article describes a burnout inventory applied to early-career teachers in a longitudinal study which identified that even people who had been teaching for

two years had highly elevated levels of emotional exhaustion. If we add to the impact of this negative experience for the individuals, by considering that the cost of replacing a worker is three times their annual salary, clearly it is in the best interests of education providers at all levels, to protect their investment in talent recruitment and training.

Herein lies the tension: financial pressures frequently deny front-end training and a gentle introduction to the role; credibility requires instructors who know what they are talking about, and have first-hand knowledge of the workplace beyond academia; yet the institutes must value quality teaching. Many providers address this issue through internal professional development programmes for their educators, such as inductions, workshops, and certificate/degree programmes. However, a central problem of accessibility remains, when format and timing cannot always be aligned with starting dates or the individual's preferred approach to learning (see Honeyfield & Fraser, 2012 for an extended discussion). It was into this gap – this need for a just-in-time, focussed and accessible guide for higher education teachers in their first few weeks on the job – that the *Signposts* and *Goalposts* resources were born.

### **Six years in the making**

Improving the quality of teaching has become a high priority, both on an institutional and a national level. In 2007, New Zealand's Ministry of Education established Ako Aotearoa, The National Center for Tertiary Teaching and Learning Excellence as a specialist body to fund research related to teaching and learning. A Creative Commons publishing platform and a national register of educational research facilitates the sharing of ideas and learnings across the breadth of the sector (<http://ako.aotearoa.ac.nz/>). An apt name indeed: "Aotearoa" is the Maori word for New Zealand: literally "land of the long white cloud", and the concept of "ako" means both to teach and to learn, with an emphasis on reciprocity and shared learning experiences.

The *Signposts* and *Goalposts* resource development projects described in this paper received three funding grants from Ako Aotearoa: first in 2008 to conduct a needs analysis for novice teachers, review existing options and develop the *Signposts* resource; second, one year later, to conduct a national evaluation of the resource, assessing its usefulness and current applications, and identifying strategies for its expansion and improvement; and third, in 2012 to develop a follow-on resource, *Goalposts*, to provide an introduction to the theories and principles underpinning adult learning and education. Each phase has been subject to rigorous peer-review as well as field pilots with the target audience of new teachers, and with staff developers and academic advisors whose role it is to support, mentor and sponsor teaching capability.

In addition to "quality", a central tenet of Ako Aotearoa's vision, and of our own pledge as a recipient of their support, is collaboration. Accordingly, the project was conceived from its very beginning as an inter-institutional collaborative process, conducted with deliberation and forethought, as "genuine partnerships, characterized by respectful and critical dialogue" (Gewirtz, Shapiro, Maguire, Mahony & Cribb, 2009, p. 567) to make outcomes meaningful and productive for all participants. Drawing on a national association of staff developers, we began our partnership with eight team members from three institutions, but by the evaluation phase of the project, other colleagues had expressed an interest in participating, and the project team expanded to include staff development representatives of five ITP institutions. Over the six years, further changes occurred with retirement, job loss and role change, so that the new team assembled to write and review *Goalposts* in 2013 had just three original members among its 13 contributors, but our spread now encompassed eight organisations, with universities and PTEs represented alongside ITPs.

### **The research process and the first resource: *Signposts***

The original project began when a group of staff developers first mooted the idea of an inter-institutional resource which would assist new tertiary teachers in their first one – two months in their role. Sharing good practice from their own institutions, the team agreed that beginning staff needed a great deal of support and information provided in simple, usable 'chunks'. Two separate literature reviews were conducted – one on new tertiary teacher professional development options and the other on inter-institutional collaboration. A methodology of action

research enquiry was decided upon, since we wanted to be able to monitor, scrutinize and adjust our collaboration as the project was underway. The action research process is usually described as a cycle which allows practitioners to test ideas and concepts as they provide opportunity for feedback through the four phases of planning, acting, observing and reflecting (Ellis, Armstrong, & Ground-water Smith, 2010). A useful and frequently cited description of this approach is offered by Kemmis and McTaggart (1988), who explain that:

Action research is a form of collective self-reflective inquiry undertaken by participants in social situations in order to improve the rationality and justice of their own social or educational practices, as well as their understanding of these practices and the situations in which these practices are carried out (p. 5).

Alongside the literature reviews, a number of professional discussions were held within the team itself, and also with our wider community of practice, examining learning and teaching, the context of tertiary education, student profiles, teaching roles, teacher and student centred perspectives, and the attributes and skills of good teachers. Eventually we decided a format for the *Signposts* resource of 10 one-page topics with tips and techniques, covering:

- Planning to teach
- How to get going with your class
- Engaging your students in their learning
- Classroom management
- Delivering the goods
- The language of assessment
- Reflecting on teaching
- Knowing about and responding to difference
- Being professional
- Literacy integration

A first draft of *Signposts* was presented at the HERDSA (Higher Education Research and Development Society of Australasia) conference in July 2008, piloted, then disseminated within the three project member institutions, and then posted on the Ako Aotearoa website for national use across the tertiary sector. Feedback from the site's administrator indicated that this resource was the most downloaded document of any on the site in the first three years after the launch. Informal feedback from staff developer colleagues suggested that the resource was filling the need for immediate teaching and learning tools experienced by staff new to an education environment.

Comments from users included:

*Very appealing. Using the columns, I am more inclined to read it*

*The language used is clear and understandable without 'jargon'*

*As a new tutor, I feel a bit overwhelmed by all the information that I have to read and know – it was very nice to read this document and I know it will come in handy for referring back to – thank you*

*Signpost 6 has a website noted that I will investigate. Being made aware of other documents within the Signposts, e.g. Quality Management, I found very useful.*

In addition to the success of creating *Signposts*, we set out to chart the progress of this collaborative project with the intention of developing insights to inform our on-going collaboration and resource development, and also be of value to other colleagues engaged in similar inter-institutional projects. A secondary aim, therefore, was to develop some guidelines for inter-institutional collaboration for staff development. A key tool was the Wilder Collaboration Factors Inventory (Mattessich, Murray-Close & Monsey, 2001). Readers who are interested in a detailed description of the research and/or the collaboration process can find more about these in Honeyfield and Fraser (2012).

The next phase of our research journey, supported by a second funding round, was a collaborative national evaluation of *Signposts* to determine its usefulness and current applications, and identify strategies for its expansion and improvement. At this still early stage in the life of Ako Aotearoa, few of the new resources available through their website had been subject to any formal evaluation process. Therefore, an added benefit of this project would be to provide a methodology which could be of interest to other teams involved in teaching and learning resource evaluation. Accordingly, an e-evaluation tool was developed and promoted through staff developer networks and communities of practice.

Feedback from staff developers, academic advisors and human resource staff included the following comments:

*It will be excellent for our vocational tutors (boat building) to give them teaching awareness and skills. They will be able to move away from 'transmission-only' teaching styles and have a more engaging and inclusive style. The level is pitched perfectly - it is very clear and accessible, and the Literacy integration page at the back isn't daunting / scary, it has practical suggestions for tutors to use. I think is an excellent resource (sic). Thank you to the designers!*

*It is clear and direct and purposeful and provides a good starting point for practical 'tips'*

*I like the fact that it covers everything in not too much detail at first as there is so much to learn for new staff*

*I deliver new lecturer training and am building this into my 2010 programme as a trial, I think it will be well received*

*It is part of the reading in the first course in our adult education qualification for academic staff. It is also promoted on our website...We believe it will be a very useful part of a planned induction pack for new tutors. We had a local version but this is much more professional and comprehensive.*

As well as such positive responses, a number of suggestions were received for improving accessibility and currency; many of these were incorporated in a second edition.

### **Goalposts**

Some years after the launch of *Signposts* and its proven utilisation, discussions at various regional, national and provider fora had identified a growing body of evidence that student successes were increased when teaching staff had some exposure to, and awareness of, the theoretical principles of Adult Learning (Mane & Snelling, 2011).

Part of being an effective facilitator of learning, say these authors, means understanding students and how they learn best in order to design more meaningful learning experiences for them. Most higher education professionals readily accept that teaching requires deliberate interventions to make sure that students achieve the best possible outcomes, but what exactly should these interventions should look like, and what is the basis for decision-making about this? That's where teaching theories, models and frameworks come in.

*Goalposts* was commissioned by Ako Aotearoa as a companion to *Signposts*, linking theory and practice. Where the earlier resource outlines learning and teaching strategies, *Goalposts* provides an overview of some of the key principles and theories of adult learning. Again, the concept was to provide a resource which is easily accessible through Ako's website, and which is self-explanatory and unthreatening. Distilling the large and ever-increasing literature down to the 10 one-page primers we planned to adopt to keep our presentation consistent was quite a lengthy process. Ideas about learning are continually evolving and changing, and further, many of the commentators in the field have developed their own taxonomies. For example, Knowles, Holton III, & Swanson (2005) listed six principles; Ambrose, Bridges, Lovett, DoPietro and Norman (2010), seven; Calloway (2009), eight; and Cercone (2008), thirteen. Then, as well as principles, there are concepts, models and philosophies related to adult learning. It is a vast field!

Following an extensive literature review, recurring themes and central concepts were identified and organised into the following ten topic groupings:

- Principle #1 Prior knowledge and experience
- Principle #2 Importance of culture and the NZ context
- Principle #3 Respectful partnerships and relationships
- Principle #4 Autonomous and independent
- Principle #5 Goals and motivation
- Principle #6 Relevant and practical
- Principle #7 Learning styles and ways of thinking
- Principle #8 Critical reflection
- Principle #9 Environment for learning
- Principle #10 Change and transformative learning

Our first draft of the 10 one-page primers, along with a Glossary of Terms and an Appendix of examples for practical application, was sent out for consultation within our professional community of staff developers, and we received

very detailed feedback and suggestions from 10 colleagues from a range of institutions, both national and international. This stakeholder group is the body most able to assist and direct new teachers, and therefore are the key conduit for dissemination of the resource. Representative comments were:

*What a great resource this is, especially in the minefield of 'theories' (when a significant number of new teachers here at XXX do not see why they have to even consider understanding this as it relates to and informs their practice!)*

*Cath, this is going to be such a useful book!! I want to make it a set text in XXX here—I'm a very new teacher in it, and it isn't mine, but believe this book will just be exactly what lots of us bursting into education from other disciplines need.*

*I loved the summaries on learning and think they have been superbly done. The inclusion of all the theories was a great strength, well done!!!!*

*GoalPost (sic) is really needed to transform tutors to a more creative, engaging, interactive, innovative and quality teaching in the Polytechnic for student success. This should be for everyone to get on the same page and use it for new staff as they enter ... Carry on this great piece of work so that current and new tutors are on the same page about what the words 'quality learner/student-centered and focused' really means.*

Once a series of revisions to incorporate useful suggestions from this review group was made, the resource was piloted with 10 new tertiary teachers from four different tertiary organisations as representatives of our target readership. Their feedback was consistently positive; representative comments included:

*If I'd had this from Day One, it would have given me a better idea of where to head. Suits me because I'm a self-learner, I like to go over things in my own time*

*Really good for me from the UK trying to understand Maori culture and place in things – it's all new and hard to find a good authoritative summary.*

*Looks good. Like the format, the contents. Glossary very good to have*

*Examples at the end are the most interesting for me and all new teachers probably. As new teachers we all want to make it exciting, but have no idea how.*

The final version of Goalposts was submitted to the Ako Aotearoa review panel, and following sign off, was launched at the ATLAANZ (Associations of Tertiary Learning Advisors of Aotearoa New Zealand) in late 2013.

### **Using the resources – who, when and where**

"Teaching is one of the few professions where beginners are put into the deep end, almost thoughtlessly" says Milburn (2011, p. 2), and most staff developers would recognise this as evident to some degree within their own organisations. Of course there are structured, systematic programmes that ease teachers into the complexity and diversity of their work – when recruitment and class handovers go to plan. But when they don't, we believe that the *Signposts* and *Goalposts* resources can fill the gap, and offer a useful addition to the toolkit available to new teachers, and the staff developers and teaching and learning enhancement centres which support them.

The two resources are designed to raise early career teachers' awareness of first, the day-to-day practice of teaching and classroom management, and second, the theoretical models and different schools of thought about how best to support adult learners – and why. The intention is to help staff build confidence, and to become more reflective practitioners and to build their classroom approaches on evidence from research reported in the literature. Each of the one-page guides is deliberately practical or applied: distilling and summarising important concepts, demystifying the language, and providing meaningful links and context. Yet even here, we know that many who are new to the ideas discussed, particularly teachers in PTEs and vocational training institutes, will still find this quite a lot of text to get through.

For this reason, the *Signposts* resource is accompanied by a *Guide for Staff Developers* which suggests ways that the resource(s) can be used with both new, and current teaching staff, rather than simply providing a link to the website.

Possible uses include:

- As part of an induction package
- As a conversation started with a buddy or mentor
- A set reading for tertiary teaching courses
- A discussion topic for online communities of practice
- Excerpts included as helpful tips in internal newsletters, with a link to the full resource
- Make an “effective teaching practice” book and include *Signposts* and *Goalposts*, adding examples from your organisation.

In addition, the Creative Commons licence means that users “are free to copy, distribute, display and perform the work as well as to remix, tweak, and build upon this work non-commercially, as long as you credit the author/s and license your new creations under the identical terms” (<http://akoaootearoa.ac.nz/download/ng/file/group-1387/signposts---staff-developers-guide.pdf>). We know that colleagues have added pages to cover specific technologies, activities, or techniques, and others have adapted the resource to the ethos of their organisation, for example a Bible College.

## Conclusion

The primary objective of this six year journey has been to develop, disseminate and evaluate a resource for early career teachers in higher education. While the resources were prepared to be relevant across the sector, and we have deliberately included colleagues from universities in this collaboration, it is in the contexts of smaller PTEs and ITPs that we think this resource will have the potential to be most influential on capability and capacity – where there may not be designated professional development pathways, or a staff development specialist. For this reason, we have designed quick reference guides which are brief, easily accessed and written in simple language – and which can be used by teachers directly and do not require a formalised delivery by a teaching and learning expert.

A national evaluation as well as local workshops has already established the usefulness of *Signposts* and *Goalposts* to new teachers, and those who support them. A future interest for the authors is the teaching – learning nexus, and an examination of the ways in which we may be able to track shifts in student engagement, changes in delivery approaches, and differences in classroom dynamics and interactions. The relationship between what teachers do and what students learn is complex. There are many variables that may affect student outcomes, and any intervention, such as the introduction of a new tool, will always be an indirect, two-step relationship. Nonetheless, there is widespread recognition that academic staff development programmes can improve teaching, and good teaching contributes to good student outcomes (Prebble, Hargreaves, Leach, Naidoo, Suddaby, & Zepke, 2005).

Another area which offers scope for future research concerns the benefits of inter-institutional collaboration – beyond the simple accomplishment of the task at hand. Shared resourcing is an easy sell; and few would disagree that input from multiple and diverse people and perspectives offers synergies unavailable to those working in isolation. But there are also longer term benefits to participating organisations, such as opportunities to grow new relationships, and to experience different approaches to the provision of professional development for teaching staff. For individual team members there are personal gains, growing research capability and strengthening a community of practice. Of interest, and deserving of further investigation here would be the sustainability of the immediate benefits, and the impact on the career trajectory of the new teachers and the staff developers who participated.

Philadelphia, PA 19122  
anne.russ@temple.edu

Courses with a clinical component and/or externships allow students to demonstrate the professional knowledge they have developed throughout their programs of study. In this session, we will look at how effective assessments can meet three important goals of these clinical curricula: (a) Content analysis, (b) Application of professional skills, and (c) Professional development.

Other topics such as syllabus organization and assessment techniques will also be discussed. Audience members will be given the opportunity to reflect on assessment tools such as student learning outcomes and accreditation outcomes and consider syllabus creation that links these assessment tools to the learning experiences.

The session time will be divided into five main areas:

- Definition of clinical education.
- Description of the assessment for clinical courses.
- Example of 1 programmatic assessment.
- Distinguish key components of programmatic assessments (e.g., portfolios, field experiences).
- Assistance in creation and editing of assessments.

The first four areas will be presented through PPT presentation and discussion. The fifth area will include an opportunity to create individual assessments and interactively critique other examples.

The outcome goal is to offer educators organizational measures of student learning, to measure current program assessment, and to provide ideas for authentic assessment of professional skills and dispositions.

1. The audience will be able to identify department Student Learning Outcomes (SLOs).
2. The audience will distinguish authentic assessment assignments.
3. The audience will create individualized assessment methods.

The session will begin with a PPT presentation describing the why, what, and how of both didactic and clinical assessment. During the presentation, open discussion will be encouraged. Examples of program assessment plans, as well as individual course assessments will be provided to the audience. Small groups will be formed and asked to create their own assessments based on their needs/interests: programmatic, course, didactic, clinical, hybrid. Once the assessment is created, the groups will trade and critique the assessment.

The presentation's emphasis will be on the interactive portion and creation of assessments and sharing of ideas.

# **Sacred and Secular Leadership Discourses: Interpreting Leadership in an Educational Framework**

Kathryn McIntosh EdD

(Educational Consulting Services)

Institute of Education, University of London

PO Box 506, Bothell, Washington 98041 USA

kaymac66@gmail.com

## **ABSTRACT**

This is a qualitative study from an insider/outsider position of a constructivist/interpretivist approach where semi-structured interviews with 12 evangelical Christian senior school leaders, four in each of three Anglophone countries informed the data. A hybrid method of grounded theory and data analysis was utilized with a number of different data sources. The preliminary literature for this research was based on the readings of various contemporary theories of leadership including transformational/relational/ethical literature. Two descriptors of leadership became the primary framework for the thesis: the “sacred” and the “secular” discourses relating to school leadership. The participants, speaking through the sacred discourse, express an extension to or linkage with the secular literature, revealing much more overlap between the two discourses than was expected. However, the secular literature does not capture the sacred discourse; there is an appurtenance – an add-on – a more spiritual dimension, to consider. The second data framework emerged around attributes of leadership. Standing in the doorway, as it were, the researcher took on a role of interpreting and translating one discourse to the other rather than acting solely as observer and interpreter of the data.

## **Introduction**

This paper explores the research established in the area of school leadership from a sacred and secular scholarly, leadership literature discourse, as well as through the sacred discourse of evangelical Christian school leaders. It is my thesis that both discourses (sacred and secular) overlap, inviting all school leaders to participate in what leadership in education espouses today concerning three attributes of leadership: “calling,” “stewardship,” and “serving”; toward the “building of community” in schools.

Three main findings emerged from this research and answered the following research question:

*How is the sacred discourse of the participants in the 12 evangelical Christian schools in three countries (Canada, the United Kingdom and the United States) expressed in terms of their leadership enactment, and is there an overlap or linkage with the relevant secular literature regarding attributes of leadership and community building?*

## **The Central Argument**

The central argument proposes that there is a discourse around evangelical Christian school leadership that is not unlike the discourse of their secular counterparts. The sacred and secular

discourses emerged as the primary framework, and were encapsulated within the “attributes of leadership” themes (the second key framework), indicating there to be little difference between the conversations around school leadership, instead revealing an overlap of the two discourses. The third framework; the transformational/relational/ethical and conventional, secular and sacred scholarly leadership literature corroborated the participant data. My voice as researcher emerged as interpreter and translator between the two discourses. For the purpose of this paper, and the time constraints involved, only the “attributes of leadership” will be discussed; leaving community building through leadership for another discussion.

## Methodology

Methodologically, data organization, collection, analysis and evaluation, and the presentation of ethical dilemmas, particularly in the area of insider/outsider and the two different perspectives (Olson, 1977) they represent is critical. I have been involved in evangelical Christian education for many years, which established me as an insider. However, I was not acquainted with any of the school leaders participating in the research, nor was I familiar with the school cultures of the participants (see Table 1, page 2), which protected me from the worst of researcher bias (Gallais, 2003) as an outsider.

Table 1: Participants’ Schools’ Cultures

Operationalizing a constructivist framework involved a qualitative methodology during each phase of the research. Collection of data from participating schools’ web documents, using a

purposive and convenient sampling of participants from which semi-structured interviews were drawn, the use of an observational journal and shadowing of the participants led to the coding and subsequent data analysis. I interviewed 12 evangelical Christian school leaders from three Anglophone countries: Canada, the United Kingdom and the United States (see Table 2, page 3). Utilizing a hybrid form of grounded theory (Rubin and Rubin, 2005) assisted me in identifying themes to emerge from the data.

Table 2: Participant Data

Country and Leader	Gender and Position	Ethnicity	Age Range	Years in Leadership Position	Education and Course Work	Professional Leadership Training	Teaching Experience and Subjects	Currently Teaching

## Review of the Literature

Exploring the discourses regarding school leadership entailed looking at the scholarly, conventional and transformational leadership literature from both the secular and the sacred discourses. The leadership literature from both discourses supported the data regarding leadership behaviours and attributes of evangelical Christian school leaders.

In this twenty-first century, a school leader's relationship to stakeholders and the institution, and their response to diverse contexts, is observed in models of leadership that are more people-centric (Kars, 2006), offering a distinction between the process of leadership and the socially-constructed role of leader brought forth in the research. Wofford (1999), with a view toward transformational leadership, affirms the sacred/secular distinction and overlap:

Christian leaders have a spiritual dimension that is unlike that of their secular counterparts. They do have in common with secular charismatic

leaders a strong commitment to their vision, a need to influence others in pursuit of the vision, a high sense of confidence, and optimism about future results.

(Wofford, 1999: 102)

Schools have increasingly focused their attention on transformational or “facilitative” leadership which relies on trust, letting go of control and allowing others to function independently, interdependently and successfully within a common framework of expectations and accountability (Conley and Goldman, 1994). Current transformational/relational/ethical theories of leadership tend to focus on values, empowerment and leadership that is more collegial and distributive; whereas prior to the twenty-first century, the management literature that was then very influential would have contrasted much more strongly with the data that I collected from the participant interviews.

### **The Sacred/Secular Discussion**

An introduction to the language of discourse explains the sacred/secular discussion in this research where reference is given to the participants’ voices and to the sacred and secular literature. Hyatt (2004) proposed a definition of “the specific language of a particular discourse community” meaning:

a group of people who share a similar and specific way of talking related to their professional interests or their social philosophy.

(Hyatt, 2004: 44)

Jensen (1995: 31) considers the “sacred” and the “secular” as “two autonomous but interdependent discourses within a multiplicity of categories of meaning that interpret different modes of existence” which, ultimately, may well be an accurate description of the two discourses in this research as they were revealed through the data analysis to overlap, corroborate and relate to one another.

### **Data Themes and Findings**

#### ***The Sacred and Secular Discourse and Appurtenance***

The sacred and secular discourse and appurtenance became the first key finding in this research. Fairclough (2003: 130–131) suggests that “different discourses may use the same words, but they may use them differently, and it is only through focusing upon semantic relations that one can identify these differences” while recognizing and appreciating their similarities. While the participants’ sacred discourse and that of the secular scholarly literature revealed an overlap, offering corroborated results from the constructs of the second framework, i.e. “attributes of leadership” some distinctions arose that presented an appurtenance to the discourse of the evangelical Christian school leader participants, adding a rich dimension to their expressions of leadership.

A key finding from CA1 and CA4, for example, offered a comprehensive description of evangelical Christian school leadership with a spiritual and practical dichotomy, illustrating the

sacred discourse, yet at the same time revealing an overlap with the practical and secular discourse in terms of leadership attributes:

Stepping out of the way, but then taking the talent and the skill-set that we have... walking humbly within it with the power of God's spirit. That is in a spiritual sense. In a practical sense, leading is modelling; laying out the critical thread with the leadership team, but allowing the team to build the structure and the skeleton with you rather than a single man's or woman's vision, and then holding them accountable; and for them to do the same with the people that they lead.

(CA1)

The appurtenance here establishes that both participants deemed God to be the source of their leadership in both a practical and spiritual sense when considering attributes of leadership that are more distributive, collegial and empowering. CA4 spoke of his frustration regarding the Christian distinctiveness and spiritual formation within his school, yet was insistent that spiritual formation be a core value:

Even though we say that our distinctiveness is Christ-likeness... we have all the trappings of Christianity: chapel, Bible courses... but is the rubber really meeting the road in the lives of our students? What would it look like if we have spiritual formation as our core value and build the school around that, rather than have the Bible as an appendage around the school?... This became my on-going vision... to build into the elements of the culture of the school... the heart of connecting to the Father [God].

(CA4)

There is a strong emphasis on core values, accentuating the sacred distinction to the discourse of CA1 and CA4, reflecting the views of 100 per cent of the participants, and intimating that it is critical to align core values to a school's spiritual and practical philosophy. While there may be a tendency in school leadership to lose sight of core values and beliefs (Creighton, 1999), the secular discourse and the sacred discourse of the participants confirmed that core values must underpin leadership attributes and subsequent leadership enactment toward the building of a spiritual and relational school community.

The findings indicated clear connections between the school leaders' espoused values and their leadership attributes. Contrary to the biblical worldview of the participants regarding the emanation of leadership attributes and values as coming from God, Gold, Evans, Earley, Halpin and Collarbone (2003: 61) and Earley and Weindling (2004: 136) suggest that the "origin of values is not always clear," but contend that values may be broadly defined as "social democratic or liberal humanist in nature." Grace (2000: 241) maintains, from a sacred discourse, that "modern professionalism may itself be understood as a secular and mediated form of an earlier sacred conception of the responsibilities of educational leadership." This conception strongly suggests that secular values have emanated from sacred values, underscoring the distinction and/or overlap between the sacred and the secular discourse.

Although the leadership values and attributes expressed through the sacred and secular discourses are analogous, with no perceived distinctions, the values and attributes may differ in expression and meaning for the participants, periodically revealing the distinctiveness of the evangelical Christian school leaders' discourse; thus, communicating the origin of their values and their leadership attributes.

***Attributes of Leadership***

The second general finding revealed that three inextricable key attributes of leadership were most often perceived to direct the leadership of the evangelical Christian school participants. With the participants making 145 direct references to leadership as opposed to 14 direct references to management (see Table 3, page 6), both discourses expressed an intentional move from “management” to “leadership” as a changing discourse, a paradigm shift regarding educational leadership, in which leadership is replacing the term management (Worrell and Appleby, 2000).

Table 3: Leadership versus Management Data

	UK1	UK2	UK3	UK4	CA1	CA2	CA3	CA4	US1	US2	US3	US4
<b>Leadership</b>	22	5	8	6	9	5	15	18	11	7	7	4
<b>Management</b>	1	0	7	1	0	0	3	0	1	1	0	0

From a secular discourse, Earley and Weindling (2004: 13), for example, contend that “leadership as a concept is in the ascendancy”:

School leaders are returning from the managerial role of the 1980’s to the twenty-first century role of lead professional – leading the learning, sharing the vision and empowering school stakeholders to shape and change, when necessary, the overall culture or sub-cultures of their particular schools.

(Earley and Weindling, 2004: 45/20)

The data showed that school leaders are the key constituents when leading and affecting their schools’ communities; that specific leadership attributes have to be enacted, but who enacts them is not so critical (Heller and Firestone, 1995). The majority of the participants expressed commitment to developing collective leadership and a sense of community in their schools, where leadership is distributed to other stakeholders (Lewis and Murphy, 2008). The three key attributes of leadership to emerge from the research data were: “calling,” “stewardship,” and “serving” (see Table 4, page 7).

Table 4: Attributes of Leadership

**The “calling” attribute of leadership** – the initial and frequent spiritual response to leadership, to ministry and to vocation – revealed itself as motivation to task enactment, having both a practical and spiritual influence in the leadership and personal lives of the participants. The first attribute, “calling,” was cited by 10 of the 12 participants who also linked this leadership attribute in some way to the other attributes of “stewardship” and “serving”.

The vision that the participants have for their schools, as well as how they lead in their “calling and vocation” (Buechner, 1973: 95) was shown to be significantly influenced by their commitment to school leadership as a calling (Jelfs, 2010) to the local and global communities. CA3 illustrates the “calling” directive to affect the world.

You are *called out* (emphasis CA3) from the world unto something... to use those gifts. It’s a vocation; a calling from God that will affect the world, change the world, love the world, win the world... to serve my community... to empower and equip... is to lead my community.

(CA3)

Sixty-seven percent of the participants asserted that they recognize divine intervention in their lives, but used terms such as “God’s hand” and “God preparing me”. UK1 expressed what she considered the direct influence of God’s intervention in this way:

It seemed a bit strange initially, God’s hand in bringing me here; but I have seen God’s hand in everything... with my knowledge and familiarity with early years education... with the situation that the school went through... God was preparing me.

(UK1)

CA3 and UK1 conveyed a sense of calling with a definitive purpose. Likewise the secular discourse referred to work as a “calling”, suggesting that it may have an impact on society in some way (Bellah, Sullivan, Tipton, Madsen and Swindler, 1996). Braskamp (2008), who writes from a sacred discourse, suggests:

Leading is *holistic* (all italics Braskamp) in nature and purpose. The core theme of the conception of leadership is this: *leading is inner-based and outer-focused*... is anchored by *vocation*, a sense of calling to a higher purpose... reflecting on one’s gifts, strengths, and opportunities... a discovery of one’s life purpose by living with vocation, leading with vocation, and developing community with vocation.

(Braskamp, 2008: 1–2)

Secularized notions of calling were shown to overlap with the sacred discourse of the participants, indicating that calling is more expansive, whereby one finds personal fulfillment in one’s work and perceives work as meaningful and purposeful when following or pursuing "one’s path with a heart" with the “intensity of a *calling*”; a work that culminates in service to a community (Hall, 2004: 9/11). Consequently, “as a subjective construct,” calling was found to be “consistent with psychological success and actually precedes objective outcomes” (Hall and Chandler, 2005: 162). As an “existential experience of work,” Steger, Pickering, Shin and Dik (2009: 10-11) suggest that “people who approach their work as a calling” have a highly valued sense of contribution and worth in their work lives,” resulting from a divine inspiration to do morally responsible work (Weber, 1963).

**The “stewardship” attribute of leadership** – the commitment to caring for and tending to all aspects of leadership – manifested itself in the safeguarding, protecting and overseeing of the various aspects of the participants’ schools’ cultures. In contrast to the “me and mine” perspective of ownership, stewardship implied an expression of interdependence and service, where the participants were guided by a shared or common vision, mission and value system (Covey, 1998). From the perspective of the participants and from the secular literature, leadership as stewardship placed the participants “in service to ideas and ideals and to those who are committed to their fulfillment” (Sergiovanni, 2007: 59).

The notion of stewardship suggests that there is a broader definition to stewardship than simply the stewardship of resources, one that encompasses a stewardship of ethics and moral leadership (Caldwell and Boyle, 2007). Stewardship is, at its foundation, a commitment to serve and lead in partnership rather than patriarchy, and empowerment instead of dependency (Keith, 2008).

As a promising leadership alternative, Reinke (2004:46) proposes that stewardship has a three-fold purpose: to put the needs of others before their own; to practice a participatory leadership style; and to demonstrate commitment to growth of stakeholders. The three most significant dimensions of stewardship to emerge from the data analysis were stewardship of the Christian heritage and ethos, stewardship of the commitment to serve stakeholder needs, and stewardship of the vision.

#### *Stewardship of the Christian Heritage and Ethos*

One hundred per cent of the participants carefully guarded their schools’ evangelical Christian heritage and ethos so that it would be maintained for future generations. Each of the schools in the UK had a strong commitment to evangelism and the preservation of the Christian heritage and the schools’ “spiritual capital” (Caldwell, 2008) as expressed by UK4:

My assuming the leadership... was a huge commitment... a deepening experience... keeping it up for the next generations... myself as a link in the chain that protects what we’ve got – the Christian ethos, because it’s so important and it’s becoming so rare. I suppose I’m seen as that of protector.

(UK4)

The participants put “sustainability at the heart of their schools’ ethos” (Fullan, 2005), engaging school stakeholders in that effort (Porritt, Hopkins, Birney and Reed, 2009). “Sustainable schools have a caring ethos – caring for oneself, for each other, in terms of the current culture, and for future generations” (Porritt *et al.*, 2009: 6). The secular discourse corroborates the sacred discourse whereby stewardship of an ethos means that leaders as stewards foster the preservation, teaching and protection of the ethos that has been given, and must be faithful to the trust that is ineradicable in relationships (Pellegrino, 2012: 228).

### Stewardship Commitment to Serving Stakeholder Needs

Stewarding the needs of the individual through a calling and serving model of leadership (Liden, Wayne, Zhao and Henderson, 2008) exhibits selfless acts of love, care and the creation of deep relationships (Scarborough, 2009), and was found to strengthen the pastoral care offered to stakeholders within a school community (Brown, Busfield, O'Shea and Sibthorpe, 2011). US2 spoke succinctly for the participants regarding his commitment as to who is to be served, emphasizing the “calling” aspect of serving the needs of others:

It's all of the family that we're *called* (emphasis US2) to serve. The person who needs your help is the person that you need to serve... on a spontaneous basis, when their need is greater than my time. That person in front of you is the most important appointment... Jesus modeled that.  
(US2)

US2 suggests that meeting the needs of others by serving is “altruistic in nature” (Whittington, 2004: 163) where commitment to the stewardship of stakeholder needs leads to a form of caring that is ethical and can contribute to “social capital,” because the emphasis is not only on the person in need of care, but subsequently impacts the entire school family toward a “give and receive” relationship (Johansson, Leonard and Noonan, 2012: 45).

### Stewardship of the Vision

With collaborative stewarding of the vision of the school, the future doesn't just belong to the senior leader (Jelfs, 2010); instead, leadership is about enacting and articulating others' “visions” (Kouzes and Posner, 2006), “ideas,” “insights,” “directions” and “perspectives,” concerning the direction that a school should take.

The main thrust of vision from the view of the participants was that it should be a collaborative process in which leaders envision stakeholders as empowered to contribute to the community-building endeavors within their schools. CA3 expressed the view of 75 per cent of the participants, declaring that stewardship of a vision must be evangelistic in purpose, but it occurs by building alignment and commitment to the vision through inspiring and equipping stakeholders toward the building of community:

Building our team... working with others, partnering, taking our expertise, helping people around the world... In the priority of our leadership, building up new vision so our latest endeavour is both growing and maintaining our kids... then reaching out. ... My biggest role is to constantly hold the direction and vision of the school... I have delegated as much management away from me as I can, so I can concentrate on managing the vision... I am continually taking the temperature of the school... constantly speaking into the vision... to move the community...to where we ought to go... Then, to inspire and gather people to go there with you... You just can't do it on your own.  
(CA3)

CA3 suggested that stewardship is more than maintenance. It is about visionary management and assessment; keeping it, and managing it for the purpose of reaching the goals of the school (Payton and Moody, 2010). CA4 explained the full implication of vision as a collaborative process:

Once the vision is cast... defined... communicated... talked about... shared, allowing the team to build the structure and skeleton along with leadership... Leading is being able to cast a vision, but then... to link arms... to work with the troops to get there.

(CA4)

CA3 and CA4 communicated a brief overview of the visionary process and what they believed to be vital in terms of visionary leadership: collaboration. Similarly, the secular literature corroborates this view. Smith (2001), from his comments regarding the learning organization proposed by Senge insists:

Stewardship involves a commitment to and responsibility for the vision, but it does not mean that the leader owns it; the leader's task is to manage it for the benefit of others.

(Smith, 2001: 9)

Consequently, as stewards of the vision, the evangelical Christian school leaders invited participation and articulated a shared vision back to their schools' communities (Digiorgio, 2008) and beyond. The secular discourse suggested that a good steward is "master in keeping vision, mission and goals at the forefront of everyone's attention" (Murphy, Elliott, Goldring and Porter, 2007: 183). "Shepherding occurs when leaders act as stewards, keepers and promoters of the vision, inspiring others to align their vision with the school" (Murphy *et al.*, 2007: 185).

Just as the mainstream secular literature regarding school leadership declares that a shared vision is not driven from the top of the hierarchy, but is derived from a collaborative process where all of the stakeholders determine the goals and vision of the school community (Fullan and Hargreaves, 1996), the participant leaders also articulated this view of visionary leadership. The participants became stewards of their institutions committed to a "clear and compelling vision that produced a sense of calling" (Fry and Matherly, 2006: 5), affirming that leaders with foresight can be trusted to be stewards, to make sound decisions, and put what is best for their followers ahead of their individual agendas (Sergiovanni, 2000).

**The "serving" attribute of leadership** – which facilitates transformational and servant-leadership – is defined as service, which is realized by giving and serving, and may apply to all leaders (Phillipy, 2010). Four participants made a direct reference to servant-leadership. UK2, while remaining sceptical about the labelling of such terms as servant-leadership, saw himself as committed to serving and leading his school.

I am a little bit wary of the term [servant-leadership]... because there is sometimes the view that it is absolute truth, or someone found a shaft of

wisdom which has made everything clear; and it's never the case... The concept is a very powerful biblical one. I don't go to the extent of... washing the feet of my senior team, but part of my role is to help them (the team members) do their jobs... We're all in this to serve others... We will not run a Christian community unless we are focused on serving others. We are not in it for ourselves.

(UK2)

UK2 intimated that servant-leadership is more complicated than one might expect, but that serving, nevertheless, is selfless in leading an evangelical Christian school community. From a secular discourse, Bass (2000: 33) notes that “servant-leaders select the needs of others as their highest priority”, revealing an attitude toward stewardship, service and an ethical dimension to leadership. The participants expressed the attribute of serving in four fundamental areas: serving is leading; serving begins with an attitude; serving is modeling appropriate leadership behaviors; and serving is empowering.

### *Serving is Leading*

First, serving surfaced not only as a distinct attribute of leadership, but half of the participants perceived that there was no distinction between the constructs of leading and serving. UK3 explained the construct of service and leadership:

Let's hope our students say that we set them up for a... Christian life of service or leadership... The two might be interchangeable.

(UK3)

CA3 confirmed a relationship between “calling” and “serving”:

Leadership is serving... the whole paradigm of being a leader is to serve people. I serve by leading... my gift, my role. If I'm using my gifts to serve my role... and my full attention in the school is how I lead the school, then that is my servant-hood to the school... If I don't lead the organisation into the callings and directions... that God has given us, then no one else is going to do that.

(CA3)

UK3 and CA3 equated serving with leading, where “servant-leadership is more easily provided if the leader understands that serving others is important” (Sergiovanni, 1992: 125). Within the secular discourse, Van Dierendonck (2010: 1231) posits that “serving and leading become almost interchangeable, where being a servant allows a person to lead; being a leader implies a person serves.”

### *Serving Begins with an Attitude*

Second, the data revealed that serving begins with an attitude toward service; that one's “attitudinal mind-set provides the basis for servant-leadership behaviors” (Matteson and Irving,

2006: 39). Ten of the 12 participants perceived that they led their schools with an attitude of service and humility, centering the serving aspect of leadership on attitudes (Greenleaf. 2002). US2 best explained an attitude of serving:

Servant-leadership starts with an attitude... I'm a firm believer in serving the person that's in front of you... I speak that to our people... Serving needs to be viewed as an honorable thing. Sometimes there is that perception that leaders lead and everybody serves them.

(US2)

Likewise from the secular discourse, Pollard (1997) posits what a true leader is, yet he suggests that a true leader is *not*:

the person with the most distinguished title, the highest pay, or the longest tenure... but the role model, the risk taker, the servant; not the person who promotes him/herself, but the promoter of others.

(Pollard, 1997: 49–50)

### *Serving is Modeling Appropriate Leadership Behaviors*

The third aspect to emerge within the serving attribute of leadership was modeling appropriate leadership behaviors. Eleven of the 12 participants perceived that they led their schools by setting a personal example (Riechmann, 1992), particularly in the outworking of their Christian faith toward the service of others. US2 expatiated 30 times the serving aspect of his school's mission and the importance of leadership that models the serving aspect of leadership:

Part of the balance in an evangelical Christian school... part of that holistic approach to education... is the element of students serving, and then our passion and our persuasion to educate them... to model and teach that spiritual aspect – learning to serve like Jesus.

(US2)

US1 commented:

It's that modeling... as Christ-centered servant-leaders... That is what leadership is about... Christ-filled, servant-leadership!

(US1)

The above responses of US2 and US1 indicated that if one desires to impart the serving attribute of leadership into the school's stakeholders as an educational imperative, one must first trust, then lead people by example, modeling servant-leadership behaviors. Covey (1998) argues:

You've got to... foster trust through individual character and competence at the personal level. Once you have the trust, then you lead people by... example and modeling. That is servant-leadership.

(Covey, 1998: xvii)

Likewise the mainstream secular literature suggests that the principal need no longer be the “headmaster or instructional leader” but may, instead, act as “head learner... modeling and celebrating what is hoped and expected that teachers and pupils will do” (Barth, 1990: 45–46). Participant school leaders must model “desired leadership dispositions and actions,” enhancing stakeholders’ beliefs about their own capabilities and passion for change (Leithwood and Riehl, 2003: 4).

### *Serving is Empowering*

Fourth, the belief that serving is empowering was asserted by 10 of the 12 participants, suggesting that leaders must trust stakeholders with a certain amount of autonomy in carrying out their specific tasks. The participant school leaders with a strong “serving” attribute had spiritual climates that were dependent on the creation of cultures of empowerment and distributive leadership (Hargreaves and Fink, 2003). The participants placed a strong emphasis on empowering stakeholders and distributing leadership as far down the stakeholder chain as possible. US4 affirmed that he sees empowerment through serving as permeating the whole school:

My success as a leader comes only when I empower others... to serve these ladies out here so that they can serve those who are utilizing the services of the school.

(US4)

UK1 aspired to serve by inspiring and empowering others to assume leadership in one’s own sphere of the school:

There’s much more to leadership; the people skills – trying to inspire other people... giving them empowerment to go ahead with things. I would devolve leadership probably! Distributive leadership would be the kind of clichéd phrase... where every decision made in the school doesn’t need to come through me – the pupils, the parents, and other staff can take responsibility... I’ve distributed that autonomy... The facilities manager taking responsibility... is showing leadership... valuing the contribution that he makes; that is distributed.

(UK1)

The findings revealed that senior leaders typically relinquished their decision-making to other team members, empowering them; leading from the bottom, non-hierarchically, valuing a collaborative/team approach to leadership, attempting to evoke “maximum involvement and participation of every member... to spread responsibility rather than to concentrate it” (Krech, Crutchfield and Ballachey, 1962: 435). The secular discourse corroborates the participant data given that collaborative and non-hierarchical leadership implies “collegiality, acceptance, co-operation, teamwork, the sharing of ideas and mentoring,” all significantly contributing to individual and organizational development and the building of community in a school (Earley and Weindling, 2004: 180–81).

A strong message from the secular scholarly literature on leadership commences with Jones (2009: 153) who, while examining collaborative leadership in schools in England, found the PricewaterhouseCooper's 2007 national study to conclude that "the role of school leaders has become more challenging in recent years, and the number and complexity of the tasks they are required to undertake has increased significantly"; therefore, "school leadership has a greater influence on schools and students when it is widely distributed." Often, the participants' "leadership tasks were not undertaken by themselves alone," but by many of their schools' stakeholders working together to produce better outcomes (Kruse and Louis, 2009: 11). Where leadership invites the participation of others, leadership is distributed, leading to "real empowerment in terms of true delegation of leadership power" (Huber, 2004: 670).

Workplace empowerment proposes that "everyone is free to do what makes sense as long as stakeholders' decisions embody the values shared by the school community" (Sergiovanni, 2007: 83). Thomas and Velthouse (1990: 666) argue that empowerment is "increased intrinsic task motivation, which reflects on one's orientation to fulfill a work role." In their efforts to reconceptualize leadership for change, the participants expressed a determination that successful change resulted not just from the work of one key leader, but from the effective utilization of the three leadership attributes by a variety of empowered school stakeholders (Heller and Firestone, 1995).

## **Conclusion**

This discussion of the research provided a summary of the findings from two discourses: the "sacred" and the "secular". The participating evangelical Christian schools' web documents, semi-structured participant interviews and a field journal containing observations during the school site visits provided the sacred discourse alongside the sacred scholarly literature. The secular discourse emanated from the secular scholarly literature. Methodologically, I determined that I could place myself in a unique position as insider/outsider researcher, interpreting, constructing, illuminating and translating one discourse to another.

A key finding from the analyzed data was that the "calling", "stewardship" and "serving" attributes of leadership served as catalysts to the spiritual, relational, experiential, organizational and instructional dynamics of the participants' schools. The initial "call" to leadership included the "calling" attribute of leadership as motivation to task enactment where school leaders act as "strategic stewards" (Mosbacher, 2007: 192) in an attempt to align their schools for service through a commitment to serving. The sacred discourse was described as a "calling" concerning the "serving," "shepherding and stewarding of God's people" (Stott, 2002: 37). The findings suggested that the call to leadership precludes all other attributes of leadership.

It was determined that no one particular leadership attribute can be linked to organizational performance; therefore, it may also be construed that no one leadership attribute on its own would yield organizational success (Currie, Lockett and Suhomlinova, 2009); that success is a compilation and integration of multiple attributes of leadership. There is a consensus from both discourses that one's core values and the three attributes of leadership are critical to the building of community in schools.

Although organizational structures, models and theories of leadership are significant, they do not matter as much as the attributes and “behaviours exhibited by the leaders of the organization” (Feiner, 2003). The overall research findings indicate that the leadership attributes of evangelical Christian school leaders are not so different from country to country, and do not differ so much from those of their secular colleagues, yet there is an appurtenance, a distinctive element to evangelical Christian school leadership that indicates a philological element to their discourse, revealing the Christian values inherent in their educational imperative.

# **Minding the Gap between High-school and Admission Level: A Competency-based Approach at Salman Bin Abdulaziz University**

Yasine A. Qandile, Salman Bin Abdulaziz University  
Saleh A. Alkahtani, Salman Bin Abdulaziz University  
Natalia Oganesyants, Al-Yamamah University

## **ABSTRACT**

*With the first decade of the 21st century, it was clear that universities began to grapple with the challenges of globalization and implications of the digital era. This study is part of a University remedial strategic project to bridge the gap between high school graduates' competencies and admission level competencies at Salman Bin Abdulaziz University (SAU). The research constitutes the first phase of the project that aims to identify the key success competencies for admission level and developing a comprehensive list of learning outcomes underlying each key competency. After reviewing the relevant literature and the work of distinguished experts, the authors reached this convincing/well-founded competency inventory for admission level at SAU. The inventory includes seven main components: language of instruction, IT communication skills, basic Statistics and numerical skills, Mathematics, Biology and Physics. This competency inventory will be the cornerstone to develop competency-based curriculum for the Orientation Program. The university strategic plan has been prioritized this program development as a strategic objective to facilitate the educational development of the university.*

**KEYWORDS:** Higher Education, Preparatory Year Program, Competency-based Approach

## **INTRODUCTION**

Studies show that too many students are leaving college without the skills needed to be successful in the workforce (Burke & Butler, 2012). Universities all over the world also confront the problem of students' retention and attrition. One major university concern is the capacity of high-school graduates to pursue their academic study adequately with high a GPA. Such academic accomplishment is important for higher education institutions to attest to the validity of the educational process and attain the progression ratio of accreditation standards.

Nevertheless, the gap between high school graduates' competencies and admission level competencies at universities is an appalling phenomenon that hinders academic progress. Therefore, quite a few institutions offer limited supportive programs or preparatory year programs to facilitate the process of students' transition from high school to university. These programs aim to help student to master the core competencies needed for success in their higher education as well as helping them as life-long learners and future employees who can communicate effectively, think creatively, solve problems, make decisions, and interact professionally with the technologies in the workplace. These competencies are essential to provide the admitted graduates to thrive in the changing work world.

## **BACKGROUND AND PROBLEM**

The Higher education sector in the Kingdom of Saudi Arabia has grown substantially since the late 1990s in response to the demand for higher education and national development plans. The number of public universities increased from eight universities in 2000 to 25 in 2012. One of the crucial developments for higher education was establishment of National Commission for Academic Accreditation and Assessment (NCAAA) in 2003.

The NCAAA issued the National Qualifications Framework for Higher Education in Saudi Arabia (NQF). This document identified the characteristics of programs and expected learning outcomes at different levels. The NQF levels start with what it calls an “Entry Level” which indicates a student’s qualifications upon completing secondary education.

The NQF assumed that the enrolled students have completed secondary education and have acquired the knowledge and skill needed to participate effectively in their chosen of study in higher education. This background includes certain linguistic competence in the language of instruction, the ability to think creatively, apply knowledge and cognitive skills gained to relevant disciplines, and the ability to work independently and take responsibility for their own learning. It further includes particular prerequisites for studying in different specialization fields. These eligible students may proceed directly to the higher education programs described in the Framework, while ineligible ones need to complete preparatory or foundation studies to acquire the necessary language, study, and academic skills needed to succeed in post-secondary programs (National Commission for Academic Accreditation and Assessment, 2009).

The NQF additionally stipulates that the foundation studies ensuing the post-secondary program are not part of the regular higher education. Thus, any credit hours allocated for this preparatory phase do not count towards a post-secondary education award (National Commission for Academic Accreditation and Assessment, 2009, P.7).

### ***Need for the Study***

During the past few decades, the Saudi government has been investing huge budgets in developing both higher education as well as public education. However, the Saudi academic community has raised concerns that the mainstream secondary education is inadequate and thus a transitional phase is required to smooth progressing into higher education. Thus, Preparatory Year became a compulsory component by the Ministry of Higher Education in help students meet the competency and performance expectations for university admission in line with many documented reasons for more effective endeavors to raise these competencies in different universities around the world. Exploring how undergraduate learning of generic, subject-related and meta-cognitive skills is therefore important to integrate skills and create supportive learning environments in higher education.

This inadequacy has been linked to various other physical and psychological skill deficiencies. Developing the level of mathematical skills, technological skills and study skills is essential for the new students in order to achieve remarkable success in higher education (Gavalcova, 2008 & Appleton, 2005). Dyslexia is another major deficiency that affects the efficiency of higher education programs. Dyslexic students face difficulties during their university study with a wide range of skills and academic tasks, such as, note-taking, essay structure and written expression (Mortimore & Crozier, 2006).

In addition, high-risk students with low high-school grades, poor study skills, low aptitude scores and modest ambition, can improve upon their predicted grade point average when a study skills remedial treatment is employed within the pre-college program (Thompson, 1977). One more vital need stems from the demands of the labor market for skilled workforce in fields of Science, Engineering and Technology (SET), while the majority of the learner preferences are predominantly in the field of Humanities, thereby creating a mismatch between graduate preferences and the needs of economic development of the country (Cosser, 2010).

### ***Objectives and Problem Statement***

One high-priority and key success objective at Salman Bin Abdulaziz University (SAU) strategic plan is to develop and implement an efficient Preparatory Year program (Salman Bin Abdulaziz University, 2012). According to the competency-based approach, the development of such a program needs to recognize the required core competences, and identify their related learning outcomes. This research is part of university endeavors to develop an efficient preparatory program that assists students to master these higher-education competencies and meet the national admission level standards.

This study, hence, aims to achieve two main objectives: first, identify the key success competencies for admission at SAU, and, second, to develop a list of comprehensive outcomes for each key competency.

Achieving these two objectives is crucial to design the assessment criteria to diagnose students' deficiencies and thus create the curriculum that will facilitate admission, and subsequently, academic performance at the University. The authors stated the problem of this research in the following questions:

1. What are the University admission-level core competences for the Bachelor programs?
2. What are the learning outcomes students should achieve in each core competency to meet the admission performance standards?

## **LITERATURE REVIEW**

The authors consider it imperative to highlight two focal topics: The Gap between Secondary and Post-Secondary Education on the one hand, and Goals Oriented Education and Competency-Based Program on the other as in the overview of the related literature.

### ***The Gap between Secondary and Post-Secondary Education***

The widening of participation in higher education and the international emphasis on promoting successful progression and high retention have always been the guiding factors for creating the best learning conducive environments. Promoting such successful progression cannot be achieved unless the higher education system designs a mechanism to ensure the adaptability of system inputs to the system processes and outcomes. Orientation programs, supplementary courses and preparatory year are examples of the different options that universities follow to bridge the gap between secondary-school capabilities and higher-education success requirements.

The findings of higher-education studies have implications that reflect the importance of generic or soft skills for business success and workforce. However, many higher education institutions maintain a stronger emphasis on subject-specific knowledge and skills when compared to soft skills and higher cognitive skills (Osman et al., 2012; Marginson & O'Hanlon, 1994). Research findings also conclude that higher education initiatives still require some radical rethinking if transferable skills are to be addressed seriously to help such students to make their learning outcomes match the real working market (Kemp &

Seagraves, 1995). Thus, universities attempting to offer such programs should heed the foregoing to bridge the gap between secondary school outcomes and college requirements.

First Year Experience program is one proposed option to address the needs of matriculating students. It was designed to supplement the necessary academic and life skills for new students at university. The design of the program is customized for each corresponding university according to the students' needs. This made the program pragmatic and efficient; not only for knowledge increasing, but also for students' life skills and attitudes towards university life and higher education in general (Schrader & Brown, 2008).

As the universities across the United States are struggling with student retention and attrition, interventions have been designed to encourage retention. Wolfe and Kay (2011) created an outdoor orientation program and explored participant perceptions. The six days' program included: challenge course, canoeing, camping, and a four-mile concluding run. Results of program completion indicated that the participants developed higher commitment to the university, transition to university life, and emotional, social, personal growth as well as the positive relationships with their colleagues.

In Japan, identity development in the learning sphere is critical for adolescents' transition from high school to university. Sugimura and Shimizu (2011) designed an intervention program to facilitate identity formation and empirical evidence showed that this program helped university freshmen to develop their own ideas and styles about learning, and enabled them to help each other to develop their identity. The University of Toronto created a one year transitional program to help aboriginal Canadian students to prepare for admission. A study of 22 program completers showed that the program helped students to address some educational barriers and increased students' self-confidence (Antone, 2011).

"Passport to Flexible Learning" was created by Central Queensland University in Australia to introduce first-year university students to interactive teaching technologies. The University introduces the program as a five days' workshop during the university's orientation week (Thompson, 2001). Moorhead State University (Minnesota) designed "The New Center for Multidisciplinary Studies" to help attracting and retaining nontraditional high-risk students. Such a program is an example of real professional work that meets high educational mission standards (Bolton, 1993).

In general, a Gap Year or a Year Out treatment is a break in students' educational continuum usually taken between leaving school and starting university (Jones 2004). This treatment may last a year, just a week, or probably even a few days. From the perspective of the youth sociological studies, it is an important transition for some young people to move from adolescence to adulthood (King, 2010).

### ***Goals Oriented Education and Competency-Based Programs***

Competency-Based Education (CBE), Role-Based Education (RBE), Performance-Based Education (PBE), and Outcomes-Based Education (OBE) are titles of movements that were launched during the sixties and seventies of 20<sup>th</sup> century. In despite of some slight differences between these movements, all of them were a response to the USA demand to repair educational system to focus on real tangible and measureable outcomes as well as moving from Subject-oriented to Goals-oriented Education (Qandile, 2010). These movements embedded under what we can call the philosophy of performance which still shining and consistent with contemporary higher education orientations.

The momentum recovery of competency-based education nowadays is a type of reflection to the significant restructuring of work in knowledge and industrialized economies. According to this contemporary role of higher education, the competency movement is about creating a more productive labor force and it does so by redefining work as a set of transferable or 'soft' generic skills that is possession of the individual (Windsor et al., 2012). Reviewing competencies approach literature give

enough evidence that this approach has a key role in the process of creating significant transformation that lead towards a new teaching and learning paradigm in higher education (Lozano et al., 2012).

Recent literature shows that there is a certainty within educators that competency-based approach is an important success option for next generation learning and there is still an efforts needed to enhance the strategies and skills for advancing new competency-based options (Sturgis et al., 2011). Hence, competency-based education is recently an adopted approach in several educational disciplines in higher education.

Abbasi (2013) dealt with the global perspective on competency-based accounting education and reviews the positions and pronouncements on accounting education of the key global players in order to provide a contemporary accounting education based on competency development approach.

In medical career, research indicates that traditional methods used to train residents to become orthopedic surgeons are not efficient as they didn't offer evidence-based learning outcomes. The reduction in resident work hours limits the time available for clinical training, which has resulted in some calls for lengthening the training process. However, this issue can be address when the training focus on a program that allows residents to graduate from a rotation based on demonstrated competency rather than on time on a service (Alman et al., 2013). In general, efforts to improve medical higher education are include adopting a new framework based on six broad competencies defined by the Accreditation Council for Graduate Medical Education. Many professional groups and task forces are working to examine the advantages and challenges of this competency-based educational framework and to refine specific competencies by developing detailed milestones (Weinberger et al., 2010).

Identification of competencies related to public health discipline and interdisciplinary domains are now required for guiding accreditation, curriculum planning, and the measurement of student achievement in both graduate and undergraduate education. Nevertheless, learning and assessment methodologies are still in need to large efforts that led to the consideration and development of strategies for promoting outcomes-based educational performance and accountability (Calhoun et al., 2011).

In Information Systems (IS) discipline, the dominance of Enterprise Resource Planning systems (ERP) raised the standards of specialists needed to gain success in field projects. Therefore, university increasingly pressurized to supply graduates with the appropriate competencies through adopting a hands-on approach for teaching ERP in Information Systems degree programs. Proposing and implemented a comprehensive, competency-based education framework for ERP education was crucial to make students enjoy the hands-on use of the ERP system and have a positive improvement in self-efficacy and competencies (Scholtz et al., 2012).

Moon (2007) argued that existing educational strategy has failed to grow up creative citizens who can play leading roles in development in democratic environment. He proposed a competency-based education model that work parallel to the current system of manpower classification and selection. In this model, the identification of individual ability, talent, and aptitude is deemed to be the most important, and the key task of education is self-actualization through recognition and cultivation of such talents and abilities. According to this trend, educators can reduce the relative weight of subject-centered education and introduce a competency-based curriculum. They can also introduce new intelligence theories in order to foster the development of students' talents, aptitudes, and potentials. In addition, they can make use of positive psychology, which is a newly emerging field, the core concept of which is the belief that happiness in life depends on one's ability to develop and maintain positive feelings and emotions.

The allegation that Competency-based approach can't move beyond a somewhat atomized behaviourist to take advantage on deep learning is not true. The planned learning outcomes can be focus on teaching and

learning at more comprehensive competencies level. Along with this shift to these more complex 21st Century, goals comes a substantial challenge in order to match higher outcomes level (Balcaen, 2013).

For this reason, outcome-based education became one of the most significant global developments in higher education during recent years (Davis et al., 2007; Khalifa et al. 2012). It helps to yield successful examples in recent higher education reform and creating world class higher education institutions (Kennedy, 2011; Tontus et al., 2012). It helps also to identify students' expected performance and the way to assess and evaluate it (Kaliannan & Chandran, 2012; Anwar et al., 2012; Colley, 2008).

According to competency-based education, educators are working for re-engineering the educational system around a new era of learning design where failure is no longer an option. This means a deep transformation of education towards a new philosophy that demands moving from a time-based to a learning-based educational system. This new direction focuses on helping students to master learning where the objectives are measurable outcomes instead of just delivering them some knowledge.

This new direction of education requires a major change in the logic of program construction as goal/outcome oriented rather than content (discipline) oriented. This change makes program design more difficult as the knowledge experts will not be able to perform this mission alone. Literature highlights the important of sharing experience with the stakeholder-experts in the process of the program design. Hence, knowledge experts in different disciplines, educators and inter-professional experts should all share the feedback of the creation of a competency-based program (Banfield & Lackie, 2009).

Other studies focused on competencies' statement technique basically depending on current professions or field experience guidelines. These guidelines help provide general a framework with detailed competencies. In a further phase, educators can refine the competency list through stakeholder interviews and expert feedback. The competency statements should employ certain initiatives, such as, the foundation for needs assessments, activity planning and development, and outcome measurement (McKeithen et al., 2011).

Abbasi (2013) proposed a global-view, system-based competency model comprising three stages of curriculum management based on system lifecycle:

1. Planning and design: The first phase involves the establishment of what competencies (learning goals/objectives), who (learner, facilitator, and other stakeholders), with (learning/facilitation methods and strategies), where (targeted placement in courses), and when (delivery modes).
2. Implementation: Curriculum implementation phase should employ an input-transformation-output-feedback system model.
3. Outcome assessment. Outcome assessment phase entails assurance of student-learning outcomes (formative assessment) and achievement of program performance goals (summative assessment) through a two-step process: learning measurement and feedback for closing the loop.

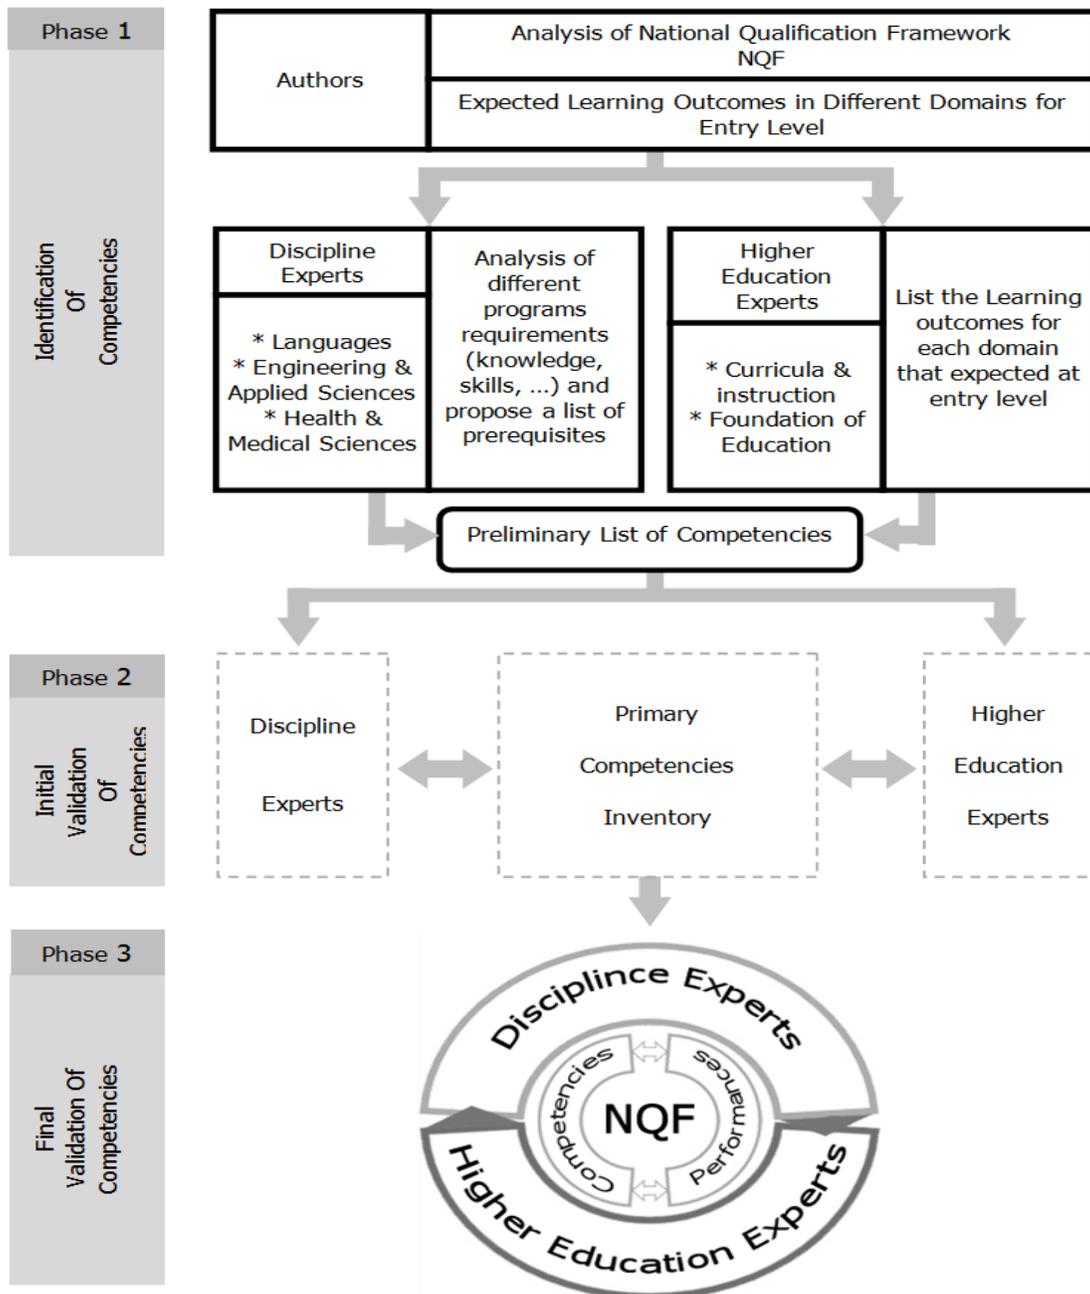

## **METHODOLOGY**

This study aims to identify the key success competencies for admission at SAU, and the learning outcomes regarding each key competency. The study follows the analytical descriptive method in order to achieve its objectives. This methodology includes the review of related literature as well as analyzing the National Qualification Framework (NQF) to conclude with the key success competencies for post-secondary admission level in different domains.

Based on the above literature, the authors proposed an operational model for the identification and validation of the competency inventory that includes competencies in different domains and outcomes associated with each competency (figure 1). Within the three successive phases of the model, authors and

distinguished experts in related disciplines and education worked to identify expected competencies and learning outcomes in the first phase, while the role of experts was essential to validate the competencies via brainstorming and discussion sessions in the second phase. In the third phase, disciplines' experts and higher education experts worked for achieving final validation of competencies. In addition, this phase guarantees sustainable improvement and validation for competencies inventory through disciplines' experts and higher education expert's permanent cooperation.

Fig.1: Competency identification and validation model

## RESULTS AND DISCUSSION

The authors reached a valid competency inventory for admission at SAU. This inventory includes seven main components: (a) competence in the language of instruction (English), (b) competence in the language of instruction (Arabic), (c) competence in Information Technology communication skills, (d) competence in knowledge and cognitive skills of statistics and numerical, (e) competence in knowledge and cognitive skills of Mathematics, (f) competence in knowledge, cognitive skills and psychomotor skills of Science (Biology), (d) competence in knowledge, cognitive skills and psychomotor skills of Science (Physics). Table 1 illustrates the number of performances embedded in each competency.

Tab.1: Competences, performances and domains

Main Competencies	Domain of Competency	Number of Performances
Competence of Language of instruction (English)	Competency in reading	10
	Competency in writing	10
	Competency in listening	10
	Competency in speaking	10
	Competency in vocabulary and grammar	10
Competence of Language of instruction (Arabic)	Competency in reading and understanding	19
	Competency in grammar	20
	Competency in writing	12
	Competency in speaking and composition	12
Competence of psychomotor skills of Information Technology communication	Competency in involve manually	335
Competence of knowledge & cognitive skills of statistics and numerical	Competency in recall, present and understand	28
	Competency in apply, investigate and think critically	10
Competence of Knowledge, cognitive skills & psychomotor skills of Mathematics	Competency in recall, present and understand	25
	Competency in apply, investigate and think critically	9
	Competency in involve manually	1
Competence of knowledge, cognitive skills & psychomotor skills of Science (Biology)	Competency in recall, present and understand	26
	Competency in apply, investigate and think critically	4
	Competency in involve manually	6
Competence of knowledge, cognitive skills and psychomotor skills of Science (Physics)	Competency in recall, present and understand	39
	Competency in apply, investigate and think critically	31
	Competency in involve manually	12

Since this study is part of multi-phase project to develop preparatory program at SAU, the findings of this research phase are essential to define objectives and learning outcomes for the preparatory program that can work as a university success gate as acknowledged in the SAU strategic plan.

Building on the proposed outcomes of this study, the university will be able to:

- Structure the required key success competencies for admission level in different learning domains according to the NQF.
- Develop valid and reliable assessment instruments for admission diagnostic and placement purposes.
- Develop a competency-based program to bridge the gap between high-school graduate competencies and admission-level competencies with pedagogical approaches designated for the remedial of prospective students' learning efficacy.

## CONCLUSION AND IMPLICATIONS

According to NQF, graduates of Saudi high-school should meet eligible standards for postsecondary admission as stated in university programs. If not, students should complete preparatory or foundation studies designed to ensure that they possess the necessary language and study skills, as well as academic background to succeed in postsecondary programs.

SAU's strategic plan identified high-school graduate competence as a main challenge, and prioritized the strategic objective of developing a preparatory program as a key success area that may guarantee better intakes for university programs. The emergent interest in measuring educational efficiency and outcomes fore grounded the competency-based education in higher education. Based on the competency-based approach, SAU planned a project study to develop a preparatory program that aims to improve candidate competencies to meet admission standards in different programs at the university.

This study is the first phase of the project that focuses on identifying the key success competencies for admission level and developing a list of comprehensive outcomes lying beneath each key competency. Deriving from the literature review and distinguished experts, the authors reached a valid competency inventory for admission at SAU. The inventory includes seven main components include 639 performances cover different cognitive and psychomotor learning domains.

Achieving this competency inventory is an indispensable source to design the assessment criteria in order to diagnose students' deficiencies in knowledge and skills. It's also a cornerstone to develop the necessary preparatory program for promoting admission prerequisites, and subsequently, academic performance at the University.

Such a development is imperative to attest that newly established universities like SAU are capable of offering support to the higher education system in Saudi Arabia and grapple with the challenges of globalization and the implications of the digital era as well.

Abstract and paper for HICE 2014 Refereed Proceedings

**Title:** Do they stay or do they go? The first destinations of international student graduates

**Topic area:** Higher education

**Presentation format:** Paper session

**Description:** Understanding the changing nature of international students is key to providing educational packages which meet their needs, equip them for life and career after graduation, and help to make our qualifications a first choice in today's competitive higher education environment. A recent survey of international graduates from the past five years from a New Zealand institution highlights the need to see this population group less as sojourners and more as potential citizens.

**Abstract**

*International student graduates' actual outcomes related to employment, career development, enrolment into higher qualifications and achieving permanent residence make interesting reading. These outcomes often come as a surprise to those who work most closely with the students - the faculty, academic advisors and learning support staff - who have long recognised this population group as high-users of academic development services. This paper discusses the early findings from a survey of international graduates from a New Zealand institution over the last five years. Our data support the phenomenon widely discussed in the recent literature: that temporary residence as a student is for many, only ever seen by many as a transitional stage, and in fact a large proportion of New Zealand's international students are prospective migrants. Further, a number of studies indicate that this trend is equally apparent in North American, and other western providers of higher education, English language qualifications. The pathways by which the students achieve their goals begin with the programmes they study and the qualifications they achieve, and lead into the decisions students make about their first destination upon graduation. Our research extended the survey results with a number of interviews to gather individual stories to get an idea of the explanations and motivations that lie behind the larger numerical patterns. The important corollary for teaching and advising staff is to recognise that we are no longer solely preparing international students to achieve a New Zealand qualification to enhance their employability in their home country. Now we are preparing them for life as a New Zealand citizen, and we need to re-examine their needs and what we are providing according to this light.*

**Introduction**

Studies demonstrate that higher education graduates, whatever their subject or level of study, have higher earnings than workers with no qualifications (NZ Vice-Chancellors Committee, 2008). New

Zealand students can be relatively laid back about recognising this imperative, but not so the citizens of many of our neighbours, especially from Asian and Pacific Island nations, who make up the largest body of our international students, although recent trends have seen growing cultural diversity. Overall, the number of international students studying in our tertiary sector has increased dramatically in the last decade, alongside the number of countries represented.

New Zealand is one of the five major host-countries for international students in the English-speaking world, together with the United States, Canada, United Kingdom and Australia (Holloway, 2004) and export education is now our fourth largest export industry, contributing at least \$2.1 billion to our economy and about 32,000 jobs (Merwood, 2007). International students currently make up around 13% of the student roll in New Zealand universities, compared to an average of more than 20% in Australian universities, so that most sector analysts believe there is still significant growth to be had – even given the global economic recession (Terra Nova Consultancy, 2010). In fact, so keenly are many of our higher education providers pursuing full-fee paying international students that some commentators are warning such “academic capitalism” and “feverish recruitment” (Brebner, 2008, p. 2) will lead to inflated expectations and making promises that we can’t keep.

What are we offering? In an increasingly globalised world and at a time of economic downturn, there is growing demand for skilled professionals with a range of skills that respond to the requirements of business, technology and culture. Commerce and business are by far the dominant aggregate area of study for international students in this country (56.2%), followed by Social and Behavioural Sciences (11.8%) and Mathematics and Information Sciences (9.2%) (NZ Vice-Chancellors’ Committee, 2008). Naturally, demand for particular skills and occupations rises and falls over time, and sometimes in quite a short time frame. This is less of a concern if we position ourselves as providers of an education qualification that students take back to their own countries, to do with what they will; it is far more significant if our international students are undertaking study with the assumption that it will lead to a job and long-term residency in this country.

Both New Zealand’s Ministry of Education and the Australian Council for Educational Research regularly conduct large-scale surveys of international students in this country and concur that while ESANA students (from European and South American countries, North America and Australia) rate travel and adventure, beautiful scenery and New Zealand lifestyle as important, Asian students - the majority of our student body - make choices about study destination according to perceptions of employment and residency opportunities, and quality of education providers (AUSSE, 2010; Deloitte, 2008). As Craven (2009) notes, temporary residence as a student was only ever seen by many of our international students as a transitional stage on the path to becoming a longer term entrant into our wider society. Where a decade ago, it was reasonable to expect that international students were aiming to achieve a New Zealand qualification to enhance their employability in their home country, we are now preparing them for life as a New Zealand citizen (Fraser & Simpson, 2012).

## **Our study**

The research project we will describe at the HICE conference is still underway at the time of writing this paper, and so our discussion here is largely confined to study goals and objectives, and preliminary findings from pilot participants. The overarching purpose of our investigation is to identify where the international graduates from our institute go after completing a qualification with

us, and whether they have been successful at moving from study into their preferred destination. Our specific research question was “How do international students’ first destinations after completing their study align with their expectations on entry?” And our goals were:

- To provide useful data for the International team about graduates’ successes and pathways following study at our organisation, and assist with the analysis of which programmes are creating the best opportunities for particular groups of students. This information would be directly useful for international marketing planning and decision-making.
- To understand more about our international students’ intentions and motivations in undertaking a study programme, recognising that these may encompass objectives other than the purely academic.
- To ensure that the programmes and delivery options we are promoting are aligned with students’ wants and needs, so that our international graduates feel that they have received the best possible outcomes and qualifications – and therefore become our ambassadors in the marketplace.

The proposed methodology uses two data collection instruments: a questionnaire and focus groups.

- The questionnaire uses Survey Gizmo software available through a link emailed to all international student graduates from the past 5 years whose contact details we are able to locate. Analysis will be partly statistical, identifying incidence and relativity of different responses, and partly qualitative, focusing on recurring themes, enablers and barriers. We have also included the option to identify stories of graduate success that students wish to share (through a comments box on the questionnaire, and consent to make further contact to discuss these and gather more details as necessary). International marketing materials already use student profiles like this, but it is likely that there are a lot more individual stories which we don’t know about – this questionnaire offers an added opportunity to build our database of role model alumni. We have had approximately 400 international students graduate over the past 5 years, and would hope for a 33% response rate, or higher. The questionnaire has been piloted with 12 students from a target group of 27, whose responses are included in the following section of this paper.
- The focus groups will be convened to address results from the questionnaire and the topics where we would like more information. Probably three or four groups will be facilitated, depending on student uptake, with 4 - 6 international students in each, grouped according to campus (and/or course if there are sufficient participants). We will offer the students lunch/refreshments as an incentive to participate, and also to set an informal and supportive atmosphere to encourage free and frank sharing of personal agendas and experiences.

Overall we hope to cover areas such as the relative importance/value/prestige of particular qualifications; where students see career opportunities in their home countries, in NZ, and abroad; awareness and targeting of Immigration wanted skills lists; awareness and goals of higher qualification pathways in NZ, home countries and abroad; job availability; and permanent residence aspirations. We also hope to gather specific stories of experiences about congruency or mismatch between study experience and destination objectives.

## Early findings

The 12 students who participated in the pilot study were spread across both genders and three age ranges: 18-24 (5 students); 25-34 (3 students) and 35-54 (4 students). However where this group are less likely to be representative of the larger target population is in nationality: half the sample came from India; and in fields of study: 11 were students from our School of Business, and one was a School of Applied Science graduate. Key findings were:

- While the majority of students knew “some”, “quite a lot”, or were “very well informed” about the institution, closer to a quarter were able to respond in the same way about the course they enrolled in. Most had got their information from the institution’s website, local education agents, contacts already in this country or a combination of these. None had seen course brochures or descriptors prior to enrolling.
- Job prospects in this country were the highest ranked determinant of study selection:

Item	Total Score <sup>1</sup>	Overall Rank
Job prospects in New Zealand	52	1
Career opportunities	50	2
Permanent residency in New Zealand	48	3
Lifestyle experience	41	4
Study pathways to higher qualifications	31	5
International qualification	28	6
Job prospects in your home country	24	7
Family	20	8
<b>Total Respondents: 11</b>		
<sup>1</sup> Score is a weighted calculation. Items ranked first are valued higher than the following ranks, the score is the sum of all weighted rank counts.		

- Students generally responded “fantastic” or “quite good” to questions about how they found the city, the campus, their teachers, the support from the International office and the support from academic learning advisors. Satisfaction decreased for questions about how they found the level of their programme, and whether they felt there was enough information about how the programme could lead to further study or employment.
- Half of the 12 students in this pilot had stayed in New Zealand after graduation; all but one were working in their professional field. Of those who had left the country, one was on holiday, one unemployed, and two each were working in either a professional role, or a job unrelated to their qualification.
- Some of the students included a paragraph outlining their post-graduate journeys, and some included useful comments and suggestions about study / employment alignment, which will inform the conference presentation when all final results are available.

## Conclusion

Many institutions collect their own data about graduating students and what they plan to do upon leaving, including whether they are employed, plan to attend graduate programmes, are still seeking employment or have other plans. Such information can: inform marketing initiatives and may provide statistics which can be published to agents and prospective students of evidence of the value of studying with the organisation; assist with International planning and resource allocation into particular markets; and highlight learning and teaching issues regarding specific needs in programme content or soft skill development. This type of research has not been previously undertaken by our organisation.

Early indications are that the exercise will be extremely valuable, and the data already gathered from this small pilot sample offers some interesting insights. First, it looks as if we may be able to confirm national trends within our own student body, such as the Ministry of Business, Innovation and Employment's (2010) study, which found around 31 % of fee-paying international students transition to work and/or permanent residence in New Zealand; and 68% of former international students were in full time employment 18 months after gaining permanent residence in New Zealand with 31% in professional occupations and 62% in a skilled job.

Second, it would appear that many students have clear mid and long term objectives when they apply to study with us, but may not always be clear about how the course they enrol in will assist them to achieve this. We may need to change out practices with how we communicate with prospective students – the questions we ask and the level of information we provide about course content, level and pathways. We look forward to the opportunity to discuss this further with conference delegates, or to correspond with interested colleagues who read these Proceedings.

**Conference Submission:** 12<sup>th</sup> Annual Hawaii International Conference on Education

**TITLE:** Does Providing Asynchronous Audio Feedback Enhance Faculty Presence in a Virtual Classroom?

**NAMES of AUTHORS:** Frank DiMarino, JD, LLM & Penny Lorenzo, JD

**AFFILIATION of AUTHORS:** Kaplan University, School of Legal Studies

**ADDRESS of AUTHORS:** 550 West Van Buren, 7<sup>th</sup> Floor, Chicago, Illinois 60607

**E-MAIL of AUTHORS:** Frank DiMarino – [fdimarino@kaplan.edu](mailto:fdimarino@kaplan.edu), Penny Lorenzo – [plorenzo@kaplan.edu](mailto:plorenzo@kaplan.edu)

**ABSTRACT:** Does Providing Asynchronous Audio Feedback Enhance Faculty Presence in a Virtual Classroom?

This case study involves providing audio feedback in addition to text-based feedback for student assignments in asynchronous courses. While prior research has demonstrated that participants in online courses can build effective learning communities through text based communication alone, we believe the inclusion of an auditory element will strengthen the rapport between instructor and student by providing more effective and personalized constructive comments of the student's strengths and areas of opportunity to improve future assignments. We also believe the inclusion of an auditory element will result in enhanced student learning and engagement in the classroom. Over the course of several terms and courses including introductory courses and courses taken later in a student's program, students in the study will receive both asynchronous audio and text-based feedback on their written assignments. We expect our findings to reveal students' level of satisfaction with embedded asynchronous audio feedback compared to asynchronous text only feedback and improved student learning; specifically, we expect to collect the following data: (1) whether audio feedback was perceived to be more effective than text-based feedback for conveying nuance; (2) whether audio feedback was associated with feelings of increased engagement in the course; (3) whether audio feedback was associated with increased retention of content; (4) whether audio feedback was associated with the perception that the instructor cared more about the student; thus, building a better rapport between instructor and student; and (5) whether audio feedback was associated with improved student learning outcomes.

# English Conversation Practice Based on Thinking Ability

Otsuki, Atsuko (Sagami Women's University)

Carreira, Matsuzaki Junko (Tokyo Keizai University)

**Key Words:** Applied Linguistics, Verbs, Productivity and Flexibility, Cue Word, Thinking Ability, English Conversation Practice

## 0. Introduction

Practical English ability as a common language communication skill is strongly demanded by international society. In Japan, however, many students seem to have trouble in studying English. On the other hand, fortunately, they never lose interest in speaking English. I suppose that this incongruous situation arises from the fact that many learning methods for 2<sup>nd</sup> languages depend on rote memorization. Therefore this study focuses on the thinking ability of human beings and searches for the possibility of “English Conversation Based on the Thinking Ability” in terms of applied linguistics. We suggest the use of the productive and flexible characteristics of verbs to induce this method, showing the theoretical back grounds and the data as the result of research that we conducted and analyzed for this study. Firstly, focusing productivity and flexibility of verbs in terms of linguistics, the theoretical background of “English Conversation Based on Thinking Ability” will be explained. Secondly, a survey and preliminary experiments conducted in order to determine the adequacy of our assumption will be reported upon. Finally the possibility of “English Conversation Practice Based on Thinking Ability” will be examined.

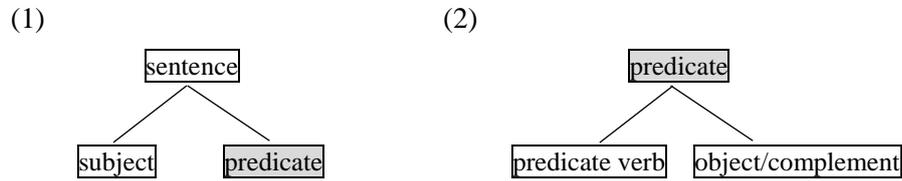

## 1. Theoretical Background

Verbs are known as having an important syntactic role which governs word distribution in a sentence. VP (Verb Phrase) Internal Subject Hypothesis, for example, defines verbs as having syntactic dominancy. On the other hand, in semantic discussion, Otsuki (2010, 2008, 2002, 2001) proposes that verbs play a critical role in generating metonymical expression and meaning though process of the generation in metonymy seems to be arbitrary. Since the high productivity and flexibility of verbs are defined in theoretical linguistics, the same must be true of language performance because both relate to human beings. Otsuki (2013) also proposes to apply the high productivity and flexibility of verbs to language performance of speaking English as a 2<sup>nd</sup> language.

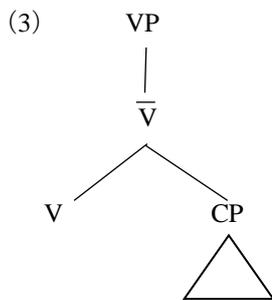

### 1.1. Productivity and Flexibility of Verbs

Diagram (1) shows that a sentence consists of a subject and a predicate. The predicate

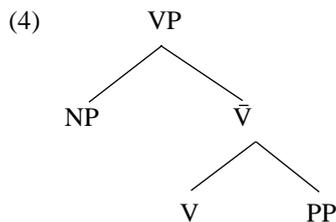

consists of a predicate verb (VP), an object and a complement as shown in (2).

In other words, a sentence is made up of 2 words at least. When it is a complex sentence or a compound sentence, the number of word in the sentence increases. Suzuki (1990:55) says that whether the sentence is complex/compound (CP) or not, the choice of the object, the complement and the modifier is determined by verbs (V), as shown in (3).

VP Internal Subject Hypothesis states that the verb has an important syntactic role which governs word distribution in a sentence, and proposes that subjects originate as specifiers in phrases headed by a lexical verb in terms of X-bar syntax, as shown in (4).

## 1.2. Metonymy and Verbs

Metonymy<sup>1</sup> contributes to linguistic problems such as polysemy and meaning extension, which has a productive and flexible mechanism. Though word meaning through metonymy is

---

<sup>1</sup> Metonymy is one of the most basic cognitive system of human beings, is a device for referring one thing to another. Its function is to transfer meaning and it enables us to employ the same expression to refer to intuitively distinct sorts of things. (Nunberg, 1996)

ambiguous on account of these linguistic phenomena, the target meaning can be identified with certainty.

The meaning of the sentence in (5), for example, is obviously ambiguous in that we can infer either that *John began to read a book* or that *John began to write a book*. The NP (Noun Phrase), *a book*, does not satisfy the type required by the predicate verb *begin*, which normally selects semantically for action. Then the predicate verb coerces the NP into an event denotation. In other words, the verb coerces the NP into an event denotation in TELIC<sup>2</sup> in the qualia structure (QUALIA) of *book*, as in (6).

(5) John began a book. (Pustejovsky (1995:203.204))

(6)

$\begin{array}{l} \mathbf{begin} \\ \left( \begin{array}{l} \mathbf{EVENTSTR} = \left[ \begin{array}{l} E_1 = e_1: \text{process} \\ E_2 = e_2: \text{event} \\ \mathbf{RESTR} = < 0_\infty \end{array} \right] \\ \mathbf{ARGSTR} = \left[ \begin{array}{l} \mathbf{ARG1} = x: \text{human} \\ \mathbf{ARG2} = e_2 \end{array} \right] \\ \mathbf{QUALIA} = \left[ \begin{array}{l} \mathbf{FORMAL} = P(e_2, x) \\ \mathbf{AGENTIVE} = \text{begin\_act}(e_1, x, e_2) \end{array} \right] \end{array} \right) \end{array}$	$\left( \begin{array}{l} \mathbf{book} \\ \mathbf{ARGSTR} = \left[ \begin{array}{l} \mathbf{ARG1} = x: \text{info} \\ \mathbf{ARG2} = y: \text{physobj} \end{array} \right] \\ \mathbf{QUALIA} = \left[ \begin{array}{l} \mathbf{FORMAL} = \text{hold}(y, x) \\ \mathbf{TELIC} = \text{read}(e, w, x, y) \\ \mathbf{AGENT} = \text{write}(e', y, x) \end{array} \right] \end{array} \right)$
y)	(Ibid.)

On the assumption that Coercion<sup>3</sup> leads to the dissolution of type error, a variety of metonymical expressions used in the scenarios of two English movies were analyzed in Otsuki, (2008). As a result of the analysis, the following seven kinds of illustrations of linking models in Figure (1) were produced. In the seven linking models, we notice that the predicate verb, P.V. in Figure (1), plays a crucial role in the operation of coercion to make metonymical expressions possible.

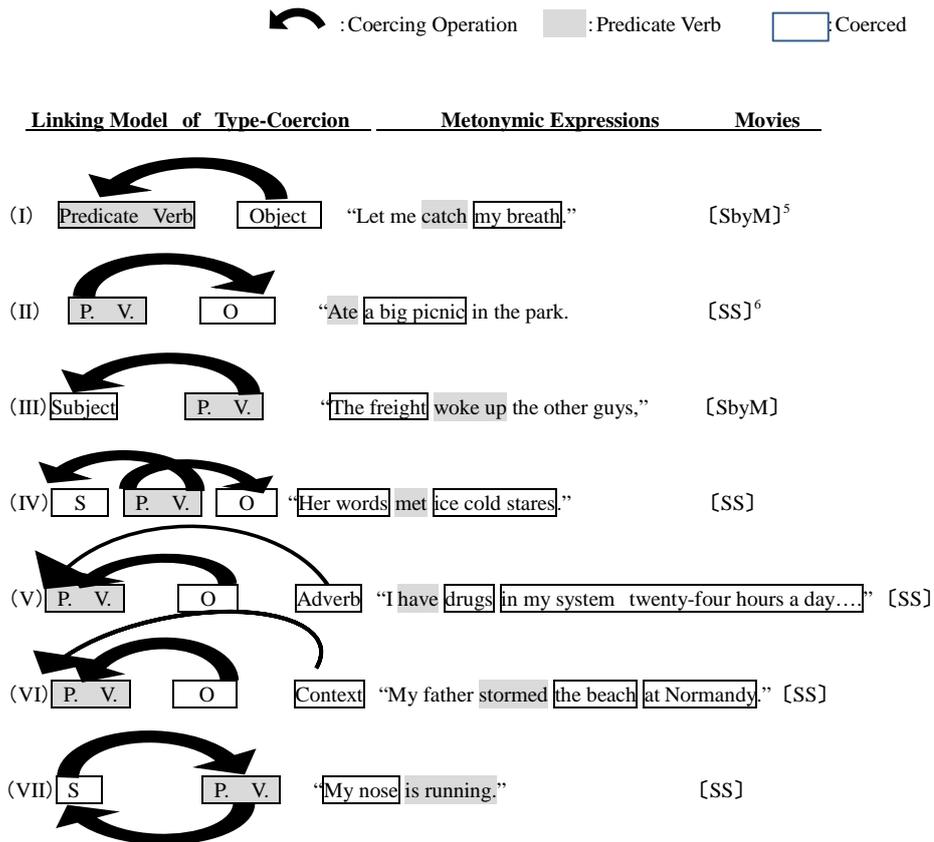

Both our syntactical and semantic discussions on the verbs demonstrates their striking productive and flexible characteristics. By applying the features of the verbs to 2<sup>nd</sup> language

<sup>2</sup> TELIC: In Generative Lexicon (GL), TELIC (The Telic Role) is a subordinate concept of the qualia structure (QUALIA) and attributes purpose and function to the object.

<sup>3</sup> Coercion: a semantic operation that converts an argument to the type that is expected by a function, where it would otherwise result in type error. (Pustejovsky, 1995)

performance of English, this paper propose a new type of English learning method which doesn't rely on memory working but on thinking ability, that is, "English Conversation Practice Based on Thinking Ability". This study proposes to use a verb as a cue-word<sup>4</sup> to build up a sentence when speaking English.

Figure (1) "Linking Models of Metonymical type-Coercion" (Otsuki, 2008, 2010)

To search for the possibility of "English Conversation Practice Based on Thinking Ability" with a cue-word, a survey and experiment were conducted in this study. The following section reports on the data, analysis, and results from that process.

## 2. Survey and Preparatory Experiment

The survey and experiment were conducted in order to determine whether our assumption

<sup>4</sup> cue: a thing said or done that serves as a signal to an actor or other performer to enter or to begin their speech or performance.

<sup>5</sup> SbyM: a movie "Stand by Me"

<sup>6</sup> SS: a movie "The Sixth Sense"

from the theory was correct or not, and to answer to the following 2 questions. One is whether 2<sup>nd</sup> language learners of English employ the striking features of verbs, productivity and flexibility, when they speak. The other is whether there is any potential in this study to develop a new type of teaching or leaning method, entitled “English Conversation Practice Based on Thinking Ability” with a cue-word. The survey and experiment were carried out as follows.

**【Subjects for Investigation】**

1. 97 university students of 1<sup>st</sup> or 2<sup>nd</sup> year grade in Japan.
2. Majoring in Marketing, Economics.
3. Their English is low ~ middle level (= 3<sup>rd</sup> ~ pre-2<sup>nd</sup> of The EIKEN Test in Practical English Proficiency of Japan).
4. Most of them are weak in English.

**【Procedures of Preliminary Experiment】**

1. The term of investigation: July ~ August 2013
2. Firstly, the questionnaire asked the students why they are weak at English.  
Secondly, a 1 minute speech on “Which country do you want to visit?” made by the students was recorded. In the speech, the students were given 15 words; 5 verbs, 5 adjectives, 5 nouns as in (7). Using these 15 words, however, was not obligatory because their spontaneous English performance was required for observation.

- (7) VERBS : like, see, play, eat study  
 ADJECTIVES : happy, fun, beautiful, exciting, cool  
 NOUNS: people, building, hiking, cars, music

3. The number of words used in the speeches was counted for data.

**3. Results (1)**

As a result of the survey that asked the students why they are weak at English, “Understanding sentence structure is difficult.” was the most common response out of five choices as in Table (1).

Table (1) “Reasons Why They Are Weak at English” (the number of students)

Reasons	To memorize words & phrases	To Understand sentence	Pronunciation is difficult	Comprehension	Other reasons
---------	-----------------------------	------------------------	----------------------------	---------------	---------------

		structure			
Number of answers	24	51	27	21	6

The results of the preliminary experiment to investigate productivity and flexibility of verbs in English performance as second language of Japanese students are shown in Table (2) ~ (4). Table (2) shows frequency of verbs (per person) spoken in the 1 minute speech. Table (3) shows frequency of adjectives, and Table (4) shows frequency of nouns (per person) spoken in the same manner.

Table (2) “Frequency of Verbs per Person” (time)

“like”	“see”	“play”	“eat”	“study”	Average Frequency
19	14	17	12	16	15.6

Table (3) “Frequency of Adjectives per Person” (time)

“happy”	“fun”	“beautiful”	“exciting”	“cool”	Average Frequency
27	0	12	11	3	10.6

Table (4) “Frequency of Nouns” (time)

“people”	“building”	“hiking”	“car”	“music”	Average Frequency
2	2	2	0	2	1.6

The average frequency of the verbs is the most out of the three. The average frequency of verbs is 15.6 times in total and adjectives is 10.6 times. The average frequency of nouns is 1.6 times and the lowest by far. “People” is a collective noun, “Building” and “Car” are common nouns, “Hiking” is an event noun, and “Music” is an abstract noun. The features of each noun are various. The frequency of each noun, however, is almost the same. Therefore, it seems that nouns were selected arbitrarily in each speaker’s own context and not bound by the 5 nouns given for the speech.

#### 4. Results of Investigation (2)

Data in this section shows how the students built sentences in their 1 minute speech, whether they listed a word or a phrase which came to their mind or not, and how much they thought about sentence structures. This data leads to the discussion of using verbs as a cue word.

Table (5) shows the number of completed sentence and incompleting sentences

respectively in the 1 minute speech. The completed sentences and the incompleted sentences are classified into VERB, ADJECTIVE and NOUN in order to look at the difference between them.

Table (5) “Completed Sentence and Incompleted Sentence in Verb” (the number of sentence)

V E R B		A D J E C T I V E		N O U N		T O T A L	
Complete Sentence	Incomplete Sentence						
54	0	6	9	2	3	62	12

Table (6) shows how many “Presented Words” or “Non-presented Words” employed in the 1 minute speeches were used in a completed sentence or incompleted sentence respectively. Table (6) also shows that “Presented Words” featured in more completed sentences than “Non-presented Words”.

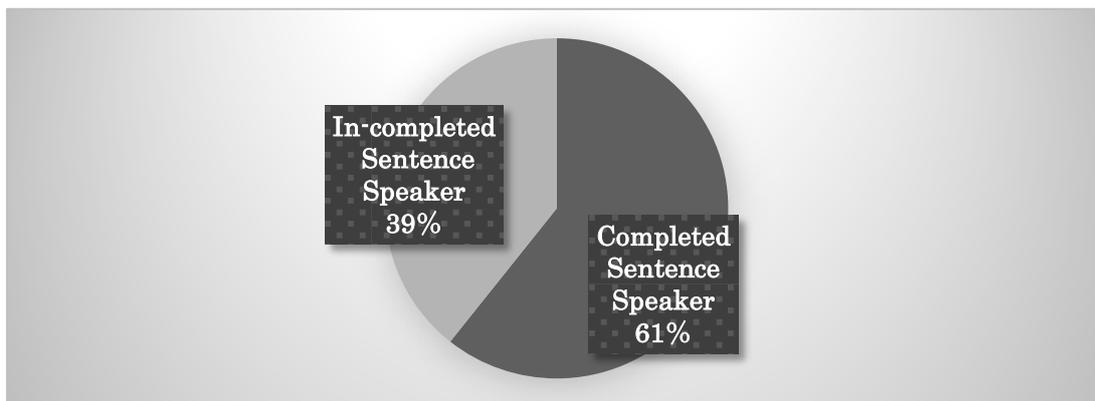

Table (6)

“Completed Sentence and Incompleted Sentence in Presented Words and Non-presented words” (%)

Presented Words		Non-presented Words	
Completed Sentence	Incompleted Sentence	Completed Sentence	Incompleted Sentence
62	12	31	15
84%	16%	68%	32%

Lastly, Chart (1) shows that 39% students can’t make a completed sentence. On the other hand, though 61% students can make a completed sentence, their sentences are mostly very simple and quite short. This means that most of them don’t speak English logically.

Chart (1) “Proportion of Completed Sentence Speakers to Incompleted Sentence Speakers” (%)

## 5. Observation

As a result of examining and analyzing the data with some linguistic theories, we can observe (a) (b) (c) as follows.

- a) From the survey results, we found that many students think they are weak at and cannot speak English because they don't understand the sentence structure of English. That is proved correct by the experimental data showing that 39% of students cannot make completed sentences, and that the completed sentences made by 61% of students are almost all very simple and quite short. In their logical English speaking, more improvement is necessary.
- b) Verbs are key in building a sentence and closely united with the subject, objects and complements in a logical discussion of theories. That means that verbs have productivity and flexibility in building a sentence. This assumption was proved in English language performance as a second language, by our survey and preliminary experiment.
- c) It was found that "Presented Words" shown in 1 minute speeches worked as a cue which generates a sentence. This means that our "English Conversation Based on Thinking Ability" can become real by using a verbs as a cue word.

## 6. Conclusion

In this paper, we verified the hypothesis of theories by an experimental approach. This means that our study will move on to the next stage. That is to investigate whether a verb cue word is effective in a real learning English conversation or not. And from the survey result, it is urgent that we develop English Conversation Practice Based on Thinking Ability.

Some problems to be solved are left. Firstly, the 15 words categorized into verb, adjective

and noun need to be clarified regarding how they are selected as Presented Words. What is the selection criterion? Secondly, the data obtained from the 1 minute speeches without using any Presented Words should be shown, because by contrasting and comparing these two datum, the effect of presenting words as cue words will be more outstanding.

## **An Exploratory Study of African American Graduate Students** **Perception of the Campus Environment**

### ABSTRACT

The purpose of this research is to understand African American graduate student's experiences and perception of the campus environment. Campus climate and the experiences of undergraduate students are common areas of study. Numerous studies, both quantitative and qualitative, have provided important data on undergraduate student experiences with recommendations for improvement (Freeman, 1999; Fries-Britt & Griffin, 2007; Oseguera & Rhee, 2009). For example, Nettles (1985) concluded that regardless of their race, individuals in minority groups who attend institutions of higher learning felt racially discriminated against by faculty, administration, and fellow students. Nettles (1985) also found that students in minority groups were more likely to have a lower progression rate and grade point average than their counterparts, resulting in higher attrition rates. A climate of prejudice and discrimination both inside and outside of the classroom has become a chief factor accounting for the differences between the way in which Black students and White students experience college. While numerous studies have examined the campus experiences of undergraduate students, only a few (Nettles, 1990; Nettles & Millett, 2006) have examined the experiences of graduate students in the academic setting.

The Council of Graduate Schools reports that in 1996, African American students comprised 8 percent of graduate enrollment. By 2006, African Americans accounted for 13 percent of the graduate population (Guess, 2007). The most recent figures demonstrate a slight decline in enrollment of African American students to 12 percent (ACE Fact Sheet). The Council

of Graduate Schools (2008) highlights several issues regarding the increased number of racial and ethnic minority students attending graduate schools. They include funding, faculty preparedness for a changing population, and minority student perception of the programs and campus climate. The increase of African American students attending graduate school demonstrates a need to explore their perceptions and experiences, especially at predominantly white institutions (PWIs). As institutions strive to not only enroll, but also graduate students of color, perceptions of the environment must be examined as well as the more commonly examined structural variables of the availability of fellowships and assistantships. The goal of this exploratory study is to give voice to the African American graduate student's experience at an urban institution.

**SERVING YOUTH WHO ARE SERVING TIME: A STUDY OF THE SPECIAL  
EDUCATION SERVICES FOR INCARCERATED YOUTH IN A SHORT-TERM CARE  
FACILITY**

This study examined the communication between sending court and community schools of a County Office of Education's (COE) Alternative Education program and the receiving juvenile detention facility of a county in a Western state and how the communication between the two facilities affected the level of special education services provided to incarcerated youth, specifically the occurrence of 30-day placement IEPs. The juvenile detention facility was selected as a site because it was a lighthouse program, one of the few chosen to pilot the juvenile detention alternatives initiative (JDAI). JDAI sought to lower the number of incarcerated youth through viable

alternatives and have a focus on interagency collaboration to better serve the myriad needs of the youth incarcerated within the facility.

A mixed methods descriptive approach was used in the study with six different instruments used for data collection; 1) intake and exit sheets, 2) questionnaires, 3) formal interviews, 4) researcher field notes, 5) photographs, and 6) observations, document collection, and informal interviews. The instruments were administered over a 90-day period, with intake/exit sheets ceasing after a 60-day period. The remaining 30 days were used to conduct formal interviews with administrators for both programs and to assess the 30-day placement IEPs that took place.

This study yielded three main findings: 1) the intake process at the juvenile detention facility is not procedurally consistent and lacks a thorough educational history component, 2) there is a limited level of interagency collaboration between the COE and juvenile detention facility, and 3) incarcerated youth with special education services are not receiving their 30-day placement IEPs.

These findings are indicative of a continuum of barriers that still persist in providing special education services for incarcerated youth. Despite implementing policies and procedures to facilitate intake and interagency communication, issues with intake procedures and interagency communication still persisted and interfered with a lighthouse juvenile detention facility providing the incarcerated youth the special education services required by law.

**iCulture Rules!**

**Online-learning and its utility to Higher-Education in the Anglophone-Caribbean.**

**Aims**

I seek to define online-learning (as an integrative application of Information Communication Technologies (ICTs)), weigh its effects on teaching and learning, and examine its utility in Caribbean higher-education. I firstly consider the technical components of online-learning. Secondly, I discuss the environment: including institutional policy,

democratization, quality-assurance, and the rise of the megauniversity. Lastly, I discuss the coalescence between tools, audience, and environment in fulfilling the needs of a Caribbean learning community.

Online-learning as an application of ICTs and the networked worldwide-web, makes teaching and learning “even more ecological and evolutionary” (Kelly, 1994, p. 394; Louisy, 2001) than before. There is a rise of what I call the iCulture. It is necessarily iNdividualistic and stems from abilities to align the functionalities of digital media to personal need. Within education, the iCulture harnesses ICTs and the new digital tools to provide life in a candy store where student-centred, user-friendly domains can be tailored to address iNdividual learning needs. The iCulture’s ability to create individually-focused, student-centred products lies in contrast to charges that online-learning disrespects contextual peculiarities of learning sites and so creates one-size-fit-all-models that Mc Donaldizes education (Ritzer, 1996). In fact, as rapid change revolutionizes jobs, online-learning includes training at the work place that can deliver skills just as they are required for performance (Clegg, Hudson, & Steel, 2003, p. 49; Larreamendy-Joerns & Leinhardt, 2006, p. 571), and increases opportunities to a variety of students, including returning and working students, benefitting from its time-place flexibility (Cantrell, O’Leary, & Ward, 2008, p. 554).

Indeed, online-learning has contributed to historic expansions in student-enrolments worldwide. Still, the huge gaps in accessibility to, and resources for, higher-education research between developed, developing, and least developed countries continues to widen (UNESCO, 1998, p. 2). Just as large strides are made towards UNESCO’s Millennium Development Goals and Education For All (EFA) in primary and secondary education, participation in higher-education is still trying to be grown even within developed countries (Geith & Vignare, 2008, p. 1). In fact, in spite of “an unprecedented demand for and a great diversification in higher-education, as well as an increased awareness of its vital

importance for sociocultural and economic development” (UNESCO, 1998, p. 1), higher-education remains a scarce resource (Hiltz & Turoff, 2005, p. 64).

### **ICT – A Tool For Democratisation or Capitalist Globalisation?**

Within the Caribbean too, promotion of higher-education as a public good is critical (Leo-Rhynie & Hamilton, 2007, p. 6). However, the touted egalitarian and democratic aims in terms of wide access to varied populations (Bernard & Thompson, 2003, p. 97; Cantrell, et al., 2008, p. 548; Evans, 1995, p. 7; Gulati, 2008, p. 1; Larreamendy-Joerns & Leinhardt, 2006, p. 568) that online-learning offers seem to have been hijacked. There are charges of managerialist agendas to cheaply educate a maximum number of workers solely as labour-force skilled to the demands of the new knowledge-economy. The charges suggest subscription to a meta-narrative proposing the inevitableness of globalisation and the indispensability of ICTs to its propagation:- necessarily concluding the use of ICTs through online-learning to facilitate instruction across global spaces as a requisite and ubiquitous aim of higher-education (Clegg, et al., 2003).

Almost as proof of managerialist agendas, Massive Open Online Courses (MOOCs) and megauniversities may become lucrative investments as government subventions in education continue to decline. Higher-education has certainly been internationalized (Louisy, 2001, pp. 426-427), and as a tradable commodity within liberalized environments has proven a multi-billion dollar business (Larsen, Martin, & Morris, 2002, p. 858).

Regionally in the Caribbean, a general situational analysis of higher-education indicates major need to smooth out and expand access and enrolment across the region; to make ICT a more prolific and user-friendly mode of educational delivery; and for a Regional Accreditation Agency to maintain high quality standards (Tewarie, n.d., pp. 4-5) through quality assurance (QA) (Smith, 2011, p. 7; Thurab-Nkhosi, 2010).

The essay discusses then the possible value of online-learning to Caribbean higher-education, and indeed suggests that the utility of online-learning be decided on a case-by-case basis. Under consideration are the English-speaking Caribbean nations who gained independence between the 1960s and the 1980s (Ali, 2008, p. 1), and whose educational developmental agendas are set largely through the initiatives of the unified Caribbean Community (CARICOM). Comparatively, as overseas holdings, the Non-Anglophone territories are not considered.

**Abstract:** In this study, we clarified whether or not one's health care information is communicated to relatives as well as willingness to communicate one's health care information via ICT to be utilized by children and relatives by conducting several surveys. Parents and guardians raising children and elderly people were the subjects for the surveys (total 740people). From the results, in regards to the group of elderly people, 77% of those who would like to utilize health care with ICT wish to succeed information on their health care to children and relatives. Studies to review an individual's health care information from the viewpoint of succession to others are extremely rare; thus this study could be very novel. Finally, we would like to propose a platform, a structure to create a record of local information.

## **Introduction**

The definition of health in the world is found in the WHO Constitution in 1948: “Health is a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity.”

Japan as an eminent country of longevity began the “Healthy Japan 21” project from 2000 as a movement to maintain people’s health. In order to further promote health and prevent diseases for people with “Healthy Japan 21” as the core, the Health Promotion Act was promulgated on August 2, 2002 as part of health care reform. In regards to health care for individuals, various companies began to propose methods for health care for individuals by utilizing Information and Communications Technologies (ICT), including Omron Healthcare’s sales of a system called WellnessLINK beginning in 2010 that utilizes a tonometer with a communication function, with which records of measurement are utilized for an individual’s own health care. With any of the existing systems, data can only be viewed by the individual who manages health, a third party with specific authority, or a person authorized by the individual.

However, diseases develop, caused by genetic factors and environmental factors. If information on one’s own health can be not only utilized by the individual but also made known to and utilized by siblings, children and relatives including grandchildren and great-grandchildren yet to be born, it might be useful for health care for the relatives in addition to the individual. From this viewpoint, we clarified whether or not one’s health care information is communicated to relatives as well as willingness to communicate one’s health care information to be utilized by children and relatives by conducting several surveys. Studies to review an individual’s health care information from the viewpoint of succession to others are extremely rare; however it is not impossible as ICT has developed these days. We would like to propose the Local Information Platform (LIP), a structure to create a record of local information by storing connection between an object and person as well as among people in combination with geographical information. LIP is not only useful for rehabilitation in affected areas but also will become a learning tool for children.

## **The Study**

Diseases are caused due to various reasons, which can be largely categorized into two factors: a factor naturally carried by a person as a host and a factor caused afterwards outside of the host including the environment. The former is a genetic issue; therefore called a genetic factor, and the latter is called an environmental factor. At present, both genetic and environmental factors are considered to be involved in most illnesses (Yamagata, 2000). Not only unhealthy lifestyle habits are involved in lifestyle diseases including high blood pressure and diabetes; but it is being clarified at the genetic level that an individual’s vulnerability to illness, i.e., genetic factors, is also related. Lifestyle diseases are caused by multiple genes as well as multiple environmental factors; therefore are called multifactorial genetic disorders (Suzumori, 2003; Yamagata, 2000). People’s genetic information is compiled in databases mainly in relation to diseases, and On Line Mendelian Inheritance in Men is open to the public and widely utilized. Even if genetic information is interpreted, genetic factors are not everything that can determine whether or not a disease is

caused; therefore some form of care of environmental factors will be necessary when an individual considers prevention of illness. Human beings in an ecosystem are a biological existence in terms of cultural anthropology and at the same time is positioned as a cultural existence. Specifically, people are considered to adapt themselves to the ecosystem in two forms including “genetic adaptation” and “cultural adaptation.” It is considered that “‘cultural adaptation’ means that people’s lifestyle comes to have characteristics selected and succeeded in the environment” and “‘genetic adaptation’ means that tissues and cells comprising a human body come to have hereditary characteristics that survive natural selection in the environment as they live in the environment of a specific ecosystem” (Michinobu, 2011). Environmental factors seem to be emphasized more than genetic factors in cultural anthropology.

## Methods

In order to clarify the consciousness to the communication of health care information to family members, the following survey was conducted at two elementary schools and one senior center. We considered health care information includes not only medical history but also daily living in relation to environmental factors such as dietary records and sleeping hours.

### Survey 1

Target: 128 people in a municipal senior center in Saitama Prefecture, Japan

Period: July 2011

Method: Hearing survey using an interview method

Survey description: Gender and age of respondents; others are indicated in Fig. 1.

- |     |   |
|-----|---|
| 1   | Do you go to a regular hospital? (Yes/No)   |
| 2   | Does your family have a family doctor? (Yes/No)   |
| 3   | Do you communicate your illness as well as illnesses and causes of death of your ancestors to your children and grandchildren? (Yes/No) |
| 3-1 | Talked / Have not talked / Will talk in the future / Do not plan to talk in the future either   |
| 3-2 | Wrote / Did not write / Plan to write / Do not plan to write  |
| 4   | Are you aware of illness of your ancestors? (Aware / Slightly aware / Not aware very much / Not aware)                                  |

**Figure 1:** Awareness survey on succession of health care information

### Survey 2-1

Target: 385 parents and guardians of all students in a public elementary school in Tochigi Prefecture, Japan

Period: June 2012

Method: Parents and guardians of students were requested through home room teachers of the elementary school; a survey form was completed

Survey description: Gender and age of respondents; others are indicated in Fig. 2

### Survey 2-2

Target: 599 parents and guardians of all students in a public elementary school in Ibaraki Prefecture, Japan

Period, method and survey description: Same as Survey 2-1

### Survey 2-3

Target: 44 people in a municipal senior center in Saitama Prefecture, Japan

Period: July 2012

Method: Hearing survey using an interview method

Survey description: Same as Survey 2-1

<p>Health is supposed to be determined by heredity, living environment and natural environment.</p> <p>Food and health can be managed by taking photos and keeping notes along with the use of a PC or mobile phone so that they can be useful for health promotion. Would you like to utilize it? (check all that apply)</p> <p>1 Yes</p> <p>1-1 I don't mind if others are made known and would like to utilize it (or am utilizing it already).</p> <p>1-2 I would like to utilize it in a way that others are not made known (or am utilizing it already).</p> <p>1-3 I am willing to show information on my health care accumulated as a result of utilization to my children, so that it will be useful for health care of my children.</p> <p>1-4 I am willing to show information on my health care accumulated as a result of utilization to my relatives including siblings, uncles, aunts and cousins, so that it will be useful for their health care.</p> <p>1-5 Other reasons</p> <p>2 No</p> <p>Reasons of unwillingness (please describe)</p>

**Figure 2:** Awareness survey on succession of health care and health care information with ICT

## Findings

### Survey 1

An interview method was used for Survey 1; therefore responses were obtained from all 128 people as a result of the survey. The responses are indicated in Tab. 1. 91% go to regular hospitals, and approximately half of them have family doctors (48%). 53% communicated illnesses about himself/herself and ancestors to children and grandchildren, while most of them communicated verbally and only 2% put it in writing. 6% of all respondents were not willing to communicate it in the future verbally, and 64% of all respondents do not intend to put it in writing. It was clarified in this survey that verbal communication about illnesses of ancestors, etc. is thought to be sufficient and only 13% think it necessary to keep it in writing, when asked whether or not illnesses of a respondent and ancestors have been communicated to

descendants without advising that genetic and environmental factors relate to health. Although descendants are not able to confirm information if not kept in writing, it seems that respondents were answering questions without paying attention to it. It was also found that 62% of respondents are willing to communicate illness of ancestors and themselves verbally, including those who are willing to communicate it in the future.

	Rate of positive answers including "Yes," "Talked," "Concerned," etc. (%)	Rate of negative answers including "No," "Have not Talked," "Not concerned," etc. (%)	Plan to talk in the future / Plan to write (%)	Do not plan to talk in the future either / Do not plan to write (%)	Rate of no response (%)
1	91.4	7.8	--	--	0.8
2	47.7	39.1	--	--	13.3
3	53.1	24.2	--	--	22.7
3-1	53.1	25.0	--	--	21.9
3-1 Details	53.1	10.2	8.6	6.3	21.9
3-2	1.6	75.8	--	--	22.7
3-2 Details	1.6	0.8	10.9	64.1	22.7
4	57.0	23.4	--	--	19.6

**Table 1:** Results of awareness survey on succession of health care information

## Survey 2

As a result of the survey, the collection rate of Survey 2-1 was 57.9% (223 people) with 217 effective answers. The collection rate of Survey 2-2 was 57.6% (345 people) with 331 effective answers. Survey 2-3 used an interview method; therefore responses were received from all 44 people. The responses are indicated in Tab. 2. Parents and guardians raising children (average age: late 30s) were the subjects for Surveys 2-1 and 2-2, and were generally positive, i.e., 63-70% answered that they would like to utilize health care with ICT. In regards to the elderly people as the subjects for Survey 2-3, however, only 39% answered that they would like to utilize it, i.e., had negative ideas to utilization. When 1-1 to 1-5 (selection items for those who would like to utilize it) are reviewed, 25-27% of all effective responses represented willingness to communicate information on health care accumulated on their own to their children. Answers with willingness to communicate information on health care accumulated on their own to their children out of those who would like to utilize health care with ICT represented 36-40% from parents and guardians raising children and 71% from elderly people, i.e., resulting in a significant difference. Furthermore, 9-11% and 30% of effective responses from parents and guardians raising children and the elderly, respectively, responded that they would like to communicate information on health care accumulated on their own to relatives including siblings, cousins, uncles and aunts. 13-18% of parents and guardians raising children in both Surveys 2-1 and 2-2, and 77% of the elderly people in Survey 2-3 responded that they would like to utilize health care with ICT and communicate it to their relatives.

	Survey 2-1		Survey 2-2		Survey 2-3	
	Average age: 37		Average age: 38		Average age: 76	
	Response rate A* (%)	Response rate P** (%)	Response rate A* (%)	Response rate P** (%)	Response rate A* (%)	Response rate P** (%)
1	62.7	--	69.8	--	38.6	--
1-1	4.6	7.4	8.2	11.7	18.2	47.1
1-2	31.3	50.0	39.0	55.8	11.4	29.4
1-3	25.3	40.4	25.1	35.9	27.3	70.6
1-4	11.1	17.6	9.1	13.0	29.5	76.5
1-5	0.9	1.5	0.9	1.3	4.5	11.8
2	37.3	--	30.2	--	61.4	--

\* Response rate A: Number of responses / Number of effective responses

\*\* Response rate P: Number of responses / Number of people who selected 1

**Table 2:** Results of awareness survey on succession of health care and health care information

Tab. 3 is indicating response rates by focusing on the number of people who selected 1-3 or 1-4 in the results of Survey 2. It was found from this extraction that approximately 30% of effective responses in all surveys represent people who are willing to communicate information on their health care to their children and relatives. If limited to those who would like to utilize health care with ICT, the group of elderly people in Survey 2-3 had the highest rate in responses stating that they would like to communicate it to their children and relatives.

	Survey 2-1		Survey 2-2		Survey 2-3	
	Average age: 37		Average age: 38		Average age: 76	
	Response rate A* (%)	Response rate P** (%)	Response rate A* (%)	Response rate P** (%)	Response rate A* (%)	Response rate P** (%)
Number of people who selected 1-3 or 1-4	32.7	52.2	30.5	43.7	29.5	76.5

\* Response rate A: Number of responses / Number of effective responses

\*\* Response rate P: Number of responses / Number of people who selected 1

**Table 3:** Response rate with willingness to communicate information on health care to children or relatives

From the results of Survey 2, parents and guardians of children in their 30s are willing to utilize health care with ICT, compared with a group in their late 70s. Consciousness to communicate information on health care to children and relatives to be used for health care of children and relatives occupies only 30%

regardless of ages. Furthermore, in regards to the group of elderly people, 77% of those who would like to utilize health care with ICT wish to succeed information on their health care to children and relatives.

However, the number of targets is small in this survey, particularly in regards to the elderly, and similar surveys need to be continued in the future.

## **Discussions**

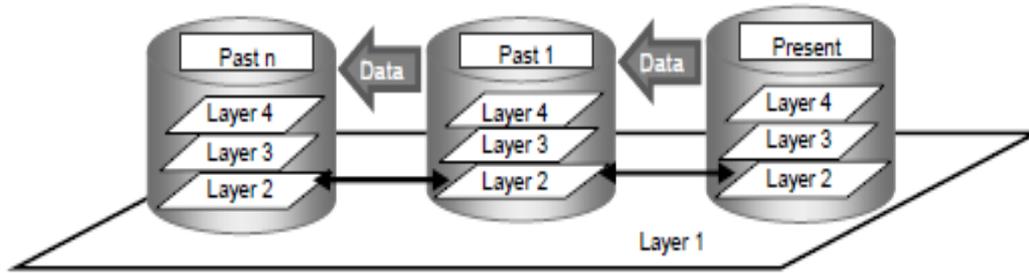

In Survey 1, 62% would like to communicate illness of their own and ancestors verbally, while 12.5% intended to leave it in writing. In Survey 2, on the other hand, approximately 30% would like to communicate information on their health care to descendants or relatives in all generations. The number of people who would like to communicate information on health care to descendants or relatives with ICT significantly exceeded the number of people who intend to keep it in writing, probably because they were indicated that “health is supposed to be determined by heredity, living environment and natural environment,” and asked if “they would like to communicate for the purpose of health care of descendants or relatives” not for their health care at the stage of the survey.

In Survey 2-3 targeting elderly people, 37.0% of respondents who answered with unwillingness of communication by utilizing ICT mentioned they are not good at machines, representing the greatest number. The second most common reason occupied 25.9% who answered with willingness to manage their health within the scope of their ability. Others included reasons such as “would like to communicate directly,” “troublesome,” “leave it to doctors,” etc. If the premise is not to use ICT on their own but someone helps to handle information with ICT, people who answer with willingness to manage their health care information and communicate it to their relatives might increase.

87.5% of people who wrote down or plan to write down in Survey 1 answered that they have concerns or a little concerns with illnesses of their ancestors. On the other hand, people who wrote down or plan to write down occupied 52.9% among those who have concerns with illnesses of ancestors, while people who wrote down or plan to write down occupied only 8.9% among those who have a little concerns with illnesses of ancestors. It might be suggesting the strong will of communication and awareness on the illnesses of ancestors, since a method to keep it in writing is not only for oneself but also helps to leave something that can be confirmed in later generations.

We previously proposed a structure to succeed information as knowledge (Kurata, Ohashi, and Hori, 2011) as well as a platform to collect and succeed information for restoration from earthquakes as indicated in Fig. 3 and Tab. 4 (Kurata & Ohashi, 2011). In addition, we will propose this platform based on a new significance as a platform(LIP) to succeed local culture including individual’s health care information, not limited to the time of disasters(Kurata,N., Kurata,Y., and Ohashi, 2012). When individual’s health care information is positioned in the LIP, it is considered to belong to Layers 4-2 in Fig. 3 and Tab. 4, since it is information that transitions relatively quickly. With multilayered archiving of local information including individual’s health with ICT, health care information at a certain point becomes interrelated and can be

learned along with related people, episodes and geographical information. Retention of health care information with ICT can condense personal information and at the same time store the surrounding information including relevance; therefore will be the best learning tool for children/relatives. Archiving health care information like this means preservation of physical and human information in the region; therefore will lead to expression of local identity itself.

**Figure 3:** The platform for the accumulation of archives and information

Time Scale	Layer	Archives/Memories/Information	Details	
Micro Scale 1-5year	Layer 4	Inhabitants, Individuals	Layer 4-2	Life log (both open and closed contents)
			Layer 4-1	Social graph
	Layer 3	Communities	Layer 3-2	Combination of public/open part of social graph and life log
			Layer 3-1	Local event & local history
Meso Scale 10-30year	Layer 2	Government etc. Public Institutions Fundamental and Variable Information	Layer 2	Three dimensional maps, including the buildings etc.
Macro Scale 100year	Layer 1	Government etc. Public Institutions Fundamental and Long-lasting Information	Layer 1-4	Long-lasting three dimensional maps, including the land elevation maps etc.
			Layer 1-3	Long-lasting two dimensional maps, including the road maps etc.
			Layer 1-2	Shallow under-ground maps, including the water pipe maps etc.
			Layer 1-1	Deep under-ground maps, including the stratum maps etc.

**Table 4:** Details of the simplified and conformed layers given in Fig. 3

## Conclusions

It was clarified in this study how many people would like to succeed health care information to relatives as well as how many people would like to succeed it by utilizing ICT, by focusing on health care information. The elderly is strongly willing to communicate, while many of them are not good at utilizing ICT, leaving difficulties in this respect. However, as we previous proposed (Kurata, Ohashi, and Hori,

2011), assignment of support staff from a local government, etc. is considered as one of the solutions to manage health care information for the elderly. It is because local governments are benefited by extended healthy life expectancy which will lead to reduction of medical expenses. Promotion of individual's health care with ICT will help succeed the information to relatives in remote places; therefore the information can be succeeded to not only relatives within a visible scope but also to descendants in future generations. However, personal information should not be leaked and security has to be strengthened. Health care information cannot be used for social discrimination either. There is also an issue of how to be consistent with the privacy rights of an individual. Regardless of these difficulties, as far as genetic and environmental factors significantly determine health, it might be a better idea to suppose that health care information is to be succeeded to relatives as their right to know unless it is specifically designated for nondisclosure, although it might be contrary to previous ideas.

## Abstract

This paper presents an overview of the patterns of collaboration in long-term assessment groups. The purpose of the study was to try to develop an understanding of how groups of pre-service teachers organised, planned and built a web-based resource using a learn-technology-by-design framework. A design-based research approach was used. This paper presents the observational data, which was collected as part of an ongoing research project on curriculum redesign in an Information and Communication Technology (ICT) in Education unit of study (course). In this study, seven groups were observed while they engaged in a long-term collaboration and completed two group assessment tasks. The results suggest that students needed both guidance and time to develop their skills in collaboration. While there were variations in the collaborative patterns, these variations did not impact upon the success of the groups in the development of their ICT resources.

**Key Words:** Collaborative learning, pre-service teacher education, ICT education, learn-technology-by-design, authentic learning

## Introduction

The benefits for students in using a learn-by-design approach have been well-researched and the research has covered a broad range of research streams. For example, one stream of studies have focused on the benefits of student learning through design across the education sector, as Kafai (2006) states that “The greatest learning benefit remains reserved for those engaged in the design process... and not those at the receiving end” (p.39). Another stream of research has investigated how to structure the design experience to support learning and has focused more on the design of learning tasks and activities (Ronen-Fuhrmann & Kali, 2010). While another stream of studies have focused on teachers as designers (Goodyear, Markauskaite, & Kali, 2009). One issue raised by Goodyear et al. (2009) on the research on teachers as designers is that it may be “all too rare for university teachers to have timely, valid and reliable data on student achievement. This is a major problem in the assessment process itself, but also handicaps any attempts at evidence-driven iterative design (p.15).

In this paper, we present the patterns of collaboration in a learn-technology-by-design project. The rationale for this approach is that, as educators, by understanding how students

collaborate and engage in design processes we can provide enhanced support and just in time feedback to support the acquisition of design knowledge. This work is part of a larger interest we have in design-based research, teaching-as-design, collaborative learning by design and design principles (see, for example (Galstaun, Kennedy-Clark, & Hu, 2011; Hu & Fyfe, 2010; Hu, Wong, Fyfe, & Chan, 2010; Kennedy-Clark, 2011; Kennedy-Clark, Galstaun, & Anderson, 2013; Kennedy-Clark & Thompson, 2012)). The study reported on here is part of an ongoing curriculum redesign project of the standalone Information and Communication Technology (ICT) in Education Unit of Study (course) at the University of Sydney. We have come to attach particular importance both to the design-based research approach which allows the research team to consider the multiple levels of design from the micro-detail of the lesson activities to the broader context of the classroom and education environment and to the role of collaboration in the design process.

## **Background**

### **Pre-Service Teachers and ICTs**

The complexity of preparing pre-service teachers for technology use in the classroom is an enduring issue. As technology rapidly evolves, it is difficult to design a unit of study that provides lasting and relevant knowledge and skills for pre-service teachers. So, in this sense rather than teaching a course that would provide students with skills in programs like MSWord, we have tried to use a more generic skills-based approach that teaches students about the process of evaluating existing resources, and designing and creating purpose-built resources so that they can develop skills that can be applied across a range of technologies. This approach draws upon Goodyear et al.'s (2009) claim of a place for pedagogical p-prims. According to Goodyear et al. (2009) pedagogical p-prims encode direct experiences of learning and teaching – they are useful for sense-making. In this respect, the pedagogical p-prims that arise from a learn-by-design experience may form the building blocks for what they call 'folk pedagogy'. In diSessa's (2004) explanation of knowledge in pieces, different sets of p-prims are activated in different contexts, so the specific context in which a piece of knowledge is experience may not be activated in a different context. For example, a pre-service teacher may learn how to use a particular software, but they may not be able to apply that knowledge in a different context. This description of context dependent p-prims may explain the apparent contradictions in teachers' and students' pedagogical views.

Building on the need to experience the design process in context, Mishra and Koehler (2006) advocate an approach of learn-technology-by-design for preparing pre-service teachers for technology integration in the classroom, using this approach pre-service teachers 'propose software and hardware solutions to their specific contexts and problems' (p. 1034). So rather than teaching technical skills or mastery of a program or application, the tutorials were used to support pre-service teachers in developing both technical and pedagogical knowledge in the context of their teaching discipline. As Mishra and Koehler (2006) advocate an approach wherein pre-service teachers have 'spontaneous and short tutorial sessions - both student to student and instructor to student driven by the immediate requirements of the groups' (p. 1034), each tutorial commenced with a short teacher led session where students could raise questions about the design process. In this respect, the learn-technology-by-design approach presents educators with an opportunity for the symbiotic development of technical and pedagogical skills. Similarly, as part of the redesign process, the research team has shifted away from our earlier studies that used more complicated technologies, such as virtual worlds and animation software, which required considerable skills training in comparison to open-source and government endorsed software. Our rationale for this was two-fold. Firstly, when

the students enter the classroom as novice teachers they will have access to interactive whiteboards and government supported software (SMART Notebook) and they will have access to a range of web-supported open-source tools that are able to be used behind the schools' firewalls.

### **Collaboration**

The scaffolding of collaborative tasks (problems) needs to be considered in the context of how people collaborate. Many researchers see, for example, Beatty and Nunan (2004) and Gillies (2003) have shown that simply putting people together will not result in an effective collaboration. The studies indicate that the collaboration needs to be scaffolded. Through scaffolding the collaboration students can develop strategies to share the workload and focus on specific areas of the task. For example, if sharing a computer, if one student is directing the group by referring to the notes, their partner can focus on implementing the navigational goals and completing the specified action. This is in support of research that indicates that calls for explicit organisation of the materials and students need to be aware of both the collaborative and task-based processes (Kim & Hannafin, 2011; Thompson, Kennedy-Clark, Markauskaite, & Southavilay, 2011).

Collaborative learning requires set of actions and processes. For example, this may include practical actions, such as a plan for the work process, skills, such as critical thinking, and a learning activity, such as a scaffolded task. Learners need to engage in these steps to effectively collaborate. Determining group priorities, therefore, is also an important part of the collaborative learning process (Jeong & Chi, 2007; Johnson & Johnson, 2002; Slavin, 1996; Stahl, 2013). Consequently, when designing an open-ended collaborative task, teachers need to commence with manageable activities that scaffold both the collaboration and the problem. In this respect, the pre-service teachers need to know how to effectively collaborate and need explicit guidance in the steps of how to plan and implement the collaborative goals in order to complete the task. When designing the unit of study, we developed a collaborative task early in the course for students to develop an interactive whiteboard resource before the development of their website. This assessment task gave the students the opportunity to develop their collaborative skills before the major assessment task, which was more complicated.

### **Web 2.0 Tools**

As new digital media technologies are developed and enveloped by mainstream society, it is necessary to reflect upon how these technologies are being used as educational tools in pre-service teacher training as there is an expectation that graduating teachers will have both the skill and understanding to be able to use a range of ICTs to support learning. If Web 1.0 (e-mail, one way video conferencing and discussion forums) was all about receiving information and users being passive consumers, then Web 2.0 is all about being part of the action with the user being the creator and distributor of information (Ajjan & Hartshorne, 2008; Usluel & Mazman, 2009). It is this user as creator element of these technologies that has afforded higher education institutions with new frontiers to engage with staff and students to provide an enhanced learning experience.

In earlier iterations of the unit of study discussed in this paper, a range of technologies have been used. This has included animation software, such as Marvin, a 3D animation package that allows users to create their own animations, and a collaborative Educational Video Annotation software (EVA) that was developed at the Faculty of Education and Social Work at the University of Sydney (Hu, et al., 2010). What we have found was that the more

complicated the technology, the more resistant the students were to use these new technologies and new skills in an educational setting. For example, in a study on the use of virtual worlds in science education we found that given the amount of time that it would take to master the virtual world that pre-service teachers did not want to risk using the technology in their own teaching (Kennedy-Clark, 2011). However, they would feel comfortable using an online point and click game that required no skills training (Kennedy-Clark, Galstaun, & Anderson, 2011). On the basis of these findings and studies, such as Choy et al's (2008), we adopted the use of web-supported tools so that the pre-service teachers would have sufficient exposure to the website platform (Google Sites and WordPress) to feel comfortable using this technology in the classroom.

## **Methodology and Process**

A design-based research approach underpins the study where each semester the unit is modified on the basis of feedback and analysis of the previous studies in a system of continual renewal and improvement that considers not only the changing student needs, but also the evolution of technologies. Design-based research is an approach to research that supports the exploration of educational problems and refining theory and practice by defining a pedagogical outcome and then focusing on how to create a learning environment that supports the outcome (Reeves, Herrington, & Oliver, 2005; Wang & Hannafin, 2005). We used a collaborative approach in both the design of the tasks and the critical feedback through a peer review process. Design-based learning activities have been shown to be of benefit to students learning how to use technology effectively in a range of educational contexts (Kali, Goodyear, & Markauskaite, 2011; Kali & Ronen-Fuhrmann, 2011; Mishra & Koehler, 2006). Research findings have indicated that pre-service teachers develop deeper understanding through the experiences of both dialogue and reflection in action (Mishra & Koehler, 2006). Learn-technology-by-design tasks are accomplished in the environments where students, and in this instance pre-service teachers, are encouraged to use ICT tools to build a learning environment.

## **Data Collection and Analysis**

The study was conducted in Semester 2, 2012 between July and November. There were fifteen participants in the study including five males. All of the students were completing an undergraduate degree in secondary education. This was a compulsory, fourth year course. The two collaborative assessment tasks were observed over a period of five weeks from week 2 through to week 6. Week 1 was not observed as this was an introductory session providing students with an overview of the underpinning theories in design and collaboration as well as information about the assessment tasks and timetable for each component around the design and development process. The tutorial sessions were two hours in length. The tutorial sessions occurred on a weekly basis. There was no lecture for this subject. The task in the first two sessions (weeks 2 and 3) was to build an interactive whiteboard resource. Week 4 was an assessment and in the remaining three sessions (weeks 5, 6 and 7), the task was to design and build a website on a particular curriculum area. The low weighted task in week 4 gave each of the groups the opportunity to develop their collaborative work strategies as well as the opportunity to work together on their curriculum areas. In these early weeks there was a degree of fluidity in the groups with groups moving seating. After the first assessment, the groups had established permanent seating arrangements (i.e. each student sat in the same seat each tutorial).

Note that Group 2 ceased to function after the first assessment in week 4. These students joined other groups. The group split to find a better collaboration using their other curriculum subject major. Though they were both languages teachers (one Japanese and one Spanish) the collaboration on the first task was quite difficult for each student finding common subject content areas as each language had unique features for learning and building a generic IWB resource that dealt with each language provided some challenges for the group. Using their other subject majors (English and History) allowed for better subject content negotiation for the newly formed groups to collaborate with each other. This allowed the group to better engage with the task.

In this paper, the observational data is being reported upon. Persistent observation was one form of data collected during the semester-long study. Persistent observation is the ongoing observation of participants in a study. Persistent observation allows the researcher to identify what is relevant to the study and what is not (Lincoln & Guba 1985). Through persistent observation, a researcher can also see how students and teachers function, which groups were motivated, which groups struggled, and how the teachers interacted with the students. The observational data was collected over the course of the semester by the second author. During this time, the second author attended all of the classes and observed the class while they were designing and developing the resources. While observations were taken throughout the tutorials, at four stages during each tutorial (start, 30 mins, 60 mins, 90mins), observations were taken that focused specifically on the group processes. These timed observation periods lasted for approximately five minutes. The second author took notes, made videos and took photos of each of the sessions in order to develop a detailed narrative of each group's interactions during the tutorials. The first author, who was the teacher, did not engage with the data collection activity during class time in order to avoid perceived coercion to participate in class or the Hawthorne Effect. The Hawthorne Effect was described by Mayo (1949) as a form of reactivity whereby students modify their behaviour or outputs purely in response to the fact that they know they are being studied. The observations were conducted over the course of the semester in order to ensure that sufficient data through a prolonged engagement with the group was collected. According to Lincoln and Guba (1985), prolonged engagement is crucial in a qualitative study in helping to support the concept of credibility in qualitative research because it assists the researcher in testing for misinformation and building trust with the participants.

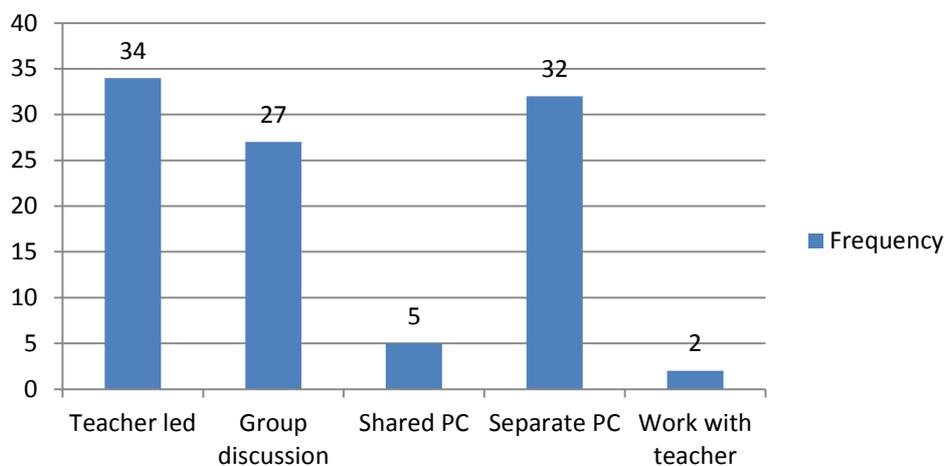

In order to validate the observations peer de-briefing was used at the conclusion of each of the sessions and at the conclusion of the semester. Peer debriefing is a process in which the investigator discusses the investigation with peers. Through peer de-briefing a research team can explore aspects of the research that may otherwise remain only implicit (Lincoln & Guba, 1985). Peer debriefing can encourage researchers to search for biases, scrutinise their hypotheses and justification for their research, discuss the direction of their research and methodological design, and to explore their feelings and emotions towards their research so that they can assess how their experience might impact upon their interpretation of the data (Lincoln & Guba, 1985).

The analysis of the observational data was undertaken in several stages. Firstly, the individual group collaborations were identified for each tutorial. In this sense, the group patterns of collaboration were isolated from the whole class narrative. After the initial analysis of data, the individual segments of collaboration were coded. Originally, the codes were teacher talk, small group discussion, individual work (side-by-side on separate computers), shared work (group working on one computer), work with teacher and assessment. The coded interactions

were developed into a visualisation. After analysing the visualisations the research team re-coded the data to remove the ‘assessment’ code as it resulted in a skewed pattern of collaboration that did not reflect the actual class interactions. Next, the coded data were developed into a series of visualisations, the research team then discussed which visualisation provided the best representation of the collaborations. Each of the actions was allocated a symbol to develop the pattern, whilst this may seem fairly simplistic, it does provide a visual representation of the groups (Figure 2). The results of the observations were compiled and analysed for patterns of collaboration and are presented in the results.

## Results and Discussion

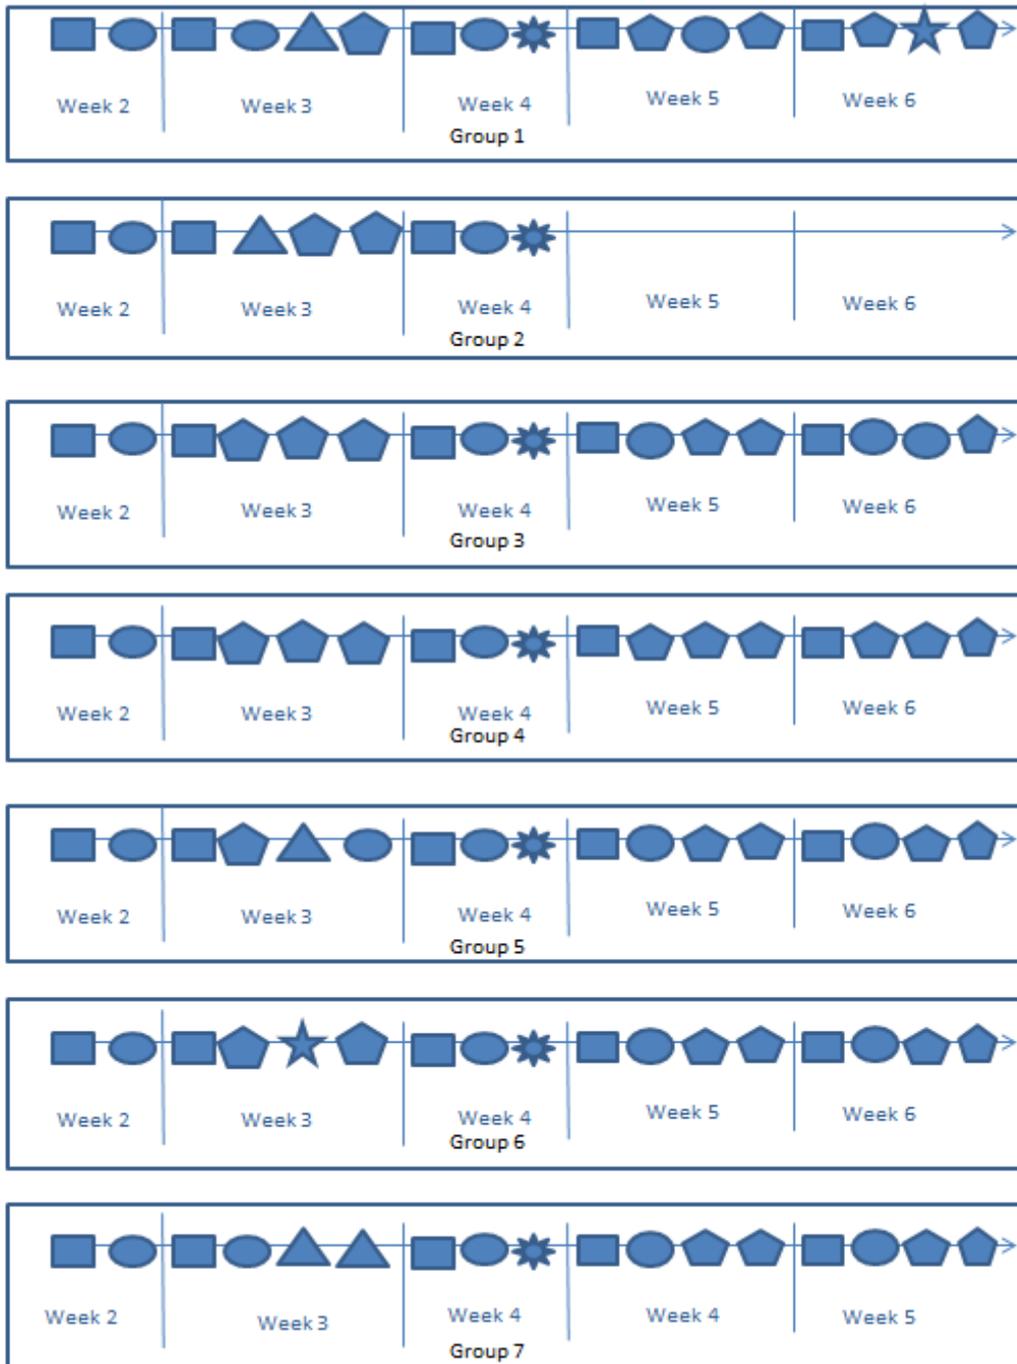

A frequency graph was developed to see if there were any trends in collaborative behaviour. As can be seen in Figure 1, of the 97 recorded activities 34 per cent were the teacher led activities. These occurred at the start of each class.

**Figure 1: Frequency distribution of class activities**

The next most frequent activity was working on a separate computer (32%) followed by group discussion (27%). The most infrequent activity was to work with the teacher (2%). What this meant was that for the timed observation the group worked with the teacher and the teacher was actually sitting with the students. This was a positive result for the researchers as it meant that the groups were able to work effectively without sustained support from the teacher. In this respect, the actual level of skill required to master the two tools (interactive whiteboard and web resource) was within the range of the class members. This indicates that in comparison to our earlier studies, the students were not struggling with the technology.

What the frequency data does suggest is that both group discussion and individual work were the main task-related activities. Sharing a computer was not a frequent activity, with only five per cent of all of the recorded observations coded for sharing. It was also observed that as the groups progressed through the collaboration, sharing became less frequent. In fact, after the first assessment (developing an interactive whiteboard resource) none of the groups shared a computer. So whilst they sat next to each other, the group members were developing aspects of the shared design. That is, while the groups had shared goals, they all had individual roles and tasks to complete.

Page 2 of 25

**Legend**

Symbol	Description
	Teacher talk (teacher at front of room, guiding class)
	Group Discussion
	Shared PC (side-by-side, share mouse)
	Separate PCs
	Work with teacher (Teacher sat with students)
	Assessment (included but not measured)

**Figure 2: Student patterns of collaboration**

While the frequency analysis may show the broad trends of the class collaboration, it does not show the actual patterns of collaboration for each group. Accordingly, the research team developed a process map for each of the seven groups. These maps present the patterns of group design processes (Figure 2). At the start of each week, the teacher led the class in discussion and through the content for the course; hence, the high frequency of teacher led activities. Note that the teacher walked around and talked to each group in each session; however, in the cases where the teacher remained with a group for a considerable period of time and not just for trouble shooting, this is recorded on the maps. Another consideration is that for weeks 2 and 4 fewer observations were included in maps due to the actual class activities. In week 2, the teacher talked for most of the class and in week 4 half the final two observations were coded as assessment. In terms of whole class behaviour, the patterns of collaboration weeks 2 and 4 demonstrate how all of the groups had the same pattern of behaviour. In week 2, the teacher led the activity and then the groups discussed (planned) their shared interactive whiteboard resources. In week 4, the teacher started the class and then each group had the opportunity to prepare for the interactive whiteboard assessment. All of the groups used this time for a small group discussion.

In regards to the development of a regular pattern of activity, some groups, such as groups 4, 7, and 5 established fairly routine patterns of behaviour as the collaboration progresses. For example, Group 4 started each week with the teacher led activity and then spent the rest of the tutorial working on separate computers. When asked about this behaviour, the two female students indicated that they met during the week to plan their tasks for the tutorial so that they could use the tutorial time specifically to build the resources. Other groups did not establish routine patterns on behaviour, for example, Group 3 changed their patterns of collaboration each week. In regards to the establishment of routines, it is not a necessary factor in achieving a group consensus or enacting a shared goal. Poole and Holmes (1995) found that the orderliness of groups had no clear relationship to consensus to change in group decision making. They established that while a general ordering of activities (good planning) may prove useful, a tight micromanagement of the discussion was not necessarily advantageous. This would appear to be supported in these results, and it may just be that students need support in arriving at the pattern of collaboration that suits their particular group and their shared goals. This will require that students know how to identify a goal, negotiate a goal pathway, agree on tasks and evaluate the process in order to modify or continue with the current strategies in subsequent iterations of the activity.

What the results suggest is that the teacher led activity at the start of each class was used to orient the groups. Some groups followed the teacher activity with a discussion. For instance, each week, Group 7 had a discussion after the teacher activity. We argue that the issue is not whether to scaffold the collaboration and the task, but when and how to scaffold (Azevedo & Jacobson, 2008). That is, a degree of scaffolding or guidance is needed to both aspects (collaboration and task), but allowing students to engage with a task without presenting a guided step-by-step task may encourage the activation of non-domain-specific knowledge and recognition of gaps in knowledge. This deeper understanding of the task increases the domain knowledge and problem-solving skills. Enabling students to struggle or make mistakes is often shied away from in education, but as Kolodner (2006) suggested, timely feedback and opportunities to re-engage with the task can afford learners with greater opportunities to learn and interpret their experiences.

What we are arguing is that if the groups only engage with highly scaffolded (guided) tasks, it is unlikely that they will delve deeper to gain a more comprehensive understanding of the task, the tool and the content. That is, if the collaborative task is too guided, the students may not develop the technological, pedagogical and content knowledge needed to be able to evaluate, develop and plan to use ICTs in their own teaching practice across a range of contexts. As Bransford and Schwartz (1999, pp. 82 - 83) suggest, there is value in allowing learners to be able to 'bump up against the world' and to revise and re-think their initial actions if their first encounter is not successful and they indicate that this testing of thinking can lead to better learning. The value having two assessments as part of the long term collaboration is that the students had time to develop and reflect upon their collaborative approach before they engaged with the more complex second assessment of planning, designing and building a web resource.

It was evident from our earlier studies that the pre-service teachers and classroom teachers found the use of complicated technologies, such as virtual worlds, to be daunting due to factors, such as the technical requirements and the amount of time it would take them to master the technology (Galstaun, et al., 2011; Kennedy-Clark, 2011). Hence, by providing students with an opportunity to use an open-source Web 2.0 tool they were able to develop both the skills and confidence of using the technology in their particular content area. The need for pre-service teachers to gain successful experience in using technology for learning and teaching is supported by Teo (2008), who reasons that there is:

a need for teacher educators to provide a conducive and non-threatening environment for pre-service teachers to experience success in using the computers, with a view to allowing pre-service teachers to gain competence and confidence in using computers for teaching and learning (p. 421).

Overall, what we were trying to achieve in this phase of the research was a move away from teaching the tool to teaching with the tool to using ICT meaningfully (Figg & McCartney, 2010). What we found was that the actual design of the unit of study and the selection of easy to use tools meant that students were able to successfully design and build their ICT resources.

## **Conclusions**

The unit of study described in this paper tried to prepare pre-service teachers to be fluent in both pedagogy and basic design theory so that they may use their newly acquired ICT skills to produce educationally sound web-based learning resources (Hu, Wong, Fyfe, & Chan, 2010). Through an analysis of the patterns of collaboration we were able to identify the most frequent activities of the collaboration, which happened best when students were working on separate computers. What can be surmised here was the success of the groups in completing both of the assessment tasks successfully due to the scaffolding and just-in-time support provided by the teacher. The lower weighted assessment task in week 4 gave the groups time to develop strategies that would enable a successful collaboration. That is not to say that all of the groups were successful, Group 2 separated after the first task and the members joined different groups. However, having time and appropriate guidance enabled the groups to develop both the collaborative skills and ICT skills to develop interactive content-based syllabus driven web-resources.

HAWAII INTERNATIONAL CONFERENCE – JANUARY 5-8, 2014

TITLE PAGE

- a) **Title:** The Festival of the *Mejorana* in Panama; the Spirit of Competition as Connected with National Pride
- b) **Topic Area:** Arts Education and/or Higher Education
- c) **Presentation Format:** This presentation falls under the conference category of “Abstracts” and most appropriately would be included with “Paper Sessions.”
- d) **Description.** See below –
- e) **Author:** Elizabeth Rhodes – Affiliation and contact information, see below.

**75-Word Description:** In the Republic of Panama, the Festival of the *Mejorana* is an event that takes place each year allowing for musicians and dancers from across the country to gather and celebrate as well as compete. The idea of competition provides a platform to discuss commonalities among the performers as well as their differences. This presentation will highlight the national pride of Panamanian folkloric performers as associated with a specific, annual festival venue.

**Contact Information for Presenter/Author:**

## ABSTRACT

This paper presentation is grounded in on-going research on folkloric dance in the Republic of Panama. My original field work occurred in 1996-97 while in residence as a Fulbright Scholar in the Department of Dance at the University of Panama. During that time period, I witnessed folkloric performances in venues including the National Theatre, schools, and on village streets during festivals, documenting the dancing through video, still photography, and hand-written notes. I participated in rehearsals and performances with the National folkloric company and conducted qualitative, intensive interviews whenever possible. Within each celebration, I observed cohesiveness of the participating groups as well as individual pride in ones wardrobe and performance which ultimately supported a sense of competition. Examples include the devils during the Congo Ritual who seek to control their neighborhood street and out-dance rivals, companies formed to represent different departments on the University campus, and annual festivals where formal competitions are organized and prizes are awarded during the culmination of the event. One of the best-known and largest occurrences of the last example mentioned above is the Festival of the *Mejorana* which takes place in September in the town of Guararé. Folk groups from the diverse provinces of Panama travel to perform and vie for awards in organized events that include competitions for the best musician of the *mejorana*, a stringed instrument with Spanish legacy, as well as the best folkloric dance troupe. The competition for the *reina* or queen would have already taken place, and the handing down of the crown is another aspect of the festival which derives from competition and selection. The festival was established over 40 years by folklorists Manuel and Dora Zárate, and it continues to bring together communities from across Panama as well as observers from other destinations and nationalities. In addition to providing an overview of the Festival of the *Mejorana*, I will describe specific folkloric dances that would have been performed during the early years of this celebration as well as more contemporary times. By using the concept of competition, I will be able to discuss commonalities among the groups performing while also offering observations dealing with diversity of theme, choreographic design, and movement style as part of each group's meaningful representation of their region or province which collectively contributes to an overall national pride.

### Research Objectives:

- To provide an overview of the Festival of the *Mejorana* in Panama
- To discuss one to two specific dances presented for competition as part of the festival
- To identify connectivity between the competitive aspect of folkloric dance and national pride, as based on the specific venue of the Festival of the *Mejorana*

**Proposed Methodology:** The project is primarily qualitative. A literature search has been conducted, and a review of personal archives from past field work will take place. At present, travel arrangements for collection of new data have been made, and continuation of primary source field work in Panama is projected for September of 2013.

**Expected Outcomes:** See abstract.

## **Extended Abstract: A Review of Cyber Bullying Policies in Saskatchewan Schools**

### **Background**

There has been extensive media coverage on cyber bullying in the past year following the suicides of two young Canadian cyber bullying victims. In addition, there has been a national call by researchers to develop Canadian cyber bullying policy guidelines and professional development programs for educators. However, at this time with the exception of student theses, there is a complete lack of research (i.e., published, peer-reviewed) on cyber bullying in Saskatchewan, Canada.

### **Review of the Literature**

Although today's adolescents survive socially via technology use, not all technological interactions are positive (Cassidy, Brown, & Jackson, 2012). Across Canada, statistics suggest approximately 30% of students between the ages of 12 and 17 have either cyber bullied others or have been victims of cyber bullying themselves (Beran & Li, 2005; Wade & Beran, 2011). Cyber bullying can be defined as a method of willful and repeated harassment through electronic communication tools (Beran & Li, 2005; Li, 2006; 2007; Pisch & Hellsten, 2012). Unlike traditional bullying, cyber bullying takes advantage of the anonymity provided by technology (Beran & Li, 2005, Li, 2006; 2007; Pisch & Hellsten, 2012). Although some individuals continue to perceive cyber bullying as insignificant (Andrie, 2013; Hinduja & Patchin, 2009; Pisch & Hellsten, 2012), it can be psychologically devastating for victims and can lead to mental health issues such as depression and school absenteeism (Shariff, 2008).

The prevalence of cyber bullying is enhanced by the proliferation of electronic media, including the use of cellular-smart phones, computers, electronic tablets, and internet gaming systems. These devices can text, email, instant message, and individually and collectively link users to offensive websites, chat rooms, webcams, blogs, twitter, message boards, and social networking websites such as Facebook and My Space (Andrie, 2013; Pisch & Hellsten, 2012; Shariff & Johnny, 2007; Wade & Beran, 2011). Electronic media provides youth with the opportunity to "torment, threaten, stalk, humiliate, embarrass, exclude, intimidate, or otherwise target others" (Broster & Brien, 2010, p. 416). Cyber bullying experiences include derogatory messages, comments, or emails about appearances or personhood, voting/rating websites, threats, false rumors, sexual messages and/or pictures, sexting, photo modifications, stolen passwords resulting in masquerading, and exclusion (Broster & Brien, 2010; Hemphill et al., 2012). Most cyber bullying is "covert, insidious and anonymous because perpetrators are shielded by screen names" (Shariff & Johnny, 2007, p. 312) and the perceived anonymity can lead to disinhibition and escalated levels of cyber bullying (Broster & Brien, 2010).

The majority of cyber bully victims fail to report the abuse to authority figures such as parents or teachers (Andrie, 2013; Cochrane, 2008; Pisch & Hellsten, 2012; Shariff, 2008). In some cases, youth believe adults cannot stop the victimization and that prevention and management of cyber bullying is ineffective (Andrie, 2013; Pisch & Hellsten, 2012). Youth may not report cyber bullying because of fear of being further victimized (Cassidy, Brown, & Jackson, 2012) or because some of the methods of managing and preventing cyber bullying impose more limitations on the victim (e.g., restricting access to technology) than they do the perpetrator (Couture & Hall, 2010).

### **Context of Cyber bullying in Saskatchewan**

While the Saskatchewan government has directed school divisions to devise anti-bullying policies to protect their students, and has urged school divisions to include cyber bullying within these polices, "it is not uncommon for schools to overlook cyber bullying as an important element of their policies and regulations" (Shariff & Johnny, 2007, p. 316). Thus, as of 2008, few Saskatchewan school divisions had specific cyber bullying policies (Coates, 2011). The lack of official direction has resulted in a policy gap for Saskatchewan schools (Shariff & Hoff, 2007). In order to provide a safe educational environment for Saskatchewan students, schools need Saskatchewan "guidelines that provide reasonable boundaries and direction as to their responsibility" (Shariff & Hoff, 2007, p. 91) with respect to cyber bullying.

### **Purpose of the Study**

The overall objective of this study is to develop foundational policy knowledge and guidelines for school divisions regarding cyber bullying in Saskatchewan, Canada. This research study developed in response to recent media attention in Canada concerning cyber bullying, a growing collection of data pertaining to the prevalence of cyber bullying in Saskatchewan schools, aging and/or obsolete information sources speaking to policy guidelines governing bullying (Coates, 2011), and recommendations to develop policy guidelines and professional development programs for educators focused on cyber bullying (Cochrane, 2008) in a Saskatchewan context. Thus, this research project will: (1) review existing anti-bullying policies in Saskatchewan school divisions for evidence of cyber bullying inclusion; and (2) conduct an environmental scan of anti-bullying education programs currently utilized by Saskatchewan schools. Results will be integrated and summarized and recommendations will be made regarding divisional policy, programming, and management of cyber bullying.

## **Theoretical Framework**

The study of cyber bullying in the Canadian context has primarily been conducted atheoretically (e.g., Beran & Li, 2005; Li, 2006; 2007). There are conflicting views regarding the origin of cyber bullying and whether cyber bullying should be considered an extension of traditional bullying (Kowalski & Fedina, 2011) or a unique form of aggression (Sheriff, 2008). Concomitant with this discord is the fact that historically traditional bullying was not viewed as problematic and was not itself systematically studied until the 1970's (Shariff, 2008). This makes the study of bullying relatively young and the study of cyber bullying (which has only been evident since the mid 2000's) in its relative infancy. Theory regarding a construct tends to develop as studies of the construct increase in number. One recent study (Hemphill et al., 2012) utilized the Social Development Model (SDM; Catalano & Hawkins, 1996) to examine predictors of cyber bullying in secondary school students. Findings suggest that the SDM may be a promising theoretical framework to use in the study of cyber bullying in Saskatchewan schools. The SDM organizes risk factors into their zone of influence in different socialization settings (e.g., student, family, peers, school, community) across development (or age), recognizing that there are different contextual influences at different developmental periods (Catalano & Hawkins, 1996). The SDM also suggests that anti-social behaviours such as cyber bullying originate with unhealthy beliefs (attitudes) and unclear standards (as would be evident in many Saskatchewan schools due to the policy gap), as well as attachment to peers who are also involved in anti-social behaviour (Catalano & Hawkins, 1996).

## **Methodology**

This study is currently underway and involves two separate but related phases.

**Phase 1 - Critical Review of Saskatchewan School Division Anti-Bullying Policies:** After obtaining the most recent anti-bullying policies from each Saskatchewan school division (we are currently engaging in this process), using multiple coders (Hsieh & Shannon, 2005) for triangulation (Tasakkori & Tedlie, 2003), we will systematically review each policy using qualitative content analysis in the summative tradition (Hsieh & Shannon, 2005) and qualitative document analysis (Bowen, 2009). These methods are appropriate and useful to use with policy analysis and reform (Hsieh & Shannon, 2005). Using summative content analysis will allow us to identify and quantify words or content in the policy texts pertaining to cyber bullying with the purpose of understanding the contextual use of the words (Hsieh & Shannon, 2005). Data will be recorded in a spreadsheet and findings will be presented using descriptive statistics. Qualitative document analysis utilizes thematic analysis (Braun & Clarke, 2006) which will allow us to code the policies according to thematic categories and relationships. Results will be presented in textual format with extracts and citations from the policy documents and a conceptual map.

## **PHASE 2 - Environmental Scan of Anti-bullying Education Programs Currently Utilized by SK**

**Schools:** We will determine which anti-bullying programs are utilized by each school division and, if needed, each school. We will then obtain information (i.e., documents, videos, lesson plans, etc.) about each of the programs utilized. We will employ both content analysis in the summative tradition (Hsieh & Shannon, 2005) and qualitative document analysis (Bowen, 2009) to assess each program for key characteristics related to cyber bullying following the process described in phase 1.

**Integration** - We will then integrate, triangulate (Patton, 1990) and summarize the results from the two phases. Results will be examined for consistent, complementarity, and discrepant findings (Lee & Smith, 2012). Results will provide a solid foundation for a Saskatchewan (Canada) cyber bullying policy.

### **Significance of Study**

Cyber bullying has received extensive media coverage in the past year following the suicides of two Canadian cyber bullying victims. The province of Saskatchewan has yet to provide school divisions with detailed direction regarding the extent of their responsibility regarding cyber bullying or how incidents of cyber bullying should be managed (Coates, 2011). Furthermore, very few Saskatchewan school divisions have specific anti- cyber bullying policies (Coates, 2011). There is also a general lack of Saskatchewan based research in cyber bullying. Specifically, we know very little about the prevalence rates, risk factors, policies regarding, school involvement levels, and outcomes of cyber bullying in Saskatchewan. This study builds upon our previous students' research and will provide stakeholders with foundational information regarding the state of cyber bullying in Saskatchewan. It will also be the first study to examine all Saskatchewan school division anti-bullying policies as they pertain to cyber bullying and the first to document which anti-bullying programs currently in use in Saskatchewan schools include elements of cyber bullying. This study will also contribute to cyber bullying theory development. Taken together, the results of this study will allow us to recommend policy changes at the division level, assist the province in developing a coordinated approach to cyber bullying prevention and intervention, and will bridge the cyber bullying policy gap that currently exists in Saskatchewan, Canada.

## **Extended Abstract**

Lemisko, Demchuk-Kosolofski & Hellsten

### **Background**

Most beginning teachers feel prepared for their first year of teaching (McPherson, 2000), however, the majority are shocked by their initiation into the profession (LeMaistre, 2000; Simurda, 2004) and find their first three years as the most stressful in their careers (Martin, Chiodo & Chang 2001). Novice teachers experience difficulties adjusting to school culture and expectations (Khamis, 2000). These early experiences affect beginning teachers in ways that influence them for the rest of their careers (Moir & Gless, 2001) and have implications for teacher effectiveness and career length (McCormack & Thomas, 2003). To ensure that beginning teachers thrive, we need a system which endorses mentorship, collaboration and continued growth and learning (Howe, 2008; Carroll, 2005) and which supports beginning teachers in these goals from the very beginning.

Effective mentorship has the ability to “bridge the gap that occurs when interns leave their teacher preparation programs and move into classroom responsibility, providing...access to best practices and resources beyond the classroom” (Carroll, 2005, p. 204). Induction involves how the teaching community acculturates beginning teachers (Wong, 2004; Wong, Britton & Ganser, 2005) and usually refers to structured programs (Wong, 2004; Wong, Britton & Ganser, 2005) or informal processes that may vary across schools (Bolman & Deal, 1997). Most beginning teacher induction programs include some aspects of mentorship by experienced teachers but the composition of the programs and the training of the mentors varies widely (Ingersoll & Smith, 2003). While studies have demonstrated the effectiveness of mentorship programs ([Algozzine, Gretes, Queen & Cowan-Hathcock, 2007](#); Serpell, 2000; Carter & Francis, 2001; Darling-Hammond, 2003) and demonstrated their ability to improve teacher quality - which is one of the best predictors of student success (Davis & Higdson, 2008) - mentoring programs are often limited by lack of funds (Carver & Feiman-Nemser, 2008).

Recommendations stemming from a recent review of existing beginning teacher mentorship programs in Saskatchewan include making formal mentorship programs a priority in education, providing release time (time off) for regularly scheduled meetings, providing opportunities for teachers to visit other classrooms, and providing training for the individuals who will become the mentors (Olafson, Elaschuk & Owns, 2002). While our induction-by-mentorship model provides beginning teachers with the support of experienced master teachers and attempts to follow these recommendations in a sustainable way via a partnership between the College of Education at the University of Saskatchewan and the Prairie Spirit School Division, our study is the first in Saskatchewan to focus on a mentorship program where the beginning teacher’s classroom is the central focus.

### **Purpose of the Study**

There are five specific study objectives: (1) to develop criteria for determining the identification of Master Teachers who become mentors; (2) to develop and assess a

mentorship training program for Master Teachers that incorporates existing University of Saskatchewan resources; (3) to explore the efficacy of a mentorship program that focuses on the Beginning Teacher's classroom; (4) to ensure the mentorship program is focused on student learning by providing opportunities for the team to co-construct specific curriculum foci for student learning in the Master Teacher's classroom by a Supportive Learning Substitute Teachers during the planned substitute teaching days; and (5) to provide feedback to the profession about the benefits of developing similar induction-by-mentoring programs in other school divisions.

## **Methodology**

### *Participants*

Participants in this study will include four beginning teacher/master teacher pairings who volunteer to participate. Master/mentor teachers will be recruited and invited to volunteer based on criteria developed by the research team and the leadership team in Prairie Spirit School Division. Beginning teachers will be recruited based on matching grade level interests (elementary/middle-years/secondary) or particular interests (eg., special education) and, in order to reduce travel costs and increase time in classrooms, mentoring pair partners will also be selected based on proximity.

### *Data Collection*

From September through May, the master teacher mentors will spend one half-day every two weeks in the beginning teachers' classrooms with a reverse visit to take place in November and March (beginning teachers in master teachers' classrooms). Classroom experiences may take a variety of forms including but not limited to observations, co-teaching, and coaching. Both the beginning teachers and the master teachers will be encouraged to informally document their experiences through the use of journaling and the collection of relevant artifacts

Along with scheduled classroom visits, beginning teachers and master teachers will meet in November and March in order to provide additional opportunity for reflection and planning. Individual interviews with all participants will be conducted outside of school time via telephone with the aid of an audio recording device in October (30 minutes) and February (1 hour). Focus group interviews (one hour; grouped by role) will be conducted in June.

In addition, to obtain pre-post assessments of teacher the variables expected to be affected by the induction-by-mentoring program, the beginning teachers and master teachers will be asked to complete a variety of survey instruments in September and June. Along with demographic questions pertaining to educational experience, current employment, and mentor characteristics, participants will be asked to complete the Teacher's Sense of Self-Efficacy instrument (Tschannen-Moran & Woolfolk Hoy, 2001), the Professional Teacher Identity Scale (Hellsten & Prytula, 2012), and the Perceptions of Success Inventory (Corbell, Reiman & Nietfeld, 2008). In addition, open-ended items pertaining to the strengths and weaknesses of the mentorship program will be included. Scales with demonstrated psychometric evidence will be used whenever possible.

### *Interview Questions and Data Analysis Plan:*

In all cases, the interviews will be scripted with the questions co-constructed by members of the research team and Prairie Spirit School Division personnel, but are expected to focus on professional and personal factors affecting teachers' beliefs about competence and confidence in their new roles in their school communities such as teacher identity, self-efficacy, and desired supports and resources as well as efficacy of the induction-by-mentoring model. Transcription of the interviews will be conducted by a neutral third party. Thematic analysis will be used to identify repeated patterns of meaning (Braun & Clarke, 2006). We will attempt to ensure the coding of the transcripts and the interpretations made from the codes are constructed from the raw data contained in the transcribed responses to the interview questions (Boyatzis, 1998). Results of the qualitative interviews and the quantitative surveys (and informally collected participant data) will be integrated using mixed methods research strategies.

### **Findings and Discussion**

During our presentation we will share initial findings arising from this project, which begins in September 2013. We anticipate that we will be able to share (1) the criteria developed for identify master teachers selected as mentors (2) initial assessment of the mentor training program; and (3) initial findings regarding the efficacy and sustainability of the induction-by-mentoring model we are employing.

Teacher Readiness for Implementing Common Core State Standards

Lisa Longoria

Claremont Graduate University

Dr. J. Hilton

July 2013

### Abstract

The Common Core State Standards, adopted by forty-five states, the District of Columbia, four territories, and the Department of Defense Education Activity, reflect the knowledge and skills that our young people need for a successful future. These research-based, internationally benchmarked, rigorous standards are designed to promote College and Career Readiness. However, states have not supplied their county offices of education with implementation plans, professional development, or deadlines for initial assessments. The only piece known of for sure is that the common assessment at the end of the school year will take place in 2015. School districts are looking to their county education offices for guidance. The literature shows that teachers are not prepared for the CCSS. There are several books and online resources for teachers to consume independently, but scholars warn against overwhelming educators. In this paper, teachers were surveyed to learn of their readiness for Common Core implementation. The majority of teachers are very concerned with instruction under the new standards and agree that collaboration is of the highest need.

Though the Common Core State Standards (CCSS) were approved by the California Department of Education (CDE) and posted on their website in 2010, the urgency for teachers to understand and integrate them in daily instruction has increased every year (California Department of Education, 2012). Along with the new standards, the new assessment tool, Smart Balanced Assessment Consortium (SBAC), was introduced as the state-approved assessment, intending to “build a system of assessment upon the Common Core State Standards in English language arts and mathematics with the intent that all students across this Consortium will know their progress toward college and career readiness” (<http://www.smarterbalanced.org>, 2013) in July of 2010. (See Appendix 1 for CCSS timeline). In the coming school year, the SBAC will complete field testing of the summative assessment and train school and district-level staff in formative tools. With full implementation of the SBAC test planned for 2014-2015, more districts are planning on full implementation in 2013-2014. To gauge teacher readiness during this critical time makes a difference in the ways in which roll-out will occur. Shaping supportive learning opportunities will be crucial for successful integration.

Many school districts have started to increase their professional development offerings to school staff. For example, the Riverside County Office of Education currently has an eleven-page catalog of low-cost, specific Common Core professional development opportunities available to teachers, administrators, and support staff during this school year to aid in this challenge. A large portion for clearer usage of the materials for teachers to access is available online and may be meant for either independent study or for schools to “assign” during staff development via handouts, PowerPoints, and professional development modules. Achieve the Core is California’s recommended website that offers “free, high-quality resources for educators to implement the Common Core State Standards” ([www.achievethecore.org](http://www.achievethecore.org)). But usage of this

resource, or resources like it, may not be enough of what teachers need to feel ready. Because there is no real required implementation program or date from the California Department of Education other than assessment in 2014-2015, the professional development opportunities offered by the Riverside Office of Education, and similar county programs, speak positively to their commitment to proper preparation. Clearly, any teacher that has been in the profession since 1999 needs support for learning and implementing the new state standards. Curriculum planning, classroom management, instructional strategies, and assessments will change. Readiness to make these changes is the focus of my study.

In general, teacher preparedness for instruction and all the duties that are expected of teachers are well-discussed issues. However, few studies are currently available that examine teacher preparedness for integrating the Common Core State Standards. Therefore, a face must forcibly be put on this topic. While student achievement data related to this shift in curriculum will surface, how teachers are affected is a valuable piece to consider. Teachers are the common denominator when it comes to standardized test accountability, and yet, the literature reports that teachers are not ready for the CCSS. Teacher evaluations based on test scores is a normal practice in many schools. How can teachers earn a fair evaluation without support for using new standards that prepare for standardized testing? That is a different question for a different study, and one that is prevalent in current literature.

### **Review of the Literature**

Fletcher's 2012 article, "*It's the Teacher, Stupid*," suggests teachers are a forgotten element in the discussions surrounding the Common Core State Standards. Ability is not the issue, as the report continues. "But what is an unknown is how ready teachers are to instruct students in the Common Core State Standards and thus in the manner in which they will be

tested” (p. 26). Fletcher presents five questions that must be addressed to measure teacher readiness, including familiarity with technology, sufficient time, and comprehension of the standards themselves. He makes an interesting analogy between current educational trends and a waterbed: “Technology, curriculum and instruction, assessment, and professional learning are all part of the same structure and you can’t make an impression on one area without the others quivering in response” (p. 26). Indeed, current and future teachers should understand that all four pieces are interrelated and require deep knowledge. Fletcher calls for an “all-out collaborative planning effort” among all school and district level staff to ensure teachers are ready. He suggests a five step plan to accomplish this task. Collaboration between teachers for the standards as well as technology planning will be most crucial, as the Smarter Balanced Assessment is a computer-based test. Teachers at any level of computer literacy need to become fluent in classroom technology that will not only prepare students for the exam, but also integrate advanced technology in daily instruction to achieve the 21<sup>st</sup> century demands of college and career. The days of Judy clocks and chalkboards are gone, making way for technology beyond dry-erase boards and overhead projectors. Fletcher also suggests giving teachers the flexibility of learning from mistakes. Even with the best-intentioned implementation plan, perfection is not the point; teachers will need to experiment, find the best practices, reflect, collaborate, and learn from mistakes.

Holliday and Smith studied Kentucky’s implementation plan in their 2012 article, “*Leading Common Core Implementation*,” to serve as a model as the nation’s first adopting state. The authors began quoting an article from Washington Post education columnist, Jay Mathews, who interviewed hundreds of highly effective teachers who “significantly raised student achievement...How teachers are trained and supported in the classroom is what matter[ed]”

(Holliday and Smith, 2012, p. 13). Clearly, research supports what we already know: teachers have an incredible task ahead, and readiness in the form of preparation makes a difference. The authors move on to explain how Kentucky developed their plan for Common Core implementation two years ago, as well as recognizing the need to partner with higher education. The plan included establishing professional learning communities (PLC), using principals as instructional coaches, and evaluating progress based on student work. Committing to working in unity, consultants from the state department of education, university faculty, district leaders, principals, and teachers, developed a three-year curriculum for each role and a “tailored set of objectives for implementing the standards, correlating to the roles” (Holliday and Smith, 2012, p. 14). Without a doubt, Kentucky will be successful in their roll-out efforts, and will arguably be a state with high student achievement. They will certainly be a model for states as implementation progresses.

In the Center for Educational Policy’s report, *“Year Two of Implementing the Common Core State Standards: States’ Progress and Challenges,”* Kobner examined the progress of transitioning in 35 Common Core State Standards-adopting states, including the District of Columbia, in the fall of 2011. Kobner’s survey asked respondents to select whether the challenges of adoption were major, minor, nonexistent, or too soon to tell. In her key findings, the majority of the states in the survey believed that the CCSS are more rigorous than previous state academic standards in math and English language arts, and was taking steps to familiarize state and district officials with the new standards and to align curriculum and assessments. However, as I’ve addressed, most of the states in Kobner’s survey did not expect to fully implement the standards until 2014-15 or later. In addition, a majority of the responding states “caution that having adequate resources is a major challenge to full implementation of the

CCSS” (p. 12). While it is assuring that many states are on board, there was still no definitive answer for readiness. This enforces the notion that teachers will need support. However, it did not mention the effects of Common Core on teacher evaluations.

Struggle is the common theme in Gewertz’s 2012 article, “*Educators in Search of Common-Core Resources*.” Curriculum developers and teachers complain of there being “nothing” available, were working hard despite a lack of direction from district leaders. The lack of directives has led many to either develop Common Core road maps on their own or simply wait until concrete guidance from administration convenes, or worse, refusing to move onward with progress, as one anonymous Colorado teacher was quoted as saying, “As far as I’m concerned, it’s better if we just keep doing what we know works, instead of jumping at every new thing just because someone decides it will work” (Gewertz, 2012). Thankfully, states that have created in-depth materials for Common Core curriculum and instructional strategies have been utilized. For example, states such as Ohio and New York have extensive, online, free resources, while Kansas was reported as having the best source of model lesson plans. However, as the literacy consultant to the state’s education department warns, “It can be a double-edged sword, because teachers can be overwhelmed with information” (Gewertz, 2012). Indeed, any Google or Pinterest searches on Common Core are met with thousands of resources. Teachers, whether new or veteran, will need a new storehouse of instructional methods and activities, but need to filter through a lot before they find what will work for their style.

The Standards for Professional Learning outline the characteristics of professional learning that leads to effective teaching practices, supportive leadership, and improved student results (Learning Forward, 2012). Among the videos and web opportunities, articles on

professional development are the main focus on this organization's site. In particular, Stephanie Hirsh's reporting on connecting these standards to the Common Core is relevant to this research. As stated in my hypothesis, "high-quality professional learning" is the link to successful CCSS implementation (Hirsh, 2012). The author eloquently highlights that "the cruelest thing we can do to teachers is to poorly prepare them for today's challenges, isolate them in dysfunctional environments, treat them as line workers while calling them professionals and then blame for the woes we face" (p. 1). Certainly in any profession, proper preparation and ongoing training are crucial for change. Crafting these opportunities is essential as the demands of critical thinking and college and career readiness will lie on the shoulders of educators. It is also the opinion of the author that expectations of students will mirror expectations of teachers; therefore, assisting teachers will be as critical.

Similarly, in Jenkins and Agamba's 2013 study, they found professional development for Common Core implementation is in fact the missing link. The challenge represents two essential issues: "K-12 teachers will require well-designed professional development for the successful implementation of the CCSS, and a mechanism must be designed that will successfully foster higher education and K-12 collaboration" (Jenkins & Agamba, p. 71, 2013). Certainly, after the California Community College System Strategic Plan was introduced in 2006, strides have been made to bridge the two worlds of K-12 and higher education. As CCSS call for college readiness, these steps must be taken faster and more seriously. The authors point out a higher need to "ensure seamless education" (p. 72). For veteran teachers, they warn, helping them make connections to higher education may prove challenging. How can we measure if professional development is effective? The authors suggest "teacher change happens only after teachers see desired learning outcomes in their students following classroom implementation" (p. 72). They

cite a 2008 study that “suggested teacher change occurs during, and directly following, professional development and consequently is evidenced prior to any measures of student achievement” (p. 73). Ongoing assessment, both formative and summative will be necessary in order to check accomplishment of student outcomes. Teachers should not wait until benchmark exams to know whether the new standards are “working” in their instruction. Constant checks for understanding will lead teachers in their new instruction and will help direct future planning. It is important that teachers not give up when things do not go as planned. This is the caveat of teaching; always have a plan B or C ready. The authors use the state of Idaho as a model of effective professional development linked to the Common Core. Idaho “operates within a framework that is based on immersion practice; teachers can collaboratively explore the CCSS and take ownership of their own professional development as they unpack, crosswalk, and align the standards both vertically and horizontally” (p. 78). This allows teachers to not only teach to the new CCSS, but also create possible tests in anticipation of the Smarter Balanced assessments. Without a doubt, Idaho is not only supporting teachers but giving them the autonomy to lead their own professional development.

Sawchuk (2012) examined readiness at the post-secondary level. This interesting report on future teachers’ readiness to teach Common Core State Standards pointed out what higher education institutions in Illinois are doing to prepare students. This topic has largely been left out of CCSS implementation discussions, as these students have not yet earned their own classrooms. However, it does bring up a crucial point: future teachers need to come into the classroom with knowledge of the new standards. Why assign lesson plans aligned to the old standards, only to have to replace them a year later? The author quotes the Illinois State Schools Superintendent, Christopher Koch, “Why pay for it in professional development later, when it’s

much more costly”? This discussion, as Sawchuk reports, is not without conflict, citing obstacles that currently and will occur, such as “adding and deleting courses, potentially a necessary step in revamping curricula” (p. 8). Though the meeting of Illinois’ institutions was simply a first step in addressing the new standards, it provided state officials with ideas to consider in terms of licensure and academic freedom.

### **Hypothesis**

Teachers are not ready for implementing the standards, because they have not had directives and/or plans to implement until now. Are teachers prepared for CCSS instruction? How will teachers prepare for CCSS implementation?

### **Methodology**

A workshop called “Champion Teaches and Common Core: How to Lead and Guide Your Team with Highly Effective Practices,” located at the Riverside County Office of Education (RCOE) in Riverside, California, and was a voluntary session open to anyone in Riverside and San Bernardino counties. The RCOE is responsible for 23 school districts, and oversees extension offices in Indio and Murrieta. The session provided participants with research, adaptive teaching techniques, strategic planning tools, and digital tools to embed technology in Common Core instruction. It also incorporated a “flipped” model of learning, in which we as learners needed to complete tasks before coming to the session. This maximized our time with the facilitator, and allowed those inexperienced with some of the Common Core language to become familiarized in advance. Snowball sampling was applied for this inquiry. It is hard to reach teachers as participants during the summer months, however, the group present at the workshop was interconnected by the same goal: to gain knowledge in rolling out

implementation of CCSS. The population included 21 teacher leaders wanting tools to lead their sites in CCSS implementation. The response rate was 76%.

The questionnaire featured 20 questions. Questions 1 and 2 were dichotomous; either the participants read through the standards or they didn't. In Question 20, respondents had to choose which county they worked in; either Riverside or San Bernardino. Questions 3 through 19 were Likert scale questions, coded as: 1=Strongly Disagree, 2= Disagree, 3=Agree, 4=Strongly Agree

## Results

The average respondent had been teaching over 10 years; 66.7% indicated more than ten years of teaching experience, and was from Riverside school districts. The sample was not evenly distributed at 70% female and 30% male.

Appendix 3 breaks down the Likert scale questions that indicate teacher readiness for the CCSS.

Many participants wrote in answers if they didn't like the restriction of the numbers, or felt their answers required explanation. Questions 1 and 2 were dichotomous; either yes or no. However, many participants wrote in other numbers, but this was not a leveled question.

## Descriptive Statistics & Frequency Tables

**I have read through the CCSS for my grade level**

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Strongly Disagree	4	25.0	40.0	40.0
	Strongly Agree	6	37.5	60.0	100.0
	Total	10	62.5	100.0	
Missing	System	6	37.5		
Total		16	100.0		

Before coming in to the workshop, participants were asked to complete tasks to better familiarize themselves with the tools we'd be utilizing. 40% of the respondents had not read the Common Core State Standards for their grade level and 30% had not read under their subject matter.

**I have read through the CCSS for my subject matter.**

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Strongly Disagree	3	18.8	33.3	33.3
	Strongly Agree	6	37.5	66.7	100.0
	Total	9	56.3	100.0	
Missing	System	7	43.8		
Total		16	100.0		

**I have concerns creating CCSS instruction**

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Strongly Disagree	2	12.5	12.5	12.5
	Disagree	1	6.3	6.3	18.8
	Agree	10	62.5	62.5	81.3
	Strongly Agree	3	18.8	18.8	100.0
	Total	16	100.0	100.0	

**I have concerns creating CCSS pacing plans**

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Strongly Disagree	1	6.3	6.3	6.3
	Disagree	2	12.5	12.5	18.8
	Agree	9	56.3	56.3	75.0
	Strongly Agree	4	25.0	25.0	100.0
	Total	16	100.0	100.0	

**I have concerns creating and implementing CCSS formative assessments**

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Disagree	3	18.8	18.8	18.8
	Agree	8	50.0	50.0	68.8
	Strongly Agree	5	31.3	31.3	100.0
	Total	16	100.0	100.0	

A large percentage of teachers had concerns with implementation of CCSS instruction, pacing plans, and formative assessments. But the level of concern for the SBAC was distributed across the board. Teachers did not have concerns with classroom management.

**I have concerns with the SBAC**

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Strongly Disagree	1	6.3	7.7	7.7
	Disagree	4	25.0	30.8	38.5
	Agree	5	31.3	38.5	76.9
	Strongly Agree	3	18.8	23.1	100.0
	Total	13	81.3	100.0	
Missing	System	3	18.8		
Total		16	100.0		

**I have concerns implementing classroom management that supports CCSS**

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Strongly Disagree	1	6.3	6.7	6.7
	Disagree	8	50.0	53.3	60.0
	Agree	3	18.8	20.0	80.0
	Strongly Agree	3	18.8	20.0	100.0
	Total	15	93.8	100.0	
Missing	System	1	6.3		
Total		16	100.0		

**I can best prepare for implementing CCSS this fall by participating in off-campus workshops**

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Disagree	3	18.8	18.8	18.8
	Agree	6	37.5	37.5	56.3
	Strongly Agree	7	43.8	43.8	100.0
	Total	16	100.0	100.0	

**I can best prepare for implementing CCSS this fall by participating in on-campus workshops**

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Disagree	2	12.5	13.3	13.3
	Agree	7	43.8	46.7	60.0
	Strongly Agree	6	37.5	40.0	100.0
	Total	15	93.8	100.0	
Missing	System	1	6.3		
Total		16	100.0		

Many teachers saw workshops as a viable option to gain more knowledge for CCSS implementation, whereas attending virtual workshops, webinars, was almost evenly split.

**I can best prepare for implementing CCSS this fall by participating in CCSS webinars**

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid Disagree	8	50.0	50.0	50.0
Agree	3	18.8	18.8	68.8
Strongly Agree	5	31.3	31.3	100.0
Total	16	100.0	100.0	

**I can best prepare for implementing CCSS this fall by reading the CDE-suggested titles**

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid Disagree	5	31.3	31.3	31.3
Agree	5	31.3	31.3	62.5
Strongly Agree	6	37.5	37.5	100.0
Total	16	100.0	100.0	

**I can best prepare for implementing CCSS this fall by researching performance tasks online**

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid Agree	10	62.5	66.7	66.7
Strongly Agree	5	31.3	33.3	100.0
Total	15	93.8	100.0	
Missing System	1	6.3		
Total	16	100.0		

**I can best prepare for implementing CCSS this fall by taking SBAC practice tests**

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid Disagree	1	6.3	7.7	7.7
Agree	9	56.3	69.2	76.9
Strongly Agree	3	18.8	23.1	100.0
Total	13	81.3	100.0	
Missing System	3	18.8		
Total	16	100.0		

Becoming familiar with the SBAC was important to teachers.

**I can best prepare for implementing CCSS this fall by talking with other teachers who've implemented CCSS at their site**

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Agree	6	37.5	42.9	42.9
	Strongly Agree	8	50.0	57.1	100.0
	Total	14	87.5	100.0	
Missing	System	2	12.5		
Total		16	100.0		

**I can best prepare for implementing CCSS this fall by working through the CCSS on my own**

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Strongly Disagree	3	18.8	21.4	21.4
	Disagree	6	37.5	42.9	64.3
	Agree	3	18.8	21.4	85.7
	Strongly Agree	2	12.5	14.3	100.0
	Total	14	87.5	100.0	
Missing	System	2	12.5		
Total		16	100.0		

Working on becoming knowledgeable in the Common Core State Standards on their own was not a favored choice from teachers, with 64% disagreeing. Collaboration with others was preferred on several levels.

**I can best prepare for implementing CCSS this fall by collaborating with grade level colleagues at my site**

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Disagree	1	6.3	7.1	7.1
	Agree	7	43.8	50.0	57.1
	Strongly Agree	6	37.5	42.9	100.0
	Total	14	87.5	100.0	
Missing	System	2	12.5		
Total		16	100.0		

**I can best prepare for implementing CCSS this fall by collaborating with course-alike colleagues at my site**

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Disagree	1	6.3	7.1	7.1
	Agree	3	18.8	21.4	28.6
	Strongly Agree	10	62.5	71.4	100.0
	Total	14	87.5	100.0	
Missing	System	2	12.5		
Total		16	100.0		

The Cronbach's Alpha is valued at .797 which indicates good internal consistency.

### **Inferential Statistics**

Respondents confirmed that if they read through the CCSS for their grade level, they also read through the CCSS for their subject matter ( $r=.791$ ,  $p=.011$ ). Respondents who read through the CCSS for their grade level did not agree that they have concerns with the SBAC ( $r=.786$ ,  $p=.021$ ). There was a direct relationship between concerns with the SBAC and implementing classroom management that supports the CCSS ( $r=.843$ ,  $p<.001$ ). The strongest direct relationship was between creating CCSS pacing plans and CCSS instruction ( $r=.923$ ,  $p<.001$ ).

### **Discussion**

Are teachers prepared for CCSS instruction? Over 50% of respondents agreed that they had concerns with Common Core instruction, pacing plans, and formative assessments. Teachers do not feel prepared. How will teachers prepare for CCSS implementation? Collaborating with others was the most agreed upon method. The most popular responses were collaborating with teachers that had already implemented the Common Core at their site, as well as grade level colleagues and course-alike colleagues.

Teachers who had read through the CCSS for their grade level should have read for their subject, since the CCSS are written in matrix form. The fact that I did not have a 100% correlation between these two variables is very odd. The relationship between those teachers who had read through the CCSS for their grade level and those who did not have concerns with the SBAC suggests that they have background knowledge in the SBAC, as the CCSS do not include test questions. However, the SBAC has been very visible in the past year in terms of communication, transparency, and sample test questions.

### **Recommendations**

How much knowledge is enough? Should the CDE have enforced stricter implementation deadlines to ensure district readiness? If we consider how teachers ask students to prepare for demonstrating knowledge, those same techniques would prove useful in gaining feedback about teacher readiness, especially knowing what teachers need most. Time and resources seem to be the most desired.

### **Limitations of Study**

The limitations of this study were largely due to the season. In the summer months, many teachers are on vacation, not participating in a voluntary workshop. I would have liked a larger

sample. Also, giving the questionnaire at the end of a long training day may have reduced my response rate. I would have preferred to administer my survey at the beginning of the workshop.

### **Future Research**

Since my questionnaire was distributed at a voluntary workshop, there is a level of intrinsic motivation and self-determination that would be interesting to research. I would like to conduct qualitative interviews as we move through the year, replicating initial survey at the beginning of the 2014-2015 school year to examine changes in attitudes of readiness. This data should be used by school administrators to communicate with district leaders. This needs to take priority in program roll-out because when the SBAC is in place, teachers need to be ready for accountability discussions. To continue this, consistent support via workshops and training should be offered and feedback sought. Feedback tools such as surveys and questionnaires from teachers are an easy and fast way to develop directives in planning implementation.

My goals are four-fold: Teachers should be properly prepared and ready for Common Core implementation. Student achievement will be affected positively if teachers are prepared. Evaluations need to consider the amount of preparation given. Credential-granting institutions need to prepare future teachers immediately. If these goals are met, we will have made history with the first federal and state curriculum plan that effectively measures students' college and career readiness. This is a major turning point for K-18 education, and it is my hope that all stakeholders act accordingly for the best interest of teachers and students.

**Title:** Integrating Reading and Writing Instruction: The Role of Professional Development in Shaping Teacher Perceptions and Practices

**Synopsis:** The increased emphasis on preparing students to be college and career ready has significant implications for the teaching of English/Language Arts. This study examines middle and high school English teachers' perceptions and practices regarding authentic, integrated reading and writing instruction and the potential for staff development to impact these perceptions and practices. Findings indicate that focused professional development can move teachers to increased confidence and proficiency in integrating the instruction of reading and writing.

## Abstract

Recommended pedagogy for middle-school and high-school (grades 6-12) English education integrates the teaching of "the language arts as interactive processes" (Maxwell & Meisner, 2001, p.3); in other words, teachers should weave the instruction of literature and writing together as two parts of one whole. Recommended practices include asking students to respond to reading through writing, to cite information from reading in writing, and to analyze reading for writer's craft in order to emulate that craft in student writing (National Council of Teachers of English [NCTE], 2004). However - with the exception of a focus on literary analysis - teachers of English/language arts continue to teach literature and writing as separate units, topics, and skills (Graham & Herbert, 2010). The separate and distinct articulation of reading and writing goals (e.g., Common Core State Standards, 2010) may contribute to this practice, as might the absence of training in effectively and authentically meshing the instruction of the language arts.

Since integrated instruction is recommended but seemingly not often practiced, research questions for this study are three-fold: 1) What are teachers' perceptions of and practices regarding the relationship between reading/literature instruction and writing instruction; 2) What are the influences on teachers' beliefs and practices regarding the instruction of language arts; and 3) How might a staff development experience that models integrative techniques affect teachers' perceptions and practices of melding reading/literature and writing instruction in an effective and authentic fashion?

Participants (n=16) in this qualitative study were teachers of high school English and middle school language arts who voluntarily participated in a week-long, content-focused professional development program in the southeast region of the United States in June, 2013. Prior to the intervention, participants were surveyed to determine their beliefs and practices regarding the integration of reading/literature instruction with writing instruction. They then participated in the intervention: two 1.5 hour trainings on techniques for successfully integrating literacy instruction, as well as the rationale for using such strategies. Techniques were drawn from the work of Beers (2003), Gallagher (2011) and Spandel (2012) and required participants to engage in close reading of texts for both meaning and writer's craft, and then to weave the techniques found in those texts into their own original pieces of writing. Time for reflecting on classroom applications was provided. Immediately following the training, participants were surveyed again regarding 1) their beliefs about the integration of reading/literature and writing instruction, and 2) their plans to implement integrative strategies in future lessons. Participants will receive a follow-up email with a questionnaire in early December, 2013, asking them to reflect on their post-workshop instructional practices. Those who choose to continue their participation will return the questionnaire to the researchers by mid-December, 2013.

Data analysis utilizes Miles, Huberman, & Saldana's (2013) post-positivist approach, which asserts that there are causal descriptions at the heart of social phenomena. Initial codes were derived from the literature (e.g., Brighton & Hertberg, 2004; Gallagher, 2011; NCTE, 2004); those codes serve as a conceptual framework through which to analyze the data. Data reduction occurs by organizing/clustering data from all sources around teachers' reported beliefs and instructional plans and practices.

Initial results indicate that 11 of 16 participants entered the study with a "disconnected" view of language arts pedagogy. Four of these 11 participants articulated the *belief* that reading/literature and writing instruction should be connected, but could not describe how to successfully achieve this integration in their practice. All four of these participants emerged from the study articulating plans to change their practices, but these changes remained at the surface or "strategy" level, and responses indicated no change to underlying philosophical beliefs. The remaining seven of the 11 could not articulate a need for instructional integration upon entering the study; they reported teaching reading/literature and writing as separate, distinct instructional units. All seven of these participants emerged from the study citing a new understanding of integrated literacy instruction as well as specific plans and strategies for integrating reading/literature and writing instruction in their classrooms during the 2013-14 school year. There was, however, a distinct difference in the depth of understanding demonstrated by respondents; some indicated surface level changes while others discussed a change in philosophy.

Five of 16 participants entered the study with a previously established view of literacy instruction as connected and integrated, although the complexity of their approaches varied. All five of these participants traced these beliefs and practices to either specific staff development opportunities or to the influence of mentor teachers. All five participants emerged from the intervention with a self-described reinforcement of their belief in the value of integrating reading/literature and writing instruction. In addition, these participants discussed an appreciation for additional resources and articulated plans to incorporate these newly acquired techniques into their instruction during the 2013-14 school year.

The study's preliminary conclusions indicate middle and high school English teachers believe that the various facets of reading/literature and writing instruction are connected and should be integrated; however, these same teachers may neither fully understand what "integration" means, nor be accustomed or equipped to deliver instruction in an integrated fashion. Professional development is valuable in shaping teachers' pedagogies and helping teachers put their beliefs into practice by a) recognizing where teachers are, philosophically, in their beliefs about integrated literacy instruction, b) instilling confidence in the value of integrated literacy instruction, and b) providing specific strategies and tools to help them enact their beliefs in the classroom.

Initial findings of this study indicate that teachers' practices would improve with access to sustained professional development in the integration of reading/literature and writing instruction. Such training experiences will be most effective if they adhere to the following three criteria: 1) emphasize practice rather than theory, providing instruction on specific integrative strategies; 2) feature modeling of recommended strategies within the training session, requiring teachers to themselves engage in close reading and original writing; and 3) allow time for reflection on how such literacy strategies connect with teachers' philosophies and can be woven into the curricula for teachers' particular classroom contexts.

## **Abstract**

iSCORE is a digital tool designed for students who take lessons from independent music teachers. One of the challenges of this learning format is that students must develop strategies to practice on their own between lessons. iSCORE can help meet that challenge. This paper describes a case study of a 15-year-old pianist who learned to play a difficult piece of repertoire by using iSCORE to archive and compare performances, develop strategies, and reflect on his learning.

### **Enhancing music learning with digital tools: A case study of a student using iSCORE**

Since the invention of the printing press, new technologies have had an immense influence on how we teach music and on what music we teach. Likewise, the digital age presents myriad opportunities for teachers to use new tools to transform their teaching. It also—sometimes painfully—causes teachers to critically examine the approaches they take to teaching music, including their pedagogical approaches and musical core content.

It is commonly acknowledged that most, if not all, of our students are digital natives; that is, they have only lived in a world with Google searches, emails, and iPods (Prensky, 2001). Conversely, many teachers are digital immigrants, meaning that their original resources for learning and communicating were hard copies of music scores and face-to-face interactions with students, parents, other teachers, and musicians. Consequently, most studio teachers have entered the digital world as newcomers to a strange land. And like other immigrants, digital immigrants wish to become more proficient with technologies and to develop their expertise in ways that will allow them to work effectively to the digital age. However, the challenge to enter a digital world is made more formidable by the isolation that often characterizes the work context of the music studio teacher, as many music teachers work independently in their studios and rarely interact with other teachers in contrast to music teachers working in school classrooms (Feldman, 2010).

Another crucial difference between studio music instruction and classroom music instruction is that students of independent music teachers are expected to practice without their teacher's presence, applying, at home, the ideas demonstrated and discussed during lessons. Often they do this without help from an adult. These students must prioritize the ideas presented at their lessons, clarify their goals, execute strategies to meet these goals, and reflect on their progress. Thus, self-regulatory behaviours are particularly important for students who

learn music through the studio lesson tradition.

Researchers have found that self-regulation is an important component of effective learning in general (Zimmerman, 2000; Zimmerman & Schunk, 2011). Self-regulation is especially important for effective practice of musical instruments (Bartolome, 2009; McPherson & Renwick, 2001; 2011). Less-skilled musicians have not developed the self-regulatory habits of advanced musicians (McPherson & Zimmerman, 2011; Nielsen, 2001; Oare, 2011) and often do not know how to structure their practices between lessons (McPherson & Renwick, 2001; 2011). McPherson and Zimmerman (2002) name six student characteristics that support self-regulated learning in music: (a) students are motivated to set goals; (b) students possess methods to practice on their own; (c) students plan and manage their time; (d) students self-monitor and evaluate their performance behaviour; (e) students structure physical environments for optimal learning; and (f) students use social connections to seek help.

A more nuanced way of characterizing the learning that occurs both during the lesson and between lessons is found in Sameroff's "transactional regulation" model (Sameroff, 2010). Under this model, it is suggested that co-regulation, that is a combination of self-regulation and other forms of external regulation—such as the support provided by music teachers—is necessary to support music learning, towards the ultimate goal of developing independent musicianship. Drawing on Sameroff's theory of transactional regulation, McPherson and his colleagues claim that in music learning we do not move linearly from other regulation to self-regulation, but rather, self-regulation includes other elements of regulation, just as other regulation is tempered with self-regulatory abilities (McPherson, Davidson, & Faulkner, 2012; Sameroff, 2010). Other regulation includes the input of ideas and strategies from teachers during lessons, but also from parents and peers in the time between lessons. McPherson, Davidson, and Faulkner (2012) followed 157 students in Australia over a 14-year period, and

found that environmental factors, such as having supportive parents, performance opportunities, and positive peer interactions, served to regulate and enhance student learning.

The premise for our long-term research program is that specially designed technological tools can reduce the isolation experienced by teachers and can also support the development of lifelong musicians. We have formed a tri-institutional partnership amongst Queen's University, the Centre for the Study of Learning and Performance at Concordia University, and The Royal Conservatory, in order to develop software and to conduct research on how 21<sup>st</sup> century learners involved studio music instruction can benefit from interactive online tools.

The present paper focuses on the use of iSCORE, one of the digital tools we have developed to support independent music instruction. iSCORE is an online learning portfolio that was created to enhance students' ability to self-regulate. It contains features to support students as they develop effective practice strategies and learn to reflect on their progress. In addition, iSCORE's web-based platform allows for both asynchronous and synchronous interactions among students and teachers. iSCORE is available without charge from The Royal Conservatory ([www.rcmusic.ca](http://www.rcmusic.ca)). Teaching support and samples of student work appear on a supporting website: [www.iscorenews.com](http://www.iscorenews.com).

To date, we have conducted a series of studies involving over 30 teachers, 50 parents, and over 150 music students (e.g., Brook, Troop, & Upitis, 2011; Upitis, Abrami, Brook, Troop & Varela, 2012; Upitis, Brook, & Abrami, 2012; Upitis, Brook, Abrami, Varela, & Elster, 2012; Upitis, Varela, & Abrami, 2013). Data sources have included interviews, observations, surveys, and iSCORE portfolio data. This particular paper describes a case study of one student's work to show how it helped this student accomplish a challenging music assignment.

### **Method**

Data for the case study of one student's use of iSCORE were gathered and analyzed according to conventional case-study protocols (Yin, 2009). The student was a 15-year-old

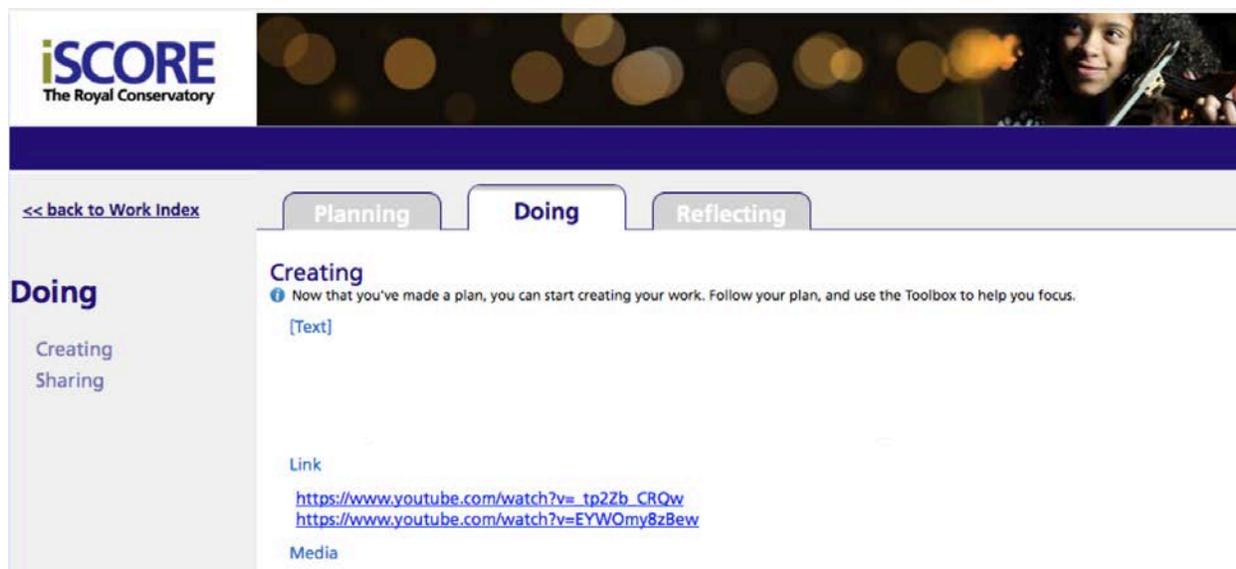

pianist who had been using iSCORE, and its predecessor ePEARL, since he was 12 years of age. His task was to learn a “quick study” piece for a local music festival. This entailed learning a 20<sup>th</sup> century Bagatelle by Alexander Tcherepnin (Opus 5, No. 4) to a performance standard in a 48-hour period. At the time of the quick study competition, the student’s regular music teacher was out of town. Consequently, he sought the assistance of two other music teachers who were available to help him master the piece. He also elected to use iSCORE to support his learning. Both of his supporting teachers are authors on the present paper.

Data included direct observations and interactions with the student for six hours on the first day and four hours on the second day. These observations and interactions were made by the supporting teacher-researchers, both of whom are music pedagogues and educational researchers. Interactions included helping the student directly with notes and interpretation, as well as offering suggestions and strategies for mastering the piece. One of the researchers was present at the performance of the piece on the morning of the third day. In addition, the student’s archived performances of the piece, links to other performances, the strategies he employed to learn the piece, and reflections on his learning were available from the iSCORE portfolio and also served as data sources. A 20-minute interview with the student after the performance, as well as an informal conversation two months later, rounded out the data collection. During the interview, the student was asked to comment on whether and how iSCORE supported his learning.

## **Results**

The student began to learn the Bagatelle by attempting to sight-read the score in its entirety. When this proved to be beyond his abilities, he called upon one of the music teachers to play it for him. This gave him a sense of the piece, but did not provide something for further reference while he was practising on his own. Consequently, he began to shape his iSCORE project artifact by uploading links to YouTube videos of several performances of the work. The figure below shows the first entries that he made to his portfolio. After naming the project, he

immediately clicked on the “doing” tab and entered the links that he had found, commenting, “I’ll think more about the planning later. Right now, I just need to have these to listen to.”

*Figure 1. Links to YouTube videos of Bagatelle Opus 5, No. 4 by Alexander Tcherepnin*

After listening to the recordings several times, the student began to learn a figure in the left hand, which repeats several times throughout the work. This was a difficult figure to learn because it was unfamiliar in both sound and feel. The first interval was a solid major 7<sup>th</sup> – an interval rarely encountered in the piano repertoire. In fact, much of the technique was new and challenging: quartal harmonies meaning that fourths, rather than the familiar thirds, were prevalent, and an inner melody needed to be featured.

The student then began to systematically plan how to learn the piece in the 48 hours available to him. To do this, he went to the planning tab and identified specific goals and strategies that would help him master the piece. Some of these strategies, such as separating the right hand and left hand, were familiar ones that he had employed in learning other repertoire, and he offered these immediately as he began typing in the text. Others were new to him, and were suggested by one of the two teachers. In this way, there was transactional regulation

evidenced: the student was able to be self-regulated with familiar approaches and techniques, and incorporated the strategies suggested by others to supplement what he already knew.

The figure below shows the filled out planning page. Most of this was completed on the first morning of the first day, with more complex strategies (e.g., playing the landing chord of the four hardest measures) being introduced on the evening of the first day and morning of the second day.

The screenshot shows the iSCORE interface for a planning task. The header includes the iSCORE logo (The Royal Conservatory) and a navigation bar with Home, Work, Overview, Calendar, Sharing, Files, Mailbox, Settings, and Logout. The main content area is titled 'Planning' and includes a 'Save' button. The task is titled 'Quick Study' and has a label with colored squares and a heart icon. The 'Task Description' section contains the text: 'I have to learn a grade 8 level piece in 48 hours and perform it for a judge after the 48 hours has passed.' The 'Criteria' section contains the text: 'I will be evaluated by the judge in: notes and rhythm, dynamics, technicality, musicality, memory. Sitting on the bench!'.

Figure 3. Planning Page – Task goals and supporting task goals

One of the most important ways that iSCORE supported the student in learning the Bagatelle was the use of the annotation feature. The annotator allows the musician to upload an audio or video recording, and then to comment – in real time – on the recording. These comments can be made by the student, by teachers, by parents, and by peers. In this particular case, the student offered a number of comments himself, which helped guide the learning. Both

teachers also offered comments, directly on the annotations and in other parts of the portfolio as well where sharing features are incorporated.

In addition to the comments that helped guide the learning, having several recordings of the Bagatelle at hand helped motivate the student to continue learning the piece within the very tight timeframe that he was given. When he became discouraged and said that he was “making no progress at all,” he was advised to listen to one of the earlier recordings and could see and hear that he had improved considerably.

The student made eight annotated recordings in total, and kept three in his iSCORE portfolio. Two of the annotated recordings, with comments, appear in the figure below. The vertical yellow marks indicate where annotations have been made, and when the recording is played back in real time, these annotations appear to the right.

The screenshot displays the iSCORE application interface. At the top, the logo for iSCORE The Royal Conservatory is visible. Below the logo is a navigation bar with tabs for Home, Work, Overview, Calendar, Sharing, Files, and Mailbox. A secondary navigation bar shows tabs for Planning, Doing, and Reflecting, with a Save button on the right. The main content area is divided into two sections. The top section, titled 'Doing', features a video player showing a student playing piano. To the right of the video player, a list of annotations is displayed, each with a timestamp and a user name. The annotations are: 0:08 H. Rasberry (Melody overpowered by middle and left hand chords), 0:22 H. Rasberry (24 hours in, still having trouble with the notes), and 0:34 H. Rasberry (well controlled entry). The bottom section, titled 'Sharing', includes a video player showing a student playing piano. To the right of the video player, a list of annotations is displayed, each with a timestamp and a user name. The annotations are: 0:07 I. Teacher (I'm not really hearing the solid 7 here), 0:13 H. Rasberry (I'm really happy with the melody here and the inner voicing), 0:26 H. Rasberry (What the heck is wrong with our piano?), 0:40 H. Rasberry (This part used to be so hard for me - now it's my favourite!), and 0:43 H. Rasberry (Whoops! Chord should have been longer). Below the sharing section, there is a 'Who Would I Like to Share With?' dropdown menu and a 'Shared with:' list showing Julia Brook and Julia Brook 2.

Figure 4. Two annotations of video recordings

The student spent most of his iSCORE time using the annotation feature and checking back to the strategies section on the planning tab. It was observed that he enlisted the strategies section when he was feeling that he wasn't making quick progress, or when his motivation to continue flagged. Remaining motivated to learn the piece was one of the most difficult aspects of the undertaking. On the evening of the first day, he considered dropping out of the class, stating, "Why am I doing this anyway? It's just so stressful." When he was assured that he could still decline to perform, he approached the task with renewed vigour.

The screenshot shows the iSCORE Reflecting interface. The top navigation bar includes Home, Work, Overview, Calendar, Sharing, Files, Mailbox, Settings, and Logout. The main content area is titled 'Reflecting' and contains a 'Self-Evaluation' section for a task titled 'Quick Study'. The self-evaluation prompt asks the user to reflect on their performance and goals. Below the prompt, there are three statements to be rated on a scale from 'never' to 'always'.

**Reflecting**  
After completing your work, it is useful to reflect on your outcome, your plan, your performance, and what lessons you can take from this experience.

**Self-Evaluation**  
How did you do? Look at the goals and criteria you set for this task. Compare the result of your efforts to your intentions and goals.

**Text**  
Please press the Save button when you are done.

Considering my main goal was to learn the piece in 48 hours and perform it, I think I met all of my goals since they all helped to achieve my overall goal.

[+ Need help? Answer these:](#)

Consider these statements. Rate how accurate they were for you and write your reflections.

I thought about what the final version of my work would look like.	never	always
I began by identifying my goals.	never	always
I was interested in what I was doing.	never	always

**Cause**  
What are the reasons for this outcome?  
Did your result match your intentions? What are the reasons for this outcome?

**Text**  
Please press the Save button when you are done.

I answered this question in my goals.

Figure 5. Reflections

On the morning of the second day, his first performance was particularly good, and he was surprised to see that it had "improved in the night." One of the lessons learned through this

process, was that leaving the piece for a few hours at a time (and sleeping!) made for better learning than continual practice for hours on end.

### Satisfaction

 How satisfied are you with your performance, overall?

least           most

### Lessons Learned

 What can you do differently next time you approach a similar task? What are the lessons you will take away from this about yourself as a learner?

#### Text

**I learned that it's important to work for an intensive period and then take a break to sleep. I found that my piece was so much better after.**

*Figure 6. Further reflections*

Just before the performance on the morning of the third day, the student returned once more to his iSCORE portfolio to listen to the performances of the Bagatelle by other musicians. This gave him the opportunity to consider small changes in interpretation and dynamics and also assured him that he was ready for the performance. Indeed, the performance went very well; he sounded as if he had been playing the piece for months. In reviewing the post-performance interview, we were struck by his love for the music, and how much joy he experienced in performing a piece he had come to know in such a short period. In the months that have passed since the “quick study” took place, he has continued to play the Bagatelle.

When asked about the role that iSCORE played in his learning, he was able to articulate three important contributions that the portfolio made to his learning. The first was that he was able to track his use of strategies and refer to the strategy list when he needed a change in direction, something that we also observed during the practice sessions. The second was that the archived performances on the annotator provided him with the aural feedback he needed to improve the melody line and phrasing. And third, while he noted that, “I could have done all of

this using YouTube, Word, and my iPhone,” he also acknowledged that, “With iSCORE, you can keep everything all in one place.” He also made clear that the tool alone would not have given him the support he needed to learn the piece. The input from teachers as well as an impromptu performance for a group of adults late on the second day, were important, too, to the learning process.

The student also identified what he perceived to be some of the shortcomings of the tool. These included issues of sound quality on the built-in recorder, awkwardness in loading video, what he perceived to be an excessive amount of text and text boxes, and the inability to export his final work in an aesthetically satisfying form. However, the student also acknowledged that he understood iSCORE to be “for learning” and as a learning tool, iSCORE “does what it needs to do.”

### **Interpretations and Conclusions**

From the student’s self-reflections on the portfolio itself, from verbal comments, and from the direct observations made by the researchers, it became apparent that iSCORE aided this student to accomplish a challenging task. While it certainly would have been possible to learn the Tcherenpnin without the aid of iSCORE – as evidenced by the other students who learned the same piece for the quick study competition – iSCORE contributed to the process in positive ways. First, the tool helped the student remain motivated when his dedication to the challenge waned. Second, iSCORE enabled the student to critically assess his progress over the 48-hour period. By listening several times to the videotaped versions using the annotation tool, he was able to reflect on what aspects of the piece still needed work and where he was making clear improvements. Third, the annotation tool provided an archive of his progress over time. Fourth, iSCORE enabled the student to solicit feedback from the teachers when they were not physically present with him, thereby making it possible for him to ask for specific feedback during his practice sessions on a need-to-know basis. Fifth, iSCORE provided a virtual learning space that

contained all of the student's planning, creations, practising sessions, and reflections in one location. Finally, by prompting the student to enter reflections about the learning, the student made observations and connections that he might not otherwise have made. For example, one of the important things that the student learned during the 48-hour period was the importance of punctuating dedicated practice sessions with breaks. He reported that has continued to apply this principle in the time that has elapsed since the quick study took place.

Another development that has occurred in the time that has passed since the quick study exercise was undertaken is that the student has learned several new pieces of repertoire, among them another Tcherepnin Ballade from Opus 5. He has not, however, used iSCORE to help learn the new repertoire, at least not directly. iSCORE was an important tool for this student, an advanced musician, in approaching a new and particularly challenging task. But it is not a tool that he employs for regular practising where he has developed effective strategies that do not include the use of iSCORE. That said, the lessons learned through the quick study experience, including the use of particular strategies he learned in the process, are ones that he has continued to apply to new repertoire. In addition, after the quick study experience, he has made more use of other performances, comparing interpretations of other musicians in making his own musical choices.

Findings from this research also underscore the important role that transactional regulation, involving both self-regulated learning and regulation by plays in studio music instruction. At the time of the quick study competition, this student was highly motivated and already quite self-regulated as a musician. However, he also relied on the interactions between himself, the two available teachers, and the support of other musicians who served as audience in the process. Students develop self-regulation through the structured and purposeful support of their teachers; that is, teachers who themselves model self-regulatory behaviours to facilitate

student agency. Finally, this case study highlights the importance of having learning tools that support planning and that provide ways of reflecting on sound, through sound.

### **Abstract:**

Literature circles give students the opportunity to learn about a given issue or subject area in greater depth than what can be achieved through textbooks or lecture alone. As part of the literature circle activities, pre-service teachers are encouraged to take the information they are learning and relate it back to their own lives and to the world around them. Students are exposed to different perspectives on current topics related to diversity and multicultural education. Aside from learning about how to set up literature circles, participants will also be given a list of books to use that deal with social issues and problems that we are currently facing in our society.

In literature circles, small groups of students gather together to discuss a piece of literature in depth. The discussion is guided by students' response to what they have read (Daniels, 2002).

The use of literature circles is a common instructional method used in the K-12 setting (Daniels, 2002; Haydon, 2003). However, there is little about using literature circles as an instructional method in the college classroom, let alone as a method for teaching about diversity and multicultural education. Research-based theories of literacy education provide the foundation of literature circles (Daniels, 1994; Raphael et al. 2004; Raphael & McMahon, 1994). Researchers have found that the discussions that take place during literature circle activities are often purposeful and critically minded and provide students with a dynamic learning opportunity above and beyond textbooks and lecture (Latendresse, 2004; Long & Gove, 2003; Sandmann & Gruhler, 2007; Wilfong, 2009). Students who feel uncomfortable expressing themselves in a large group, often feel more empowered to speak out about personal experiences and opinions in a small group setting (Johnson, 2000; Sandmann & Gruhler, 2007; Wolfing, 2009). In depth discussion and the sharing of thoughts, feelings and beliefs is a critical component to learning about diversity and becoming a culturally responsive teacher (Gollnick & Chinn, 2013).

6) **Abstract::** This paper presentation reveals my experience with web development at various levels within my institution since the mid-90s. This era was a progressive time for web development. Most institutions of higher education were just beginning to launch web presences for delivery of content. The design to 1024X768 browser display approach to content delivery as the initial benchmark has changed radically since the early desk top environment. The ubiquitous mobile devices and their exponential growth in use, variety and versatility are proving to be the seemingly ever evolving environment for content delivery for the foreseeable future. However, mobile devices have not necessarily simplified the process of decision making and implantation involved in web development. Rather, mobile devices complicate the issues regarding delivery of content to users as the variety of digital receptacles throughout the campus and community today has increased. A one size fits all solution is not necessarily the best approach for web development where content and experience rule and dictate success. Well-informed choices will create positive experiences, satisfy expectations, and build community for the user. In this paper presentation, I will discuss lessons learned, best practices, and recommendations for making intelligent decisions for development and implementation as well as the place for analytics, usability, and marketing for the successful deployment of web content for your institution.

### Abstract

Jacques Maritain once stated, "...the painter is not the art of painting, nor is he merely a painter. He is also a man, and he is a man before being a painter." (The Responsibility of the Artist) This perspective of always regarding the artist as a holistic, concrete, unitary, and particular man, a perspective inherited from Aristotle and Aquinas, permeates Maritain's theory of artistic creation. In art education, we are confronted by the student, a holistic, unitary, and particular man or subject, who is in the process of making a work.

In this paper, based on Maritain's description of the artist's creation, we will construct a structural model to illustrate the process of creative activity. Through this structure, we will be able to see that in this creative process, the creator is involved as a holistic person, who brings all his powers (such as senses, imagination, memory, intellect and will) into harmony. From this point of view, we can claim that art education is not an education which merely instructs people how to create artworks; in fact, it is also an education which helps people to work holistically, or, more precisely, to dedicate oneself to a human activity as a whole. Art education, then, is not just professional training of the artist, but also the very formation of a holistic human being. Free from the constraints of a mere professional education, art education creates dialogue with other disciplines, such as the education of life, moral education, and other fields of study. In Chinese traditional philosophy, such as Confucianism, the training of the artist and his self-cultivation are integrated in every case. This position also supports our understanding of art education.

Research objectives: We will explore the values of art education itself from the process of artistic creativity, and reveal possible relations between art education and other disciplines.

Methodology: This paper, based on Maritain's philosophy of art, will construct a

structural model of artistic activity. Through this structure we are able to illustrate the artist's operations in creation and his self-progression and cultivation as a holistic human being. Chinese philosophy of art will also be introduced in this context to help expound this formation process.

Expected outcomes: This paper will provide a foundation to reflect upon art education more broadly and reveal the aspect of the artistic subject as a holistic human being in creation. This perspective will help teachers elevate art education from mere professional training to a training of the holistic man, who himself is the intercross of life, morality, and culture.

## Philosophical Reflections on Art Education: From the Perspective of Jacques Maritain's Philosophy of Art

### 1. Introduction<sup>1</sup>

Jacques Maritain once stated, "...the painter is not the art of painting, nor is he merely a painter. He is also a man, and he is a man before being a painter."<sup>2</sup> This perspective of always regarding the artist as a holistic, concrete, unitary, and particular man, a perspective inherited from Aristotle and Aquinas, permeates Maritain's theory of artistic creation.

This paper, based on Maritain's philosophy of art, will create a structural model of artistic activity. Through this model we are able to illustrate the artist's creative operations in which the artist engages himself into an activity as a holistic human being. Chinese philosophy of art, illustrated by Confucius, will also be introduced in this context to help expound this formation process.

We will first analyze Maritain's theory of artistic creation, and then build a structural model to illustrate the creative process of the artist. Following this structure, we will elucidate Confucius' viewpoint on music and self-cultivation to support our conclusion, resulted from our analysis of Maritain's theory, that art education is not the mere training of making an artwork, but is also the vary formation of a holistic human being.

### 2. Maritain's theory of artistic creation

Following Thomas Aquinas (1225-1274), Jacques Maritain claims that in our

---

<sup>2</sup> Jacques Maritain, *The Responsibility of the Artist* (New York: Charles Scribner's Sons, 1960), p. 29.

intellect there are the speculative and practical orders. “There are in the intellect virtues whose *sole end* is to know. They belong to the speculative order.”<sup>3</sup> And, “The *practical* order is opposed to the speculative order because there man tends to something other than knowledge only. If he knows, it is no longer to rest in the truth, and to enjoy it (*frui*); it is to use (*uti*) his knowledge, with a view to some work or some action.”<sup>4</sup>

Since it is turned towards action, and not towards the pure interiority of knowledge, art “belongs to the practical order.”<sup>5</sup> In the practical order, there exist two different spheres: “... the practical order itself is divided into two entirely distinct spheres, which the ancients called the sphere of Doing (*agibile, prakton*) and the sphere of Making (*factibile, poiêton*).”<sup>6</sup> The sphere of Doing is that of morality, while the sphere of Making is that of art. Maritain says, “The sphere of Making is the sphere of Art, in the most universal sense of this word. Art, which rules Making and not Doing, stands therefore outside the human sphere; it has an end, rules, values, which are not those of man, but those of the work to be produced. This work is everything for Art; there is for Art but one law—the exigencies and the good of the work.”<sup>7</sup>

Accordingly, the artist should be concerned only for the good of his work, and he can achieve it only by properly using his virtues of art, which is an “infallible” *habitus*, and finds its root in man’s powers of soul.<sup>8</sup>

In *Art and Scholasticism and the Frontiers of Poetry*, Maritain’s early work concerning Art, virtues of art in the artist play the most important role in artistic activities. When it comes to the fine arts, which is beyond the realm of the useful, a higher intellectuality of art is then found in Maritain’s most famous work, *Creative Intuition in Art and Poetry*:

This creativity of the spirit is the first ontological root of the artistic activity. And in fine arts it is pure, cleared of all adventitious elements. And the pure creativity of spiritual intelligence tends to achieve something in which spiritual intelligence finds its own delight, that is, to produce an object of beauty...the intellect strives to engender in beauty.

<sup>4</sup> *Art and Scholasticism and the Frontiers of Poetry*, p. 6.

<sup>5</sup> *Art and Scholasticism and the Frontiers of Poetry*, p. 6.

<sup>6</sup> *Art and Scholasticism and the Frontiers of Poetry*, p. 7.

<sup>7</sup> *Art and Scholasticism and the Frontiers of Poetry*, pp. 8-9.

<sup>8</sup> Maritain says, “Art resides in the soul and is the certain perfection of the soul. It is what Aristotle called ἐξῆς, in Latin a *habitus*, an inner quality or stable and deep-rooted disposition that raises the human subject and his natural power to a higher degree of vital formation and energy...” See Jacques Maritain, *Creative Intuition in Art and Poetry* (New Jersey: Princeton University Press, 1953), p. 48.

Such is, in its longing for beauty, that pure creativity of spirit, to the release of which the appetite basically tends, together with the intellect, in the vital dynamism of the fine arts.

...For beauty, which is of no use, is radiant with intelligence and is as transcendental and infinite as the universe of the intellect. Thus the very end—transcendent end—intended pertains to the realm of the intellect, of its exultation and joy, not to the world of utility, and the intellectuality of art is in the fine arts (though more bound there with the sensitive and emotional power) at a much higher degree than in the arts of the craftsman. The need of the intellect to manifest externally what is grasped with itself, in creative intuition, and to manifest it in beauty, is simply the essential thing in the fine arts.<sup>9</sup>

According to Maritain, free from a useful end, intellect, actuated by the pure creativity of spirit which is longing for beauty, strives to engender in beauty. To produce an object of beauty, the intellect in the creative intuition receives something, which is what Maritain calls “poetic knowledge” and which is also what should be manifested externally in a work. In the fine arts, the creative intuition becomes therefore the primary rule, to which the virtues of art of the artist, different from a craftsman’s arts, “must first of all be loyal.”<sup>10</sup>

From what is stated above, we can conclude that for Maritain the creative process of the artist in the fine arts involves both his will and his intellect: it is the pure creativity of spirit, to the release of which the appetite or will basically tends, that actuates the intellect to engender in beauty. But this creative process of the artist remains unclear, since we all know that in producing a work the artist’s intellect does not work alone. For this reason, we shall return to Maritain’s discourses on the creative intuition and how it works in this creative process.

According to Maritain, “His[the Artist’s] intuition, the creative intuition, is an obscure grasping of his own Self and of things in a knowledge through union or through connaturality which is born in the spiritual unconscious, and which fructifies only in the work.”<sup>11</sup> In this statement we discovered two key words: one is the spiritual unconscious; and the other is connaturality. The spiritual unconscious or preconscious is conceived by Maritain as a “a spiritual milieu—a kind of fluid and moving world, activated by the diffuse light of the Illuminating Intellect, and seemingly asleep but secretly tense and vigilant—which is this preconscious life of intellect, and of imagination and of emotion, empty of any actual concept of idea,

---

<sup>9</sup> Jacques Maritain, *Creative Intuition in Art and Poetry* (New Jersey: Princeton University Press, 1953), pp. 55-56.

<sup>10</sup> *Creative Intuition in Art and Poetry*, p. 59.

<sup>11</sup> *Creative Intuition in Art and Poetry*, p. 115.

but full of images and full of emotional movements, and in which all the past experiences and treasures of memory acquired by the soul are present in state of virtuality. It is within this fluid and moving milieu that poetic experience and poetic intuition [creative intuition] exist, not virtually, but as an act or actuation definitely formed.”<sup>12</sup> It is obvious to see that the spiritual unconscious has its kinship with the idea of “pre-reflective consciousness” (la conscience non-réflexive) in phenomenology, which indicates a status or primordial consciousness of a subject before any reflection and concept formed in him while he and the object encounter one another.<sup>13</sup> It is exactly in this spiritual milieu, spiritual unconsciousness, where senses, intellect, imagination, emotion, and memory all together come into an organic and harmonious interplay. The artist’s entire being and all that constitutes him, if I may say that, with all his powers, are involved in his creative process.

The spiritual unconscious or preconscious is a milieu which allows all of the subject’s powers to together work, namely, which allows the creative intuition to take place, but it remains a question of how these powers could work together as they are in harmony and how “an obscure grasping of his own Self (the artist) and of things” could be possibly obtained by the creative intuition. Maritain says that it is “through union or through connaturality.” “Connaturality” is a concept from Thomas Aquinas which refers to a connatural knowledge gained by one’s being connatural to the matter he judges in terms of a moral judgment, and this knowledge as well is used later on by Aquinas in terms of one’s knowledge of sacred doctrine.<sup>14</sup> In other discourses of Aquinas, he also refers to this connatural knowledge as an affective or experimental knowledge.<sup>15</sup> By adopting the idea of “connaturality” into his artistic creation theory, Maritain illustrates how man’s powers operate together in the creative intuition: by being connatural or inclining to the object, the artist in his spiritual preconscious, where the preconscious life of his senses, imagination, and intellect permeate one another, grasps a kind of knowledge from a union between his self and the object by means of emotion. He says,

It [emotion] suffices for emotion disposing or inclining, as I have said, the entire soul in a certain determinate manner to be thus received in the undetermined vitality

---

<sup>12</sup> *Creative Intuition in Art and Poetry*, p. 301.

<sup>13</sup> Jean-Paul Sartre, *L’être et le néant* (Paris: Editions Gallimard, 2004), p.19.

<sup>14</sup> Thomas Aquinas, *Summa Theologica*, II-II, 45, 2. The English translation by Fathers of the Dominican Province is adopted in this paper: “. . .wisdom denotes a certain rectitude of judgment according to the Eternal Law. Now rectitude of judgment is twofold: first, on account of perfect use of reason, secondly, on account of a certain connaturality with the matter about which one has to judge. Thus, about matters of chastity, a man after inquiring with his reason forms a right judgment, if he has learnt the science of morals, while he who has the habit of chastity judges of such matters by a kind of connaturality.”

<sup>15</sup> Thomas Aquinas, *Summa Theologica*, II-II, 97, 2.

and productivity of the spirit, where it is permeated by the light Illuminating Intellect: then, while remaining emotion, it is made—with respect to the aspects in things which are connatural to, or *like*, the soul it imbues—into an instrument of intelligence judging through connaturality, and plays, in the process of knowledge through *likeness* between reality and subjectivity, the part of nonconceptual intrinsic determination of intelligence in its preconscious activity.<sup>16</sup>

In this way, the emotion serves as an instrument which conveys the aspects in things connatural towards the soul to the intellect. The obscure grasping of the kind of knowledge presented as nonconceptual knowledge of inseparable Self and things—poetic knowledge—is finally received by the intellect through the inclining and disposing emotion. Why is the intellect the receiver? Maritain said, “I am speaking of a certain kind of knowledge, and emotion does not know: the intellect knows, in this kind of knowledge as in any other.”<sup>17</sup>

This is the process how the creative intuition grasps the “poetic knowledge,” an obscure yet precious knowledge of a union between the subject and the object, for which the artist aims in order to realize it in his works.

In the following section, we will illustrate in a structural model the process of artistic creation proposed by Maritain in order to more clearly manifest the holistic character of this human activity.

### 3. A structural model of artistic creation and its meaning

When Aquinas discusses the human being, he describes him within a general metaphysical account of human nature. Maritain does the same. Maritain’s theory of artistic creation is rooted in his Thomistic understanding of human nature.

Since art pertains to the practical order, it is concerned first and foremost with the appetite, and for the same reason, it is also concerned with the object created. It is in his longing for beauty and the desire to engender in beauty, that the artist unfolds his creativity. Maritain therefore says, “No wall of separation isolates the virtue of art from the inner universe of man’s desire and love. There exists, to be sure, a special desire and love which is simply one with the activity of the artist, consubstantial with this activity. That is the desire and love to create a work.”<sup>18</sup> From this viewpoint, it is then not surprising that in his theory of the creative intuition, Maritain adopts the concept of “Connatural knowledge” from Aquinas, which, as a kind of knowledge, in one way involves the working of one’s intellect and in the other

---

<sup>16</sup> *Creative Intuition in Art and Poetry*, pp. 122-123.

<sup>17</sup> *Creative Intuition in Art and Poetry*, p. 119.

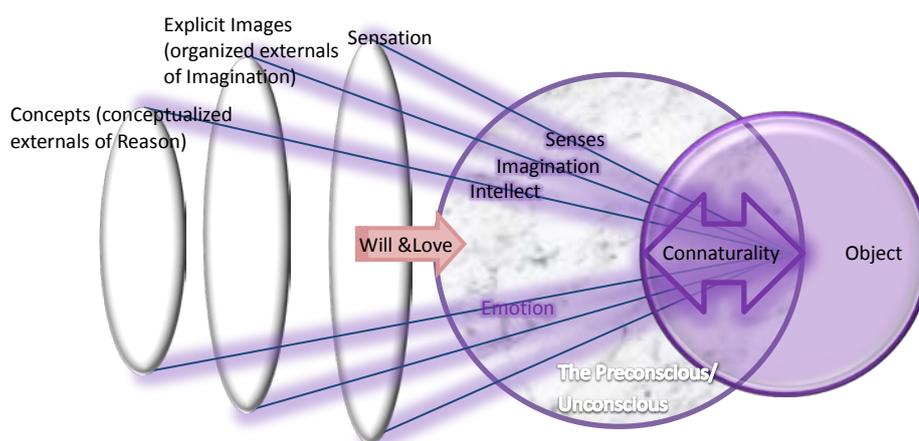

<sup>18</sup> Jacques Maritain, *The Responsibility of the Artist* (New York: Charles Scribner’s Sons, 1960), p. 50.

involves the effects of one's will. Hence, in grasping the poetic knowledge by the creative intuition, "the intellect is at play not alone, but together with affective inclinations and dispositions of the will, and as guided and shaped by them."<sup>19</sup>

The spiritual unconscious or preconscious is essential to Maritain's theory, since it is only in the spiritual unconscious or preconscious, that the artist could possibly bring his will and powers together. The spiritual unconscious or preconscious engages the artist with his whole being into that vital point in which he primordially encounters the object in all its abundance, a point that precedes his separation from the object and the concept of it. The spiritual unconscious or preconscious is not a milieu where the object presents itself meaninglessly or chaotically, but conversely, it is a milieu where the artist's soul, as all that he is, suffers the reality (object): the creative intuition is "born in the depths of the soul."<sup>20</sup> So to speak, the spiritual unconscious or preconscious is "near the center of the soul" and is "the living springs of the preconceptual or supraconceptual vitality of the spirit."<sup>21</sup>

All the powers of the artist, including intellect, imagination, and senses, are together actuated in the creative intuition. They work harmoniously while the emotion permeates them all as they permeate it. The emotion is not one of these powers yet related to each one of them. It thus perfectly serves as an essential instrument through which certain aspects in the object, that the soul suffers and is connatural to, is conveyed to the intellect. As Caldera puts it: judgment by inclination (connaturality) is "an intuitive judgment of the value of an object, posited by means of the affective reation of the subject in relation to it."<sup>22</sup>

Now we will endeavor to illustrate the creative process of the artist through a remodeled figure from Maritain's own drawing:<sup>23</sup>

<sup>19</sup> *Creative Intuition in Art and Poetry*, p. 117.

<sup>20</sup> *Creative Intuition in Art and Poetry*, p. 77.

<sup>21</sup> *Creative Intuition in Art and Poetry*, p. 235.

<sup>22</sup> See Kevin E. O'Reilly, *Aesthetic Perception: A Thomistic Perspective* (Dublin: Four Courts Press, 2007), p.62.

<sup>23</sup> See Maritain's own figure in *Creative Intuition in Art and Poetry*, p. 108.

## Illustration:

In this figure, the powers of senses, imagination and intellect all fall into the preconscious area (shown in a marble background). This structure is modified on the basis of Maritain's own sketch. In Maritain's sketch he depicts the outermost level as the intellect and the innermost level as the senses. In our model, however, this order is reversed, since the first level encountering the object, in any case, is the senses. In addition, the emotion is not expressed in Maritain's drawing, although the emotion is the most important instrument in his theory. In this figure we use the halo effect to mark the work of emotion, which is extremely important yet has no particular corresponding physical faculty. The emotion permeates the senses, imagination, and intellect as they permeate it. Through the emotional connaturality with the aesthetic object, a kind of knowledge in regard with one aspect of the object together with the subject's self is conveyed through the emotion and finally grasped by the intellect. In this figure we use the "halo" and "double-headed" arrow to express the openness in the process of an emotional connaturality between the two (the subject and the object).<sup>24</sup>

Through this structure, we are able to see that in this creative process, the creator is involved as a holistic person, who brings together, with his past experiences and treasures of memory in virtuality, all his powers (such as senses, imagination, memory, intellect and will) into harmony in his inclining will towards the object and in his love for beauty or engendering in beauty.

Once the obscure knowledge from the union between the creator's deep self and the thing, namely, the poetic knowledge, is grasped, the artist then endeavors to realize it in the artwork. Now his mission is to bring something into its being, something that has never existed before him. He uses all the skills he has learned to complete this mission. He practices under the instruction of his virtues of art and he concerns himself with only the good of his work. It is a hard task. "A sort of conflict may therefore be observed between the transcendence of beauty and the material narrowness of the work to be made, between, on the one hand, the formal *ratio* of beauty, the splendor of being and of all the transcendentals combined, and, on the other hand, the formal *ratio* of art, undeviating ingenuity in the realm of

---

<sup>24</sup> This structural model was first formed in "On Aesthetic Experience in Thomas Aquinas," *World Philosophy* 5 (2013): 45. The figure in this paper was revised again from the figure in *World Philosophy*, since in the figure of *World Philosophy* the subject and the object were depicted separately, and in this figure I overlapped the two to show their union when the creative intuition is actuated to grasp the meaning of the object in the spiritual preconscious.

works-to-be-made.”<sup>25</sup> It is not at all surprising that art education emphasizes so many of the skills, the techniques and the cleverness of the artist’s hands, without which the work can never be made in the way it should be, or precisely, in the way the artist wants it to be.

Maritain also emphasizes the need for skills and techniques, yet he puts more weight on the living *habitus*, or *ratio* of art, related to these skills. He therefore condemns ossified academic teaching, claiming accordingly, “the manner in which education cultivates the natural dispositions may atrophy the spontaneous gift instead of developing the *habitus*, especially if this manner is material and rotten with recipes and clever devices—or again if it is theoretical and speculative instead of being operative, for the practical intellect, on which the rules of the arts depend, proceed by positing an effect in being, not by proving or demonstrating; and often those who best possess the rules of an art are the least capable of formulating them. From this point of view one must deplore the substitution (begun by Colbert, completed by the Revolution) of the academic teaching of the schools for corporate apprenticeship.”<sup>26</sup>

When all is said and done, art education remains absolutely necessary. Key to this is forever keeping the kinship and vivid dynamism between the living *habitus* and techniques. “In all teaching the master only assists from the outside the principle of immanent activity which is within the pupil.”<sup>27</sup> Even with the assistance of the master, the pupil needs to cultivate his own *habitus* by himself and in himself.

In the fine arts, art *habitus* elevates itself upwards to the highest level of intellectuality when it works towards realizing in the work the poetic knowledge gasped by the creative intuition. From this point of view, if we may say something further that Maritain did not say, art education is not an education which merely instructs people how to create artworks; in fact, it is also an education which helps the artist to work holistically, or, more precisely, to dedicate oneself to a human activity as a whole, since the grasping of the poetic knowledge requires all his powers working in harmony (including intellect, imagination, and senses) and an openness with all that he is to the object. Art education, then, is not just professional training of the artist, but also the very formation of a holistic human being.

Creation, for Maritain, is a real living human activity. The artwork, as the fruit of this activity, is a most sweet taste which necessarily conveys both the depth of the artist’s self with all his substance and the secret of the object revealed to him. No fixed standards should constrain this activity, which involves a living person

dedicating all his being and powers and the living relationship that he has with the world. *Habitus*, basing its operation on this living person, is free from any constraint of the academic teaching of art.

If what Maritain describes about artistic creation is true, art education then will be an education which cultivates the artist to work as a holistic human being with all his powers and being engaged, and at the same time cultivates a positive intimacy, gained only through the activity of creation, that he can have with the world. In other words, every creative process the artist experiences is a process that deepens himself as a living and complete human being, and is also a process that deepens his insight of the world that he brings into light. In regard to this incredible abundance of the creative process, art education thus “can be” and “should be” regarded as an education more than professional or technical training of the artist to make a work. It should be regarded as a cultivation of the holistic human being and also a cultivation of a decent person who sincerely opens himself to the world with all that he is. In this way, free from the constraints of a mere professional education or art technique education, art education creates dialogue with other disciplines, such as education of life, moral education, and other fields of study.

In this paper, we reveal the meaning of art education and its links to moral education and education of life through our analysis of Maritain’s model of artistic creativity. It would be interesting to see a different approach in which moral education and art education are from the beginning considered as one, an approach that was adopted by Confucius. Confucius’ discourses may not be enough for us to form a model of artistic creation, yet his insights on the link between moral education and art education perfectly echo the claim that we have made in this paper.

#### 4. A Chinese approach illustrated by Confucius

According to Confucius, the training of the artist and his self-cultivation are integrated in every case. A story on Confucius clearly demonstrates this standpoint:

Confucius learned to play lute under the instruction of Shi Xiang (師襄). He had practiced one piece for ten days and could not complete it. Shi Xiang said: “You may move on to the next piece.” Confucius replied: “I have acknowledged the tune, but am not yet familiar with the playing technique.” After a period of time, Shi Xiang said: “You have learned the technique, and now you may move on to the next piece.” To which Confucius replied: “I have yet to acknowledge its emotional implication.” After a period of time, Shi Xiang said: “You have learned the emotional implication, and now you may

move on.” Confucius replied: “I have yet to acknowledge the person in this piece.” One day, after a period of time, Confucius was in quiet and pleasant contemplation and seemed to look to the horizon filled with great aspiration. He said: “I have recognized this person. He is black, he is tall, and his vision is high and far. It seems that he is ruling all the lords of lands. If he is not King Wen (文王), who else could have composed this!?”<sup>28</sup>

“The ‘tune’ and ‘technique’ of the piece designate skill. The ‘emotional implication’ means the spirit of the music, and the ‘person’ is the presence in the music of some spiritual world of a real subject. The process of learning for Confucius is to start from skill and move on to the spiritual world which is itself beyond skill, and from there to reach the person who is possessed of this world. This shows us the active process of a great artist. To grasp the ‘person’ in the music is to fuse, for Confucius, himself to the music and to make his whole personality permeate in music.”<sup>29</sup> It is obvious for us to observe that for Confucius the deep experience of music and the cultivation of his personality is in fact one thing.<sup>30</sup>

In *The Analects*, Confucius said, “Get aroused by the Odes; acquire a firm standing through ritual; complete the process with music.” (*The Analects*, Book VIII)<sup>31</sup> Music therefore is the last step to achieve the highest level of life. Confucius’ education for his students is often addressed to their moral integrity and their self-cultivation as moral beings in the society. Interestingly enough, he designates music, or an artistic accomplishment precisely speaking, as the ultimate end of the process of this self-cultivation. Without experiencing the integration of a musical cultivation and self-upbringing, or without seeing the connection between the two at the highest level of his spiritual life, he would not have so firmly made this statement.

Another paragraph in *The Analects* says, “Ritual! Ritual! they said. But is it just a matter of jades and silks? Music! Music! they said. But is it just a matter of bells and drums?” (*The Analects*, Book XVII) If music is something more than music, then what is that something extra beyond the bells and drums? As the story in *Records of the Historian* shows us, one is able to capture the “person” in music only when his spiritual level reaches the same height of this “person” in music. This spiritual status

<sup>30</sup> This paragraph and the paragraph above are cited from Katia Lenahan, “Beauty and Goodness: A Comparison between the Aesthetic Theories of Jacques Maritain and Confucius,” *International Journal of Philosophy* (2010): 65-66.

<sup>31</sup> The translation of *The Analects* in this paper is based on Burton Watson’s work. See Confucius, *The Analects of Confucius* (New York: Columbia University Press, 2007). There are some words and sentences modified by the writer.

of the artist or the performer refers to in one way his moral status and self-cultivation, and in the other his artistic taste. One's higher moral status is contributed to his understanding of the music, as is one's higher artistic taste is contributed to his moral status. These two do not exclude one another, but rather, they may grow together and facilitate one another. Confucius thus said, "A human being who lacks benevolence (humaneness)—what is ritual to someone like that? A human being who lacks benevolence—what is music to someone like that?" (*The Analects*, Book III) Music is something more than the bells and drums, since the spiritual world which it implies is too rich and sublime to be regarded as mere external sounds, and this spiritual world, as we have seen, is not something irrelevant to one's moral integrity and self-cultivation. The undeniable kinship between art and morality, or between art education and moral education, is revealed in both Confucius' personal life and his philosophy.

## 5. Conclusion

Confucius' discourses well support our understanding of art education, which is an expanded point that we gained from the analysis of Maritain's theory of artistic creation: art education is not only training of a person to produce a work, but is also an education which helps this person to work holistically as a human being, deepens his insight into things, and cultivates his positive intimacy with the world. This kind of education is thus related to the education of life and moral education, and becomes a discipline which is open to and is able to create a real dialogue with other disciplines.

Yet one thing is worth noting: the link between art education and moral education or education of life does not result in the illusion that art education, moral education or education of life is not able to develop as it is without one another. It is more than obvious that each discipline has its own rule and specialty which other disciplines are not able to replace. Our aim is only to draw out the fact that we are confronted in art education by the student, a holistic, unitary, and particular man or subject, who is in the process of making. He is at the same time a moral being, an artistic being, and a being endeavoring to reach a higher status of spirituality and a deeper understanding of the world. Accordingly, the link and the possible dialogues between art education and moral education or education of life shall not always be left aside if we are on the way to conceive of an art education which is more perfect, more complete, and much closer to the students in their real situation.

Title:

Pre-Service Teachers' Mental Models of Electricity and Magnetism

### **ABSTRACT**

This study investigated the mental models on electricity and magnetism of pre-service teachers with specialization in physics at a government education university. The respondents consisted of 174 students divided into two groups: No E&M and With E&M. The No E&M group are the students who have not taken any college electricity and magnetism (E&M) course while the With E&M group are the students who have taken at least one college E&M course. The instrument used is the Conceptual Survey on Electricity and Magnetism (CSEM), a 32-item multiple-choice standardized test, and it consisted of 11 conceptual areas in E&M. The statistical treatments used for the data were factor analysis and model analysis. Factor analysis was used to determine the common conceptions of students in E&M while model analysis was used to determine the mental models employed by students when answering E&M problems. The mental models of the students were categorized as expert, student and null model. The expert model is the mental model that is accepted by the scientific community to be correct. The student model is an incorrect or partially correct mental model that students created based on experience or previous instruction. The null model is a mental model that is not describable by a well-understood mental model. The student model was based on the most common conceptions used by students in E&M.

Using the model analysis, both groups showed that the respondents consistently made use of the student model in 5 out of 11 conceptual areas of the

CSEM. These conceptual areas are the following: 5) work, electric potential, field and force, 6) induced charge and electric field, 7) magnetic force, 8) magnetic field caused by a current, and 10) Faraday's law. However, both groups possessed mixed model for the conceptual areas of Coulomb's force law and Newton's third law.

Factor analysis was also used in this study, where 14 factors were obtained. These 14 factors have explained 64.5% of the total variance and only about 35.43% is attributed to other variables. This was different from the 11 topics that were presented by Maloney et al. Each factor represents a robust conception for both groups in electricity and magnetism, which was derived from the correlation between the factors and the items of CSEM.

To further probe the conceptions of students, an interview was done on high performing and low performing students. The answers of both the high performing and low performing students during the interview showed that they have the same conceptions on E&M. The high performing students showed that there was little change in their conceptions even if they have already studied college E&M.

The results from the three methods used: model analysis, factor analysis and interviews, corroborated with each other.

**A Study on Constructing a Meta-evaluation Checklist for a System  
Assessing Student Learning Outcomes at Universities in Taiwan**

# **A Study on Constructing a Meta-evaluation Checklist for a System Assessing Student Learning Outcomes at Universities in Taiwan**

## **Abstract**

The main purpose of this study is to develop a meta-evaluation checklist for a system that assesses student learning outcomes at colleges and universities in Taiwan. The checklist is based on *The Student Evaluation Standards: How to Improve Evaluations of Students (SES)*. The findings and conclusions of this study may serve as a reference for higher education institutions when designing, implementing and evaluating systems for assessing student learning outcomes at their institutions. The three-stage Delphi technique is utilized to achieve the above mentioned goals. The main conclusions of this study are summarized as follows:

1. The proposed meta-evaluation checklist for a system assessing student learning outcomes is suitable for colleges and universities in Taiwan.
2. Four kinds of standards and 28 sub-standards are all applicable to the system for assessing student learning outcomes at colleges and universities in Taiwan.
3. The meta-evaluation checklist of the system for assessing student learning outcomes developed here is complete and sound for colleges and universities in Taiwan. The contents of this meta-evaluation checklist include a cover page, table of contents, and the checklist itself. The structure of the checklist includes: standards/sub-standards, checkpoints, a data collection method and results. In total, there are four kinds of standards, 28 sub-standards, and 45 checkpoints on the checklist.

Based on the conclusions of this study, suggestions are provided for colleges and universities, as well as for further studies.

**Key Words:** student learning outcomes assessment system, student evaluation system, meta-evaluation checklist, colleges and universities

## I. Introduction

Over the last few decades, higher education in Taiwan has grown at an overwhelming rate. The number of undergraduate and graduate students and the number of schools has increased many fold (Low, 2007). In 1949, only 1 university and 3 junior colleges existed in Taiwan. Over 60 years, the number of higher education institutions (HEIs) had grown to 163, including 147 universities/colleges and 16 junior colleges (Yao & Jacob, 2012).

The growth of the numbers of HEIs has caused high opportunities and easy access for students to study in colleges and universities. Therefore, HEIs' student learning outcomes are rapidly taking center stage as the principal gauge of the effectiveness of higher education. Parents and the public—acting as “consumers” of higher education—are looking not just at price, but at the underlying quality of a college credential and what it will buy them in the employment marketplace. The public is concerned about what and how much students are learning in Taiwan's colleges and universities. Therefore, organizations assessing student learning outcomes must become more aggressive and creative in requiring effective student learning outcomes as an integral part of their standards and processes (Ewell, 2001).

It is very important to assure the quality of teaching and student learning outcomes. The Taiwan Ministry of Education launched evaluation programs to evaluate the indicators of student learning outcomes for higher education in 2009. Many colleges and universities have tried to establish systems to assess student learning outcomes and assure the quality of teaching and student learning outcomes. However, what are the actual situations behind the design, planning and implementation of assessments for student learning outcomes? Are the systems for assessing student learning outcomes solid? Can the expected functions be realized? Are the processes taking place within proposal units and executive units equitable, fair and objective?

The standards for program, personnel and student evaluation were defined by the Joint Committee on Standards for Educational Evaluation (JCSEE) (JCSEE, 1981; 1994; Stufflebeam, 1999). Based on these three books, *the “Program Evaluations Metaevaluation Checklist”*, *“Personnel Evaluation Standards Metaevaluation Checklists”* and *“Personnel Evaluation Systems Standards Metaevaluation Checklists”*, they were later developed (JCSEE,

1981, 1984, 1988; 1994; Stufflebeam, 2000a, 2000b). These checklists are effective tools for evaluating the original evaluations. Metaevaluations allow public, professional, and institutional organizations to assure that evaluations provide sound findings and conclusions. They also gauge whether or not evaluation practices continue to improve and reveal whether or not institutions administer efficient, effective evaluation systems (Scriven, 2000; Stufflebeam, 2001). Suitable checklists for evaluating student evaluations have yet to be developed. Therefore, it is necessary and urgent to develop related checklists.

The main purpose of this study is to develop a meta-evaluation checklist for a student learning outcomes assessment system in Taiwan's universities from the viewpoint of meta-evaluation. The dimensions, standards and checkpoints of a meta-evaluation checklist for assessing student learning outcomes are included. The proposed checklist is expected to serve as a guide for the improvement of planning/designing/implementing of student evaluations and to be used as reference in reporting/utilizing the results of student evaluations. Finally, suggestions are offered to the colleges and universities in Taiwan.

## **II. Basic Concepts for a Meta-evaluation Checklist for a System Assessing Student Learning Outcomes in Colleges and Universities**

The meta-evaluation checklist for a system assessing student learning outcomes is viewed as important as HEIs strive to achieve the effectiveness (JCSEE, 2003). The meta-evaluation checklist for the system assessing student learning outcomes covers six concepts, including student evaluation, student learning outcomes assessment, system of assessment for student learning outcomes, meta-evaluation, meta-evaluation standards and a meta-evaluation checklist. These concepts are described as follows:

### **1. Student Evaluation**

Student evaluation can be interpreted as a process of systematically collecting and interpreting information that can be used as follows: (1) To inform students, and their parents/guardians where applicable, about the progress they are making toward attaining the knowledge, skills, attitudes, and behaviors to be learned or acquired. (2) To inform the various personnel who make educational decisions (instructional, diagnostic, placement, promotion and graduation) about students (JCSEE, 2003).

## 2. Student Learning Outcomes Assessment

Student learning outcomes assessment is the process of collecting information that tells an organization whether the services, activities, or experiences it offers are having the desired impact on those who partake in them (Rebecca, Ken & Samantha, 2009).

## 3. System Assessing Student Learning Outcomes

A student assessment system supports a variety of information needs, such as informing learning and instruction, determining progress, measuring achievement, and providing partial accountability information. All of these purposes, and the decisions based on them, should ultimately lead to improved quality and learning levels in the education system.

A student assessment system is a group of policies, structures, practices, and tools for generating and using information related to student learning and achievement. Effective assessment systems provide information of sufficient quality and quantity to meet stakeholder information and decision making needs in support of improved education quality and student learning outcomes (Ravela et al., 2009).

## 4. Meta-Evaluation

An evaluation must be evaluated. This type of evaluation is labeled as meta-evaluation and is defined as the process of delineating, obtaining, and applying descriptive information and judgmental information about the utility, feasibility, propriety, and accuracy of an evaluation in order to guide the evaluation and publicly report its strength and weaknesses (JCSEE, 2003; Scriven, 2000; Stufflebeam, 2001).

## 5. Meta-Evaluation Standards

The standards that are used for meta-evaluation are drawn only from the meta-evaluation checklist proposed in an evaluation project by Stufflebeam (1974). We therefore intend to develop a meta-evaluation checklist to carry out meta-evaluation based on the “SES” issued by JCSEE (2003). The main part of the JCSEE standards consists of the explication of the 28 standards and propriety, utility, feasibility and accuracy are emphasized.

## 6. Meta-Evaluation Checklist

An evaluation checklist is a list for guiding and assessing evaluations. A checklist can easily, effectively and accurately collect information about evaluation activities. A designed checklist can help evaluators to justify the values, advantages and shortcomings of their work based on the appropriate standards (Stufflebeam, 2000c).

The main purpose of a meta-evaluation checklist for assessing student learning outcomes system is that it can easily, effectively and accurately collect information about evaluation activities (Griffin, 2010; JCSEE, 2003; Scriven, 2000). However, a sound student evaluation system needs to be well planned and systematically conducted to achieve its intended purposes.

### **III. Methods**

The Delphi technique was utilized to develop a meta-evaluation checklist that is suitable for colleges and universities in Taiwan.

#### ***Instrumentation***

The Delphi method originated in a series of studies conducted by the RAND Corporation in the 1950's. The objective was to develop a technique to obtain the most reliable consensus of a group of experts (Dalkey & Helmer, 1963). While researchers have developed variations of this method since its introduction, Linstone and Turoff (1975) captured the common characteristics in this description:

“Delphi may be characterized as a method for structuring a group communication process so that the process is effective in allowing a group of individuals, as a whole, to deal with a complex problem. To accomplish this “structured communication” there is provided: some feedback of individual contributions of information and knowledge; some assessment of the group judgment or view; some opportunity for individuals to revise views; and some degree of anonymity for the individual responses.”

Delphi researchers employ this method primarily in cases where judgmental information is indispensable, and typically use a series of questionnaires interspersed with controlled opinion feedback (Rowe, Wright & Bolger, 1991). A key advantage of this approach is that it avoids direct confrontation with the experts.

#### ***Procedures of the Study***

The eleven invited experts audited the questionnaire item by item and provided their suggestions and comments. The 1st round questionnaire for “the meta-evaluation checklist of

the student learning outcomes assessment system for colleges and universities in Taiwan” was created after completing a discussion with the adviser. The researcher reiterated the same process 3 times. In this way the refined 2<sup>nd</sup> and 3<sup>rd</sup> round questionnaires were generated. Finally, the checklist was fixed and confirmed. The checklist is applicable to colleges and universities in Taiwan.

### ***Research Problems and Scope***

The research problems, subject and scope were determined after the survey and review of the development of higher education evaluation systems were completed.

### ***Literature Review and Analysis***

The researcher explored, studied, analyzed, compared and summarized the definitions, standards and methodologies concerning higher education evaluation systems. The theory and architecture of the meta-evaluation checklist were determined after the exploration of relevant studies was completed.

### ***Initial Questionnaire***

After the literature analysis, the researcher designed an initial questionnaire for “the meta-evaluation checklist of the student learning outcomes assessment system to improve student evaluations” at colleges and universities in Taiwan based on the checklist proposed by the JCSEE (2003).

### ***Experts’ Review***

The invited experts audited the questionnaire item by item and provided their suggestions and comments to help to identify the potential problems about the applicability and representative.

### ***Modification of Checklist***

The feedback from experts was discussed by the researcher and adviser. Then the researcher corrected the initial questionnaire for “the meta-evaluation checklist of the student learning outcomes assessment system for colleges and universities in Taiwan”. These corrections made the questionnaire more suitable and applicable to colleges and universities in Taiwan.

### ***Questionnaire***

The 1st round questionnaire for “the meta-evaluation checklist of the student learning outcomes assessment system for colleges and universities in Taiwan” was created after the researcher discussed the feedback with the adviser.

### ***Investigation by Delphi Method***

The eleven invited experts audited the questionnaire item by item and provided suggestions and comments. The 1<sup>st</sup> round questionnaire for “the meta-evaluation checklist of the student learning outcomes assessment system for colleges and universities in Taiwan” was created after discussion with the adviser.

The researcher reiterated the same process 3 times. In this way the refined 2<sup>nd</sup> and 3<sup>rd</sup> round questionnaires were generated.

### ***Analysis and Discussion***

According to the results of group discussions among the 3 rounds of questionnaires, the task of statistical analysis was executed to modify and correct the checkpoints.

### ***Complete Checklist***

Finally, the checklist was fixed and confirmed. The checklist is applicable to colleges and universities in Taiwan.

### ***Conclusions and Discussion***

Based on the conclusions of this study, suggestions are offered to colleges and universities, as well as for further studies.

## **IV. Findings**

The feedback from three rounds of questionnaires were carefully collected, discussed and analyzed, leading to the development of a meta-evaluation checklist suitable for colleges and universities in Taiwan.

### ***Qualitative Analysis***

The derived meta-evaluation standards include 4 standards (propriety, utility, feasibility, accuracy) and 28 sub-standards, which are based on the “SES” issued by JCSEE (2003). The

researcher designed an initial questionnaire for “the meta-evaluation checklist for the “student learning outcomes assessment system for colleges and universities in Taiwan” based on the derived meta-evaluation. Four experienced experts were invited to review the questionnaire item by item and provide their suggestions and comments before applying the Delphi method.

The eleven participants in Delphi analysis selected by the purposive sampling method included educational experts and staff from educational administrative agencies at colleges and universities in Taiwan.

There were three stages in the process of generating the questionnaire, including design, review and modification.

### *Quantitative Analysis*

Generally, the “mean value” numbers were above 5, the value of “mode” was 6 and the value of “standard deviation” was less than 1. The results show that the items of the checkpoints were either “important”, “very important” or “less different”.

### *Propriety Standards*

In table 1, the “mean value” numbers were all above 5.5, the values of “mode” were 6 and the values of “standard deviation” were less than 1 except for items P4-3 and P7-1. The results show that the items of the checkpoints were either “important”, “very important” or “less different”. Unified points of view and consensus were reached for the propriety standards of the checkpoints.

Table 1 Analysis of the Responses for the Propriety Standards

Sub-standard	Checkpoint	Mean Value		Mode		Standard Deviation	
		2 <sup>nd</sup> round	3 <sup>rd</sup> round	2 <sup>nd</sup> round	3 <sup>rd</sup> round	2 <sup>nd</sup> round	3 <sup>rd</sup> round
P1 Service to Students	1. Evaluation system should promote sound education principles and fulfillment of institutional missions.	5.72	5.72	6	6	0.46	0.46
	2. Evaluation system should serve the needs of students.	5.54	5.72	6	6	0.93	0.46
P2 Appropriate Policies and Procedures	1. Written policies should be developed and implemented.	5.81	5.90	6	6	0.40	0.30
	2. Written procedures should be developed and made available.	5.72	5.81	6	6	0.46	0.40
P3 Access to Evaluation Information	1. Access to a student’s evaluation information should be provided, but limited to the student and others with legitimate permission.	5.54	5.81	6	6	0.82	0.40
P4	1. The procedures, meanings and purpose	5.63	5.81	6	6	0.67	0.40

Treatment of Students	should be explained with understandable manner.						
	2. Establish procedures for dealing with the problems during the process of evaluation.	5.54	5.72	6	6	0.68	0.46
	3. Students should be treated with respect throughout the process of evaluation.	5.63	5.54	6	6	0.50	0.52
P5 Rights of Students	1. Evaluations of students should be consistent with laws and principles of human rights.	5.63	5.72	6	6	0.67	0.46
	2. Students' rights and welfare should be protected.	5.72	5.81	6	6	0.46	0.40
P6 Balanced Evaluation	1. Evaluations of students should provide information that identifies both strengths and weaknesses.	5.54	5.63	6	6	0.93	0.67
P7 Conflict of Interest	1. Conflict of interest should be avoided.	5.63	5.54	6	6	1.02	0.68
	2. Conflicts of interest should be dealt with openly and honestly.	5.54	5.63	6	6	0.68	0.67

### *Utility Standards*

In Table 2, the “mean value” numbers were all above 5 except for item U7-1, the values of “mode” were 6 except items U5 and U7-1 and the values of “standard deviation” were less than 1 except for item U7-1. The results show that the items of the checkpoints were either “important”, “very important” or “less different”. Unified points of view and consensus were reached for the utility standards of the checkpoints.

Table 2 Analysis of the Responses for the Utility Standards

Sub-standard	Checkpoint	Mean Value		Mode		Standard Deviation	
		2 <sup>nd</sup> round	3 <sup>rd</sup> round	2 <sup>nd</sup> round	3 <sup>rd</sup> round	2 <sup>nd</sup> round	3 <sup>rd</sup> round
U1 Constructive Orientation	1. Evaluation system should promote positive development of students.	5.81	5.90	6	6	0.40	0.30
	2. Evaluation system should promote integral effect of student learning outcome.	6.00	6.00	6	6	0	0
U2 Defined Users and Uses	1. The users and use of a student evaluation should be specified.	5.54	5.63	6	6	0.82	0.50
U3 Information Scope	1. The students' learning information can be selected during the process of student evaluation.	5.63	5.90	6	6	0.67	0.30
	2. The collected students' learning information should be carefully focused and sufficiently comprehensive during the process of student evaluation.	5.63	5.72	6	6	0.50	0.46
U4 Evaluator Qualifications	1. Teachers and others who value students should have the necessary knowledge and skills.	5.63	5.81	6	6	0.50	0.40

U5 Explicit Values	1. In conducting student evaluations, evaluators should identify and justify the values used to judge student performance.	5.27	5.45	5	6	0.64	0.68
U6 Effective Reporting	1. Reports of student evaluations should be clear, timely, accurate and relevant.	5.54	5.63	6	6	0.52	0.50
	2. Reports student evaluations should be helpful to students.	5.54	5.45	6	6	0.93	0.68
U7 Follow-Up	1. Student evaluations should include follow-up procedures.	4.81	5.00	5	5	1.72	0.63
	2. Students and other legitimate users can understand the information and take appropriate follow-up actions.	5.45	5.54	6	6	0.93	0.68

### *Feasibility Standards*

In table 3, the “mean value” numbers were all above 5, the values of “mode” were 6 and the values of “standard deviation” were less than 1. The results show that the items of checkpoints were either “important”, “very important” or “less different”. Unified points of view and consensus were reached for the feasibility standards of the checkpoints.

Table 3 Analysis of the Responses for the Feasibility Standards

Sub-standard	Checkpoint	Mean Value		Mode		Standard Deviation	
		2 <sup>nd</sup> round	3 <sup>rd</sup> round	2 <sup>nd</sup> round	3 <sup>rd</sup> round	2 <sup>nd</sup> round	3 <sup>rd</sup> round
F1 Practical Orientation	1. Student evaluation procedures should be practical.	5.90	6.00	6	6	0.30	0.00
	2. Student evaluation procedures can be conducted effectively.	5.72	5.81	6	6	0.46	0.40
F2 Political Viability	1. Student evaluation procedures should be planned with the anticipation of questions from students, so that their questions can be answered effectively.	5.45	5.72	6	6	0.68	0.46
F3 Evaluation Support	1. Adequate time and resources should be provided for student evaluations.	5.63	5.71	6	6	0.50	0.46

### *Accuracy Standards*

In Table 4, the “mean value” numbers were all above 5, the values of “mode” were 6 except for items A7-2 and A10-1 and the values of “standard deviation” were less than 1 except for item A3. The results show that the items of the checkpoints were either “important”, “very important” or “less different”. Unified points of view and consensus were reached for

the accuracy standards of the checkpoints.

Table 4 Analysis of the Responses for the Accuracy Standards

Sub-standard	Checkpoint	Mean Value		Mode		Standard Deviation	
		2 <sup>nd</sup> round	3 <sup>rd</sup> round	2 <sup>nd</sup> round	3 <sup>rd</sup> round	2 <sup>nd</sup> round	3 <sup>rd</sup> round
A1 Validity Orientation	1. Student evaluations can make reasonable interpretations about students' performance.	5.63	5.81	6	6	0.67	0.40
A2 Defined Expectations for Students	1. The performance expectations for students should be clearly defined.	5.36	5.63	6	6	0.80	0.50
	2. The standards for justifying learning performance should be clearly defined.	5.81	5.90	6	6	0.40	0.30
	3. Student evaluations should be planned with the anticipation of students expectations, so that expectations of actions and responsibilities can be clarified.	5.27	5.63	6	6	0.78	0.50
A3 Context Analysis	1. Student and contextual variables that influence performance should be identified.	5.09	5.45	6	6	1.04	0.68
	2. Evaluators should consider the personalized variables that influence performance.	5.36	5.45	6	6	0.92	0.68
A4 Documented Procedures	1. The procedures for evaluating students should be described, so that the procedures can be explained and justified.	5.81	5.90	6	6	0.40	0.30
A5 Defensible Information	1. The information collected for student evaluations should be defensible, so that the information can be reliably and validly interpreted.	5.63	5.63	6	6	0.92	0.67
A6 Reliable Information	1. Evaluation procedures should be developed and implemented, so that they provide reliable information for decisions about the performance of a student.	6.00	5.90	6	6	0.00	0.30
A7 Bias Identification and Management	1. Student evaluation should be free from bias, so that the conclusions can be fair.	5.72	5.72	6	6	0.46	0.46
	2. Develop a mechanism to record, manage and correct bias.	5.36	5.45	5	5	0.67	0.52
A8 Handling Information and Quality Control	1. The information collected from student evaluations should be systematically reviewed and corrected.	5.66	5.81	6	6	0.50	0.40
	2. The information collected from student evaluations should be kept secure.	5.63	5.81	6	6	0.50	0.40
A9 Analysis of Information	1. The information collected for student evaluations should be systematically and accurately analyzed.	5.81	5.81	6	6	0.40	0.40
A10 Justified	1. Develop a written framework to guide student evaluations.	5.45	5.63	6	6	0.52	0.50

Conclusions	2. The evaluative conclusions should be explicitly justified, so that students and others can have confidence in them.	5.72	5.63	6	6	0.46	0.50
A11 Meta- evaluation	1. Develop a mechanism to periodically examine student evaluation procedures.	5.63	--	6	--	0.50	--
	2. Mistakes occurring during student evaluation can be detected and corrected.	5.63	--	6	--	0.67	--
	3. Periodically examine pertinent standards and modify the procedures of student evaluations to develop sound evaluation practices.	--	5.63	--	6	--	0.50

The feedback from three rounds of questionnaires was carefully collected, discussed and analyzed. Unified points of view and consensus were reached for the accuracy standards of the checkpoints. This meta-evaluation checklist developed here is suitable for colleges and universities in Taiwan (see the Appendix 1).

## V. Conclusions and Recommendations

The main purpose of this study was to develop a meta-evaluation checklist for a student learning outcomes assessment system for colleges and universities in Taiwan. The checklist was based on *The Student Evaluation Standards: How to Improve Evaluations of Students* (SES). Qualitative and quantitative analysis methods were utilized to construct this checklist. The three-stage Delphi technique, qualitative and quantitative analysis methods were utilized to achieve the goal. The findings can hopefully provide national policy makers, education ministry officials, development organization staff, and other stakeholders with a framework and key indicators for diagnosis, discussion, and consensus building for constructing sound and sustainable student assessment systems that will support improved education quality and learning for all.

### *Conclusions*

Based on the above findings, the main conclusions of this study are summarized as follows:

1. The meta-evaluation checklist of the system for assessing student learning outcomes developed in this study is suitable for colleges and universities in Taiwan.
2. The four kinds of standards and the 28 sub-standards are all applicable to student learning outcomes assessment system for colleges and universities in Taiwan.

3. The meta-evaluation checklist of the student learning outcomes assessment system developed by this study is complete and sound for colleges and universities in Taiwan. The contents of this meta-evaluation checklist include a cover page, table of contents, and the checklist itself. The structure of the checklist includes: standards/ sub-standards, checkpoints, the data collection method and results. In total, four kinds of standards, 28 sub-standards, and 45 checkpoints are included on the checklist.

### ***Recommendations***

Based on the above findings and conclusions, the following recommendations are presented.

To promote student learning outcomes assessment systems, universities may refer to this checklist to develop or modify their meta-evaluation checklists. This will facilitate better understanding and improvement of the effectiveness of the implementation of systems for assessing student learning outcomes.

To guide planning and implementation student learning outcomes assessment systems, universities may refer to the student evaluation standards proposed here to achieve their expected goals and functions.

Based on the conclusions of this study, further studies and related research can be conducted to develop more checklists suitable for different classes, departments, colleges and universities in Taiwan.

Appendix 1

The Meta-evaluation Checklist of Assessing Student Learning Outcomes System for Universities in Taiwan

Standards/ Sub-standards	Checkpoints	Data Collection Methods	Implementation Results
P1 Service to Students	1. Evaluation system should promote sound education principles and fulfillment of institutional missions.	Document analysis	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
	2. Evaluation system should serve the needs of students.	1. Document analysis 2. Interview 3. Questionnaire	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
P2 Appropriate Policies and Procedures	1. Written policies should be developed and implemented.	1. Document analysis 2. Interview 3. Questionnaire	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
	2. Written procedures should be developed and made available developed and made available.	1. Document analysis 2. Interview 3. Questionnaire	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
P3 Access to Evaluation Information	1. Access to a student's evaluation information should be provided, but limited to the student and others with legitimate permission.	1. Document analysis 2. Interview 3. Questionnaire	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
P4 Treatment of Students	1. The procedures, meanings and purpose should be explained with understandable manner.	1. Document analysis 2. Interview 3. Questionnaire	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
	2. Establish procedures for dealing with the problems during the process of evaluation.	1. Document analysis 2. Interview 3. Questionnaire	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
	3. Students should be treated with respect throughout the process of evaluation.	1. Document analysis 2. Interview 3. Questionnaire	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
P5 Rights of Students	1. Evaluations of students should be consistent with laws and principles of human rights.	1. Document analysis 2. Interview	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description :

		3. Questionnaire	----- <input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
	2. Students' rights and welfare should be protected.	1. Document analysis 2. Interview 3. Questionnaire	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
P6 Balanced Evaluation	1. Evaluations of students should provide information that identifies both strengths and weaknesses.	1. Document analysis 2. Interview 3. Questionnaire	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
P7 Conflict of Interest	1. Conflict of interest should be avoided.	1. Document analysis 2. Interview 3. Questionnaire	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
	2. Conflicts of interest should be dealt with openly and honestly.	1. Document analysis 2. Interview 3. Questionnaire	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
U1 Constructive Orientation	1. Evaluation system should promote positive development of students.	1. Document analysis 2. Interview 3. Questionnaire	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
	2. Evaluation system should promote integral effect of student learning outcome.	1. Document analysis 2. Interview 3. Questionnaire	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
U2 Defined Users and Uses	1. The users and use of a student evaluation should be specified.	Document analysis	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
U3 Information Scope	1. The students' learning information can be selected during the process of student evaluation.	1. Document analysis 2. Interview 3. Questionnaire	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
	2. The collected students' learning information should be carefully focused and sufficiently comprehensive during the process of student evaluation.	Document analysis	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
U4 Evaluator Qualifications	1. Teachers and others who evaluate students should have the necessary knowledge and skills.	1. Document analysis 2. Interview 3. Questionnaire	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----

U5 Explicit Values	1. In conducting student evaluations, evaluators should identify and justify the values used to judge student performance.	Document analysis	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
U6 Effective Reporting	1. Reports of student evaluations should be clear, timely, accurate and relevant.	Document analysis	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
	2. Reports student evaluations should be helpful to students.	1. Document analysis 2. Interview 3. Questionnaire	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
U7 Follow-Up	1. Student evaluations should include follow-up procedures.	Document analysis	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
	2. Students and other legitimate users can understand the information and take appropriate follow-up actions.	1. Document analysis 2. Interview 3. Questionnaire	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
F1 Practical Orientation	1. Student evaluation procedures should be practical.	1. Document analysis 2. Interview 3. Questionnaire	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
	2. Student evaluation procedures can be conducted effectively.	1. Document analysis 2. Interview 3. Questionnaire	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
F2 Political Viability	1. Student evaluation procedures should be planned with the anticipation of questions from students, so that their questions can be answered effectively.	1. Document analysis 2. Interview 3. Questionnaire	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
F3 Evaluation Support	1. Adequate time and resources should be provided for student evaluations.	1. Document analysis 2. Interview 3. Questionnaire	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
A1 Validity Orientation	1. Student evaluations can make reasonable interpretations about students' performance.	1. Document analysis 2. Interview 3. Questionnaire	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
A2	1. The performance expectations for students should be	1. Document analysis	<input type="checkbox"/> Yes <input type="checkbox"/> No

Defined Expectations for Students	clearly defined.	2. Interview 3. Questionnaire	Qualitative description : -----
	2. The standards for justifying learning performance should be clearly defined.	1. Document analysis 2. Interview 3. Questionnaire	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
	3. Student evaluations should be planned with the anticipation of students expectations, so that expectations of actions and responsibilities can be clarified.	1. Document analysis 2. Interview 3. Questionnaire	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
A3 Context Analysis	1. Student and contextual variables that influence performance should be identified.	1. Document analysis 2. Interview 3. Questionnaire	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
	2. Evaluators should consider the personalized variables that influence performance.	1. Document analysis 2. Interview 3. Questionnaire	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----
A4 Documented Procedures	1. The procedures for evaluating students should be described, so that the procedures can be explained and justified.	1. Document analysis 2. Interview 3. Questionnaire	<input type="checkbox"/> Yes <input type="checkbox"/> No Qualitative description : -----

Using Active Case Studies to Teach Leadership, Management and Supervision

Teacher Education

Paper Session

The presentation intends to describe in detail the process of using active learning strategies, case studies, and real life new supervisor struggles to engage students in learning the fundamental basics of leadership, management and supervision. The learning process is modeled through classroom discussion, experiential learning, case development, and student group presentations. The presentation will thoroughly describe these processes.

## Abstract

The concept of teaching leadership, management and/or supervision in higher education has normally been regulated to theory about how these concepts came into existence, along with best practices used by today's current crop of successful leaders. The list of published leadership icons includes political leaders, organizational leaders, and even civic leaders; however, these ideas, theories, and guides are much too focused on the top of the organizational pyramid, otherwise known as senior management. Normally, this is not the typical audience in an average undergraduate business program or undergraduate classroom. Students who graduate with a bachelor's degree in Business are more apt to start off in an entry level supervision position, long before they are going to take over as the CEO of a Fortune 500 company.

Commonly missing from most leadership, management and supervision programs is the hands on experiential learning that is needed for students to be prepared to enter entry level supervision and management positions.

This paper intends to describe in detail a new strategy for creating an active learning environment using student developed case studies and real life new supervisor struggles to engage students in learning the fundamental basics of leadership, management and supervision. The learning process is modeled through faculty facilitation, classroom discussion, experiential learning, case development, and student group presentations.

In this process, students use real life supervision issues taken from front line and entry level supervisors and build training programs and cases to help teach each other how to handle day-to-day problems. All done through the guidance of a professor or instructor of management, students transform the classroom into a "supervision laboratory" to be used for trial and error management planning, organizing, leading and controlling of many issues facing entry level leaders in today's business environment.

The process was used by the author of this paper and documented through several supervision courses to help identify a more active and hands on approach to teaching students how to lead and supervise. The discussion created from the process and described in this paper will identify what students and faculty found beneficial to one business school's curriculum. By using active learning techniques students became more engaged by the process, in addition to learning valuable leadership, management, and supervision skills. Theory is still taught, along with traditional lecture portions, but the value comes from the experiential learning taking place in the classroom.

**Title:** Teacher Fidelity and Student Response to a Model of Differentiation as Implemented in One High School

**Synopsis:** US classrooms are becoming increasingly diverse. High schools have addressed academic diversity in several ways, including sorting students into ability-grouped classes (tracking) or mixing students into heterogeneous classes (de-tracking) and differentiating instruction to meet varying student needs. This study examines 1) how one US high school's administration addressed increasing diversity by de-tracking classes and implementing differentiation, 2) how teachers changed their practices in response to these policies, and 3) how students responded to resulting changes.

## **Teacher Fidelity and Student Response to a Model of Differentiation as Implemented in One High School**

### *Abstract*

This study investigated how one high school faculty implemented differentiated instruction in its recently de-tracked classrooms and to what degree teachers' practices adhered to the principles of differentiation as defined in the literature. The study also examined how students at the research site responded to differentiated instruction as enacted by their teachers. Qualitative research methods (Miles & Huberman, 2004) were employed to investigate 1) how teachers of various grades and subjects (n=29) thought about and implemented differentiation; 2) how teachers (n=29) and administrators (n=7) believed students responded to differentiation; and 3) how high school students of all grade levels (n=80) thought about and responded to differentiated instruction. Classroom observations, teacher and administrator interviews, and student focus-group interviews occurred over the course of 10 months, from mid-May of one school year until mid-March of the next. All data were collected from a New England High School implementing school-wide initiatives to de-track courses and differentiate instruction in the resulting heterogeneous classes.

The study's findings indicate that the model of differentiation is comprised of interdependent principles (community-centered, based in rich curriculum, driven by formative assessment, appropriately challenging, flexibly grouped), each of which affects the others. For differentiation to be most successful, all principles must be operating in synch with each other. The use of formative assessment emerged as the most integral part of this system, as it drove the implementation of the others. Students responded favorably (increased test scores, increased motivation and satisfaction in work) to differentiated instruction, which adhered to the model, but were dissatisfied with aspects related to deviation from the model (e.g., use of flexible grouping, provision of appropriate challenge). An additional finding emerging from the study was the vital role that administrative expectations and selected staff development models played in influencing teachers' successful implementation of differentiated instruction.

**Title:** Integrating Reading and Writing Instruction: The Role of Professional Development in Shaping Teacher Perceptions and Practices

**Synopsis:** The increased emphasis on preparing students to be college and career ready has significant implications for the teaching of English/Language Arts. This study examines middle and high school English teachers' perceptions and practices regarding authentic, integrated reading and writing instruction and the potential for staff development to impact these perceptions and practices. Findings indicate that focused professional development can move teachers to increased confidence and proficiency in integrating the instruction of reading and writing.

## Abstract

Recommended pedagogy for middle-school and high-school (grades 6-12) English education integrates the teaching of "the language arts as interactive processes" (Maxwell & Meisner, 2001, p.3); in other words, teachers should weave the instruction of literature and writing together as two parts of one whole. Recommended practices include asking students to respond to reading through writing, to cite information from reading in writing, and to analyze reading for writer's craft in order to emulate that craft in student writing (National Council of Teachers of English [NCTE], 2004). However - with the exception of a focus on literary analysis - teachers of English/language arts continue to teach literature and writing as separate units, topics, and skills (Graham & Herbert, 2010). The separate and distinct articulation of reading and writing goals (e.g., Common Core State Standards, 2010) may contribute to this practice, as might the absence of training in effectively and authentically meshing the instruction of the language arts.

Since integrated instruction is recommended but seemingly not often practiced, research questions for this study are three-fold: 1) What are teachers' perceptions of and practices regarding the relationship between reading/literature instruction and writing instruction; 2) What are the influences on teachers' beliefs and practices regarding the instruction of language arts; and 3) How might a staff development experience that models integrative techniques affect teachers' perceptions and practices of melding reading/literature and writing instruction in an effective and authentic fashion?

Participants (n=16) in this qualitative study were teachers of high school English and middle school language arts who voluntarily participated in a week-long, content-focused professional development program in the southeast region of the United States in June, 2013. Prior to the intervention, participants were surveyed to determine their beliefs and practices regarding the integration of reading/literature instruction with writing instruction. They then participated in the intervention: two 1.5 hour trainings on techniques for successfully integrating literacy instruction, as well as the rationale for using such strategies. Techniques were drawn from the work of Beers (2003), Gallagher (2011) and Spandel (2012) and required participants to engage in close reading of texts for both meaning and writer's craft, and then to weave the techniques found in those texts into their own original pieces of writing. Time for reflecting on classroom applications was provided. Immediately following the training, participants were surveyed again regarding 1) their beliefs about the integration of reading/literature and writing instruction, and 2) their plans to implement integrative strategies in future lessons. Participants will receive a follow-up email with a questionnaire in early December, 2013, asking them to reflect on their post-workshop instructional practices. Those who choose to continue their participation will return the questionnaire to the researchers by mid-December, 2013.

Data analysis utilizes Miles, Huberman, & Saldana's (2013) post-positivist approach, which asserts that there are causal descriptions at the heart of social phenomena. Initial codes were derived from the literature (e.g., Brighton & Hertberg, 2004; Gallagher, 2011; NCTE, 2004); those codes serve as a conceptual framework through which to analyze the data. Data reduction occurs by organizing/clustering data from all sources around teachers' reported beliefs and instructional plans and practices.

Initial results indicate that 11 of 16 participants entered the study with a "disconnected" view of language arts pedagogy. Four of these 11 participants articulated the *belief* that reading/literature and writing instruction should be connected, but could not describe how to successfully achieve this integration in their practice. All four of these participants emerged from the study articulating plans to change their practices, but these changes remained at the surface or "strategy" level, and responses indicated no change to underlying philosophical beliefs. The remaining seven of the 11 could not articulate a need for instructional integration upon entering the study; they reported teaching reading/literature and writing as separate, distinct instructional units. All seven of these participants emerged from the study citing a new understanding of integrated literacy instruction as well as specific plans and strategies for integrating reading/literature and writing instruction in their classrooms during the 2013-14 school year. There was, however, a distinct difference in the depth of understanding demonstrated by respondents; some indicated surface level changes while others discussed a change in philosophy.

Five of 16 participants entered the study with a previously established view of literacy instruction as connected and integrated, although the complexity of their approaches varied. All five of these participants traced these beliefs and practices to either specific staff development opportunities or to the influence of mentor teachers. All five participants emerged from the intervention with a self-described reinforcement of their belief in the value of integrating reading/literature and writing instruction. In addition, these participants discussed an appreciation for additional resources and articulated plans to incorporate these newly acquired techniques into their instruction during the 2013-14 school year.

The study's preliminary conclusions indicate middle and high school English teachers believe that the various facets of reading/literature and writing instruction are connected and should be integrated; however, these same teachers may neither fully understand what "integration" means, nor be accustomed or equipped to deliver instruction in an integrated fashion. Professional development is valuable in shaping teachers' pedagogies and helping teachers put their beliefs into practice by a) recognizing where teachers are, philosophically, in their beliefs about integrated literacy instruction, b) instilling confidence in the value of integrated literacy instruction, and b) providing specific strategies and tools to help them enact their beliefs in the classroom.

Initial findings of this study indicate that teachers' practices would improve with access to sustained professional development in the integration of reading/literature and writing instruction. Such training experiences will be most effective if they adhere to the following three criteria: 1) emphasize practice rather than theory, providing instruction on specific integrative strategies; 2) feature modeling of recommended strategies within the training session, requiring teachers to themselves engage in close reading and original writing; and 3) allow time for reflection on how such literacy strategies connect with teachers' philosophies and can be woven into the curricula for teachers' particular classroom contexts.

## **Curricular contents and practical requirements of commercial and business service occupations – theoretical concepts and empirical results**

### **1. Research objectives**

The demographic change, the fall in the birthrate, and the requirement for flexibilization of occupational careers are giving rise to considerations on reducing the number of initial and advanced training occupations in the German “Dual System”. At the same time, one of the objectives of a debate on occupational core profiles taking place at a European level is increasing employment opportunities for those who have completed training. The project on “similarities and differences between commercial and business service occupations” aims at finding a set of common core and comparable qualifications/requirements of service occupations as well as their main differences.

The aim of this contribution is to present the results of a survey of 2.304 employees in commercial and business service occupations. It was conducted to find out more about employees’ tasks, skills and self-concepts. The basis for the hypotheses and the questionnaire design is a systematic analysis of the relevant initial and advanced training curricula. Additionally data from the German BIBB/BAuA Employment Survey 2011/12 conducted by the Federal Institute for Vocational Education and Training (BIBB) and the Federal Institute for Occupational Safety and Health (BAuA) are evaluated to answer the research questions.

### **2. Body of knowledge**

Flexible disposition of the good work (cf. Boes/Kämpf 2008), a “market-oriented mode of control” (Kotthoff 1997, p. 293) and an increasing focus on customers and services are basic changes in commercial occupations. The self-conception’s of workers trained in commercial occupations includes an interest to help develop and contribute to the enterprise’s interests (Weber-Menges 2004). The project identified the following as central and ongoing trends influencing commercial and business service trainings and occupations: There is an increasing informatisation of work-processes, which have changed their contours due to international division of labor and cooperation (Boes/Kämpf 2010). Also a subjectivication and delimitation of work is seen to take place. The results are a flexibilization of working-hours and -places, work organized in projects, in some branches a filialization of commercial and business service occupations leading to working conditions like in self-employment and precarious job conditions (Voss-Dahm 2009). Service occupations today are formed by a rationalization of processes and a focus of all employees on increasing the enterprise’s value (financialization) and target achievement. This goes together with centralized strategic decisions and operative decentralization, controlled via the company’s strategic objectives (Haipeter 2011, p. 135).

Discretion rises regarding communicative interfaces inside and outside the enterprise being modeled by the employees – demanding translations of economic logic and symbols into different contexts (cf. Kaiser 2012, p. 6f.). This increasingly requires the ability to reflect connections, knowledge of business processes and a competence of organizing creatively (Brater/Freygarten/Rahmann/Rainer 2011, chp. 3.4) so that aspects of self-employment also become integrated in vocational training curricula.

Several aspects of commercial thinking and acting are discerned: on the basic level of concrete transactions merchants' thinking and acting is marked by communicative and interactive tasks, use of planning, organizing, regulating, documenting and balancing systems, thus constituting situations and interactions with binding character influenced by typical spheres of activities (Tramm 2009). They consider company-specific conditions, aims and processes as well as external ties to markets, relevant political trends and applicable laws (cf. Kaiser 2012, p. 10).

### **3. Proposed methodology**

In the project a theoretical concept of commercial thinking and acting was set up, grounded in a historical and a sociological literature study. It is aimed at defining merchants' mentality and work capacity and the "cultural difference" between industrial-technical and commercial occupations (cf. Reinisch 2011; Haipeter 2011).

A document-analysis of the curricula of 55 initial and 33 further trainings in service occupations regarding their commonalities and differences was carried out. It is now possible to say which contents are learned in which contexts and institutions, what their impact on the vocational qualification is and how they are examined. This analysis was complemented by historical and sociological literature studies (cf Reinisch 2011; Haipeter 2011).

Data from a follow-up study to the German BIBB/BAuA Employment Survey 2011/12 of employees in commercial and business service occupations were analyzed. With this analysis we intend to gain deeper understanding on tasks, skills and self-concepts of service-workers as well as their demand for further qualification and their future prospects. It was conducted as a CATI-survey (Computer Assisted Telephone Interview). A sample of 2.304 employees in 10 relevant occupational groups is covered. The survey connects to results of the document-analysis and the literature studies, which also include elements of economic-pedagogical theoretical models. The survey data is used to validate the theoretical assumptions.

### **4. Discussion of expected outcomes**

A central result of the content analysis was a system of categories structuring subject matters and competencies in commercial vocational trainings. „Commercial communalities“, „commercial specialties“, „comprehensive qualifications“, and „non-commercial qualifications“ are differentiated. Within the 55 vocational trainings there are 69 percent of communalities – at least on a high aggregation level. The share of specialties lies around 13 percent. Comprehensive qualifications, not containing any specificities, hold a share of 15 percent. Lastly there are 3 percent of non-commercial qualifications. The following subject matters and fields of action show the highest shares: accounting and controlling, marketing, information and communication as well as law and contracts.

Conclusions on the commercial profile of singular occupations as well as, based on these profiles, grouped occupations can be drawn. We can also deduce evidence on different levels of initial and further vocational trainings plus improve concepts of linking initial and further vocational trainings. Descriptive analyses of the quantitative data give some hints on activities, skills and self-concepts in commercial and service occupations. The survey showed that all commercial employees accomplish tasks regarding the company's accounting in terms of accounting documentation. Furthermore the evaluation of controlling data is to some extent part of their tasks. This validates the outstanding role corresponding learning

contents in “commercial accounting and controlling” have within the curricula. The survey indicates that all groups of commercial employees need basic knowledge in the areas of contract law, employment law and tax law. This also validates the findings of the curricula-analysis. The same applies to the area “information and communication”, which is also an important part of the curricula. Regarding this 97% of the employees state that communicative skills are ‘very important’ or ‘important’ for their occupation. We analyze differences in internal and external communications for each occupational group, with internal communication being far more important. So far the assumption that commercial knowledge and skills cannot be learned only on the job, but need a systematical instruction within vocational school or other courses could only be proved gradually. However the assumption that the self-concept of commercial employees is formed by customer- and market-orientation is supported by the data. The importance of generic skills is dependent on the occupational status, while chances for professional development are influenced by qualificational levels. Economic sustainability is mediated by self-concepts and orientation. Finally the assumption that commercial employees have room for designing their own work proceedings but not regarding the business processes of their enterprise could be confirmed. Overall differences between male and female employees seem to be marginal.

# Cloud Service Model for ERP Experiment Teaching

Bing Wu, Qinfang Li, Pingping Chen

*School of Economics and Management, Tongji University, Shanghai, China 200092*

[ww\\_bing@163.com](mailto:ww_bing@163.com)

**Abstract:** The purpose of this paper is to solve the existing problems in ERP experiment teaching, such as high cost of hardware and software, difficulties in software maintenance, and complex issues in basic data management, by the application of cloud service. As cloud computing in the education field has been bringing a broad space for the development of the cloud service, this study built a cloud-based ERP experiment teaching model. The model is constituted by the cloud service platform, cloud services terminals and teaching service, which fully reflect the four elements, i.e., context, collaboration, exchange and sharing in the teaching environment. Then, the features of ERP experiment teaching by cloud service are analyzed, including system flexibility, versatility, virtualization, and low cost. Finally, SAP ERP application cloud platform is used as an example to illustrate the application of the proposed model.

## Abstract

*Pioneers for Justice: A Social-Historical Examination of Daisy Bates and the Little Rock Nine* is a curriculum, based on the documentary, *Daisy Bates: First Lady of Little Rock*, a film produced by Sharon A. La Cruise. The Pioneers for Justice Curriculum focuses on the role of Daisy Bates and the Little Rock Nine during the 1957 Integration Crisis at Little Rock Central High School in Arkansas. It examines effects of public school segregation and integration, and the how past historical implications impact experiences of current students in public schools today. The curriculum is organized as an interdisciplinary thematic unit, based on the Bowie State University Conceptual Framework Dispositions and the University of Arkansas at Little Rock Standards of Professional Conduct. The paper will discuss how the Curriculum Instruction Specialist designed the curriculum as a pilot and implemented in an Assistant Professor of Education Social Studies Methods course.

Social Studies Common Core State Standards are intertwined with this historical Civil Rights Event to bring together the integration of activities and lessons. The instructor used and will continue to use the curriculum to teach lesson and unit planning, the history of Daisy Bates and the Little Rock Nine; exposing students to social studies, reading, writing, and technology integration. Each lesson and activity includes differentiated instruction practices and strategies to meet the learning needs of all students engaged. The curriculum is fully integrated with media, social media, and technology.

The initial curriculum will be implemented by pre-service educators who are in the “Student Teaching Phase” of their programs in the Colleges of Education at Bowie State University and the University of Arkansas at Little Rock. Gradually, the curriculum will be expanded and re-designed for educators to teach in other states to include districts in rural and urban areas. Also, pre and post surveys will distributed to teachers and students to collect data on the effectiveness of the curriculum as it evolves.

The final curriculum design document, will include the framework for each lesson plan and activity, list of activities with additional descriptions and specific detail to include, list of lesson plans with additional descriptions and specific details to include, methods and procedures; assessments and evaluations, a list of materials, upcoming curriculum presentations/workshops of the unit, a list of resources for students, and a list of resources for teachers.

6. Abstract

## **Abstract - The Urban Garden as an Educational Environment**

The World Commission on Environment and Development (WCED) defines sustainable development as “a process towards a new normative horizon...a paradigm shift from development based on inequity and overexploitation of natural resources and environmental services, to one that requires new forms of responsibility, solidarity, and accountability”(1987). Education for Sustainable Development (ESD) provides people with knowledge, skills, attitudes and values necessary to shape a sustainable future for themselves and others. ESD integrates key sustainable development issues and concepts into teaching and learning. Increasing knowledge related to topics like the importance of biodiversity, and environmental benefits of composting, and principles of water and soil conservation can help change learners’ attitudes and behaviours towards the environment in a positive way. Such individual changes may be the foundation to societal sustainable development.

One strategy for ESD is utilizing urban gardens as educational environments. The urban garden can become a living classroom preparing gardeners and others with knowledge, skills and attitudes to take action and lead to way to a sustainable future. Urban gardens are one type of urban agriculture. Mougeot’s (2000) defines urban agriculture, “an industry located within (interurban) or on the fringe (periurban) of a town, a city or a metropolis, which grows or raises, processes and distributes a diversity of food and non-food products, using largely human and material resources, products and services found in and around that urban area, and in turn supplying human and material resources products and services largely to that area” (p. 49). Types of urban gardens that can become living classrooms include house lot gardening, school-yard gardens, roof-top gardens, community gardens, backyard or kitchen gardens, and allotment gardens.

This poster includes a description of types of urban gardens and discussion of ways urban gardens can be used as educational environments. The urban garden can teach learners about principles of science, chemistry, physics, health, and environmental studies. Students can draw from the urban garden to increase their understanding of environmental/ecological, human health, and social and economic concepts and theories. Specifically, planting, maintaining and harvesting an urban garden can help participants increase knowledge related to the importance of biodiversity, environmental benefits of composting, and principles of water and soil conservation. This experiential education can help change attitudes and behaviours towards the environment in a positive way. A modified model of human development that includes health promotion and sustainable development (Kickbusch, 2010) is used to examine selected possible linkages between the educational benefits described. Findings from research literature in terms of

educational outcomes of urban gardening including increased environmental awareness, social and personal growth, increased science and gardening skills, social and personal development are detailed. This background and theory are used to propose an educational urban community garden design that could help to achieve ESD. The poster also outlines constraints related to utilizing urban gardens as educational environments and poses questions for further research related to urban gardens and ESD including evaluation of gardens as learning tools, and short and longer term impact on learners participating in urban gardening learning experiences.

# **Role Modeling: The Forgotten Part of Elementary School Physical Education**

## **Abstract**

The elementary school years are a crucial time period for a child's physical development (Fishburne, 2005). A major aim of elementary school physical education programming is to help children become physically educated (Hickson & Fishburne, 2005) in order to choose physically active and healthy lifestyles (Rink & Hall, 2008). What teachers do to achieve this aim is a critical consideration. In order for children to become physically educated, teachers need to create conducive learning environments. Therefore, teachers must use all the skills and resources at their disposal to develop a learning environment for children that supports the development of physically active and healthy lifestyles. Issues such as planning, lesson delivery (Rink, 2006), and the evaluation of learning (Pangrazi & Beighle, 2013) have continued to be constant themes of consideration and thought. However, although a teacher may be well-planned (e.g., lesson plans, assessment tools, etc.) when entering the learning environment, an area often overlooked is the importance of teacher as a role model in physical education. Role modeling is a powerful teaching tool (Cardinal & Cardinal, 2001). With the skills, talents and attitudes teachers possess or lack, they are one of the key, perhaps the most important, building blocks of the educational system (Yalmiz, 2011). In fact, teachers have the opportunity to impact children in a positive manner every school day (Vidourek, et al., 2011). For example, teachers who take pride in being physically active and demonstrate motor skills during physical education lessons can influence school children in a positive manner (Pangrazi & Beighle, 2010). The purpose of the paper is to communicate the importance of "teacher as a role model" in physical education. When striving to enhance teaching effectiveness in physical education, role modeling is a teaching strategy that must be considered. However, it seems that in our schools, role modeling can be a forgotten element of teaching. Hence, this is an issue that deserves further consideration and discussion.

## Introduction

*“Every experience influences in some degree the objective conditions under which further experiences are had.” (Dewey, 1938)*

The elementary school years are a crucial time period for a child’s physical development (Fishburne, 2005). A major aim of elementary school physical education programming is to help children become physically educated (Hickson & Fishburne, 2005) in order to choose physically active and healthy lifestyles (Rink & Hall, 2008). What teachers do to achieve this aim is a critical consideration.

In order for children to become physically educated, teachers need to create conducive learning environments. Therefore, teachers must use all the skills and resources at their disposal to develop a learning environment for children that supports the development of physically active and healthy lifestyles. Issues such as planning, lesson delivery (Rink, 2006), and the evaluation of learning (Pangrazi & Beighle, 2013) have continued to be constant themes of consideration and thought. However, although a teacher may be well-planned (e.g., lesson plans, assessment tools, etc.) when entering the learning environment, an area often overlooked is the importance of “teacher as a role model” in physical education.

*“Role modeling is a powerful teaching tool.” (Cardinal & Cardinal, 2001)*

With the skills, talents and attitudes teachers possess or lack, they are one of the key, perhaps the most important, building blocks of the educational system (Yilmaz, 2011). In fact, teachers have the opportunity to impact children in a positive manner every school day (Vidourek, King, Bernard, Murnan, & Nabors, 2011). For example, teachers who take pride in being physically active and demonstrate motor skills during physical education lessons can influence school children in a positive manner (Pangrazi & Beighle, 2013).

## Purpose

*“It is possible learners have a difficult time valuing knowledge when they perceive that the teacher does not model the information presented ...” (Dean, Adams, & Comeau, 2005)*

The purpose of the paper is to communicate the importance of “teacher as a role model” in physical education. When striving to enhance teaching effectiveness in physical education, role modeling is a teaching strategy that must be considered. However, it seems that in our schools, role modeling can be a forgotten element of teaching. This is an issue that deserves further consideration and discussion.

## Teachers as Role Models

In a recent study, Vidourek, et al. (2011), reported that teachers who were enthusiastic toward children and the subject material created more positive, welcoming learning environments.

Teachers who are consistently enthusiastic in the classroom act as an impetus for academic achievement whilst motivating learners to connect to others and the school as a whole (Vidourek, et al., 2011). Yilmaz (2011) supported this by contending that teachers who role model positively in the classroom through enthusiasm and excitement toward the learning outcomes contribute to academic success by encouraging learners to participate willingly in learning activities and to remain focused.

Enthusiasm for teaching is commonly defined as a teacher's use of eye contact, facial expression, vocalization, gesturing and movement throughout the learning environment (Vidourek, et al., 2011). Teachers are in a unique position to role model a caring attitude through recognition of each child in the learning environment as well as modeling key behaviors of concern, support and understanding for all school children (Martino & Rezai-Rashti, 2012; Vidourek, et al., 2011).

### **Teacher as a Role Model in Physical Education**

*"Whether they like it or not, physical educators must view themselves as role models."*  
(Dean et al., 2005)

Understanding the relative contributions of role modeling physical activity and fitness-promoting behaviours towards children has been identified as an understudied and potentially powerful influence in promoting physically active lifestyles within society (Cardinal, 2001). In 2004, the National Association for Sport and Physical Education (NASPE) suggested that teachers of physical education should teach children what to do to be healthy and fit, how to do it, and why it is important. Therefore, the actions of teachers of physical education seem to be as important as the material being presented during lessons.

In addition to teacher actions, the appearance (i.e., clothing) of teachers of physical education has also been found to play an integral part in the learning environment. For example, what a teacher chooses to wear while teaching physical education can lead to children's perceptions towards the teacher and the subject area. Bradford and Hickson (2010) found that children do form perceptions of their teacher the moment the teacher enters the physical education environment. These perceptions formed by the children are primarily due to what the teacher is wearing (i.e., appearance).

Hence, the actions and appearance of a teacher during a lesson is a form of role modeling (Pangrazi & Beighle, 2013). For example, teachers of physical education who take pride in being physically active and demonstrate motor skills during lessons can influence children in a positive manner (Pangrazi & Beighle, 2013). Fishburne (2005) holds a similar view by contending that teachers of physical education should demonstrate motor skills and participate regularly in the physical activities with children during lessons.

## **How Can Teachers be Role Models in Physical Education?**

We believe that teachers can be role models in the physical education class by: CARING, USING, CHOOSING, GIVING, UNDERSTANDING and BEING.

### **CARING toward Learning and Learners**

*“Students will advocate either for or against physical education, and that outcome is largely contingent on the caring education that physical educators provide.” (Rikard, 2009)*

Teachers can show children that they truly care about their learning by engaging in the learning process. Fostering interpersonal relationships with children based on a caring perspective requires teachers to interact with children, to develop mutual trust and respect, and to attend to children’s needs (Rikard, 2009). A caring attitude toward children and their learning is a strategy that has been found to build rapport between teachers and learners (Bradford, Stanec, & Hickson, 2012). Such rapport can be most beneficial, as Rikard (2009) contended that care plays a part in the enhancement of children’s learning.

### **USING a Variety of Teaching Styles**

*“Different teaching styles promote different types of learning.” (Fishburne, 2005)*

Teachers can use a variety of teaching styles throughout their physical education programs. Using different teaching styles can provide children with opportunities to reproduce and produce knowledge (Mosston & Ashworth, 2002). Teaching styles differ from one another depending on the level of control a teacher chooses to retain. Numerous authors have identified different styles available to educators (Fishburne, 2005; Mawer, 1999; Grasha, 1996; Siedentop, 1991). Although several of these styles are similar, there are also significant differences. For example, providing learners with opportunities to discover the proper way to kick a soccer ball is much different from a teacher directly showing the proper way of doing so. Using different teaching styles can offer learners with different opportunities to obtain knowledge. For example, the use of a variety of teaching styles throughout the school year can support the learning of the foundations of movement (i.e., basic fundamental motor skills) required for all types of physical activity (e.g., soccer, skipping, taekwondo) (Mosston & Ashworth, 2002; Na, 2009).

### **CHOOSING to Wear Appropriate Clothing for the Learning Environment**

*“Appropriate dress is a sign that an individual is responding to situational demands.”  
(Workman & Freeburg, 2009)*

What a person chooses to wear is a powerful communicator (Damhorst, Miller-Spillman, & Michelman, 2005; Roach, 1997). Therefore, first impressions, which lead to firmly held perceptions by children at the beginning of a class, are affected by a combination of teacher

characteristics including the teacher's clothing (Workman & Freeburg, 2009). For example, the clothing being worn by a teacher in physical education must fit that of a person who is prepared to engage in physical activity or children may perceive the teacher as uncaring toward the subject area, not prepared to demonstrate the skills, and/or disinterested in engaging in physical activities (Bradford & Hickson, 2010). The selection of professional attire enhances occupational attributes of teachers (Gordon, 2010). Therefore, in physical education, teacher clothing that is associated with physical activity should be recognized as a teacher's choice of attire.

### **GIVING Proper Attention toward Curriculum Outcomes**

*"Teachers of physical education have the responsibility to develop and teach programs that physically educate elementary school children."* (Hickson & Fishburne, 2005)

Through innovative teaching approaches, teachers can offer breadth and variety in quality physical education programs. By attending to children's learning needs, the use of different resources can assist in the learning process. For example, bulletin boards, DVDs, task cards, music, an array of developmentally appropriate equipment, etc. can be included throughout a quality physical education program. Special guests, such as physical education consultants can join the class to introduce new activities that can assist learning. Attention to lesson plan delivery, assessment strategies and facility choice can become a regular part of a teacher of physical education's planning. Moreover, a teacher who is well planned and organized with long-, mid-, and short-term plans, assessment strategies, etc. in place would afford them the flexibility throughout the year to create, modify and reflect on children's overall learning.

### **UNDERSTANDING the Impact of Demonstrations**

*"Presenting a motor task by role modeling is one of the most powerful forms of communicating to children in physical education."* (Vogler, 2003)

An underlining basis for modeling is that it becomes easier to perform a motor task more proficiently after watching the task being modeled (Vogler, 2003). The use of demonstration is part of a larger issue related to presenting information clearly to learners and is better understood as part of the process of communication. The combination of verbal and visual information and rehearsal are most effective when the objective is to provide the learner with a clear idea of how to perform a motor task (Rink, 2010). When teachers of physical education demonstrate motor skills, participate in physical activities with children, and display enthusiasm consistently during lessons can help children reach higher levels of motivation (Vidourek et al., 2011).

### **BEING Willing to Send Proper Active, Healthy Lifestyle Messages**

*"It is essential that as role models, physical educators exhibit healthy lifestyle practices to optimize teaching effectiveness."* (Cardinal & Cardinal, 2001)

It would not be difficult to argue that, on a daily basis, teachers are constantly sending messages to children (Hickson & Bradford, 2010). For example, when teaching the importance of nutrition and active, healthy living, teachers can role model behaviors that they want children to learn from. Hence, teachers can either show their children that they believe in what they are teaching, or not. If a teacher stresses to his/her children that healthy eating is an important part of healthy living, then mixed messages will be communicated if the teacher chooses to eat an unhealthy lunch in front of them. In addition to eating habits, lifestyle choices can also be communicated to children. Ideally, effective teachers model, and thus teach, the most current information in their field. Since the promotion of “healthy, active lifestyles” appears to be a primary goal of physical education, effective teachers of physical education should teach and role model the most favored behaviors and processes for improving their health and physical fitness (Dean et al., 2005).

### **Ideas for Future Thinking and Research**

*“Teachers possess the unique opportunity to impact children in a positive manner every school day.” (Vidourek, et al., 2011)*

This area of research on “teacher as a role model” in physical education has the potential to make a significant contribution to the field, especially at a time when there is so much emphasis on obesity rates, sedentary lifestyles and low levels of self-efficacy. If teachers of physical education become more aware of the importance of “teacher as a role model” in physical education, children’s learning may be enhanced leading to greater levels of self-efficacy. This, in itself, may play an instrumental part in helping children increase their potential to live active, healthy lifestyles through quality physical education programs during their elementary school years.

Based upon the literature that is available, it is evident that role modeling has a substantial impact on children’s learning. It is, therefore, essential that we, as researchers in education, continue to identify effective strategies to help teachers understand the importance of role modeling, and investigate this phenomenon in order to develop conducive learning environments.

### **Conclusion**

*“Elementary school physical education programs should provide breadth, variety, and educational experiences that help develop whole children.” (Hickson, 2003)*

In order to physically educate “whole” children, role modeling is an essential part of teaching that requires greater attention. There are several ways that teachers of physical education can be role models to their children, including, caring, using, choosing, giving, understanding and being. For example, role modeling active, healthy behaviors is one method that children will observe during the school day. Hence, mixed messages will occur when teachers say one thing,

and do another in front of children. By reading this paper, it is hoped that a deeper level of understanding toward the importance of “teacher as a role model” in physical education has been reached.

# **“Creative Drama Exercises For Children With Social-Emotional Disturbances Due To Parental Separation”**

## **Special Education**

### **Paper Session**

#### **Description:**

Creative drama exercises were utilized in this research as a therapeutic technique in improving the social-emotional disturbances of students with Emotional/Behavioral Disturbances (E/BD). The drama exercises used were concentrated on play, games and improvisation concentrating on making the subjects of the study feel comfortable and not necessarily making an immediate breakthrough in their progress (The Drama Therapy Institute of Los Angeles, CA, 2008).

#### **Abstract**

This is a descriptive-experimental study on the effects of creative drama exercises in improving the social-emotional development of 8 male pupils aging 9 to 12 years old identified as having Emotional/Behavioral Disturbances (E/BD) caused by parental separation in Saint Paul SPED International Foundation, Baguio City, Philippines. The participants were identified as having E/BD using a checklist before engaging in the creative drama exercises. After a month, the post-evaluation was conducted. The prepared Creative Drama Exercises had twelve sessions conducted within a month, three times a week. The styles and techniques on creative drama exercises were adapted from Ian McCurrach & Barbara Darnley’s Special Talents, Special Needs: Drama for People with Disabilities (1996). The findings are as follows: the creative drama exercises significantly modified the social-emotional disturbances of children with E/BD; and the creative drama exercises slightly affected the social-emotional disturbances of children with E/BD within the program of twelve sessions.

## 6. Abstracts:

**Title: Finland's Teacher Preparation built upon collaboration and inquiry**

**Author: Cynthia Coler**

This paper examined the teacher preparation process and the collaboration of universities and school sites in training teachers. Becoming a teacher in Finland is a challenging undertaking and students must rank within the top five percent of their graduating classes. Through interviews with several Finnish teachers and university professors in both rural and urban communities, published articles and books, trust and autonomy among teachers ranked very high in creating collaborative learning environment. This type of teacher leadership can guide and shape student learning.

**Title: Curriculum Instruction, Multilingualism, and Educational Values of Finland**

**Authors: Martha Romero and Sue Parsons**

In this investigation, we focused on the connection between curriculum, instruction, and multilingualism along with the values that are the basis of the Finnish education system. The principles of student welfare services, a cooperative between the home and school, and vocational/educational guidance are all provisions of the national curriculum. Teaching values and national culture are paramount to the foundation of their education. This includes mother tongue learning as well as multilingualism in order to compete in a global economy.

Our investigation included research on the Finnish education system and a visit to schools in Espoo and Kokkola Finland. The resulting paper and presentation provide a look at some of the practices that make Finland a top performing education system based on international assessments.

**Title: The Roles and Responsibilities of Educational Leaders: A Contrast in Administrative Duties Across the Continents**

**Author: Dr. Colleen Robertson**

This investigation looks at the differences and similarities of the role of the Administrator at the school site in the U.S. as opposed to role of the Administrator in Finland. From Headmaster, to Principal, to Superintendent, how are these disparate roles impacting student academics? Can the duties of the administrator have a positive impact on student achievement and on the effectiveness of the teaching staff? First hand visits to schools in Finland reveal a contrast of administrative duties, expectations, and hierarchy in comparison with those found in the United States. This investigation reveals some of the lessons we can learn to help our administrators be more effective and successful educational leaders.

**Title: Policies that Inform Success in K-12 Education**

**Author: Dr. Janice Tucker**

This paper examines policy in Finland that supports and informs their education system. Through the examination of policy documents, interviews and visits to

schools and universities this paper compares the social, cultural and educational policies that have over time created a system that is recognized globally as equitable and highly successful. The results of this study can inform teachers and administrators and enlighten future policy direction.

Spotlight on Professional Learning Communities: How Principal Leadership Behaviors  
Can Influence Student Achievement

### **Abstract**

The purpose of this study was to investigate teacher perceptions of principal's leadership behaviors as they relate to Professional Learning Communities (PLCs). This quantitative study utilized a validated survey and responses from one hundred and seventy three teachers. The five variables that emerged were: (1) Shared Vision and Mission, (2) Culture of Collaboration, (3) Focus on Improvement, (4) Shared Leadership, and (5) Personal Practice, and their influence on school achievement.

An independent sample t-test was conducted to evaluate the differences between high and low achieving schools, on each of the five variables of PLCs. Results suggested a statistical significance between teacher perceptions of Personal Practice through their perceptions of principal leadership behaviors, between high and low achieving schools. Results of the logistic regression, indicated Personal Practice is the major predictor, followed by Focus on Improvement, of a teacher responding from a high achieving school. A path analysis determined Shared Leadership and Culture of Collaboration are the major predictors of Personal Practice, which in turn was used as a mediator of achievement.

**Keywords:** Teacher Perceptions, Principal Leadership Behavior, Professional Learning Communities

*The most promising strategy for sustained, substantive school improvement is developing the ability of school personnel to function as professional learning communities.*

*~Richard DuFour*

Today's educational institutions face a plethora of obstacles affecting daily operations and organizational structures. External and internal factors such as greater academic challenges for students, budgetary limitations, lack of effective leadership, and increased teacher accountability have forced schools to prioritize decision making as stakeholders navigate outside influences, state and federal mandates, and augmented expectations/accountability. Despite the growing list of challenges today's schools face, educational institutions are still charged with the task of educating students. To accomplish this task, administrators are challenged to find ways to professionally develop staff with limited resources. Fostering a Professional Learning Community (PLC) provides one method of increasing a school's capacity to address challenges a daily.

The research knowledge base and the articulation of profession standards within education expanded over the past quarter century, (DuFour & Eaker, 1998). Many educators are unaware of, or are inattentive to research focusing on effective pedagogical strategies and improving student achievement. Members of a PLC make these findings the basis of their collaborative efforts toward achieving a shared vision and goals (DuFour & Eaker, 1998).

The PLC model is built upon the foundational belief that the core mission of formal education is not simply to ensure that students are taught but to ensure that they learn. The shift in perspective from a focus on teaching to a focus on learning has profound implications for schools. PLCs focus on the processes of learning and grapple with questions of what, when, and how learning should take place. Learning communities

place an emphasis on organizational structures, relationships, and the nature of individuals within an organization. PLCs rely on collaboration and focus on ways that educators can work together to facilitate change and school improvement (DuFour, 2004).

Research focusing on educational reform influenced the conceptualization of processes involved in PLCs. According to Huffman and Hipp (2003), PLCs are a way of working; "a school's professional staff members who continuously seek to find answers through inquiry and act on their learning to improve student learning" (p. 4). Further, DuFour (2004) expressed concern that PLCs may lose their credibility as an important part of education reform unless educators think critically about the fundamental concepts which make up the model. As a tool for school reform, Huffman and Hipp (2003) asserted a PLC is "the most powerful professional development and change strategy available" (p. 4). What educators are looking for in today's school reform initiatives are those that result in not only improved teaching, but also in overall school improvement and student learning. Vescio, Ross, and Adams (2008) reviewed six separate research studies that scrutinized the relationship between teachers' participation in PLCs and student achievement. The results of all six studies revealed that student learning improved when teachers worked in PLCs.

The purpose of this study was to investigate teacher perceptions of principal's leadership behaviors through the frame of Professional Learning Communities: (1) Shared Vision and Mission, (2) Culture of Collaboration, (3) Focus on Improvement, (4) Shared Leadership, and (5) Personal Practice, and their relationship school achievement.

### Theoretical Perspective

PLCs have been present within the current body of research. Each definition has a slightly unique perspective, but there are major themes throughout, including (1) Shared Vision and Mission, (2) Culture of Collaboration, (3) Focus on Improvement, (4) Shared Leadership, and (5) Personal Practice.

According to DuFour, DuFour, and Eaker (2008), there are six characteristics of PLCs. “1. Shared Mission (Purpose), Vision (Clear Direction), Values (Collective Commitments), and Goals (Indicators, Timelines, and Targets) – All Focused on Student Learning; 2. A Collaborative Culture with a Focus on Learning; 3. Collectively Inquire Into Best Practices and Current Reality; 4. Action Orientation: Learning by Doing; 5. A Commitment to Continuous Improvement; and 6. Results Orientation” (pg. 15 – 17).

Richardson (2011) contributed to the research on PLCs by defining the responsibilities of educators. “In the new culture, educators assume collective responsibility for student outcomes. At the heart is the belief that a team of teachers working together can achieve more than one teacher working alone” (pg. 29).

In addition, Thessin and Star (2011) further defined the four key roles for districts in the implementation of PLCs as providing. “Ownership and support; professional development, clear improvement process; and differentiate support” (pg. 51).

The practice of building successful PLCs can extend beyond the borders of the school or district. Linder, Post, and Calabrese (2012) studied the factors that contributed to successful PLCs and how university faculty can assist in their development. The researchers selected three groups of teachers based on a match between their areas of interest and the submitted proposals. A collective case study design was used to learn

about each of the PLCs and a survey was given at the end of the year to provide qualitative ratings. “The three most highly rated components of the PLCs were (a) studying a selected topic in depth; (b) having the assistance of a university faculty member; and (c) selecting, implementing, sharing, and discussing results of activities with each other” (Linder, Post, & Calabrese, 2012, pg. 18). Key learnings from this study included establishing relationships with area schools, providing guidance to groups, allowing for autonomy, and building a sense of community.

First, classroom teachers should not hesitate to join together to investigate topics of common interest... Second, educational administrators should consider PLCs as a viable method of professional development for their building and district personnel... Third, university faculty can help establish and sustain PLCs by placing the major decision-making in the hands of the teachers” (Linder, Post, & Calabrese, 2012, pg. 20-21).

The above implications of the study are for stakeholders in considering the implementation of PLCs.

Once a PLC has been implemented, part of the on-going process is to understand the benefits to the district. An article was published about a study that was conducted by Williams (2013) to understand the differences that existed in reading achievement across different grade levels within a district that implemented PLCs and the teacher perceptions of the activities and their impact. Williams’ conducted a causal-comparative research design utilizing the Texas Assessment of Knowledge and Skills (TAKS) to collect qualitative data over a five-year period. Study results were categorized into four major themes: the collaborative teacher learning, data-driven decisions, curriculum, instruction

and student learning, and student learning. The quantitative aspect of the study included a repeated-measures ANOVA to analyze the overall percentage of passing rates within the elementary, middle, and high school levels. Results study indicated several improvements within student achievement data. After three years, there was a .33% increase mean percent passing in elementary reading scores, .75% improvement in middle school, and .67% improvement in high school achievement. Teachers at all levels expressed their beliefs that PLCs provided avenues to learn and positively impact their classroom practices. Williams concluded “This study contributed to research on PLCs by providing further evidence that potent connections among student achievement, teacher collaboration, and change continue to exist in the 21<sup>st</sup> century” (Williams, 2013, pg. 37). Additionally, Williams espoused the continuation of the PLC model as a strategy for teachers in K-12 within the district to increase student achievement.

The five PLCs components are (1) Shared Vision and Mission, (2) Culture of Collaboration, (3) Focus on Improvement, (4) Shared Leadership, and (5) Personal Practice. The current body of literature has provided the framework for the following definitions.

Shared vision and mission is the alignment of goals and objectives throughout the organization. Saban and Wolfe (2009) studied the leadership practices of 106 public school principals through a quantitative analysis of their responses to The Leadership Practices Inventory As Saban and Wolfe (2009) stated:

To motivate individuals to share your vision is a behavior that requires a trusting relationship. To “encourage” – another behavior that is learned, meaning to

hearten, to give confidence by recognizing, to show appreciation for – also requires that one have confidence in the relationship (pg. 5)

Through this study on leadership practices, mentoring was identified as an effective method of professional development for sharing a vision through relationship building.

The culture of collaboration requires that all parts of the organization are working together toward a common goal. “All department members are part of a team working towards a shared vision,” (Edmonson, Brown, Irby, & Lunenburg, 2002, pg. 11). The culture of collaboration also included the practice of shared decision making. “Shared decision making was identified as the most frequently used method by which democracy and social justice can be integrated for student learning” (Wasonga, 2009, pg. 219).

A focus on improvement includes student achievement through assessments. “These formative assessments allowed me to identify areas of weakness for my students and then shape my classroom lessons based on what students still needed to understand,” (Bakula, 2010, pg. 43). Embedding formative assessments allows teachers to focus on student achievement throughout a unit of study. “Having some embedded formal formative assessments or reflective lessons in a curriculum is useful because it reminds teachers to reflect back on what has been learned and hopefully guide future lessons toward unit goals,” (Ayala, et al., 2008, pg. 332). Reagle (2006), also discussed focus on improvement. “This collective effort requires a comprehensive change in the school climate and encourages new systems to be developed that focus on students and best practices in teaching, learning, assessment and reporting,” (pg. 3).

Shared leadership includes reciprocity and enduring learning. “Lasting leadership was intended to be not only reciprocal and purposeful, but also to embody learning that is

a lasting, continuing facet of sustainability,” (Lambert, 2006, pg. 253). The goal of shared leadership is to build a solid foundation to improve school achievement. “When learning is continuous and participation in that learning is broad-based and skillful, high leadership capacity and the potential of sustainable, lasting school improvement result,” (Lambert, 2006, pg. 253). Printy and Marks (2006), found that principals and teachers working together is optimal for improving teaching and learning. “Best results occur in schools where principals are strong leaders who also facilitate leadership by teachers; that is, principals are active in instructional matters in concert with teachers whom they regard as professionals” (Printy & Marks, 2006, pg. 130). Shared leadership was further explored by Lindahl (2008) to clarify the importance of teacher leaders bringing the shared vision to their classroom.

Though it is clearly crucial that the formal leader prominently articulate and model the vision for a wide range of stakeholders, teacher leaders can, and should, have a strong voice in formulating the vision; they also can take leadership roles in modeling the vision in their classrooms and bringing it alive to students, parents, and peers. Teacher leaders must be included in school planning – not operational planning for administrative functions, but planning how the vision should be translated into classroom and curricular practice, and in the school culture (Lindahl, 2008, pg. 304).

Personal Practice is defined as the act of teachers sharing their strengths in a collegial environment. “An overarching PLC theme was that if one colleague was struggling, teachers were collectively responsible for supporting that teacher – in the same spirit that student learning was the responsibility of all school personnel,”

(Shernoff, et. al, 2011, pg. 469). Having a specific form of communication in order to address issues was also valuable within the literature. “Our evidence on the qualities of effective professional learning communities and of constructive problem talk, show the importance of respectful inquiry into the theories that inform teachers’ practice,” (Robinson & Timperley, 2007, pg. 259). See Table 1.1 for an overview of the current literature related to the themes of PLCs.

## Methods

### *Participants*

Fulton (2009) conducted a quantitative study using a validated survey distributed to 1,200 high school teachers across New York State from schools of varying need and achievement statuses. Fulton utilized the New York State's Need/Resource Capacity to identify the level of need and then selected high and low need high and high and low achieving schools based upon the mastery percentage derived from three years of Math A scores. According to Fulton (2009), "163 high need and 120 low need schools which had three years of Math A scores (2005,2006,2007), and were identified by New York State's Need/Resource Capacity were eligible for the study," (pg. 82). "Three hundred English, mathematics, sciences, and social studies teachers from high-need / high-achieving, high-need / low achieving, low-need / high achieving, and low-need / low achieving high schools were sent a color-coded / number-coded survey called the Principal Instructional Management Rating Scale," (Fulton, 2009, pg. 82). Consent was obtained through a form letter sent to participants. Of the 173 responses that were collected and used in the data analysis, 48 were from high need and low achieving schools, 56 were from high need and high achieving schools, 38 were from low need and low achieving schools, and 31 were from low need and high achieving schools (See Table 1.2).

*Measures and Procedures*

The purpose of this study was to investigate teacher perceptions of principal's leadership behaviors through the frame of Professional Learning Communities: (1) Shared Vision and Mission, (2) Culture of Collaboration, (3) Focus on Improvement, (4) Shared Leadership, and (5) Personal Practice, and their relationship school achievement.

This quantitative study was developed using survey results collected by Dr. Fulton (2009) for his dissertation entitled *High School Principal Instructional Leadership Behavior in High and Low Need and High and Low Achievement Schools*. The survey instrument, *Principal Instructional Management Rating Scale*, was developed by Dr. Philip Hallinger (1987). Within this study, original items that were initially categorized as Job Functions were re-arranged based on the framework of Professional Learning Communities. Analysis resulted in the creation of five variables: (1) Shared Vision and Mission, (2) Culture of Collaboration, (3) Focus on Improvement, (4) Shared Leadership, and (5) Personal Practice. Shared Vision and Mission combined the Job Functions and associated items of *Framing the School Goals* and *Communicating the School Goals*. Culture of Collaboration combined the Job Functions and associated items of *Coordinate the Curriculum* and *Protect Instructional Time*. *Supervise and Evaluate Instruction* and *Monitor Student Progress* were combined to create the component of Focus on Improvement. *Maintain High Visibility* and *Provide Incentives for Learning* were combined to create Shared Leadership. Finally, Personal Practice was a combination of the Job Functions of *Provide Incentive for Teachers* and *Promote Professional Development*. A reliability analysis was conducted in order to determine the variables

that could be identified from the items in the survey, resulting in reliabilities higher than 89% (see Table 1.3).

Table 1.3

*Principal Instruction Management Rating Scale Reliability Analysis*

<i>PLC Component</i>	<i>Items</i>	<i>Number of Items</i>	<i>Cronbach's Alpha</i>

Results

*Research Question One*

When teachers are divided into high and low-achieving schools, how do they differ in their perceptions of their principal's leadership behavior within the five components of a Professional Learning Community: (1) Shared Vision and Mission, (2) Culture of Collaboration, (3) Focus on Improvement, (4) Shared Leadership, and (5) Personal Practice? To analyze the data of research question one a *t*-test of independent means was conducted and reported on (see Table 1.4).

Table 1.4  
*Comparison of the Five Components of PLCs on Achievement*

	Low Achievement\ High Achievement	<i>N</i>	<i>M</i>	<i>SD</i>	<i>SEM</i>	<i>t</i>	<i>df</i>	<i>p</i> *
Shared Mission and Vision	Low Achieving	83	32.99	10.50	1.15	-1.37	167	0.17
	High Achieving	86	35.17	10.20	1.10			
Collaborative Culture	Low Achieving	84	31.42	9.09	0.99	-0.84	165	0.40
	High Achieving	83	32.63	9.53	1.05			
Focus on Improvement	Low Achieving	85	29.32	9.68	1.05	-1.20	166	0.23
	High Achieving	83	31.18	10.48	1.15			
Shared Leadership	Low Achieving	81	28.02	9.62	1.07	-1.71	158	0.09
	High Achieving	79	30.70	10.19	1.15			
Personal Practice	Low Achieving	83	26.24	9.21	1.01	-3.10	162	0.00
	High Achieving	81	31.05	10.63	1.18			

*\*p < 0.05 equals statistical significance*

A *t*-test of independent means was conducted to understand how teachers differ in their perceptions of their principal’s leadership behavior, when divided into high and low-achieving schools, across all variables, the mean scores were higher for high achieving schools (See Table 1.4). This suggests that teacher perceptions of the principal’s leadership behavior are stronger in schools that are high achieving.

For the variables of Shared Vision and Mission, Culture of Collaboration, Focus on Improvement, and Shared Leadership, the score was above .05, the top row of data was used to test Levene’s test for Equality. In all of the above cases, these data were not statistically significant, indicating that teacher perceptions of those factors did not differ significantly between high and low-achieving schools. For Personal Practice, Levene’s Test for Equality of Variances was also above .05, and the top row of data was used. For Personal Practice, there was statistical significance, indicating that teacher perceptions of

Comment [M1]: Identify variable

Personal Practice ( $M_L = 26.24$ ,  $M_H = 31.05$ ,  $SD_L = 9.21$ ,  $SD_H = 10.63$ ) were higher in high achieving schools. Although not statistically significant, teachers perceptions of Shared Leadership ( $M_L = 28.08$ ,  $M_H = 30.70$ ,  $SD_L = 9.62$ ,  $SD_H = 10.19$ ) were also higher in high achieving schools.

#### *Research Question Two*

Which of following components of a Professional Learning Community: ((1) Shared Vision and Mission, (2) Culture of Collaboration, (3) Focus on Improvement, (4) Shared Leadership, and (5) Personal Practice, predicted school achievement? Research question two was analyzed using a logistic regression and a path analysis.

A correlation analysis was performed and between the five components of PLCs and school achievement. When teachers were divided into high- and low-achieving schools, teacher perceptions of their principal's leadership behaviors were analyzed in relationship to the five components of a Professional Learning Community by using a Pearson Product Moment Correlation. There is a positive and significant relationship between Personal Practice and school achievement, indicating that schools where teachers perceive Personal Practice as a principal leadership behavior have higher achievement. All of the interrelationships between each of the five variables (1) Shared Vision and Mission, (2) Culture of Collaboration, (3) Focus on Improvement, (4) Shared Leadership, and (5) Personal Practice, are strong, positive relationships that are statistically significant. This suggests that all of the variables are related in the framework of PLCs (See Table 1.5).

Table 1.5

Correlation between Achievement and Perceptions of PLC Components

		Low Achievement / High Achievement	Shared Vision and Mission	Culture of Collaboration	Focus on Improvement	Shared Leadership	Personal Practice
Low Achievement / High Achievement	r	1					
	p						
	N	173					
Shared Vision and Mission	r	.106	1				
	p	.172					
	N	169	169				
Culture of Collaboration	r	.065	.789**	1			
	p	.402	.000				
	N	167	164	167			
Focus on Improvement	r	.093	.825**	.826**	1		
	p	.233	.000	.000

Shared Leadership	r	.134	.771**	.762**	.820**	1	
	p	.090	.000	.000	.000		
	N	160	159	157	156	160	
Personal Practice	r	.237**	.720**	.758**	.783**	.852**	1
	p	.002	.000	.000	.000	.000	
	N	164	162	158	159	156	164

\*\* indicates  $p < 0.05$  equals statistical significance

A logistic regression was applied and confirmed that Personal Practice was the major predictor of school achievement, followed by Focus on Improvement (see Table 1.6).

**Table 1.6**

*Logistic Regression*

		B	S.E.	Wald	Df	Sig.	Exp(B)
Step 1 <sup>a</sup>	Personal Practice	0.039	0.017	5.435	1	0.02	1.04
	Constant	-1.199	0.503	5.677	1	0.017	0.302
Step 2 <sup>b</sup>	Focus on Improvement	-0.057	0.028	4.015	1	0.045	0.945
	Personal Practice	0.084	0.028	8.674	1	0.003	1.087
	Constant	-0.766	0.543	1.989	1	0.158	0.465

a. Variable(s) entered on step 1: Personal Practice.

b. Variable(s) entered on step 2: Focus on Improvement.

A path analysis was designed utilizing Personal Practice as the dependent variable (Figure 1). The variables of Shared Vision and Mission, Culture of Collaboration, Focus on Improvement, and Shared Leadership were factors in the model. All relationships between the factors were positive and strong  $r$  ( $r = .76$  to  $.83$ ). Figure 1 shows that Shared Leadership had the strongest predictive impact on Personal Practices. The second highest predictor is Collaborative Culture, followed by Focus on Improvement. All three variables accounted for 76% of the variance of Personal Practice. Shared Vision and Mission, although not in the regression, correlated highly with other variables, as shown in Figure 1.

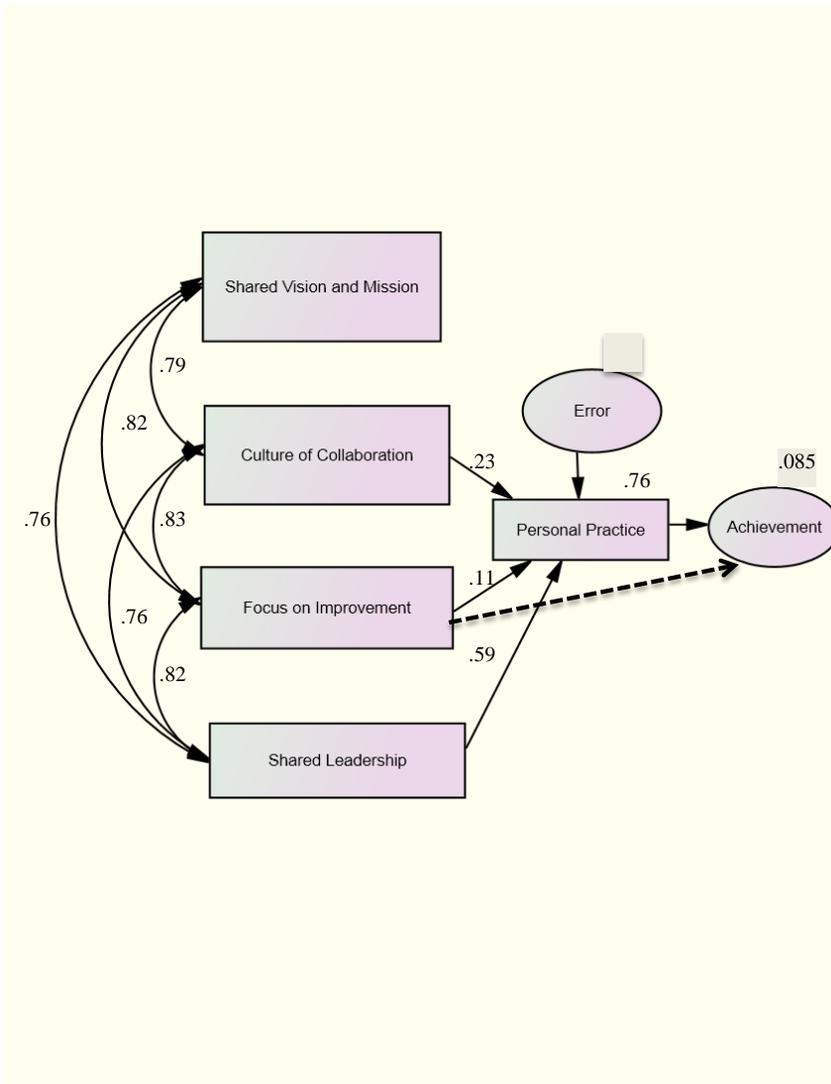

Figure 1 Path Analysis

### Discussion and Implications

The five variables of PLCs that were examined were: (1) Shared Vision and Mission, (2) Culture of Collaboration, (3) Focus on Improvement, (4) Shared Leadership, and (5) Personal Practice. Based upon our findings, Personal Practice had the greatest influence on student achievement. Shared Vision and Mission, Culture of Collaboration, Focus on Improvement, and Shared Leadership interrelate with each other. Personal Practice was selected as a mediator to evaluate how other variables relate with achievement. By examining the teacher perceptions of principal's leadership behaviors, we were able to better understand the elements of PLCs and their effect on student achievement.

The cornerstone of the PLC model shifts focus from teaching to student learning. Our findings align with Linder, et al. (2012), as he found that shared personal practice is a key part of PLC. While all of the variables are interconnected, the suggestion is that focus on personal practice can be connected with high student achievement.

In contrast, we did not find a direct relationship between achievement and three other variables of PLC, as Williams (2013) did. However, looking further, we prepared a path analysis showing that indeed Personal Practice can play a mediator role of the other variables to predict achievement.

Based on our findings, we strongly recommend professional development in Personal Practice to begin the process of developing PLCs, especially in school districts with limited budgets. One limitation is the lack of input from the principal's perspectives of their own leadership behaviors. We would recommend surveying the principals to see if their intended leadership behaviors are aligned with the perceptions of the teachers.

## **Collaboration in Inclusive Schools in Saudi Arabia: Recommendations for Policy and Best Practices**

Equal learning opportunities and high quality education are right for all students. Many students with disabilities are not receiving the services they need in inclusive classrooms because of the lack of collaboration between general and special education service providers. Collaboration among educators is a critical for successful implementation for all education programs, especially special education programs, in inclusive classrooms. When general education teachers, special education teachers, and other service providers work separately and do not have the efficient skills to work collaboratively to address and meet the needs of students with disabilities/at risk in inclusive classrooms, the gap between students with and without disabilities will widen.

In Saudi Arabia, there is a lack of using collaborative practices among Saudi educators in inclusive schools. Implementation of this essential approach will lead to a large, positive difference in students' outcomes (Lingo, Barton-Arwood, & Jolivette, 2011 and Garderen, Stormont, & Goel, 2012). Successful collaboration will benefit all students, families, and school personnel.

The ultimate goal of inclusion will be achieved by implementing the best collaborative practices that are research-based. Describing the best collaborative practices will help the practitioners to understand the nature of these practices and implement them with accuracy. Saudi policy makers in education should consider effective collaboration as a critical tool to developing and implementing any special education program in order to close the gap between all students in inclusive classrooms. This presentation is beneficial for any global education system that applies inclusion.

Designing healthy and effective school environments for all students needs collective efforts. These efforts will help to gain the ultimate goals of successful inclusion and overall education for all students. As an introduction for this presentation, I will present the current view of inclusive schools and the nature of collaboration among educators in these schools in Saudi Arabia. I intend to persuade educational policy makers and educators that implementing successful collaborative practices in inclusive schools is critical. I will demonstrate several research studies that indicate the effectiveness of collaboration between special education teachers and other educators. Such collaboration will (a) improve inclusion in schools, (b) increase the quality of provided services for special education students, (c) develop and apply special education programs effectively, (d) address and meet all students' needs, and (E) enhance special education students' achievements. I will identify and describe some of the best practices of effective collaboration that are research based.

### **Abstract**

Data-Driven Learning (DDL), or the use of corpora and concordancing tools in second language (L2) classrooms, is expanding globally. In this study, we investigated the effectiveness of DDL for understanding targeted language usage in an L2 university classroom using a new web-based, Japanese-English bilingual concordance tool. Students followed instructions on worksheets to search and observe keywords in a newspaper corpus, shared their observations in paired and class groups, and applied their understanding to production activities. Efficacy was measured by pre- and post-test scores, students' notes, and questionnaire responses. The results indicate that the DDL tasks using worksheets in a five-step teaching procedure was effective for learning the identified language items, and for fostering L2 learners' perspectives toward L2 language rules and patterns. The feedback from students was positive.

### **1. Introduction**

Using data in language teaching is called Data-Driven Learning (DDL). DDL is implemented in pedagogical settings with a concordancer, which is a search software, and a corpus, which is a body of language data. Using a concordancer, a targeted word can be viewed in a variety of contexts (shown as partial sentences) called concordance lines, which are extracted from the corpus. The target word, or keyword in context (KWIC), is aligned in the center of the computer screen. The screenshot in Figure 1 shows concordance lines for the KWIC *issue*. In this figure, words to the left and right of the KWIC can be sorted and highlighted to more easily view various

language forms such as articles, determiners, common clusters and common pre and post modifiers. In the example shown, we can easily understand that *issue* can be used as a noun (e.g., *the key issue*) and a verb (e.g., *issue bonds*); and that adjectives such as *crucial*, *latest*, *major* and *pending* modify *issue*. The noun form of *issue* is followed by verbs such as *was*, *is*, *may be*, *requires*, *would be*, *cannot be*, *arises* and *dropped*.

tariffs and Trade would become more of an **issue** because of the necessity of incorporating China into

Figure 1 View of a Corpus Search for the Keyword *Issue*

In using corpora and concordance tools, learners become “language detectives” by observing and finding rules of language and vocabulary usage by themselves (Johns, 1997, p.101). In this way, it is inductive, learner-centered, promotes “noticing,” and fosters student autonomy (Braun, 2005; Huang, 2008; Hunston, 2002; O’Keeffe, McCarthy & Carter, 2007). Furthermore, students can observe ample authentic language data that they cannot access in English textbooks.

However, as can be seen from Figure 1, although there are benefits to using this kind of text analysis, two main problems are the complexity of the language in the authentic text (Boulton, 2009), and the potentially complex use of concordancers (Nishigaki, Kijima, Chujo & Oghigian, 2010). Before the availability of *WebParaNews*, to use a bilingual concordancer in class, the instructor would need to purchase the software and prepare corpora in the L1 and L2; and students would need to learn to use the bilingual concordancer, including how to adjust settings and upload an L1 corpus and then an L2 corpus. (For more information on the relative merits of other available corpora, see Oghigian & Chujo, 2010). *WebParaNew* was used to reduce the difficulty and complexity of using this type of tool. It contains an English and Japanese bilingual corpus based on a *Daily Yomiuri* newspaper corpus, and uses a search program that works like a simple Google search which can be viewed with a browser such as Internet Explorer, Firefox, Chrome, or Safari. No initial settings are needed, so searches can be done immediately. It displays English concordance lines with corresponding L1 (Japanese) translations. When a target word is typed in, it displays English concordance lines with corresponding L1 (Japanese) translations (Figure 2). The L1 translation allows the students to confirm the meaning of the concordance lines so that they can focus on the language rules. Thus, the L1 translation reduces the learning burden. *WebParaNews* was released by the project the authors involved (Chujo, Anthony & Nishigaki, 2012).

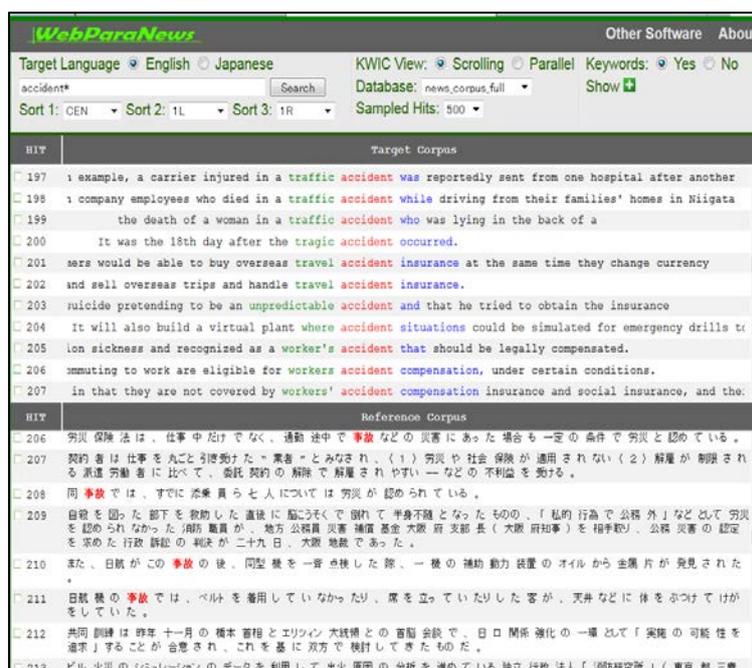

Figure 2 Search Results Using *WebParaNews*

In this study, *WebParaNews* was implemented in an L2 classroom with aims to verify if it can be used effectively in an L2 class, and to investigate what and how students learn with *WebParaNews*. The research questions (RQ) addressed for this study were:

RQ1: Is *WebParaNews* an effective tool for learning targeted language items in a university L2 class?

RQ2: Does using *WebParaNews* help students foster their perspectives on L2 rules?

RQ3: Do Japanese learners in this study view the tasks and tool (*WebParaNews*) favorably?

RQ4: How does using *WebParaNews* help students as language learning tool?

## **2. Methodology**

### **(1) Participants**

The participants were 12 university students, five male and seven female students, attending a TESOL class in a teachers' training program at a Japanese university. Their first language was Japanese. Their average TOEFL ITP score was 522, ranging from 450 to 583.

### **(2) DDL Instruction**

In each 90-minute class, the participants worked with *WebParaNews* for about 30 minutes to learn the target language items. The DDL instruction was based on sequential activities with five steps: (1) warm-up, (2) observation, (3) share, (4) understand, and (5) use. In the *warm-up* stage, students took quizzes to self-evaluate their current level of knowledge about the target words. Next, in the *observation* stage, they studied concordance lines independently and wrote down what they found on a worksheet. (An example worksheet is shown in Figure 3.) In the *share* activity, students shared their findings first with a partner and later in class. In the *understand* activity, the teacher summarized the class discussion and gave an explicit explanation of the target words in order to confirm or correct students' hypotheses on the targeted language items. In the *use* activity, students applied their acquired knowledge and worked on production such as creating sentences or conversations using the target words.

### **(3) Targeted Language Items**

The participants worked with *WebParaNews* for ten weeks. In Table 1, the targeted keywords in context are shown in italics. An example worksheet is shown in Figure 3.

Table 1 Target Items Learned in Class

Figure 3 Example Worksheet  
 (The original instructions were in Japanese.)

#### (4) Evaluation

The effectiveness of the DDL material and instruction was evaluated by pre- and post-tests, a questionnaire, and notes taken by students on their worksheets. The pre- and post-tests contained 65 questions; half of the post-test was administered a week after the DDL instruction, and the remaining questions were administered two weeks later. The pre- and post-tests were identical. The types of questions were 27 multiple choice questions; 10 partial translations into L1; 20 partial translations into English; and eight questions to correct incorrect English sentences. The instructor collected the worksheets after class, made copies and returned them to the students. The notes made on the worksheets by the students were then analyzed. The questionnaire consisted of five-point Likert-scale questions, and open-ended comments.

### 3. Results and Discussion

#### 3.1 Pre- and Post-tests

The results of descriptive statistics, the gain between the pre- and post-test, the  $p$ -value, and the effect size are shown in Table 2. Since the number of participants was twelve, a non-parametric statistical test, the Wilcoxon signed-rank test, was administered. As a result, the gain between the pre- and post-tests was statistically significant ( $Z = -3.06$ ,  $p = .002$ ,  $r = -.63$ ). The effect size was  $r = .63$  and was “large”. Since the increase of the score before and after DDL instruction was verified, we can say that DDL was effective in this setting for increasing the participants’ L2 knowledge of the targeted items. Thus, we concluded that the answer for RQ1 is yes.

Table 2 Results of Descriptive Statistics ( $n = 12$ )

	Pre-test	Post-test	Gain	$p$ -value	Effect Size
Mean	43.73	73.86	30.13	$p = .002$	$r = -.63$
SD	11.74	9.08			

#### 3.2 Worksheets

In class, students used *WebParaNews* with a worksheet that the instructor created for each target language item. On the worksheets, students wrote what they found from *WebParaNews*. Figure 4 shows an example of notes that a student took on a worksheet in class. The ideas from her partner and the class were added with a red pen.

incident は、国境を越える / 国境を越える / 国境を越える / 国境を越える / 国境を越える / 国境を越える / 国境を越える / 国境を越える

Figure 4 Example of a Student's Notes

When we look at the notes on the worksheets, we can see what students found in the concordance lines and how they formulated language rules. Samples of the findings that students wrote on notes are shown with the target language items in Table 3. *Incident*, *accident*, and *event* were chosen as target words because their concepts and translations are similar, but meanings and usages are not, and therefore are confusing for Japanese students. Similarly, since both *America* and *U.S.* are translated as “Amerika” or “Amerika-no” in Japanese, Japanese students are likely to use *America* or *American* in contexts phrases where *U.S.* should be used. They often do not distinguish between *America* and *U.S.* A sample of these findings is shown in Table 4.

Table 3 Student Findings for *Incident, Accident, and Event*

Student Findings for <i>incident, accident, and event</i>
<ul style="list-style-type: none"> <li>◆ an <i>accident</i> happened unexpectedly</li> <li>◆ an <i>accident</i> is an unfortunate matter</li> <li>◆ an <i>incident</i> was planned</li> <li>◆ an <i>incident</i> occurred intentionally</li> <li>◆ an <i>event</i> was often fun and interesting</li> <li>◆ an <i>event</i> was planned in advance</li> <li>◆ the verbs frequently used with <i>accident</i> and <i>incident</i> were <i>occur</i> and <i>take place</i></li> <li>◆ a specifying name frequently came before <i>incident</i> such as <i>the Matsumoto poisoning incident</i></li> <li>◆ an <i>event</i> was often used as a phrase such as <i>in the event of...</i> and <i>in the event that...</i></li> </ul>

Table 4 Student Findings for *U.S. and America*

Student Findings for <i>U.S. and America</i>
<ul style="list-style-type: none"> <li>◆ <i>America</i> refers to a part of a continent</li> <li>◆ <i>America</i> refers to a place such as North America or Latin America</li> <li>◆ <i>U.S.</i> is used to talk about the United States of America</li> <li>◆ <i>U.S.</i> refers to a country</li> <li>◆ <i>U.S.</i> is used as an adjective such as U.S. government</li> <li>◆ <i>U.S.</i> means a country, not an area</li> <li>◆ <i>U.S.</i> often relates with government thing</li> <li>◆ <i>U.S.</i> is often followed by a noun</li> </ul>

A third example of a student's findings is shown in Figure 5. In class, students looked at what words fit the pattern "It is A that...", listed those words found from a *WebParaNews* search, and categorized them using their own ideas. This student categorized the words for A of "It is A that..." as 1) possibility (e.g., *possible, probable*), 2) presumption (e.g., *assumed, believed...*), 3) decision (e.g., *decided, determined*), 4) tangibility (e.g., *certain, clear, ...*) 5) necessity (e.g., *essential, inevitable...*) 6) hope (e.g., *desirable, hoped*), 7) unfortunate (*unfortunate, regrettable*), and 8) worry (*doubtful, feared*). (Category names were translated by the authors.)

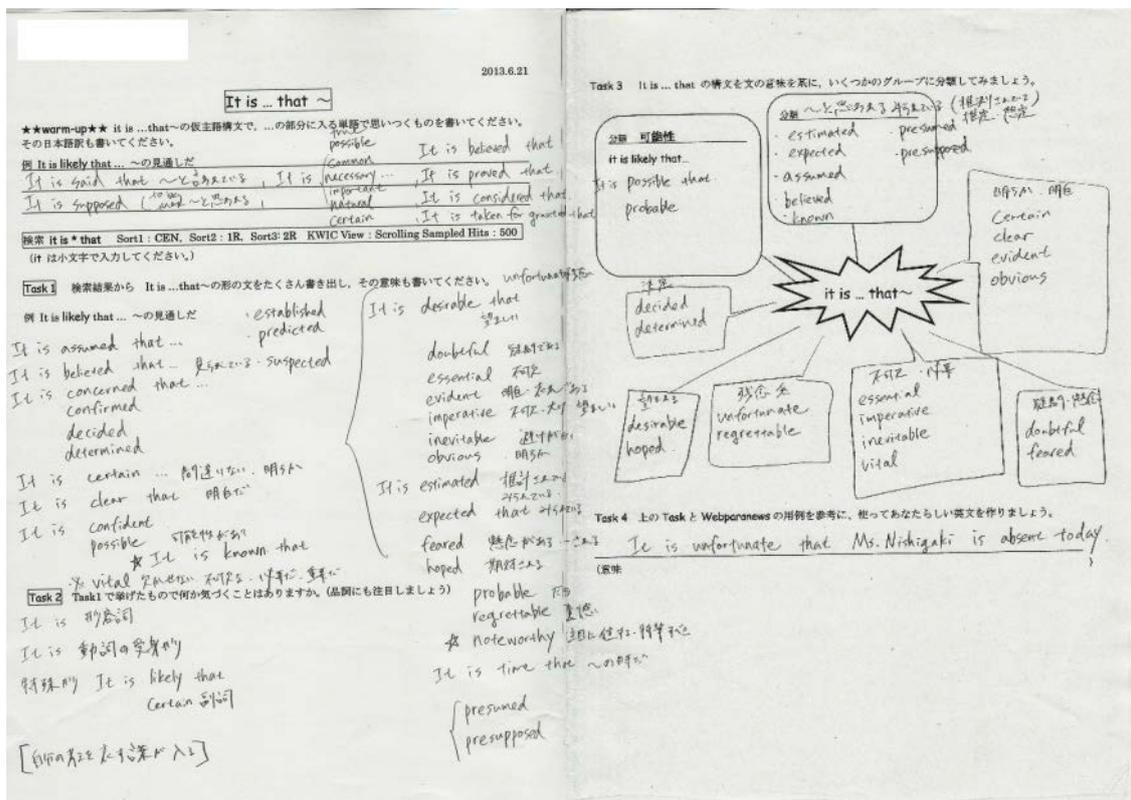

Figure 5 Example of a Student's Categorization of "It is \_ that..."

From the observation of students' notes written on worksheets, we understood that students found rules by themselves, and expanded their learning through pair-work and group work. Thus, we can say that DDL in this setting extends students' viewpoints on L2, fostering their autonomy as an independent L2 learners. Therefore, we concluded that the answer for R2 is yes.

### 3.3 Questionnaire

#### (1) Five-point Likert Scale

The first question on the questionnaire was about *WebParaNews*. In looking at the 5-point Likert score results in Table 5, we can say that students found *WebParaNews* interesting, and useful for learning a language and for fostering language knowledge. However, the score for "memory" is not as high as other items (3.9). Some review activities or production activities to consolidate the learned material could be added to improve this aspect.

Table 5 The Use of WebParaNews

Questions	Score
WPN is interesting.	4.3
WPN is useful for learning a language.	4.4
WPN is good to foster the perspectives of language learning.	4.3
The target item looked up in WPN is memorable.	3.9

5: I agree very much. 4: I agree to some extent. 3: Neither.  
2: I don't agree to some extent. 1: I don't agree at all.

For the second question, students addressed questions about the number of tasks and length of time needed to do the DDL exercises using *WebParaNews*. From Table 6, we can say that the time and the number of tasks used for DDL are mostly appropriate. From the results shown in Table 5 and 6, we concluded the answer to RQ 3 is yes.

Table 6 The Activities in DDL

Questions	Score
Time Used for DDL (1 too long 3 appropriate 5 too short)	2.8
Number of Tasks (1 too much 3 appropriate 5 too little)	2.5

For the third question, students compared *WebParaNews* to an electronic dictionary (DIC in Table 7) and answered each question using a 5-point Likert scale. We can see that students thought that *WebParaNews* was useful, showing many examples and providing authentic and interesting examples. On the other hand, we can see that students thought that electronic dictionaries were easy and convenient to use, and students could look up the targets items quickly. Thus, we concluded for RQ4 that *WebParaNews* has its own benefits as an L2 learning tool, and complements electronic dictionaries.

Table 7 Comparison between WebParaNews and Electronic Dictionary  
WPN: *WebParaNews* DIC: Electronic Dictionary

Questions	WPN	DIC
It is useful for learning a foreign language.	4.7	4.3
It shows many examples.	4.6	2.8
I can find and notice about words and language rules.	4.4	3.8
The example sentences are authentic and interesting.	4.1	3.0
I can look up a target item quickly.	3.8	4.3
It is easy to use.	3.5	4.2
It is convenient to use.	3.5	3.9

5: I agree very much. 4: I agree to some extent. 3: Neither.  
2: I don't agree to some extent. 1: I don't agree at all.

## (2) Open-ended comments

Examples of comments expressed on the questionnaire are shown in Table 8. From these comments, we can say that the students liked *WebParaNews* as an English learning tool. Therefore, we can say that the answer of RQ 1 is yes. Regarding RQ4, we conclude that *WebParaNews* gives ample and authentic English example sentences to the students and can complement electronic dictionaries.

Table 8. Sample Comments from Student Questionnaires

Comments
Searching words and observing meanings and usages was interesting and fun.
I liked <i>WebParaNews</i> very much. I was amazed by and liked this new way of language learning.
The data given by <i>WebParaNews</i> shows me things clearly.
I learned various meanings and usages of English words and realized I need to learn English more broadly and deeply.
When I shared ideas about a target word with my partner and class, I deepened my ideas.
The language data shown by <i>WebParaNews</i> made me certain about language rules.
If the concordance lines were arranged in the order of frequency, it will be easier to find rules.

## 4. Conclusion

DDL tasks targeting ten specific language items were provided on worksheets to participants who used *WebParaNews* to find and observe language rules. The teaching procedure included warm-up, observe, share, understand and use aspects, and employed individual, paired, and class work. In this study, pre- and post-test scores indicate that this method was effective. Student comments on questionnaires indicate that using a corpus was helpful with regard to finding numerous examples that were authentic and interesting and in broadening their understanding of language rules; students also indicated that *WebParaNews* complements electronic dictionaries as a language tool although an electronic dictionary was faster and more convenient when just seeking a definition. Further improvements to this type of classroom implementation would include more review and productive activities. It is hoped that this research provides teachers with ideas on how to implement DDL in L2 classrooms using *WebParaNews*.

## Three Men and a Maybe: Identity and Privilege in Male Preservice Elementary School Teachers

Stephen I. Tucker, School of Teacher Education and Leadership, Utah State

University, [pragmaticteacher@gmail.com](mailto:pragmaticteacher@gmail.com), 2605 Old Main Hill, Logan, UT 84322-2605

### **Abstract**

Male preservice elementary teachers often receive special attention. However, hybrid identities consist of many complex components. Constant-comparative methodology revealed emergent themes of privilege and disadvantage linked to gender, religion, and ethnicity in this exploratory examination of the stories of three male preservice elementary teachers. The men demonstrated varying levels of awareness of their hybrid identities and the associated privileges and disadvantages. All three men found privileges and disadvantages related to their gender, but members of religious and ethnic minority groups perceived significant disadvantages of those aspects of their identities. Findings suggest that preservice teachers' identities are more complex than gender alone, that being in multiple minority groups may compound challenges for preservice teachers, and that current teacher training may not sufficiently address issues of hybrid identity.

Title: ACCIDENTAL PLAGIARISM IN HIGHER EDUCATION:PART 2.

Topic Area: Distance Education, Higher Education  
Presentation Format: Paper Session  
Paper author: Dr. Cheryl A. Kier  
Department/Division: Centre for Social Sciences  
University: Athabasca University  
E-mail Address: [cherylk@athabascau.ca](mailto:cherylk@athabascau.ca)

Some alarming numbers have been published in academia and in the media that reinforce the perception that plagiarism is a widespread and urgent problem (e.g., Briggs, 2009). Yet, as recently as February, 2010, it was reported that the actual prevalence of plagiarism is unknown, as most data come from self-reports (Walker, 2010). More research needs to explore student understanding as well as actual behaviour. This project explores the potential extent of accidental plagiarism by assessing Canadian distance education students' knowledge of plagiarism. Four pieces of evidence are analyzed: (1) students' attempts to select plagiarised passages from a number of choices; (2) paraphrases these students produced; (3) results from a simple exercise aiming to improve plagiarism understanding; (4) the types of errors made in identifying and writing paraphrases.

One way to test whether students understand plagiarism is to have them identify which of several passages is or is not plagiarized. Several researchers have done this, and most found undergraduate students did rather poorly (Jones, 2011; Roig, 1997). In contrast, Hale (1987) found "only 11% of the total judgments were instances where students believed a passage was honest when it was plagiarized" (p. 68) and argued that his results demonstrated that inadvertent plagiarism is unlikely. However, 11% of the student body can be a large number of individuals!

Overall, the literature indicates that a large proportion of students genuinely do not recognize plagiarism and do not fully understand what it is. Therefore they likely do not plagiarize on purpose.

There have been several attempts to prevent plagiarism; some more effective than others. A few found that students who received instruction later plagiarised less than those without instruction, but still continued to commit plagiarised acts (e.g., Jocoy & Dibiase, 2006). Walker (2008) was partially successful in uncovering the types of errors students made by creating a coding system to detect different types of plagiarised text:

"1) word strings, that is lifting exact phrases consisting of five-to-nine words from the original 2) substitutions, modifying the original text by using one to two synonyms; 3) additions, including one-to- two new words to the original 4) deletions, eliminating one-to-four words from the original; and, 5) reversals, rearranging sentence order or interchanging phrases." (p.390).

She found that training a randomly selected group of 19 students to paraphrase properly significantly reduced all five types of plagiarism in comparison to a control group of 17 students, although there was no difference in use of word strings for a second, lengthier passage. The fact that students benefitted from this training suggests that they may be uninformed about plagiarism, but can learn with intervention. It seems that more research is needed to determine the circumstances in which training is useful and perhaps the types of training that suit particular audiences.

Because insufficient research exists on the topic of accidental plagiarism, the present study assesses whether two different groups of university students recognize plagiarised work in which wording from the original had been changed in various ways. One of these groups received feedback on their recognition attempts and then were asked to paraphrase a passage. The prediction is that with feedback and practice, this group should improve over time. It is also expected that this improvement will transfer to their attempt to paraphrase a passage. A second group of more diverse students was tested to see if the results generalize. The types of errors made, based on Walker's (2008) definitions, will be assessed for descriptive purposes, but no hypotheses are offered.

## ***Method***

### ***Participants***

Eighty-five percent of 497 students (N=420) who registered in the Psychology of Adolescence course from August 8, 2007 to November 9, 2010 completed all five course quizzes and are included in this report. This study analyzed the data obtained from the questions about plagiarism. The university's Research Ethics Board provided permission to use student data for the purposes of the present study. The majority of students (87%) was female with a mean age of 29. Most (44%) lived in Alberta, and 2.2% were international students. The remainder lived in other Canadian provinces or territories.

A second group of participants from the same university received a different set of scenarios. This group consisted of undergraduate (N=125; 71% female) and graduate students (N=103; 73% female) from Arts, Business, Communications, Journalism, Nursing, Allied Health Studies, Math, Science, Social Sciences, and Interdisciplinary Studies. The undergraduate students were spread roughly equivalently across the four years of university and all students were taking at least one course online at a distance.

### ***Procedure***

The course was online, taken at a distance. Built into the course is a series of five quizzes, each consisting of 15 multiple choice questions and five short answer questions. Students read a portion of their textbook and study guide, and then took a quiz before proceeding to the next readings. Most quiz questions were related to course content, but for the first four quizzes, one multiple choice question from each involved recognizing plagiarism. For this question, a passage from the textbook was presented. Students were asked to select one of four options that did or did not represent plagiarism of that passage. Because students receive feedback from the markers, the aim was to teach students to recognize plagiarism so they would not engage in it in the essay they needed to write later in the course. It was expected that the markers' feedback

would increase students' awareness of plagiarism so that their ability to recognize it would improve throughout the course.

For the second task, students were selected from throughout the university rather than from a single course. All four multiple choice scenarios included a proper citation. Three scenarios asked students to identify the correct paraphrase from a number of options. One further scenario asked students to identify what was wrong with a paraphrased passage.

## **Results**

Slightly more than half of the 420 Psychology students (N=215; 50.8%) correctly classified all four items as plagiarised or not. The remaining students correctly answered between none and three questions.

Most students got the first question correct (93.8%), followed by the fourth question (82.2%), the second question (75.5%), and finally the third question (71.5%). Turning to the Psychology student paraphrases, the majority contained at least one instance of plagiarised text (word string, substitution, addition, deletion, or reversal). Using substitutions (453 instances) was the most common type of plagiaristic behaviour. This was followed by word strings (376 instances). Fewer occurrences of the other behaviours were observed: 58 additions, 34 deletions, and 18 reversals.

For the second task, most university students got the first plagiarism scenario correct (58% of undergraduates and 52% of graduates). For Scenario 2, 62% of undergraduates and 66% of graduate students correctly recognized the reasons why a particular paraphrase was plagiarised. A slim majority of students got the correct answer for Scenario 3 (50% of undergraduates and 55% of graduate students). Results for Scenario 4 revealed that a minority of students selected the correct answer (26% of undergraduate students and 36% of graduate students).

## **Discussion**

The objective of this project was to assess the ability of students taking online courses to recognize plagiarised material and to paraphrase properly. This study found that almost half of the students in a third-year psychology course did not recognize plagiarised material consistently. The evidence does not support the prediction that student scores would improve over time given feedback and practice, as more students got the first question correct (93.8%) than the fourth question (82.2%). Furthermore, the majority of these students did not correctly paraphrase a passage they were asked to write in their own words, even after they had received feedback on their recognition quizzes. This suggests more extensive instruction is needed.

Undergraduate and graduate students from throughout the university also failed to recognize many plagiarised passages that included word strings, reversals, substitutions, additions, and deletions. As suggested by Hochstein et al. (2008), the poor ability of students to identify plagiarised passages may imply poor understanding of the concept. Therefore, when these students write their course essays, they may not be able to recognize their own tendency toward plagiarism and thus engage in it accidentally.

If it is true that a large number of students do not fully understand plagiarism, proactive prevention rather than punishment may be the best means to deal with it. Several authors suggest training in skill development is key. Information literacy has been touted as a crucial factor in preventing plagiarism (Rolfe, 2011). Reading peer-reviewed journal articles, as is often asked of students in higher education, can be very difficult. Students may need guidance in their selection of journals, but even more so, students may need to be taught how to read such articles. Prevention may need to focus on helping students grasp the main ideas and summarize material rather than focusing on details (Walker, 2008). This may help ensure “students don’t conclude that creating a technically perfect bibliography is enough” (Howard & Davies, 2009, p. 65).

Rather than perceiving plagiarism as a type of cheating, it may be more appropriate to identify it, particularly poor paraphrasing, as a weakness in skills. The remedy for committing plagiarism should be sending students to tutorials or other methods of learning to read, write, and reference at the level required for the discipline (Briggs, 2009).

Becoming familiar with terminology, learning how to read academic papers for meaning and how to summarize the main points of a text, in addition to learning proper citation rules and how to avoid plagiarism, are essential skills for students in higher education. Currently, instructors may be assuming that students have skills that, in fact, they lack; they may also be assuming that all instances of plagiarism are intentional. If students do not possess the skills of their disciplines, asking them to write without plagiarizing may be asking many of them to perform “what they have not been taught” (Levin, 2006, p. 6). Knowing where student weaknesses lie provides essential information as to where to direct intervention.

## **The Robot Project: Teaching Concepts and Brainstorming Techniques from Perspective Mechanics to Storyboard Animatic**

### *Abstract:*

The Robot Project is a case study of a brainstorming exercise that involves classroom collaboration. The purpose of the project is to introduce basic perspective exercises to generate a character and situation for a short story. The processes involve hand drawn perspective sketches to quickly idealize and narrow down camera shots of scenes for their sequence. These concept drawings are scanned then fully enhanced through the use of digital editing software to develop a fully rendered digital short story animatic. Techniques include character development, as a classroom activity, digital paint and image manipulation, and digital video editing including sound.

### *Introduction*

Researchers suggest that, although IQ scores are rising, there is a decline in creativity in America [1]. "To be creative requires divergent thinking (generating many unique ideas) and then convergent thinking (combining those ideas into the best result)" [2]. In this paper, I discuss the trials of developing an effective technique to generate a character and situation for a short story. Visual Thinking is a class I teach within the Digital Media Program at East Tennessee State University where this case study applies. In previous classes, students had difficulty generating character and story concepts. Through innovation and restructuring of class projects, I effectively engage students to develop imaginative ideas to produce a storyboard animatic as a class project.

Visual Thinking is a class to introduce students to digital media concepts by bridging techniques of hand drawn perspective sketches and refining those renderings through the use of digital editing and design software. Students begin with traditional exercises to develop skills in 2D perspective sketches. These 2D exercises progress to more complex creations such as interior and exterior environment sketches. From this, students are encouraged to look beyond the 2D plane to envision digital 3D environments. The objective is to move students beyond the basic skills so they can transfer sketches to fully-rendered computer generated imagery.

### *The "Robot Project" Origin*

In earlier classes I found that the projects I assigned yielded lackluster results and left students frustrated as we progressed to storyboard development. Students would often ask in a

panic, "What should I do?" The solution was simple. Begin with traditional perspective exercises then institute a project that everyone had a hand in creating. Educators suggest brainstorming activities for storyboarding [3]. The concept of the "Robot Project" allowed students a different way to collectively brainstorm. It also allows students to draw, even if the student is not skilled in drawing. Visual Thinking is not a figure drawing class. Drawing is a skill that may take years to develop for one to effectively draw a proportionally correct human figure. Instead, I thought it would be interesting to develop a robot figure because human proportion can be excluded, plus it is an extension of previous perspective exercises while allowing creativity to flourish.

### *A Hands-On Brainstorming Session*

The project was simple. All class members sat around a table; in this class there were 27 students. I asked them, using skills from the perspective exercise, to create a robot in 90 seconds. The students thought this was extreme, but they frantically drew to accomplish the task. After 90 seconds, I told them to pass their drawings to the right and continue drawing the robot, adding or deleting details from the previous person. This exhibited loud and hilarious reactions from the students. The process continued until each student got back their original sketch. When the laughter and jokes faded, each student was looking at a distorted mess of a robotic structure. However, before each student was an image yielding a multitude of possibilities.

### *Refining the Robot*

After each student got back his or her robot sketch that was passed around the class, they were asked to refine their robot character and incorporate at least 20 percent of what was before them. This refining period was done through a series of small thumbnail sketches to narrow down their ideas to produce a final image. Once the final render was done, it was scanned and sent to the digital environment for final color, shading and shadowing. The results were successful. Plus, this was the catalyst of the character or storyline they would use for their storyboard creations. I removed the problem of "What should I do?" At this time they were asked to answer a series of questions about their robots including:

- Where is it from?
- What is its purpose?
- What is its mission?
- What is its special ability?
- Who is its nemesis?
- Is it to protect or destroy?

Through the development of their robots, their ideas flourished with stories of their robots, and some students even came up with other main characters for their project. Now we were ready for storyboard creation.

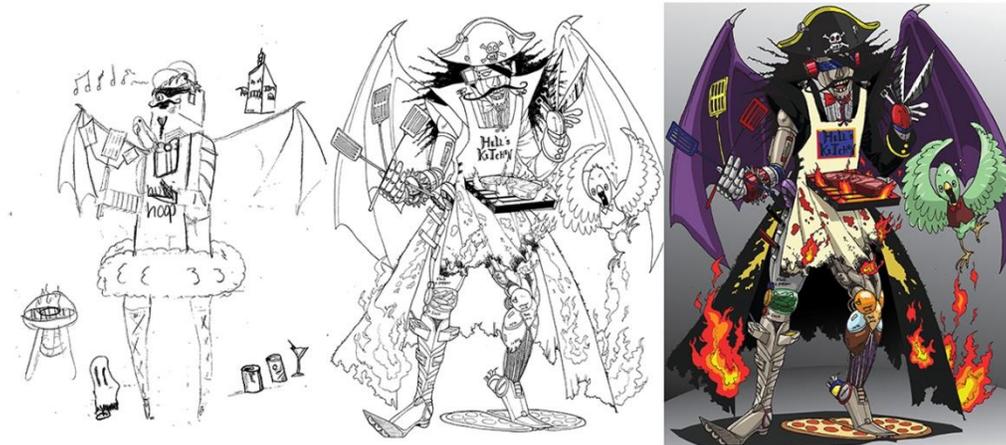

Fig. 1 Interactive Classroom Sketch to Final Robot Rendering, Sachiko Iba

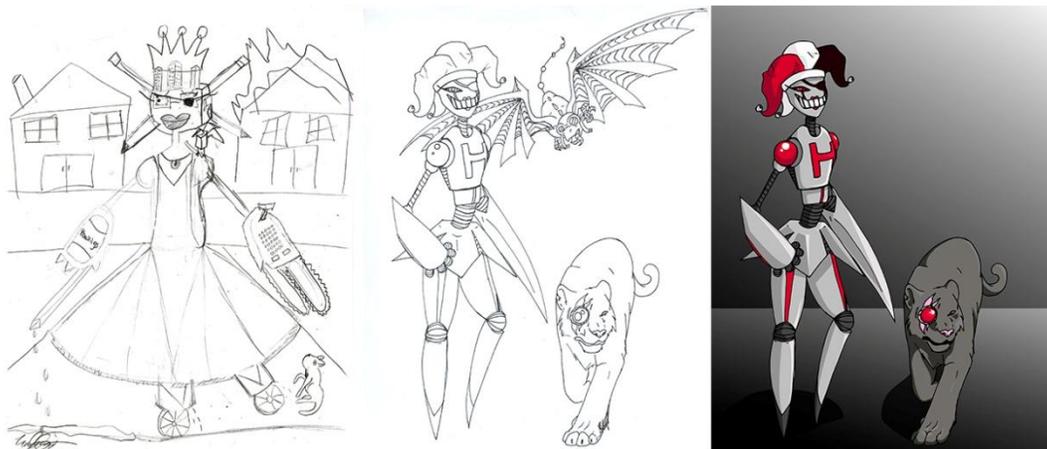

Fig. 2 Interactive Classroom Sketch to Final Robot Rendering, Taylor Grant

### The Storyboard

The restructuring of projects and the order in which they were assigned from the beginning of classes all led to this point of storyboard development. By now, the students had a grasp of perspective sketching, and through the robot project, had an idea of a storyboard sequence. Each student rendered an 11" x 17" storyboard template consisting of 6 frames per sheet, including comment boxes for dialogue and notes pertaining to the story sequence. A minimum of 12 frames were required for the project; however, students could illustrate more frames if needed. I encouraged students to look at each frame as if it was shot through a camera. Therefore, they needed to vary shots from extreme close-ups, close-ups, medium and wide shots. I presented several examples of how to look at different angles of a scene. The idea was to keep the shots interesting and varied. Students would produce their storyboard frames by sketching in pencil first, then finalizing by going back over their sketches with a fine point marker, and then erasing all pencil marks. Scanning the storyboards as a fine point marker contour sketch worked much better than pencil when imported into the design software. I also had the students scan their images at a high resolution. This foresight was going to prove beneficial when creating the animatic. High resolution images will allow the opportunity for video

retargeting. Video retargeting adapts the high resolution images to better suit the target video format. The storyboard images can be moved during a shot to introduce virtual pans, cuts and zooms that ensure cinematic plausibility [4].

When the storyboard images were imported into the design software, we were able to extract the black contour drawing and use as a transparent overlay. I asked the students to fill, shade and shadow the drawings using only grayscale. This created a high contrast image that appeared very sharp. This process could be done in color, but since this was an entry level class, most students do not understand color theory and may produce disastrous color schemes.

When the storyboard frames were completely rendered, each frame was then cropped and saved individually, such as Frame1.jpg, Frame2.jpg, Frame3.jpg, and so on. It was now time to create the animatic.

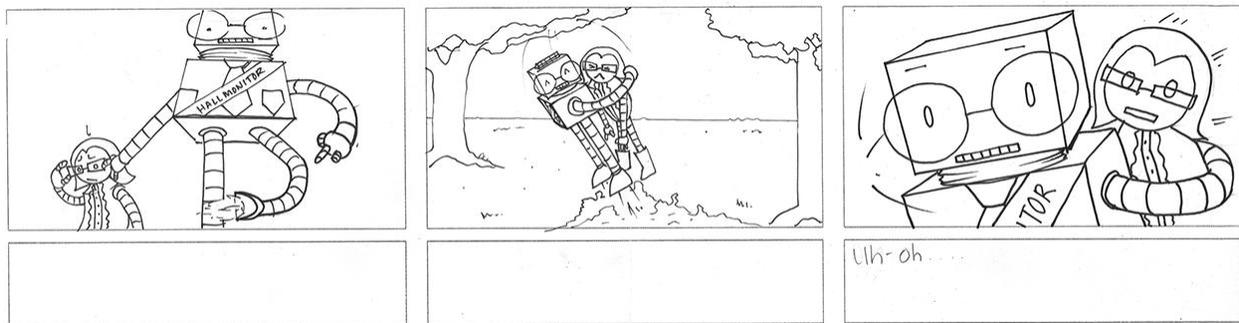

Fig. 3 Storyboard Contour Rendering, Shasta Bailey

Fig. 4 Final Storyboard Rendering, Shasta Bailey

### Storyboard Animatic

Using video editing software, all of the student-rendered frames were imported into the program. We setup a project as HD720 24fps. As mentioned earlier, since the images were formatted at a higher resolution than the video format allowed the students to pan and scale while keeping the entire image in frame. When the storyboard creation was in progress, I showed examples of previous animatics and provided resources for music and sound effects. I asked students to research appropriate music for their animatic. Musical soundtracks are a

crucial element for a sequenced video presentation. Music will create a mood and allow the editor to effectively use the timing of the music to create edit points for their clips. This provides a flow for the video sequence and transitions. Furthermore, music engages the brain and causes audiences to focus more intently [5]. Sound effects were also encouraged as accents for certain actions within their images. Voiceover provided dialog and gave the characters personality. When the video sequence was finalized, it was rendered out as a single video file for presentation.

### *Conclusion*

In earlier classes I worked on storyboard development immediately after my perspective sketch exercises. This resulted in a problem for students. Students struggled to develop a creative idea for a storyline. By implementing a classroom interactive project, "The Robot Project", students were more focused on a character, and stories developed through the creation of that character. Some students decided not use the robot character as their story theme, but through this exercise, students opened doors to a creative story solution. This was evident through student feedback and consistent upward quality of storyboard sequences.

6. Abstract and full paper

The purposes of this study were to investigate the patterns of adaptive learning both on students of different goal orientation in the same context and on students of the same goal orientation in different contexts. This study adopted pretest-posttest experimental design. The participants were four Grade 4 classes selected from an elementary school in Taichung City. The instruments used in this study included classroom goal structure scale, personal goal orientation scale, and patterns of adaptive learning scale. The obtained data were analyzed by one-way MANCOVA. The findings in this study were as follows: (A) Students who pursued mastery goals in mastery context demonstrated adaptive learning behavior pattern, and students who avoided performance goals were associated with maladaptive learning behavior pattern. Students with avoidance- mastery goals and approach- performance goals were inconsistent effects. (B) The students of the same goal orientation in different contexts had non-significant difference in their patterns of adaptive learning. The results of this study indicated that students with mastery goal orientation perceived a strong mastery goal structure in the classroom, their patterns of adaptive learning would become obvious. Furthermore, it was suggested that teachers should encourage students pursuing mastery goals instead of emphasizing the performance goals in the writing classroom.

Keywords: classroom goal structure, goal orientation, patterns of adaptive learning, writing

### **Introduction**

According to the most recent National Assessment of Educational Progress, many children do not learn to write well enough to meet classroom writing demands (Rogers & Graham, 2008). Studies based on American classroom demonstrated that the quality of the child-child and teacher-child interaction is crucial to the achievement of successful reading and writing development for all children, (Guthrie & Alao, 1997). Observing that children with reading and writing difficulties lack supportive environments, Kjellin & Wennerstrom (2006) emphasized the impact of classroom climate.

How do students develop positive learning behavior in school? Two tracks of research have been considered. The first track of research reflects the personal perspective of motivation which focuses on the motivational dynamics of individuals with different types of personal goals (Dweck & Leggett, 1988; Elliot, 1999). The second track of research reflects the contextual perspective which focuses on how different types of contextual goal structures influence achievement-related behavior in educational settings (Ames, 1992; Ames & Archer, 1988).

In the recent research of achievement goal constructs, the goal orientation has been classified into four types of personal goals: (a) approach-mastery goal, (b) avoidance-mastery goal, (c) approach-performance

goal, and (d) avoidance-performance goal (Elliot & McGregor, 2001; Pintrich, 2000a, 2000b, 2000c). Many studies have shown that holding mastery goals is associated with many positive outcomes. However, Goal theory assumes that students' motivation is influenced not only by their individual goal orientation but also by the classroom environment (Ames, 1992). For the most part, studies demonstrate that perceptions of mastery-focused classroom are associated with positive outcomes, whereas perceptions of performance-focused classroom are associated with negative outcomes for students (Gutman, 2006).

A wide range of studies have shown that goal orientations and goal structures are associated with a constellation of motivational and achievement outcomes (Ames & Archer, 1988; Kaplan, Middleton, Urdan & Midgley, 2002; Lau & Nie, 2008; Turner & Patrick, 2004; Young, 1997). In this study, the researcher considered both the classroom goal structure perceived by students and the personal goal orientation that students held, and examined their influences on students' patterns of adaptive learning.

### **Motivation to Learn**

Achievement goal theory describes different purposes that students adopt for engaging in academic tasks (Ames, 1992; Kaplan et al., 2002). Researchers have focused predominantly on two different types of goals: mastery goals and performance goals. Mastery goals are focused on increasing competence, whereas performance goals are focused on demonstrating competence. Each of these goals can be held by individual students (i.e., personal goals) and also be perceived as being emphasized in the classroom (i.e., goal structure) (Kaplan et al., 2002; Turner & Patrick, 2004; Urdan, Ryan, Anderman, & Gheen, 2002).

There is also a distinction between the goals of the individual and goal-related messages that students perceive in the classroom. Thus, both factors influence students' use of various cognitive strategies, adaptive and maladaptive behaviors. One factor which influences students' use of various cognitive strategies, adaptive and maladaptive behaviors is motivation from a personal goal orientation perspective (Ames, 1992). Another factor that may influence cognitive strategy is classroom environment (Ames, 1992; Ames & Archer, 1988; Kaplan et al., 2002; Lyke & Young, 2006).

#### ***Personal Factors: Personal Goal Orientation***

In educational settings, students' achievement goals represent their reasons or purposes for engaging in academic tasks. A lot of empirical evidence has been accumulated in relation to four types of personal goals: (a) approach-mastery goal, in which the students try hard to acquire new knowledge and improve their skills; (b) avoidance-mastery goal, in which the students are very cautious to avoid making mistakes; (c) approach-performance goal, in which the students strive to demonstrate their competence over others; and (d) avoidance-performance goal, in which the students avoid competing with others to avoid showing their incompetency (Pintrich, 2000a, 2000b, 2000c).

Results from many studies have shown that holding mastery goals is associated with many positive outcomes, including choosing challenging tasks, using adaptive learning strategies, seeking help when needed, and holding positive attitudes and emotions in relation to tasks, the classroom environment, and the self (Ames, 1992; Kaplan et al., 2002; Urdan, 1997). Both approach-performance and avoidance-performance goals are associated with anxiety, a disorganized approach to studying, the use of superficial learning strategies, and low exam performance. Approach-performance goals are also linked to efficacy beliefs, effort and persistence while studying, whereas avoidance-performance goals are also associated with avoiding engaging actively in task requirements (Kaplan et al., 2002; Urdan et al., 2002).

### ***Contextual Factors: Classroom Goal Structure***

In school, students perceive information which can emphasize different reasons for engaging in classroom tasks (Ames & Archer, 1988). Several empirical work in goal theory has found that students' personal goals are affected by their perceptions of the classroom goal structure (Roeser, Midgley & Urdan, 1996). Classroom environments communicate purposes and meaning for engaging in academic tasks to students, and students' perceptions of these messages are related to how they participate in class. Similar to the meanings associated with personal goals, a mastery goal structure conveys a perception that students' learning and understanding, in contrast to mere memorization, are valued and that success is accompanied by effort and indicated by personal improvement. A performance goal structure conveys to students that learning is predominantly a means of achieving recognition, and that success is indicated by outperforming others, surpassing normative standards, or looking smart (Ames, 1992).

The classroom with mastery goal structure describes an environment in which the teacher emphasizes that learning, task mastery, and working hard are important. The classroom with performance goal structure describes an environment in which the teacher emphasizes that demonstrating high ability and getting better grades than other students are important. Classrooms that are perceived as having a strong emphasis on mastery goals have been shown to be the most adaptive. They have the lowest rates of students' cheating, self-handicapping, being disruptive, and avoiding seeking help. In contrast, classrooms that are perceived as highly performance-focused tend to have more negative outcomes, including higher rates of students' cheating, disruptive behavior, self-handicapping, and avoiding seeking help (Kaplan et al., 2002; Turner & Patrick, 2004; Urdan et al., 2002).

Most research in goal theory focused on independent effects of different goals. However, few researches considered the effects of combining personal goals with classroom goal structures, not to mention those on writing. In this study, the researcher considered both the classroom goal structure perceived by students and the personal goal orientation that students held, and examined their influences on students' patterns of adaptive learning on writing.

## **Method**

### ***Participants***

The participants in this study were four Grade 4 classes selected from an elementary school in Taichung City. The sample consisted of 28 males (54.90%) and 23 females (45.10%) in mastery goal structure, and consisted of 26 males (54.17%) and 22 females (45.83%) in performance goal structure. The participants were chosen because all students formally started learning writing in Grade 3, so the classroom climate had already been formed in Grade 4.

### ***Measures***

All of the items on the survey were rated on 5-point Likert scales ranging from "Not at all true" to "Very true." The scales were examined by using a sample of 408 Grade 4-6 students from 15 classes in 4 elementary schools in Taichung City. The gender distribution of the sample was 52.21% males and 47.79% females.

*Classroom Goal Structure Scale on Writing.* Two types of classroom goal structures were assessed--classroom mastery and classroom performance goal structures. The measures of classroom mastery and classroom performance goal structures were adapted from the classroom goal structure scale on Writing, which was designed by the researcher. A confirmatory factor analysis was conducted to examine the factor

structure of the constructs. A two-factor structure provided a good fit for the data,  $\chi^2(19, N=396)=63.67$ , RMSEA = .077, GFI = .96, AGFI = .93, NFI = .93, NNFI = .93, CFI = .95. Each scale showed adequate internal consistency ( $\alpha = .84$  for classroom mastery goal structure and  $\alpha = .72$  for classroom performance goal structure).

Classroom-level measures of classroom goal structures were derived from aggregating (i.e., averaging within each classroom) individual students' perceptions of classroom goal structures.

*Personal Goal Orientation Scale on Writing.* Four types of personal goals were measured: approach-mastery, avoidance-mastery, approach-performance, and avoidance-performance goals. The personal approach-mastery goal scale assessed students' desire to learn new thing and to master challenging concepts in writing. The personal avoidance-mastery goal scale assessed students' fear of making mistake and failing to write well. The personal approach-performance goal scale assessed students' desire to demonstrate their superior ability relative to their peers and to obtain favorable judgment from teachers. The personal avoidance-performance goal scale assessed students' desire to hide their weaknesses in writing and to avoid being perceived as incompetent by their teachers and peers. The measures of personal goals were designed by the researcher. A confirmatory factor analysis was conducted to examine the factor structure of the constructs. A four-factor structure provided an adequate fit for the data,  $\chi^2(129, N=399) = 282.04$ , RMSEA = .058, GFI = .92, AGFI = .90, NFI = .90, NNFI = .92, CFI = .93. Each scale showed adequate to high internal consistency ( $\alpha = .80$  for personal approach-mastery goal,  $\alpha = .78$  for personal avoidance-mastery goal,  $\alpha = .84$  for personal approach- performance goal, and  $\alpha = .81$  for personal avoidance-performance goal).

*Patterns of Adaptive Learning Scale on Writing.* Six adaptive learning behavior patterns were assessed in this study. The adaptive learning behavior patterns included self-efficacy, positive emotion, effort and persistence, interest, using strategies, and seeking help in writing classes. Our measure was based on students' self-report of their perceptions in their writing classes. The self-efficacy scale assessed students' confidence in their own writing ability. The positive emotion scale assessed students' positive attitudes and affection in relation to task, the classroom environment, and the self. The effort and persistence scale assessed students' attention, engagement, effort, and persistence. The interest scale assessed students' intrinsic motivation and enjoyment. The measure of using strategies scale was based on students' report of their using adaptive learning strategies. The seeking help scale assessed students' seeking help behavior when needed. The measures of personal adaptive learning behavior patterns were designed by the researcher. A confirmatory factor analysis was conducted to examine the factor structure of the constructs. A six-factor structure provided a good fit for the data,  $\chi^2(382, N=390) = 706.63$ , RMSEA = .047, GFI = .91, AGFI = .90, NFI = .91, NNFI = .95, CFI = .96. Each scale showed adequate to high internal consistency ( $\alpha = .87$  for self-efficacy,  $\alpha = .88$  for positive emotion,  $\alpha = .90$  for effort and persistency,  $\alpha = .88$  for interest,  $\alpha = .82$  for using strategies,  $\alpha = .85$  for seeking help).

### **Procedure**

The "Classroom Goal Structure Scale on Writing" was administered to all Grade 4 classes in the third week of the first semester. Then four classes were chosen: two with the highest classroom mastery goal structure class average and another two with the highest classroom performance goal structure class average. After making sure that the four classes were the target through observation, "Personal Goal Orientation Scale on Writing" and "Patterns of Adaptive Learning Scale on Writing" were administered to these four classes.

Finally, at the end of the semester, “Patterns of Adaptive Learning Scale on Writing” was given again as the posttest.

## Results

### *Classroom Level: Mastery Goal Structure*

Means and deviations for the patterns of adaptive learning scale are reported in Table 1. The first omnibus test for the overall adaptive learning behavior patterns by Multivariate ANCOVA yielded statistically significant result ( $\lambda=.096, p=.000, \eta^2=.542$ ). In Table 2, statistically significant differences by univariate ANCOVA were found for the six adaptive learning behavior patterns on students of different goal orientation in the mastery classroom climate. Individual ANCOVAs revealed that four type students of personal goals differed on the following adaptive learning behavior pattern measures.

For self-efficacy,  $F_{(3,41)}=6.61, p=.001, \eta^2=.326$ , approach-mastery, avoidance-mastery, and approach-performance students perceiving more self-efficacy than avoidance-performance students.

For positive emotion,  $F_{(3,41)}=7.80, p=.000, \eta^2=.363$ , approach-mastery students perceived more positive emotion than avoidance-mastery and avoidance-performance students; avoidance-mastery and approach-performance students perceived more positive emotion than avoidance-performance students.

For effort and persistence,  $F_{(3,41)}=7.71, p=.000, \eta^2=.361$ , approach-mastery, avoidance-mastery, and approach-performance students revealing more effort and persistence than avoidance-performance students.

For interest,  $F_{(3,41)}=8.22, p=.000, \eta^2=.363$ , approach-mastery students revealing more interest than avoidance-mastery, approach-performance, and avoidance-performance students; avoidance-mastery and approach-performance students revealing more interest than avoidance-performance students.

For using strategies,  $F_{(3,41)}=9.62, p=.000, \eta^2=.413$ , approach-mastery students revealing more using strategy behaviors than approach-performance, and avoidance-performance students; avoidance-mastery and approach-performance students revealing more using strategy behaviors than avoidance-performance students.

For seeking help,  $F_{(3,41)}=58.56, p=.000, \eta^2=.811$ , approach-mastery students revealing more seeking help behaviors than avoidance-mastery, approach-performance, and avoidance-performance students; avoidance-mastery students revealing more seeking help behaviors than approach-performance and avoidance-performance students.

### Classroom Level: Performance Goal Structure

Means and deviations for the Patterns of Adaptive learning Scale are reported in Table 3. The overall adaptive learning behavior patterns by Multivariate ANCOVA were also found statistically significant effect indicating a difference among four types of personal goals,  $\lambda = .089$ ,  $p = .000$ ,  $\eta^2 = .554$ . In Table 4, statistically significant differences by univariate ANCOVA were found for the six adaptive learning behavior patterns on students of different goal orientation in the performance classroom climate. Individual ANCOVAs revealed that four type students of personal goals differed on the following adaptive learning behavior pattern measures.

For using strategies,  $F_{(3,37)} = 6.81$ ,  $p = .001$ ,  $\eta^2 = .356$ , approach-mastery students revealing more using

strategy behaviors than avoidance-mastery, approach-performance, and avoidance-performance students.

For seeking help,  $F_{(3,37)} = 97.26, p = .000, \eta^2 = .887$ , approach-mastery goal students revealing more seeking help behaviors than avoidance-mastery, approach-performance, and avoidance-performance students. Avoidance-mastery students revealing more seeking help behaviors than approach-performance and avoidance-performance students. And approach-performance students revealing more seeking help behaviors than avoidance-performance students. The self-efficacy, positive emotion, effort and persistence, and interest effects among four types of personal goals were not statistically significant ( $F_{(3,37)} = 1.35, p = .275; F_{(3,37)} = 1.57, p = .214; F_{(3,37)} = 2.61, p = .066; F_{(3,37)} = 1.97, p = .136$ ).

### Discussion

Establishing linkages between the classroom learning environment, personal goals, and student motivational outcomes has been very important, determining how to create these goals in the classroom is the next step, though not an easy one.

How students develop positive learning behaviors has been investigated following two tracks. The most common one has been to explain students' behavior based on motivational dynamics of individuals. More recent researches overemphasized the effects of classroom learning environments. However, this study showed that the four types of students with personal goals had significantly different adaptive learning behaviors in mastery goal structure. The students with approach-mastery goals outperformed the other three types of students in self-efficacy, positive emotion, effort and persistence, interest, using strategies, and seeking help under mastery goal structure. Nevertheless, under performance goal structure, they outperformed the other three types of students only in using strategies and seeking help. Generally speaking, students with approach-mastery goal demonstrated the best patterns of adaptive learning, especially under mastery-goal structure. On the other hand, students with avoidance-performance goals revealed the worse patterns of adaptive learning. Students with avoidance- mastery goals and approach- performance goals were inconsistent effects. This study implies that to foster the mastery goal structure or increase personal mastery goal orientation will associate to the adaptive learning behavior patterns. These findings are by and large consistent with Lau and Mie (2008), and Kaplan et al. (2002).

Given that research indicates that students with approach-mastery goals and perceptions of a classroom mastery goal structure are related to more adaptive learning behaviors, these results may not be surprising. What is striking is that students of the same goal orientation in different contexts had non-significant difference in their patterns of adaptive learning. In other words, their patterns of adaptive learning under classroom with mastery goal structure were not significantly better than classroom with performance goal structure. It is worth noting that the personal goal orientation appears to be more influential than classroom environments on students' patterns of adaptive learning. Ames (1992) emphasized that children in the same classroom are treated differently and therefore have different experiences. Students have different classroom experiences because they bring different prior experiences with them (Ames & Archer, 1998). It is necessary to attend to how that student perceives and gives meaning to classroom experiences. It cannot be studied through behavioral checklists or observations. By combining qualitative and quantitative method, it was

possible not only to determine that the writing classroom climates and goal structures in each class were different, but also to identify some of the possible explanations for why they were different. The qualitative data gave depth and meaning to the “numbers”. It is suggested that future studies may focus on triangulation of data from students, teachers, or related documents.

The present study has a number of limitations. First, the researcher used a self-report measure of classroom goal structure, personal goal orientation and patterns of adaptive learning. Whereas this measure has been used successfully in other studies, it is still not a direct measure. The use of self-report measure of latent variables such as classroom goal structure, personal goal orientation and patterns of adaptive learning pose problems that researchers must consider. Thus future studies should be designed to link specific individual process to these latent variables in order to truly understand interindividual differences. In addition, the researcher was only able to assess classroom goal structure and personal goal orientation at one point, and in an elementary school. Assessing these latent variables at additional points in time and at additional sites would have allowed us to develop more precise trajectories of changes.

In summary, results of the present study indicate that students with approach-mastery goals in the mastery goal structure revealed more adaptive learning behaviors, whereas students with avoidance-performance goals revealed maladaptive learning behaviors. So teachers may encourage students pursuing mastery goals by stressing the importance of learning writing skills and its relevance to the formation of mastery goal structure in a Writing Classroom.

#### Acknowledgements

The study was conducted as part of the project “Classrooms: Goals, structures, and students’ patterns of adaptive learning on writing“, and given financial support by the National Science Council.

### **Introduction and Objectives:**

This program addresses the creative diversity inherent in learning by using sports as the context through which scientific principles can be explored. Through the vehicle of sports not only are students learning the underlying principles of science embedded in the mechanics of performing a sport; but also, they are learning the scientific principles in an atmosphere that embraces the psycho-social-creative-emotional connection to learning. For instance, everyday students learn how to ride a bike, throw a ball, and/or jump rope. They learn these activities in an environment that is non-competitive and non-threatening academically. What they are not aware of is the scientific and mathematics principles laden in performing these activities. In the classroom students learn these scientific and mathematical principles in a context that is foreign to their everyday experiences. They learn about the trajectory of a golf ball without connecting this principle with the actual practice of hitting a golf ball.

What is unique about the concept of this program is that the academic and the everyday experiences of students can be bridged through the creative process of using sports as a mechanism to learning science and mathematics. By using sports as a creative vehicle for learning scientific and mathematical principles, the program is responding to the call for creating innovative and creative programs that provide access to the latest strategies in promoting science literacy. The following objective is pursued: To increase science and mathematics achievement of middle school students through the creative use of sports.

### **Theoretical Perspectives on Creativity and Innovation**

A current view of how individuals receive and process information proposes several independent forms of information processing, including logical-mathematics, linguistic, musical, spatial, creative, bodily kinesthetic, interpersonal and intra-personal (Gardner, 1993). Because individuals may differ in their specific profile of “intelligence’s,” education needs to be diverse in its offerings, both in terms of content and format of instruction.

The previous decade has witnessed many voices calling for reform in the teaching of science and mathematics. The federal government identified six National Education Goals that boasted that the United States would be first in the world in science and mathematics by the year 2000 (Culotta, 1990; Vinovski, 1996); and it is presently launching a series of exams in reading and mathematics to improve student achievement

and increase the status of American students in an ever-increasing global marketplace (Baker, 1997). Also, NO CHILD LEFT BEHIND legislation supports the mission of working to improve elementary and secondary math and science achievement (2001). Furthermore, policymakers, scientists and mathematicians have focused on change to develop the scientific and mathematical knowledge that will produce a healthy economy and maintain a meaningful democracy (Tate, 1994, Barlow, 1999). Most recently, under the current administration Science, Technology, Engineering, and Mathematics (STEM), is a focus of priority in funding and educational efforts (A Report from the Committee on STEM Education National Science and Technology Council, 2013; Gonzalez and Kuenzi, 2012). Reform, however, does not over overnight. Systemic reform must remain on the national agenda if we as a nation hope to attain the goals posed by the federal government and such professional organizations as the National Council of Teachers of Mathematics and the American Association for the Advancement of Science.

While the standards provide a map for improving the science and mathematics education of all students; the barriers urban schools face and the communities to which they belong are lacking the necessary resources to provide adequate science and mathematics programs. However, when examining the conditions of many urban schools and the communities to which they belong the reform necessary to reach such improved student achievement seems daunting (Barlow, 1999; Kozol, 2000 Darling-Hammond, 2010). The goal of lifelong learning in science, mathematics and technology is difficult to realize when many urban students have little access to the Internet and fewer textbooks, manipulatives and science equipment than suburban students. In particular, minority students (i.e., African-Americans, Latinos and women) and students from low socioeconomic backgrounds confront great challenges in choosing and performing well in science, mathematics and technology related fields (Hammrich, 1997; Hammrich, 1998; Hammrich et.al., 2000; Hammrich, 2002; Hammrich, 2008; Hanson, 1996; Oakes, 1990; Scheurich, et.al. 2010). Innovative and creative programs must provide access to the newest and most advanced tools in science, mathematics and technology. Furthermore, awareness of cultural differences, including learning style, need to be an integral part of the format, organization and content of an effective program. A current view of how individuals receive and process information proposes several (rather than just one) independent forms of information processing, including logical-mathematics, linguistic, musical, spatial, bodily kinesthetic, interpersonal and intra-personal (Gardner, 1993). Because individuals may differ in their specific profile of “intelligence’s,” education needs to be diverse in its offerings, both in terms of content and format of instruction, in order to be effective (Nieto, 1996; Bryk et. al. 2010). Sports are a means by which educators can address the forms of information processing mentioned above in both content and format.

This program supports and furthers this vision by providing mathematical and scientific concepts through the vehicle of sports. In doing so, the program is reaching students on multiple levels of intelligence’s and strengthening the education of students in science and mathematics by creating an unique and diverse atmosphere. The American Association of University Women (AAUW, 1998) publication “Gender Gap: Where Schools Still Fail Our Children” posits a variety of other positive affects that sports can have on children. They suggest that “sports participation in general is linked not just to

higher academic achievement but also to better physical and mental health and greater leadership capacity...Like classroom interactions, sports can either challenge or reinforce stereotypes about girls' and boys' roles" (p.74) and "...Unique capacity of school sports to prompt students and adults to question their own assumptions about gender (p.77).

Girls and minority youth in the late elementary through middle school years tend to struggle with self-esteem, physical fitness, skill development, goal setting, and problem solving (AAUW, 1998). Sports are one ideal mechanism to reach girls and minority youth during these uncertain years in which they explore their self-identities. Research links physical activity for girls to higher self-esteem, positive body image, and lifelong health (AAUW, 1998) and "...involvement in activities valued by school (athletics and the arts) leads to higher self-esteem, positive attitudes toward school, and less self-destructive behavior" (AAUW, 1998, p. 77). By using sports as a vehicle for learning scientific principles, the program is responding to the national call for creating innovative programs that provide access to the latest strategies in promoting science literacy.

This program seeks to address equity in science by providing students exposure to science through sports. The program is designed for sixth, seventh, and eighth grade girls attending urban middle schools and furthers the vision of its predecessor programs (Hammrich, 1997; Hammrich, 1998; Hammrich et.al., 2000; Hammrich, 2002; Hammrich, 2008). The program's vision is to increase students' positive attitudes, achievement, and exposure to science. What is unique is that the program teaches science concepts within the contexts of playing sports. By doing so, the program is successfully reaching students in a variety of ways and strengthening the education of students in science and mathematics by creating a unique and diverse pedagogical atmosphere.

## **Sports Program**

The Sports Program targets 6<sup>th</sup> -8<sup>th</sup> grade and focuses on the use of sports as a vehicle for science exploration. The program provides hand-on, inquiry based sports science activities that allow students to develop a repertoire of experiences, which can then be used as the foundation for learning scientific concepts. There are a total of 8 sport science modules that focus on science and mathematics concepts in life, earth, and physical sciences. Each module lasts for 5 weeks. The sports are golf, tennis, fencing, basketball, track and field, volleyball, health related fitness, and soccer. Program components include an in school program, after school program, teacher training, family education and summer camp.

## **Methods and Results**

The middle school students took individually administered pre and posttests covering skills and concepts inherent to the science and mathematics concepts they were exposed to in the sport. The science faculty on staff developed the instruments. The students' responses were open-ended allowing them to express their creative understanding of the content. A sample question includes the following examples: What does the word velocity mean? What is speed? What is a projectile? What is a trajectory? Each question was scored as correct or incorrect. The students' responses were open-ended allowing the students to express their understanding of the content. There were four questions for each activity. In reporting the scores for each activity the four

questions were grouped into either correct or incorrect for the entire concept. Pretests were administered at the beginning of the day's activity, and posttests were administered at the end of the day's activity. The pretest and posttests were identical instruments.

Gain scores were analyzed using a simple *t* test. Based on raw scores, the percentage of correct responses was used as the measure. The data consistently shows statistically significant mean increases from pre to posttest ranging from 27 to 60 percentage points ( $p < .001$  in each case). Looking at these gains in a different way, in every case, the lower quartile on the posttest exceeded the upper quartile on the pretest. All of the results from the after school and Saturday academy are summarized in Table 1.

Table 1: Pre- and Posttest Mean Scores and Standard Deviations

Sport Science	n	Pre-test: m	SD	Posttest: m	SD	Gain
Tennis-Geometry	52	29	22.1	84	17.3	55**
Fencing-Forces	40	38	21.4	86	14.2	48**
Basketball-Motion	32	27	16.5	77	23.3	50**
Golf-Mechanics	50	34	19.4	93	8.6	59**
Volleyball-Aerodynamics	48	28	19.4	77	22.5	49**
Soccer-Mechanical Engineering	35	28	19	88	12.2	60**
Track (field)-Aerodynamics	33	36	22.3	90	12.5	54**
Track(running)-Biomechanics	42	33	15.5	60	18.7	28**

*Notes.* Scores are raw scores, reported as a percent of correct response.

\*\*Denotes statistically significant gains ( $p > .001$ )

Additionally, we point out that of the sixth graders who completed the 6<sup>th</sup> grade program 67% returned as 7<sup>th</sup> graders. Furthermore, 54% of all students who completed the 7<sup>th</sup> grade program returned to participate as 8<sup>th</sup> graders. We believe that these retention rates speak volumes about our students' attitudes toward the program. Also with respect to students grades at the beginning of the year compared to the end of the year, *t*-test results showed that the students achievement scores (grades) in both mathematics and science increased significantly ( $p < .05$ ) during the year pre to post.

## Discussion

The only quantitative analysis of the *SISS* program we have been able to perform thus far are the analyses of simple gain scores of participants presented in the previous section along with their classroom grades in science and mathematics prior to and after participating in the program. With no potential comparison available as to what gains would be expected in a traditional approach to learning these concepts, we can draw no

strong conclusions regarding the effects of the program at this point. Thus, while these results are suggestive of a positive effect of the program, nevertheless they must be regarded as preliminary and not generalizable. However, we have ample anecdotal evidence that the program has had a positive effect on the lives of many of the students. The journals kept by the middle school students are one source of such evidence. In reflecting about the program, the features cited most frequently by these students is that they are having fun (“this is fun”), enjoying the program (“I really like participating in this program”), and learning science and mathematics (“I am learning about angles, measurement, and reflection”). Some of the students were able to see connections among the things they were learning in the program and what they are studying in school (“Throwing a ball is like learning about trajectory in school”). Another positive benefit of the program is that of the parents surveyed prior to and after their child’s participating in the program, parents increased their awareness of the connection of sport to science and mathematics by 60 percent (33% awareness at the beginning to 83% at the end of the year).

### **Implications**

Based on the significant increase in students understanding of science concepts through sports, it seems that sports provide a creative way to reach students cognitive understanding. While programs that address the equitable achievement for all students in science and mathematics are not new, using sports as a vehicle through which science and mathematics interest and achievement can be attained is unique. This approach bridges the application of concepts embedded in science and mathematics to the mechanics of performing a sport. Sports provide a unique and innovative approach to reaching students in a friendly atmosphere while learning concepts usually too abstract for them to grasp due to their limited experience and exposure.

Another unique feature of this project is the focus on middle schools science and mathematics. It responds to a dearth of attention to this level in public schools and fills a gap in the relevant literature. Middle school students often experience a drop in grades due to lack of organizational skills and difficulty adjusting to the requirements of several teachers. Learning science and mathematics principles through participating in sports will help students through this transition phase and will reduce the chances of “falling through the cracks”.

In conclusion, one project or one group of committed science and mathematics educators alone cannot tear down all of the barriers for students in the areas of science, mathematics, and technology. One set of dedicated teachers, mentors, or undergraduates by themselves cannot change the often negative course of employment or postsecondary education for future scientists or mathematicians previously described in the professional literature. But this project clearly is a start. On-going, pro-active involvement by the students themselves can both teach important science and mathematics skills, while simultaneously expanding new horizons through early transition awareness. What became evident in the program implementation was that (a) parental behavioral expectations for their children have important implications for their interest and achievement in science and mathematics; (b) intervention programs that are specifically designed to include role models have a strong and positive impact on students’ achievement in science and mathematics and assist to help identify with science and

mathematics as possible areas for study or employment; (c) program interventions evolve in stages of development, growth, and change. In order to promote the sustained success of students in science and mathematics, there must be a conscious effort to provide support for collaboration among schools, parents, and the community as ideas for useful strategies are developed, implemented, and evaluated.

What we have learned over the course of implementation of the program is that any such intervention program would be strengthened if designed so that: (a) students come to see the intervention program as an extension of their formal education; (b) older students serve as mentors and role models for younger students; (c) students are presented means for academic success; (d) students are presented with avenues towards possible careers; and (e) students are expected to succeed academically. Using sports to teach science is one possible approach to academic enhancement for students living in the urban environment. The results indicate that the program is serving the population of students in a positive manner.

# **Detection of Text Coherence Breaks in EFL Reading: A Pilot Study of Eye-Tracking**

Yuji USHIRO

*University of Tsukuba*

Shingo NAHATAME, Yukino KIMURA, Yusuke HASEGAWA, and Akira HAMADA

*Graduate School, University of Tsukuba/The Japan Society for the Promotion of Science*

## **Abstract**

This presentation reports an eye-tracking study that examined the process by which Japanese EFL learners detect a coherence break while reading a text written in English. A Japanese university student's eye movements were recorded while she read an experimental passage that included a coherence break. A qualitative comparison of eye movements between when she did and did not detect the coherence break demonstrated that an EFL learner's behavior in reading differed according to whether she noticed the textual inconsistency. The results showed that (a) when the EFL reader did not detect the coherence break, she simply read the text from beginning to end, with fewer regressions, and (b) when she succeeded in detecting the coherence break, her eyes moved from the end of the text to the earlier context to resolve the broken text comprehension. This suggests that eye-tracking measurements can be used to capture different reading processes in EFL learners according to the detection of text coherence breaks.

Key words: EFL reading, cognitive process, coherence breaks, eye-tracking

## **1. Introduction**

Comprehending a text involves not only identifying individual words and analyzing syntactic structures, but also monitoring the coherence of what has already been read and that currently being read, to construct a coherent mental representation (O'Brien, Rizzella, Albrecht, & Halleran, 1998). However, Ushiro (2010) demonstrated that Japanese-speaking readers of English as a foreign language (EFL) have difficulty maintaining the coherence of their own text comprehension when they encounter information that is inconsistent with their current understanding of the text (i.e., when a text coherence break occurs).

In this pilot study, we examined whether different reading processes in EFL learners during the detection of coherence breaks can be captured using eye-tracking measurements to investigate how readers solve problems that arise while trying to comprehend a text. Eye-tracking allows us to record and observe visualized data of human eye movements (Rayner, 1998). The latest research in second-language (L2) acquisition is increasingly utilizing eye-tracking measures to investigate lower-level language processing in L2 learners, such as lexical processing and syntactic parsing (see Roberts & Siyanova, 2013; Winke, Godfroid, & Gass, 2013); however, there is little research on how L2 learners maintain textual coherence in higher-level language processing. Thus, the current pilot study used eye-tracking measurements to examine Japanese EFL learners' higher-level reading processing, as in similar research on native English speakers (e.g., Camblin, Gordon, & Swabb, 2007; Rayner, 1998). Specifically, we qualitatively analyzed the eye movements obtained from a Japanese university student while she was reading an experimental passage that included a coherence break.

## **2. Method**

### **2.1 Participants**

Initially, 10 Japanese EFL graduate students volunteered to participate in the pilot study. The participants were first- or second-year English education majors who had studied EFL since age 13 in formal education in Japan. All participants had corrected-to-normal vision. However, we focused on a single participant's reading behavior in this article because she showed the most typical process of both successful and unsuccessful detection of coherence breaks.

### **2.2 Apparatus**

Eye movements were recorded with the Mobile EyeMark Recorder System (EMR-9), a contactless eye tracker manufactured by NAC Image Technology. Passages were presented in 14-pt Times New Roman font on a 21.5-in iiyama computer monitor at a distance of 75 cm from the participant's eyes.

### **2.3 Materials and Procedure**

The experimental session included the following four phases: (a) the first reading, (b) oral interview about the first reading, (c) the second reading, and (d) oral interview about the second reading. The participant read two short passages (a practice set and an experimental set) in English while an eye-tracker recorded her eye movements (Figure

1). After reading these passages, the participant was interviewed and the coherence break was explained to her by the experimenters. Afterward, she read the experimental passage again. The experimental session lasted approximately 30 min.

*Figure 1.* The experimental setting.

The experimental passage was adapted from the study by O'Brien et al. (1998, p. 1210) with minor modifications. Specifically, very low-frequency words were replaced by easier equivalents, and some sentences were eliminated for the eye-tracking measurements. The main passage used in this study is shown in Table 1.

Table 1

*An Experimental Passage*

---

Bill had always enjoyed walking in the early morning. This morning was no exception. During his walks, he always stopped to talk with some of his neighbors. Bill had just celebrated his eighty-first birthday. He did not feel as strong as he did twenty years ago. In fact, Bill had begun using a long thin stick to help him during his morning walks. He could not walk around the neighborhood without taking a lot of rests. Today, Bill stopped to talk with Mrs. Jones. They were talking about how hot it had been. As Bill was talking to Mrs. Jones, he saw a young boy lying in the street. He was seriously hurt and crying. Bill quickly ran over and picked the boy up. Bill carried the boy to somewhere safe. While Bill helped the boy, Mrs. Jones ran into her house to call an ambulance. Bill kept the boy calm and waited until help arrived. (156words)

---

In this passage, readers are required to update their text comprehension during the time course of reading because the content of the prior context (e.g., *He could not walk around the neighborhood without taking a lot of rests.*) is not coherent with the situation described in the sentence *Bill quickly ran over and picked the boy up.*

After reading this passage, the participant performed a coherence-break detection test. She was orally asked whether she had noticed anything strange in the passage (i.e., coherence-break detection), and what made the passage strange. As she had not recognized the inconsistency in her text comprehension, this first reading was regarded as an unsuccessful pattern. We informed her that there was a coherence break in the passage, and then asked her to read the same passage again. When the coherence-break detection test was conducted again after the reading, she stated that the passage did include a coherence break and appropriately identified the sentences that caused the lack of coherence in the passage; her second reading was regarded as a successful detection of the coherence break.

### **3. Results and Discussion**

As noted above, the participant's answers to the coherence-break detection question indicated that she had not noticed the coherence break in the passage at all during the first reading; her answers after the second reading showed that she did notice the coherence break that time, and was able to identify the cause of the incoherence.

We qualitatively compared the participant's eye-tracking data obtained during the first and second reading (Figures 2 and 3) to investigate the differences in processes between the successful and unsuccessful detection of a coherence break. The most remarkable difference appeared in the participant's regressive eye movements. Specifically, the data from the first reading (in which the participant did not detect the coherence break) showed that the participant read the text from the top to the end with few regressions. On the other hand, in the second reading, the participant's eyes clearly moved from the end of the text to the earlier context (e.g., *He could not walk around the neighborhood without taking a lot of rests*). In addition, the participant gazed at this context longer during the second reading than the first reading.

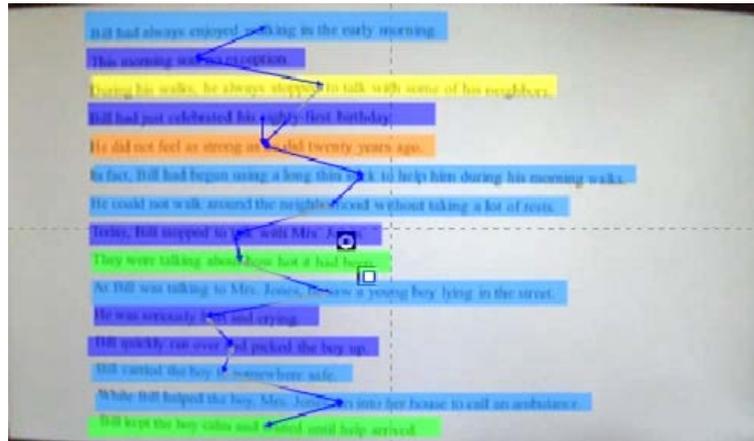

Figure 2. Eye-tracking data during the first reading.

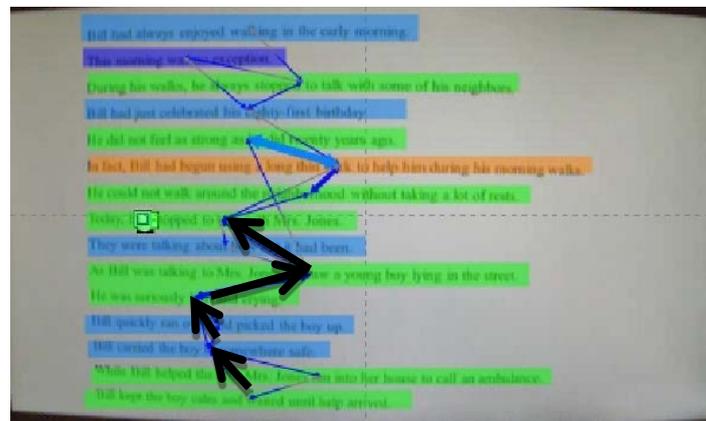

Figure 3. Eye-tracking data during the second reading.

In summary, the oral interview data showed that the participant detected the text-coherence break successfully only in the second reading, and the eye-tracking data showed that she carefully reread the earlier context of the passage during the second reading. This suggests that she attempted to resolve the detected coherence break by reanalyzing the prior context. Therefore, the present study confirmed that eye-tracking data during reading can reflect EFL learners' successful and unsuccessful reading processes in terms of detecting a text coherence break.

Interactive Whiteboard Use at Secondary Schools in South Australia: What teachers have to say?

**Name of the Author:** Amrit Pal Kaur

**Affiliation:** School of Education, The University of Adelaide

**Address:** Level 8, 10 Pulteney Street, The University of Adelaide, SA, Australia, 5005

**Email address:** amrit.kaur@adelaide.edu.au

**Abstract**

Secondary schools in South Australia are investing heavily in Interactive Whiteboards (IWBs) to equip the classrooms with this technology, but this decision is predominantly based on the findings of the IWB research studies done in other countries and that is also mainly at the primary school level. There is a serious lack of research studies done to explore the IWB use at the secondary school level in South Australian context. This paper reports the findings of a qualitative study which included 16 secondary school teachers from South Australia who use IWB in their teaching. The study which was the part of a bigger research investigation was conducted with the purpose to explore the factors/reasons behind the decision of South Australian secondary school teachers from different subject-areas to start using IWB technology, the barriers/constraints faced by them in using this technology in their teaching, their classroom interactions using IWB and their perspectives about the impact of IWB on the learning of the students. The findings provided in-depth understanding of the point of view of teachers regarding the use of IWB at secondary school level and its impact on the student learning along with highlighting some practical examples of the possible ways of using IWB in different subject-areas. Various factors were identified which can be used as guidelines by the schools to encourage the use of IWB and to ensure the successful adoption and integration of this technology into the secondary school level of education.

Grade 5 Students Viewing a Digital Learning Object to Understand Particle Models of  
Solids, Liquids, and Gases

Science Education

Poster Session: Submission ID 563

This presentation explores Grade 5 students' understanding of the particle model of solids, liquids, and gases after they viewed a digital learning object created by the authors. Data includes students' responses to on-line questions and their subsequent efforts to self-generate and explain their own particle models. Results have implications for the design of digital learning objects and support needed by students to decode multiple models.

## **Grade 5 Students Viewing a Digital Learning Object to Understand Particle Models of Solids, Liquids, and Gases**

### **Abstract**

The aim of this study was to explore 40 (22 male; 18 female) age 10-11 students' ability to: a) distinguish among particle models of solids, liquids, and gases embedded in a digital learning object (DLO), and b) self-generate and explain their own particle models for solids, liquids, and gases. Students worked in pairs to view a digital learning object drawn from a series of six DLOs created by the authors that featured text, dynamic models, and virtual characters intended to draw attention to the movement, spacing, and holding of a variety of particle models of solids, liquids, and gases. Data consisted of the student-pair responses to on-line questions, and after viewing the DLO, their individual work to complete a worksheet. Responses to on-line questions showed that nearly every student-pair identified particle movement, holding, and spacing as important to distinguishing among models of solids, liquids, and gases. Individual self-generated models drawn on the worksheet tended to show accurate differences among particle models of solids, liquids, and gases. The students' accompanying explanations of their self-generated models, however, showed that many students only focused on a subset of salient features (e.g., spacing only) needed to distinguish among states of matter. Results have implications for digital learning object design and the kinds of support needed by students to decode the salient features of complex dynamic particle models.

Grade 5 Students Viewing a Digital Learning Object to Understand the Behavior of  
Water Particles in the Solid State

Science Education

Poster Session: Submission ID 564

This presentation explores Grade 5 students' ability to view a digital learning object created by the authors and understand the significance of the polarity of water molecules to the density of water in a solid state. Data includes students' responses to on-line questions and their self-generated particle models of water. Results have implications for the design of digital learning objects and support needed by students to understand how solid water differs from other solid substances.

## **Grade 5 Students Viewing a Digital Learning Object to Understand the Behavior of Water Particles in the Solid State**

### **Abstract**

The aim of this study was to explore 38 (22 male; 16 female) age 10-11 students' ability to view a digital learning object (DLO) and: a) notice that the spacing between model water particles in a solid state differs from other solid substances, b) understand the significance of the polarity of water molecules to the density of solid water, and c) self-generate and explain their own particle models for liquid and solid water. Students worked in pairs to view a digital learning object drawn from a series of six DLOs created by the authors that featured text, dynamic models, and virtual characters intended to draw attention to how the spacing of solid water differs from other substances in the solid state and how this can be explained by considering the polar nature of water molecules. Data consisted of the student-pair responses to on-line questions, and after viewing the DLO, their individual work to complete a worksheet. Responses to on-line questions showed that students were challenged to distinguish between how water in the solid state differed from other substances in the solid state and had difficulty noticing the spaces among water molecules in the solid state. Students, however, were confident about how the negative and positive ends of a water molecule interacted with other water molecules. Individual self-generated models of particles comprising solid and liquid water showed that previous lessons about differences between particle models of other solid and liquid substances were robust and used to depict water particles. Results have implications for digital learning object design and the kinds of support needed by students to decode the salient features of complex dynamic particle models of solid water that differ from their existing ideas about particles comprising other solid substances.

## **Abstract**

Research has indicated that the majority of parents and teachers would like to see health and physical education programs as mandatory components of the regular school day (KidsHealth, 2013; Physical and Health Education Canada, 2013). However, despite considerable reform occurring in schools and the world-wide understanding of the problems of obesity facing children, many students are still provided limited exposure to health and physical education programs. For example, the Centers for Disease Control and Prevention (2010) reports that nearly half of high school students in the United States have no physical education class in an average week. One might conclude that despite the health issues facing children and youth, there is a clear lack of support or promotion of health and physical education curricula and lesson delivery. Physical education programs have begun to shift from being dominated by traditional, competitive team sports to individual fitness and “lifetime” activities (Adams, 2013). Health programs are no longer a collection of ideas presented in individual lessons but are recommended to be part of a coordinated effort to promote comprehensive health and wellness programming (Berg, Hickson, & Fishburne, 2010). Such a shift in thought has challenges though. Different approaches to programs are often associated with an increase in the costs of funding for new and different instructional resources and/or equipment and creative scheduling may be required to ensure lesson frequency or access to off-site programming (Adams, 2013). As instructional leaders, school principals are ideally placed to ensure that teachers are provided with the resources for the delivery of effective health (Berg, Hickson, & Fishburne, 2010) and physical education programs (Lambert, 2000). Through such things as: staff development; opportunities for collegial and professional dialogue; critique of program planning and lesson delivery to ensure quality instruction and assessment practices; and the provision of resources to support activity and learning, school principals can truly become leaders and advocates of health and physical education programming.

## **Health and Physical Education: The Need for School Leadership**

Research has indicated that the majority of parents and teachers would like to see health and physical education programs as mandatory components of the regular school day (KidsHealth, 2013; Physical and Health Education Canada, 2013). This is not a new issue, as Marzano and Kendall (1998) declared over a decade ago that when adults were asked what was important for school graduates to be taught prior to graduation, they responded with the answer of “health.” However, it is not unusual whenever large-scale test results are released, that there is an immediate demand from a variety of sources for schools and teachers to direct programming and educational experiences for students on activities that re-focus on the basic elements of curriculum and reduce time spent on non-essential activities.

Such a direction, if followed, would have a tremendously negative impact on subject areas such as health and physical education, the very programs that parents and teachers strongly believe are important for children and youth. It could also be argued that the potential impact on the health and wellness of children and youth would be catastrophic. For example, the declining health and wellness of children and youth in recent years has resulted in researchers declaring that, for the very first time in history, the present generation of children face a shorter and a lower quality of life than their parents’ generation. For those who happen to be parents, this is a very sad legacy to leave to children.

However, instead of blindly accepting this outcome, there may well be some things we can do to offset this pattern and cause a different outcome for our children and youth. Schools and

teachers are the “front line” environments and people that can offer hope for change. This paper addresses some ideas for consideration.

### **Marginalization of Health and Physical Education Programming**

Lounsbery et al. (2011) contended that physical education is a subject area that is often marginalized in our school systems. This is often displayed through a lack of curriculum time allocation and inadequate resourcing. Therefore, physical education programs are challenged in contributing to public health goals. For example, the Centers for Disease Control and Prevention (2010) reported that nearly half of high school students in the United States have no physical education class in an average school week. One might conclude that despite the health issues facing children and youth and the world-wide understanding of the problems of obesity, there are many students who are still provided with a limited exposure to health and physical education programming, and there continues to be a clear lack of support or promotion of health and physical education curricula and lesson delivery.

However, Berg, Hickson, and Fishburne (2010) suggested that the school environment is particularly well-suited to promote health and wellness with students. Schools are vital locations for such programming as students spend a significant portion of their lives there. Therefore, Berg et al. further declare that school principals have the responsibility to ensure that health programming is well-planned, based on student needs, and is current with emerging concepts and issues.

## **The Role of School Leadership**

Leidl (2007) suggested that the strength of a learning community is determined by the strength displayed by the school leadership personnel and that the responsibility for curriculum implementation falls under the direct responsibility of school principals. As principals are often referred to as “instructional leaders” in their school environments, Lambert (2000) contended that they must attend to the development of the teachers in their schools and evaluate and support the teaching effectiveness of those teachers. Therefore, school leadership personnel are vital elements for any possible change to occur at the school level. Hence, they are necessary change agents. Without the support of school leadership personnel, subject areas such as health and physical education are most likely to continue to be marginalized to a point where their very existence in schools will no longer be debateable, as they will have already disappeared.

## **School Leadership in Health and Physical Education**

Lounsbery et al. (2011) suggested that the support of school leadership personnel is most important to physical education programming and, wherever possible, school principals or assistant principals should be encouraged to champion the program at all times. This is a critical issue as there continues to be a decentralization of power in the world of education that has resulted in school principals being key decision makers in programs such as health and physical education being cut, maintained, or prioritized (Stevens & Carpenter, 1998). Bisceglie (2008) in summarizing the position of school leaders stated that despite being pressured to improve test scores, retain good teachers, and manage dwindling budgets, it is hard to imagine a single

school leader who is not in favour of nutrition and fitness. The issue is how to do so when already being expected to accomplish so much. The competition of pressing issues and priorities for school leaders is a major factor that seems to hinder support for programming such as health and physical education that can support student health and wellness.

## **Considerations for School Leaders**

Although there are likely challenging obstacles that school leaders need to overcome, these challenges are not insurmountable. We would like to suggest four areas of focus that could help to facilitate the kind of change necessary in schools.

1. ***Be Part of Programs.*** School leaders should be active within the health and physical education programs in their schools. They need to spend time in classrooms, school gymnasias or on the playing fields and playgrounds to observe the instructional practices of their staff members. Health and physical education programs need to promote knowledge and understanding that clearly focuses on life-long healthy activity. Without visiting classrooms and gymnasias, school leaders cannot guarantee that programming exists in their schools. While visiting classrooms to observe mathematics or language arts teaching is still vitally important, school leaders can also easily observe these other subject areas.
2. ***Develop Knowledgeable Staff.*** As with all subject areas, health and physical education programs in schools need to be taught by qualified and enthusiastic teaching staff. Although it might be argued that specialist subject area teachers are required, in today's financial situation that schools are placed in, this might not be possible. Therefore, school leadership personnel should encourage and provide opportunities for all staff members to participate in

professional development opportunities to improve their teaching or understanding of health and physical education programming. This might take the form of conference attendance or 15 minutes of professional development in a regular school staff meeting. The fields of health and physical education have changed considerably in recent years. Teacher knowledge, skills, and attributes need to match such change (Lambert, 2000). For example, in physical education, children and youth are now frequently drawn to activities beyond the traditional sports that have typically been part of the school experience. Failure to recognize such a change can only further alienate children and youth from participating in physical activity. Therefore, teachers need to understand and be prepared to offer programming that not only meets the requirements of educational mandates but, and perhaps more importantly, meets the interest of children and youth.

3. **Support Curriculum Time.** School leaders can assist health and physical education programming by ensuring that these subject areas figure prominently in a child's weekly timetable, if not daily schedule. The US Centers for Disease Control and Prevention (2010) has clearly determined that research has indicated that physical activity can assist in academic achievement, including standardized test scores. Equally, research has shown that healthy lifestyle promotion and increased levels of physical fitness not only supports school achievement but also helps to off-set future health issues such as heart disease, type 2 diabetes, several types of cancer, and osteoarthritis.

4. **Ensure Comprehensive Programming.** School leaders can work to ensure that health and physical education programs are integral parts of a Comprehensive School Health (CHS) program. There are countless organizations available to assist CHS programs in today's

schools and with the constant addition of quality educational resources online, school leaders can help provide a variety of healthy, active messages to the school community. For example, a “Physical and Health Education Fair” can aid in school communities coming together whilst assisting in the learning process for children and youth on a number of topic areas (Bradford, 2013). School principals can assist in the delivery of active, healthy messages through morning announcements, weekly health tips on the school website (e.g., importance of daily physical activity), and monthly newsletter entries (e.g., information of the physical education program of studies). These are simple strategies that can help educate the school community on active, healthy living. Other school-wide initiatives can include, (1) school bulletin boards that are consistently updated to ensure quality messages about active, healthy living, with an inspiring quote from the school principal, (2) monthly homework assignments for parents-guardians and their children that includes a statement from the school principal (e.g., “This month, try to join your family for a 30-minute walk three 3 days a week.”), and (3) a morning 20-minute dance session led by the school principal and the staff members that gets everyone moving at the start of the day (e.g., first school day of the month). Strategies such as these will help demonstrate to the school community that the school leadership team views health and physical education as an essential component to the learning environment. Playing a part in student learning and ensuring healthy, active messages are being communicated throughout the school day are important teaching tools (Hickson & Bradford, 2010). Therefore, carrying out strategies such as the ones described in this section will send strong messages to the school community that the school leadership team believes in the development of active, healthy lifestyles!

## **Concluding Thoughts**

Physical education programs have begun to shift from being dominated by traditional, competitive team sports to individual fitness and “lifetime” activities (Adams, 2013). Health programs are no longer a collection of ideas presented in individual lessons but are recommended to be part of a coordinated effort to promote comprehensive health and wellness programming (Berg, Hickson, & Fishburne, 2010). Such a shift in thought has challenges though. However, as instructional leaders, school principals are ideally placed to ensure that teachers are provided with the resources for the delivery of effective health (Berg, Hickson, & Fishburne, 2010) and physical education programs (Lambert, 2000). Through such things as: staff development; opportunities for collegial and professional dialogue; critique of program planning and lesson delivery to ensure quality instruction and assessment practices; and the provision of school-wide planning to support activity and learning, school principals can truly become leaders and advocates of health and physical education programming.

### **6. Abstract:**

Student learning is one of the primary goals of Professional Development Schools (PDS). Over the years, research has been conducted to address the many aspects of PDS, yet very little has been done to document the impact on student learning. Recent increases in the demand for accountability have caused schools and teachers to evaluate programs and their impact on student learning.

The National Council for Accreditation of Teacher Education (NCATE) released the Blue Ribbon report in 2011, conveying the idea that when designing clinical teacher preparation programs, student learning should be at the center. In 2012, the Breaults found limited research on pre-K-12 student learning in Professional Development Schools. There is compelling demand for research that examines student learning in Professional Development Schools.

PDS are established through collaborative working relationships between the university and school site. PDS relationships are, by nature, humanistic making it difficult to assess

student learning using standardized testing as a means of measurement. One of the purposes of this case study is to provide a model for other PDS partnerships to assess student learning.

In this case study, thirteen eighth grade students, five cooperating teachers, nine pre-service candidates, three supervisors, and two site principals were interviewed for their perceptions of student learning in their Professional Development School partnership. The participants were asked to define student learning and questions regarding best practices professional development, and challenges in learning within the PDS model. Documents and observations were also conducted to provide a triad of data to have a broader examination. In coding all the interviews, documents, and observations, categories were formed and themes emerged from those categories. In the preliminary findings, one theme that emerged through all five participant groups was one regarding one on one time that is provided to students when working with pre-service candidates. Another preliminary finding was noted as all five participants groups had discussed the ability to have another person explain, or reteach differently, the content and understanding when using different language or visuals to explain the content. The perceptions of these participating groups confirm that Professional Development School partnerships should be measured and evaluated as to the significance they have on student learning in each of their partnerships.

Topic area: Educational Policy and Leadership, Special Education & Systems Change

Presentation format: Paper Session

Presentation Description:

A new divergent research method is the vehicle used to unfurl new findings for actionable plans in the study of systems change processes in the field of parent involvement, autism and special education. Highlights include recommendations and practical insights for concerned school, parent, community, and policymaking groups facing the growing crisis of autism. The new mixed method research model molded for this specific study extended inquiry into the role of parent involvement in their schools and communities. The study was realized through a volunteer organization, Families for Effective Autism Treatment (FEAT) and their subsequent contributions to promoting effective autism services through foundational legislation, research, support communities, and school programs. An examination was conducted of how the group's efforts were initiated and their ongoing activities to advocate for those with autism and with other disabilities. Factors related to past, present, and ongoing change processes were compared and analyzed. The first phase of this research captured, through qualitative interviews with the founding members, factors related to effective educational change. The results were developed into an adapted systems change model. The focus of the second phase used those factors in quantitative surveys with second and third waves of participating parents of FEAT. Additionally, the respondents were asked qualitative questions regarding the anchoring of factors related to an effective educational change process. Research results were provided in the context of factors that perpetuated the continued implementation of change throughout the community. What had begun as a

small support group of six parents and professionals, eventually evolved into a dynamic volunteer parent driven organization whose efforts reached out nation-wide to more than 10,000 members in the autism community. The final research recommendations provide an action plan for all groups seeking to address the growing needs of children with autism and their families. Information gathered from the research points the way for those desiring to become part of a ground swell of groups and individuals dedicated to seeing lasting change in educational policy and programs in the autism community and beyond. The new research model continues to hold significance for those who seek to conduct research in new and inventive ways.

5. [rockettc@hawaii.edu](mailto:rockettc@hawaii.edu)
6. Abstract:

When implementing research or program grants within Hawaiian communities, to be effective, data collection efforts must understand and address the community’s attitude toward the implementer. The Hawai‘i Preschool Positive Engagement Project seeks to positively engage with the community through culturally relevant ways to connect with people, recognize strengths, and provide information and resources. Successful ways of culturally relevant data collection and dissemination with Hawaiian communities almost always include initiating relationships with humility. This involves acknowledging that the community is the expert and we are the learners, and that we are asking to receive as much as we are proposing to give. HPPEP strives to engage with all participants respectfully, being sensitive to any resistance, honoring self-determination, and seeking regular feedback. It is through personifying these principles in the field that we can hope for maximized and accurate data collection from our participants and partners.

Dissemination of data that we receive from the community plays a crucial role in building and solidifying trust with those who participate in HPPEP activities. This project has dedicated substantial resources to enable quick analysis of data in order to share results with participants as soon as possible. This type of “giving back” can make the community feel valued, allows them to provide additional wisdom on interpretation of results, and strengthens the partnership to work towards community-sustained interventions that provide lasting benefits to program and participants alike.

The Hawai'i Preschool Positive Engagement Project (HPPEP) aims to bring out the best in students, parents, and teachers by focusing attention on what's going right and providing research-based services. Learn how HPPEP was created based on feedback from early educators, how values are woven into our services, and initial data results of this innovative project.

### **Abstract**

The Hawai'i Preschool Positive Engagement Project (HPPEP) is implementing a combination of research-based and innovative interventions intentionally grouped to address needs that are significant in magnitude: 1) Improvement of early learning outcomes for at-risk preschoolers, 2) Positive parent engagement, and 3) Professional development of preschool teachers and staff. The project is training, implementing, evaluating, and disseminating results in order to help inform the future design of effective early education programs, specifically those that serve high percentages of Native Hawaiian students. HPPEP just began its third and final year of implementation.

The project objectives are to 1) Improve early learning outcomes for at-risk preschool students through a unique grouping of research-based school and home interventions, 2) Build protective factors of families with preschool students by facilitating parental positive engagement through the use of a research-based home intervention and 3) Address the professional development needs of teachers and staff in the field of Early Childhood Education, in which Native Hawaiians are underemployed, by building knowledge of existing behavior and classroom management strategies. Culturally relevant training and support is provided for classroom components Check-In Check-Out and Positive Behavioral Interventions and Supports

and parent component First Step to Success homeBase Plus, including book making using Storytelling for the Home Enrichment of Language and Literacy Skills. The project's values of Positivity, Productivity, Responsiveness, Flexibility, and Humility are intentionally woven throughout implementation of services.

Paper Title: Two different systems of higher education - U.S. and Italy:  
The sugar and fist approaches, learning from the comparison

### **Abstract**

The idea of writing this paper was born from faculty exchanges between the California Polytechnic State University (CalPoly), San Luis Obispo, U.S. and the University of Camerino (UNICAM), Ascoli Piceno, Italy, that occurred in 2011 and 2013.

Teaching the same subject on the other side of the world and to students with a very different cultural background has been not just an exciting experience for the faculty involved, but also an opportunity to compare two very different systems.

Furthermore this paper intends to be a mean by which this interesting experience may not remain an end in itself; instead it wants to become a useful and fruitful exchange of cultural knowledge, practical skills and teaching methodology.

This paper, written by one professor from CalPoly and one from UNICAM, Enrica Lovaglio Costello and Monica Rossi, compares the higher education systems in CalPoly and UNICAM in particular, extending the analysis to the U.S. and Italy, in more general terms. A list of possible improvements, that incorporates the strengths of the two systems, is drawn from the detailed examination of each of the main differences, such as students' level of education at point of entry, class size, image and pedagogical approach of the professors, facilities, cost of education, enrollment and graduation rates.

**Keywords:** Higher education, Italian university, American university, intellectual struggle

## **Introduction**

Today the higher education system is at the verge of a technological revolution, thanks to the Internet, technological advances (with the possibility of delivering lectures through video/screen casting) and new pedagogical models. It is foreseeable that universities will be delivering their lessons beyond the boundaries of the physical classroom and across continents. Currently “massive open online courses,” or MOOCs, are delivering classes in remote places and to a varied audience; these MOOCs are free, accessible to all economical levels of society. How can we structure an improved educational system that also crosses cultures and continents? What are the main traits and strengths new system must possess? It is an incredible chance, not to be missed, these are indeed promising times for education.

In the perspective of an educational model that in part takes advantage of the benefits of globalization, allowing students from all over the world to access the classes, and in part retains the individuality of its culture, we must know the differences among those systems and propose compromises that can be adopted at a global scale. This paper is focusing on the Italian and the American higher education systems.

## **The differences between higher education in Italy and U.S.A**

The main differences between higher education in the two countries relate to: cultural background of students, number of students for each teacher, relationship between students and teacher, facilities, cost of education, enrollments and graduation rates and students attitude toward learning and earning such knowledge.

- 1) *Cultural background of students.* There is a complete absence of general education (GE) courses in the Italian university; the classes are all focused on the field of expertise of the chosen major. The general education in Italy is taught, and well, in the five years course of studies during high school, where the classes of 20-30 students are closely monitored and challenged. High school in Italy is as challenging as college in term of studying, much easier in the realm of self-discipline. There are three different kinds of high school: Liceo, that is intended for students who'll continue into college, Istituto tecnico and Istituto professionale, that are vocational schools and intended for students that will enter the work force right after high school. For each of these kinds of high schools there are variations: e.g. “Liceo” can be “classical” (humanities driven), scientific, artistic, linguistic, etc., depending on the students' inclination. The Istituto tecnico prepares the students to

enter the administrative work force (administrative assistants and alike positions), the Istituto professionale prepares the students with hands-on expertise, such as plumbing, electricians, etc.

- 2) *Number of students and perception of the teacher.* Another aspect where U.S. and Italy differ greatly is the organization of the university and the figure of the professor. The lecture classes in Italy are attended by 100+ students, the labs are attended by 50 to 60 students; with such a crowd in each class, each student has to take the education in her/his own hands. Faculty members never “hold the student’s hand”, in part because of the large number of students in the class, in part because hand-holding is considered acceptable in high school, not in college. For handholding we mean closely monitoring each student and giving constant feedback, through grading and direct communication, of the growth of the student throughout the class. Italian classes often do not require attendance; students are required to show up at the final exam with the needed knowledge, there are no demands of intermediate tests (such as assignments, homework and midterms in the U.S.). There are design critiques, which the student can benefit from, but those are not required in order to pass the class.

Only 20-30 students attend the American college level classes, a part of the general education courses; attendance is required and handholding is not only the norm but also the students’ demand and expectation. One would think that in such small classes the faculty could encourage the learning of self-discipline, intellectual freedom and independence; unfortunately such task is not part of the curriculum and classes’ learning objectives; the American professor must cater to and please the student in order to earn good students’ evaluations. American state colleges treat students in equivalent manner of the Italian high schools: the students are given small assignments and various grades throughout the course of the class, they are constantly waiting for and expecting the faculty’s directions, showing very little decision making and self discipline. The Italian students have and want total freedom; the American students have and want constant direction.

- 3) *Relationship between students and teacher.* Sugar coating the communication with the students is another sad outcome of the professor having to earn good students’ evaluations in the public universities’ higher education system in America. Every critique

in the U.S. seems to start with “Good job!” no matter the quality of the work, mainly because the students’ evaluations determine if the faculty will become tenure or promoted; pleasing the students, catering to them and at times making the class less demanding generates positive evaluations. Direct and honest communication is not well received by the American students, which will consider honesty and directness as “rude”, hence the need of sugar coating. The Italian faculty is respected, at times feared and admired despite the curt communication methods; the students have the belief that if the “professore” earned that position he must be worthy of it, he must be respected and valued for such achievement. The professore’s attitude is to prepare the students for the real world; no time is devoted to soften critiques and embellished communication, especially in large classes of 50, 100 or 200 students. The American sugar coating methods are replaced by the firm fist of the “professore”; for the Italian students the tough approach is part of the leaning and the growth: the ability to take criticism and endure the hardship of it; it is considered training for the professional world.

- 4) *The perception of intellectual struggle.* Psychologist Jim Stigler has spent years researching how a different attitude toward struggle will generate very different learning outcomes. He compares learning in the U.S. to learning in Eastern cultures, like Japan and China; in an interview with NPR (National Public Radio) Stigler states: “From very early ages, we (Americans) see struggle as an indicator that you're just not very smart. It's a sign of low ability. People who are smart don't struggle. They just naturally get it. It's our folk theory. Whereas, in Asian cultures, they tend to see struggle more as an opportunity.” The Italian higher education system is built to put the students through the high pressure of intellectual struggle; students demand that challenge because it is considered indispensable in order to achieve professional growth and obtain the few jobs available, once graduated; faculty members are appreciated based on their ability to challenge students and promote intellectual struggle, independence, determination to succeed and self-discipline. This is the main reason why handholding is not accepted in Italian universities. Just as Stigler demonstrates through his research, the American state university system gives a negative connotation to struggle; it is visible most in the students’ evaluations, which measure the instructor’s ability to make everything clear and unchallenging for the students. This idea of “clear” to us is key to the presence or lack of intellectual struggle. We quote Stigler once again, in the Japanese classrooms that he has

studied “teachers consciously design tasks that are slightly beyond the capabilities of the students that they teach so the students can actually have the experience of struggling with something just outside their reach - and then, once the task is mastered - the teachers actively point out to the student that they were able to accomplish it through the student's hard work and struggle.” In order to evaluate the instructor American students are asked: “How clearly were your responsibilities for this course defined?” and “How do you rate agreement between the course objectives and lesson assignments?”

The faculty member must be clear in outlining how much work is asked of the student and what needs to be learned, preventing the possibility of a struggle beyond what has been just taught, very little expectations of individual research and exploration beyond what is spelled out by the faculty member is shown. Students are told what to do and earn a grade base on it, why would they venture beyond their comfort zone to find exceptionality?

Another concrete example of the difference among the Italian and American state universities in this regard is the fact that American classes must have a syllabus, in which every component taught in the class is listed and explained, with detailed learning objectives (sometimes shown for the entire class, and then again for each topic taught in such class); Italian classes most often do not require a syllabus, and faculty members leave learning objectives open in order to challenge the students in term of going beyond what's explained in class; individual research and experimentation is expected of each student, it would not be college level education otherwise. In this regard the Italian university is like the Eastern culture, analyzed by Jim Stigler: “it's just assumed that struggle is a predictable part of the learning process. Everyone is expected to struggle. And, in a way, struggling is a chance to show that you have what it takes emotionally to overcome the problem by having the strength to persist through that struggle.”

The main author of this paper earned an undergraduate degree in architecture in Italy, and studied urban design in France; when she enrolled in a graduate degree in multimedia engineering in the U.S. she was asked, during the first week of classes, to use Java and C++ to reverse a string in the communication between a server and a client using TCP and UDP protocols. Many of her classmates had a bachelor degree in computer science; she had no knowledge of programming. She ended up completing her two years Master's Degree in four consecutive quarters, while her classmates where still working at it, thanks to her determination to overcome each problem through a struggle. We believe

that if we could add this trait to the excellence of the education in America we would truly have a nation of over achievers, sophisticated thinkers and problem solvers.

- 5) *Facilities.* In Italy the specific majors occur in separate buildings scattered throughout a city, contrary to the large U.S campuses with multiple buildings at walk able distance, each teaching different fields of expertise. In Italy even the physical structure of the university does not lead to cross-disciplinary education: taking classes in other disciplines other than the one hosted in that particular building, where a particular major is taught, is virtually impossible because of the physical distance among buildings. The benefit of this aspect of the Italian system is stronger specialization; the shortcoming is lower cross-disciplinary learning as well as the expectation that a teen-ager would already know which professional path to take in life: at 13 years old a student chooses which “field of expertise” to pursue in high school, if scientific, artistic, linguistic or classical studies, and that sets the choice for the college major and the future career.
- 6) *Cost of education.* The cost of state education in Italy is quite low, college tuitions amount for about 1000 euros (currently \$1,300) per year; part of the Italian taxes help support the citizen’s education (as U.S. taxes help pay for education in state colleges and universities). In Italy the common practice of residing in the childhood home while in college also contribute in keeping education affordable, there is no shame in living with the parents during college. In United States the cost of education is quite high; in state universities college tuitions can range from \$5,000 to \$10,000 per year, for private universities much more. The average cost of a year on campus is \$27,000. Most Americans leave the parents’ home around 18 years of age; there is a stigma of failure for living with parent in adulthood.
- 6) *Number of students who enter colleges and graduate.* The percentage of Italians obtaining the “Laurea” degree has always been very low, at the point that in 1999 the government established a 3+2 system by which a “short laurea” can be obtained in three years (instead of the traditional five) and a graduate (specialized) degree is achieved in an additional two years course of studies. As in a Darwinian selection, only the strongest in Italy achieve a college degree, the others become the work force needed for the country to function (plumbers, electricians, tradesmen, etc.).

The data provided in 2013 by the inter-university consortium AlmaLaurea shows that only 30% of 19 year old Italians go to college and 20% of them graduates from college. Based on the Graduation data from the National Center for Education Statistics' Integrated Postsecondary Education System, in 2012 in United States 66.2% of high school graduates were enrolled in colleges or universities, and 42% graduate from college. One of the main reasons for the Italian's low attendance to universities is the high numbers of unemployed college graduates in Italy and the low incentive given by the fact that college graduates make only 7% higher income than non college graduates (Americans with a college education make an average of 20% more than without a college education).

### **Results and proposed improvements for a future global educational system**

“Close to 60 percent of Americans believe that the country's colleges and universities are failing to provide students with “good value for the money they and their families spend,” according to a 2011 survey by the Pew Research Center

Discontent with the quality of education in America, as well as the increasing costs of it, is the main reason behind the explosion of the MOOCs and the desire for a significant overhaul of today's higher education system, in part rendered possible by the technological revolution mentioned at the beginning of this paper. We base our recommendations on the main strengths of the two systems analyzed.

The main strengths of the Italian college education are:

1. The high quality derived from training students to face challenge, struggle through it and overcome problems, no matter how hard is the fight. The Italian education fosters determination, high problem solving skills, resourcefulness in overcoming any struggle.
2. Cost of education is extremely low
3. Strong high school programs that teach general education well across five years, allowing college to focus on the chosen field of expertise (no GE classes in college)
4. Large classes foster sense of independence, self discipline, resilience and perseverance
5. Moderate emphasis is placed on students' evaluations, freeing the faculty from the constraints of having to spell everything out to render the perception of the class' learning

objectives and assignments easy to understand and collect high scores in the clarity component of the students' evaluations. Faculty are free to demand beyond what is taught in order to train students to struggle and solve problems without the risk of lower students' evaluations.

The main strengths of the American college education are:

1. Small classes with direct contact with the faculty member
2. Opportunities for cross-disciplinary education, thanks to the campus setting
3. A relaxed and informal relationship among students and the faculty members, that fosters ability to ask questions and one-on-one attention

The following recommendations are based on the comparison of the Italian and American public educational systems, they must be considered in the light of the need of a reform in higher education, already initiated by the explosion of the MOOCs:

1. We should think globally and think critically in order to set up an educational structure, with no physical boundaries, that could be attended by students from very different parts of the world, thanks to the technological revolution that allows on line/remote learning.
2. First and foremost we must train students to face challenge, fostering self-discipline and determination to struggle intellectually in order to succeed. We must stop feeling that every task in a college curriculum must be "clear and spelled out"; part of the students' learning must be in the unknown and unclear, in thinking outside their comfort zone, in figuring things out, this exploration must be a common practice. Faculty members should demand of the students to perform a notch above what is taught, to go beyond the obvious; such practice fosters critical thinking, problem solving, determination to succeed and ability to endure intellectual struggle. We must praise more the "hard work" that allowed the students to reach learning than the intelligence employed in order to learn.
3. We must add in the students' evaluations the assessment of intellectual struggle, and revise the items pointing at "clear explanation of tasks and responsibilities" (for example: How do you rate agreement between the course objectives and lesson assignments?), since room must be given for exploration, the thinking outside of the comfort zone, the

originality of solutions, all of which must be a constant component of the student's learning experience.

To strengthen our recommendations we quote the review of Amanda Ripley's book "the smartest kids in the world: And how they got that way", from the New York Times: "In an automated, global economy, kids needed to be driven; they need to know how to adapt, since they would be doing it all their lives. They needed a culture of rigor" and "Kids in hamster-wheel countries (Korea) knew what it felt like to grapple with complex ideas and think outside their comfort zone; they understood the value of persistence. They knew what it felt like to fail, work harder and do better. They were prepared for the modern world."

## **Conclusion**

We are fortunate to be in a time of change in higher education, we have the great opportunity to make our country a nation of thinkers and over achievers by adding to our students' learning the ability to endure intellectual struggle, as well as the resilience and perseverance needed to go beyond the stated and discover new solutions and perspectives. We indeed all hope that education will have no geographical boundaries and will be affordable, and that "computers will ultimately be able to tailor an entire "learning environment" to fit each student" (David Kuntz). If all those expectations ultimately fail we need to at least equip our American students with the intellectual thinking capacity needed to truly excel in the real world. American faculty members today are so concerned about receiving high scores on the students' evaluations that they do all that is possible to detail goals and assignments to the point of preventing the students from having to think. This process undermines the essence of a university itself, that, in the words of Prof. Drew Gilpin Faust, the newly installed first lady president of Harvard University: "is not about results in the next quarter. It is about learning that molds a lifetime, learning that transmits the heritage of millennia; learning that shapes the future".

### Abstract

In today's society, race is often seen as a divisive factor. This article discusses adventure based counseling programs and the impact that race has with regards to the group members' perceptions of group cohesion. When examining adventure based counseling programs and group cohesion, research suggests that there were no significant differences in perception of group cohesion by race. The implications for counselors are examined and discussed.

## Adventure Based Counseling and Diversity:

### Perceptions of Group Cohesion

Over the past few decades, there has been an increase in the use of adventure based counseling (ABC) programs (Nassar-McMillan & Cashwell, 1997) as interventions among adolescents with behavioral and social problems (Johnson, 1992) and as a method of building teams (Springett, 1987). ABC is an innovative alternative to traditional group counseling, and uses the elements of adventure and risk to promote growth and change among participants. Because of this increased usage, there is a need for researchers to examine potential uses of challenge course programs and determine possible outcomes of their implementation (Davis, Ray, & Sayles, 1995). In addition, with an increased emphasis on diversity issues within the counseling profession, it is critical that the role and usage of low-element challenge course programs in multicultural counseling be addressed.

Springett (1987) acknowledged that one of the potential benefits for participants in challenge course programs is increased perception of group cohesion. Cohesiveness has been identified as one of the key factors in the development of a group (Griffin & Pennscott, 1991) and an important variable for a variety of groups and different types of group processes (Evans & Jarvis, 1980).

This paper examines the effect of participation in a low-element challenge course on the perceived level of group cohesion among diverse participants. Race was included

as an independent variable in the study to determine if participants belonging to various racial groups perceived group cohesion differently.

#### Low-Element Challenge Courses

Adventure based counseling uses a progression of activities including icebreakers, group initiatives, trust building exercises, low-element challenge courses, ropes courses, service projects, and peak experiences as a way to encourage change (Schoel & Maizell, 2002; Fletcher & Hinkle, 2002). While some elements typically focus on leadership abilities and others focus on communication skills, all activities emphasize group cohesion. The elements in the type of ABC programs used in this study (low-element challenge course) are designed to make few physical demands on the participants, however, they require participants to share responsibility and solve problems as a team.

There are several significant aspects to tasks typically employed in adventure based approaches with low-element challenge courses. The sequence of activities typically progresses from easier exercises through tasks that are more physically and mentally challenging (Alexander & Carlson, 1999). The activities build upon one another and increase in difficulty so that the group is consistently challenged. This requires participants to improve their social and problem-solving skills as well as their ability to work together in order to successfully complete the activities.

#### *Multicultural Counseling and Group Work*

In today's society, it is likely that counselors will be called on to assist in dealing with diversity issues within groups (Johnson, Torres, Coleman & Smith, 1995). As

DeLucia-Waack (1996) stated, “All group work is multicultural” (p. 218). Within any of the groups (e.g., committees, peer groups) to which people belong, members bring their unique cultural identity, which is developed through cultural background, race, gender and socioeconomic status (Conyne, 1998). Therefore, an important task for counselors is to develop the ability to help members learn about themselves and each other, which requires attention to multicultural factors (McRae & Johnson, 1991).

Participants in these programs work toward the same goals and must communicate effectively and recognize the diversity represented among group members as a form of enrichment rather than as a deficit (Manning & Lucking, 1993). Each member is viewed as an important component of the group and members experience success or disappointment as a whole rather than as individuals. This focuses on each member’s strengths and incorporates those characteristics into the group.

Manning and Lucking (1993) positive human interaction among individuals of various races or cultures tends to facilitate feelings of harmony among involved members. The low-element challenge course program attempts to facilitate this type of experience for each member of the group.

### *ABC and Group Cohesion*

The results of one study (Glass & Benshoff, 2002) suggested that an increased perception of group cohesion by participants could be achieved through participation in a one-day low-element challenge course program. In addition, similar results were experienced with a group of college students (Glass, 2002). While these studies revealed

that participation in ABC programming could cause an increase in participants' perceptions of group cohesion, they also revealed interesting issues related to perceptions of group cohesion and race.

These studies revealed that various races (White, African-American, and Hispanic) perceived group cohesion in a similar manner after participation in the one-day program. This suggests that ABC programs may facilitate cohesion among diverse participants with group members, regardless of cultural differences, experiencing similar perceived levels of cohesion. This information is exciting for counselors seeking to build strong relationships through group work. In order to offer the most culturally sensitive approaches, it is critical for the counseling profession to research and identify counseling programs that may aid in the lessening of racial effects without diminishing the importance, or ignoring the relevance, of each person's background.

These results suggest low-element challenge course programs can be a valid method for helping diverse groups to experience higher levels of perceived group cohesion, while perhaps minimizing the effects of race. The implications for group work are powerful, in that all counseling groups may benefit from higher perceptions of group cohesion. Feeling connected to the other group members helps to facilitate self-disclosure which, in turn, helps to facilitate personal growth, the basic premise of counseling. It is possible that regardless of the reasons for a group's origination, the use of a low-element challenge course program could help group leaders facilitate the cohesion needed to move the group along in its development to deeper stages of interaction.

**Session Title:**

*If I knew then what I know now: Bridging the gap between credential and the first day of school*

**Topic areas:**

Special Education/Teacher Preparation

**Presentation Format:**

Paper Session

**Session Description:**

The disconnect between teacher education programs and new teachers' feelings of preparation and confidence is well documented. We will share one university's efforts to bridge the gap between preparation and classroom through a summer workshop. Special education teachers who just completed their credential program but had not yet begun their first job worked with teachers and a professional development expert to plan for the specific needs of their students before the first day of school.

**Presenter:**

Vanessa Goodwin

New special education teachers have reported a disconnect between their teacher preparation program and the actual skills they needed on the first day of school. Research tells us that there is a persistent gap between academic curriculum in teacher preparation programs and the actual skills new teachers report they need. This gap contributes to a significant problem with teacher retention in special education (Billingsley, 2004). There is consistent data across years that attrition in special education is higher than general

education, and highest in the first five years of teaching (Boe, Sunderland, & Cook, 2008). Teachers cite lack of preparedness for professional tasks as reasons for leaving the profession (Billingsley, 2004; Sack, 1999). Specifically, new special education teachers felt they needed additional preparation in areas including: classroom management and behavior support; adaptation of curriculum, materials, and instructional strategies; knowledge of legal regulations and Individual Education Plans (IEP); and collaboration with other teachers and paraeducators (Kamens, Loprete, & Slostad, 2000).

These findings were replicated in a large university through review of exit data, surveys, and interviews with teachers who had either completed a mild/moderate, special education credential program and were teaching in their own classroom, or were currently in the program and working in a student teaching field placement. These teachers reported feeling well prepared as they finished coursework, but that once in the classroom, they felt they had been under-prepared to effectively cope with behavior management, collecting and using formative data for instructional design, collaboration, and establishing and maintaining effective systems for managing special education caseloads.

What causes this disconnect? Universities have been pushed by local and federal regulations to shorten programs and move teachers into the classroom at a quicker pace. Simultaneously, budget demands on school districts have forced the development of special education classes that serve students with a wide, and sometimes disparate, range of needs. As a result, special education credential programs are using fewer courses to prepare teachers to work in schools with a broader range of responsibilities than ever before. Beginning special education teachers are expected to meet the varied needs of

students with disabilities with mild to moderate learning differences (including diploma-track to non-academic, functional skills), across multiple grade levels, and across a wide range of placements and service delivery models (Nougaret, Scruggs, & Mastropieri, 2005).

Given the recent recession across the country, teachers completing preparation programs never know where they are going to end up and their fieldwork is often a mismatch with their actual first teaching position. As the recession continues and school districts are forced to serve children with shrinking funds, more children have been folded into one-size-fits all programs. Despite the best efforts of programs to provide a broad array of experiences and curriculum, teacher education programs are faced with the dilemma: how can we sufficiently prepare candidates to meet an incredibly diverse range of demands on the first day of class?

With support from a 325 T grant and using multiple data collection methods (focus groups, advisement groups, observations, student surveys, and faculty feedback groups) one large urban university identified several key areas in which students felt they needed more support, and set out to address them. Two weeks before the beginning of the K-12 school year, we offered a 2-day summer workshop that provided new teachers the opportunity to receive supplemental support in planning formative assessment, creating instructional groups, preparing behavior management systems, and designing instructional strategies before they began teaching. Twenty-two newly hired or interviewing special education teachers attended the workshop and worked directly with exemplary candidates from one year earlier who had just completed their first year as a classroom teacher, veteran educators, university faculty, and a professional development

expert, to plan for the specific needs of their students in preparation for their own first day of school.

The workshop consisted of several different session types, and was led by a variety of support providers. Session formats included: whole-group, hands-on, interactive activities; a “Rap Session” panel of novice teachers sharing advice after their first year as a teacher; small-group “Station” sessions with experienced, mentor teachers on specific topics of need; and a whole-group, full-day professional development provided by an expert in the field. All sessions were videotaped and participants were invited to share through interview which parts of the workshop they found most valuable. Evaluation data was collected.

### **Paper Session**

This session will share an analysis of findings from the two-day workshop, including which session types, levels of presenters, and specific content, were most valued by the teacher candidates who attended the workshop. Participants will have an opportunity to discuss the findings of this project and learn about what the teacher candidates and new teachers identified in the first place as the gaps in their credential program, how those needs were supported through the workshop, and hear about whether or not the workshop met its goal. Session participants will view video clips of actual workshop sessions and hear, through videotaped interviews, directly from the new teachers. Participants will discuss what supports might be offered in their programs to help bridge the gap between credential and practice, and more fully prepare beginning teachers for the first day of school. Research questions include the following:

1. What skills are needed by new special education teachers to feel prepared to teach the wide diversity of students who might be assigned to their caseload?
2. What types of supports make a difference to new teachers, and are they sustainable?
3. With these supports, can new teachers begin the school year ready to meet the individualized needs of their students?

### **Learner Outcomes**

Participants will be able to:

1. Identify gaps between teacher preparation programs and demands in the field;
2. Discuss activities that have been shown to increase new teacher confidence for the first day of school;
3. Identify methods of sustainable support to bridge the gaps;
4. Share strategies for preparing teachers that are ready for the first day of school.

# LEARNING NEEDS IN THE MULTICULTURAL CLASSROOM: IMPLICATIONS TO EQUITABLE TEACHING

## Abstract

*(Full paper will follow, if requested/accepted)*

This qualitative study identified the learning needs of students in the multicultural classroom. The study utilized a semi-structured interview guide and data were gathered through focus group interviews of six ethnic groups, namely: *Asian, Black, Filipino, Filipino-American, Hispanic, and White*. Each group was comprised of eight to twelve members purposively sampled from the student population of Adventist University of the Philippines (AUP) for the collegiate year 2012-2013. The themes that emerged from the *Qualitative Data Analysis* of interview transcripts showed that learning needs in the multicultural classroom are *culturally responsive teaching, teacher immediacy behaviors, differentiated instruction, instructional clarity, and teacher language competence*. Each need was inductively extracted from recurring themes and concepts evident from the interview transcripts. Thus, each was extensively supported by relevant interview excerpts and related studies. Students from various cultural, political, geographical, and language backgrounds voiced out the common inequality problems they encounter in a classroom. The study confirmed the importance of teacher language competence, particularly in the use of English as medium of instruction, considering context of AUP where students come from over 50 countries and the teaching force is dominantly comprised of Filipino teachers. They were one in affirming that teachers need to be sensitive to and respectful of cultural differences, warm in accommodating students' needs, creative and constructivist in terms of employing varied teaching strategies, competent and eloquent in communicating classroom instructions (spoken and written) and content. The teacher's communicative competence was deemed to play a significant role towards mutual respect and equitable teaching. It is thus recommended that teachers rethink their approaches so that students from diverse cultural and language backgrounds will have equal learning opportunities. Further, it is deemed imperative to look into the curriculum and instruction to bring about changes in the way educational programs are conceptualized, organized, and taught.

Keywords: *learning needs, multicultural classroom, equitable teaching, culturally responsive teaching*

## *Abstract*

### *An innovation into primary teacher education program in Bangladesh*

This paper portrays an assumed change in the primary teacher education program in Bangladesh. An initiative has been taken with a vision to ensure an integrated approach to developing teachers' knowledge and understanding about learning at a deeper level, and with that aim the Diploma in Primary Education (DPED) program replaces the Certificate-in-Education (C-in-Ed) program in Bangladeshi context for primary teachers. The stated professional values of the existing program such as 'learner-centered', 'reflective' approach to pedagogy tend to contradict the practice exemplified through the delivery mechanism. To address the challenges, through the main two components (i) Training Institute-based learning and (ii) School-based learning, the new program tend to cover knowledge and value that underpin the actual practice of teaching. These two components are given approximately equal weighting within the program in terms of both time, content and assessment as the integration seeks to combine theoretical knowledge with practical knowledge and vice versa. The curriculum emphasizes a balance between the taught modules and the components of the practicum. For example, the theories of formative and summative assessment techniques are elaborated through focused reflection on case studies as well as observation and teaching practice in the classroom. The key ideology that is reflected through this newly developed program is teacher's belief in 'holistic education' that can lead to creating opportunities for skills development in all three (*Cognitive, Social and Affective*) domains simultaneously. The proposed teacher education program aims to address these areas of generic skill development alongside subject-specific learning outcomes. Although the new program addresses the above mentioned factors, one of the challenges of the proposed program is the issue of equity regarding teachers' background qualifications and experiences. Careful consideration needs to be given to the recommendations suggested for effective implementation.

The Effects of Web-Based Learning on EFL Learners' Refusal Speech Act  
Performance and Learning Motivation

Ting-Yun Cheng, Shu-Chu Chen

Department of Applied Foreign Languages, National Yunlin University of Science and  
Technology, 123 University Road, Section 3, Douliou, Yunlin 64002, Taiwan, R.O.C.

**Abstract**

The purpose of the current study was to investigate the effect of web-based learning on EFL university students' production of refusal speech act sets and motivation.

Sixty-six freshmen from two classes in a university of science and technology in central Taiwan were assigned into an experimental group or a control group. The experimental group received the web-based learning instruction for 3 weeks while the control group received regular instruction. The questionnaire of discourse completion test (DCT) and mini-attitude/motivation test battery (mini-AMTB) were applied in order to collect the data. After the instruction, the results demonstrated that the experimental group outperformed the control group and revealed a significant progress on the posttests of refusal strategy use. Further, the experimental group had positive motivation toward learning refusals.

In conclusion, web-based learning had a positive effect on refusal strategy learning and motivation. Finally, pedagogical implications and suggestions were offered for learners and teachers.

# **“Dynamic and Ecological Factors of Bullying: A Qualitative Methodology”**

**Ida Malian, Ph.D**

**Arizona State University**

## **Introduction**

The incidence of bullying, in its various forms, in public schools continues to be not only a problem for local school districts but also at the national level. A review of the research literature yields 74 peer-reviewed publications 54 in journals, 11 books and 9 reports in the period between 1992-2011. A review of the research literature yields multiple definitions. To be sure, each state, local school district endorses its own specific definition of bullying in the context of schools. Olweus has brought the issue of bullying to the forefront through his seminal works. He proffers that “Every individual should have the right to be spared oppression and repeated intentional humiliation, in school as in society at large” (1993,) p.427). As a result Olweus (1993) states, “A person is being bullied or victimized when he or she is exposed, repeatedly and overtime, to negative actions on the part of one or more persons (Olweus, 1993. P.413). His definition has been accepted and supplemented by many researchers. (Bernstein & Watson, 1997; Cantu & Heumann, 2000). A more recent variation has been suggested by Nansel, Overpeck, Pilla, Ruan, Simons-Morton, and Scheidt (2001) as a: “specific type of aggression in which (1) the behavior is intended to harm or disturb, (2) the behavior occurs repeatedly over time, and (3) there is an imbalance of power, with a more powerful person or group attacking a less powerful one” (Nansel et al., 2001, p. 2085). Funneling the definition to specific targets Hoover & Stenhjem (2003) suggests, “bullying consists of a series of repeated, intentional, cruel incidents between the same children who are in the same bully and victim roles” (p.2).

## **Review of Literature**

A study by Shafer, Korn, Smith, Hunter, Mora-Merchan, Singer, & Van der Meulen (2004), investigated the stability of victimization from primary to secondary school, found that those students who were continuously bullied had lower self-esteem than the control group or those only bullied in primary or secondary school. This demonstrates that experiencing bullying for several years reasonably

introduces the possibility that this long duration could result in harmful effects. Hoover & Oliver (1996) reported that both males and females students who were bullied perceived the reason as not “fitting in” This was true of both genders at 4-8<sup>th</sup> grades and 8-12 grades. The second most common reason for being bullied was reported to be a result of their friendships. Further, victims reported being anxious, insecure and having reported self-esteem. Putting these findings in the context of the inclusion movement to educate students with disabilities in the general education class creates another layer of potential bullying. In fact the very reasons given by the victims of bullying-not fitting in and association with friends parallels the notion of students in special education and their respective peers. In fact, Roberts & Smith (1999) found that children generally have a negative attitude towards their peers with disabilities.

The research related to disabilities and bullying is emerging. Kaukianinen, Salmivalli, Lagerspetz, Tamminen, Make, & Poskiparta (2002) ; Torrence (1997), Whitney, Nabuzoka & Smith 1992 have reported Prevalence). Bowman (2001) suggested that students with disabilities have a greater likelihood of being victimized by bullying. Regardless of disability Bullying has been reported at a higher rate than with nondisabled students. Intellectual disabilities (Reiter& Lapidot-Lefler 2007;McGrath, Jones, & Hastings 2010); Emotional and behavior disorders (Frances & Potter 2010,); Aspergers’s Syndrome (Biggs, Simpson & Gauss (2010). Whitney (1994) suggested that bullying was related to disabilities and that bullying occurs regardless of disability (Mishap 2003, Yule, Goodman and McConachie 1998; Martlew, & Hodson 1991; Dixon 2006; Biggs, Simpson & Gaus 2010). Sweeting & West (2001) suggested that less attractive, overweight, disabled and poor school performers were more likely to be bullied. Those students with visible disabilities have been targeted (Dawkins, 1996) as well as students with attention deficit disorders (Unnever & Cornell, 2004). Marini, Fairbairn & Zuber 2001) reported that “children with disabilities are at least twice as likely to be bullied than their nondisabled peers” (p.175). Gil & Costa (2010) similarly stated that children with disabilities more likely to encounter violence and victimization- further suggesting that inclusion might exacerbate this bullying. Luciano & Savage

(2007) found that students with learning disabilities self-reported significantly more incidents of being bullied than their non-disabled peers. Taylor (2012) suggested that all students are susceptible to bullying but that student with disabilities are more susceptible due to “characteristic that place them on either side of the bullying issue, be it as a bully or victim of bullying” (p. 1). Estell, Farmer, Irvin, Crowther, Akos, Boudah (2009) found that teachers rated students with moderate disabilities as bullied significantly more than peers. Martlew and Hodson (1991) corroborated this study by reporting that students with learning disabilities had fewer friends and were teased significantly more than non-learning disabled peers.

A comparative analysis of bullying among students in special education and general education was conducted by Rose, Espelage & Monda-Amaya (2009). They found that students in special education classes reported greater incidences of bullying than reported by students in general education classes. Specifically students receiving education in self-contained classes reported more incidences of bullying than those students in inclusive classes. In general it was reported that over 18% of students with disabilities in inclusive classes reported being bullied. This same number also reported assuming the role of bully. The theme of “fitting in” and core of friends that student associated with seems to merge again as a factor in targeted bullying. Additionally Egan & Perry (1998) suggested that their peers do typically not accept students that are bullied. Others have suggested that bullied students tend to lack friends in school (Olweus 1994). Conversely, students with disabilities have also been identified as bullying others. Whitney (1993) found that students with learning disabilities were as likely to bully as being bullied. Olweus (2001) reported that anywhere between 10%-20% of those that are bullied are bullies themselves.

## **Methodology**

This was a qualitative study of bullying of students with special needs in select public schools. Eight, 4<sup>th</sup> grade students, two female and 6 male, ranging in age from 9 years old to 10 years old were observed on the playground, cafeteria,

resource room, general education classroom during transitions and during specials. Observations were conducted in a variety of settings where students with disabilities would interact with typical peers.

## **Results**

This qualitative inquiry employed a constant comparative method utilizing and open and co-axial coding of the qualitative data- specifically the descriptive field notes, verbatim scripts and observer journals. Several common themes emerged through the analyses. Observations of the student with disabilities that experienced bullying. These prominent themes were ritual bullying; attention seeking; isolation; verbal antecedents, superiority and retaliation.

## **Implications for schools**

With all efforts there needs to be a collaborative partnership with parents to make school resources available and provide for communication. It is imperative that generalized bullying behavior from school to home is corrected and management consistently for maximum effectiveness for correction. Additionally, university professional teacher education program ,for both general and special education, should include knowledge and skills in identifying bullying and it long-term effects. Effective behavior management strategies to address bullying could be incorporated into classes.

6. Abstract

## **Abstract**

Nowadays, the study of teachers' professional identity as an important research field in teachers' professional development draws much attention. Researchers (Beijjaad et al., 2004; Miller, 2011; Tsui, 2007) agreed that teachers' professional identity is variable, flexible and shifting, and the construction of professional identity is related with teachers' personal background, institutional culture and environment. But to the questions like "how do teachers in the same institution construct their professional identity?" or "whether the processes or trajectories of teachers' professional identity construction are similar?", there are not clear answers (Liu, 2011).

The research objectives of the present study are to explore three aspects concerning teacher professional identity construction and to answer three questions: 1. How do university EFL teachers in China understand their professional identity? 2. How do university EFL teachers in China construct their professional identity in community of practice? 3. How do the teachers differ in the process of shaping and constructing their professional identity? The university EFL teachers who participate in the present study are from a key comprehensive university in Chongqing, China. They are divided into three groups and categorized as novice teachers, developing teachers and experienced teachers. The theoretical base adopted in this study is Wenger's Theory of Community of Practice. A qualitative research methodology is used in the study. The data are collected mainly by interviews and observations. In addition, narrative inquiry is used to analyze the stories of the participated teachers. By using coding framework and thematic analysis, some key words and key incidents have been elicited to help us to understand how the teachers construct their professional identity, what trajectory of constructing professional identity as a university EFL teacher is in the institutional community, and to understand the similarities and differences in the process of the teachers' shaping their professional identity. According to the investigation, the results indicate that academic identity, teacher identity and institutional identity compose the university EFL teachers' professional identity. Institutional community where teachers work together and teaching community involving the interaction between teachers and students are of great significance in the construction of EFL teachers' professional identities. Furthermore, the results indicate that collaborative and caring institutional community helps to enhance novice teachers' sense of belonging and awareness of development, and the emotional motivation and resources support from the institution, colleagues and institution leaders' positive feedback help the teachers a lot in developing an integrated professional identity. The results also suggest that teachers participating in this study have shown strongest awareness of teacher identity, followed by academic identity, while institutional identity is rather implicit. Meanwhile, some problems are revealed in the present research. For instance, novice teachers report that they feel helpless in construction of their academic identity; the assessment system is both motivation and pressure; insufficient cooperation in teaching and academic research between teachers; and the peripheral teachers' need of chances of being involved in

the community of practice. Finally, some suggestions are given as follows: developing teachers' learning community which can play an important role in guiding and leading younger teachers in academic research; empowering teachers in decision making to raise their obligations and responsibilities for developing themselves with the whole group; teacher education should be human-oriented, focusing on the teachers' pressure and confusion in their development; teachers should reflect the context such as change of policies and institutional development as well as themselves, so they can know themselves better and make future plans for their professional development.

This study draws attention to the complexity and differences in the process of teachers' professional identity construction. It implies that it is crucial to create a supporting atmosphere for constructing teacher professional identity. It sheds some light on Chinese university EFL teachers' rethinking of their duties, rights, and professional identities, and of their professional development.

**Abstract:** Teacher evaluations are common in the United States, but are not in Saudi Arabia. The purpose of this study was to examine the Students Rating of Teachers (SRT) scale using Item Response Theory (IRT) and Differential Item Functioning (DIF) analysis in high school students ( $N = 1,503$ ) in Saudi Arabia. Refinement of the measure is needed; however, the results support the SRT's eventual use as a way to evaluate high school teachers in Saudi Arabia.

## **Using Item Response Theory to Examine the Student Rating of Teachers Scale for Saudi Arabia**

### **Objectives/Purposes:**

The purpose of this study was to examine the psychometric properties of the newly developed Students Rating of Teachers (SRT) scale using Item Response Theory's (IRT) Graded Response Model (GRM; Samejima 1969; 1972) and Differential Item Functioning (DIF) analysis in a sample of high school students ( $N = 1,503$ ) in Saudi Arabia. This study provides a description of teacher evaluations and how they have been used in Saudi Arabia. It will also provide an idea of the most efficient way to evaluate teacher performance using quantitative responses to the newly developed measure. The main research questions addressed the following: (1) What are the psychometric properties of the SRT?, and (2) Are there differences in how the items function based on if a student is evaluating a Religion/Language Arts class or a Math/Science class?

Teacher evaluations are a means by which many decisions can be made on behalf of the instructor with regards to teaching style and course content, or from an administrative position of instructor promotion and tenure and course allocation decisions (Alqarni, 2007). One widely-used method is the evaluation of teachers by students through mid-semester evaluations, final course evaluations, or at other time points during the academic year (Aleamoni, 1999). These evaluations are commonplace in the United States, but have not been used consistently in other countries, specifically Saudi Arabia. With regards to the professional impact that teacher evaluations can have, it is no surprise that the development and psychometric properties of these measures are important. Thus, it is imperative to examine the construction and psychometric properties of teacher evaluations, which can be considered "high stakes" depending on how they are used.

### **Perspectives/Theoretical Framework:**

Student evaluations are a natural method of soliciting feedback about teacher performance in that students have the most contact with teachers (Follman, 1992). Popular methods include surveys with Likert rating scales and some including a few open-ended questions near the end of the survey. However, student ratings of teachers are sometimes not considered a good source of information due to a number of potential biases. In the literature, a number of issues related to student evaluations have been investigated (Aleamoni, 1999). One common misconception included measurement-related problems such as poor reliability and validity evidence to support the use of student rating forms. The author reported inconsistent findings for these measurement issues.

Chapman and Kelly (1981) indicated that an enormous amount of research has investigated high school and college students' evaluations of effective teaching behavior. The authors point out that most of these studies, however, have been conducted in Western countries, primarily the United States and Canada. Very little research has investigated these relationships in rapidly developing non-Western countries where there is often the greatest demand both for increased teacher training and the means for evaluating the performance of teachers. With the

burgeoning international exchange of instructional materials and personnel, there is a growing need to understand the variables that describe effective teaching across cultures and the best ways to measure these variables.

Additionally, it has been identified that instructors teaching in certain disciplines receive higher ratings than their colleagues teaching in other disciplines (Cashin & Downey, 1992; Feldman, 1978). The highest ratings were in the arts and humanities, followed by the biological and social sciences. The lowest ratings were in business, computer science, math, engineering, and the physical sciences. Thus, it is necessary to examine this phenomenon in the current study, where the purpose is to create a flexible teaching evaluation to be used in multiple subject areas.

### **Methods:**

A measure was developed entitled the Students Rating of Teachers (SRT) scale in 2007. The SRT was developed by investigating literature and multiple resources describing the factors that are influential in how a student rates his/her teachers (Omotani & Manatt, 1993). Data collection involved visiting all of the schools within the Bisha School District and asking principals to allow students to be surveyed. The SRT was administered at volunteering schools, which included male high school students in the 1<sup>st</sup>, 2<sup>nd</sup>, and 3<sup>rd</sup> grades in December of 2007. The SRT was administered in paper-and-pencil form by the same researcher during a time when the teacher was not in the classroom. Classes included subjects in mathematics, English, science (e.g., chemistry, biology), computer science, religion, and Arabic.

The sample consisted of 1,503 male high school students (i.e., 28% of the total students in the Bisha School District), ranging in age from 16 to 18 years. The participants were obtained from eight public high schools (i.e., 29% of high schools) and 58 different classes. The students assessed teachers in six different subjects (i.e., mathematics [ $n = 215$ ], Arabic [ $n = 254$ ], English [ $n = 276$ ], religion [ $n = 245$ ], science [ $n = 270$ ], and computer science [ $n = 243$ ]). The participants were drawn from both rural and urban secondary schools in three different grades (i.e., 1<sup>st</sup> [ $n = 581$ ], 2<sup>nd</sup> [ $n = 472$ ], and 3<sup>rd</sup> [ $n = 450$ ] grade, which is equivalent to the 9<sup>th</sup>, 10<sup>th</sup>, and 11<sup>th</sup> grade in the United States). Therefore, the intent is for the results to be generalized to male, public high school students across Saudi Arabia.

### **Data Sources/Evidence:**

Alqarni (2007) developed the Student Rating of Teachers (SRT) scale, which is a measure of students' ratings of teachers (e.g., end-of-course evaluation). The measure contains 25 items, which were reviewed by 14 individuals in education (i.e., principals, supervisors, and teachers in all different subjects) and three psychometricians. These items measure teaching behaviors in secondary school, which were derived from the characteristics of good quality teaching in the teacher evaluation literature (e.g., Omotani & Manatt, 1993). The items were constructed and developed according to Classical Test Theory principles (Allen & Yen, 1979; Crocker & Algina, 2008). The SRT is on a 5-point Likert scale (i.e., Excellent = 5, Very Good = 4, Good = 3, Acceptable = 2, Weak = 1). All the items were worded in the direction of the construct (i.e., no reversely worded items). The highest possible score is a 125 (i.e., students' highly evaluating their teacher), and the lowest is a 25 (see Appendix A).

The main statistical analyses implemented included Differential Item Functioning (DIF) and Item Response Theory (i.e., the Graded Response Model [GRM]) in IRTPro 2.1. DIF is a condition when an item functions differently from one group to another. DIF analysis will be used to identify SRT items that function differently across groups of subjects by course evaluated (i.e., Religion/Language Arts [ $n = 775$ ] and Math/Science [ $n = 728$ ]). After DIF, due to the polytomous response structure of the items, Samejima's Graded Response Model (GRM) was used (Samejima 1969; 1972) to examine the psychometric properties of the scale.

### Results/Conclusions:

*DIF.* Prior to DIF analysis, descriptive information for all the items was examined (Table 1). It has been noted that instructors teaching humanities, fine arts, and languages tend to receive somewhat higher ratings compared to instructors teaching mathematics or chemistry (Feldman, 1978). Therefore, it is assumed that SRT items might behave differently across these groups (i.e., Language Arts/Religion and Math/Science). DIF analysis was implemented to investigate the equivalence of item functioning for the classes (i.e., mathematics, English, science, computer science, religion, and Arabic). As mentioned previously, these six classes were grouped into two groups – Religion/Language Arts (i.e., English, religion, and Arabic) and Math/Science (i.e., science, computer science, and mathematics).

Table 2 presents the parameters for each item separately for the Math/Science group and the Religion/Language Arts group. For the overall  $\chi^2$ , five items were found to have significant DIF ( $p < .05$ ). Further scrutiny revealed that these items (i.e., 8, 11, 14, 18, and 19) had significant DIF in the difficulty parameters with the Math/Science group endorsing lower levels of the construct (e.g., “Weak” or “Acceptable”) compared to the Religion/Language Arts group. It was also noted that item 18 also had significant DIF in the discrimination parameter. Overall, 20% of the items showed significant DIF. Several studies show that item-level bias does not necessarily weaken measurement quality of the overall test (Roznowski & Reith, 1999; Waller, Thompson, & Wenk, 2000), and item bias does not necessarily lead to differential test functioning (Waller et al., 2000). Therefore, the remaining analyses were therefore conducted using the combined sample for the two subject groups.

*GRM.* Prior to analysis, the assumptions of Local Independence and Unidimensionality were examined and were satisfied. The GRM showed satisfactory fit ( $M^2(200) = 172.70$ ,  $p = .919$ ; RMSEA  $< .01$ ), with no indication of Local Dependence among the 25 items. The results showed that the parameter estimates for the slopes ( $a$ ) ranged from 1.11 (Item 2) to 3.30 (Item 9). The lowest  $a$  value (Item 2) indicates that the curve is flatter compared to the highest  $a$  value (Item 9) where the curve is steeper (see Table 3). According to de Ayala (2009), discrimination values between approximately .8 and 2.5 are considered ideal.

In addition to the  $a$  parameters, the threshold parameter ( $b$ ) was examined. In the GRM, for the SRT with five response categories, there are four thresholds (i.e.,  $b_1$ ,  $b_2$ ,  $b_3$ , and  $b_4$ ). The  $b$  parameter estimates have a range of -4.45 (Item 2) to -1.33 (Item 20) for  $b_1$ , -3.80 (Item 2) to -.98 (Item 20) for  $b_2$ , -3.01 (Item 2) to -.43 (Item 16) for  $b_3$ , and -1.78 (Item 2) to .26 (Item 16) for  $b_4$ . Item 2 had the lowest parameter for all  $b_j$ . Therefore, this item is the easiest to endorse. In contrast, Items 16 and 20 have the highest  $b$  parameters. Therefore, these items are the most

difficult to endorse. Overall, there were very few positive  $b$  values, so this scale would be designed to discriminate among respondents with lower levels of  $\theta$ .

The maximum information values for all of the items were associated with  $\theta$  values of  $-.8$  and  $-1.2$  or less. The Total Test Information function is high in the area below the mean between approximately  $-1.2$  and  $-.8$ . The maximum information value for the entire test is  $51.73$  and  $51.14$  ( $\theta = -1.2$  and  $-.8$ ), which means that information from the test is centered below the mean (Figure 1). Therefore, this test is not able to discriminate between different levels of the construct along the continuum.

### **Educational/Scientific Importance of Study:**

The results have implications not only for the evaluation of high school teachers in Saudi Arabia, but also for administrators and school districts looking for quick and efficient ways to gauge general teacher performance, diagnose weaknesses, and provide feedback to the teachers from the perspective of the students. The main purposes of the study addressed the following questions: (1) What are the psychometric properties of the SRT?, and (2) Are there differences in how the items function based on if a student is evaluating a Religion/Language Arts class or a Math/Science class? The analyses revealed that, although there is a need to improve some items to discriminate among respondents with higher levels of  $\theta$ , overall, the psychometric properties of the SRT scale are acceptable.

In Alqarni (2007), many studies were cited that indicate that teachers' evaluations in Saudi Arabia are not providing teachers with practical feedback to improve their performances. Additionally, Alghamdi (1999) indicated that teachers' scores through the official evaluation procedures and evaluations by superiors (i.e., administrators via supervision) have been inflated. Therefore, the SRT scale should provide teachers with timely and practical feedback supported by the psychometric properties examined in this study.

Although refinement of the measure (e.g., eliminating poorly discriminating items, conducting a factor analysis, repeating this study with female high school students and teachers, validation through various mechanisms such as corroborating student evaluations with administrator, peer, or outsider reports, etc.) will be implemented in future research, the results from this study support the SRT's eventual use as a way to evaluate high school teachers in general in Saudi Arabia. With this measure, some areas of weakness can be identified, and can highlight where teachers may need remediation and further training with regards to a specific course they are teaching.

Figures

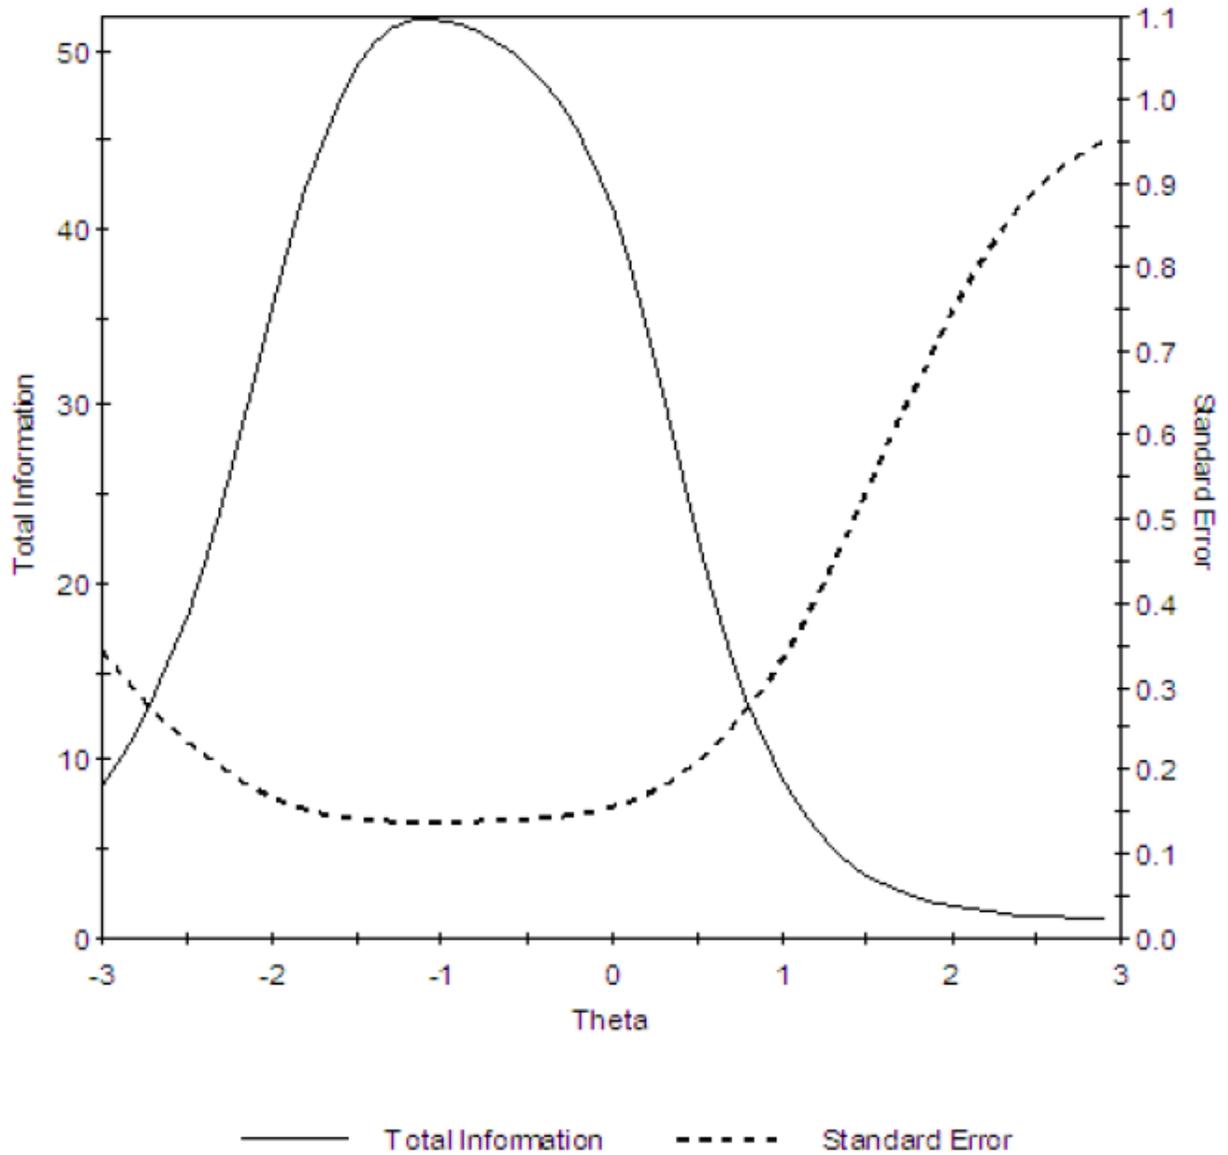

Figure 1. The Total Test Information function is high in the area below the mean between approximately -1.2 and -.8. The maximum information value for the entire test is 51.73 and 51.14 ( $\theta = -1.2$  and  $-.8$ ), which means that information from the test is centered below the mean

### Appendix A

*Directions:* Please answer the following questions honestly to help your teacher understand your experience and impressions regarding his teaching methods and performance. This information will remain anonymous, but he will receive summative results about his performance. The survey contains 25 items on a 5-point Likert scale from Weak to Excellent. Please rate your teacher's performance accordingly.

	Item	Weak (1)	Acceptable (2)	Good (3)	Very Good (4)	Excellent (5)
1	Teacher's knowledge of the subject content.					
2	Teacher's commitment to coming to the class on time.					
3	Teacher's preparation for the lesson.					
4	Teacher's ability to present an exciting lesson.					
5	Teacher's explanation of the purpose of each lesson.					
6	Teacher's ability to think deeply about the subject.					
7	Teacher's interest in student learning of the subject content.					
8	The clarity of the teacher's explanation of the subject content.					
9	Teacher's ability to lead you to understand the subject content.					
10	Teacher's use of the educational media.					
11	Teacher's skill to hold a useful discussion.					
12	The appropriateness of teacher's tests.					
13	Teacher's interest in student work.					
14	Teacher's interest in student questions.					
15	Teacher's ability to connect subject-matter content.					
16	Teacher's ability to connect subject-matter content with other areas.					
17	Teacher's ability to connect the subject content to the real world.					
18	Teacher's interest in the correction of student mistakes.					
19	Teacher's respect for students when they make mistakes.					
20	The relationship between the students and the teacher.					
21	Teacher's fairness when dealing with all students.					
22	Teacher's skill to control the classroom.					
23	Teacher's interest in student participation during the class.					
24	In comparison to other subjects, what is your evaluation of this course?					
25	In comparison to other teachers, what is your evaluation of this teacher?					

**Title:** What are School Rankings Lists of Academic Achievement Really Measuring?

## What are School Rankings Lists of Academic Achievement Really Measuring?

### Background

For several decades “think-tanks” have rated and ranked schools, and even education systems, throughout North America and the world. How schools perform on these various ranking schemes varies by the political ideology of the organization conducting the ranking (Dorn & Libby, 2013). A wide variety of reasons for the value and utility of these rankings lists are often cited. These most often include accountability to tax-payers and the ability to exercise informed choice on the part of parents. We question, though, whether these rankings lists really reflect these ideals of accountability or choice, or whether, in fact, these lists unknowingly and simply reflect some other societal construct.

In Canada, one organization that has taken on the role of critiquing school systems and ranking schools over the past decade is the Fraser Institute (<http://www.fraserinstitute.org>). This organization has focused its attention on the provinces of Alberta, British Columbia, Ontario, and Quebec. The Fraser Institute website states:

Our vision is a free and prosperous world where individuals benefit from greater choice, competitive markets, and personal responsibility.

Our mission is to measure, study, and communicate the impact of competitive markets and government interventions on the welfare of individuals. (<http://www.fraserinstitute.org/about-us/who-we-are/mission.aspx>, retrieved August 5, 2013a)

The organization describes itself as “an independent, non-profit organization with no affiliations to any political party” (<http://www.fraserinstitute.org/about-us/who-we-are/funding.aspx>). Furthermore, its “activities are funded by charitable donations, unrestricted grants, ticket sales and sponsorships from events, the licensing of products for public distribution, and the sale of publications”

(<http://www.fraserinstitute.org/about-us/who-we-are/funding.aspx> ). While the Fraser Institute may be independent of political parties, it does orient itself with a neo-liberal view of education and health as competitive markets in which consumers should be able to exercise freedom of choice to obtain the best service possible.

In the province of Alberta, the Fraser Institute annual education report is one that appears in the news and that some Albertans look to when deciding where to send their children for their kindergarten to grade 12 educations. The annual report provides overall rankings for school performance based on annual Provincial Achievement test results. It also provides some more nuanced analyses examining gender gaps in achievement as well as comparisons between actual ranking and predicted ranking based on parental income (as a proxy for socio-economic status or SES). Unfortunately, most lay people, including the media, focus on the much more easily understood “school ranking” numbers.

### **Purpose**

The focus of this paper is not to question the validity of the methods used by the Fraser Institute in its annual education report of Alberta schools. Over the past decade we, the authors, have, qualitatively, noticed a trend in which schools from low SES communities are consistently ranked very low while schools in higher SES communities are consistently ranked very high in terms of educational achievement. *Our purpose is* to examine how closely school rankings obtained through analyses of student achievement data can be replicated using SES data that include: family income, family assets, family ancestry, and parental educational attainment. We have selected these indicators of SES on the basis of research in the health field which explored the relationship between SES and “quality and length” of life for individuals (e.g., Duncan, G., Daly, M., McDonough, P., & Williams, D., 2002) as well as the work of an American Psychological Association task-force which examined SES (Saegert, et al., 2006).

## Method

In this paper we make use of the most recently available Canada census (Statistics Canada, 2006) detailed data to regress demographic data on schools ranked according to academic achievement by the Fraser Institute organization (2013b). Data used by this organization are collected annually by the Province of Alberta during the previous academic school year (i.e., the report released in 2013 is based on data from the 2011/12 academic school year). While the school rankings report produced by the Fraser Institute ranks schools throughout the Province of Alberta, we will limit our analysis to Public Schools in the Edmonton, Alberta area: approximately 170 schools in total during the period of the analysis.

In this paper we will focus our analysis on the Fraser Institute's ordinal ranking of each school relative to its peers in the province. All Edmonton Public Schools ranked in this report were initially included in our data set ( $n = 129$ ). Detailed explanations of the methodology used the Fraser Institute for determining the rank order of each school is described in their report (2013b).

Furthermore, to reduce the effects, as much as possible, of students from higher socio-economic backgrounds being transported to lower SES communities in which "programs of choice" (often referred to as "magnate programs" in the literature) have been established, we eliminated from our analysis schools having such programs since the academic achievement effects caused by low SES are simply masked by the achievement levels of the higher SES students who are transported from throughout the city to attend the schools' programs of choice. By eliminating from our analysis (a) schools with programs of choice, (b) those not ranked by the Fraser Institute, and (c) those in geographic

areas (what Statistics Canada calls Dissemination Areas<sup>1</sup>) for which Statistics Canada data were incomplete, our final sample for this analysis consisted of 79 schools.

To prepare the Statistics Canada data set for this analysis, we first identified the Canadian Postal Codes for each school within Edmonton Public Schools. The postal codes were then used to identify the Statistics Canada DA within which each school lay geographically. We reasoned that while the catchment area for each school was considerably larger than the individual DA, this would still provide us with a good indication of the SES level of the nearby surrounding area for each school. This decision was made on the basis that there are no dramatic changes in the SES of adjoining DAs in Edmonton; in other words, the transition from low to middle to upper-middle SES areas is rather gradual rather than abrupt. Additionally, for variables for which Statistics Canada simply reports frequency data, we converted the frequency data for each DA to percentages by dividing the frequencies by the total number of respondents for each DA. Thus variables were comparable across DAs.

From the 2172 variables provided to us from the Statistics Canada data set, we identified those variables that could be classified into the following categories: family income, family assets, family ancestry, and parental educational attainment. We used data reported as means or medians directly and created new variables to reflect means based on the original data. This resulted in a total of 39 demographic variables, our dependent variables, for the study.

Our regression analysis began with all 39 demographic variables and, using a backwards stepwise approach, variables were eliminated which did not contribute significantly to the variance in the data. Significance levels were held to the standard 0.05 level.

---

<sup>1</sup> A dissemination area (DA) is a small, relatively stable geographic unit composed of one or more adjacent dissemination blocks. It is the smallest standard geographic area for which all census data are disseminated. DAs have a population of 400 to 700 persons. All of Canada is divided into dissemination areas (Statistics Canada, 2013).

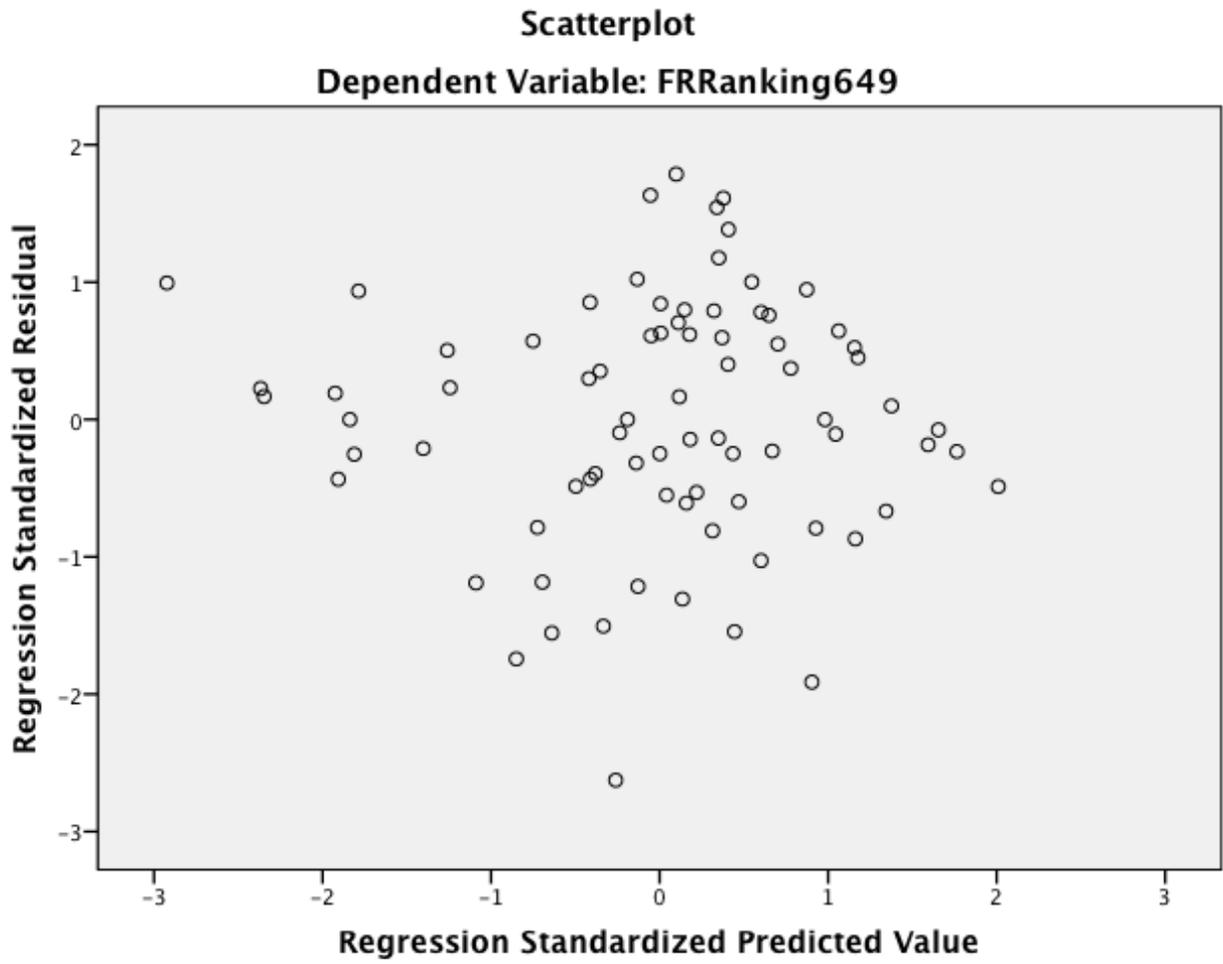

## Findings

Our backwards stepwise regression analysis yielded a model with 17 independent variables (see Table 1,  $F = 7.723$ ,  $p = .000$ ) explaining 59.4% (after adjusting for interactions among the independent variables) of the variance ( $r^2 = .594$ ), in the academic school rankings obtained from the Fraser Institute. An examination of a scatterplot of standardized residuals versus standardized predicted scores yielded no anomalies beyond three standard deviations positive or negative (see Figure 1). The assumptions underlying the multiple regression analysis were met.

Table 1. Coefficients of regression remaining after backwards stepwise regression ( $\alpha = 0.05$ )

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig
	B	Standard Error	Beta		
(constant)	10132.753	2558.960		3.960	.000
Percent of lone parent families ( $x_1$ )	280.202	159.734	.171	1.754	.084
Average number of rooms per dwelling ( $x_2$ )	-87.802	18.992	-.495	-4.623	.000
Percent of dwellings needing minor repairs ( $x_3$ )	410.748	198.563	.235	2.069	.043
Percent of dwellings built before 1946 ( $x_4$ )	436.433	188.629	.186	2.314	.024
Percent of dwellings built before 1986 ( $x_5$ )	202.674	75.489	.350	2.685	.009
Percent of dwellings built after 2000 ( $x_6$ )	768.791	197.232	.848	3.898	.000
Percent of pop. whose mother tongue is English ( $x_7$ )	-905.089	191.805	-.490	-4.719	.000
Percent of pop. whose mother tongue is French ( $x_8$ )	-983.033	531.057	-.152	-1.851	.069
Percent of pop. whose mother tongue is European (but not English or French) ( $x_9$ )	-933.925	380.837	-.225	-2.452	.017
Percent of pop. whose mother tongue is South East Asian ( $x_{10}$ )	-656.851	279.005	-.212	-2.354	.022
Percent of pop. whose mother tongue is Creole-based ( $x_{11}$ )	-26926.861	11215.652	-.180	-2.401	.019
Percent of pop. who have not moved within one year ( $x_{12}$ )	-8637.603	2500.296	-5.266	-3.455	.001
Percent of pop. who have moved within one year ( $x_{13}$ )	-9203.185	2548.827	-5.577	-3.611	.001
Percent of pop. aged 25 – 64 employed without a certificate, diploma, or degree ( $x_{14}$ )	-1123.380	489.690	-.500	-2.294	.025
Percent of pop. aged 25 – 64 employed with an apprenticeship or trades certificate ( $x_{15}$ )	3975.242	866.500	1.685	4.588	.000
Percent of pop. aged 25 – 64 employed with a College certificate/diploma ( $x_{16}$ )	-765.122	422.350	-.776	-1.812	.075
Percentage of pop. aged 25 – 64 employed with a University undergrad certificate or diploma ( $x_{17}$ )	-3046.012	1249.145	-.955	-2.438	.018

Figure 1. Check of assumptions for regression analysis.

Not surprisingly, given the literature exploring the effects of SES on student achievement, this simple regression analysis yields a model that explains almost 60% of the variance in school achievement by simply drawing on demographic data from each school's local geographic area. In interpreting the results of this analysis the reader must keep in mind that the dependent variable was provided such that lower numbered ranks indicated higher levels of achievement (e.g., the school ranked as "1" has a higher level of achievement, and therefore, as far as the Fraser Institute report writers are concerned, is more desirable than one ranked "600" in their list); therefore, variables loading negatively actually correspond to local school achievement improving.

Variables such as mother-tongue origins, size, age, and state of repair of the family dwelling, proportion of lone parent families, education levels of employed adults aged 25 to 65 all combine to explain a very large proportion of the factors contributing to school achievement rank. There are some anomalies in our model that we wish to explore further to develop a deeper understanding of how these results may have come about. For example, the identification of both those people who have moved within one year and those who have not moved within one year - increased numbers of either both contributing to increased achievement ranking of the local school. Another that surprises us is related to education levels of the population aged 25 to 65; namely that being employed without a certificate, diploma, or degree of any kind related positively to increased levels of local school achievement, while being employed with an apprenticeship or trade certificate related negatively to increased levels of local school achievement. Another very surprising, to us, finding was that average or median family income did not form part of this regression model.

We, the authors of this paper, are not suggesting that because demographic variables play such a large role in levels of local school achievement we should simply give up on those communities whose

socio-economic capital is toward the lower end of our society's continuum. In fact, we advocate quite the opposite, and what is really the basis for this exercise, school academic achievement ranking lists typically promote the idea in many members of society that they are a valuable tool for selecting the best, or at least better, schools for their children; however, what we find is that parents who choose to remove their children from their local schools, because they are given choice and they have the means by which to transport their children elsewhere, actually reduce the social capital of the student population at their local school – further reducing the local school staff's ability to demonstrate how they are truly able to prepare their learners to successfully learn and master curriculum. Schools of choice further contribute to this effect by skimming off students whose parents have the social capital and who are able to provide the best supports for their children to value education and to be educationally successful.

We are very concerned about how school achievement ranking lists, such as the one from which we drew our dependent variable, are provided to members of society. The superficial message that most people who take these ranking lists seriously take away is that in order to provide their children with the best possible education they must move their children to one of those schools ranked highly. Unwittingly, they don't realize that a great deal of what makes local schools high achieving is grounded in the social capital that the families in the community bring to bear in supporting their children to learn and their teachers to teach. As a society we should, instead of focusing on easily quantified rankings, focus on the social issues underlying the lower academic achievement of some schools. Our focus needs to be on how to give all parents excellent educational experiences and relationships with their schools (i.e., with teachers, school leaders, support staff) so that they value education and see that time and effort in supporting their children is a valuable investment. Society also needs to address the social issues many children from low SES communities face on a daily basis.

**6. Abstract**

The entrance ways of most schools display “No Skateboarding” signs to deter youth from using school staircases and walkways as playgrounds for their wheeled devices, but are schools striking the right balance between banning skateboards and encouraging youth activity? This paper juxtaposes contemporary architectural philosophy and injury incidence data to paint a picture of a hidden curriculum deep within the subconscious of our litigious education systems. At heart: the phenomenological experience of youth skateboarders at school.

Growing out of pools, ramps, and skateparks, modern skateboarding terrain involved anything encountered in the modern city. ... The new skateboarding sites are not private houses or suburban roads, hidden from public view, but university campuses, urban squares, public institutions, national theatres, commercial office plazas, as well as the more public quotidian spaces of back streets, main roads, alleys, sidewalks, malls and car-parks. ... Compared to the suburbs, city cores offer more opportunities and concentrated heterogeneous social spaces. (pp. 179/186)

Kelvin Ho

*Skateboarding: An Interpretation of Space in the Olympic City*

Thus where the decentralized suburb promotes life as divorced from the city, isolating people from participatory creativity, skateboarders related individual life to the form of the city, reintroducing the city as creative and active oeuvre and thus conceptually moving the suburb closer to the complex contradictions of the city core. ### **‘No Signs’ & ‘Accidental Skateparks’**

A few years ago, I noticed an interesting feature that seemed to be a part of the design of all of Calgary’s schools. Posted near the multiple entranceways of hundreds of schools, a sign was affixed to the brick facade. This sign didn’t bear a welcome to the school, a brand extension

of the school board's mission statement (such as "future leaders at work and play"), nor even a courteous reminder for guests to please register at the office on their way into the school. No, the message found ubiquitously on all of Calgary's school reads as follows: No Skateboarding, No Scooters, No Rollerblading (Figure 1).

Figure 1. The sign affixed to all Calgary Board of Education schools. Although hard to see at this resolution, the sign is also the canvas for two different types of graffiti: stickers from a nearby skateboard store (including one crossing out the word "no"), and pencil writing (written over top of the word "no" so the sign reads "go skateboarding"). (Grassick, 2013).

I have taught in Calgary for almost ten years and it is only recently that these 'No Signs' have emerged from the urban background to the forefront of my attention. This occurred when I was visiting a school for an after-hours meeting. When I pulled up in front of the main office and got out of my car, I stopped and laughed. At the base of the walls leading toward the front

doors, the bottom of the outer school walls were angled concrete ramps. The walkway to the school's entrance had these ramps on both sides. Although the grade and angle were not exactly consistent with the smooth transition found in skateboard and snowboard terrain parks around the world, there could be no doubt; I was standing in a half-pipe. Looking right, I saw that the school was ringed in asphalt and that rest of the school's walls ended in more ramps and raised

Figure 2. 'Accidental skateparks' outside three Calgary schools. 1A-C shows an entranceway that was part of a redesign at the turn of the century. A new office and library wing was added to the school and this entranceway was built with a ramp (not visible), multiple sets of three stairs, handrails and multi-level stone gardens with smooth concrete edges. 2A-C shows a 1960s school built into a slight hill. The main entrance (2C) includes a relatively steep set of steps which splits into two directions and two more sets of steps before reaching street level. 2B shows a section of the walkway that runs parallel to the road where a series of three benches are set just above the asphalt leading to the back door of the school (2A) where a longer set of stairs leads from the school down to a graded section of pavement and the road. 3A and 3B show the school mentioned in the introduction. The angled ramps leading to the school's entrance can be seen somewhat in 3A, but 3B clearly shows the ramps and benches that surround the school. Photos from Google Maps.

bike racks) a number of important questions immediately spring to mind: Where do these signs come from? What do they attempt to produce? What do they mean? What is it like to be a student who skateboards, scooters, or rollerblades who is confronted by these signs on a daily basis? What do these signs say to students about what their schools value?

These questions lend themselves to hermeneutic and phenomenological consideration. Hermeneutics is the study of interpreting 'texts' to derive their meaning, underlying values, and origins (Buchanan, 2010). Texts worth studying in this inquiry are school board policy statements, municipal bylaws, and the architectural space itself.

"As an approach to research in education, phenomenology involves a careful and systematic reflection on the lived experience of a pedagogical phenomenon," (Adams & Thompson, 2010, p. 736). Phenomenological lenses are particularly helpful at helping determine students' affective response to No Signs and the institutional thinking that produced them. In their 2010 paper, *Interviewing Objects: Including Educational Technologies as Qualitative Research Participants* Cathy Adams and Terrie Lynn Thompson propose a series of heuristics which allow an object to be interviewed as an active research participant. The heuristics are derived from merging the horizons of Adams's hermeneutic-phenomenological work with Thompson's Actor-Network Theory (ANT) approach. For this paper, I will employ a number of Adams and Thompson's heuristics to interview, not the No Signs, but the architectural school space itself.

Although my interpretations on school space could certainly be drawn by any student who navigates urban space in a non-mainstream fashion (parkour 'traceurs', unicyclists, BMX bikers, pogo-stickers, and those skiers and snowboarders who move ice shavings and snow from their local hockey arenas so they can jam urban rails), I will focus this paper on skateboarders

because they have been the subject of considerably more research than other de/reterritorializers of urban space. The terms “skateboarder”, “skater”, and “rider” will be used interchangeably.

### **On Architectural “Space”**

Arguably the world’s leading skateboarding academic is Iain Borden, who is neither a cultural historian nor a youth anthropologist, but a professor of architecture who specializes in critical urban re/design. In his book *Skateboarding, Space, and the City: Architecture and the Body* (2001), Borden points out that the notion of “space” in architecture has changed over the last century. Initially, the product of architecture was the design and construction of structures within space. With the development of gestalt psychology, architects began to pay more conscious attention in their designs to building space between structures as part of the architecture. Only recently has architecture started to take a new turn thanks to the writings of Henri Lefebvre. Contemporary architecture includes an understanding that space and architecture are created by those who inhabit and move through the spaces between structures. As Borden states:

Architecture, like all other cultural objects, is not made just once, but is made and remade over and over again. Each time it is represented through another medium, each time its surroundings change, each time different people experience it. (2001, p. 5)

Informed by a swath of researchers including Foucault, Lacan, Lefebvre, Heidegger, and Idhe, contemporary architecture is not an object, but a series of multiple interactions created as different subjects enter into short-term relationships with the objects inhabiting a space as they move through it.

In a culture stuck on cruise control, the [O]ther skater chooses to operate in a forgotten no-man's land. In fact, the skater thrives on using the discarded, abandoned and generally disregarded portions and structures of the society at large. Metropolitan dwellers are simply witnesses to the functioning of the city, where the experience of urban space is like that of a museum, with visitors' bodies controlled by an 'organized walking' of contrived route, speed, gestures, speaking and sound.' (Borden, p. 190, 2001).

The same entranceway of a school can be read in multiple ways and the space itself is created by different agents. To the average school 'comer-or-goer', the entranceways shown in Figure 2 are neither special nor flexible in their potential uses. They are conduits into and out of the school, nothing more. To me, the steps and handrails are virtual skatepark elements; I have neither the skill nor the inclination to negotiate these elements on a skateboard myself but I can see the potentiality of the space. To a student skateboarder, however, the "handrails aren't for people with mobility problems" (2001, p. 192), they're an object to ollie onto that allows for a downward flow to the concrete below. These youth not only see the multiplicity of affordances that certain arrangements of concrete, steps, and handrails provide, but they are able to change how they negotiate these spaces in unique ways that transform a school entranceway, for example, into a performative skatepark.

Once you are introduced to the idea that school entranceways can be deterritorialized and reterritorialized by skateboarders, you come to see the multiplicities of the shapes that were intentionally designed by school architects, but that perfectly align with the needs of young riders. In Figure 2, there are numerous stretches of smooth concrete and asphalt runways needed

to gain speed, take-off zones and landing zones for tricks, and run-outs that can be used to come to a safe stop or to redirect the board's direction for another pass.

Contemporary architecture also demands that designers consider the temporal aspect of space. A school entranceway is only such for a few busy periods at the beginning and close of the school day and at either end of recesses, breaks, and the lunch hour. For the vast majority of the day, these spaces are vacant and functionless. They are no longer entranceways, they are a meaningless assemblage of structures. Their designed monofunction dissolves into functionlessness. The space becomes entirely virtual, an area ripe for deterritorialization by skaters.

### **The Skateboard as a Reading Device**

Objects touch one another, feel, smell, and hear one another. Then they contemplate one another with eye and gaze. One truly gets the impression that every shape in space, every spatial plane, constitutes a mirror and produces a mirage effect; that within each body the rest of the world is reflected, and referred back to, in an ever-renewed to-and-fro of reciprocal reflection, an interplay of shifting colours, lights and forms. (Lefebvre in Borden, p. 105, 2001).

Skateboards 'read' the urban environments through their skateboards, arranging corridors of space (stretches of pavement, drops, rails, benches, and sets of steps) together like words in a sentence. Skateboarder and skateboard develop a human-machine relationship that Idhe (1979) refers to as "embodiment". The rider experiences the city *through* his board, each bump and crack of the urban environment is absorbed into his body. The board affords the experiencing of

the landscape as an extension of the rider (Ho, 1999). Not only is the city read through the skateboard like brail on a page is read by a trained hand, but it's song can also be heard.

I listen to the skateboard. ... Skating over concrete with consistently spaced [concrete slabs] produces a regular rhythm that varies according to my velocity. Also, the different textures of the ground surface will communicate their qualities to me aurally. A smooth skateable surface such as marble, for example, will reveal itself in smooth, calm sounds, whereas an unskateable surface such as gravel will sound coarse and unforgiving. (Ho, p. 101, 1999).

### **What Schools Value**

In his analysis of human-technology relations, Don Ihde (1979) describes how some objects that exist almost constantly in our surroundings disappear into the background. These taken-for-granted constructions remain hidden to us until they reemerge as 'Other' due to some breakdown (such as when a vending machine fails to accept your money or holds on to your Coffee Crisp, dangling it in front of your eyes behind the impenetrable glass forcefield) or due to a sudden temporal-spatial change (like the vending machine that just fell on top of someone who was rocking it, trying to retrieve a mis-vended chocolate bar). Background and alterity can be applied to the human-spatial relations which occur by different actors negotiating the same space. A school administrator is functionally blind to the space of their school entranceway; this space and its stairs and handrails has fallen into the background. This space becomes Other when the administrator leaves school one afternoon and finds that a 'mob' of skateboarding youth have reterritorialized the entranceway for 'anOther' purpose.

The No Sign was designed, mass produced, and mounted on schools for a reason: to prevent the use of school spaces by riders. Its messaging is explicit, its intent is clear. But what

values does it promote and whose values are they? What is the hidden curriculum of these signs?

### It's About Keeping Kids Safe

Why no skateboards? Because skateboards are dangerous. Doctors, administrators, and school board lawyers are worried about possible litigation stemming from skaters colliding with pedestrians or from parents expressing outrage that their children were injured while skateboarding on the school's property (Borden, 2001).

Skating is dangerous. A number of studies from Australia, America, Canada, and the United Kingdom have found conclusively that skateboarding is one of the leading causes of adolescent injury, causing between 21-24% of all falls (Berström, & Björnstig, 1991; Konkin, et al., 2006; Harris, Allyson, Rowe, & Voaklander, 2012; Unni, Locklair, Morrow, & Estrada, 2012; Lincoln, Caswell, Almquist, Reginald, Norris, & Hinton, 2011). Most skate-related injuries resulted in non-urgent and semi-urgent traumas to the extremities that required mostly non-surgical medical interventions. Fatalities are extremely rare and other activities result in injury rates similar or great than those of skateboarding.

Cause of injury	<1 y	1-4 y	5-9 y	10-14 y	Total	% of all falls
Fall from one level to another (tree, haystack, stationary vehicle, embankment)	28	44	75	31	175	26%
Fall from playground equipment	0	38	84	9	131	19%
Fall from furniture (including chair, bed, other furniture)	18	54	30	1	106	16%
Fall from slipping and tripping	0	32	24	16	72	11%
Fall from stairs	4	16	5	5	30	4%
Fall from skateboard	0	1	4	22	27	4%
Other	6	47	40	41	134	20%
<b>Total</b>	<b>56 (8%)</b>	<b>232 (34%)</b>	<b>262 (39%)</b>	<b>125 (19%)</b>	<b>675 (100%)</b>	<b>100</b>

Table 1. The cause of fall injuries organized by age (Unni, P., et al., p. 1459, 2012).

Unni, P., et al. (2012) studied the medical records of patients treated at a pediatric emergency care centre over a three year period. Table 1 show the causes of fall injuries organized by age. Skateboarding does account for a large number (22 out of 125 cases; or 17.6%) of falls resulting in injury for youth aged 10-14, warranting its own row on the table. The number of skateboard injuries, however, is less than the incidence of injuries sustained by children falling from trees, stationary vehicles, and embankments (31/125; 24.8%), and is half as much as 'other' falls which include injuries sustained on trampolines, while roughhousing, while engaged in organized sport and in unstructured play (41/125; 32.8%). Looking at injuries due to falls for younger primary students (aged 5-9), one must notice that skateboarding related injuries essentially disappear but are replaced by a startlingly high number of injuries from falling during all sorts of activities including falls from playground equipment and furniture.

At school specifically, physical education classes and team sports cause 46% of all injuries across all grade levels, with another 38% occur during unstructured play during lunch and recess breaks (Berström, & Björnstig, 1991). Despite this schools don't come equipped with "No Playing on the Playground" and "No Playing Soccer" signs. There are values and norms at work here. Why are only a few activities seen by school authorities as being unsafe? Why is bike culture the norm, but skate culture is not?

Bicycle riding is a potentially dangerous activity that results in injuries across all age groups (Konkin, et al., 2006), but bicycle riding is the only activity that is explicitly prohibited in administrative regulations for the Calgary school board whose schools and signs are the focus of this paper (CBE, 2005). The policy mentions neither skateboards, scooters, nor roller blades nor does it make use of the broad term "wheeled conveyance" used in the City of Calgary's Parks

and Pathways bylaw (2011). If bicycles aren't permitted on school grounds, why are there bicycle racks in every school yard?

Ironically, perhaps the greatest risk to students is the one that is so socially acceptable that it fades completely into the background. Despite their risks, skateboards will never be as dangerous as cars. In 2009, cars caused 172,883 injuries in Canada; 11,451 being serious enough to require emergency medical care, and 2,209 resulting in death (Transport Canada, 2009). Regardless, a study in Victoria found that, despite living within a 20 minute walk from school, 56% of school-age children commuted by car (Underwood, 2012).

### **It's Not About Keeping Kids Safe**

No one wants to see a student get hurt at school, nor do youth skateboarders want to hurt pedestrians. Both adult authority figures and skaters alike want their schools to be safe, but, why then are other school-based activities which are as likely as skating to result in injury, permitted? How can a school prohibit skateboarding but condone the frequent use of motor vehicles?

Skateboard- made of wood, metal and plastic, costs about £100, runs on leg power; causes chips and scratches on bits of stone and metal. Car- costs a fortune, runs on poisonous shit, pollutes the air and water, fills the city with 'smog', causes the death of hundreds of thousands of people every year. Mmmmm? And yet, despite all this cars are O.K. but skateboards are evil, objects of vandalism, a dangerous menace that must be stopped. (Borden, 2001, p. 257)

'Safety' is a master signifier, a form of hermeneutic cheating that schools use to explain away activities that they don't want to understand (or don't want to take the time to understand). The hidden curriculum inherent in the No Signs does not come from a desire for safety (solely),

but also stems from the dominant culture's disrespect and aversion to countercultural youth activities. Lefebvre points out that architecture can be explored in terms of rhythm analysis. Skaters don't move through space at the same rate and in the same linear fashion as do pedestrians and bicyclists, rather they deke and weave through crowds very quickly and then occupy public common spaces (like stair cases, parking garages, and plazas) for extended periods of time. Temporal-spatially, skaters are Others.

### **Mixed Messages**

As Giroux says, the school is "organized not to eliminate differences but to regulate them through cultural and social divisions... [D]ifferences are either ignored ... or subordinated to the imperatives of a history and culture that is linear and uniform" (2000, p. 177). He uses the term "border youth" to describe those who occupy the fringes of social institutions and who must be brought into the centre. Twenty years ago, only a handful of institutions and boosters saw skateboarding as the 'best youthful antidote to urban boredom that has come along for years' (The Times of London), more usually the public dialog was about banning skateboarding from the city streets. Such concerns have now died away, perhaps from the realization that skateboarding although physically robust is not inherently life-threatening. (Borden, pp. 249/250, 2001).

The City of Calgary has an award-winning multi-phase Skateboarding Amenities Strategy that is seeking to increase the amount of skatepark space available to the city's exploding youth population. A skatepark recently opened on the Vancouver campus of the University of British Columbia. Some communities in Australia are actively encouraging skateboarding as an acceptable youth sport. Some cities in Europe, the United States, Canada,

(and even Pakistan) have opened skateboarding alternative schools. Yet there seems to be little interest by Calgary school authorities to acknowledge and accept skate“border” youth into the mainstream public space of the school.

Despite widespread cries to battle youth obesity, and research supporting the value of unstructured play (Figure 3), anti-skateboarding sentiments still permeate our schools. Giroux (2000) begs teachers to consider the roots of modern identity formation in youth so articulately, that he merits quoting verbatim here.

This is a world in which one is condemned to wander across, within, and between multiple borders and spaces marked by excess, otherness, difference, and a dislocating notion of meaning and attention. ... No longer belonging to any one place or location, youth increasingly inhabit shifting cultural and social spheres marked by a plurality of languages and cultures. (Giroux, p. 180, 2000).

Educators need to understand how different identities among youth are being produced in spheres generally ignored by schools. Included here would be an analysis of how pedagogy works to produce, circulate, and confirm particular forms of knowledge and desires in those diverse public and popular spheres where sounds, images, print, and electronic culture attempt to harness meaning for and against the possibility of expanding social justice and human dignity. Shopping malls, street communities, video halls, coffee shops, television culture, and other elements of popular culture must become serious objects of school knowledge. (Giroux, p. 190, 2000).

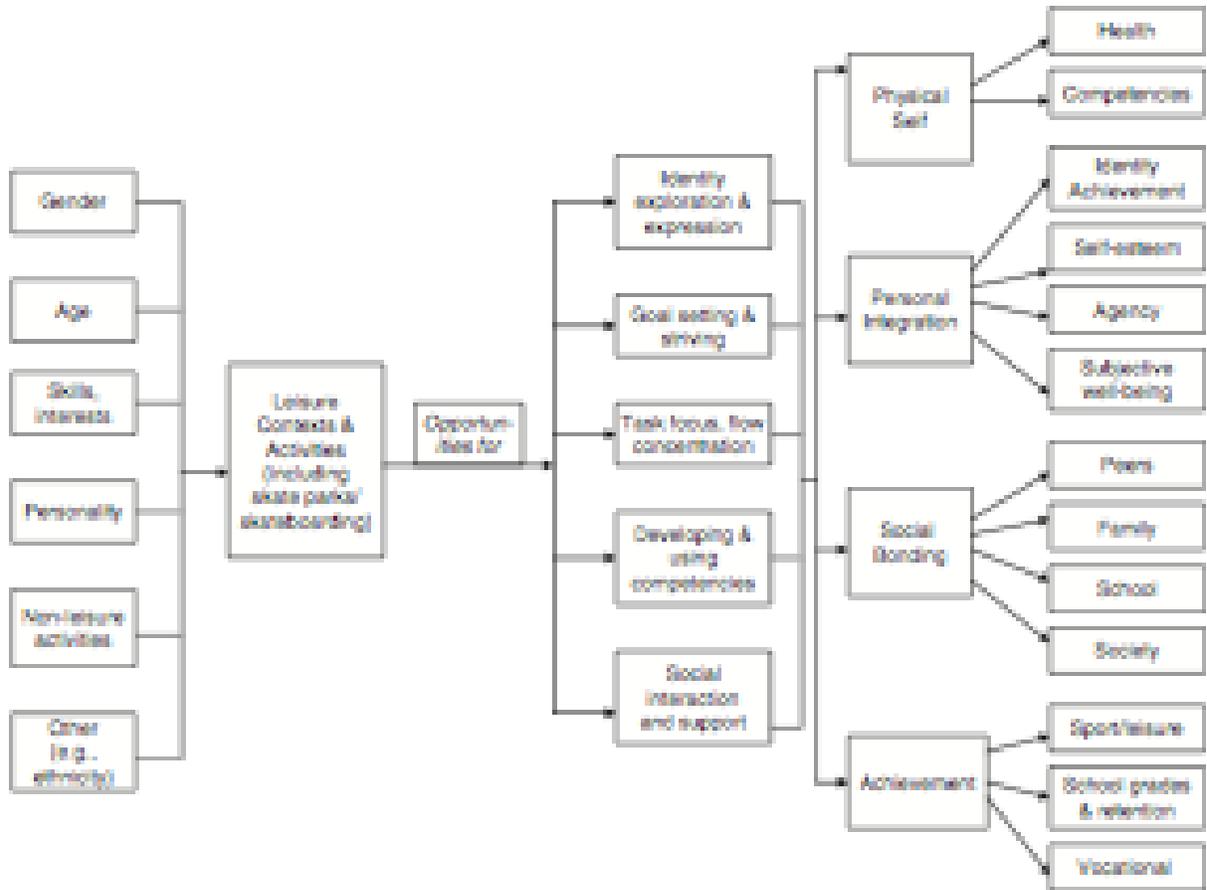

Figure 3. The benefits derived from unstructured play. (Bradley, p. 293, 2010)

Schools are meant to be inclusive spaces, but the use of No Signs and their undercurrent non sequitur logic persist and need to be confronted and resisted.

### Conditional Identities

I went into a clothes store and a girl came up to me and said, ‘If you need anything, I’m Jill.’

I thought, *This is amazing! I’ve never met anyone with a conditional identity before.* ‘Wait! Who are you if I don’t need anything?’

‘If you don’t need anything, then I’m Eugene’. (Martin, 2006)

Comedian Demetri Martin tells the joke above during a number of his shows in which he deconstructs word choices and meaning. Although the idea of a ‘conditional identity’ is a humorous one, it does apply in the case of skateboarders at school where no skateboarding is allowed.

Bruno Latour contends that, when different subjects and objects are assembled, complex human–technology hybrids emerge which engage “new intentions, associations, and actions” (as cited in Adams & Thompson, p. 733, 2011). Latour’s famous example is the ‘citizen-gun’ that results when a person and a firearm are brought into proximity. The way that the citizen-gun approaches the world and interactions is significantly different than the way the citizen-without-gun does. By extension, the configuration of skater-with-skateboard has different potentialities than the skater-without-skateboard.

A skater-without-board, compliant to the hierarchical and non-sensical rules of the No Sign and school authority, arrives to school and still sees the space of the school’s entranceways as the skater-with-skateboard would. Only now, without the tool that allows him to develop performative architecture, his ability to produce the actual space that he perceives is impaired; he is handicapped. Like ghosts able to see the world but not act upon it or a Greek character trapped in repetitive and ironic perpetual torture in Tartarus, skaters-without-skateboards are constantly disciplined. Not only suffering from not being able to occupy and negotiate space in the way he would prefer, a skater-without-skateboard suffers from a kind of ‘conditional identity crises’.

## Conclusion

Performative architecture, such as skateboarding and parkour, have different intention than traditional forms of architecture. They are less about “form, space, and materials, and more about critical place-making that seeks to subvert the power of hierarchies inherent in building edifices. ... Interestingly, the apparently powerless, can use the ‘tactics’ of movement and timing to usurp that power momentarily. ... Architecture has always repressed the ‘other’. (McGaw, p. 219/220, 2009)

No Signs are about oppressing skate“border” youth just enough that they’ll conform to institutional norms which emerged decades before their sport. The hidden curricular message being received is loud and clear: If you’re a student who is book smart, you’ve got it made. If you can draw, you’ve got a gift. If you are good with computers, you might be kind of a nerd, but you’ve got a future. If you’re a creative writer, teachers will love you. If you’re a skater, you’re not welcome.

**6. Abstract**

Across North America, teachers struggle to keep students engaged, to meet district standards, and to set them on career pathways where their skills and interests will be well-used. A way forward can be found in the original *Dungeons & Dragons* roleplaying games of the 1980s. The key is identifying student interests, changing how curriculum is organized, and designing “quests” and “feats” which require students to master new abilities and move through a progressive tree of skill development.

Teacher as Dungeon Master:  
Using Dungeons & Dragons to inform middle school curricular transformation

Dan Grassick

*Filled with dread, the group of adventurers peered around the bushes towards the large brick keep that held their treasure. Within the walled towers of the Arcane Academy lurked the Dire Necromancers of Administrivia and their undead servants, animated through an unholy combination of cheap coffee and dark magicks. The party ducked quickly for cover as two of the*

*ghouls suddenly appeared from the direction of the parking lot and stumbled for the front door, the putrid stench of caffeine and perfume billowing off their shuffling corpses. The adventurers quickly rolled their twenty-sided dice to check their fortitude. The six-year-old paladin, with his higher-than-average constitution score, rallied the group and urged them to bolster themselves. As the five-year-old thief disappeared under her elven cloak and crept off to look for an inconspicuous point of entry, the young wizard looked doubtfully at the high tower window of the Academy. Getting the vellum scrolls of knowledge might take a little longer than he had originally thought.*

\* \* \*

Twelve years later, most of these students will finally emerge from the dungeons of their mandatory schooling. Although some will carry found treasures and will be eager for their next quest, many will be beaten and bruised as a result of their constant battles against the competitive hordes in their classes who fought with them daily for the limited attention of barely-interested educators.

The teachers too had been shaped and scarred by the same system and had eventually become trapped within it, their summer vacations providing only a brief resuscitation once every solar cycle. Formerly engaging spellcasters who could combine various elements into a lesson that would captivate and expand the minds of their students, these acolytes of industrial education now use their skills in a cruel ritualistic fashion. Putting slide after slide onto their projectors, they cast monotonous lecture sleeping spells over their classes before summoning standardized tests, externally-produced measurable outcomes, and similar accountability beasts to pulverize their pupils physically and psychically. These teachers probably care that they are inflicting pain and suffering, but most days, they can hardly be bothered to look any one of their students in the eye (where they might recognize the slowly dying soul within)

There has to be a better way.

### **People Trapped in Glass [School]Houses Seem Stoned**

The problems of the industrial model of education that grew out of Western Capitalism, Scientific Management, and the Tyler Doctrine are not ground-breaking news. Neither is the increasingly-common sob story from teachers that today's millennial generation are more

difficult to engage than those who came before. Today's kids are less likely to congenially complete pointless busy work without complaint (either from their own mouths or from the mouths of their ever-present hover parents). It is not really fair to place fault with one party or the other. Many kids *do* want to be edutained; the cell phone in their pocket at any second has the potential to create an opportunity for something a thousand times better than even the best lesson on subject-verb agreements or the Canada's Constitution Act of 1982. How many lessons are that great anyway? Many teachers *do* plan terrible lessons and expect all students to be engaged at all times and every group of students to be the same as the last. Finally, many parents *do* hover like helicopters and arrive seconds after their children experience any discomfort (or carpet bomb all obstacles out of the way with a few proactive phone call strafing runs and email napalm deployments).

Isn't all of this the anticipated result of maintaining a broken structure even after all parties involved know it's broken? Certainly everyone is aware of and complicit in the system and the structure of the 20th century educational system. Together teachers, students, and parents can see into the glass school house and point to all the faults. The kids know that a great deal of what they're learning has no real connection or bearing on their lives or interests. The teachers know that externally prescribed assessments, reporting, and initiatives imposed alongside ever-decreasing budgets are taking away from their work and their students. Parents are reacting to a system that provides lots of evidence that it cares less and less for individual children and increasingly on average scores on international and inter-district exams. To the outside observer, it must seem like the people trapped in glass [school] houses must be stoned. But the control dramas and emerging neuroses of students, teachers, and parents are the product of being trapped with a hegemonious power that they don't know how to overthrow. My suggestion is to start by picking up a copy of the *Dungeons & Dragons Player's Handbook*.

### **D&D for Dummies (Skip this Section if You're Already a Level 21 Geek)**

The authors of the current (4th) edition of the *Dungeons & Dragons Player's Handbook* subtitled *Arcane, Divine, and Martial Heroes* begin as follows:

Before roleplaying games, before computer games, before trading card games, there were wargames. Using metal miniatures to re-create famous battles from history, wargamers were the original hobby gamers. In 1971, Gary Gygax created *Chainmail*, a set of rules that added fantastic creatures and magic into the traditional wargame. In 1972, Dave Arneson approached Gygax with a new take; instead of controlling a massive army, each player would play a single character, a hero. Instead of fighting each other, the heroes would cooperate to defeat villains and gain rewards. This combination of rules, miniatures, and imagination created a totally new entertainment experience, and in 1974 Gygax and Arneson published the first... DUNGEONS & DRAGONS game.

(Heinsoo, Collins, & Wyatt, 2008, p. 7).

The first Player's Handbook (PHB) published in 1978 became a seminal piece of gaming literature, providing the architecture and algorithms used in all role playing games (RPGs) that followed include today's massive multiplayer online RPGs (MMORPGs) like the *World of Warcraft*.

Players develop characters with different physical and mental attributes. These avatars are designed with complex backgrounds with race and motivation coming into play. Each player also chooses a character's class which determines their specialties, strengths, and weaknesses. Fighters, for example, are strong and have high endurance and are capable hand-to-hand combatants. Spell-casting wizards, however, are physically weaker but can launch devastating ranged attacks that help to control the flow of entire battlefields.

Each game of D&D involves multiple player-characters (PCs) and a Dungeon Master (DM), a non-player individual who designs the adventure, the landscape, and who controls the actions of all non-player-characters and determines the outcomes of all events and interactions in the game. In computerized derivatives of D&D, the Dungeon Master can be understood as a combination of the game designers who storyboard the quests and develop the monsters and the programmers who create the "game engine" that determines action success and failure.

D&D is a role-playing game..., where players and the Dungeon Master work together to craft a story of adventure... At its core D&D is a game of imagination. Players are able to act out their character, share in an ongoing story and engage in heroic combat. Unlike

computer RPGs, D&D is a social game where a group of players sit around a table and play. ... The game is framed by a series of rules to provide structure and the result of actions taken is determined by rolling dice. (Ellis, 2010, Section: What is Dungeons & Dragons, para. 2/3)

Of course, school is not governed by random throws of a dice, but it is based on a set of rules, characters, levels, abilities, and skills. D&D, despite its inner striations, it could represent a line of flight away from the predominant curricular system.

### **Personalized Learning**

A current movement in North America is towards “personalized learning” for students. Although the topic is contentious (mostly due to top-down implementation from school boards) the core tenants of personalized learning are easy for educators to accept: learning must begin with engagement, learning must be active and effortful, learning must be assessment-rich, and learning should be metacognitive and transformative (Calgary Board of Education, 2011). D&D can help with this.

One of the biggest challenges facing today’s educators is the perceived “need to edu-tain” students. Whether it is the result of growing up in a plugged-in wifi world or just the product of mundane teaching practices, students are case studies in narcolepsy. Kids need to find meaning in what they’re doing. They have to be engaged.

A lot of international attention is being paid to Finland with the Finnish education system being used as a lens through which to examine local pedagogical institutions. While reading Pahlis Sahlberg’s (2010) *Finnish lessons: What can the world learn from educational change in Finland?* many things jumped out at me, but two fundamental differences between the Finnish and Alberta education systems are worth mentioning in this essay.

In Finland, mandatory schooling starts at age seven; Finnish children start their formal public education two years later than Alberta students. This means that Finnish students upon entering the school for the first time are more cognitively developed at the beginning of their educational journeys, and they, arguably, have a greater sense of self and their personal interests. During their compulsory years of education, students progress grade-to-grade, sorted by age in much the same way as North American students, but with one considerable difference. At the age of sixteen, Finnish students choose to pursue either an academic or vocational stream for

high school and university. Either path results in respected careers and students can pursue post-secondary degrees regardless of the track they choose for their secondary education. In marked difference to North American culture, the Finns attach no stigma to those students who choose to pursue a vocational education.

In Alberta, teachers are very “streaming” conscious; the accepted pedagogical model at the middle school level is one of an inclusive classroom. Students may be working on adapted assignments based on their educational exceptionalities, but in general, the class is learning the same thing. I’ve taught middle school in Alberta for ten years so working with students in an inclusive classroom is something familiar to me. Despite what parental wishes, not all of my students will grow up to be engineers, doctors, or lawyers. Some are mechanics, chefs, and ballerinas. In stark contrast to the Finnish system, in most North American educational districts, students are not given freedom to pursue their educational interests until late in secondary school.

This essay will make use of what Guattari calls a transversality (1972/2003). Genosko (2002) defines “[t]ransversality [as] the tool used to open hitherto closed logics and hierarchies” (p. 78). Transversality is a tool which can be used to liberate and transform the routines of institutional life (Wallin, 2013). As a means to cracking open the industrial education model still employed in much of the western world, I will employ the role-playing game Dungeons & Dragons (D&D) as a transversal to crack open the existing structures of public education so its shortcomings can be better considered.

### **Learning must Begin with Engagement**

Dungeons & Dragons respects the differences of individuals and allows them to develop according to their desires. If public education was more like D&D, student engagement and identity would be handily addressed.

### **Attributes, Classes, and Skills**

The first steps of playing D&D is creating a player’s character. Of central importance in this design is assigning a character’s physical and mental attributes as they determine the prowess and abilities that enhance (or limit) how a character develops and what they are capable of doing. The six core attributes in Dungeons & Dragons are:

- Strength (Str)            measures your character's physical power. It's important for most characters who fight hand-to-hand.
- Constitution (Con)    represents your character's health, stamina, and vital force. All characters benefit from a high Constitution score.
- Dexterity (Dex)        measures hand-eye coordination, agility, reflexes, and balance.
- Intelligence (Int)     describes how well your character learns and reasons.
- Wisdom (Wis)          measures your common sense, perception, self-discipline, and empathy. You use your Wisdom score to notice details, sense danger, and get a read on other people.
- Charisma (Cha)        measures your force of personality, persuasiveness, and leadership.

(Heinsoo, et al., 2008, pp. 16/17)

Not all players have the same attributes, not all students do either. In the original version of D&D, starting attributes of PCs were determined by dice throws which meant that really low scores in any of the core attributes was possible (Myers, 2010, para. 2). Sexual recombination is kind of like rolling a twenty-sided die. Anything is possible although most outcomes fall into a middle range, with other extremes occurring less frequently. Not all students are going to have the Intelligence to be doctors. Those who are may not have the wisdom and charisma to work with people effectively and may find themselves unsuccessful in medicine as well. Being well-endowed in one attribute does not guarantee success any more than being weak in one attributes guarantees failure. Why in North American education is there still such a stigma attached to calling a spade a spade (or a non-academic student a non-academic student)? There are culturally-engrained definitions of what a "successful student" looks like, and these blind teachers to identifying other possible strengths in their students. It is essential for educators to see children not as an overall score (A+, Valedictorian) but as a unique combination of attributes, all of which can be developed (albeit some more easier than others).

It doesn't take kids very long to learn what they are interested in and to desire to explore and develop in these areas. Schooling is particularly good, I think, at killing this natural learning drive. We correct doodling, fidgeting, sass, and theatrics, but all are the unanswered screams of trapped artists, athletes, authors, and actors. Another significant aspect of D&D character development is the selection of a class. Each class of character has certain advantages and

weaknesses in terms of their attributes, skills, and abilities. There are many classes of character (and sub-classes and cross-class hybrids), but the basic categories suggested in the *Dungeons & Dragons Player's Handbook* (Heinsoo, et al., 2008, pp. 52) are the:

Cleric: A divinely inspired warrior.

Fighter: A master of martial combat.

Paladin: A champion dedicated to a specific deity.

Ranger: A ranged or two-weapon combat specialist.

Rogue: A combatant who uses stealth and slyness to thwart enemies.

Warlock: A wielder of arcane power gleaned from otherworldly entities.

Warlord: A commander who leads from the front.

Wizard : The world's most powerful purveyor of magic.

In the game, players are free to choose your class with all its strengths and limitations. In real life, I think children ultimately end up choosing their character class as well, but after they become aware of their own strengths and limitations. I suggest that educators should speed up this process a bit, and let students begin to specialize and develop certain skills and attributes during their middle school years.

In D&D, different classes require different skills sets; they can't progress with any success without developing certain key skills (Table 1).

### SKILL TRAINING

Training in a skill means that you have some combination of formal instruction, practical experience, and natural aptitude using that skill.

When you select a skill to be trained in, you gain a permanent +5 bonus to that skill. You can't gain training in a skill more than once.

The entry for your class in Chapter 4 tells you how many skills you're trained in and what skills you can choose at 1st level. For example, if you're a 1st-level warlock, you can pick four skills from a list of eight. You can take the Skill Training feat to gain training in a skill even if it's not on your class skill list. Some multiclass feats also give skill training.

The table below shows the skills available in the game, the ability modifier you use when you make that kind of skill check, and which classes have that skill as a class skill.

Key Skill	Ability	Class Skill for ...
Acrobatics	Dex	Ranger, rogue
Arcana	Int	Cleric, warlock, wizard
Athletics	Str	Fighter, ranger, rogue, warlord
Bluff	Cha	Rogue, warlock
Diplomacy	Cha	Cleric, paladin, warlord, wizard
Dungeoneering	Wis	Ranger, rogue, wizard
Endurance	Con	Fighter, paladin, ranger, warlord
Heal	Wis	Cleric, fighter, paladin, ranger, warlord
History	Int	Cleric, paladin, warlock, warlord, wizard
Insight	Wis	Cleric, paladin, rogue, warlock, wizard
Intimidate	Cha	Fighter, paladin, rogue, warlock, warlord
Nature	Wis	Ranger, wizard
Perception	Wis	Ranger, rogue
Religion	Int	Cleric, paladin, warlock, wizard
Stealth	Dex	Rogue, rogue
Streetwise	Cha	Fighter, rogue, warlock
Thievery	Dex	Rogue, warlock

### USING SKILLS

When you use a skill, you make a skill check. This check represents your training, your natural talent (your ability modifier), your overall experience (one-half your level), other applicable factors (relevant bonuses), and sheer luck (a die roll).

The DM tells you if a skill check is appropriate in a given situation or directs you to make a check if circumstances call for one.

### SKILL CHECK BONUSES

When you create your character, you should determine your base skill check bonus for each skill you know. Your base skill check bonus for a skill includes the following:

- ◆ One-half your level
- ◆ Your ability score modifier (each skill is based on one of your ability scores)
- ◆ A +5 bonus if you're trained in the skill

In addition, some or all of the following factors might apply to your base skill check bonus:

- ◆ Armor check penalty, if you're wearing some kinds of armor (see Chapter 7) and making a check using Strength, Dexterity, or Constitution as the key ability
- ◆ Racial or feat bonuses
- ◆ An item bonus from a magic item
- ◆ A power bonus
- ◆ Any untyped bonus that might apply

### SKILL CHECK

To make a skill check, roll 1d20 and add the following:

- ◆ Your base skill check bonus with the skill
- ◆ All situational modifiers that apply
- ◆ Bonuses and penalties from powers affecting you

The total is your check result.

### DIFFICULTY CLASS

When you make skill checks, high results are best. You're always trying to meet or beat a certain number. Often, that's a fixed number, called a Difficulty Class (DC). The DC depends on what you're trying to accomplish and is ultimately set by the Dungeon Master. The skill entries in this chapter give sample DCs for each skill. The DM sets the DCs for specific situations based on level, conditions, and circumstances, as detailed in the *Dungeon Master's Guide*. All DCs assume acting in situations that are far from mundane; the DM should call for checks only in dramatic situations.

### OPPOSED CHECKS

Sometimes, you make a skill check as a test of your skill in one area against another character's skill in the same area or in a different one. When you use Stealth, for example, you're testing your ability to hide against someone else's ability to spot hidden things (the Perception skill). These skill contests are called opposed checks. When you make an opposed check, both characters roll, and the higher check result wins. If there's a tie, the character with the higher check modifier wins. If it's still a tie, both sides roll again to break the tie.

Table 1. Dungeons & Dragons key skills for character classes. (Heinsoo, et al., 2008, p. 178)

There aren't many thieves who are lacking in stealth, being streetwise, or (of course) thievery. Through curricular redesign (perhaps involving a move towards competency-based education or breaking large courses into smaller modules) students could develop knowledge, skills, and abilities at school related to their fields of interest. Each student would be required to meet certain basic skill requirements in a field of study (in Math and Language Arts, for example), but they would be able to explore different skill areas to further their currere/career paths early in their schooling. The key, according to author Daniel Pink's (2011) *Drive: The Surprising Truth About What Motivates Us*, is providing students with opportunities to be autonomous, develop mastery, and pursue a purpose.

In some D&D itinerants, there are guild halls where PCs can gather to learn the skills important for different classes. Usually skill development happens more quickly in a guild hall than through occasional skill use in the world-at-large. Such is the story of arts and vocational schools. An artist learns more about painting with acrylics when she paints for three hours a day for four months straight than if she were to participate in two painting weekends *en plein air* over the course of a year. Schools should, therefore, be structured like guild halls with various

classroom spaces being allocated for different types of skill development. Although one could argue that schools are already arranged this way, the difference is that in today's classrooms, the students are grouped against their will and are organized into semi-fixed grade and class groups. The D&D school spaces I'm proposing would be more dynamic; with students coming-and-going continuously over the course of the school day, moved by desire rather than automated bells. If a young thief wants to improve their pick-pocketing skills, he can practice for six hours a day. If a young mathematician wants to master trigonometry, they can do so.

### Learning is Effortful & Assessment-Rich

So far the ways D&D can be used in teaching that I've shared are pretty superficial. A key difference would be in how knowledge is assessed and how students advance.

### Player Development & the Role of the Dungeon Master

In D&D, as characters win battles and complete tasks, they gain experience points (XP). Once a certain number of XP is reached, the character "levels up" and gains more attributes, skills and abilities as shown on of the current player hand book (Table 2).

Total XP	Level	Ability Scores	Powers and Features	Feat
0	1st	see race	class features; racial traits; gain 1 feat; train starting skills; gain 2 at-will attack powers; gain 1 encounter attack power; gain 1 daily attack power	
1,000	2nd	—	gain 1 utility power; gain 1 feat	
2,250	3rd	—	gain 1 encounter attack power	
3,750	4th	+1 to two	gain 1 feat	
5,500	5th	—	gain 1 daily attack power	
7,500	6th	—	gain 1 utility power, gain 1 feat	
10,000	7th	—	gain 1 encounter attack power	
13,000	8th	+1 to two	gain 1 feat	

Table 2. Dungeons & Dragons character advancement. (Heinsoo, et al., 2008, p. 28)

The particular sequence of events of the game, including their reward payoffs are determined by the D&D Dungeon Master (DM).

The Dungeon Master controls the monsters and villains in the adventure, but he isn't your adversary. The DM's job is to provide a framework for the whole group to enjoy an exciting adventure. That means challenging the player-characters with interesting

encounters and tests, keeping the game moving, and applying the rules fairly. (Heinsoo, et al., 2008, p. 8).

The Teacher as Dungeon Master would need to develop a number of individual tasks or series of tasks organized into “quests” for her students. These quests, like those in MMORPGs, would involve small steps that may occur concurrently and in synchronicity. A student might, for example, be working on the quest called “Make a Sushi Roll” which would require her to develop her basic knife skills, to research edible fish and types of knives at the same time that he pursues a crash course in Japanese culture and cuisine.

In most versions of D&D, when players level up a certain number of times, they gain new skills and receive points they can distribute among their attribute scores (i.e. they become stronger, smarter, or more deft while at the same time becoming more skilled). In a general sense, the same thing also happens as students move through the grades in a western school system, but I think this underlying architecture should become much more explicit.

What I’d like to see (maybe develop) is a skill tree version of Alberta’s provincial curriculum that doesn’t necessarily group specific outcomes by grade and topic with advancement based on month and year, but by grouped clusters of knowledge which branch out and interconnect with advancement based on mastery of specific nodes on the tree. Access to some branches and skills on the tree would be dependent on prior accomplishments which “unlock” new avenues for growth. These prerequisites might not all belong to a single “branch of knowledge” in isolation, but may require progress on multiple branches. We can see examples of knowledge tree structures in the lesson progression for Math skills provided by the Khan Academy website (Figure 1) and in cultural development structure of the game *Civilization* (Figure 2).

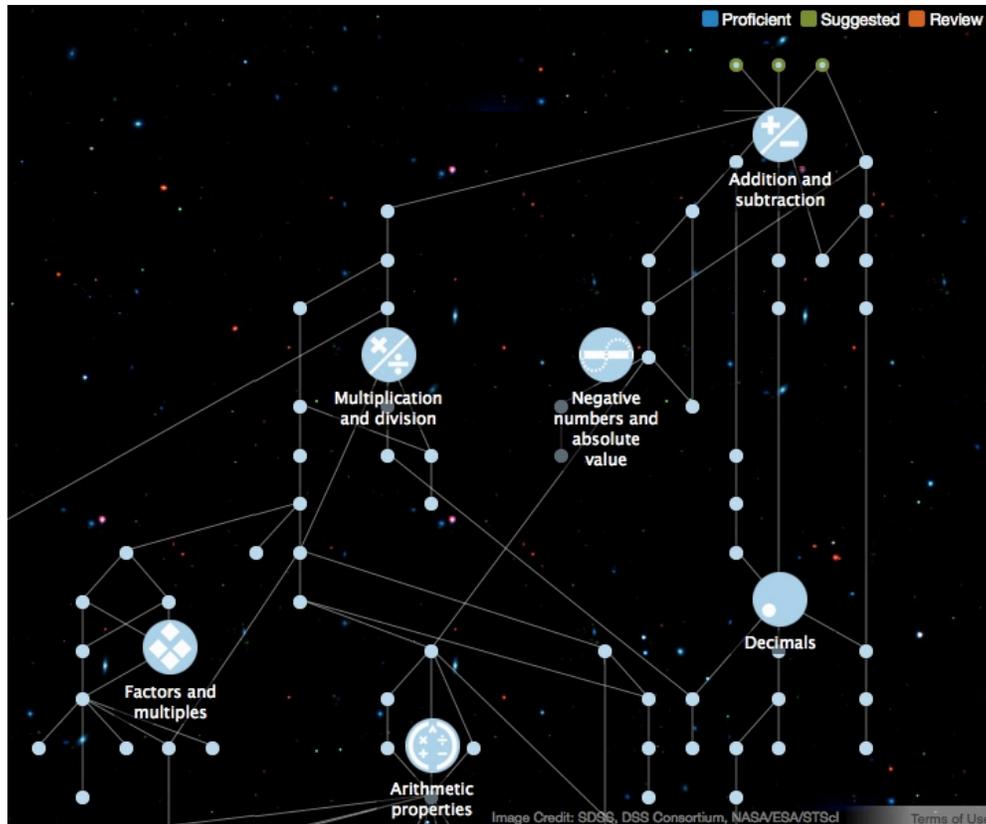

Figure 1. Knowledge tree from the Khan Academy. ([www.khanacademy.org](http://www.khanacademy.org))

In the Khan Academy, students begin with a limited number of green node skills where they can start learning about a particular topic. As they progress, they can access light blue nodes which become available, increasing the number of topics and skills which the student can explore.

exploration, physical and social skills). As students develop mastery in a particular area, more options become available to them. Some of these paths and options would have prerequisites (maybe not just the lower-level skill, but, like in D&D, certain attributes or experience levels may be needed before a particular experience is made available). For a student to start exploring mixed media arts, for example, they would need to have completed tasks relating to: basic visual design; drawing; visual representation in the language arts; and either water colour, acrylic, or oil painting.

The big job of the Teacher as Dungeon Master would be to monitor student progress and to set “Goldilocks” assessment tasks for each skill node which are neither too hard, too easy, but are just right. Each task over which a student gains mastery comes with some form of XP/credit which students can use to “level up”.

### **Min/Maxing**

In D&D, min/maxing is the term used to describe a player-character who continually increases their character’s already strong attributes ignoring their areas of weakness (e.g. your wizard can still be easily smote by a single mighty blow from a troll, but he is likely to transport the troll and all of his ancestors into a volcano before this can happen). The purpose of a D&D classroom would not be to allow students to work around their areas of weakness while pursuing their passions, but to develop holistically as well. This could be done by requiring certain “fundamental” skills and knowledge prior to leveling up.

### **Feats**

In a D&D school, would students wander around randomly “doing stuff” with no summative skill assessments? Would everything be based on project and module work? In D&D, “feats” are special abilities which are granted at certain levels. For example, at level 8, a fighter might suddenly be able to fight with weapons in both hands, something that was previously impossible (or which incurred huge penalties to his attack strength). Instead of awarding similar abilities to students in a D&D classroom, the Teacher as Dungeon Master could assign particular feats as a summative assessment before a student could level up. This means the student would have to demonstrate knowledge and skill in all of the modules that they’ve completed up to that point. For younger students, these feats would be very similar (since less

specialization is available at lower levels). For older students, these feats would become highly personalized. These could take the forms of tests or project-based tasks. Regardless, once the student has completed their assigned feat, there should be little doubt whether they are ready to level up or not.

### **Learning is Transformative**

Once a student can successfully demonstrate knowledge and skill in a certain number of areas (and has completed the required feat) she will level up and be able to work on increasingly difficult concepts and tasks. This is no different than the current grade-based model except that progress is not limited to a ten-month academic year; it happens when a student demonstrates mastery.

### **Branching Out**

Besides new modules only becoming available along a single trajectory (Trigonometry 1 granting access to Trigonometry 2, for example), branching would occur as each new level is reached (Trigonometry 1 branches into Trigonometry 2, Drafting1, and Architectural Studies 1). As a student progresses, his skill tree would become increasingly dendritic; with more possible fields (breadth) available and more specialization along particular branches of knowledge (depth).

At any point in his schooling, a student might decide he needs to learn a skill from a different part of the tree. For example, a student who has started to specialize in writing might decide they need to develop some illustration skills. This student could start working on developing artistic ability, but would need to complete the prerequisites to illustration prior to attempting an advanced skill first. Prerequisite knowledge and skills would not be waived. If you want to illustrate children's books you either have the required skills or you don't. Advanced students developing knowledge on new branches would have to demonstrate their mastery, but would likely be able to progress through feats more quickly than younger, less-experienced students.

### **Defining & Changing Classes**

At some point, a student in a D&D school might choose to specialize in one particular field. This would likely happen early in the teenage years, far sooner than is allowed for in Alberta's educational current system. The student would spend more time working with certain teachers in identified areas. Like hybrid classes in D&D, sometimes a student will want to develop in two areas. It may take longer for skill development and leveling up, but this is to be expected when a student is trying to master multiple branches of knowledge. Eventually the students might develop enough on certain branch of the curriculum tree that they may take a name for their program of study (e.g. Digital Storyteller, Biologist/Healer, Mathematician).

### **Equipment**

In D&D, some equipment is specific to certain character classes at certain levels. A level 4 wizard, for example, cannot wear heavy armor (no wizards can) nor can she wield the Mighty Staff of Ra (level 20) because it will either not work for her or burn her face off given her low skill level. In D&D education, beginners start with beginner tools and progress to more advanced tools. Only the most advanced twelve-year old designers and writers would need MacBook Pro laptops; these mighty tools would only be misused unless they are in the hands of students working on complex multi-media, content authoring, and design tasks. Students beginning their guitar explorations would start with ukeleles or half-size acoustic models so they can learn the basic skills; at higher levels they would move on to semi-acoustic and electric models. At the highest levels, they might design and construct their own guitar to meet their personal preferences. Until students reach a specific level or a specific part of the learning tree, their tools stay basic, giving them time to master them. Equipment that is used repeatedly becomes integrated; it becomes an embodied autonomic extension of the body, not a clumsy tool. D&D education recognizes this sort of development and many feats would require mastery of equipment in addition to a complete grasp of concepts.

### **Magical Artifacts**

Sometimes, a player-character comes across or is awarded an item of magic which grants special bonuses. This can happen in a D&D classroom too. A student with particular artistic skill, for example, might be awarded with the Fabled Digital Tablet which will allow them to do considerably more with their digital painting program than they could with a mouse and

keyboard. The student working on mindfulness and meditation might “come across” a singing bowl that allows them to create a sense of calm in the room.

### **Conclusion- Putting Real Learning First**

In 2009, the Alberta Teachers’ Association put out a document called *Real Learning First: The Teacher Profession’s View of Student Assessment, Evaluation and Accountability*. Right after the introductory preamble, the document reads:

1.A29 Procedures used to evaluate student achievement must be designed so that they

1. are fair, just and equitable;
2. motivate students;
3. instill confidence in students’ abilities to learn and succeed;
4. test a variety of knowledge, skills and attitudes;
5. provide the teacher with information to make informed instructional decisions

(ATA, 2009, p. 4)

Don’t you think that a D&D classroom could address the above recommendations? Wouldn’t Students as Player-Characters and Teachers as Dungeon Masters insist and deliver upon these five key points?

We need to remind ourselves that the function of schools is broader and deeper [than high test scores] and that what really counts is what people do with their lives when they can choose to do what they want to do. In fact, I would argue that the major aim of schooling is to enable students to become the architects of their own education so that they can invent themselves during the course of their lives. -Elliot Eisner (ATA, 2009, p. 7)

A Dungeons & Dragons curriculum will never exist, but pieces of this pedagogical transversal are adoptable in part or in whole. The D&D metaphor can help education leaders make schooling more engaging and assessment more authentic. If these two changes can be evoked, we’re well on our way to meaningful transformation.

\* \* \*

*The six-year-old paladin, smiled as he snuck a peak into the artisan hall next door where his young sister worked wet clay into a large mermaid and their young friend, the cleric, wove cedar strips together to make a wide-brimmed hat. The Arcane Academy had not turned out to be as terrible as they had feared and all party members had opted to stay and grow. He smiled to himself as he thought about all of the coffee-drenched ghouls that he and his companions had had to smite upon their arrival, but, now that the blood had dried up and the smells and screams had receded, this place was getting down-right cheery. Looking at the time, he rearranged the broadsword slung on his back and took off down the hall towards the training room. This was going to be another good day.*

**Abstract**

It is said that university students are found to be the most commonly characterized as “*night owls*” and “*sleepyheads*” among other groups of the same age in Japan. The aim of this study was to further elucidate the association between circadian preference and motivation for learning among Japanese university students. A total of 191 undergraduate students at Hosei University, located in Tokyo, completed the questionnaire battery. The questionnaire included followings: Japanese version of Morningsness-Eveningness Questionnaire (Ishihara et al., 1986), Achievement Goals Scale (Murayama, et al., 2011) and Autonomous Motivation Scale (Nishimura, et al., 2011).

As a result of an exploratory factor analysis, two factors (Mastery-Goal and Performance-Goal) from Achievement Goals Scale and four factors (Extrinsic-Regulation, Intrinsic-Regulation, Identification-Regulation, and Introspection-Regulation) from Autonomous Motivation Scale were obtained. Four types of the achievement goal (high only Performance-Goal, high only Mastery-Goal, both high, and both low) and three types of the autonomous motivation (high only Extrinsic-Regulation, high Identification- and Introspection-Regulation, and high only Intrinsic-Regulation) were classified by cluster analysis, using Ward’s method. An interaction effects in multiple regression analysis were found that the higher Introspection-Regulation, the more nocturnal the respondents showed in the high only Mastery-Goal condition. Furthermore, the higher Mastery-Goal, the more morningness the respondents showed in the high Identification- and Introspection-Regulation condition. These results indicate that the relationship between circadian preference and motivation for learning may not be that simple. It is important for students to recognize how influence the lifestyle on their academic performance through appropriate education of sleep hygiene.

**This paper and presentation describe the partnership formed to transform teacher's geometry understanding and instruction between the Florida Atlantic University College of Education, Honor's College, and the School District of Palm Beach County. In year one of the program, the partners developed a year-long curriculum to extend and support both content knowledge, through mathematics faculty from the Honors College, and methodology/ pedagogy, through the Department of Teaching and Learning. Through ongoing program evaluation and participant feedback, the partners reviewed outcomes and refined interventions to maximize results for both students and teacher participants. The year one results began with student success on end of course exams and extended to systemic teacher change in both instructional methodology and pedagogy. Currently in the third year of the partnership, the presenters will discuss lessons learned, both positive and not so positive outcomes, and next steps.**

# DANCING WITH THE FUTURE:

## A New Hope for Aboriginal Education

### Work in Progress Abstract

#### Overview

After decades of disappointing results, it is difficult to deny that traditional approaches to the provision of education to First Nations populations have been, at best, ineffective. Given there is little reason to believe that, even with additional resources and effort, this might change, it is likely that the time has come to consider alternative approaches. This thinking underpins recent developments in Wild Rose Public Schools (WRPS) as it strives to redefine its approach to First Nations Education to better reflect the core values of dignity, purpose and hope. This presentation will chronicle the journey and results to date.

#### Background

In large measure, traditional approaches to Aboriginal education have been rendered ineffective for two broad reasons. First, they have tended to focus primarily on trying to change indigenous populations to better "fit" the system, both at the school, as well as at the larger societal level. This has been compounded by dictating to these populations how this change will be achieved with little consideration given as to what they might perceive their own needs and wishes to be. Somewhat related is a second issue which results from decisions being made based on incomplete understandings both of what is at issue and, subsequently, what action is appropriate. Consequently, we have too often focused our efforts on addressing the "wrong" problem and utilizing the "wrong" approaches. In education, the unfortunate result has been that, not only have the fundamental problems never been properly identified and addressed, but too many First Nations students have turned away from the one institution that offers them a real means to a better future.

In WRPS, over the past 3 years, we have sought to address these challenges through beginning to explore the potential of utilizing the education system differently to meet the *self-identified* needs of First Nations students in *culturally sensitive* and supportive ways. Fundamental to this approach are the following key understandings:

1. Public education is an extremely powerful resource that can be utilized differently to address the needs of First Nations students;
2. First Nations communities are best able to identify the needs of First Nations students and to provide insight on how best to meet these needs;
3. All work must be culturally sensitive and appropriate; and,

4. Within the expectations inherent in a relationship built on mutual respect, it is possible for the education system and First Nations community to work together to develop the capacity of the community to meet its identified needs.

For many of our most at-risk Aboriginal students, an essential first step is to rebuild a solid inner core based on traditional cultural teachings. Additionally, though, there was a desire to create a forum to enhance cultural understanding in the education system and broader community. In response, the division created the Aboriginal Resource Centre (ARC) which serves as the cultural/spiritual "centre" for students and the program in general. Recently captured in a short documentary to be released this fall, the work of the ARC will be extensively reviewed as it is key to the many successes of the students.

In pursuing this work, a deliberate decision was made to avoid formal, contractual agreements. Instead, agreements have grown out of respectful dialogue and have resulted in a number of positive, collaborative undertakings that extended beyond the scope of regular "education" and have served to enhance community relations. These outcomes along with the transformation of at-risk students into community leaders will be presented.

Finally, given the success of the initial "informal" work, the following next steps will be reviewed as part of the presentation

1. Expansion of the program to include an academic component built around a "Certificate of Aboriginal Studies" to be available as a graduation enhancement to students completing the course of studies; and,
2. A formal study of the initiative to measure the impact of more culturally-appropriate approaches to learning on program completion rates and students' sense of dignity, purpose and hope.

## **Summary**

While much of the original thinking for this program was presented before the *Standing Senate Committee on Aboriginal Peoples* in 2010, the story lies in the work of turning the vision into reality. While each situation is different, this presentation will share the insights garnered through the journey of one Alberta school division and will provide much material for dialogue on creating a future of possibility and hope for Aboriginal youth rather than one of futility and despair.

# Celli speaks to senate committee

**Superintendent speaks on helping First Nations students succeed in school**

**Courtney Whalen**  
Western Review

It's not every day a person gets to stand up in front of a group of the country's senators, but on Oct. 7 Wild Rose Public School Superintendent Brian Celli did just that.

Celli was speaking to the Standing Senate Committee on Aboriginal Peoples that is currently looking at ways to reform First Nations primary and secondary education systems.

"They are engaged in a cross country exploration," said Celli. Although Wild Rose Public Schools includes a sizeable First Nations community, Celli said he wasn't sure why he had been invited to speak to the senate committee.

The answer, it turns out lay with something the school division took on last spring.

The committee had seen some information on the First Nations Youth Forum held by the division last spring where First Nations youth shared their perceptions of the school system.

What came out of that forum, said Celli, was that First Nations

students said the issues had little to do with the school itself, but instead how outside forces going on in their lives affected the time they spent in school.

For example, Celli said, if a student is worrying about something going on in their family, or issues such as drugs, alcohol or abuse, understandably their mind won't be on what's happening in school. However, with none of that background information at the school only address the seeming inattention instead of the cause of it.

Celli gave a five minute presentation to the senate committee and then spent the next hour answering questions and taking part in a dialogue.

"What I was talking to the senators about is that we have to ask the right questions," said Celli.

The issue in the past hasn't been that efforts haven't been made when

it comes to First Nations youth in the school system, it's that the approach has been the wrong one.

The question in the past has been what to do to make First Nations students fit into the system. Celli said the better question is how to best utilize the "vast resource" of public education to address the root issues and then work on turning that into academic accomplishment.

"I think we do have something to share," said Celli of the work Wild Rose Public Schools is doing in partnership with the First

Nations communities in its area. In addition to the youth forum the school division is working with the Rocky Native Friendship Centre to look at key understandings identified by the division and its partners.

"We are not the only player here," said Celli.

In the relationships that are being built he said all dealings are based on mutual respect and no formal agreements exist.

The division doesn't have all the answers, but the progress they've made is something he was happy to share with the senate committee.

## Aboriginal resource centre offers support for students, community

### WRSD funds centre that will work with students and offer traditional teaching and more

Louise Russell, the new aboriginal community resource worker for WRSD Public Schools in the new aboriginal resource centre that is opening up this month.

VICTORIA PATERSON | THE MOUNTAINEER

BY VICTORIA PATERSON  
STAFF REPORTER

Wild Rose Public Schools is getting innovative with its approach to aboriginal students by opening up an aboriginal resource centre for the community to use.

"This service has never existed and always should have," said Louise Russell, who has been hired as the aboriginal community resource worker to run the centre.

Russell said the centre was the initiative of Superintendent Brian Colli, who found the funds in the budget to get the centre started. The Aboriginal Resource Centre is located behind Ecole Rocky in the former kindergarten mobile but has been fixed up for its new use.

"We're going to run student, family and community projects in the centre," Russell said.

The centre will be used as a resource for aboriginal students but is also open to community members who are looking to learn more about aboriginal culture.

"It's open to the whole community and [school] district," Russell said. She said as far as she is aware it is the first of its kind in Alberta.

For students, the centre offers a place to learn

*"This service has never existed and always should have."*

**Louise Russell**  
Aboriginal Community Resource Worker

about their traditional aboriginal culture, consult with elders or to access other resources.

"It's not to become a hangout," Russell said. Students who are there will need to be working on learning.

Russell herself is not to be a teacher and instead will concentrate on pulling in the resources for students.

"I bring in the elders, the artists, the traditional teachers, the local partners," she said.

Local partners include the Rocky Mountain House National Historic Site which will be offering chances for traditional teaching and a sweat lodge. The Rocky Native Friendship Centre was another partner Russell named.

Students will be able to take things like Aboriginal Studies for credit, as well as working toward class credits in things like art or music by working with teachers at the resource centre.

Russell gave several examples of the activities and purpose of the centre. Some of the purposes of the centre include working with parents and students on attendance issues, working with the aboriginal communities to build successful relationships with the school division, encouraging participation of aboriginal community members in school activities and events and more.

Some of the activities the centre will be putting on include the opportunities to learn about traditional uses

of meat, speaking with elders, storytelling, round dances, educational trips to museums and going to conferences.

"We will be having a culture camp," Russell said.

She said the aboriginal history of the area will be taught to students, including the old treaties and federal government legislation.

"The Indian Act will be taught here," Russell said.

There will be fundraising for some of the projects or trips Russell would like to organize for the students.

"The centre itself is going to be doing fundraising ... to enhance the journey," Russell said.

Those who might like to participate can think about volunteering. "We're always seeking volunteers," Russell said. "It's about sharing the journey."

While the centre is not yet officially open for business, Russell said there will be an open house for the community to check it out by the end of January.

## ***Innovative Approach to Aboriginal Learning***

In February, 2012 Wild Rose Public Schools officially opened an Aboriginal Resource Centre as an innovative approach to engage aboriginal students in a way that honors and incorporates their culture. It is located behind Ecole Rocky Elementary in a newly renovated portable classroom building.

For students, the centre offers a place to learn about their traditional aboriginal culture, consult with elders and access other resources. Students are offered courses such as Aboriginal Studies, as well as working toward class credits in areas of art and music. It serves as a culture-based approach to support First Nations students' efforts to complete their programs and develop a deeper appreciation of their heritage.

The purpose of the centre is two-fold:

- to act as a resource/support centre for students, parents, teachers and schools with respect to educational matters involving FNMI students, and
- to meet the need for a tangible focal point for the FNMI program in the Rocky Mountain House area.

It includes working with parents and students on attendance, working with the aboriginal communities to build successful relationships, and to encourage participation of aboriginal community members in school activities and events.

Local partners such as the Rocky Native Friendship Centre and the Rocky Mountain House National Historic Site work with the Resource Centre offering chances for traditional teaching and a sweat lodge.

The centre is also open to community members who are looking to learn more about the aboriginal culture.

Please feel free to visit this very unique setting and enjoy the welcoming atmosphere and learning environment.

### ***Our Vision***

*All youth have a right to live their life with a sense of Dignity, Purpose and Hope.*

### ***Our Mission***

*To help start a life path that guides and challenges youth Spiritually, Physically and Emotionally through traditional cultural teachings.*

### ***Our Philosophy***

*That aboriginal youth that are connected with their culture and community have a better chance to succeed. This starts with the seven sacred teachings:*

*Love, Respect, Courage, Honesty, Wisdom, Humility, Truth*

# **IMPROVING LIFE CHANCES THROUGH REFLECTIVE PROFESSIONALISM:**

## **Maintaining Momentum**

### **ABSTRACT**

#### **OVERVIEW**

Our design-based research inquiry is mapping the journey of one Alberta school division's pursuit of systemic change. Through a widely shared vision of reflective professionalism, division leaders are working collaboratively with school leaders, teachers and other staff members to foster a culture of exemplary teaching, supportive leadership and sustained professional learning.

#### **RESEARCH QUESTIONS:**

To what extent is the emerging vision of "reflective professionalism" understood, shared, and considered to be making a difference by teachers, leaders and trustees?

What can be done to improve the translation of this vision into reality going forward?

#### **RESEARCH OBJECTIVES**

There are two broad purposes to this research. Our primary objective is pragmatic. We seek to better understand the processes that have successfully moved the change agenda forward, while also gaining deeper insights into the myriad of challenges encountered along the way. Contributing to the growing understanding of effective district leadership practice is our second objective.

#### **RESEARCH METHODOLOGY**

A mixed methods approach is being employed in our design based study. Participant observations, reflective journals, semi-structured and open-ended interviews as well as focus group conversations are being utilized. In this third year of the study, classroom observation protocols and staff surveys are also being employed.

#### **OUTCOMES**

As the study moves into its third year work, we anticipate that the inquiry will continue to yield insights in four broad outcome areas:

The importance of a coherent, widely shared and compelling vision emerged as a significant theme in year one. Through their words and thoughtful action, the division leadership team is consistently demonstrating its commitment to thinking about all the people in the system in a particular manner in relation to the notion of "reflective professionalism." The focus on this approach to professionalism is the deliberate intent to try to get people to think differently about

what they are doing, why, how, and for whom. Ultimately, this approach aims to help teachers move to a deeper level of obligation to all students and their learning

A second major theme was the strengthening of professionalism through attention to the development of exemplary practice . Extended staff engagement processes have generated three key documents to guide this work: the Shared Visions of Exemplary Teaching and Outstanding Leadership and the Framework for Supporting Exemplary Practice, which provides a link between the first two pieces.

Outcome three looks at the impact of structural changes to undergird sustained professional learning. Two structures have been put in place to support this work: (1) the Learning Calendar, which increased the number of Professional Learning Days to 18/year and (2) the collaborative development of a Professional Learning Model (PLM). The PLM emphasizes common understandings and language that allow teachers from every level and subject area to talk productively and professionally with each other about student learning and how best to pursue this.

A fourth outcome emerging from year one data, was the need to pay further attention to the following priorities:

- staying the course – building coherence to continue to close the gap between the vision and the reality
- building instructional leadership capacity – continuing to enhance the skills and actions of school leaders
- sustaining system leadership – creating a smooth transition to the next generation of division leaders
- implementing identified structural changes within the organization
- improving reciprocal communication
- sustaining professional relationships in communities of practice within the Division
- conducting ongoing research through classroom observations, staff surveys and stakeholder interviews.

Since the initiative began, the Leadership Team at both the school and the division levels has seen a 50% turnover in personnel. Accordingly, in addition to the foregoing, the third year of the study will probe (1) the degree of impact that this turnover has had on the work of realizing the vision, (2) the practices that supported new leaders as they developed their understanding of, and commitment to, the vision, as well as (3) the “growing edges” for the division in this regard.

In this session, evolving insights in all areas, with a particular focus on maintaining the work the work of system transformation in the face of significant leadership turnover, will be shared.

## Hawaii International Conference on Education

# **SUPPORTING EQUITABLE ACCESS THROUGH SHARED TECHNOLOGY SERVICES**

## **WORK-IN-PROGRESS ABSTRACT**

### **Overview:**

Cultural transformation demands that citizens of the future be relatively fluent in their use of digital and online tools. Accordingly, it is incumbent upon public school systems to ensure they help students build the capacity to respond appropriately to this demand. Unfortunately, structural inequities inherent in the system often mean that students in rural, less densely populated jurisdictions are disadvantaged relative to their peers in more densely populated centres. This presentation will chronicle the initial efforts of two rural school divisions, Wild Rose Public Schools and Canadian Rockies Public Schools, to address this inequity through the integration their technology services.

### **Background:**

Across Alberta, less densely populated rural districts struggle to afford the hardware and to provide the expert supports required to build, operate and maintain high quality access to IT networks that are fundamental requirements of preparing students for the future. Unlike larger urban centres which are able to staff larger and more diverse IT teams, in the rural setting, it is more common for there to be a single person who is expected to have expert knowledge in all aspects of operating, maintaining, and developing all aspects of the system. As a result, rural IT staff often are required to work outside their areas of expertise and are only able to spend enough time to get a specific technology 'operational' before being pulled to the next project or issue. As a result, over time, the operation of the system tends to deteriorate and to become a hindrance to, rather than a support of student learning.

The Shared Technology Services initiative is intended to support the convergence of rural technical infrastructure and staffing as well as to leverage the opportunity of the Alberta SuperNet to create a closer to level playing field for all students. Where several small jurisdictions, individually, may struggle to staff a Help Desk, Network Specialist, SIS expert, Moodle guru, etc., as well as to construct and maintain robust network capabilities, as a collective, these are all much more attainable. Thus, partnerships and the sharing of expertise and resources across jurisdictions bridges gaps in service and support that smaller districts are less able to address individually.

The following are the goals for the Shared Services Project between Canadian Rockies Public Schools and Wild Rose Public Schools:

- o Create a governance model that will support the sharing of experience and expertise between school jurisdictions.

o Develop a shared technology services model that will enable multiple jurisdictions to integrate network services and to share and extend their learning and knowledge of specific technologies thereby enhancing the learning environments for students in all divisions.

o Leverage the WRPS-CRPS experience to develop guidelines and templates that will assist other jurisdictions to make the same migration more smoothly and within a much tighter time frame.

### **Outcomes:**

While there are many potential outcomes of this joint initiative proposal, for the most part, they can be grouped into the following large categories: more effective and efficient use of resources; improved access to digital environments supported by a robust architecture; and, improved learning environments for students--regardless of their geographic location.

Specifically, in the first phase of the project, it is expected that the cross-jurisdictional leveraging of expertise and infrastructure will result in the following outcomes/benefits:

1. A common, high standard of access to technology for students of both divisions.
2. Efficiencies through the reduction of redundancies (e.g., reducing data center sprawl by consolidating services into shared data centers; greater utilization of the potential of the Supernet).
3. More effective utilization of existing expertise, both in terms of technology support and the evolution of classroom instruction.
4. Increased coherence in the technology landscape.
5. Creation of the foundation from which to explore additional shared services opportunities; and,
6. The generation of a model of shared technology environments designed for elasticity and agility that can be scaled and applied rapidly to other small jurisdictions, FNMI schools, etc.

This presentation will report on developments to date in each of these areas.

### **Summary:**

Inspired by the collaboration of experts uninhibited by jurisdictional boundaries or silos of IT knowledge, the overarching outcome of the *Shared Technology Services* initiative is the creation of a world class IT platform to support the learning of all students regardless of jurisdiction size and location. Within the collaboration, each district can offer its best ideas to all and, subsequently, borrow some back knowing that within the pool is the expertise of someone who has “done it before.” The end result is an enhanced learning environment for all students, regardless of where they live.

Collaborative Anarchy in Andragogy:  
A Paradox in Collaborative Learning Models  
Through the Lens of Situated Learning

**Celia Farr**

Adult Basic Education/Program and Curriculum Development  
Western Washington University/Charter College  
Bellingham, WA  
celia.rivers.farr@gmail.com

**Abstract:**

This poster session will examine the emergence of leader/follower roles in collaborative learning when adult learners are engaged in collaborative problem-solving experiences. It will demonstrate how team-building activities build the roles of both leader and follower and reveal the need for accountability and responsibility; adaptability and creativity: essential components to students' collaborative learning experiences in adult education. This poster session will also examine the value of anarchy within the teambuilding process and how a spirit of anarchy can benefit and grow the overall collaborative learning experience for the individual and the group.

**Proposal and Outline of Focus:**

This poster presentation will provide an introduction to Collaborative Anarchy: applying previous experience, knowledge, resources, and tools to “an informed and committed action” in a collaborative setting. The presentation will examine the Model of Situated Learning and its role in the adult learner's experience. It will discuss what takes place during collaborative problem-solving situations in the classroom and will reveal the importance of the paradoxical roles of Collaborative Anarchy within a Community of Practice (CoP).

An outline of this presentation's focus is as follows:

- Jean Lave & Etienne Wenger's Model of Situated Learning
- Daniel Goleman's research on Emotional Intelligence (EI)
- Stephen Krashen's Affective Filter hypothesis
- David Kolb's Experiential Learning Theory (ELT)
- David Kolb's Learning Cycle
- Link the characteristics of a CoP's *domain*, *community*, and *practice* to Collaborative Anarchy in the classroom
- Successful strategy building and concept mapping involving teambuilding activities

Collaborative Anarchy explores how facilitated disorder and chaos can allow for the exploration of how all may contribute and participate by building on students' respective knowledge and

resource. By facilitating an experience that builds connection between experience and activity, students are better able to reflect on how their knowledge and experience can translate into transferable problem-solving skills. Within the activities, the participants are the practitioners and facilitators; by sharing their respective repertoire of resources (Wenger, 2007), they develop a practice of specific focus that calls for “informed and committed action” (Smith, M. K., 2003, 2009).

There is an intimate connection between knowledge and activity. Learning is part of daily living as Eduard Lindeman argued many years ago. Problem solving and learning from experience are central processes (although, as we have seen, situated learning is not the same as ‘learning by doing’ – see Tennant 1997: 73). Educators need to reflect on their understanding of what constitutes knowledge and practice. Perhaps one of the most important things to grasp here is the extent to which education involves informed and committed action (Smith, M. K., 2003, 2009).

### **Theoretical Framework and Objectives:**

The research devoted to this presentation is focused on a mélange of related educational theory:

- 1. Model of Situated Learning: (Jean Lave & Etienne Wenger)**
- 2. Communities of Practice (CoPs): (Jean Lave & Etienne Wenger)**
- 3. Duality in Communities of Practice: (Jean Lave & Etienne Wenger)**
- 4. Legitimate Peripheral Participation (LPP): (Jean Lave & Etienne Wenger)**
- 5. Emotional Intelligence (EI): Daniel Goleman**
- 6. Experiential Learning Theory and Reality (ELT) (David Kolb)**

To gain a fuller understanding of how the facilitation of Collaborative Anarchy engages and strengthens legitimate peripheral participation, the presentation will also discuss how “. . . emotional reactions to instruction can heighten or dampen an individual’s desire to learn” (Wlodkowski, 2003, p. 39). Stephen Krashen’s Theory of Second Language Acquisition and Affective Filter hypothesis speak of the impact that anxiety in the classroom has on motivation, self-esteem, and learning. When an emotional hijacking takes place, these key factors of learning are influenced and the affective filter is raised – thus, raising levels of anxiety and creating mental blocks in the learning process (Schütz, 2007). Allowing collaborative anarchy to unfold within teambuilding activities allows for motivational barriers to be reduced and participation to be increased.

To meet this presentation’s objectives, narratives of student success applying David Kolb’s Experiential Learning Theory will be shared. “ ‘Experiential learning . . . involves a, ‘direct encounter with the phenomena being studied rather than merely thinking about the encounter, or only considering the possibility of doing something about it.’ (Borzak 1981: 9 quoted in Brookfield 1983)” (Smith, 2001).

In addition, Kolb’s four-stage learning cycle (or spiral) and the learning cycle’s lines of axis: feeling/thinking and doing/watching will be discussed: all essential elements of “informed and committed action” within the framework of Collaborative Anarchy. The four stages of Kolb’s learning cycle are listed below:

1. Concrete Experience – CE (feeling)
2. Abstract Conceptualization – AC (thinking)
3. Active Experimentation – AE (doing)
4. Reflective Observation – RO (watching).

Collaborative Anarchy emphasizes the importance of self-discovery while building relationships in a shared experience.

As McDermott (in Murphy 1999:17) puts it: Learning traditionally gets measured as on the assumption that it is a possession of individuals that can be found inside their heads... [Here] learning is in the relationships between people. Learning is in the conditions that bring people together and organize a point of contact that allows for particular pieces of information to take on a relevance; without the points of contact, without the system of relevancies, there is not learning, and there is little memory. Learning does not belong to individual persons, but to the various conversations of which they are a part (Smith, M. K., 2003, 2009).

*In this workshop you will discover 10 problems that faculty, staff and administrators must address to create a sustaining, welcoming environment for students of color. How does your college stack up?*

---

You'll be shown with facts and figures, examples and studies, how diversity benefits everyone. You'll learn the distinction between diversity and inclusion. You'll also:

- Discover how the changing demographics will affect you personally and the future of higher education.
- Learn how to respond to those who resist change or feel that we should not be focusing on racial diversity.
- Discuss the conditions necessary for organizational change and why your campus must undergo a cultural shift if it is to be successful in the long run.
- Learn how adopting a set of diversity themes can actually unite a campus.
- Examine your own assumptions and values as they relate to creating an inclusive campus.
- Learn new ways to look at old problems and do a better job for all students.
- Discuss what makes a culturally competent person and institution.
- Leave with practical skills and knowledge that you can implement immediately.

## **Developing Student Excellence Through Collaboration, Teamwork, and Leadership**

Programmatic Excellence and Innovation in Learning

White Paper 2013

California State University, East Bay

Topic area: Curriculum, Research and Development. Presentation format: Paper session.

Description: This research project was developed in support of the Programmatic Excellence and Innovation in Learning initiative at CSU East Bay as a means of examining how curriculum supports the university's institutional learning outcomes. This research found evidence of where students were exposed to, or developed, capacity in leadership, teamwork and collaboration skills to make them effective forces in the larger community following graduation.

## **Abstract**

This planning project was developed to identify effective teaching and assessment practices of collaboration, teamwork, and leadership (CTL) in support of the CSUEB CTL Institutional Learning Outcome. Three proposed phases involving multi-method data collection, were: 1) data collection on the current state of CSUEB CTL instruction and assessment of the value that CSUEB students and employers place on CTL competencies, 2) analysis of collected data and investigation of existing CTL instructional methods, supplemented with secondary research, and 3) formative assessment, working definitions of CTL, and recommended content and tools for instructional use, learning assessment, and faculty development to enhance student success on CTL learning objectives.

*key words:* collaboration, teamwork, leadership, and education

## **Student Learning and Success Focus**

In 2012, California State University, East Bay approved six institutional learning outcomes (ILO's) to identify expectations for all graduates to prepare them for more successful lives and careers. The ILO studied for this research project involved collaboration, teamwork, and leadership (CTL). Specifically, the ILO states: "Graduates of CSUEB will be able to work collaboratively and respectfully as members and leaders of diverse teams and communities. Working with others is an essential component of our university experience. Students work as teams on classroom assignments, on service learning projects, in student organizations, in campus service departments and elsewhere on campus. Collaborating with others, working in teams comprised of diverse members, and assuming leadership roles are essential in our workplaces and communities, so it is critical that our graduates master these skills.

- Collaboration, teamwork and leadership competencies include:
  - o understanding that effective collaboration involves an appreciation of the ways that cultural, gender and other differences can affect team dynamics;
  - o applying the key elements of teamwork and leadership, such as member roles and responsibilities and the fair allocation of work and rewards;
  - o collaborating within and leading diverse groups with patience, objectivity, respect, inclusivity, and equity;
  - o crafting consensus when presented with differing values, perspectives and priorities, and identifying, mitigating and resolving conflicts;
  - o sharing in decision-making, creative group brainstorming, active listening, and giving and receiving constructive feedback;

o being sensitive to and appreciative of the views of others, comfortable in diverse social and professional settings, and aware of their own perspectives and biases; understanding the implications of values and ethics for leadership, teamwork and collaboration.”

The purpose of the current project was to investigate students’ CTL learning and experience at CSUEB and the value of their CTL exposure. Specifically, this project sought to: 1) identify where students are exposed to CTL instruction or experiences in coursework and in co-curricular activities at CSUEB, 2) assess the value that two groups of stakeholders, students and employers, place on CTL competencies, and 3) make preliminary recommendations regarding CTL instruction at CSUEB based upon a review of the external literature and opinions of CSUEB students and employers of CSUEB graduates.

### **Background**

Organizations, including businesses and universities, have long recognized the growing value of collaboration, teamwork, and leadership. A rich scholarship has developed around each of these concepts, providing a theoretical background for understanding each. Consistent with this global valuing of leadership, teamwork, and collaboration, the CSUEB community, through a campus-wide, inclusive year-long process, has also recently identified CTL as one of our six core values, stated in the form of an Institutional Learning Objective (ILO): “Graduates of CSUEB will be able to work collaboratively and respectfully as members and leaders of diverse teams and communities.”

Following a review of existing scholarship, some of which will be discussed or cited in this white paper, for this project, our team defined collaboration, teamwork, and leadership as follows:

**Collaboration** involves working with others cooperatively to solve problems, make decisions, or create or produce something that cannot easily be achieved by someone acting alone. Collaboration requires the ability to communicate openly, to value and work with diversity, and to respond constructively to conflict. Collaboration can be short term and informal, or it can develop over time and with more formal agreements about how outcomes will be achieved.

**Teamwork** occurs where people interact on behalf of shared goals. Teamwork involves cooperating and coordinating to get work done in an interdependent fashion, with defined roles, and clear objectives. Team members are often selected as a function of the knowledge, skills and experience that they contribute to the work of the team. Teamwork is usually best accomplished with the influence of a leader, and a team that has shared accountability for its actions. Working in teams involves sharing one's expertise and relinquishing some autonomy to work closely with others to achieve better outcomes. Teamwork requires the ability to establish productive working relationships, applying interpersonal communication skills, working well with diverse others, and responding constructively to conflict.

**Leadership** is a reciprocal influence relationship where leaders enlist the support of others engaged with them in the accomplishment of a common goal. Leaders are responsible for achieving a group's shared commitments and desired outcomes. In order to be effective, leaders must be able to communicate a vision that engages others toward a common goal. Effective leaders value all team members' contributions and they interact with team members in ways that draw out potential contributions. Leaders communicate expectations, enroll others in the common goal, set the direction for team action, provide guidance and feedback, motivate followers, and encourage cooperation.

Leading national educational organizations identify collaboration, teamwork, and/or leadership skills as essential for college graduates. The American Association of Colleges and Universities (AAC&U), as part of a national advocacy and research initiative called “Liberal Education and America’s Promise” (LEAP), has produced a list of essential learning outcomes for college students, one of which is teamwork and problem solving. The California State University, in Executive Order 1065, adopted the LEAP outcomes in September 2011. In a 2013 survey of 318 employers conducted by Hart Research Associates for the AAC&U, 67% of employers stated they wanted colleges to place more emphasis on teamwork and collaboration in diverse group settings. In this same report, *It Takes More Than a Major: Employer Priorities for College Learning and Student Success*, 74% of employer respondents stated that expecting students to develop the skills to conduct research collaboratively with their peers would be a new approach to learning that had the potential to help students succeed (Hart Research Associates, 2013).

The AAC&U has also created a teamwork value rubric, which involves assessing individuals on the following qualities: contributions to team meetings, facilitation of the contribution of team members, individual contributions made outside of team meetings, fostering of constructive team climate, and responding to conflict. Additionally, the Academic Advising and Career Education (AACE) department at CSU East Bay (2010) has researched skills that employers routinely seek, and has produced a list of 15 frequently sought skills, one of which is teamwork and collaboration. The Lumina Foundation for Education recently identified collaboration as one of the significant skills college students should master as an aspect of civic learning (Lumina Foundation, 2011).

College professors and administrators also advocate for leadership training. In a report summarizing results from a study of over 50,000 students in 52 higher education institutions in the United States, the authors discuss the growing recognition in universities that leadership training is an essential component of a college education, recommending that college teachers routinely teach leadership skills, even in courses which have not traditionally focused on leadership development (Dugan & Komives, 2007).

A century-old, interdisciplinary body of literature exists on CTL. Research has developed sufficiently that some knowledge exists regarding how and why groups may be relatively effective or relatively ineffective in accomplishing goals. For example, we now know that there is not a single productive leadership style, but rather, effectiveness of leadership in a particular situation depends upon characteristics of the general situation, the particular leader, and the dynamics of the particular group (e.g., Fiedler, 1964, 1996). As another example, problem-solving may sometimes be optimized through team work, but in other cases, team work can hamper problem solving (e.g., Laughlin, Bonner, & Miner, 2002; Laughlin, Zander, Knieval, & Tan, 2003; Michaelsen, Watson, & Black, 1989). As an example of the former, recent research on collaboration in a game-playing context has piqued interest in collaboration for solving science problems. Researchers found that a group of game players, not formally trained in molecular biology, were able to identify the crystal structure of a specific retroviral protease that experts had been unable to solve after decades of research (Katib et al., 2011).

Although we know much about CTL processes, relatively less is known about how to teach these competencies to students. In *Education for Life and Work: Developing Transferable Knowledge and Skills in the 21st Century*, a lengthy (more than 200 page) report of the National Research Council released in 2012, the forty-one contributing authors, representing universities

and testing, assessment, or research organizations across the United States, define a set of 21st century skill-sets and summarize the findings of vast quantities of research on the impact that these skills can have on significant life outcomes: education, work, health, satisfying interpersonal relationships, civic engagement, and other domains of “adult responsibility.” They additionally review research on what is known about how these skills can be taught, learned, and assessed. In the early stages of their work they organized the competencies, identifying three main clusters, one of which, the interpersonal, prominently includes collaboration, teamwork, and leadership:

“The **Cognitive** Domain includes three clusters of competencies: cognitive processes and strategies; knowledge; and creativity. These clusters include competencies such as critical thinking, information literacy, reasoning and argumentation, and innovation.

The **Intrapersonal** Domain includes three clusters of competencies: intellectual openness; work ethic and conscientiousness; and positive core self-evaluation. These clusters include competencies such as flexibility, initiative, appreciation for diversity, and metacognition (the ability to reflect on one’s own learning and make adjustments accordingly).

The **Interpersonal** Domain includes two clusters of competencies: teamwork and collaboration; and leadership. These clusters include competencies such as communication, collaboration, responsibility, and conflict resolution.” (National Research Council, 2012, p. Sum-3)

As the authors discuss, the bulk of research on teaching, learning, and assessing of these skills has focused on the cognitive domain. The authors emphasize that both employers and academics are recognizing that intrapersonal and interpersonal skills are equally important to life success as are the cognitive ones and thus, researchers need to shift some of their focus to the investigation of these non-cognitive skills.

A primary theme of the report is that 21<sup>st</sup> century teaching at all levels, including university, must focus on “deeper learning,” which means learning that will “transfer” to

new situations. The authors make a number of recommendations about how to achieve “teaching for transfer,” including the following:

- Teaching should be done in a systematic fashion, with learning goals that are clearly defined. Results of research indicate that “learning for transfer requires knowledge that is mentally organized, understanding of the broad principles of the knowledge, and skills for using this knowledge to solve problems” (p. 4-25).
- Students need ample opportunity to practice new knowledge and skills. Learning is much less likely to “stick” without sustained practice.
- Formative assessments of student work appear to be helpful. These are assessments which occur *during* the learning process, providing ample feedback, and allowing for revisions of student work before the work is considered “final.”
- Efforts should be made to teach students that individual characteristics relevant to learning (e.g., cognitive ability, persistence, general work ethic, motivation) are at least partially teachable and malleable. Students who believe that they can change their own characteristics can perform better than students who do not hold this belief (e.g., Yeager & Walton, 2011).
- College professors will need to be taught how to integrate new teaching principles into their teaching. This will require faculty development work and adequate time for the college professors to receive training.
- At this point it is difficult to determine if teaching for transfer is domain/discipline specific or is interdisciplinary. Private funders and the government should fund research to investigate this issue further.

The report authors caution that the recommendations above are based primarily upon research which has been conducted on competencies in the cognitive domain. Although they believe that these recommendations may apply to interpersonal competencies, research is required to confirm this. The authors make the following recommendation which applies to CTL competencies (using their vocabulary, “interpersonal competencies”):

- Researchers need to develop clear, valid ways of assessing CTL competencies in students, both formative and summative assessments. The lack of reliable, valid, and fair measurement devices has led to a limitation of useful research regarding how to effectively teach or learn CTL. A publication from the National Research Council (2001) provides recommendations regarding what constitutes an evidence-based assessment.

### **Research and Findings**

Our CTL research at CSUEB involved three components: a) a survey of employers who participated in job fairs on campus during October 2012, February 2013, or April 2013; 2) an online survey of CSUEB students; and 3) a survey of the CSUEB 2011-2012 course catalog.

#### **Employer Survey**

Employer surveys were distributed to job fair participants by one of the researchers or an AACE employee. Job fair participants were asked to complete the survey at their convenience and return the survey to the researcher either at the completion of the job fair, in person, or through using a pre-addressed, stamped envelope addressed to one of the researchers. The employer survey was a three-page hard-copy questionnaire which asked the employers to evaluate the importance of ability to collaborate, teamwork ability, and leadership ability in their employees and which also included demographic questions. The assessment of CTL included

both overall questions about CTL (e.g., “How important is the ability to collaborate when you consider hiring college graduates”) and questions about specific features of or skills involved in collaboration, teamwork, and/or leadership (e.g., “Rate the importance of the following competencies for success in your organization: the ability to actively listen”). The respondents rated items on a scale of one to five (where one equals not at all important and five equals very important). The survey also included open-ended questions. Numeric results of the employer survey are presented in Table 1.

**Table 1**  
***Results of Employer Survey: Mean Scores and Standard Deviations (SD) for Survey Questions***

<b>Survey Question</b>	<b>Mean</b>	<b>SD</b>
1. How important is <i>the ability to collaborate</i> when you consider hiring college graduates?	4.63	0.55
2. How important is <i>teamwork ability</i> when you consider hiring college graduates?	4.85	0.46
3. How important is <i>leadership ability</i> when you consider hiring college graduates	4.56	0.67
4. Rate the importance of the following competencies for success in your organization		
i. Understanding the ways that cultural, gender and other differences can affect team dynamics.	4.23	1.03
ii. Collaborating within diverse groups with patience, objectivity, respect, inclusivity, and equity.	4.80	0.50
iii. Crafting consensus when presented with differing values, perspectives and priorities.	4.40	0.76
iv. Identifying, mitigating, and resolving conflicts.	4.64	0.49
v. Understanding team member roles and responsibilities.	4.52	0.71
vi. Applying the key elements of leadership, including fair allocation of work and rewards.	4.38	0.82
vii. The ability to participate in team decision-making and creative group brainstorming.	4.52	0.71
viii. The ability to actively listen.	4.96	0.20
ix. The ability to give and receive constructive feedback.	4.80	0.41
x. Being sensitive to and appreciative of the views of others.	4.68	0.56
xi. Being comfortable in diverse social and professional settings.	4.60	0.58

xii. Being aware of one’s own perspectives and biases.	4.64	0.64
xiii. Understanding the implications of values and ethics for leadership, teamwork and collaboration.	4.80	0.41
xiv. Leading diverse groups with patience, objectivity, respect, inclusivity, and equity.	4.64	0.57
xv. The abilities to identify strengths of team members and nurture these strengths in service of group goals.	4.24	1.13

**Notes:**

Scale for items 1-4 is as follows: 1= not at all important; 3 = moderately important; 5 = very important

n = 27

**Demographics of the sample:**

Type of Business: Private company or publicly traded company (33.3%), Non-profit organization (11.1%), Government agency or municipality (25.9%) , School, school district, college, or university (18.5%), Other (7.4%), Missing (3.7%).

Approximate number of employees: Range = 29 to 50,000; Mean = 4631.

Is your company primarily: Bay Area based (48.1%), Regional or statewide (11.1%), National (29.6%), International (14.7%), Missing (3.7%); (Two employers selected more than one option).

Have you hired students from CSU East Bay? Yes (66.7%), No (18.5%), Missing (14.7%).

Do you accept interns from CSU East Bay? Yes (55.6%), No (33.3%), Missing (11/1%).

Gender: Male (37.0%), Female 51.9%), Missing (11.1%).

Age: Range = 30 to 70; Mean = 39.4

Results indicate that employers rate collaboration, teamwork, and leadership as very important competencies for their employees; each item on the questionnaire was rated higher than “four” on a scale of one to five (where one indicates not at all important, three indicates moderately important, and five indicates very important). Open-ended survey responses, described below, also reveal the importance that employers place on CTL skills and provide a vivid, real-world picture of the ways in which they are actually applied in the workplace.

**Qualitative Survey Responses: Collaboration**

In response to the following question, “Which collaboration skills would you most like to see in college graduates?” the skills most frequently cited were good oral and written communication, strong interpersonal skills, the ability to manage conflict, valuing and respecting

the different cultures and opinions of others, professionalism, problem solving, and global thinking. Additional collaboration skills cited more than once were negotiation, giving and receiving constructive feedback, flexibility and follow-through.

In response to the following, “Describe... under what circumstances employees in your organization need to collaborate,” the most frequent responses were program development, special projects, in support of the organization's mission and goals, for product development, process improvement, making decisions under pressure, addressing client concerns, working in client communities, thinking of new ideas, and using technology such as WebEx or screen sharing.

#### **Qualitative Survey Responses: Teamwork**

In response to the following question, “Which teamwork skills would you most like to see in college graduates?” the skills most frequently cited were operating as a part of many teams, adaptability, working with others' ideas, clearly communicating, and listening. In response to the following, “Describe... under what circumstances employees in your organization work in teams,” the most frequent responses were: acting quickly and effectively in the client's best interest, intervening in a crisis, to support communities, to establish rapport, to work with other viewpoints and diverse groups, serve customers, work on multiple roles concurrently, mentor students, and facilitate the classroom.

#### **Qualitative Survey Responses: Leadership**

In response to the following question, “Which leaderships skills would you most like to see in college graduates?” the skills most frequently cited were: leading by example, high personal accountability, conflict and problem resolution, high integrity, persuasiveness, persistence, follow through, effective communication, organization, and confidence.

In response to the following, “Describe... under what circumstances employees in your organization use leadership abilities,” the most frequent responses were: able to take constructive criticism from their manager, positive and hard-working, meet the needs of the community, employees need to portray themselves as leaders, "step up" when needed, work on multiple teams, course correct, direct, and create a positive work environment.

### **Survey Responses: General Comments**

The survey concluded with a section which asked respondents to provide any general comments that they may have. General comments included the following, which focused on internship/work experience prior to employment, CTL skills and attitudes, communication, and general job skills:

There is an advantage to have (sic.) people who have a broad world view and have had internships; Would like to see that students have had hands-on experience; Field experience/internships - it brings confidence about their field; Students should spend more time working on practical team assignments working with businesses; Leadership experience at school or job is important; We want employees that are focused on improving the group as a whole - not just themselves; Communication and working with a highly diverse group of people is critical; Good oral and written communication skills are critical and collaboration is critical to a global economy; Students need political savvy and need to get job done with high quality; Candidates need to know how to write a resume and know what they want in a career before interviewing; Many seem to lack the self-esteem for a quick interview; Suggest a mixer without alcohol before the fair to get to know students - students need to know how to make the first move to approach an employer; Students need knowledge of collaboration tools (technology - Webex); Some students lack the ability to multi-task.

## **Interpretation of Employer Survey Results**

A few themes emerge from the employer survey results. First, employers are reporting that they value all CTL competencies assessed in the survey. Both general communication skills and listening are rated relatively highly in the numeric results and are mentioned frequently in the qualitative data. Additionally, valuing and respecting diverse cultures and opinions is mentioned frequently. In general, collaboration and teamwork skills are valued more highly than are leadership skills. In summary, employers highly value the multi-dimensional ways that employees get work accomplished through working together and also value employees' leadership behaviors whether or not in a formal leadership position.

## **Student Survey**

One of the researchers emailed the online survey link to CSUEB students in the winter quarter of 2013. The survey software used was Qualtrix. The survey was managed through the Office of Planning and Institutional Research on campus since the faculty researchers did not have access to Qualtrix software. The survey link was sent to 2940 CSUEB students (588 freshmen, 588 sophomores, 588 juniors, 588 seniors, and 588 graduate students), which represented 17% of the total CSUEB student body in winter 2013. A total of 877 (29.2 %) of the 2940 started the survey and 690 (23.5%) of the 2940 completed the survey. Among those who completed the survey, 78 (11.4%) skipped one or more questions on the survey. The survey asked respondents to estimate how frequently they were exposed to CTL and related experiences in classes and co-curricular activities, amount of their involvement in co-curricular activities, identification of CSUEB courses in which they were exposed to CTL, and their assessment of the degree to which their CTL experiences at CSUEB prepare them for the workforce and contribute to their personal growth. Results of the student survey are presented in Table 2.

**Table 2*****Results of Student Survey: Percentages and Means for Survey Questions***

1. Please indicate the percentage (%) of courses which involved learning about or the course work required:

	<u>Percentage</u>
a. Group work	50.55
b. Leadership	46.96
c. Teamwork/ collaboration	55.29
d. Applying teamwork and leadership skills in a real-life setting	50.93
e. The influence of diversity (culture, race, gender, or age) upon group behavior	55.78
f. Identification and resolution of conflicts within groups	46.42
g. Collaboration and creative group brainstorming	53.36
h. Respecting the views of others in group settings	65.05
i. Importance of integrity and ethics when interacting in a group	62.72

2. Have you been involved in any of these co-curricular activities.

	<u>Mean</u>
a. Student Government/ASI	1.19
b. Academic clubs	1.30
c. Cultural clubs	1.28
d. Greek organization (Fraternity/Sorority)	1.17
e. Recreational clubs	1.22
f. Religious clubs	1.12
g. Special interest clubs (orientation team, FYE, peer advocates, etc.)	1.20
h. Attending intercollegiate athletic events	1.32
i. Attending campus entertainment events, such as comedy shows, dance performances, etc.	1.52
j. Attending campus intellectual events out of the classroom, such as seminars, special lecture events, etc.	1.55
k. Recreation and Wellness Center programs and events (RAW)	1.65

3. To what extent do the following aspects at CSU East Bay prepare you to enter the workforce as an effective leader:

a. course work	3.46
b. co-curricular activities	3.29

4. To what extent do the following aspects at CSU East Bay prepare you to enter the workforce as an effective team member:

a. course work	3.80
b. co-curricular activities	3.44

5. Your personal growth since entering CSU East Bay can be attributed to many factors some of which may NOT be related to your experiences at this college.

PERSONAL GROWTH: Indicate the extent of your personal growth since entering this college (regardless of the college's contribution to that growth).

COLLEGE CONTRIBUTION: Indicate the extent of the college's contribution (i.e., your college experience both in and out of class) to your growth.

- |  |      |
|--|------|
| a. Personal growth in regard to becoming an effective leader                       | 4.01 |
| b. personal growth in regard to becoming an effective team member                  | 4.07 |
| c. college's contribution to growth in regard to becoming an effective leader      | 3.58 |
| d. college's contribution to growth in regard to becoming an effective team member | 3.69 |

**Notes:**

n for all items ranges from 612 to 687

For question #2, the choices were: Never (1), Occasionally (2), Often (3)

For questions #3, #4, and #5, 1 = none, 3 = moderate, 5 = very much

**Demographics of the sample:**

Gender: 27.8% male; 62.7% female; 1.3% other or decline to state; 8.2% missing.

Age: Range = 15 to 63; Mean = 25.68.

College Major: Many

Current class standing: 18.9% freshman; 15.3% sophomore; 16.7% junior; 19.4% senior; 20.9% graduate student; 0.9% open university; 7.9% missing.

Class standing when first enrolled at CSUEB: 42.7% freshman; 4.9% sophomore; 24.3% junior; 2.3% senior; 15.1% graduate student; 2.3% open university; 8.3% missing.

Hispanic/Latino ethnicity? 68.5% no; 22.9% yes; 8.6% missing.

Race: 0.3% American Indian or Alaskan Native; 29.7% Asian or Pacific Islander; 10.6% Black; 23.2% White; 11.3% Multiracial; 13.7% Other or Race Unknown; 11.1% missing.

Citizenship and Residency: 77.1% US citizen-in state student; 1.8% US citizen-out of state student; 4.8% resident alien/immigrant; 7.7% non-resident alien/nonimmigrant; 8.6% missing.

In which language do you communicate best? 81.5% English; 1.3% Spanish; 6.6% An Asian language; 2.4% other; 8.2% missing.

**Summary of Student Survey Results**

Results indicate that students are exposed to CTL experiences or instruction and/or group activities frequently in their coursework; students are reporting at least one of these types of experiences in about 50% of courses. Participation in co-curricular activities is generally low. Students report that coursework prepares them to be effective as both a team member and a

leader; students further report that coursework contributes more to their team member and leader effectiveness than does participation in co-curricular activities. Students claim personal growth in both team member and leader effectiveness over the time that they have attended CSUEB. They attribute a portion of both types of personal growth to their experiences at CSUEB. In sum, the university appears to be doing a good job of exposing students to CTL and group activities in courses and students perceive that the classroom experiences are at least moderately effective in preparing them as team members and leaders. Further study of CSUEB co-curricular activities is needed to determine where and how CTL exposure exists in those activities, and whether the exposure is effective in teaching CTL competencies.

### **Course Catalog Survey**

The course catalog survey was conducted by one of the researchers using the CSUEB 2011-2012 catalog. The researcher searched each of the departments on campus separately, a total of 88 programs, scanning for the following words in course descriptions: “leadership,” “teamwork,” “collaboration,” and “group.” Table 3 illustrates the incidences of these key words in course descriptions. The courses are organized by college.

**Table 3**  
***Course Catalog Survey: Incidences of the Words “Leadership,” “Teamwork,” “Collaboration,” and “Group” in Courses, Organized by College.***

College	Leadership	Teamwork	Collaboration	Group
Science	2	4	0	20
Letters, Arts, & Social Sciences	9	5	6	62
Business &	2	6	1	3

Economics				
Education & Allies Studies	63	8	8	32
Library	0	0	0	0
*Other	0	0	0	5

\*Other includes programs not associated with a particular college such as General Studies.

Three items in the student survey began with the following stem, “Please list the course ID for one or more classes which involved learning about:” and each was completed by one of the following three expressions: “Group work,” “Leadership,” and “Collaboration/Teamwork”. Table 4 illustrates the number of different courses which students reported as involving group work, leadership, or collaboration/teamwork, organized by college. When comparing the student course feedback to the course catalog survey, it is clear that students are experiencing CTL or group activities in many courses which do not include any of these key terms in their course catalog description.

**Table 4**  
*Student Survey Responses: Number of Courses Reported by Students*

College	Leadership	Teamwork/Collaboration	Group
Science	50	71	51
Letters, Arts & Social Sciences	86	105	113

Business & Economics	10	41	26
Education & Allied Studies	39	50	40
Library	0	0	0
*Other	12	13	15

\*Other includes programs not associated with a particular college such as General Studies

### **Recommendations for Practice**

Our external literature review and our own on-campus research involving students and employers reveals that CTL competencies are highly valued and that educators, students, and employers all agree that learning CTL competencies is a necessary part of a college education. Our student survey revealed that students are frequently exposed to CTL experiences in courses at CSUEB and that students feel that they benefit from these exposures.

As reported in *Education for Life and Work: Developing Transferable Knowledge and Skills in the 21st Century* (National Research Council, 2012), the evidence that CTL competencies (which they call “interpersonal” competencies) are taught effectively in universities is scant because fair, reliable, and valid measures of these competencies are unavailable for most college teaching. They recommend that researchers commit themselves to creating fair, reliable, and valid measurement devices. CSUEB research funds could be devoted to the development of measures of CTL competency.

The authors of the report also make a number of recommendations for teaching any type of knowledge or skill, although they caution that the evidence that these recommendations are effective come primarily from research on cognitive competencies. We listed a number of

recommendations earlier in the report (pp. 8 & 9); a number of the recommendations are worth repeating here:

- Allow opportunities for sustained practice of the competencies. Here at CSUEB we appear to be exposing our students to CTL experiences frequently in classes, and thus are allowing for “sustained practice.” Future research on campus could investigate more about *how* we are exposing our students to CTL in classes as a part of assessing our effectiveness in teaching CTL.
- In classes, do formative assessments of student work in CTL. Formative assessments are assessments that occur during the learning process, in which teachers provide detailed feedback of student work and allow students to revise the work before the final product is submitted for a grade.
- Encourage students to believe that their personal qualities are potentially malleable, since evidence reveals that individuals who think this way perform better on cognitive tasks (Yeager & Walton, 2011). This message of malleability could be communicated to students by their professors and by personnel in the Student Center for Academic Achievement, in Accessibility Services, and in Academic Advising and Career Education. For instance, some people believe that there are “born leaders,” but evidence indicates that leadership qualities can develop in individuals.
- The university should support the Office of Faculty Development for training professors in teaching methods that may not be well known (e.g., formative assessments, the importance of sustained practice, and AAC&U high impact practice to develop teamwork through group work).
- We, the researchers, intend to disseminate our results and recommendations through presentations on campus, such as “Back to the Bay,” and off campus.

While further research is conducted on CTL to determine the most effective teaching methods, other resources are available. Griffith University has created a 43-page Teamwork Skills Toolkit, with practical “how to” advice, available at [http://www.griffith.edu.au/\\_data/assets/pdf\\_file/0006/162726/teamwork.pdf](http://www.griffith.edu.au/_data/assets/pdf_file/0006/162726/teamwork.pdf). The National Clearinghouse for Leadership Programs produced a helpful report on leadership development available at <http://nclp.umd.edu/include/pdfs/MSLReport-FINAL.pdf>.

## Authors

**Gretchen M. Reevy** received her B.A. in Psychology from the University of North Carolina at Chapel Hill and her Ph.D. in Psychology from the University of California, Berkeley. Since 1994 she has taught in the Department of Psychology at California State University, East Bay, specializing in personality, stress and coping, and psychological assessment courses. With Alan Monat and Richard S. Lazarus, she co-edited the *Praeger Handbook on Stress and Coping* (2007). She is also author of the *Encyclopedia of Emotion* (2010), with co-authors Yvette Malamud Ozer and Yuri Ito. With Erica Frydenberg, she co-edited *Personality, Stress, and Coping: Implications for Education* (2011). Her research interests are in personality, stress and coping, emotion, college achievement, and the human-animal bond. In her free time Gretchen enjoys running and dance classes and is interested in animal welfare.

**Julie Stein** has a B.S. in Industrial Psychology and an M.S. In Human Resources Management from California State University, East Bay. She has 25 years combined experience in corporate education and college and university instruction. Her corporate training and development experience includes work for Pacific Gas and Electric Company, DHL Airways, and most recently as the marketing, retail, and web training manager at Safeway. She has instructed 19 different courses in the Business department at Las Positas College and in the Communication, Marketing, and General Education Departments at CSU East Bay. Her experience also includes working for the CSU Chancellor's office as a Faculty Development Specialist on the "Give Students a Compass" initiative for General Education reform.

**Chris Chamberlain** has a B.A. in Liberal Studies, a B.S. in Recreation Management, and an M.P.A. in Public Management, all from California State University, East Bay. He has a Doctor of Management in Organizational Leadership from the University of Phoenix. Chris has over 20 years of field experience working in municipal recreation for the Cities of Concord and

San Ramon. In addition to serving as the Program Coordinator for the B.S. in Recreation Management, Chris serves the California Park & Recreation Society on the local district board as well as a state administrator's board. He is a regular contributor to recreation administration publications and is a speaker at local, state and national conferences. For his own leisure, Chris is an avid outdoorsman, scout leader, and landscape photographer.

# **Using Social Media as a Tool to Drive Collaboration, Enhance Critical Reflection and Engender Improved Socialization Outcomes in Enterprise Learning**

**Topic Area:** Business Education

**Presentation Format:** Paper Session

**Presentation Description:** Research paper on the use of social media tools to enhance student-learning experiences in dynamic enterprise-learning environments. Findings indicate that pedagogical transformations can be achieved by carefully designed approaches to engaging social media in facilitating greater collaboration, critical reflection and enhanced student socialization.

**Paper Author:** David. H. Gilbert.

**Affiliation:** School of Management & Office of the Pro Vice-Chancellor (Business). Royal Melbourne Institute of Technology University.

**Address:** Bld 80. 445 Swanston St. Melbourne, Victoria. 3000 Australia

# **Using Social Media as a Tool to Drive Collaboration, Enhance Critical Reflection and Engender Improved Socialization Outcomes in Enterprise Learning**

## **Introduction**

This paper examines the use of social media tools, in particular the enterprise-level social platform 'Yammer', and 'YouTube' in fast tracking the democratization of commercial innovations as part of a collaborative enterprise learning program. The program is called the Innovation Fastrack Program or IFP; it has sought to offer students real life experiences in conceptualizing, prototyping and commercializing innovations in collaboration with industry partners that range from multi-billion dollar global retail firms, to world renowned professional services firms to not-for-profit organisations engaged in mobilizing social capital in realizing more equitable and just community outcomes. The program has been running since 2007 and in that time 165 students have graduated from the program with enhanced (and highly practical) skills focusing on creativity, design thinking, rapid prototyping, business model development, client reporting and presentation as well as life skills concerning communication, critical analysis and reflection, emotional intelligence and ability to understand and develop group dynamics.

Given the innovative nature of the program, it has been essential to continually evolve both content aspects and delivery modes as each innovation presents unique problems, opportunities and resource requirements. This has required academic staff and industry partners to strive to manage the tension between high levels of uncertainty and nascent student capabilities through immersion in real world conditions supported by high level mentoring and coaching. Many of the innovations the teams have worked on have been digital product and service offerings e.g. on-line idea capturing and assessing portals, data visualization dashboards for senior executives or mobile phone apps used to track tax liabilities for 'off-boarding' international executives. Given the propensity for industry to seek our assistance in driving their digital commerce it has required academic staff to engage with social media tools to align with the nature of the innovations and to also innovate around pedagogy in delivering and assessing enterprise learning programs

such as the IFP that by and large sit outside mainstream business studies; akin to what Gibb (2002) calls 'creative destruction' of the way we have been endeavouring to 'teach' entrepreneurship and innovation. This paper presents research from data gathered over six years regarding the efficacy of social media platforms at an enterprise level in fostering collaboration and knowledge spill-overs between Higher Education students enrolled in undergraduate and postgraduate business degrees, academic staff and industry participants and their key stakeholders (e.g. customers, suppliers, distributors, business partners).

### **Research Problem**

High levels of uncertainty, ambiguity and at times, volatility characterize the IFP. Thus, learning contexts need to be able to facilitate rapid and symmetrical access and development of knowledge. The life cycle of delivery and development is far from linear, being iterative and at times dense and at other times loose and free form. A traditional approach to workshopping the conceptualization, problem-solving, prototyping and commercial delivery of innovations is not entirely effective as a stand-alone approach (this was trialled in the first year of the program). A more composite or blended approach to facilitating capability development is required. Moreover, as Gilbert (2012) notes, overcoming one of the major constraints of enterprise learning, i.e. 'differing stakeholder perspectives and evolving outcomes' is not easy and assessing student learning outcomes in a program like the IFP can be problematic. These identified challenges are further exacerbated by the fact that the university involved has a high percentage of international students in its programs and in such a dynamic context as the IFP, innovative ways must be developed to ensure that they are socialized into the program quickly and effectively. Hence in regard to student overall learning experience we have three complex issues that this research addresses:

1. Research Problem - Does the use of an enterprise social network platform like Yammer, enhance collaboration amongst IFP participants?
2. Research Problem - How can social media be used in the IFP, to facilitate better critical reflection by student participants?

3. Research Problem - Can social media be used as a tool to achieve better socialization outcomes for students?

### **Literature Review**

Grosbeck (2009) provides a useful dissection of the use of web technologies in Higher Education, listing both the pros and cons for academics. Much of this insight is based on web 2.0 technology and it is obvious that at the cusp of web 3.0 there can be found a good measure of fear and a tendency on the part of many universities to avoid risk in engaging with such technologies, often citing security as a major constraint. Yet this overlooks the fact that access to and proprietary of data continues to evolve rapidly and if we raise the ramparts then it is obvious that innovation will be stifled. This innate fear of being compromised is somewhat falsely founded given as social media technology becomes more omnipresent and accepted so too security capability around many of these platforms improves. Data security cannot be totally ensured however closed channels and enterprise boundaries around platforms along with careful administration regarding content and participants can go along way to overcoming the constraints oft cited. As Grosbeck notes (2009:482), “teachers should look up from their textbooks...the reason these social technologies work is because teachers can foster collaborative work not only among their own students, but with colleagues and community members from around the world”.

Constructivist learning appears to have become an area of concerted focus in Higher Education. McLoughlin and Lee (2008) propose that didactic models of teaching and learning are out-dated and need rethinking. Furthermore they note a movement away from instructor-centred ‘positivist’ approaches to more constructivist models characterized by collaborative learning communities, user-created content and personalisation of learning approaches. Knowledge can no longer be seen to be exclusive and protected rather it is consumed and created often by collectives that offer different perspectives than that of unilaterally delivered knowledge. As McLoughlin and Lee (2008) note new learner-centred pedagogy are subject to rapid change and to differences based on discipline area though at a mezzanine level, learner-centred pedagogy is likely to be characterized by the following:

- digital competencies that focus on creativity and performance;
- strategies for meta-learning, including learner-designed learning;
- inductive and creative modes of reasoning and problem-solving;
- learner-driven content creation and collaborative knowledge-building;
- horizontal (peer-to-peer) learning and contribution to communities of learning, e.g. through social tagging, collaborative editing and peer review.

Gray et al (2012) also refer to the synergistic nature of collective learning and the leverage that web-based pedagogies may afford educators in terms of content and communication. They also detail that there appears to be little empirical work in regards to summative assessment whilst noting a greater proliferation of efforts in regard to formative assessment. They observe that this may be due to academics remaining reticent in revealing their use of novel approaches that may challenge institutional values and policies. In particular the issues of academic integrity and IP ownership comes to the fore continually.

Engagement Theory originally developed by Kearsley and Shneiderman (1999) has been used as a theoretical lens by some researchers to test the emergence of factors significant in identifying issues critical to collective, problem-based learning. It is predicated upon three core components, 'Relating, Creating and Donating'. Hazari, North and Moreland (2009) developed a four-factor model underpinned by Engagement Theory that sought to measure the pedagogical value of wikis for user-centered business school education. Four constructs based on a literature review were developed, 'Overall Learning', 'Motivation', 'Group Interaction' and 'Technology'. Their results indicate that the scale was reliable and valid (Cronbach alphas ranged from 0.85-0.93) with overall scale reliability at 0.97, though such a high result needs to be treated with some caution as it could indicate that some of the measurement items measure the same thing or that over-measurement has occurred. Notwithstanding this, the scale reflects many of the findings in the IFP over the past six years as detailed by Gilbert (2012) except for 'Technology', as a wiki was used whereas Gilbert operationalized both Yammer and YouTube, the former to drive collaboration

in democratizing innovation and assisting in the socialization process of international students and the latter in formatively assessing critical reflection by student participants in the IFP. Hazari, North and Moreland (2009) note that their research was confined to the use of a wiki and with business students and called for further research to explore for example social networking and student learning and motivation.

As previously discussed, Gilbert (2012) identified 'differing stakeholder perspectives and evolving outcomes' along with 'variability in student experience' and 'level of industry partner engagement' as critical issues that must be addressed in designing and implementing a successful enterprise learning program. In regard to stakeholder perspectives we have observed that industry are not overly concerned with assessment, they are more focussed on commercial outcomes and see assessment as an aside to be accommodated if the assessment aligns with their objectives. This is somewhat more easy to achieve when evaluating presentations and reports but more difficult in gauging the impact of content and delivery on student learning outcomes. In particular, assessing how and to what extent students critically reflect on their learning.

Crisp (2012) further articulates the movement from positivism to collectivism going further to posit that in recent times a neuroscience approach has been adopted by educators wishing to embrace more dynamic and interactive learning and subsequent assessment approaches. He maintains that assessment is critical in determining an appropriate approach towards student learning. He categorizes approaches into 'convergent' or 'divergent' pedagogy, where convergent expects students to provide the same response and divergent where 'students may provide different but equally valued responses' (2012:6). The former often adopts standardized feedback in assessing core knowledge whilst the latter requires more innovative approaches to determine the 'relative worth' of students' functional and procedural knowledge. As previously observed, researchers have noted the paucity in summative approaches to assessment with a greater preference for formative assessment when web-based learning environments are engaged. Through continual re-design of the IFP resulting from additional learning that each program offers (to all stakeholders) an integrative approach to

assessment has emerged that overcomes the variance in expectations between academic and industry. This approach essentially addresses the six key characteristics that Crisp (2012:8) maintains promote student learning in terms of self-direction, problem-solving capabilities and adaption of learning to future scenarios as follows:

1. students are provided with opportunities to make judgements about their own learning or performance through review and critique;
2. students are provided with opportunities to define standards and expectations in their response;
3. students are provided with opportunities to track and analyse their approaches to responding to a problem, issue, situation or performance;
4. students are provided with opportunities to integrate prior or current feedback into their response;
5. students are provided with opportunities to engage with a meaningful task that has inherent worth beyond just an assessment activity;
6. students are rewarded for the quality of their analysis of metacognitive abilities, rather than declarative knowledge.

An additional challenge in designing enterprise-learning programs that deal with real world problems and opportunities is how to better socialize students into such a program; particularly international students so that their experiences are equally as positive as their domestic counterparts? Higher Educational institutions around the world are well aware of the global nature of the education industry. Many institutions aggressively market their programs particularly in Asia and the institution offering the IFP is no different, indeed if both onshore and offshore students were aggregated then just over half of the College of Business's 30,000 students are international. So it is not surprising that international students apply to participate in the IFP and in upholding fair and equitable access to all, careful and measured attention must be brought to bear on ensuring that international students prosper and that the domestic students who work together with them do not suffer as a consequence of a poorly designed program. Sümer, Poyrazil and Grahame (2008) note that in the United States there are over 600,000 international

students with over 58% coming from Asian countries. Given that most university students are challenged by both the content and workload of their degrees it is to be expected that they will suffer stress. This is compounded for international students who must deal with culture shock and issues such as language barriers, social adjustment, homesickness, immigration requirements and loneliness and isolation. This of course can impact on their ability to perform, moreover the potential for them to suffer more intensely due to the nature of the IFP and the need to become comfortable with uncertainty and ambiguity is compounded. Trice (2004) calls for educators to 'mix it up' as research shows that international students better able to socialize both within their studies and outside their studies with students of other nationalities perform better and have a richer university experience. She also found that the ability to communicate effectively was a strong predictor of a better social experience.

According to Gardiner (1994), the critical components and competencies that educational institutions provide students to face society should include:

- capacities for critical thinking and complex problem solving;
- respect for people different from oneself;
- principled ethical behaviour;
- life-long learning and
- effective interpersonal interaction and teamwork.

Tham and Werner (2005) note that on-line learning environments can if carefully designed facilitate more positive outcomes for international students in regard to Gardiner's competencies, as the on-line environment is less threatening and the terms of engagement more self-directed. Gardner's 'critical components and competencies' align with the learning outcomes for the IFP and given the participation of international students in the program and the heightened socialization issues that thus present, YouTube has been effectively used to not only promote critical reflection by students but also to monitor international student experience in the program.

## Method

To measure overall student learning experience an adapted scale based on the work of Chickering and Gamson (1987) and O'Neill, Moore and McMullin (2005) has been developed. The scale measures items such as encouragement of active learning, reciprocity and co-operation amongst students, time and task, feedback, critical thinking and achievement of learning objectives. The scale has been used over the course of the IFP and has proven robust. Cronbach alphas assessing items to scale have ranged from 0.83 to 0.91 over the period of measurement. Convergent and discriminant reliability of items to scale show high correlation and sphericity using Bartlett's test, significant at the  $p < .001$  level. Similar testing has been undertaken for all scales used to measure student learning and satisfaction outcomes in the program over six years.

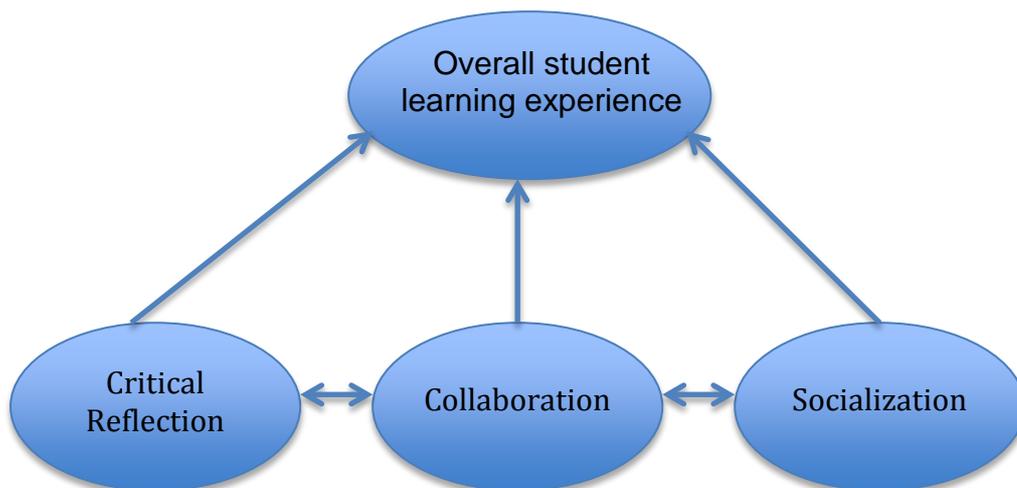

To investigate 'Research Problem 1 - Does the use of an enterprise social network platform like Yammer enhance collaboration amongst IFP participants?' - a Yammer feed is established for each Fastrack program. An overarching 'All Network' group is operated that includes all students, academics, industry partners and other key stakeholders depending on the nature of the innovation. Teams are then able to operate 'Private Groups' that consist of each team, their industry mentors and coaches as well as academic staff involved. The purpose of this is that for each innovation at least two teams are assigned to each innovation and provided with symmetrical information. This encourages divergent solutions to the opportunity and also a little friendly competition that does tend to enhance performance!<sup>1</sup> Collaboration is measured in two ways, firstly through Yammer Analytics that provide metrics and statistics in relation to members, groups, messages, files, pages and access. Secondly, students are surveyed to gather data relating to their experience in using Yammer. Measures relate to degree of engagement; quality of engagement; utility in accessing knowledge; equity in collaboration; ability to interact with mentors and coaches; knowledge dissemination; and overall experience in comparison to other courses that use Blackboard.

---

<sup>1</sup> For an extensive overview of the IFP program see: David H. Gilbert, (2012) "From chalk and talk to walking the walk: Facilitating dynamic learning contexts for entrepreneurship students in fast-tracking innovations", Education + Training, Vol. 54 Iss: 2/3, pp.152 - 166.

To investigate 'Research Problem 2' - How can social media be used in the IFP, to facilitate better critical reflection by student participants? - A 'Reflection Journal' assessment requires students to post weekly YouTube diaries to their instructor over a private channel. The diaries are assessed using Crisp's (2012) Integrative Assessment criteria and students are also surveyed to measure their experience with the medium in relation to the following items: ease of use; time effectiveness; effectiveness in making judgements about their own learning or performance; ability to integrate prior or current feedback into their activities; ability to track and analyse their approaches to responding to a problem, issue, situation or performance; management of team dynamics; and performance and applicability of theory to practice.

To investigate 'Research Problem 3' - Can social media be used as a tool to achieve better socialization outcomes for students? - A combination of Yammer and YouTube is used to build a community, drive collaborative engagement and reduce stress experienced by all students, particularly international students in having to conceptualize and then support critical discussion relating to design-driven innovation. Outcomes are measured through Yammer Analytics and self-reported measures from surveying participants in the IFP.

**Figure 1: Conceptual Model**

## Findings

An exploratory factor analysis using principal component analysis with varimax rotation was conducted to test model ability to measure 'student learning experience'. The model explained 84.7% of the variance and provides an appropriate basis for further investigation into associations between the factors. Table 1 following presents measurement model results.

Factor/items	Mean Score (1-5)	Factor Loading	Scale Alpha
<b>Factor 1</b>			
Overall Student Learning Experience			
1. Active learning	4.35	.887	.91
2. Reciprocity	4.77	.798	
3. Time & task	3.98	.712	
4. Feedback	4.92	.914	
5. Critical thinking	4.90	.898	
6. Learning objectives	4.94	.910	
<b>Factor 2</b>			
Collaboration			
1. Degree of engagement	4.65	.915	.89
2. Ease of access	4.11	.862	
3. Utility	4.50	.798	
4. Knowledge dissemination	4.91	.756	
5. Level of mentor interaction	4.05	.815	
6. Level of team engagement	4.22	.799	
7. Equity in effort	3.87	.705	
8. Blackboard Comparison	4.89	.825	
<b>Factor 3</b>			
Critical Reflection			
1. Ease of use	4.76	.768	.90
2. Time	4.25	.790	
3. Learning/performance judgement	4.33	.935	
4. Feedback integration	4.60	.908	
5. Problem-solving analysis & tracking	4.57	.836	
6. Team dynamics	3.98	.756	
7. Applicability between	3.15	.776	

theory & practice			
<b>Factor 4</b>			
Socialization			
1. Access	3.96	.729	.83
2. Convenience	4.11	.810	
3. Self-direction	4.53	.709	
4. Degree of loneliness	4.21	.822	
5. Identity & belonging	4.88	.836	
6. On-line community support	4.92	.825	
7. Communication proficiency	3.45	.716	

**Table 1: Rotated Component Results**

The factor analysis results as detailed were analysed in conjunction with Yammer analytics, which offer statistics around a number of metrics. This includes number of members, number of groups, number of both network and private messages, number of files uploaded and exchanged and growth in member engagement. In the IFP use of both Yammer and YouTube is voluntary and alternate 'traditional' communication mediums are offered such as face-to-face weekly workshops and typed or hand-written critical reflection journals. 100% of students chose to use both Yammer and YouTube and statistics over the course of the program show strong trends in growth across all categories of metrics, from the beginning of the program to conclusion. The average member engagement over the IFP lifecycle has been 100% and the growth in overall member engagement 19.2%. Moreover, when international student statistics are compared to domestic students two interesting trends have emerged, Firstly, at the beginning of the program international students are slower to become engaged, indeed many remain almost unengaged preferring to let a group 'spokesperson' drive team traffic. This individual is usually the most proficient in English and often the most confident in interacting. Secondly, when overall engagement is compared at the end of the program, the growth rate for international students is trending at 6.7% higher than their domestic counterparts, though of course off a lower base to begin with. Yammer analytics provide a transparent means for academics to monitor levels of engagement and combined with interaction with students and

industry partners in various discussions and exchanges a more tangible means to facilitating and assessing the level of socialization of all students and particularly international students participating in enterprise learning program such as the IFP.

## **Discussion and Conclusions**

The 'overall student learning experience' model has been developed to compliment existing data collection in the Innovation Fastrack Program that measures the lifecycle of innovations from creation to substantiation to activation underpinned by a design thinking approach. The IFP has become well known with industry for producing especially digital innovations that drive greater business profitability. Significant outcomes for industry partners have been achieved in terms of new products and services, enhanced mentoring capabilities and exposure to fresh talent that offers a different perspective into what can be achieved. For students, the opportunity to be immersed in real-world problems and opportunities in collaboration with skilful industry partners, results in outcomes not possible in a traditional higher educational learning environment. For educators in the program, the strong focus on digital business model development and execution has necessitated innovation around pedagogy. We know business cycle times are ever diminishing and market reach is more often than not viewed in global terms, thus heightening uncertainty, ambiguity and volatility in business. Enterprise learning programs need to tackle these issues and it is difficult to do so in a simulated environment. That said, the duty of care to students is undeniable and as educators it is imperative to find ways to ensure that students are able to collaborate, socialize and reflect on their experiences in ways that facilitate these objectives whilst not placing them under unnecessary duress.

The use of Yammer has driven greater collaboration in the IFP, students have responded positively to the platform whilst industry partners (some of whom have not yet taken to Facebook or Twitter) have found the interaction dynamic, in real time and effective in engaging other external partners able to further enhance knowledge exchange. Industry partners are time poor, indeed students also face significant time pressures and as for academic staff, the increasing pressures to conduct research and publish results, bring in grant-

related income, supervise doctoral candidates and achieve excellent teaching outcomes means that innovation in the way we design and deliver learning programs is often constrained. Yet, we have found in the IFP that the use of social media such as Yammer and YouTube can be useful in enabling innovative methods of achieving greater collaboration amongst students in a self-directed mode facilitated by mentoring from both industry experts and academic staff. This creates a synergistic nexus between theory and practice with feedback loops regarding practice assisting students to contextualize their learning and theoretical feedback loops assisting industry to ground their practice offering additional supporting evidence for proposed courses of action.

The less threatening virtual environment also allows students to essentially self-manage their socialization into a community and one of the pleasing outcomes of our use of social media in the IFP has been the continuation of communities after the program has concluded; communities that are globally interconnected providing enterprise opportunities and support. International students in particular view this approach positively and speak highly of the IFP and the approaches taken to both facilitating their experiences and also leveraging their international perspectives and networks.

The success of YouTube in engendering greater critical reflection has been somewhat of a surprise. It was at first trialled as an experiment but soon became a critical component of the student learning experience. Students are more likely to reflect honestly and deeply on their own learning and ability to integrate feedback into their endeavours. Likewise, they are not shy in evaluating their team's performance (often in comparison to other teams) and it has been noted by academic staff involved in the IFP that a 3-5 minute weekly video affords a more valid and uncompromised view of each student's learning journey, than several pages of notes in a written diary that are often of a sanitized nature. This enables the corrugations in experience to be smoothed quickly and effectively and student trust increases as they see that any issues that do arise are managed professionally and expediently.

Further experimentation and innovation will occur in the IFP and we suspect that given the digitally driven nature of this enterprise-learning

program and the propensity for the Millennial generations to live their life constantly connected and engaged via technology, social software tools will become more central in the program's evolution. We have found that the tools we have used increase autonomy and levels of socialization and interactivity, while enabling user-controlled, peer-to-peer knowledge creation and network-based enquiry and problem solving. We must however be alert to not make the mistake of seeing technology as the driver of pedagogical innovation rather it is the tool to operationalize theory and research-driven transformations.

The paper is based upon experiences from a Swedish Business School of educating in the area of Entrepreneurship. Starting from traditional class room teaching, a specific pedagogical concept “entrepreneurial learning” emerged. The paper discusses how interaction with partner organizations and local communities can be used on bachelor and master level.

Topic area: Curriculum, Research and Development

Presentation format: Paper Session

## *Abstract*

The School of Business and Economics at Linnaeus University, Växjö, has a long tradition with research and education in the area of Entrepreneurship. It started with a small business program where traditional class teaching was combined with internship at a company. Later this program developed to a bachelor alternative at the traditional Business Administration program focused on Entrepreneurship as a subject. Year 2000 the Business Development Study Program (EBD) started guided by a specific pedagogic idea of “Entrepreneurial Learning” based on earlier experiences of making close links between the local business environment and Higher Education.

The pedagogical idea “Entrepreneurial Learning” was formulated by Jonsson and Jonsson (2002) in a conference paper. The concept was influenced by the among others Freire (1997), Mentowski et al (2000), Rogers (1969) as well as the Växjö professor Bengt Johannisson. It has close connection to what has also been framed as Problem Based Learning (PBL) or Project Based Learning as well as Experiential Learning.

The EBD Bachelor Program is based upon some basic principles which are elaborated in the paper;

- Learning takes place in the space that is created between the students, the universities and a partner organization.
- Learning is stimulated by the investigation of themes.
- The learning process is steered through the formulation and design of tasks and examination forms.
- Learning is an ongoing process.

While the Bachelor Program has been running for more than ten years some initiatives has been taken to learn from non-academic entrepreneurship education (Johansson and Rosell, 2012). Currently a Master Program is being developed based upon the experiences from the EBD Program. Considering these experiences and research reports on PBL this paper discusses how to bring practice and theory together in advanced Higher Education in the area of Entrepreneurship. Specifically the paper discusses ways to create space to allow students to get close to practice, to spend long enough time in the field of practice in order to contribute to practice and to use the student’s earlier personal experiences in practice. Such encounters with practice require specific methodology training and coaching in order to make the projects successful. Finally we discussed how knowledge of practice can contribute in advancing theoretical knowledge as well as how theoretical knowledge can be used as an interpretative repertoire to understand practice.

Keywords: entrepreneurial learning, problem based learning, experiential learning

## Introduction and purpose

Entrepreneurship education is on the political agenda of most countries today. More and more entrepreneurship education is celebrated as a highway for future wealth creation (Johansson and Rosell, 2012, Stevenson and Lundström, 2005). In Europe the European Commission has long supported the cause of entrepreneurship education and there have been national strategies and action plans developed in most EU countries to integrate entrepreneurship throughout the whole school systems (Eurydice, 2012). The idea behind this massive trend reflects a strong discourse on that national and regional economies need new entrepreneurs (Taatala, 2010). The entrepreneurship discourse has by large favored a focus on the individual. In Ogbor's (2000) interpretation this discourse has created a myth about the entrepreneurial hero. As a consequence the underlying argument why society need entrepreneurship education is that the school system could foster upcoming generations to become (hero) entrepreneurs or at least more entrepreneurial in their behavior. It is seldom reflected upon the good and bad sides of this as it is presumed that entrepreneurship only makes the society better and wealthier (Berglund and Johansson, 2012). Entrepreneurs are assumed to do good not bad things to society.

As there are many views on what entrepreneurship is, there are also different views on what entrepreneurship education should accomplish. One main argument is that entrepreneurship education should develop entrepreneurial skills of the students, as this would result in more people with higher entrepreneurial capacity. However, academic education in general emphasizes theoretical knowledge, which means that abstract and generalizing thinking is promoted and practical training is less emphasized. In line with this there are many textbooks on entrepreneurship. The title of Kuratko (2008) is accordingly: "Entrepreneurship – Theory, Process, Practice". The publisher advertises the book in the following way:

Learn the true process of a successful entrepreneur with ENTREPRENEURSHIP: THEORY, PROCESS, AND PRACTICE, Eighth Edition! Presenting the most current thinking in this explosive field, this renowned entrepreneurship text provides a practical, step-by-step approach that makes learning easy. Using exercises and case presentations, you can apply your own ideas and develop useful entrepreneurial skills. Cases and examples found throughout the text present the new venture creations or corporate innovations that permeate the world economy today. This book will be your guide to understanding the entrepreneurial challenges of tomorrow.

What is promised is an integration of theory and practice. As most textbooks on entrepreneurship, Kuratko's book refers to an implicit assumption of the learning process. The book claims to define and present the knowledge content which is relevant in order to become a successful entrepreneur. The book first present theory - generalized knowledge about entrepreneurship divided into different themes. Following theory cases are presented as illustrations of the generalized knowledge. Through exercises the students are then guided to reflect upon the cases as well as themselves and through this process come up with a kind of roadmap or plan for how to become entrepreneurs themselves or how to understand and assess entrepreneurship processes.

Textbooks such as Kuratko's are well aligned be used to design academic education *about* (Taatala, 2010) entrepreneurship. Generalized knowledge (theory) presented in an abstract

way is just that – knowledge *about* entrepreneurship. The cases provide elaborated knowledge about entrepreneurship related to specific contexts. This knowledge content can be further elaborated in lectures and seminars as well as examined through oral or written exams. All course activities could be performed within the classroom, the students do not need to interact with someone outside the classroom setting. Despite this the idea is that given that a student learns about entrepreneurship this learning could be followed by a second step where knowledge is applied in real life. That is however not part of an entrepreneurship program *about* entrepreneurship.

Another alternative is to design academic education *for or in* entrepreneurship. Education *for* entrepreneurship as used by Taatila (2010) is an education preparing for a career in self-employment and education *in* entrepreneurship refers to management training for established entrepreneurs. Taatila argues that an education for entrepreneurship is based upon experiential learning or learning by doing. Such learning is an abductive process starting from real life situations. Seen this way “an entrepreneurial student constantly learns via real experiences and creates new personal knowledge by producing creative solutions that solve emerging problems” (p56). Being true to experiential learning would mean that a textbook in entrepreneurship could not be prescribed in advance, as is usually done in course syllabuses. All prescribed literature would at most be labeled reference literature, a menu of suggestions where it is up to the student to decide whether or not it is relevant in the process of experiential learning. Thus experiential learning contrasts education about entrepreneurship as presented above, the latter being in line with a deductive process.

Taatila provides four examples of how experiential learning or learning for or in entrepreneurship is used in academic settings. The first example is a four month post-graduate diploma course. The second example seems not to be a clear case of experiential learning. The third example relates to an undergraduate program where different parts seems to be more successful than others. The fourth example is a learning environment arranged outside the regular curriculum encouraging students to turn their hobbies into new business ventures.

We draw the following conclusions from the examples Taatila describes:

1. To be true to experiential learning seems not to be unproblematic.
2. Experiential learning are exceptions that proves the rule and appears in the margin of academic contexts.
3. Entrepreneurship education through experiential learning is exclusively focusing new venture creation.
4. There is no example illustrating in what way an entire bachelor and/or master programme is designed based upon experiential learning.
5. There is an emphasis on practice which leaves the question of the relevance of theoretical (general/abstract) knowledge unanswered.

To sum up the discussion so far, two types of entrepreneurship education at the academic level have been described. The first is education *about* entrepreneurship based upon deduction starting with generalized knowledge. In the following we will refer to this type as traditional entrepreneurship education. This type is distanced from practice and fall short of bringing theory and practice together as theory takes the superior position. The second type is education *for or in* entrepreneurship. This type is based upon abduction and appears in the margins of the academic context. As this type is distanced from theory in that it gives personal experience a superior position it is also falling short of bringing theory and practice together.

This conclusion raises the question if there is a way to bring practice and theory together in a more balanced way, where practice and theory has an even weight.

The purpose of the paper is therefore:

1. To present a pedagogy of entrepreneurship education which brings practice and theory together in a balanced way
2. To illustrate how entrepreneurship education could be designed on bachelor and master level based upon such pedagogy.

## **Method**

The paper is based upon experiences from the School of Business and Economics at the former Växjö University and now Linnaeus University. The school has a long tradition of research in entrepreneurship and has run different kinds of educational programs in the area. In the beginning there was a small business program combining traditional education with internship (students working weekly at a small company). Later this was developed into a bachelor alternative within the traditional Business Administration program. At this time the education was rather close to education *about* entrepreneurship, however successful. One of the versions of this program was ranked fourth in the world in a ranking 1997. The reason it was ranked so high is related to a close connection to the local business environment and strivings to combine academic theory and practical enterprising already at that time.

Against this background the Enterprising and Business Development Program (EBD) was launched the summer of year 2000. The idea was to use all experiences from earlier programs and to develop a more distinctive pedagogy where the students raise the questions and take responsibility for their own learning. A pedagogic idea was developed by a team of lecturers, which will be described in the following section of this paper.

The pedagogic idea is articulated in a conference paper written by Christer Jonsson and Thom Jonsson (2002) and their paper is the main source used to describe the pedagogy in the following section of this paper. Descriptions of and experiences from running the program have also been published in book chapters by Johansson and Rosell (2012) and Kans (2009). 2012 an internal quality assessment of the EBD program was undertaken and is a further source which the following section builds upon.
