In 2012 a process was initiated with the intention to develop a master program of entrepreneurship. Currently a one year master program has been decided to start 2014 and the work to develop a two year master is ongoing. Documents from the planning process of the master programs are the main source of the section about the master programs together with the personal experiences of the authors. We authors of this paper has been involved in teaching on the EBD program for several years as well as involved in developing the master program.

## **The pedagogy of an entrepreneurship bachelor program and its design**

The team of lecturers who formed the EBD program formulated six basic principles of the program. Theoretically this team was informed by the works of entrepreneurship researchers as Hjorth and Johansson (1998), Johannisson and Madsén (1997), Stevenson and Jarillo

(1990), Hjorth (2001), Forslund (2002) and pedagogically by scholars as Rogers (1969) and Freire (1997). The six principles were:

*Learning is created in the room that occurs between the university – the student and the partner company.* The first week now starts with a bus trip starting at the university bringing the students to various potential partner organizations. The bus in itself symbolizes the “in-between space”. The idea with the bus trip is to communicate the idea that this in-between space is an open space – full of possibilities for the students to choose. From week two of the program, the students need to find a partner organization to work with, something they then has to stick with the rest of the program, with the possibility to change organizations over time. With this principle a setting is created where the students has to work with theory and practice at the same time.

*The learning process is steered through the formulation and design of task and examination forms.* In traditional education the literature governs what the students read and try to learn. In the EBD program the learning is governed by what the students are doing, the problems they want to solve. That is also the focus of the examination. There is a list of literature in the course syllabuses, but these are seen as a support system together with lectures and seminars. The examination forms are divided into two parts, projects related to the theme of the course and discipline related exams. This way a balance between examining the acquisition of theoretical and practical knowledge is created. The projects have to be formulated together with the partner organization in order to be of practical use for this organization. The projects are about solving practical problems by drawing from contextual information together with theoretical/generalized knowledge. Therefore the projects are assessed with pass and distinction, while discipline oriented exams only can give pass, as it is only the generalized knowledge which is assessed in these latter exams.

*Learning is something the student is responsible for.* The message to the students is that they are responsible for their learning – it is not the teacher and it is not the literature. To study is to learn how to learn. In this way experiential learning is encouraged, a learning which is expected to take place together with the partner organization, the teachers and by *using* theoretical knowledge. The students have to find their own ways of how to learn by focusing different aspects of enterprising and the teachers assist the students in this process.

*Learning is individual and individualised.* Part of the content in the courses is the same for all students, but parts are determined by the choices the students make. This means that the students to a large extent decide upon the content of their education. This content is related to their own interests and to the partner organization. If a partner organization for example is in the service industry, for example software programming, the student will have to learn a content related to that specific industry. This content is different compared to a student who work with a truck producer. Also the kind of projects that are formulated in a dialogue between the student and the partner organization will influence the content of the course for each student.

*Learning is a continuing process.* The program starts with an overview of the disciplines that builds up the program (the disciplines are Business, Economics, Law, Informatics and Social Psychology) and then through different themes encourages a deeper and deeper theoretical understanding parallel to solving practical problems of the partner organizations. On every theme most of the disciplines that build up the program are represented. Traditionally, progression in university education is secured through the pre-planned sequel of courses that

the student takes. Each course handles more complicated questions and phenomena. On the EBD program each discipline returns on every theme and add on to what has been discussed previously. Progression here is secured in the way that each discipline is related to a new theme. In this way, the student's ability to analyse and solve problems are enhanced gradually since the basic assumptions and models of each discipline is applied to new types of problems and questions.

*Learning is done through the investigation of themes.* The theoretical underpinnings of the program mean understanding entrepreneurship as a process, predominantly business processes and how they can be developed. This means the following themes are worked with: creating new businesses, administration of ongoing businesses, internal renewal, radical change processes and internationalization processes. In each of the themes the students meet relevant subthemes such as as law, economics, marketing, social psychology, etc. This way the students is trained to develop their abilities to solve the complex problems of their partner organizations.

During the first semester of the programme, the students are introduced to the academy and to the disciplines that build up the EBD programme. The concept of process is focused upon as each discipline is introduced from a process perspective. The students also start to interact with the community when they identify a partner organization and start to do project work in relation to this organization. In the project assignments, the students identify, describe and analyse processes in their partner organizations from the perspectives of the different disciplines.

The second semester of the first year introduces the first theme on the programme. This theme is related to the creative process of developing a new idea or product. The semester is based on entrepreneurship theory and focuses opportunity recognition and starting new ventures. In the beginning of the semester the students perform an environmental analysis from the perspective of their partner organization. Based upon the analysis they identify and formulate a development project. The last quarter of the semester this project is performed. During the second semester of the first year the discipline of social psychology has its own course (7,5 credits) labelled "the individual and the company". Here the student is asked to reflect upon his/her relation to the group and his/her development as an individual. The idea behind this is that the students are encouraged to reflect upon themselves as entrepreneurial selves, that is their own personality and their own thinking and acting in relation to the project assignments on the program are reflected upon.

The second year starts with the theme management and control of processes. This theme is worked with the entire third semester of the programme. During the semester students do in total seven project assignments. Each assignment is related to the partner organisation. The instructions are formulated by the university teachers. The students are asked to analyse and solve problems related to different aspects of management and control. One assignment focuses on human resource management, another deal with operations and process management, a third is about sustainability and so on. The students are asked to apply specific theories in each assignment. Within these limits, the students can however adapt the assignments so that they solve a problem that is relevant also to their partner organization. The theme finishes with an assignment where the students are asked to formulate a project plan for a development project in their partner organisation.

The fourth semester of the programme there is a return to renewal, change and development in organisations and thus to entrepreneurship theory. The project plan that was formulated in the end of the previous semester is developed into a project at the partner organisation. The

students also do an assignment where the history of the partner organization is documented. Theories about change in organizations are then used in order to interpret the development. The third year of the program focuses upon internationalization of organizations. The students do literature reviews on internationalization of businesses and they identify and perform a project assignment related to the international operations of their partner organisation. This semester, students have the option to go abroad and study courses at another university. The last semester of the program, the students write their bachelor thesis.

After twelve years the team of teachers working with the program have experienced opportunities as well as challenges. Starting with the challenges, in order to understand and solve a real life problem in an educational setting, knowledge from many disciplines has to be applied. There is a need for cooperation between staff that to some degree has their own way of thinking and working and thus belongs to different academic cultures. Adding to that, the EBD program is built upon a different pedagogical idea compared to other education programs at the school of Business and Economics at Linnaeus University. This makes it difficult for new teacher on the program to understand how she/he should contribute to each specific theme. There is a risk that the program is experienced as messy. There is consequently a great need of cooperation, dialogue and joint reflection between the groups of teachers involved in the programme. This could be experienced as time consuming compared to other types of programmes that does not cut across disciplines and faculties in the same way. Despite this, the EBD program has the same amount of resources as other programmes at the school of Business and Economics.

There are also opportunities. One reflection is that the pedagogic idea is useful in promoting some of the goals of higher education that other types of programmes might find difficult to reach. More specifically, the interdisciplinary aspect of the programme promotes a variety in methodological approaches and techniques, ranging from the more quantitative approaches of i.e. management control and logistics to the generally interpretative approach of social psychology. Additionally, the student's connection to both the university and to local organizations in the surrounding society makes it necessary for the students to at the same time handle many and different stakeholders in their education. The students have to discuss their education and their project assignments with actors outside the academy, in this case with representatives of local businesses and other types of organizations. This brings an extra dimension to the learning process, as practitioners may value their work according to different standards compared to the ones used in academia.

An internal quality assessment of the EBD program was undertaken in 2012, at a point in time when the program had been running for twelve years. The report states that the EBD program is unique in Sweden in the respect that it is the only coherent bachelor program for business students using a specific pedagogy for entrepreneurial learning, which means education for or in entrepreneurship. It is thus not an education *about* entrepreneurship, but an education which supports the students to develop their own entrepreneurial capacity (including characteristics like personal maturity, creativity, ability to act and self-confidence) parallel to the study of enterprising from different discipline perspectives.

At the start of the program the school arranged for partner organization in an effort to facilitate for the students. After some years it was decided it was the students who were responsible to recruit a partner organization. This message now is announced the first week of the program. During this week students also are encouraged to re-evaluate whether the program and its pedagogy really meets their own personal desires and fit with their personalities. Some students usually leave the program during this week or the first month.

The task to find a partner organization is a kind of challenge some students are not comfortable with. It has however not been difficult for students to find partner organizations and many companies in the region have been welcoming EBD students year after year. In 2012 a sample of partner organizations were interviewed. The respondents were in general very positive to be acting as a partner organization. They declared that it did not require very much preparatory work, they were satisfied with the contribution from the students and they appreciated the self-going character of the students. Sometimes the value for the companies were comparable to commercial consultants sometimes of lower value, but generally the students were considered to come up with sound and reasonable ideas for the problems they had worked with.

### **The pedagogy of an entrepreneurship master program and its design**

While the EBD program is unique in Sweden in being the only coherent bachelor program *for* or *in* entrepreneurship, there are a few others on the master level. Two of the existing programs specifically focus innovation and they are provided by technological universities. They therefore have a close connection to technological innovation and new venture creation. The Linnaeus University is a general university and the entrepreneurship tradition at the School of Business and Economics is broader. A key concept at the School is societal entrepreneurship (see Berglund, et al, 2012) which refers to entrepreneurship from a societal perspective, not least entrepreneurship taking place at the intersection between, the private, public and civic sectors of society.

The objective of the master program at the School of Business and Economics is to offer both one-year and two-year programs for entrepreneurship, which are based on the same pedagogic idea as the EBD bachelor program. The pedagogical principals are therefore the same but the structure of the program is somewhat different from the theme oriented design of the EBD program. In the following the two year master will be described. All courses are on advanced level.

The first semester are divided into two courses. The first half of the semester there is a course in business development. This course is to give a deepened theoretical understanding of business development processes. As such it is of the traditional kind, where theory is given superior emphasis. The second half of the semester has a course in action based methods and application. This course gives a thorough understanding of different action based methods, which includes a range of action research methods as well as other qualitative methods such as focus groups and participant observation methods. Philosophical foundations of action based methods are included in the course as well as problematization of action based research processes. During the course the students has to initiate a larger project for societal entrepreneurship. This could be a project concerning rural community development or a project involving different private or public organizations.

The first quarter of the second semester has a course on Scandinavian perspectives on entrepreneurship. This course gives a deepened theoretical understanding of entrepreneurship, emphasizing societal aspects of entrepreneurship. Half of the second semester the students work with the implementation of the initiated societal entrepreneurship project. Here the students need to interact with the partners involved and to take responsibility to acquire relevant knowledge in order to make a significant and useful contribution to the identified development objectives for the partners and other stakeholders. The last quarter of the

semester there is a methodological course about how to analyze the project so that the knowledge created can contribute to generalized, theoretical knowledge.

The first half of the second year is for studies at a foreign university. Here the students are encouraged to choose universities with whom the School of Business has a close cooperation. During this semester the students will take theoretical courses aiming at deepening theoretical knowledge in the area of entrepreneurship and to make project work with partner organizations in the this foreign context. The second half of the second year is for thesis work. The student can use the projects they have undertaken as empirical material for their thesis. There students can choose either to align their thesis for work outside the academy or they can prepare for PhD education.

When comparing the master and the bachelor program the sixth pedagogical principle need to be commented. In the EBD program each semester has different themes and the traditional subjects are taught in portions relevant to the specific theme. In the master program a new theme is introduced, which is societal entrepreneurship. This theme does not follow the life cycle of a firm like the EBD program, but is integrating business process with societal processes thus approaching entrepreneurship quite broadly, opening for several kinds of entrepreneurial processes. Most entrepreneurship programs focus on new business creation. In comparison this program includes new business creation as no more than one kind of entrepreneurial process. The internationalization theme is part of the EBD program and in the master program as well. In the master program students are expected to deepen their understanding and experience of internationalization issues.

Theoretical knowledge in the EBD program is supported by portions of discipline oriented content covering a broad range of disciplines. In comparison the master program is more focused on business development and entrepreneurship theory thus specializing more in order to get deeper theoretical knowledge. As well the practically oriented projects are more extensive and deals with more complex processes. Further methodological courses are focusing action oriented methods and gives deepened methodological skills within this range of scientific methodology.

## **Conclusions**

The purpose of this paper has been to present a pedagogy of entrepreneurship education which brings practice and theory together in a balanced way and to illustrate how this pedagogy can be used coherently on bachelor and master level. The basic difference with the proposed pedagogy, here called entrepreneurial learning, when compared to traditional academic education is the way it deals with balancing theory and practice. While traditional education privileges theoretical knowledge entrepreneurial learning emphasize practice in a more balanced way. In both the bachelor and master program students are made responsible to design and acquire parts of the knowledge content based upon the project work and their personal interests. The project work is an important part of the education. In the bachelor program it is the quality of the project work that is deciding if the students get higher grades, while discipline exams only can give a pass. In the master program the curriculum had theoretical courses to start with complemented by methodological training before undertaking complex project work. The project work is expected to give significant contributions to the

development of the partner organizations/communities involved. To the end of the master program the students are then expected to use the (practical) outcome of the projects to contribute to theory.

Traditional education means a deductive approach starting with theory and ending with practice. Entrepreneurial learning means that you let theory and practice go hand in hand following an abductive approach. In the bachelor program themes and practice guides the education process and portions of theory are integrated in order to solve practical problems. In the master program theory is taught to provide students with an enlarged interpretative repertoire, then indulging in practice and at the end using practice to contribute to theory, Experiential learning also uses an abductive approach but in comparison entrepreneurial learning is not limited to learning by doing in its pure form, as theoretical knowledge is guiding the practical project work, although in a balanced way. The projects are expected to solve the real and experienced problems of the partner organizations/communities and if the theories the students use are not adequate new theoretical knowledge/enlarged interpretative repertoire are expected to be acquired.

The amplitudes between practice and theory in the master program are higher compared to the bachelor program. In the latter project work is more limited in scope, with a progression to be more and more complex. The master program deals with more complex processes. This is why theoretical courses are separated from project courses. This separation together with methodological training helps the students both to get close and deep into practice but as well allow for needed distancing from practice in order to be able to reflect critically on practice as well as allowing enough time to be able to use practice to bring back theoretical contribution.

**Professional Learning Community and Principal Leadership in Song Ping Primary  
School: a case study in Mainland China**

**Topic area:** Elementary Education

**Presentation format:** Paper Session

**Brief Description:** This paper introduces the professional learning communities observed in one primary school section in mainland China and the role school principal is playing in the process of building PLCs.

**Author(s):**

## **Abstract**

The objectives of the study are to explore 1) the characteristics of professional learning communities (PLC) in the observed primary school and 2) how does principal leadership influence the professional learning community, i.e. what is the role of principal in the process of building professional learning community in the primary school in Shenzhen, China. As a qualitative case study, data are collected through interviews, observations and school documents. Teachers and the principal are interviewed in semi-structured questionnaires. Data analysis is conducted using NVIVO software. Results show that in the observed school, the characteristics of PLCs are evidently found: Shared values and vision, Collaborative culture, Supportive and shared leadership. Strong professional learning communities are observed and identified in this school. The study also found that several leadership styles (i.e., instructional leadership, distributed leadership) have been observed through the building of PLCs and within the progress of the school reform. Detail results of how instructional leadership influence the professional community is presented and further discussed. The study takes the first attempt to explore professional learning community in primary school section in Mainland China. The study further explores relationship between principal leadership and PLCs to better understand the mechanism. The research will certainly enrich the area and stimulate further studies.

**Title:** Exploring Methods for Improving the Design of Prospective Teachers' Mathematics Content Course

**Topic Area:** Mathematics Education

**Session Format:** Paper Session

**Description:** In this project, we developed and piloted a framework to explore methods for improving the design of K-8 prospective teachers' mathematics content courses. We aim to design coherent curricular materials that are needed to implement service-learning in a mathematics content course for prospective K-8 teachers. We also investigate the impact of service-learning by exploring relationships between service-learning experiences and prospective teachers' learning outcomes, changes in professional development and perspectives of civic engagement.

## **Exploring Methods for Improving the Design of Prospective Teachers' Mathematics Content Course**

### **Introduction**

A recent research report from the National Survey of Science and Mathematics Education (NSSME) shows that mathematics and science teachers in the elementary and middle school grades do not have strong content preparation in their respective subjects and they do not feel equally prepared in each area (Banilower et al, 2013). In the mathematics education research community, the quality of preparation of future K-8 teachers has always been a central concern. To address this concern, Phillips and colleagues provided the opportunity of an early field experience to pre-service elementary teachers to enhance their content knowledge and beliefs *while* they are learning the mathematics they would teach (Phillip, et al., 2007). However, very little research has studied K-8 prospective mathematics teachers' learning through authentic instructional experiences *before* their admission to a teacher education program. That being said, most prospective teachers' learning experiences in mathematics take place in college classrooms. To explore methods for improving the design of mathematics content courses for prospective teachers, the question that motivates this study and guides the analyses of learning was: What types of curriculum materials are operative in helping prospective elementary teachers gain knowledge needed for effective instruction and an appreciation of the important connection between mathematical content and pedagogy?

### **Theoretical Framework**

#### **Cobb's View on Mathematical Learning**

Cobb (1994) argued, "Mathematical learning should be viewed as both a process of active individual construction and a process of enculturation into the mathematical practice of wider society" (p. 13). Sociocultural and constructivist theorists both highlight the crucial role

that activity plays in mathematics learning and development. The main difference between the two is that sociocultural theorists typically link activity to participation in culturally organized group practices, whereas constructivists give priority to individual students' conceptual activity. That is, constructivists analyze thought in terms of conceptual processes located in the individual, whereas sociocultural theorists take the individual-in-social action as their units of analysis (Minick, 1989; Sfard, 1998). For example, when teacher educators try to *create* experiences for pre-service teachers to enhance their conceptual understanding, they view mathematical learning as active construction. In contrast, when teacher educators value pre-service teachers' interests and connect them to ideas and traditions, emphasizing the importance of social interaction, and culturally organized activities, they view mathematical learning as enculturation. Cobb encouraged the mathematics education community to explore ways of coordinating constructivist and sociocultural perspectives because, "Each of the two perspectives, the sociocultural and the constructivist, tell half of a good story, and each can be used to complement the other" (p.17).

### **How Service-learning Fits Cobb's View**

Service-learning is a teaching and learning pedagogy, that provides a course-based educational experience in which college students participate in an organized service activity that meets the needs of the community (in our case, schools), enhances their understanding of course content, and fosters a broader appreciation of the discipline. The integration of service-learning is a new method of teaching and learning to improve the design of mathematics content courses for K-8 prospective teachers. This integration of service-learning provides students the opportunity to have socially and culturally diverse interactions with elementary school children through organized mathematics activities. In this account, we expected the interactions with diverse elementary school children would influence the processes of prospective teachers'

mathematics reasoning and its increasingly sophisticated mathematical ways of learning the content. Encouraged by Cobb's view, this project has chosen to explore the impact of service-learning on prospective teachers' learning.

### **Methods**

In the United States, the development of mathematics content knowledge of future elementary and middle school teachers takes place in undergraduate courses. In many teacher education programs, prospective teachers are required to take one or more mathematics content courses from a mathematics department prior to admission into the teacher/education program. As in many college-based mathematics content courses for prospective teachers, in our institution, Math 157, *Structure of Arithmetic for Teachers* is a typical mathematics content course for K-8 prospective teachers, focusing on numbers and operations. Math 157 is a lecture based, 4-credit course, in which prospective teachers meet three times a week.

### **Participants**

The project started in a Math 157 service-learning classes with 25 participants at a northwestern university in the United States. The Math 157 course was designed to have hands-on experiences through service-learning in addition to their Math 157 course work. During the first week of the semester, the service-learning staff at our institution gave a service-learning demonstration during a class time and then all participants were scheduled to have an orientation at the local schools. To complete the course, all participants were required to provide 10-hours of service at a local elementary school throughout the semester as a requirement of their course content.

### **Choice of Schools**

When choosing schools, we first considered schools where our institution had established service-learning experiences and where the teachers were already familiar with service-learning. A second consideration was to choose schools that varied in student composition. It is important for the project to learn more about how the implementation of service-learning curriculum would need to be tailored to family background of students. We decided to start with three public schools representing a range of contexts so that prospective teachers would have the opportunity to have social interactions with students with different cultural and socio-economic backgrounds. The three schools are community partners of the service-learning program at our institution and would allow prospective teachers to see the diverse types of public schools, mathematics curriculum and teaching methods. Brief descriptions of the three schools are as follows:

The first school is a Title I school in which 85% of students qualify for free or reduced lunch. Collectively, these students speak more than 25 different languages. This school was chosen for this project because of its tremendous diversity, high percentage of students from low-income households, and its commitment to high quality education.

The second school is a charter school that offers students hands-on exploration and a project-oriented learning environment. This school was chosen for this project because of its innovative mathematics instructions which includes flexible student grouping across mathematics ability, the use of computer technology and the expectation that all students are provided a mathematical thinking environment in which to learn.

The third school is a mathematics and science school which offers students a project-based learning opportunity in a small school setting. This school was chosen for this project because of its focus on professional development in mathematics through cross-grade level collaboration and the opportunity it affords prospective teachers to be in this environment to

participate in an innovative teaching practice. It has 38% of students qualify for free and reduced lunch.

All participants worked with one of the three public schools based on their available schedules and the convenience of traveling between our institution (taking classes during the week) and the schools (providing services at local schools).

### **Data collection**

#### **Learning Mathematics for Teaching Assessment**

The *Learning Mathematics for Teaching (LMT) Assessment* assesses teachers' content knowledge for teaching elementary mathematics in *Number Concepts and Operations, Patterns Functions and Algebra* and *Geometry*. (Hill, Schilling, & Ball, 2004). We chose the LMT assessments for its fit with Math 157 course contents for the project, and as a reliable measure of prospective teachers' overall level of mathematics content knowledge growth over time.

We used the Teacher Knowledge Assessment System (TKAS) for administering the LMT assessments online for all students at the first week of the semester (pretest) and at the last week of semester (posttest) to all participants. All pre and posttests were conducted during the class time. The LMT tests were analyzed to determine the change in prospective teachers' content knowledge as a group while attending the class.

#### **DEAL Model for Written Reflections**

Reflecting on experiences is a key component of successful service-learning programs, and well-designed reflection processes encourage students to use problem-solving and higher order systematic thinking (Eyler & Giles, 1999). We chose to use and modify Ash & Clayton's (2009) DEAL Model for critical reflection to develop a schematic prompt to help prospective teachers extract meaning from their hands-on experiences, because it has been explicitly

designed and refined to generate, deepen and document learning. The DEAL Model consists of three sequential steps, namely, *Describe*, *Examine* and *Articulate Learning*. Each step is supported by specific prompts to guide students learning up through the evaluation level of Bloom's Taxonomy (1956).

As part of curriculum materials for this course, critical reflection questions were designed to help prospective teachers reflect on their learning in writing throughout the semester. Table 1 provides the information on the design of reflection prompts as well as sample questions for each DEAL Model step during the ten weeks of service learning.

Table 1.

*DEAL Model critical reflection with sample questions in a 10-week period*

Describe	Weeks 1-2 (n=2)
For Describe, reflection prompts are designed to guide PSTs observing social-cultural mathematics classroom norms at Grades K-5. Sample questions:	
<ul style="list-style-type: none"> <li>• What was the mathematics discussed in the class? How did students/teacher talk about it?</li> <li>• How did the students and their teachers interact with each other during the class?</li> </ul>	
Examine	Weeks 3-8 (n=6)
For Examine, reflection prompts are designed to guide prospective teachers (PSTs) focusing on examine how academic learning from Math 157 and personal growth connect to their service at schools. Sample questions:	
<ul style="list-style-type: none"> <li>• What mathematics did you learn in Math 157 that was related to your service? How did you use your understanding of mathematics concepts in your service? Or where did you find your lack of understanding of mathematics concepts limiting your actions?</li> <li>• How did your service change or not change who you want to be as a mathematics learner</li> </ul>	

---

and a future teacher? What assumptions and expectations about yourself as a learner and a future teacher have been unearthed through your service?

---

Articulate

Weeks 9-10 (n=2)

Learning

---

For Articulate Learning: reflection prompts are designed to elicit more meaningful reflective thinking by considering that their learning has value *beyond* the context of service experience.

Sample prompts:

- I learned that.... Identify and explain an aspect of yourself as an early teacher, a mathematical learner and/or evidence of one or more Math 157 concepts that you are beginning to understand better.
- I learned this when.... Clearly connect the learning to your specific SL-related activities so that someone who was not there would understand, including a discussion of the positive and negative impacts.
- This learning matters because.... Consider how this learning will affect your beliefs of yourself as an early teacher; affect your beliefs of yourself as a mathematical learner; or affect your understanding of Math 157 content knowledge
- In light of this learning I will.... What do I need to do to improve as a learner AND as a future teacher?

---

### **Results**

Given a small sample size (n=25) of the study, there was no identified statistical significance in participants' performance using a paired-sample *t*-test. However students did perform better in their final exam than the students in the previous semester. Although we cannot

draw any conclusions on the changes in mathematics content knowledge as a group regarding to the LMT tests, we found changes in their beliefs and attitudes towards mathematics learning and teaching as a result of service-learning. In the following section, we share our findings from participants' critical reflections over the ten weeks services at local schools.

### **Critical Reflections**

Analyses of participants' written reflections revealed their mathematical learning in content and pedagogy as a result of service-learning outside of the college classrooms. In this section, we share samples of service-learning students' critical reflections regarding to the DEAL Model sequence in *Describe, Examine* and *Articulate Learning* during their ten weeks services at schools to show some keys elements of their learning. To narrow the scope, in this paper we focus on the questions that prompt students to reflect on their mathematical learning and connections to their perceived applications of mathematics.

**Connecting service-learning to mathematics content.** The reflection questions such as, "What mathematics did you learn in Math 157 that was related to your service? How did you use your understanding of mathematics concepts in your service? Where did you find your lack of understanding of mathematics concepts limiting your actions?" guided prospective teachers' to the process of participating and then reflecting their service at schools. We found that for students' who did well in their Math 157 classes, service-learning helped to enhance and to apply the mathematics learned in a new context at schools. Anna<sup>1</sup> wrote, "One specific thing that I discovered is that I am beginning to see multiple ways to teach/and or solve different mathematical problems."

In contrast, some prospective teachers who were still learning the concepts introduced in Math 157 class, service-learning provided an opportunity to re-learn fundamental mathematics

---

<sup>1</sup> All participant names used in the paper are pseudonyms

from the elementary classrooms. For example, Abbie shared the following experience:

I have also learned new ways of applying math concepts to everyday life so that it is easier for students to remember and learn the concepts. I noticed that I would need more experience with students in classrooms and teaching effectively to young children.

Funda wrote:

I know that I do not want to teach math, but I have known that all along. Being in a math class this semester has also changed how I approach the subject. I am no longer afraid of not being able to teach math, which I was afraid of because I wasn't very good at it. This has made me want to learn more about how to teach students and how to reassure myself that I can teach all the subjects. Understanding math more will make me more confident when I am teaching math to students.

Mike wrote this about his past experience:

This service learning experience has helped me to see the importance of math on a personal level. Growing up, I was always behind in math. I find math to be very intimidating and scary specifically fractions and word problems. If I cannot get a better handle on my own issues with math, then how will I be an effective teacher, especially for middle school?

The most revealing part of the reflections which prospective teachers provided is the change in their attitudes towards mathematics and towards mathematics learning. For example, to respond to the question, "How did your service change or not change who you want to be as a mathematics learner and a future teacher?"

Cindy wrote this about her experience:

I believe that the service-learning portion of our Math 157 class has truly helped further prepare me to work in the classroom and with students. I was able to put to use what I had learned in class, which is definitely a part of the learning process. I believe that in order to gain a better concept about what one has learned they need to teach and explain to others what they have learned.

Ella wrote, “After service learning I really believe that I could be a great math teacher if I continue to understand math concepts and new ways to teach them in order to connect with all levels of students.” Linda described, “I have learned a lot from service learning. You don’t truly understand something until you can teach it. I have found this to be true during my service.” While Rina made the connection between her learning of the mathematics content course, not only to her performances, but the importance this knowledge would have in her future career. She states, “My service learning experience also helped me realize that what the instructor is teaching us in class is really important, because someday we will have to explain it to a student, and she showed us how to do that. “

At the last two weeks of services, we asked our prospective teachers to summarize their learning experiences through the last DEAL step of *Articulate Learning*. This process helped prospective teachers to reflect their learning experience as a whole over the ten weeks period. We learned that an *effective* hands-on experience through service-learning depended on a thoughtful curriculum design in which students had the opportunity to experience *and* were able to reflect on their experiences.

### **Conclusions**

As a case study, we implemented service-learning as hands-on classroom experiences paired with a mathematics content course. This pedagogy offers an opportunity for prospective

teachers to learn or relearn the mathematics outside their traditional college classrooms, and made it possible to incorporate to Cobb's (1994) view, "Mathematical learning should be viewed as both a process of active individual construction and a process of enculturation into the mathematical practice of wider society" (p. 13), with what service-learning could offer to better prepare our future teachers. In our study, service-learning provided prospective teachers the opportunity to have socially and culturally diverse interactions with elementary school children through organized mathematics activities. In this account, we made the first attempt that the interactions with diverse elementary school children could influence the processes of prospective teachers' mathematics reasoning and its increasingly sophisticated mathematical ways of learning the content.

In terms of curriculum materials to incorporate service-learning in a mathematics content course, we found that choice of school partners, reflection prompts, extra readings on tutoring students, poverty and time management on service-learning are crucial components of curriculum design. For example, our prospective teachers are new to teacher education program and most of them do not know or do not understand what kind of work teachers do daily. Therefore, the choice of schools and classrooms in which these prospective teachers will be placed becomes an important decision to make as part of course design. We learned from students' critical reflections that our prospective teachers viewed classroom teachers as their role-models in teaching mathematics and they have in part, nurtured prospective teachers' learning experiences in their classrooms. The DEAL Model for critical reflections provided a framework helping prospective teachers to reflect and documents their service-learning experiences.

The analyses of their critical reflections revealed the potential of mathematical learning in both content and pedagogy as result of service-learning. In particular, to some low achieving students, being able to be part of elementary mathematics classrooms, service-learning provided the opportunity to re-learn the materials taught in the class, that successful prospective teachers would then be instructing in their subsequent student teaching courses and possible careers.

We found that exploring service-learning as a method of improving the design of a mathematics content course took a first step to make connections simultaneously between how mathematical knowledge was learned in a college classroom, and how the knowledge was re-learned or strengthen in a new context, culturally organized elementary classrooms. It also took a first step to reconsider the possibility of multiple approaches of curriculum changes in mathematics content courses for future teachers in our teacher preparation program.

## **THE PERFECT PAIRING: THE ADULT LEARNER AND START-UP BOUTIQUE WINERIES**

### Abstract

This study explored the role of adult learning and its impact on the performance of small boutique wineries operating in the start-up phase of the organizational life cycle. The research objective was to identify connections relationships between learning and progress of a small business. Fourteen entrepreneurial individuals from four wineries were interviewed in their workplace for this qualitative study. The findings provide information about connections between adult learning in a specific workplace context and industry.

### **Introduction**

Often with little, if any, appropriate education or practical experience, entrepreneurial owners and managers enter a market. They are looking to grasp a unique opportunity, but are frequently caught unprepared for realities of meeting challenges that face small businesses. This study explored the process of learning as experienced by owners and managers of small, local boutique wineries operating in the start-up phase of the organizational life cycle. The purpose of the study was to determine the effect of adult learning on business performance. This article highlights results and themes from the larger study; adult learner entrepreneurs in boutique winery businesses make a perfect pairing.

Small business, or entrepreneurial, contexts provided a unique lens for exploring adult learning. The winery sites participating in this study were operating in a young, emerging industry in a geographic region. Our exploration offers insights into how adults' learning can influence organizational growth and success.

Acknowledged as one of the fastest growing segments of the economy in the United States, small businesses have become particularly appealing for many individuals who have become displaced or unemployed in the current economic downturn (Lans, Biemans, Versteegen, & Mulder, 2008). Small businesses are recognized as “engines of economic development” (p. 598) because of their rising influence in today’s world.

As a part of our changing economy and appeal of the emerging wine industry, individuals have become motivated to start and operate small boutique-style wineries. During early years of small business formation, also known as the start-up phase, operations can be intense and difficult. Even during ideal times with appropriate resources over half of new organizations fail within four years (Kaplan & Warren, 2007; Scarborough, Wilson, & Zimmerer, 2009). Boutique wineries emerged as a ripe context offering an in-depth view of learning for the study.

This phenomenological, qualitative study explored the process of learning experiences of adults who represented the owners and managers of small, local winery businesses. While extensive literature is available about adult learning, research detailing descriptions of the personal learning experiences of entrepreneurial individuals in a small business context is lacking (Choy, 2009; Cope, 2005). The study examined adult learners in an environment in which they constructed and gave meaning to their experiences. Results provide a greater understanding of the influence and impact of learning during the start-up phase, offering direction to future small business entrepreneurs. Researchers advocate for more study in a wider variety of contexts to develop a deeper understanding of the role environment plays in learning (Casey, 2005; Knowles, Holton, and Swanson, 2005; Phelps, Adams, & Bessant, 2007). Discussion has also surfaced among scholars about developing greater insights into practical applications addressing needs of specific industries (Beverland & Lockshin, 2001; Masurel &

van Montfort, 2006). Further exploration of these relationships in small business contexts can provide insights into what creates an atmosphere where individuals are given more opportunities to learn, and therefore, positively impact performance of a business.

#### Related Adult Learning Literature

The field of adult learning or andragogy represents a “set of core adult learning principles that apply to all adult learning situations” (Knowles et al., 2005, p. 2). An increased focus on the adult learner recently has created a corresponding interest in research. According to Sadler-Smith (2006), “Learning is a longer term change in the knowledge possessed by an individual, their type and level of skill, or their assumptions, attitudes and values which may lead to them having increased potential to grow, develop, and perform in more satisfying and effective ways” (p. 4). Transformational learning theorist Mezirow (1996) stated “learning is understood as the process of using prior interpretation to construe a new or revised interpretation of the meaning of one’s experience in order to guide future action” (p. 162). Both definitions include an emphasis on potential expectations as a result of individual change occurring in the past. Even though scholars across disciplines have contributed to the adult education literature a constant evolving environment and needs of the individual learner continually create a demand for innovative research and new assumptions to be developed.

Knowles, Holton, and Swanson (2005) advocated a transactional model, *Andragogy in Practice*, as a guide to explain how adult learners adapt their learning to their distinctive environments. The unique characteristics and experiences of each individual influence and determine how learning occurs and what learning will result (Knowles et al., 2005; Kolb, 1984). Their model advanced the idea that an integration of learning and environment provides a direct impact on learning effectiveness, and often occurs due to conflicts or problem-centered contexts

(Knowles et al., 2005). Small start-up wineries provided contexts to study adult learning in a challenging, uncertain environment and a unique dimension to the learning process.

### *Transformational Learning Theory*

Mezirow (1978) introduced transformational learning theory as an expansion of adult development and learning theory. This expansion is recognized as an increasingly important element of the adult learning discipline because it offers a specific lens, which clarifies how adult learners give meaning to and understand their experiences. Transformational learning provides the key to developing an awareness of how learning occurs in a more profound, meaningful way in response to conflicts and new experiences. Taylor (1997) advocated for a stronger connection between transformational learning and adult learning by stating, “transformational learning is considered uniquely adult” (p. 5) and applied distinctly to the field of andragogy.

Previous individual knowledge and understanding form a “frame of reference – a mindset or worldview of orienting assumptions and expectations involving values, beliefs, and concepts” (Dirkx, Mezirow, & Cranton, 2006, p. 124). Relationships, the role of culture, and societal norms need to be given consideration (Choy, 2009; Mezirow, 1991). Furthermore, transformational learning demonstrates learning encompasses more than merely developing skills (Choy, 2009). The process is significant, leading to a fresh way of thinking and addressing problems.

Two major factors recognized as crucial to transformational learning include critical reflection and rational discourse (Kitchenham, 2008; Mezirow, 1978, 1994, 2003; Taylor, 1997). Reflection allows an individual to develop greater potential to appreciate emerging knowledge and ideas. Active self questioning helps learners become more aware of their beliefs and assumptions. Reflection highlights the process of perspective and behavior formation. Rational

discourse arises from interactions enabling an individual to assess the validity and value of others' beliefs. It results in enhanced learning while expanding greater self-awareness (Mezirow, 2003). Addressing the need for current research on transformational learning in context, Choy (2009) advocated learners use context to establish meaning and shape interpretations. The workplace can be explored to develop an understanding of existing norms and assumptions.

### *Entrepreneurship and Entrepreneurial Learning*

Entrepreneurship involves practices associated with the creation and start-up of new organizations, typically with profit motives accompanied by risk and uncertainty (Baum & Locke, 2004; Dyer & Ross, 2008; Kaplan & Warren, 2007; Scarborough et al., 2009). As the field has evolved and segmented, researchers began addressing the need to study *how* entrepreneurs learn, or entrepreneurial learning, defined as “learning experienced by entrepreneurs during the creation and development of a small business enterprise” (Cope, 2005, p. 374).

According to Cope (2005), five dimensions are included in the entrepreneurial context: (1) learning about oneself; (2) learning about the business; (3) learning about the environment and entrepreneurial networks; (4) learning about small business management; and (5) learning about nature and management of relationships (p. 380). Entrepreneurial learning transforms prior experiences into valuable knowledge allowing new information to be integrated into an individual's existing framework with future behavior changing as a result (Holcomb, Ireland, Holmes, & Hitt, 2009; Politis, 2005; van Gelderen, van der Sluis, & Jansen, 2005). Learning becomes a critical aspect of the entrepreneurial process “it is through learning that entrepreneurs develop and grow” (Cope, 2005, p. 379). Politis (2005) acknowledged, “entrepreneurial learning

is often described as a continuous process that facilitates the development of necessary knowledge for being effective in starting up and managing new ventures” (p. 401).

The preceding theoretical perspectives provided a foundation to view the impact of individual learning on growth and progress of small businesses operating within the start-up phase of the organizational life cycle. The emerging relationships between the perspectives invited further examination.

### Methodology

Qualitative, phenomenological methodology provided the framework for viewing the learning process in a natural setting. Qualitative inquiry enables the researchers to “discover and understand how people make sense of what happens in their lives” (Locke, Spirduso, & Silverman, 2000, p. 97). Through a process of investigating the meaning individuals gave to their lived experience, a construction of realities, perspectives, and accumulated experiences was sought (Bogdan & Biklen, 2003; Merriam, 2002). Semi-structured interviews supported with observations and artifacts were used to gather data which focused on “key patterns of interactions” to explore the world of adult learning and provide a richer, detailed picture of the process (Mezirow, 1978, p. 108).

Participants were asked to share and reflect on their most memorable learning events, which created a profound personal change in perceptions and attitudes (Cope, 2003). Direct contact was made in a natural setting in order to develop a clearer view of how people interact in their world because human behavior is greatly influenced by the environment in which it occurs (Bogdan & Biklen, 2003; Locke et al., 2000; Merriam, 2002).

The study included stories of learning experiences from individuals in four small boutique wineries operating within the start-up phase of the organizational life cycle (see Table

1). Fourteen entrepreneurial owners and managers participated in the semi-structured interviews (see Table 2). The connections and patterns that arose were analyzed and meaning was given to the data collected (Bogdan & Biklen, 2003).

Workplace observations were also conducted and allowed for a clearer understanding of the interactions, relationships, and participant perspectives (Maxwell, 2005). Observed behaviors in the winery settings enriched the interview data and permitted the researchers to become more familiar with the owners and managers as well as the context, and gather additional data to form a more complete picture of participant learning. Observations took place in the wineries, tasting rooms, and vineyards. Interactions and relationships between the entrepreneurial owners and customers, employees, and volunteers were observed as well as interactions between the owners and managers. The observations clarified relationships and provided a richer picture of the learning dynamics in each context. Follow-up interviews informed the data collection process as participants elaborated on earlier information

Purposeful sampling was employed in the initial choice of sites and participants (Maxwell, 2005). This sampling strategy involved deliberate selection of participants in an identified context concerning an activity most likely to exhibit the phenomenon of the learning process in which the researchers were exploring (Maxwell, 2005). The objective provided insights judging to have the potential to be most significant or appropriate by the researchers given the goal of the study and what the researchers wanted to learn (Maxwell, 2005; Merriam, 2002).

The selection process criteria included a specific industry, age and size of the winery businesses, and geographic location. The wineries were considered very small by the wine industry, termed “boutique winery” operations, having few, if any employees. The owners

served as managers and key decision-makers and accordingly, strongly impacted the business performance (Lans et al., 2008). Boutique winery is a term used in the wine industry and refers to the level of production. With an annual production of 1,000 cases of wine or less the wineries site in this study were categorized within that size range for a length of time during all or part of their start-up phase.

Each winery was operating in an early formation phase, or start-up, of the organizational life cycle. The longest period of operation for wineries in this study was approximately six years. The wineries were geographically separated from other wine producing areas, providing easier accessibility to for data collection as well as distinct settings and opportunities for studying entrepreneurial learning (Lans et al., 2008).

Fourteen face-to-face interviews were conducted. Each interview session lasted approximately 60 to 90 minutes. Emails, phone calls, and face-to-face methods were utilized for follow-up questions. To help ensure greater accuracy and for review and verification purposes, responses were tape-recorded and transcribed verbatim as each interview was completed.

As recommended by Moustakas (1994) for data reduction with phenomenological studies, the data from each of the fourteen participants was analyzed and organized into a coding scheme from which six themes emerged. As the learning patterns became apparent, comparisons and differences between contexts and individuals materialized. The data clarified connections and provided evidence to develop a culminating description of the role adult learning has on the characteristics of the small businesses.

### Findings

The findings demonstrated a strong relationship between the learning experiences of the participants and context of the businesses. Small boutique wineries operating in the start-up

phase provided a challenging, dynamic environment, advocating the role of context as a significant effect on all types of learning. Small wineries operating in a start-up environment offered a lens to view the contextual influence as an impetus for learning and change (Cope, 2005; Knowles et al., 2005; Mezirow, 1978). The participants' learning demonstrated strong connections between fields of adult learning theory, transformational learning, and entrepreneurial learning.

Identifying themes led to a more clearly defined thread between individual learning, comparable learning experiences, and discovery of differences. The themes evolving from the data analysis included: (1) Developing an entrepreneurial sense; (2) Relationships; (3) Challenges; (4) Learning; (5) Joy or enjoyment; and (6) Reflection.

#### *Developing an Entrepreneurial Sense*

Developing an entrepreneurial sense and relationships were identified as having the most significance to the purpose of the study. Participants described their experiences as "learning" woven into their everyday work environment. Their descriptions reflected behaviors of developing an entrepreneurial sense; they learned what was needed to keep their businesses going while becoming more competent. Learning occurred as individuals developed abilities to perform what would become routine responsibilities as new situations were encountered. Participants' learning skills helped them to adapt and improve their responses to environmental circumstances.

Activities described by participants indicated strong connections between their experiences and each of the five major dimensions of entrepreneurial learning as advocated by Cope (2005). Entrepreneurial learning enabled participants to form a broader view of the

environment and adapt to changes. Hence, their learning facilitated the process of “starting up and managing new ventures” (Politis, 2005, p. 401).

Participants had little, if any, previous or related experiences in the wine industry, small business management, or starting a business. One participant explained:

When I started thinking about a winery, I wasn't even 21 yet... I never would have done it on my own. I was too young. I didn't have enough money. The world of business, taxes, paperwork, everything, and it was just a big world out there.... The thought of going through all the paperwork to start a business and tackle that when I was a scientist, still to me this day is a different world because I am so much on the production end of it. Activities described by participants related to professional growth because they symbolized the participants' ability to learn, adapt, and become more knowledgeable. They integrated learning into the workplace, creating a positive influence on wine production and improved management skills.

Participants discussed a growing awareness of themselves and how their views evolved as they developed a sense of what had become important in their lives as a consequence of starting their wineries. One of the key elements of entrepreneurial learning includes learning about oneself (Cope, 2005). Abby reflected:

That's another thing, dealing with customers.... I worked in a lab, so learning how to deal with customers at a retail level is different.... We're [Abby and husband] pretty shy people but I have to put myself out there. I had to learn that to make it.

Participants shared stories representative of the strong relationship between learning and core adult learning principles of the Andragogy in Practice model (Knowles et al., 2005). They

focused on needing to know as situations arose. On the nature of learning, one participant summarized:

My own personal learning has been a lot of being self-directed to begin with... for winemaking, I read as much as I could.... and it was all self-directed, driven out of passion. Now there is a lot less time for that.... There is unfortunately a lot less learning now from other sources. Now a lot of it is trial and error.

Prior experiences also provided guidance when encountering challenging situations. New information was integrated into existing frameworks often with positive outcomes. Participants developed innovative skills and abilities over time further fueling a motivation to learn.

Challenging entrepreneurial context offered on-going dilemmas in which learning was used to cultivate and practice fresh approaches to problem solving. The participants' worldviews evolved, incorporating past beliefs and assumptions into new knowledge exhibiting facets of transformational learning (Mezirow, 1978). They learned from their actions, revising previous assumptions and changing future behavior based on new knowledge.

### *Relationships*

Equally important, relationships grew among owners and managers of the winery businesses and strengthened over the course of the start-up phase. These relationships were beneficial to participants and wineries representing an enjoyable, unexpected aspect of the management process.

Learning about the nature and management of relationships and networks represent two essential components of entrepreneurial learning as advocated by Cope (2005). The participants

described relationships as being an important aspect of the business environment in the wine community. Sophie stated:

I was just explaining this to my boss at my other job.... He was asking me how I did something so well at the winery. I said, "I sell passion." It is not always about the product and whether it is good... when the customers come through that door, they want the experience. They want the good feeling that they are going to get.

Relationships became a fundamental part of entrepreneurial networks exemplifying the importance of business connections. Individuals at three wineries set goals of using locally sourced grapes for their wine. Sharing similar aspirations led to a stronger community among the individuals involved. Callie shared:

My role has been more in trying to get those that are already growing to raise the bar and increase the quality of the fruit and use different viticultural practices. I have tried to get them to communicate as a group rather than having all isolated growers in the valley, to get them unified, talking to each other about what is going on in their vineyards, going out and walking the vineyards, talking to the growers, and trouble-shooting. Then building trust with them, if they do raise the bar, that they will be compensated for that.

Abby also reflected, "Our relationships with the growers that we buy from have become really special. You have to trust your growers and your growers have to trust you. We know that first hand, being growers ourselves."

The relationships developed as philosophies were being shared. The connections were valued and it was anticipated they would endure through time. The entrepreneurial component of relationships was seen as a key to survival and, ultimately, an avenue of growth for the small wineries.

The relationship experiences signified a critical aspect advocated in transformational learning as well (Mezirow, 1978). Rational discourse as an element of transformational learning occurred when individuals described approaching others in response to challenging situations. Participants first used trial and error, and if results were unsatisfactory, engaged in discussion local winemakers and growers in the regional wine industry as resources.

Interview data indicated a strong connection between these entrepreneurial individuals and their ability to develop an entrepreneurial sense while creating significant business relationships. An essential facet of developing an entrepreneurial sense was associated with establishing and strengthening valuable relationships enabling the small wineries to adapt and find an avenue to be successful. Ample evidence was collected exhibiting collaboration and cooperation among all participants.

### *Challenges and Learning*

Numerous connections were found between elements of transformational learning demonstrating critical reflection and rational discourse (Mezirow, 1978, 2003). Participants described challenging situations illustrating these connections. When confronted with challenges and crisis, a need to evaluate previously held assumptions was created. Self-assessment or critical reflection occurred as participants looked within themselves to find answers. They also turned to others with which they had developed relationships for guidance and support. Participants learned to respond to dilemmas by questioning prior beliefs and developing a broader view of their world when adapting to their environment.

The Andragogy in Practice model refers to an adult's orientation to learning in which learning is problem-centered and contextual in nature (Knowles et al., 2005). Participants

welcomed learning and came to use it to improve skills and augment their base of knowledge in response to workplace challenges.

Interview questions were developed to encourage participants to reflect on and share their learning experiences; learning arose as another major theme. Applying Knowles, Holton, and Swanson's model, *Andragogy in Practice* (2005), to these individuals and their experiences offered insights into the adult learning environment.

Participants' goals were based on what they wanted to achieve directing future actions and behavior. Two adult learning principles promoted by Knowles, Holton, and Swanson (2005) involve a need to be autonomous and self-directed with a strong motivation to learn. The participants indicated a preference for making their own decisions and elected to spend time on learning key aspects of the winery businesses. They experienced a sense of accomplishment from these activities and, in turn, confidence emerged. Participants developed a heightened awareness of their learning preferences.

Learning was crucial, in part, due to the nature of the wine industry involving long periods of time between production and finished product. The winemaking process creates uncertainty, requiring a significant commitment. These factors necessitated learning about small business management and developing a deeper awareness about oneself (Cope, 2005).

Lane described the relationship between the learning process and how the work would be done, "in the end, we went to the persons who had the most interest... the greatest passion for the process.... Once we figured that out, it helped smooth things out." Learning was especially critical for the winemakers responsible for the finished product, the quality of the wine. Callie noted:

I am always learning and investigating what I could do with the wine.... I have never hit a point where I thought I have got it down.... so I am always learning.... and considering ways I could change things up.

The winemakers concentrated on activities that would enhance their wines, constantly thinking about improvements. Being involved in the process sealed their commitment to bring back grape growing and winemaking to the region where the industry's roots date back to the late 1800s.

### *Joy or Enjoyment*

The entrepreneurs choose to become involved in the wine industry because they sought to spend their time pursuing an enjoyable lifestyle. They wanted more from their work life: the resulting enjoyment was apparent in their shared experiences. Participants attributed progress of their small wineries to the learning process in which they experienced pleasure and satisfaction. A sense of joy or enjoyment was acknowledged by participants from performing their day-to-day activities as they talked about having a "passion" for work. The enjoyment created an incentive to learn more and represented an intrinsic value to the participants representing one of the core adult learning principles as advocated by Knowles et al. (2005).

Participants received validation about their work through remarks made during wine competitions. Recognition for improvements in quality were increasingly apparent as the learned more about the process, environment, and themselves (Cope, 2005). Winning awards boosted confidence because it provided a competitive arena where more resources, money, education and training, and state-of-the-art facilities were not considered. Growth was achieved, in part, by developing critical relationships (Cope, 2005; Mezirow, 1978, 1991, 1994, 2003).

Not only were participants surprised and happy with the quality of their wines but they also enjoyed the process of making wine as well. Goals reflected a desire to stay in control and be responsible for all aspects of the winemaking process as autonomy represents a major aspect of what made their lives so enjoyable (Knowles et al., 2005). Entrepreneurs' efforts were realized when drinking their own wines, seeing others enjoy them as well. Michael reflected: "You could just sit in the winery all day and taste and touch and smell, it was such a pleasure."

### *Reflection*

The reflection process helped to solve problems and develop new approaches as participants learned their craft. Reflection provided a vehicle for participants to look back and identify learning and attach meaning to it as advocated by transformational learning theory (Mezirow, 1978, 1991, 1994, 2003); it provided an impetus for change. Rational discourse allowed opportunity for discussion with others to further reinforce, question or challenge new information and attitudes while reflection also emphasized the role of prior learning (Knowles et al., 2005; Mezirow, 1978, 1991, 1994, 2003).

Participants both reflected and learned from rational discourse with others in the industry. Emerging themes involved reflection, from previous experiences to progression through the start-up phase. Participants described changes in their approach to problem solving due to recognition of a need to adapt and build upon prior knowledge (Knowles, et al., 2005). As they became more knowledgeable as winemakers, and small business managers, they experienced more satisfaction with life and work (Cope, 2005).

Frequently participants were confronted with a unique or new challenge requiring learning for a successful outcome and developing the ability to move forward. Learning, then, became valuable in at least two ways. First, participants became more receptive and open to

learning, changing their perspective and future actions as they saw rewards resulting from learning. Second, performance of the winery businesses improved and experienced growth. The true value of learning emerged in this challenging context. Reflecting on past experience led to strengthening the connection between learning and work, with the participants experiencing joy and satisfaction.

### Conclusions and Implications

The purpose of the study was to develop a better understanding of the effect of learning on the performance of small winery businesses operating in the start-up phase. Adult learning is recognized as a complex process strongly influenced by each learner's unique perspective and background and the context in which learning occurs. Learning as experienced by the entrepreneurial participants in this study was identified as the primary tool to approach challenges arising from the operation of businesses progressing through the start-up phase.

Reflection is a critical element in transformational learning theory (Mezirow, 1978, 1991, 2003). Use of reflection has also been advanced as an effective technique to help individuals approach problems and challenges in the workplace (Choy, 2009). It is important for learners to have an awareness of context in which learning is occurring (Cope, 2005; Minitti & Bygrave, 2001; Young & Sexton, 2003; van Geldern et al., 2005). The emerging regional wine industry offered an ideal venue to study the phenomenon of learning because participants lacked entrepreneurial experience or education and there were few resources available to them.

We found learning did significantly impact small winery businesses during the uncertain start-up period. Participants recognized *relationships* as an integral element of learning in this context. *Relationships* with other individuals who were experiencing the same issues provided support and insight into challenges.

The entrepreneurial owners frequently were unprepared for many of their new responsibilities. They quickly realized, by starting their own wineries, they became part of a small, eclectic group of entrepreneurial individuals in a defined geographic area seeking others with like goals and interests in life.

The entrepreneurial owners exhibited similar learner characteristics such as a need for autonomy and self-direction, which led them to becoming entrepreneurs. Autonomy and self-direction are elements of core adult learning principles advocated by Knowles, Holton, and Swanson (2005) and a key aspect of the entrepreneurial learning literature. Autonomous, self-directed individuals help stimulate entrepreneurial ventures due to independent actions fostering innovation and creativity. Autonomy is seen as a “driving force” because entrepreneurial individuals desire the ability to make their own decisions, which is advocated as a positive aspect of their work lives (Lumpkin, Cogliser, & Schneider, 2009, p. 47). It is generally recognized that these entrepreneurial characteristics affect the performance of most small businesses (Lumpkin et al., 2009).

The participants relied upon their relationships with each other when encountering problems because their roles and situations had many similarities. Local winery owners knew they were experiencing and confronted with comparable issues. They developed and strengthened connections with other entrepreneurial individuals as their small winery businesses were entering the start-up period about the same time in this region. The owners intentionally reached out to each other, wanting to be helpful in any way they could. Michael noted, “If I have a problem, I could call any of the other winemakers and visit with them.... Establishing and maintaining those relationships have been beneficial...” and Abby concurred, “We’re pretty close with the other wineries.... Everyone wants everyone else to success in business.”

The *relationships* they built and established offered an additional source of knowledge and assistance with individuals in the regional wine industry creating an atmosphere where encouragement and cooperation were common. The process of critical discourse, or communicating and sharing of insights and knowledge while interacting with others, provided a comfortable method of resolving problems. According to Mezirow (1978, 2003), critical discourse or discussions with others leads to change indicative of transformational learning. Participants identified learning from interactions with others involved in the wine industry, either locally or regionally, as being essential in their development and leading to better performance.

Relationships grew to represent an integral aspect of learning how to cope within the entrepreneurial environment. *Relationships* represent a major component of entrepreneurial learning as advocated by Cope (2005). *Relationships* provided a fundamental network of individuals necessary to performance and progress of the small businesses. Participants recognized all of the *relationships* they developed were mutually supportive of each other and represented comparable goals. The entrepreneurial owners discussed similarities and values and willing collaboration on current and prospective activities allowing each winery a greater capacity to grow and be successful. They chose an entrepreneurial lifestyle and enjoyed all that it encompassed with associated *relationships* with others being described as significant. By first learning, then educating each other, each individual and winery benefited, with the entire budding wine industry making progress as a result.

A second attribute involved the role and effect of *challenges* during the start-up of small winery businesses. The learning experienced tended to be both problem-centered and context-based. *Challenges* were a common element of the everyday work environment. The first preference of participants was to look within themselves and use trial and error and

experimentation to find solutions to dilemmas. Cope (2005) advocated learning about oneself and learning about the business as two components to entrepreneurial learning. Entrepreneurial owners in this study build upon existing knowledge by integrating new ideas into their previous framework helping them adapt to the environment. Research suggests a strong link between prior learning and experience in addition to learning being driven by problem-centered contexts (Holcomb et al., 2009; Knowles et al., 2005; Kolb, 1984).

Participants described learning as a part of a reflective, self-examination process which often involved discourse with others, creating a shift in thinking and influencing behavior. According to Mezirow (1978, 1994), a trigger in transformational learning is initiated by a crisis or dilemma in which an individual uses reflection and discourse to help reshape his or her assumptions and beliefs to adapt to the environment and create a new foundation for future action (Mezirow, 1978, 1994). These types of events usually present a significant *challenge* to individuals.

Currently held assumptions were questioned and ultimately to change in beliefs and values as the participants reflected. Their learning tended to be autonomous and self-reliant, but looking outward toward others as resources when appropriate. The learning experiences represented positive outcomes for individuals and business performance when they effectively dealt with *challenges* in the work environment and advanced their management and winemaking skills.

The final theme regarded learning as being fun and *enjoyable*. Learning led to formation of strong entrepreneurial bonds and relationships and helped constructively manage and cope with challenges in the environment. When successfully exhibiting an ability to learn and improve skills, participants experienced great satisfaction and enjoyment in their personal and

professional lives. They experienced fulfillment and pleasure in both accomplishments and sharing knowledge with others. Learning created unexpected surprises in the workplace. The nature of a product such as wine is this has unique characteristics, a final version being unknown for a considerable amount of time, and is affected by many diverse elements. Due to these challenging factors, it was a wonderful reward when a finished product resulted in a remarkable tasting wine. The owners enjoyed developing an ability to make good quality wine in an erratic environment: lack of winemaking and small business management skills, inadequate resources, and time constraints.

Participants overcame barriers of working with unfamiliar responsibilities in a new environment. They received accolades from recognized professionals in the wine industry and praise from a broadening base of customers. Each winery continues to grow and participants look forward to the future. Future collaborative projects are planned as well, with owners holding an optimistic outlook that the regional wine industry will expand.

It is *the perfect pairing* between willing adult learners and new small winery businesses. Learning experiences helped owners form an entrepreneurial identity by creating and strengthening relationships. Participants managed challenges and adapted to their environment through learning within themselves and cooperating with others. They enjoyed learning and grew as entrepreneurial owners, favorably affecting progress of the boutique wineries.

Implications suggest adults need to experience learning as an effective avenue to adapt and change to the environment, being especially critical for entrepreneurial individuals starting small businesses hoping to survive early uncertain years as they struggle through the initial start-up phase. Cope (2005) stated, “it is through learning that entrepreneurs develop and grow” (p. 379).

Small businesses are one of the fastest growing segments of our economy including many individuals becoming more engaged in the small business arena as owners and managers. The field of entrepreneurship is currently being integrated more universally into college and university coursework designed to meet the needs of the growing number of entrepreneurs. Regional educational institutions have begun to acknowledge this trend by introducing and expanding upon entrepreneurial courses, and in some instances, comprehensive entrepreneurial tracks to their business programs. It is a necessary appropriate adaptation to the business curriculum in the United States to meet the changing needs of the workplace.

The development of innovative and relevant curriculum in education will inform and guide support for entrepreneurial individuals. Researchers from diverse learning theory backgrounds and disciplines can study the role of context to create and improve practical tools to apply in the workplace and further examination across disciplines would inform past work (Choy, 2009; Corbett, 2005; Fenwick, 2008; Harrison & Leitch, 2005).

Managers and owners of small businesses, small wineries specifically, business educators, and human resource professionals are a few of the practitioners that could adopt or adjust practices to improve entrepreneurial performance. Successful entrepreneurs will develop abilities to use learning across contexts as it is assimilated into their existing foundation of knowledge as well (Holcomb et al., 2009). Members of the wine industry in this region have indicated they are in the initial stages of forming an association to provide assistance to each other and promote the industry and related endeavors. A mentoring program could be initiated connecting the owners and managers of local wineries with other interested entrepreneurs.

As participants in this study were assisted and positively influenced by learning from those who had gone before them, it is now their role to become educators. It is a *perfect pairing*

between the learner and the teacher as the cycle continues to promote the development of the local wine industry, promoting the healthy growth in a welcoming environment for a new industry.

Research to date addresses adult learning in small business context on a limited basis, yet adult learning is becoming an increasingly more important component of the personal and professional lives of individuals as they adapt to an entrepreneurial environment. “It is virtually impossible to imagine any human behavior that is not heavily mediated by the context in which it occurs. One can easily conclude that generalizations that are intended to be context free will have little that is useful to say about human behavior” (Guba & Lincoln, 1981, p. 62).

Small business organizations are often a culmination of a major life goal for an entrepreneurial individual, in addition to the desire for balance in one’s life. Consequently, a *perfect pairing* of the adult entrepreneurial learner and the wine industry emerged in this study.

# Comparing the Responsibilities of Faculty Senates by Institutional Type and Senate Type

James G. Archibald, Ph.D., LPC

Valdosta State University

1500 N. Patterson Street  
225 SLP Building  
Valdosta, GA 31698

## Abstract

Faculty senates provide a forum for the discussion of all issues of concern to faculty members. Research and theoretical knowledge regarding faculty senates' involvement in campus decision-making is limited (Minor, 2004). The purpose of this study is to determine if there are differences in the responsibility areas of faculty senate by type of institution and type of senate. The data used in this study were extracted from The Faculty Senate Leader Survey (FSLs). The FSLs collected information from senate leaders regarding the characteristics of the faculty senate and critical issues of concern to faculty at their institution. The sample consisted of 434 faculty senate leaders identified in the search and were invited to participate in the Faculty Senate Leader Survey. Approximately 207 senate leaders of master's institutions and doctoral institutions in the United States responded to the survey. A total of 105 senate leaders of master's institutions and 102 senate leaders of doctoral institutions completed the Faculty Senate Leader Survey. Descriptive statistics, factor analyses, and t-tests were used to analyze the data.

Faculty senates tended to be responsible for ensuring academic freedom, committee appointments, curriculum and academic programs, and faculty grievances. Areas that faculty senates appear to have no responsibility or only advisory influence are retirement plans, faculty compensation, and campus facilities. The results also indicated that there are differences in the responsibilities of faculty senates by type of institution and type of senate. It was concluded that doctoral institutions tend to have more influence in areas usually managed by both faculty and administrators compared to master's institutions. In regards to differences by type of senate, it was concluded that pure faculty senates tend to have more influence in areas managed by both faculty and administrators compared to mixed faculty senates. No differences were found in the remaining factors.

### c) ABSTRACT:

The purpose of this project was to investigate and describe how Kindergarten children develop iPad interaction strategies during a combining task. The task investigate is part of the mathematics iPad application (app) Hungry Guppy. This app, requires children to quickly recognize small quantities and combine those quantities to create a sum of three or four. Our hypothesis was that children's initial app interactions and the development of interaction strategies are linked to mathematics learning.

The methods of analysis were qualitative. The participants in this study were 5 children, ages 5 and 6, all enrolled in Kindergarten during the 2012-2013 school year. The children participated in clinical interviews during which they used six different mathematics apps. This

analysis focuses specifically on children's interactions with Hungry Guppy. Three instruments were used to collect data during the interviews: video recording, iPad video screen-capture recording (using a GoPro camera), and observation protocols. Data were analyzed qualitatively for children's strategies and strategy development. The results of children's learning on the iPad will be described in terms of children's strategies, strategy development, and mathematics learning.

### c) ABSTRACT:

The purpose of this interactive workshop is to present an autoethnographic research project and to engage participants in exploration of autoethnography as a valid and valuable qualitative research method. Autoethnography is a socially-conscious research act undertaken to study one's own self using tenets of autobiography and ethnography. The data collection methods include reading personal journal entries, writing about memories, and at times conducting reflexive dyadic interviews with other key event participants. Data is analyzed through an effort on the part of each author to write artfully and vulnerably about a personal topic while considering issues of memory and truth, ethics, risks, and the writing's possible effect on others. The findings of autoethnography are the stories themselves, relationships among the stories and their authors, and the stories' broader connections to culture. Autoethnographic research is open to interpretation by each individual reader. From this interpretation the reader

may draw conclusions and/or create connections between themselves, the author, and culture. In this way both author and reader contribute to a collective web of socio-cultural understanding. During this workshop, we will examine autoethnography methodology, share our experiences and stories, and facilitate participants' applications of autoethnographic techniques through writing and discussion activities.

**TITLE:** "I LET THEM USE THEIR FIRST LANGUAGE": MAINSTREAM TEACHERS' PERCEPTIONS OF THE ROLE OF LANGUAGE AND CULTURE IN TEACHING ENGLISH LEARNERS

**Author:** Anthony J. Trifiro, Ph.D.

**Affiliation:** Arizona State University

**Address:** Department of English, TELAC Program MC 0302, P.O. Box 870302, Tempe, AZ 85287-0302

**Email:** [anthony.trifiro@asu.edu](mailto:anthony.trifiro@asu.edu)

**Format:** Poster Session

**Poster Session Title:** *"I let them use their first language": Mainstream Teachers' Perceptions of the role of language and culture in teaching English Learners*

### **Abstract:**

This paper presents a study of a long term professional development (PD) program for mainstream teachers of English Learners (ELs) in a large metropolitan school district with a significant majority of first language speakers of Spanish. This dissertation study reviews the case of 88 participants who comprise four PD cohorts participating in 10 month, 18 graduate credits ESL developed for these teacher cohorts.

The PD program included curricular aspects to support teacher understanding of EL students' bilingualism and second language acquisition, bi-literacy, and the role of parents and community. Curricular included the district's objectives for instruction of ELs increasing the program's coherence (Desimone et al, 2002; Garet et al, 2001) to participating teachers. Underlying the PD program is the theoretical perspective of Cochran-Smith & Lytle's (1999) addressing the notion that teaching expertise is enhanced through subject-matter study.

The study's findings revealed themes in participants' perceptions of language revealing the complex nature of teachers' affirming (Walker, Shaffer & Liams, 2004) and empathetic dispositions (Mcallister & Irvine, 2002) as well as an understanding of the sociolinguistic nature of language development (Harper & de Jong 2004; Lucas & Greenberg, 2008). The broader notions of language and culture indicated a view of supportive and non-supportive perceptions relative to EL students' first language and cultural connections in the classroom (Faltis & Coulter, 2008; Lucas, Villegas, & Freedson-Gonzalez, 2008). Overall teachers' perceptions were supportive of notions that bolster culturally responsive teaching (Villegas & Lucas, 2002).

The study has broader implications in preparation of teachers of ELs. Developing culturally responsive perspectives towards teaching ELs can be achieved through ESL curriculum. The implication on teacher education presents the possibility that in fact, teacher preparation should include preparation that fosters culturally responsive teaching.

# A Study of *Wh*-Question and Clefting Productions in Children\*

Akemi Matsuya  
Takachiho University

## 1. Introduction

The purpose of this paper is to explain why there is a time lag between children's output of *wh*-cleft sentences and cleft sentences. Although parents frequently provide young children with the stimuli of both of these two types of sentences in everyday speech, children seem to take more time to utter the former, compared to the latter; the data show that children acquire cleft sentences earlier than *wh*-cleft ones. Retrieving data from the Database CHILDES and examining the daily speech among children and those around them, I will demonstrate that the acquisition of *wh*-cleft sentences tends to occur later than that of cleft sentences. Moreover, I would like to suggest a theoretical reason for this phenomenon in the acquisition processes from the viewpoint of the Minimalist Program (Chomsky (1995), Grohmann, Panagiotidis, and Tsipplakou (2006), Hornstein, Nunes, and Grohmann (2005)). Section 2 will touch on the preceding study concerning the derivation of *wh*-cleft sentences. Section 3 will show and examine the results of the search of CHILDES. Section 4 will present two possible reasons why cleft sentences are acquired by children earlier than *wh*-cleft ones. Section 5 will present the summary of this paper.

## 2. Previous Work

From the facts that *wh*-cleft sentences undergo overt *wh*-movement, which is observed in Old Japanese,<sup>1</sup> and that they are D(iscourse)-linked, which means their *wh*-phrases are referential and specific, Matsuya (2011) claims that this type of *wh*-question is incurred by the presupposition. Assuming that *da* (= copular), which usually is used in declarative sentences, functions as a Q marker, Matsuya (2011) proposes that C contains a [-Q] feature and an interpretable presuppositionality feature ([+ P] feature) whereas a *wh* phrase has a [+ Q] feature and a [-P] feature. A *wh*-phrase moves to the Spec of FocP in order to check the [-P] feature, as (1) illustrates.

- (1) a. Ichiroo, who knows that Taroo went to the Takashimaya department store for shopping, says to her when he just came back home bringing the shopping bag:

Ichiroo: [TopP [CP Kimi-ga kinoo t<sub>i</sub> Takashimaya-de katta]<sub>j</sub>-no wa  
 you-Nom yesterday Takashimaya-at buy-Past C<sup>0</sup>-Top  
 [FocP t<sub>j</sub> nani<sub>i</sub> Foc<sup>0</sup> da/na no/desu ka] Top<sup>0</sup>]?  
 what is Cop/Cop+Q/Cop-Polite+Q

‘What is it that you bought at Takashimaya?’

Taroo answers to this question:

Taroo: Kono boosi da/desu.  
 this hat Cop/Cop-Polite

- b. On entering the classroom, Mr. Tanaka notices that the window was broken during the break and says to his students,

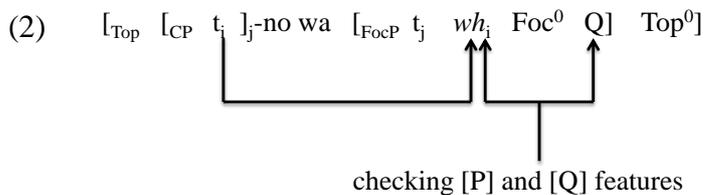

Taroo: [TopP [CP t<sub>i</sub> kono mado-o wat-ta]<sub>j</sub>-no wa  
 this window-Acc break-Past C<sup>0</sup>-Top  
 [FocP t<sub>j</sub> dare<sub>i</sub> (to) Foc<sup>0</sup> da/na no/desu ka] Top<sup>0</sup>]?  
 who Cop/ Cop+Q/Cop-Polite+Q  
 Who is it that broke this window?’

One of his student replies to him:

Student: Boku da/desu.

I Cop/Cop-Polite

Matsuya (2011:162-163)

Matsuya (2011:163)

Taking the biclausal structure of English *wh*-cleft sentences, which is demonstrated in (3), into consideration, Matsuya (2013) attempts to revise (2), which is monoclausal, in order to make the derivation process more universal.

- (3) Who is it that hit you?

Matsuya (2013:1134)

Grohmann, Panagiotidis, and Tsipplakou (2006) have dealt with *wh*-clefts in Cypriot Greek such as (4a), to which informants invariably assign a D-linked interpretation, and suggest that it is produced through the numeration (4b) (see Chomsky (1995)) and the course of derivation (4c): N is exhausted through successive Select, Merge, and Move (see Hornstein, Nunes, and Grohmann (2005)) and *pcos* ‘who’ moves sideward, merges with the small clause (SC) predicate  $\emptyset$  for checking  $\theta$ -role, and moves to SpecCP of the cleft for checking [*wh*] feature.

(4) a. *Pcos embu efie?*

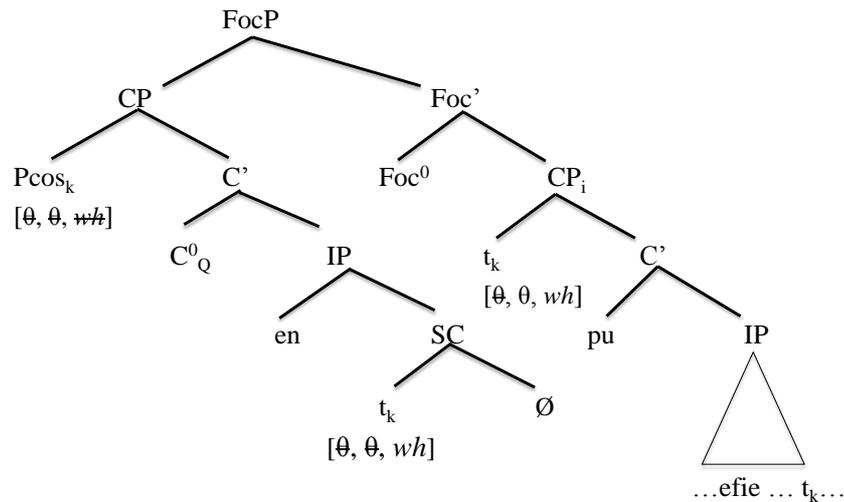

Who-NOM is-that left-3SG

Lit.: ‘Who is it that left?’

b.  $N = \{efie, v^0, pcos, I^0_{[PAST]}, pu \text{ [(=non-interrogative complementizer)]},$

$Foc^0, \emptyset, en \text{ [(= present-tense inflectional head } I^0_{[PRES]}], C^0_Q\}$

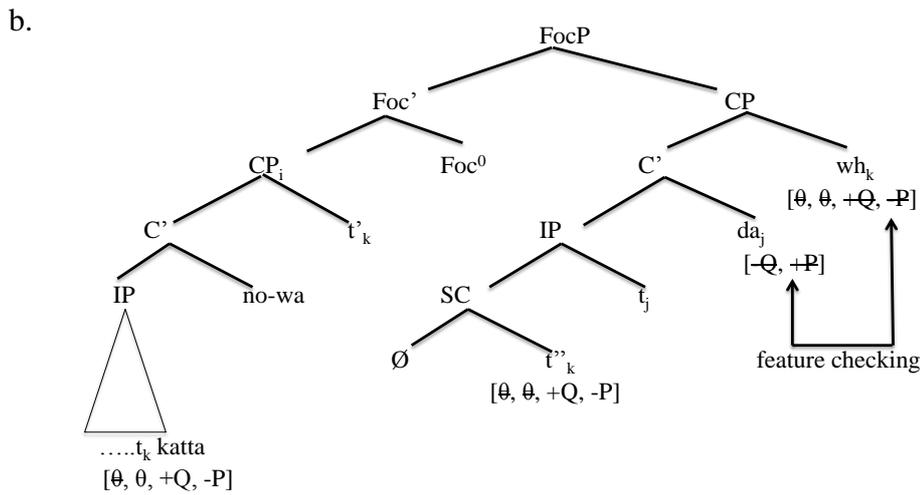

c.

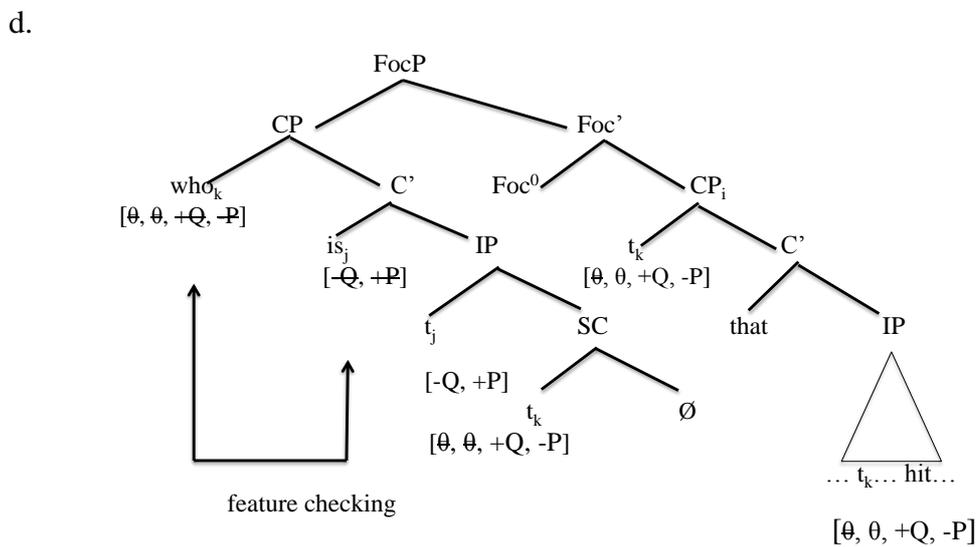

Grohmann, Panagiotidis, and Tsipplakou (2006:91)

Under the assumption that C (= Q-marker) contains a [-Q] feature and a [+P] feature and that a *wh* phrase has a [+Q] feature and a [-P] feature, Matsuya (2013) tries to apply Grohmann, Panagiotidis, and Tsipplakou’s (2006) derivation process to English and Japanese *wh*-cleft examples and proposes (5b) and (5d) for (5a) and (5c), respectively. Notice that as in (5b) and (5d), copulas with [-Q] and [+P] overtly move to CP head of the cleft, which is different from Grohmann, Panagiotidis, and Tsipplakou (2006).

- (5) a. Kimi-ga kinoo Takashimaya-de katta-no wa  
 you-Nom yesterday Takashimaya-at buy-Past C<sup>0</sup>-Top  
 nani<sub>i</sub> Foc<sup>0</sup> da/na no/desu ka?  
 what is Cop/Cop+Q/Cop-Polite+Q  
 ‘What is it that you bought at Takashimaya?’

- c. Who is it that hit you?

### 3. Analysis of Corpus Data

The results of CHILDES search for the production of *wh*-cleft sentences and cleft sentences by Japanese children are summarized as follows.<sup>2</sup> Among 21 kinds of corpus database with respect to Japanese children, I observed the stage when children started to produce *wh*-cleft and cleft sentences. As (6a) shows, seven of 10 participant children produce both of them, while 3 subject kids utter only cleft sentence, although their parents and acquaintances tried to talk to them, using *wh*-clefts as well as clefts in everyday conversation quite frequently.<sup>4</sup>

#### (6) a. The Search Results of CHILDES

	(i)	(ii)	(iii)	(iv)	(v)	(vi)	(vii)	(viii)	(ix)	(x)
<i>Wh</i> -cleft sentence	—	—	✓	✓	✓	✓	—	✓	✓	✓
Cleft sentence	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓

#### b. Names of Corpus

- |                     |                         |
|---------------------|-------------------------|
| (i) Ishii           | (ii) MillPro/ArikaM     |
| (iii) MillPro/Asato | (iv) MillPro/NJD Nanami |
| (v) MillPro/Tomito  | (vi) Miyata/Aki         |
| (vii) Miyata/Ryo    | (viii) Miyata/Tai       |
| (ix) Noji           | (x) Okayama             |

In addition, notice that the average ages at which children started to utter these two types of sentences are different from each other: the average age of the production of cleft sentences is 4 month earlier than that of *wh*-cleft sentences.

#### (7) Average Age When Subjects Produce Each Construction

- |                              |         |
|------------------------------|---------|
| a. <i>wh</i> -cleft sentence | 3;01.24 |
| b. cleft sentence            | 2;9.14  |

(8) and (9) describe examples of *wh*-cleft and cleft sentences produced by children of the 10 databases above.<sup>3</sup> Compare the age at which each construction was uttered by children for the first time. Except for the cases of MillPro/Asato and Noji, children

produced cleft sentences earlier than *wh*-cleft ones; the child of MillPro/Asato said the latter only one month earlier than the former and the child of Noji produced them at about the same time.

Judging from these three pieces of evidence, it can be said that Japanese children tend to produce cleft sentences earlier than *wh*-cleft sentences.

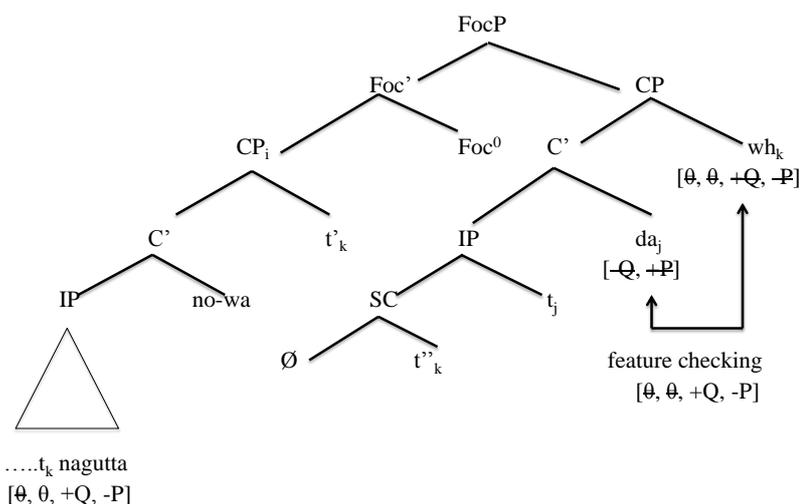

#### 4. Discussion

Why is there a temporal difference in the acquisition of these two types of sentences as observed above? How can we explain this fact from the perspective of formal linguistics? There may be two possibilities that can account for it. One is that Q-feature checking between a *wh*-phrase and copular, *da*, in the CP directly dominated by Focus Phrase is difficult in the early stage of language acquisition. Consider the following examples. As Figure (10-b) shows, *wh* phrase, *dare* in the case of (10a), moves to the Spec of the higher CP in order to check the Q-feature with the copular, *da*, which is not necessary in the derivational process of cleft sentence (10c). See Figure (10d). That is, the feature checking of cleft sentences is less costly than that of *wh*-cleft ones. The other is that the CP, which is directly dominated by the Focus Phrase, is absent in the child language of the early stage. So Q-feature checking is not done, which blocks *wh*-clefts.

(10) a. *wh*-cleft sentence

Kimi-o nagutta no wa dare da?  
 You-ACC hit-PAST C<sup>0</sup>-TOP who Cop  
 ‘Who is it that hit you?’

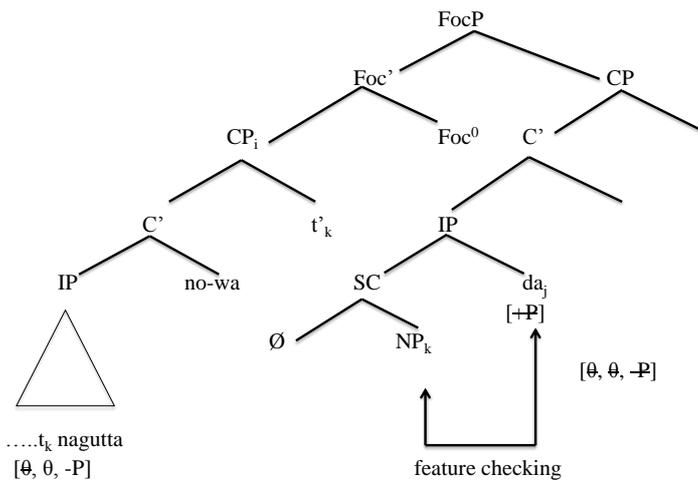

b.

c. cleft sentence

Hanako-o nagutta no wa Masao da.  
 Hanako-ACC hit-PAST C<sup>0</sup>-TOP Masao Cop  
 ‘It is Masao that hit Hanako.’

d.

## 5. Summary

The findings of this study are as follows. First, there is a time lag between the acquisition of *wh*-cleft sentences and cleft sentences by Japanese children. Second, the delay of the production of *wh*-clefts can be attributed to the difficulty of Q-feature checking at the higher CP, which is costly in the derivation. In the case of cleft sentences without Q-feature checking, all features, e.g. P-feature, theta role, and so forth, are checked under the analysis of a Small Clause, which is lower than the CP directly dominated by Focus Phrase for Q-feature checking in the clausal architecture. Third, the CP dominated by the Focus Phrase might be absent in the child language of the early stage.

## Notes

\* I would like to express my gratitude to Patricia Hironymous, who discussed this topic together, and Fred Savarese, who proofread this paper and gave me helpful suggestions.

1. As for the details of overt *wh*-movement in Old Japanese, see Watanabe (2002).
2. This paper does not deal with the *wh*-cleft sentences where *wh* phrases are ellipsed.
3. All of *wh*-cleft sentences are uttered by children in situations, such as picture book reading and pretend play, where they shared the same topic and information with parents and someone around them. Thus they did not contain rhetorical meaning.
4. Referring to the context, I supplemented some phonologically-unrealized words into the samples and translated them into English.

## ABSTRACT

*Enthroning democracy in Nigeria appears to be a difficult project. Since independence and even after the fourth republic, rather than practice democracy, our leaders have always resorted back to either militocracy, mobocracy or totalitarianism. This is not because our socio-political nature is antithetical to freedom, fairness and justice, but because such principles are not reflected in the kind of education used to nurture Nigerians, especially their leaders. They are trained by the authoritarian teacher in a military-like classroom through a regimented and dictatorial curriculum. It takes only miracles to produce democrats from such environment. This paper thus argues that if Nigeria is really serious in becoming a free and democratic society, as reflected in her official documents, then its philosophy, policy and system of education would have to be re-patterned to give room for the usual relationship between a nation's ideology and the education system which is meant to achieve such ideology. This means that to achieve democracy in Nigeria, education needs to be democratized.*

**Key words:** Democracy, Education, Educational Policy, Egalitarianism, Elitism and Curriculum.

## INTRODUCTION

Experts have established in various works that the custom and the way of life of a people determine the kind of education given to the inhabitants of a particular community. Dewey, for instance, posits that education is a social function, securing direction and development in the immature through their participation in the life of the group to which they belong, and to that extent, education will vary with the quality of life which prevails in a group. He goes further to say that a society which not only changes but which has the ideal of such change as will improve it, will have different standards and methods of education from one which aims simply at the perpetuation of its own custom (Dewey1916:104).

This Deweyan position is, however, not new; it is a recapitulation of Platonic conception of education and society; and others like Russell, Pestalozzi, Froebel, Comenius, Comte, Durkheim, Peters, *et cetera*, in their various works. They all agree that any education given by a

group tends to socialize its members, but the quality and value of the socialization depends upon the habits and aims of the group. This means that a society which is authoritarian or democratic will generate a mode of socialization that corresponds to the former or latter. In the same vein, if a society is socialistic or capitalistic, the educational system will either be patterned after socialism or capitalism; but on varieties of associations, democracy is currently preferred as the best mode in any form of human interaction. Democracy, in the general parlance, is a form of government. It is a rule by the people, for the people and of the people {Kennedian axiom}. This definition, commonly celebrated, imposes only a political connotation on democracy. In Dewey, however, the term receives a wider attention. Democracy, for him, is...

more than a form of government; it is primarily a mode of associated living, of conjoint communicated experience. The extension in space of the number of individuals who participate in an interest so that each has to refer to his own action to that of others to give point and direction to his own, is equivalent to the breaking down of those barriers of class, race, and national territory which kept men from perceiving the full import of their activity. These more numerous and more varied points of contact denote a greater diversity of stimuli to which an individual has to respond; they consequently put a premium on variation in his action (Dewey1916: 111-112) .

Dewey's understanding of democracy is a mode of life which allows for consideration of varieties of interests, so that on the long run, the interest which is majorly considered to be the best is accepted and operated upon. This mode of life, incidentally, is not restricted to politics. It cuts across social, economic, moral, religious, family-life and all other facts of life. In Horne's opinion, democracy is an attitude of mind under which exploitation of man by man is abhorred; a way of life in which the human personality is judged as supreme and of measureless worth; an order of social relationship dedicated to the promotion of the individual and collective interest of common folk; a spirit of understanding, sympathy and cooperation; a spirit which envisages responsibility for every man; a belief in humanity; an attitude that values the rights of others as well as one's own; a conviction and determination to base every action on goodwill, fraternity and sense of responsibility; a society in which ordinary men and women may grow to their full

stature; a society of the people, by the people and for the people in which every individual finds his scope of development and self-expression according to his potentialities (Taneja 2001:240).

Democracy is thus infused into all aspects of life and it is the most logical form of living. Dewey uses the analogy of acorns to explain the necessity of democracy for human existence. In his opinion, acorns are many things at different times. What they become depends on the transactions they engage in. For instance, they become food when squirrels need and desire them for survival. When acorns, however, engage in harmonious transactions with soil, water, air, sunshine and other essential factors, they become oak trees. This analogy holds for human beings. Human beings need to engage in harmonious relationships or transactions, especially with fellow human beings, if they are to grow healthy and strong. This harmony is, ironically, reflected in pluralism and difference, which is the key to becoming an individual mind. In this case, we need others to enjoy freedom. A pluralistic democratic community which encourages dialogues in the midst of differences {varieties of opinions} best satisfies this need {that is, the need to become free}. Diversity provides alternatives, which in turn ensures freedom. There is a great need for intelligent deliberations upon all modes of life, even if we will, on the long run, reject those modes as incapable of meeting our present and peculiar needs. The danger in a society having narrow interests, instead of allowing for varieties of interests and their possibilities, is that the society faces the risk of being stagnant as it struggles with the protection of what it has got, instead of reorganization and progress through wider relationships. Democracy is, hence, the best form of association.

At this juncture, we need to quickly examine the relationship between democracy and education. The relationship between democracy and education is multifaceted. In the first place, Plato in his *Republic* and other socio-political philosophers, have demonstrated the necessity of education to political democracy. Such scholars concur with the popular maxim which says – ‘education makes it easy to lead the people, but difficult to cheat them’. Dewey specifically says;

...a government resting upon popular suffrage cannot be successful unless those who elect and obey their governors are educated. Since a democratic society repudiates the principle of external authority, it must find a substitute in voluntary disposition and interest; these can be created only by education (Dewey 1916:111-112).

Education, as it were, infuses the spirit of responsibility, duties and commitments to the development of the state in individuals. If a society is characterized with high dose of illiteracy,

governance becomes difficult, which could de-generate into despotism, militarism or something else.

In the second place, democracy provides the freedom needed for intellectual fertilization in education. This is how Dewey puts it;

Lack of the free and equitable intercourse which springs from a variety of shared interests makes intellectual stimulation unbalanced. Diversity of stimulation means novelty, and novelty means challenge to thought. The more activity is restricted to a few definite lines – as it is when there are rigid class lines’ preventing adequate interplay of experiences – the more action tends to become routine on the part of the class at a disadvantage, and capricious, aimless, and explosive on the part of the class having the materially fortunate position (Dewey 1916:108).

Through the freedom provided by democracy, fertile conversation or communication is promoted in education. Democracy is a social structure which permits the growth of the freedom of intelligence, and because of this, education ought to be democratic. Dewey says;

The object and reward of learning is continued capacity for growth. Now this idea cannot be applied to all the members of a society except where intercourse of man with man is natural, and except where there is adequate provision for the reconstruction of social habits and institutions by means of wide stimulation arising from equitably distributed interests. And this means a democratic society (Dewey 1916:122).

Thirdly, it is only an education which stresses conversation in diversity, multiple inquiries and a free democratic spirit, which best suits the citizens of a society which is continually evolving with emerging daily sophistications, complexities and constant changes. Dewey writes;

A society which is mobile, which is full of channels for the distribution of a change occurring anywhere, must see to it that its members are educated to personal initiative and adaptability. Otherwise, they will be overwhelmed by the changes in which they are caught and those

significance or connections they do not perceive. The result will be a confusion in which a few will appropriate to themselves the results of the blind and externally directed activities of others (Dewey 1916:112).

Again, and this is instructive, the school should be constituted in such a way that allows for the training of the young ones in specific and experimental thinking and assisting them to experience the need for democratic cooperation. This suggestion was one of the findings generated from Chicago school laboratory's experiment. Although these results had been earlier expressed by the German scholar, Friedrich Froebel {the originator of kindergarten school}; they are summarized as follow;

- that the primary business of the school is to train children in cooperative and mutually helpful living;
- that individual tendencies and activities of the young are organized and directed through the uses made of them in keeping up the cooperative living already spoken of, taking advantage of them to reproduce on the child's plane the typical doings and occupations of the larger, mature society into which he is finally to go forth; and that it is through productive and creative use that valuable knowledge is secured and clinched (Curtis & Boulwood 1965:466).

By and large, a democratic arrangement is the best form of association in any social interaction, and the school is the hatching or breeding ground for this kind of arrangement. In Taneja, one finds a synopsis on the relationship between democracy and education as thus;

Democracy cannot be thought of in isolation from education. Infact, democracy is the result of education. Unless the principles of democracy are reflected in the aims and ideals of education, curriculum, methods of teaching, administration and organization, in discipline, in the outlook of the teacher, democracy cannot grow. If democracy can catch roots anywhere, it is in the school, which is a very rich and fertile field for its growth and development (Taneja 2001:244).

By and large, our contention so far is that whatever conception we have of democracy, it needs education. Education contributes to the necessary forms of understanding which assist the public in the attempt to learn to perceive, think, feel, imagine, desire, choose and act in a way that is fully and distinctively human (Crittenden 1973:136). If all these forms of understanding

are needed for the survival of a democracy, and if they can only be supplied by education – formal or informal, then one could conclude with Omotoso and Aladejana that education is a *sine qua non* in a democracy (Omotoso & Aladejana 2003:7-8).

Nigeria, however, proclaims in her various documents (Nigeria's Constitution and the National Policy on Education) that she wishes to become a democratic and egalitarian nation. If she is indeed serious with achieving a democratic society, then it needs to take her education seriously. Again, such education must be democratized. This means that education and democracy have to be infused into each other. Kneller has pointed out that the conduct of education in a democracy is guided by a number of generally accepted principles. These principles are regarded as the cornerstones of education and democracy; they are;

- i. since the people elect their government, they should be educated to do so responsibly
- ii. through education, every individual is expected to develop his own talents to the full
- iii. men must be educated to be free
- iv. education should train the open mind
- v. education should develop the habit of productive cooperation as well as healthy competition
- vi. wherever possible, we should adopt democratic practices in school behaviour; and
- vii. political control over education must be kept to the minimum (Kneller in Omotoso & Aladejana 2003:6).

A critical reflection on Nigeria's policy-document on education shows that it is far-away from adopting the above general principles. The system of education propelled by the policy, and anchored by a philosophy, is a total disconnection from democratic principles. This disconnect falls in right description in Counts' observation as follows;

We say that our children should be trained for life in a democracy and then we place them in schools which are autocratically managed from the board of education to the pupil in the classroom; we say that our children should learn the lessons of cooperation and then we subject them to an educational regimen of marks, certificates and degrees which place a premium upon individual competition and self-aggrandizement; we say that our children should be taught to love music and literature and then place them in learning situations which engender feelings of distaste and boredom (Counts in Lucas 1969:93).

The enthronement of democracy in Nigeria could have been much more easier but for undemocratisation of education. If people are to elect their government freely, then they should be educated to do so responsibly. In the same vein, an egalitarian society could have been easier to realise, if there were no structures that favour elitism in the policy. The system for instance, creates rooms for special schools populated by ‘special citizens’ and ‘special treatment’ for some favoured regions in the name of equalizing educational opportunities. These special schools, as noted by Nduka, are designed to serve the elites, and are head and shoulders above the general run of institutions of the same educational level which serve the great mass of citizens. The special schools, in his opinion, serve the role of reinforcing the educational advantages, which the children from the favoured homes have over those from the less favoured ones, especially as regards initiation into various aspects of western culture. On the long run, the schools play the role of widening the educational and cultural gap together with the concomitant economic advantages between the children of the western educated elite and their less fortunate fellow citizens (Nduka 2006: 126-127). Of course, neither the practice of autocracy nor the creation of ‘sacred cows’ can produce a democratic and egalitarian society. The result at best is a capitalistic or elitist society.

From the foregoing, it is obvious that democracy is difficult to achieve if education is not democratized. It is however golden to say that an education which instills the spirit of competition *in lieu* of habitual cooperation; an education that preaches individualism in place of mutually helpful living; an education that ridicules challenges in diversities of voices, and embraces monotony instead; an education that allows the autocratic administrators rule bureaucratically in our schools; an education that tolerates the autocratic teacher in a cemetery-type of classroom with passive, deaf and dump learners; an education that features teacher-centred and subject-centred curriculum {instead of child-centred} without any involvement of the learners in designing such curriculum; an education that is not readily accessible and affordable to the common man, but is made a special reserve of the privileged-class who use it to perpetuate themselves in power; an education which hinders the spirit of exploration but promotes conformism in the learner – can never and will never be able to produce a democratic society. This is the rationale behind the submission that unless the principles of democracy are reflected in the aims and ideals of education, curriculum, methods of teaching; administration and organization, in discipline, in the atmosphere of the school and in the outlook of the teacher,

democracy cannot grow (Taneja 2001:244). Thus, education would have to be completely democratized in Nigeria if indeed we are serious at achieving a democratic society “founded on the principles of freedom, equality and justice”(FRN in NPE 2004:1). This will entail the removal of all encumbrances to democratic ideals in our educational system.

It is clearly shown on page one of the National Policy on Education that Nigeria wishes to build a democratic and egalitarian society; and that she wishes to achieve this through education as an instrument. Such education is expected to promote self realization and better human relationship; individual and national efficiency; effective citizenship; national consciousness and unity; social, cultural, economic, political, scientific and technological progress (FRN in NPE 2004:1-2); but as we have argued earlier, education would have been able to achieve all these if it were democratized. A democratized education will expose the child to basic democratic principles such as justice; fair-play; freedom of expression, of worship, of association. Amaele understands this argument when he affirms that democracy cannot be attained, well enough, in the wider society if it is not practiced in the nation’s education; educational institutions are the human factories where all the societal theories are manufactured and tested (Amaele 2005:85). Taneja equally agrees with Amaele as he insists that “if democracy will catch roots anywhere, it is in the school which is a very rich and fertile field for its growth and development” (Taneja 2001:244). So, Nigerian educational system must be democratized to achieve a democratic society. To kick start this process, education will first and foremost, be made available, accessible and highly affordable, if not free, to all and sundry. This condition is highly pertinent because as noted by Olarewaju, there is no way we can have a full democratic society in a nation where we have many illiterates. The people who cannot make a rational decision that affect their own lives cannot be called upon to make decisions that affect the life of society; they cannot make such decisions because they lack the rational information on which they could base their decision upon (Olawaju 2009:38). And then, it is proposed that the curriculum at all levels must feature learning experiences that will predispose the principles of democracy in the educand. Akinpelu suggests the inclusion of civic education, political education, moral education and so on, as ways of inculcating democratic attitudes in the learners; or alternatively, he recommends the participation of all constituencies of education {parents, teachers, students and the community} in the organization and administration of education (Akinpelu 2005:185). While we agree with Akinpelu on the inclusion of the afore-mentioned

courses and participation in school management, we contend that the subjects-contents in the entire curriculum should be arranged in such a way that the child is exposed to the meaning of unity in diversity and the principles of harmonious living in the society. Dewey recommends problem method because it fosters the spirit of cooperation or togetherness in the child; the Nigerian teacher should constantly adopt this method and/or any other method which fosters cooperation *in lieu* of competition.

## CONCLUSION

By and large, we argued in this paper that Nigerian education needs to be democratized, and it shall be seen as democratized when the following happen;

- When education is seen and operated as a right and not a privilege, and consequently made available, accessible and highly affordable, if not free.
- When curriculum features subjects which are capable of fostering the spirit of democracy in the child.
- When learners are made to be part and parcel of the process of curricular design, planning and implementation, which will create a room for child-centred curriculum.
- When learners are encouraged to practice democracy in their various students' associations; and when they are given opportunities to go on field trips visiting places where democratic institutions are solidly entrenched.
- When all stakeholders in education have 'a say' and 'a way' in the planning and execution of education in Nigeria.
- When educational administrators especially at the primary and secondary levels are encouraged to drop the habits of being autocratic or despotic, and instead, embrace the spirit of democracy in educational affairs.
- When educational posts {e.g. vice-chancellor, principal, head teachers, zonal education officers, etc} are not imposed by external bodies, but instead, decided on the basis of merits and collective choice of the people affected.

All these factors, and others not mentioned here, must be taken into serious consideration if we truly need a democratic society. In a similar vein, Nigerian society is expected to be egalitarian through education; but with what type of education? We have argued earlier, that

rather than have an education which fosters equal rights and fairness, what we have in place is elitism at its apogee. An instance is the institution of unity schools, which harbour some selected children from all over the states in the country, under the guise of uniting the nation. These schools, rather than unite, further expand the gap between the privileged and non-privileged, who in turn ensures the perpetuation of their children in the process that produced them. This situation prompted Olarewaju to ask the following questions: “if we aim to build an egalitarian society, why are we selecting few children among all the children in the society for such prestigious education?; why are we working against what we aim to build?; what are the purposes of these elitist schools?” (Olawaju 2009:41). Perhaps, Fafunwa is right in saying;

The problem that is created by unity schools will continue until all the 5,000 secondary schools in Nigeria become unity schools.... Either you convert all the Nigerian schools to unity schools or you ban them (Fafunwa in Akinkugbe 1994:105).

If Nigeria is to be an egalitarian and a democratic society, then, it “must part company with the present elitist system of education which cannot, because it was never intended to, mobilize the great mass of the citizens and gear them for rapid development” (Nduka 2006:127). In other words, education should not allow special treatments for special children; Nigerian education must be egalitarian and democratic.

Student Participation in Arts Education and Graduation Rate Improvement in

Los Angeles Unified School District

Amanda Ditto Hernandez

Claremont Graduate University

Student Participation in Arts Education and Graduation Rate Improvement in  
Los Angeles Unified School District

**Executive Summary**

In Los Angeles Unified School District, only 65% of the students graduated high school in 2012 (Lim, 2011-12 Graduation and dropout rates, 2013). That leaves 35% of the potential graduating seniors without a high school diploma. A high school diploma is socially accepted as the gateway to college and career, and these students are being left behind without the means to progress in meaningful careers. Most of the students who do not graduate are minority children who live in high poverty neighborhoods (Lim, 2011-12 Graduation and dropout rates, 2013). Without certification of having met the basic educational standards of the American school system, these poverty stricken minority children will be stuck perpetuating the poverty cycle that exists in their neighborhoods and in their schools. Not only is this detrimental to the children, but as a society, we are also losing potential human capital and a voting, tax paying citizenship. For many students, the symptoms of dropping out of high school can be understood by the pulled out/pushed out model (Bradley & Renzulli, 2011). Bradley and Renzulli (2011) suggest that students are pulled out by family needs, economic obligation, or personal commitments; on the contrary, students are pushed out by discipline issues, dislike of classes or teachers, absenteeism, and student conflict. The core of both models is lack of student engagement. Measures currently in place to retain students are after disengagement occurs and provide a disincentive for students to attend school. The proposed solution is to offer arts education programs as a form of engagement for students. Although there is no causal relationship between arts education and graduation

rates, there is ample evidence in other minority majority urban centers to suggest arts education is a positive alternative that may yield successful results.

The purpose of this policy brief is to draw attention to the abysmal graduation rates in Los Angeles Unified School District (LAUSD) and provide policy options related to arts education that may improve graduation rates. The organization of this paper: 1) establishes low graduation rates as a significant problem to society, 2) provides research-based symptoms of student dropouts, 3) explores policy options to address the problem of dropping out, 4) examines arts education as a possible policy to improve student engagement, 5) proposes that LAUSD implement a program similar to the Arts Ecosystem established by The Hewlett Foundation using the current LAUSD Arts and Education Plan.

## **Context and Importance of the Problem**

### **Description of the problem**

The problem addressed in this policy brief is the low graduation rate of high school students in Los Angeles Unified School District (LAUSD). The politically charged phrase for this problem is the dropout rate; however, the dropout rate is defined differently in a variety of studies and the numbers range from 14.4% (Torlakson, 2012) to 52% (Silver, Saunders, & Zarate, 2008) depending on the context of the information. In addition, in 2009 the California data on dropout rates were adjusted making the aggregate state data not available. A more reliable number for analysis is the graduation rate, which for the 2011-2012 academic year was 65% in LAUSD (Lim, 2011-12 Graduation and dropout rates, 2013). The operational definition of graduation rate for this paper is the rate which cohorts of students graduated high school in four years. Although the

graduation rate in LAUSD has been steadily improving from 48% in 2007-2008, the California graduation rate has been in decline from 80% in 2007-2008 to 78.5% in 2011-2012 (Lim, Graduation and dropout rates, 2011). It is important to focus on LAUSD within the context of California because it is the state's largest school district. There are 6,217,002 students enrolled in California public schools; 667, 251 of those students attend schools in LAUSD (California Department of Education, 2012). The enrollment of one district makes up 10% of California schools. The next largest district is San Diego Unified with an enrollment of 131, 784 (California Department of Education, 2012). Table 1 (below) shows the graduation rate percentages of LAUSD and California over a five-year period from 2007 to 2012.

Table 1

*Graduation Rates by Year*

	2007-2008	2008-2009	2009-2010	2010-2011	2011-2012
LAUSD	48%	52%	55%	62%	65%
California	80%	79%	Not Available	77%	78.5%

*Note.* Adapted from Lim (2012, 2013).

The students who drop out of high school are typically minorities who come from low socioeconomic status (SES) conditions (Rumberger, 1987). In LAUSD, the graduation percentages for whites (72%) and Asians (78%) is higher than African-Americans (56%) and Latinos (65%), but the state-wide data reveals a much greater disparity of whites (86%) and Asians (91%) with African-Americans (66%) and Latinos (73%) (Lim, 2012; Lim, 2013). The student race/ethnic population of LAUSD is: African-American (9.6%), Latino (72%), Asian (4%), and white (10%) (California

Department of Education, 2013). The percentage of students in LAUSD who are low SES is 79% (California Department of Education, 2013). Students are considered low SES if they qualify for the Free and Reduced Meal Program (FRMP). Only 68% of low SES students graduate in LAUSD, and only 73% of low SES students graduate in California (Education Data Partnership, 2013). Table 2 (below) presents a comparison of the LAUSD and California graduation rates disaggregated by sub-group for the 2011-2012 academic year.

Table 2

*Graduation Rates by Ethnicity and SES*

	LAUSD 2011-2012	California 2011-2012
African-Americans	56%	66%
Latinos	65%	73%
Whites	72%	86%
Asians	78%	91%
Low SES	68%	73%

*Note.* Adapted from Education Data Partnership (2013)

**Context of the problem**

Students drop out of high school for myriad reasons. In a prescient study by Rumberger (1987), six factors are given for dropping out: demographics, family-related, peers, school-related, economic, and individual reasons. More recently, Lee and Burkam (2003) separate three factors to predict dropouts: students’ social background, students’ academic background, and school demographics. The President’s Committee on Arts and the Humanities (2011) cites two studies suggesting why students drop out of high school. The first study, Bridgeland, et al. (2006) reports students are bored and uninspired, classes are not interesting, and expectations of them are low (President's Committee on the Arts and the Humanities, May 2011). The second study, Pytel (2008) uses the Child

Trends Databank to demonstrate that as early as sixth grade students who exhibit excessive absences, low levels of engagement, failing grades, and disruptive behavior are at risk of dropping out (President's Committee on the Arts and the Humanities, May 2011). A theoretical framework created by Bradley & Renzulli (2011) synthesizes the previous studies. The pushed-out/pulled-out theoretical model (Bradley & Renzulli, 2011) combines the factors that push students out of school: dislike school, disagreement between teachers/students, discipline, not safe, no sense of belonging, academic failure, and absenteeism. A controversial component of the pushed-out theory is “oppositional culture” proposed by Ogbu (1987), cited in Bradley and Renzulli (2011), suggests that African-Americans and Latinos come from cultures that do not conform to the academic structure and organization of schools. This theory is not supported by current research. The factors that pull students out of school are also defined: employment, pregnancy, parenthood, family member needs/support, and marriage (Bradley & Renzulli, 2011). The pulled-out model is an opportunity-cost evaluation for most students. The trends that emerge from the research are students are more likely to drop out if they are minorities, low SES, poor social networks, lack of participation in extra-curricular activities, low GPA, family background, and cultural differences (Bradley & Renzulli, 2011). These trends describe students in urban school districts, like LAUSD, which have very low graduation rates.

### **Policy and other implications of the problem**

It is imperative that all students graduate from high school. Students who drop out are limited in their employment options and will not be able to move out of poverty. They are likely to stay in low SES neighborhoods, and their children will attend urban schools

with low graduation rates. To supplement their inadequate income, many turn to crime and end up in the prison system. Other high school dropouts turn to drug use and also end up in prison. The taxpayer money spent on the dropouts once they are in the court system could be better spent preventing children's early downfall by investing in the students' successful completion of high school graduation requirements. In addition, there is low voter turnout among high school dropouts. The limited human capital stunts society from progressing. Students are not able to access opportunities, like career trajectory, that become available with a high school diploma. This also yields fewer tax dollars that contribute to social programs and government needs. Subsequently, high school dropouts tend to be more dependent on government programs. The potential of these students to contribute to society, to eradicate the poverty cycle, to change the world, hinges on their ability to graduate from high school.

### **Policy Options to Address the Problem**

#### **Description of various policy options**

There are numerous ways districts have tried to improve graduation rates. Students have been required to take remedial classes to improve their GPA, non-profit organizations work with schools to offer enrichment courses after school, on weekends, and during summer to help the students academically. Truancy officers are hired to find students in the community who are not attending classes. Security officers are hired to keep students safe and monitor students on campus. All of these solutions are embedded with a disincentive for the students. Interventions either take time away from positive social activities or financial and emotional family obligations. Or, interventions pose a threat to the students with truancy consequences or disciplinary action on campus.

Interventions are put in place after the problem occurs. These options are not effective for students struggling to stay in school as evidenced by the current drop out rate. In considering the reasons students drop out of school, many of the students in the pushed out model can be encouraged with opportunities for student engagement. Engagement can be in the form of sports, clubs, and arts. Engagement activities may not be as effective for students in the pulled out model because they leave as a result of opportunity cost. It is more costly for them to attend school than it is for them to drop out. The engagement activity must be greater than the opportunity or obligation outside of school. Either way, the low graduation rates need to be improved through policy that demonstrates a commitment to meeting the academic and personal needs of students at risk for dropping out.

### **Empirical evidence related to the effectiveness of the policy options**

LAUSD is taking an innovative approach to improve the graduation rate and other challenges facing the district by making a commitment to arts education. In 2013, LAUSD created the Arts and Education Plan (Los Angeles Unified School District, 2013). The goal of this program is to bring arts into the core instruction over the next ten years (Los Angeles Unified School District, 2013). The plan to integrate the arts includes professional development, sample lessons online, salary-point incentives for teachers to include arts instruction, and partnerships with local non-profit organizations. Funding, however, is not guaranteed over time.

There are six dominant organizations involved in the LAUSD Arts and Education Plan. First, the LAUSD Arts and Education branch is funded by LAUSD (Los Angeles Unified School District, 2013). Second, The LA Fund is a philanthropic organization

initiated in 2011 by Superintendent John Deasy and philanthropist Megan Chermin (The Los Angeles Fund for Public Education, 2011). This fund is not specific to arts education, but it does focus on innovation and results-driven programs. Third, Arts at the Core is a program sponsored by College Board that pairs teaching artists with classroom teachers to design cross-disciplinary hands-on arts instruction (College Board, 2011). Fourth, Arts for All is a non-profit organization that works to establish a strong arts foundation and partners with schools to implement and restore the arts (Arts for All). Districts must join Arts for All and the organization provides coaching, artists in the classroom, and professional development for teachers. Fifth, Arts for LA is a non-profit organization that developed a policy framework for arts education, a cultural economy, and civic engagement (Arts for LA, 2012). It does not specifically work with schools, but it does provide afterschool programs and summer programs in regions of Los Angeles. Sixth, Friends of the Arts in LAUSD has been the organization dedicated to maintaining the arts in LAUSD (Friends of the Arts in LAUSD, 2012). For the last ten years, Friends of the Arts has been an active arts advocacy group in LAUSD; however, the organization was reduced to one person in 2012. A Save the Arts campaign is underway. These programs are working with LAUSD to bring arts to the students; there is not an explicit arts program to improve graduation rates.

Implementation of arts programs is not unique to LAUSD. A study by Israel (2009) in New York City considered relationships between access to the arts and graduation rates. In 2008, the graduation rate was 56%, and the demographics of student graduates were similar to LAUSD: Latino (49%), African-American (51%), White (72%), and Asian (74%) (NYC Department of Education, 2013). Three significant

findings emerged from this study: 1) Students at risk of dropping out cite participation in the arts as their reason for staying in school; 2) Arts education has a measurable impact on at-risk youth; 3) In New York City public schools, students with the least access to arts instruction have the lowest graduation rates (Israel, 2009). The NYC Department of Education (2013) reports that 65.5% of NYC students graduated in 2012. Although this improvement cannot be directly linked to the arts programs, there is a research based positive relationship between the two variables.

Missouri is another state where research has been conducted on the relationship between student academic behaviors and arts education. Although the demographics in Missouri are different from those in the urban centers of New York City and Los Angeles, the large cities in Missouri have significant minority populations. In Jackson, 42% of the students identify as non-white; St. Louis, 37%; St. Louis City, 66.5% (The Annie E. Casey Foundation, 2013). Scheuler (2010) found a positive relationship between participation and fine arts education and attendance and student behavior. In addition, Scheuler (2010) reports a positive relationship between fine arts education and student academic performance. Most importantly, Scheuler (2010) found a positive relationship between fine arts education and graduation rates. In both cases of New York and Missouri, the recommendations from the studies included maintenance and expansion of the current arts programs (Israel, 2009; Scheuler, 2010).

Not only are individual states implementing arts programs, but arts education is also coming to the national forefront. In 2011, President Barack Obama established a Committee on the Arts and the Humanities. The objective of the committee is investing in arts education through collaboration, developing arts integration, expanding current

arts programs, reinforcing the arts through policy, widening focus on evidence supporting arts education (President's Committee on the Arts and the Humanities, May 2011). In the report *Reinvesting in Arts Education*, the literature supporting arts education is vast. In *Champions of Change* by Fiske (1999), seven correlative studies show the pattern of linkage between higher levels of arts participation and higher grades and test scores in math and reading (President's Committee on the Arts and the Humanities, May 2011). In the *Champions of Change* report, Fiske (1999) concluded that arts integration approaches were successful in producing better attendance and fewer discipline problems, increased graduation rates, and improved test scores. An unsurprising conclusion by Catterall (1999, 2009) found that data from National Educational Longitudinal Survey (NELS) showed that students with economic advantage had more arts experiences (President's Committee on the Arts and the Humanities, May 2011). Students with high involvement in the arts, including minority and low-income students, performed better in school and stayed in school longer than students with low involvement, the relative advantage increasing over the years (President's Committee on the Arts and the Humanities, May 2011). In follow-up research, two findings emerge: 1) arts-engaged low-income students are more likely than their non-arts-engaged peers to have attended and done well in college, obtained employment with a future, volunteered in their communities and participated in the political process by voting; 2) arts-engaged low income students tend to perform more like average higher-income students (Catterall, Dumais, & Hampden-Thompson, 2012). In *Critical Links: Learning in the Arts and Student Academic and Social Development*, Deasy (2002) compiled 62 studies that revealed a transfer of skills from the arts to other subjects, in addition to habits of mind, self-motivation, social skills,

tolerance, empathy, and positive peer interaction. Similarly, McLaughlin (2000) reported that when low-income youth participated in arts programs, they were more likely to be high academic achievers, be elected to class office, and participate in math or science fair (President's Committee on the Arts and the Humanities, May 2011). In addition, Israel (2009) found that students who experience success in arts appreciate the results of effort and persistence, and are more motivated to apply themselves to other learning tasks. As a by-product of another study, Heath (1998) found that students who were involved in arts education for at least nine hours a week were four times more likely to have high academic achievement and three times more likely to have high attendance (President's Committee on the Arts and the Humanities, May 2011).

California leadership has also made a commitment to the arts. When Governor Jerry Brown was mayor of Oakland, he created the Oakland School for the Arts, which is now a top performing school in an urban district (Jerry Brown Governor 2010, 2010). Creating magnet schools and theme schools were a part of his education plan in 2010 when he became Governor of California. Improving high school graduation rates was also part of his plan. Based on the research, both objectives can be met by implementing a strong arts program in LAUSD.

The Hewlett Foundation has established an arts ecosystem, which is a thriving collaboration of arts integration in the San Francisco Bay Area (The William and Flora Hewlett Foundation, 2013). At the top of the ecosystem are foundations and government that fund the programs. In the middle are schools and for-profit entertainment that use the funding for arts education. At the bottom are artists and the public who work in the schools or entertainment houses and become the paying audiences for the art

performances. Through taxes, for-profit groups return money to the government. The schools produce productive members of the public, many of whom donate to the foundations and support the artists. In this model, the six agents of arts education work together for mutually beneficial results.

### **Analysis and Recommendations**

#### **Key actors and levels in addressing the problem**

The key actors in the arts ecosystem are listed in Table 3 (below). The specific groups that could be utilized in the arts ecosystem are listed in the second column. How each actor will function within the arts ecosystem is in the third column. The fourth column lists possible benefits to each actor after participating in the arts ecosystem. The table shows how the arts ecosystem can be mutually beneficial to all actors involved.

Table 3

*Agents of the Arts Ecosystem, their Function and Benefits*

<b>Agents</b>	<b>Specific Groups</b>	<b>Function in arts ecosystem</b>	<b>Benefit</b>
Foundations	LA Fund	Funding Accountability	Philanthropy Tax incentives
Government	Los Angeles California State	Funding Data reporting Accountability Provide tax incentives to Foundations and For profit entertainment	Improved graduation rates Model for other urban centers Political leverage
Non-Profits	Arts at the Core Arts for All Arts for LA Friends of the Arts	Provide artists Collaborate with teachers Present to students Organize activities (afterschool, summer)	Funding Research support Employment Venue to pursue mission/goals Train youth
Schools	LAUSD K-12	Provide students, teachers, classroom space, and facilitate experiences Identify and monitor at-risk students	Improved graduation rates Higher attendance

		Allow students to be interviewed for research purposes on perception and engagement Commit to arts education	Fewer discipline issues Student engagement Community involvement
For profit entertainment	Center Theatre Group	Organize student performances Discount (or free) student tickets Talk back after performances Bridge performances to curriculum Provide lesson plans for teacher to use before/after production Invite student interns and/or ushers	Audiences Student workers Tax incentives
Artists	Various	Perform at schools Teach students Collaborate with teachers Incorporate curriculum goals	Performance Mentorship Paycheck
Community	Los Angeles County	Attend arts programs and performances Donate to foundations Pay taxes	More graduates Better jobs Pay taxes Less crime Contribute to eradicating poverty cycle Donate to foundations

*Note.* Information collected from (The William and Flora Hewlett Foundation, 2013) and (Los Angeles Unified School District, 2013).

### **Recommendations**

Based on the symptoms of dropping out, the empirical evidence showing a positive relationship between arts education and graduation rates, and the commitment LAUSD has made to the arts, it is recommended that policy be implemented to secure an arts ecosystem in LAUSD modeled after the Hewlett Foundation Arts Ecosystem in the San Francisco Bay Area.

The suggested process of creating an arts ecosystem in LAUSD follows. First, identify foundations, such as the Hewlett Foundation, and secure funding for twelve

years. The first four years will follow one cohort of students. The first cohort will allow stakeholders in the eco system to identify challenges. The second cohort (years five through eight) will enable stakeholders to implement solutions to perceived challenges. The third cohort (years nine through twelve) will allow stakeholders to identify results. In particular, if and how graduation rates have changed since the ecosystem was put in place. Integral to the process will also be identification of unintended consequences not only at the school sites, but also in the community. Although the Hewlett Foundation limits grants to the Bay Area, other arts advocates in the Los Angeles area are likely to commit funding with tax incentives from government agencies. Los Angeles is one of the performing arts capitals of the world, not to mention a pocket of an egregious amount of wealth in Hollywood. There is a concentration of financial support in Los Angeles disproportionate to many other cities that have made a commitment to the arts, and a positive consequence of so much money is philanthropy. There is money available for a program such as this; it needs to be identified and secured.

The second step is to synthesize the programs offered by the current non-profit groups working with LAUSD. Identify clear responsibilities for each organization. Provide incentives through funding for meeting student graduation rate goals or student participation. Create accountability measures for each program and establish clear responsibility guidelines for each role involved in the ecosystem.

The third step is to hire researchers to monitor the effects of the programs on graduation rates and the factors associated with the pushed-out/pulled-out theoretical framework (Bradley & Renzulli, 2011). This research will include interviewing students about their social networks and participation in the programs, in addition to following the

data on graduation rates, minority demographics, academic standing, and SES. Research should include changes to each of the stakeholders from the inception of the program through the twelfth year. A final longitudinal study should include findings for each stakeholder and recommendations for how the ecosystem should be improved.

There are many advantages to implementing an arts ecosystem in LAUSD. Primarily, it is likely to encourage high school students in LAUSD to graduate. The low SES and minority populations who are at risk of dropping out generally do not have access to arts. Based on the literature, the positive consequences of arts programs include higher graduation rates, better attendance rates, and lower incidence of misbehavior. Since LAUSD is the largest district in California, it is likely to serve not only as a model for other California districts, but also for urban centers across the United States. If the arts ecosystem is created, as it is structured in San Francisco Bay Area, it may bridge the California arts community. The benefits would then expand to foundations, schools, for profit entertainment, local artists, and the public. Although the expansion of the program will likely benefit the LAUSD community and the state in a larger model, the focus should be on how we can create programs to help students succeed before an intervention is required.

Despite arts programs being included as a core subject in the *No Child Left Behind* policy, it is often the first program cut. Arts programs can be expensive. They require specialized teacher training and disposable materials. Unlike textbooks, art supplies cannot be used year after year. Another disadvantage of arts education is that the arts do not appeal to everyone. Many students are discouraged by the stigma or simply not interested. In this case, other programs like sports or clubs can have a similar effect

on student engagement. Arts education is not the only answer, but it is a viable answer. Since students are all very different, it logically follows that a variety of programs should be created to help all students graduate from high school.

### **Conclusion**

The problem is clear: too many high school students dropped out of LAUSD schools before they graduated from high school. Only 65% of students in LAUSD graduated high school in 2012 (Lim, 2011-12 Graduation and dropout rates, 2013). Most of these students are low SES, minority youth who are either pulled out or pushed out of academic programs (Bradley & Renzulli, 2011). Arts programs are not the only answer to the dropout problem, but they do address many of the symptoms that cause students to dropout. There is a wealth of literature supporting the relationship between student participation in arts programs and academic engagement. LAUSD is the largest district in California, and having an arts ecosystem in place may help the high poverty, minority population stay in school. Unlike many other student-centered programs, an arts ecosystem is mutually beneficial for all stakeholders. In addition, providing arts programs may help urban youth develop skills that will enhance their human capital. Considering many of the options students turn to when they drop out of school, the arts are a positive choice to keep students from dropping out.

## Abstract

The purpose of this study is to examine high socioeconomic status (SES) students' perception of arts and education. The significance of this topic is explained by the depleting funding for arts education in low SES schools, the maintained or increased funding for arts programs in high SES schools, and the continued growth of the academic achievement gap between the low and high SES schools. The literature review establishes play as an early model for arts education. Cultural capital theory is presented to develop arts education as a class issue. The value of arts education is then emphasized through the research presented in the President's Commission on the Arts. The research questions drive the data in three categories: student perception of availability and value of arts programs, arts participation levels in a high SES school, and student perception of and arts integration in core classes. The method was to survey a small sample (n=85) of students, grades 9-12, at a high performing, high SES school in Los Angeles County. The survey included 25-questions exploring the nuances of the research questions in addition to student demographics. The results indicate the literature in this field is supported. The students report access to the arts and disagree that the arts are cost prohibitive. All of the students participate in the arts at home and at school. There is a relationship between students who like the arts and students who like school. Students reported that all academic core classes integrate the arts in some way. The school has an API of 938 (out of 1000), so although there is no causal evidence linking arts education to academic achievement there are striking connections between arts participation and academic achievement.

## **Introduction and Background**

In light of the Common Core State Standards initiative (2010), meaningful teacher professional development has become an urgent and paramount focus for teacher educators as they grapple with implementing these standards and practices. The Arizona Mathematics Partnership (AMP) Project, a five-year research-based professional development program for middle school mathematics teachers, is a strategic response to the need for increasing teachers' knowledge of and proficiency with implementing the standards in their classroom practices. Through this project, we have begun to explore the degree to which teachers embrace (or not) the philosophies and new ways of thinking about mathematics that are promoted by AMP. This paper details preliminary findings from a qualitative analysis in grounded research regarding teachers' beliefs about the teaching and learning of mathematics.

The AMP project provides professional development for teachers through three primary activities: Summer Institute (35 hours), Saturday Workshops during the academic year (30 hours), and Collaborative Community of Learners (CCOL, 30 hours). Project leaders help teachers identify essential mathematical ideas and empower them to move away from the “mile wide but inch deep” approach by emphasizing the coherence of related ideas, concepts, skills and procedures that form the foundation for understanding, thus preparing students for challenging courses. The Institutes and Workshops focus on content and students' thinking relative to problem solving, number sense, proportional reasoning, additive and multiplicative reasoning, geometry, patterns/algebra, and probability and statistics. Teachers explore these ideas by engaging first in unpacking the meaning of the mathematics and then through group discussions intended to deepen their content knowledge, pedagogical content knowledge, and problem solving behaviors. Each school-based CCOL, comprised of 4-8 peer teachers, is facilitated by highly trained community college faculty and serves as a connecting link between the Institutes/Workshop activities and teachers' experiences in the classroom. Each CCOL group determines their mathematical and pedagogical focus for the academic year through an environment for open discussion, exploring mathematical content, reviewing assigned readings, and determining learning goals for future sessions. During CCOLs, teachers are encouraged to share successes and challenges with the ultimate goal of making their teaching practices public.

## **Teacher Beliefs and Attitudes**

The literature has long described how teachers' beliefs about mathematics influence their approach to teaching mathematics. Thompson (1984) showed that a teacher's approach to classroom practice was strongly linked to his or her view of mathematics. If a teacher believed that mathematics was an accumulation of facts, rules, and skills, then his or her instruction was likely to be quite procedural. In his synthesis of the research on beliefs, Pajares (1992) outlined key findings that had been substantiated by multiple studies. He explains that belief structures are acquired through cultural transmission, so it is common for teachers to teach in the same ways that they were taught. The cultural influence on teaching was also pointed out by Stigler and Hiebert (1999) in their comparison of teachers in the U.S., Japan and Germany. Kagan (1992), who also provided an overview of the literature on the influence of teacher beliefs on their practice, reported that after entering service, teachers continued to solve instructional problems by relying on their own beliefs and experiences, rather than by the principles of their teacher education. Other key findings outlined by Pajares (1992) were that beliefs about teaching are well established even before pre-service teachers go to college. The research also shows that belief change in adulthood is rare, and when it does occur, it is associated with a conversion from one authority to another, or with a Gestalt shift. In other words, any professional development program aimed at reforming teaching practice should expect that the change process is difficult and requires attention to changing the beliefs and preconceived images that the teachers hold.

## **Methodology**

The study consists of 59 teachers from seven school districts in the state of Arizona. The data for this study were collected by videotaping all 10 CCOL groups throughout the academic year for a total of 18 hours of video for each group. Video footage from CCOL meetings is the primary data set, although a few quotes are taken from video footage of Math Symposiums and Summer Institute presentations. Using a grounded theory perspective, three researchers carefully analyzed the videos' content, taking notes on teacher participation, behaviors that effected productive and non-productive discussions, and topics of conversation. The researchers met frequently to share initial observations and to refocus their research lens based on these observations.

## **Preliminary Results**

We identified two extreme categories of teachers regarding responses to the AMP Project. One category, a group of five teachers local to the same school district, was characterized as the most traditional, and resultantly did not fully embrace the philosophies of the AMP Project. There were three main characteristics of these teachers:

- Engaged minimally with little reflection
- Opposed AMP teaching philosophies
- Displayed negative attitudes

When presented with novel mathematical problems, these teachers often gave up quickly and relied on the solutions of others. This group commented that AMP teaching philosophies were not viable in their classrooms. During CCOL meetings, these teachers complained about the relevancy of Workshop and Institute activities to their classrooms. For example, one of the five told her CCOL facilitator after a Saturday Workshop, “I don’t get the point of them [the Workshop activities], except really making me feel stupid.” We categorized remarks such as these as evidence of resistant behavior, and thus categorized these teachers as Early Resisters (ERs).

The ER teachers will serve as a comparison case for the teachers at the other end of the spectrum, those who exhibited evidence of embracing project goals and ideals early in the process. We will call the second category of teachers Notable Early Embracers (NEEs). Eight teachers from six school districts were identified as NEEs. It is important to note that not all NEEs responded in the same way, but rather displayed at least one or more of the following characteristics:

- Made recruitment efforts for future cohorts and promoted AMP
- Contributed enthusiasm and positive attitudes
- Engaged reflectively
- Demonstrated immersion in AMP teaching philosophies

Some teachers made diligent efforts to encourage more mathematics educators in their schools and districts to participate in the AMP Project. We recognized other NEEs for their consistent positivity regarding challenges in the classroom while transitioning to the Common Core State Standards. They also displayed positive attitudes toward mathematical content development tasks during Institutes, Workshops, and CCOLs. Furthermore, regarding math content

development activities, many NEEs demonstrated reflective engagement, meaning they viewed tasks as problematic, not routine (Oehrtman et al., 2009). For example, one teacher mentioned she spent several days working on a single word problem; she made her own manipulatives to model the situation and also collaborated with family members. Finally, several teachers in this group professed significant shifts in their teaching practice to be more reflective of the mathematical practices promoted by the Common Core State Standards.

After characterizing the two categories we advanced our analysis by focusing on teachers' beliefs about the teaching and learning of mathematics. Specifically, we were interested to see if NEE teachers shared common beliefs that differed from the ER teachers. We found two contrasting conceptions of a successful math class between the NEEs and the ERs. The ERs believed that a teacher-centered, direct instruction, textbook-reliant classroom created the most successful learning environment for students. As a group, the NEEs did not display these same beliefs, and instead supported a more student-led, collaborative, discovery-based learning environment, using real-world problems to explore mathematical concepts. NEE teachers believed that having their own strong mathematical understanding was essential to classroom success. The following sections discuss our findings for each category of teachers.

### **Characterization of Early Resister (ER) Teachers' Beliefs**

The ERs appeared to hold the notion that direct instruction was preferred over having students discovering and creating their own meanings. When commenting about her experience solving math problems during an AMP Saturday Workshop session, Tara compared her AMP experience to her own students and stated that she would never expect them to be able to do something she had not explicitly taught them. When discussing students' ability to think about problems, Dee stated, "But our students have very raw talent right now, and by leaving them to their own ways of thinking, their own devices, we end up with things that don't look like math during math." One of Jan's students chose to convert decimals into fractions, and she shared that she told the student, "Whoa [sic], maybe we shouldn't have done it that way... The more you touch something, the more chances you'll make a mistake. Keep it simple." All of these remarks point toward beliefs associated with a traditional learning environment where the focus is not placed on student thinking and in-depth understanding.

### **Characterization of Notable Early Embracer (NEE) Teachers' Beliefs**

The NEEs envisioned a very contrasting mathematics classroom. To begin, they expressed the belief that a teacher's role is to facilitate as students spearhead their own learning. During a CCOL meeting, Ken told his colleagues, "With this conceptual piece, the kids are the ones that are modeling. The kids are the ones that are providing the feedback. The teacher is there to clarify, guide, and support them." On several occasions, Rob conveyed to his CCOL how he "sat back and listened for a while" as his students "discussed their own viewpoints back and forth." He also told the group, "I probably said maybe five sentences in maybe 30 minutes. I just said, okay, your turn, your turn. That's all I did." Similar to the discourse that Rob described, Rita said at a Math Symposium,

I kind of step aside and let them take over and it's incredible to see the students who wouldn't have ever talked. Now they have a chance to feel safe and share what they've learned, and you can see the confidence in them when they get to share.

As the teachers talked about their facilitator role, several stressed the importance of having students work together. Rob described a conversation with a student who asked if her answer was correct. He replied, "You need to learn to ask your partner first instead of just me." Collectively, NEE teachers seemed to believe that students assume an active role in their own learning while the teacher provides guidance.

Coinciding with the belief in student-led learning was the belief that creating a discovery-based environment supports student understanding. Students should explore mathematical concepts in their own way and need the freedom to solve a problem guided by their own thinking. Rob said,

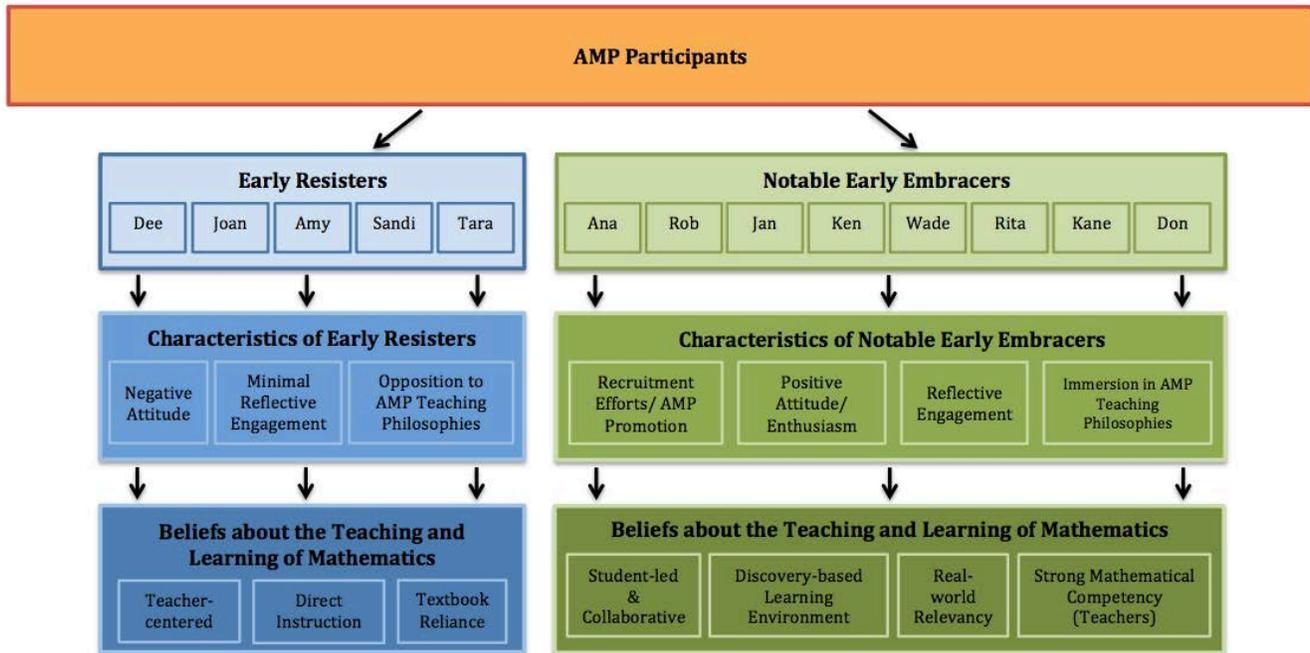

We're sitting here saying, do this, do this, do this. I call it... the recipe or cookbook style of mathematics where you have a recipe in front of you and you follow it. But for them to fully understand it, they're going to *have* to do it their own way.

During a Math Symposium, Rita displayed pictures of a student's solution and explanation to a multiplication problem, and commented, "[I] never would have thought of that myself, but these are the minds that we silence because it has to be the teacher's way... They're full of knowledge. You have to give them that chance to speak." This exemplifies the NEEs' belief that students can and need to approach a mathematical problem in a way that makes sense to them.

Another common belief that surfaced during research was that the teaching of mathematics must be relevant in students' lives outside of the classroom. The video data suggested that NEE teachers believed their students should know why learning a certain mathematics concept is important in their lives by "making it exciting for them. Mak[ing] it real." In fact, Wade stated, "Students are dying to make situations relevant when going through a traditional lesson." Wade spent his time "...looking for relevant word problems rather than planning Power Points," because "Word problems are not something specific to teach, rather they are your tool to teach your content." For example, Ken explained two real-world applications, "This week we used Ferris wheels to find least common multiple. We used cicadas, the lifecycles of cicadas to figure out the least common multiple." NEEs appeared to believe that even complex or abstract ideas could be illustrated in ways that students can connect the mathematical concepts to real life situations.

The NEEs recognized that the vision of a student-led, collaborative, discovery-based classroom was only feasible if they themselves had the strong mathematical understanding to facilitate student learning. Sometimes NEE teachers explicitly expressed this belief, and at other times they exemplified the belief through sharing teaching practice examples. Ana noted, "My understanding of the mathematics [is important] if I start teaching something...[and if] I don't have a full understanding of it, how are my kids supposed to have a full understanding of it?" Wade noted that if students did not provide convincing arguments to support their understanding of math concepts, he did not give them credit for their solutions. Rita pressed her students for more information, "...[the students] are now to, not just give me an answer, but to tell me why." These teachers believed in having a strong mathematical understanding themselves in order to consider the validity of students' mathematical arguments apart from textbook solutions and scripts. NEE teachers relied on their belief in a strong mathematical background as an undercurrent that supports their students' global mathematics classroom experience.

We recognize there are more than two categories of teachers, however, for the purposes of this paper, we solely analyzed Early Resisters and Notable Early Embracers. The diagram below summarizes the ER and NEE teacher construct.

## Conclusion

While analyzing the video data of teachers' discussions in the CCOL sessions, two opposing categories of teachers surfaced, those who resisted the need for changing their practices (ERs) and those who embraced mathematical practices promoted by the AMP Project (NEEs). The ERs were characterized by negative attitudes, minimal reflective engagement, and opposition to AMP teaching philosophies. The group of Early Resisters shared beliefs centered on a more traditional learning environment. The NEEs were characterized by recruitment efforts and AMP promotion, positive attitudes, reflective engagement, and immersion in AMP teaching philosophies. The NEEs appeared to share beliefs centered on student-led learning, discovery-based and collaborative work, and real-world relevancy. They also placed importance on their own mathematical competency. Future research will investigate the validity of the initial findings from this study.

## Abstract

### Shaping OurSpace: A Multidisciplinary Approach for Developing Spatial Reasoning

The Housing Authority of a large southern metropolitan area was preparing to demolish and rebuild a low-income housing complex into a mixed use and mixed income development. When looking for ways to engage children in the learning process, a common pedagogical approach involves finding ways to connect the material taught to the child's lived experience. So, we, a multidisciplinary team of researchers from a local university, including an urban geographer and thespian, capitalized on this coming change by using it as an "in context" basis for developing spatial reasoning tasks for youth.

The thinking behind Shaping OurSpace was that spatial reasoning, though difficult for some (Linn & Peterson, 1985; McGillicuddy-De Lisi & De Lisi, 2002; Law, Pellegrino & Hunt, 1993), might arise more naturally when using tasks that are inherently engaging and/or meaningful. Because spatial reasoning is not often tapped into in young people (Snow, 1999; Wai, et al., 2009), we also felt the activities for the program might allow the children to demonstrate strengths in ways that are not always tapped into in schools. We worked with 2 groups of youth for this project: a small group of low-income young girls ranging in ages from 6-14 that were participating in a summer program located at the housing complex and a small group of African American children from a variety of different income backgrounds participating in an elementary after-school program, with the school being one of the neighborhood schools for the housing complex. The project started in the summer of 2012 and wrapped up in the spring of 2013.

The research questions we pursued and are pursuing are how did this process unfold? How did the urban geographer and thespian tap into their discipline specific views of spatial reasoning to shape the tasks? What changed for them as the process unfolded? To address these questions, the teaching sessions were observed and video-recorded. Interviews were also conducted and analyzed. A final data source were reflective writings by the urban geographer and the thespian.

The project captured and capitalized on spatial reasoning that is discipline specific. So, a key task involved understanding and coalescing around a definition for spatial reasoning. The community planning process used by the urban geographer and the theatre process used by the thespian cultivated ways of viewing space that become more symbiotic over time and built upon each other. At the same time, there were also unique foci that helped frame unique ways of working with and thinking about space, including the importance of relational space. The activities also emphasized "grounding" the children, with grounding being specific to the discipline. Because time was of an issue, the community planner and thespian had to be flexible and exploratory in the design of the tasks to best meet their overall goals.

Implications for the study will address how their work can help articulate approaches to teaching and developing spatial reasoning in young children.

**Title of Proposal:**

An Investigation of Mathematics Teacher Professional Development Focused on Multiplicative Reasoning

**Topic Area of Submission**

Mathematics Education

**Presentation Format:**

Paper Session (Research Paper)

**Presentation Description:**

Professional development for teachers is often focused on pedagogy, rather than providing opportunities to build deep understandings of mathematics. Research has shown that a powerful way for improving teaching practices is to engage teachers in meaningful activities that not only deepen their understanding, but also focus their lens on student thinking. This report presents initial findings of how PD focused on multiplicative reasoning can help improve teachers' content knowledge and influence their beliefs about teaching.

**Author/Presenter:**

April Strom, Ph.D.

Mathematics

Scottsdale Community College

[april.strom@scottsdalecc.edu](mailto:april.strom@scottsdalecc.edu)

## **Introduction**

Past professional development (PD) for teachers of mathematics has largely focused on providing teachers with strategies and methods for teaching. The teaching strategies promoted in many PD programs are typically not discipline-specific and lack a fundamental focus on mathematical content. Research has shown that a powerful way for improving the teaching and learning of mathematics is to engage teachers in meaningful activities that not only deepen their understanding and conceptual knowledge of the mathematics they teach, but also focus their lens on student thinking in the context of mathematics (Silverman & Thompson, 2008). Reflecting this focus, a research-based PD program was implemented with middle school mathematics teachers. A major emphasis of this program is to improve the teaching and learning of middle school mathematics by improving teachers' content knowledge and influencing their beliefs about teaching mathematics. More specifically, we believe that if the participating teachers develop meaningful ways of thinking about mathematics, develop a profound understanding of the fundamental mathematics that they teach, and develop strategies for effective problem solving, then these same teachers will be better prepared to engender these mathematical practices in the students that they teach (Ma, 1999).

In this report we intend to present some of our initial findings that demonstrate how a curriculum built upon a central mathematical theme – multiplicative reasoning – can help improve teachers' content knowledge and influence their beliefs about teaching mathematics. We will present preliminary evidence based on teacher surveys, observations and quantitative instruments that were implemented during 2012-2013 to support our claims.

### **Why Middle School Mathematics?**

Research has shown that middle school is the gateway to high school course taking and college enrollment (Hill, 2007). In particular, completion of Algebra II is strongly correlated with success in college as well as future earning potential (Adelman, 1999). Yet over recent years, school districts have repeatedly seen student mathematics performance rates decline from grade 4 to grade 8. If students do not succeed in middle school mathematics, they will not have the foundation necessary to succeed in Algebra and other challenging high school math courses (Evan, Gray, & Olchefshe, 2006). We therefore believe that students who possess a solid foundation in middle school mathematics are more likely to experience positive outcomes in high school mathematics, further preparing them for success in mathematics beyond high school.

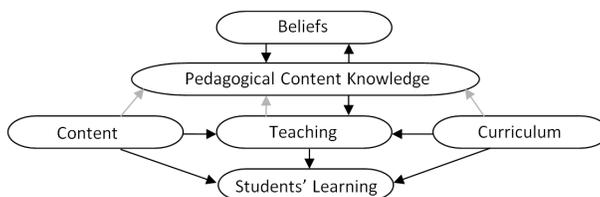

### **Theoretical Perspective**

Rooted in the theory of pragmatism, the core idea of conceptual field theory is that knowledge has many local facets that are molded and connected by mastering problems that are related conceptually (Vergnaud, 1994). One theory, in particular, that has captured the attention of mathematics education researchers is multiplicative conceptual field (MCF) theory, which addresses the ability to reason multiplicatively. Vergnaud argues that multiplicative reasoning plays a significant role in the development of conceptual understandings of multiplication, division, fractions, proportions, ratios, rates, rational numbers, and linear functions. It also serves as a gateway for building a mature understanding of exponential functions (Strom, 2008). Vergnaud refers to these topics as ingredients for the MCF which he defines as a complex theory that is “simultaneously a bulk of situations and a bulk of concepts” (p. 46) where concepts (tools for analyzing situations) become meaningful through situations (things that require multiplicative operations) and situations are analyzed through these multiple concepts. This reflexive

relationship between concepts and situations provides the basis of the conceptual field theory and serves as the mathematical foundation for this investigation with middle school teachers.

### Research and Implementation Framework

The framework for this study originates from the network of pedagogical content knowledge described by An, Kulm and Wu (2004, see Figure 1). An et al. integrate teacher beliefs and key student characteristics such as addressing student misconceptions and building on students' math ideas. The focus of this framework is *students' learning* from the viewpoint of teaching as a convergent process that “focuses on knowing students' thinking, which consists of 4 aspects: building on students' mathematical ideas, addressing students' misconceptions, engaging students in mathematics learning, and promoting students' thinking mathematically” (p. 148). This investigation builds teachers' pedagogical content knowledge by focusing on content and curriculum. Teachers collaborate to develop their mathematical knowledge, and they focus on understanding students' thinking while keeping students' prior knowledge in the forefront.

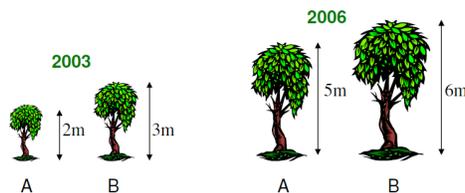

**Figure 1. Network of pedagogical content knowledge (abridged) (An et al., 2004).**

The primary research questions driving this study are: (a) In what ways does a teacher PD program grounded in MCF promote teachers' conceptual understanding of mathematics? (b) What effect does a curriculum focused on multiplicative reasoning have regarding teachers' beliefs about teaching mathematics?

### Multiplicative Concepts – A Sample Activity

As an example of the activities that are implemented in the PD program, consider the following situation of the Tree Problem (see Figure 2). Which tree grew more, Tree A or Tree B?

**Figure 2. The Tree Problem (Lamon, 2005).**

We have found that when teachers first encounter this problem, they feel as though the wording of the question is “vague.” Once we explain that this question can be answered in more than one way, they begin to consider the meaning of *more*. If teachers define *more* in the additive sense, they contend that neither tree grew more since each tree grew an additional 3 meters from 2003 to 2006. However, if teachers define *more* in the multiplicative sense, they can then think about Tree A as growing more since its height in 2006 is 2.5 times (or copies of) its height in 2003 while Tree B's height in 2006 is only 2 times (or copies of) its height in 2003. Another

important concept is the ability for teachers to be aware of the type of reasoning they engage in and to consciously choose to reason additively and/or multiplicatively based on the context of the problem. Opening teachers' minds to thinking multiplicatively allows them to expand how they compare quantities and operate on numbers. This ability to reason multiplicatively is an important component of the MCF underpinning K-12 mathematics.

### **Methodology**

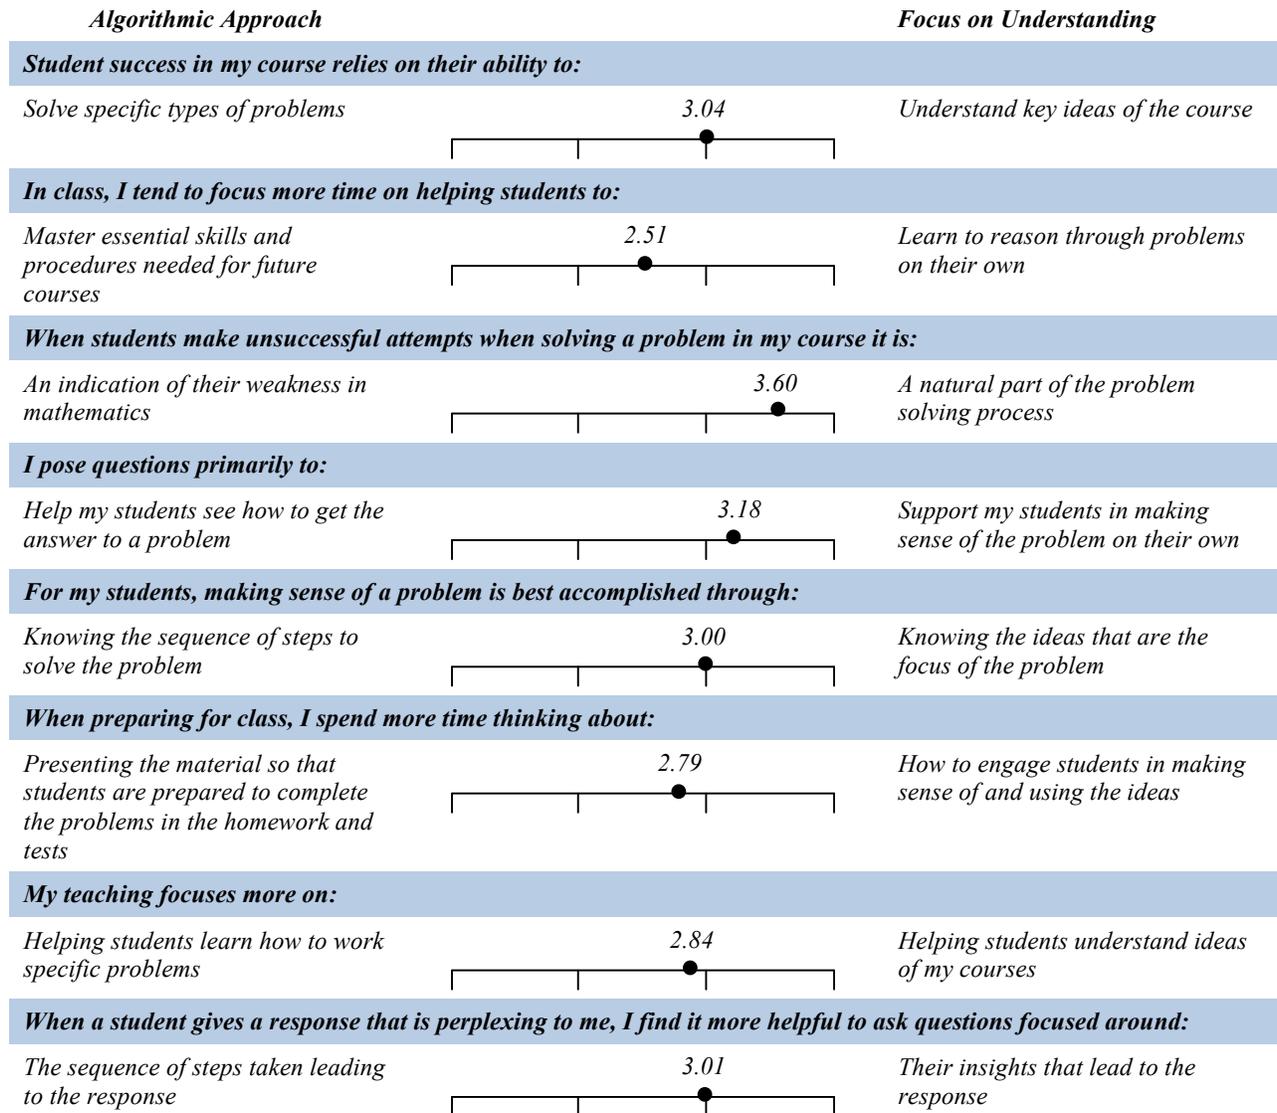

Sixty-seven middle school teachers from seven school districts were recruited to participate in the Arizona Mathematics Partnership (AMP) program, which focuses on increasing teachers' mathematical content knowledge during a one-week summer workshop, followed by four workshops over the school year. Teachers were given conceptually rich tasks designed to promote multiplicative thinking and meaning making. These workshops were augmented with school-based CCOLs (Collaborative Community of Learners) facilitated by project staff. The CCOLs met regularly throughout the school year and are designed to support teachers as they deepen their content knowledge and transform their beliefs relative to mathematics. Both quantitative and qualitative data has been collected and analyzed.

Prior to the PD workshops, we administered the Mathematical Knowledge for Teaching (MKT) Instrument developed by the Learning Mathematics for Teaching project (Learning Mathematics for Teaching, 2011) and an adaptation of the Views About Mathematics Survey (Carlson, Buskirk, & Halloun, 1999) to measure teachers' beliefs and attitudes towards mathematics and teaching mathematics. Teachers have also provided periodic reflections of their views on the changes they have implemented in the classroom as a result of their learning.

### **Preliminary Results**

An initial analysis of teachers' beliefs about mathematics and mathematics teaching was conducted from data gathered through the Views About Mathematics Survey. Eight of the survey items asked teachers to identify which of 2 statements they agreed with the most. Exhibit 1 shows the mean score and where that score falls on a continuum from 1 (*totally agree with the statement on the left*) to 4 (*totally agree with the statement on the right*). The statement on the left represents a traditional algorithmic approach to teaching mathematics (*1 rating*) whereas the statement on the right represents a focus on developing student understanding (*4 rating*). These items address the evaluation question "How have the teachers' belief systems changed as a result of the project?" The hypothesis was that if teachers participate in a professional development project focused on mathematics content, then their belief systems ratings will move toward the teaching for understanding side of the continuum over time. As shown in Exhibit 1, the teachers tended to choose the items on the teaching for understanding end of the continuum; however, in most cases there is room for further movement toward a focus on student understanding.

**Exhibit 1**  
**AMP Teachers' Beliefs About Mathematics Teaching**

Note.  $n = 67$ .

Researchers analyzed the responses to the belief items for differences between teachers who had high scores on the MKT assessment (i.e., answered 70% or more of the items correctly) and teachers who had lower scores (i.e., answered fewer than 70% of the items correctly). For this analysis, researchers translated each of the 8 belief items into 2 separate items using an agree/disagree scale. Exhibit 2 shows the items for which the mean difference between the 2 groups was 0.4 or higher.

**Exhibit 2**  
**AMP Teachers' Beliefs and MKT Assessment Scores**

Item	High	Low	Mean Difference
<b>Geometry</b>			
For my students, making sense of a problem is best accomplished through knowing the ideas that are the focus of the problem	3.37	2.85	0.52
My teaching focuses more on helping students understand ideas of my courses	3.16	2.71	0.45
My teaching focuses more on helping students learn how to work specific problems	1.84	2.29	-0.45
For my students, making sense of a problem is best accomplished through knowing the sequence of steps to solve the problem	1.63	2.15	-0.51
<b>Number Concepts and Operations</b>			
For my students, making sense of a problem is best accomplished through knowing the ideas that are the focus of the problem	3.43	2.77	0.66
Student success in my course relies on their ability to understand key ideas of the course	3.35	2.89	0.46
When a student gives a response that is perplexing to me, I find it more helpful to ask questions focused around their insights that lead to the response	3.35	2.84	0.51
My teaching focuses more on helping students understand ideas of my courses	3.22	2.64	0.58
Student success in my course relies on their ability to solve specific types of problems	1.65	2.11	-0.46
My teaching focuses more on helping students learn how to work specific problems	1.78	2.36	-0.58
When a student gives a response that is perplexing to me, I find it more helpful to ask questions focused around the sequence of steps taken leading to the response	1.65	2.16	-0.51
For my students, making sense of a problem is best accomplished through knowing the sequence of steps to solve the problem	1.57	2.23	-0.66

*Note.* Geometry high  $n = 19$ . Geometry low  $n = 48$ . Number concepts and operations high  $n = 23$ . Number concepts and operations low  $n = 44$ . Score scale: 1 (*strongly disagree*) to 4 (*strongly agree*).

The findings indicate that teachers who had lower scores on the MKT assessment were more likely to view the focus of mathematical instructional practices as helping students perform a series of steps (algorithmic approach), whereas teachers with high scores were more likely to view the focus as helping students develop a broader understanding of mathematical ideas (e.g., for my students, making sense of a problem is best accomplished through knowing the ideas that are the focus of the problem.).

Further analysis is being conducted to investigate the gains in teachers' understanding of the mathematics content promoted by the AMP program. This additional data and analysis will be shared during the presentation.

## **Discussion and Implications**

Initial results have also shown that teachers who scored high on the MKT (answers 70% or more of the questions correctly) view the role of mathematical instructional practices as helping students develop a broader understanding of mathematical ideas while teachers who scored poorly (answers less than 70% correctly) feel the focus should be helping students perform a series of steps. Since one of our goals is to help teachers reshape their practice around the Common Core Standards for Mathematics (NGA, 2010), we believe improving their content knowledge while reinforcing the Standards for Mathematical Practice will have an impact on their beliefs about mathematics teaching and thus influence their classroom practices.

By engaging the teachers in a curriculum of number sense, geometry/measurement, and problem solving tied together by the common theme of multiplicative reasoning we are helping them to develop deep, well-connected meanings of mathematics. Focusing on these big mathematical ideas facilitates teachers' development of a cohesive and flexible knowledge base for teaching mathematics. Early evidence suggests that teachers believe they have changed their teaching practices because of their increased content knowledge. The following excerpt provides insight into how one teachers' classroom practice has been modified:

*Teacher:* As part of the AMP program, in my classroom, I have used more task-oriented lessons and hands-on activities. Taking more effective prompts in my questioning of my students and allowing them to use their knowledge and not me give them the answers, but waiting for them to come up with them. I'm having more discussions on mathematics instead of just a lesson where they're doing all the work...showing ideas and reasoning – not mine – but the students' ideas and reasoning and discussing those.

Additional data from the post-test MKT and the VAMS survey adaptation in summer 2013 will be compared with pre-test data to determine potential shifts in teachers' beliefs and attitudes of mathematics relative to their conceptual shifts in mathematical content.

Title: Special Considerations in Counselling Post-Secondary Students

Topic Area: Counsellor Education

Presentation Format: Workshop

Description: There are specific challenges counselling students within a post-secondary environment that require a thorough comprehension of this population to best meet their needs. This workshop will address some of the concerns specific to this treatment population and present best-practice recommendations for therapy. Speaking from over 6 years experience providing post-secondary counselling, the author will include ideas born of individual experiences as a personal counsellor, the perspectives of colleagues and evidence-based research.

## Special Considerations in Counselling Post-Secondary Students

Ariana Walstra, M.Ed., R. Psych.

### Abstract

There are specific challenges in counselling students within a post-secondary environment that require a thorough comprehension of this unique population. This workshop will address some of the concerns specific to this treatment population and present several of the best-practice recommendations for therapy. The workshop will begin with an introduction to the distinct nature of this population, including the change in scope of issues presented. The most commonly presented issues and concerns specific to post-secondary students will be discussed. The session will conclude with a discussion of effective therapeutic interventions, including rationale and examples. This workshop will be delivered from an experiential perspective, providing a fresh consideration of this unique population and allowing participants room for discussion and sharing of ideas.

When Anita, a fifth grade student with mathematical learning difficulties, was asked to solve the mental math problem  $1000 - 998$ , she immediately grabbed paper and pencil, did the calculation, stared at her work a minute and then looked up with eyes that asked, “How could a problem with such big numbers have such a small answer?” In our work with Tier II tutoring, this scenario is a common occurrence. Anita without difficulty could count from 998 to 1000, could solve the problem doing the algorithm, but did not mentally recognize that 1000 and 998 was just two numbers apart. Students with mathematical learning difficulties often struggle with number sense (Shumway, 2011). An important aspect of number sense is the students’ ability to use numbers and operations in a flexible ways, including mental computation (Markovita & Sowder, 1994).

Research indicates that children have already intuitively developed many number sense strategies before coming to school (Clements & Sarama, 2009). However, because traditional instruction of the standard algorithms tends to encourage students to follow the procedures without thinking about the meaning of the computation (Markovita & Sowder, 1994;Varol & Farren, 2007). While learning the standard algorithm, students are typically not encouraged and often not allowed to use more efficient mental math strategies. Thus in the process of learning the algorithms, many students tend to stop thinking about numbers as quantities and instead think only about trying to recall the steps of the standard algorithm procedure (Shumway, 2001). Not thinking about the numbers as quantities limits students’ development of mathematical concepts. In a review of research studies, Varol and Farren (2007) concluded that teaching mental computation strategies encouraged students to make meaning of numbers, helped students to improve accuracy in computing and tended to bridge the gap between procedural and conceptual understanding.

Although a large body of knowledge is developing which addresses the issues of blending and developing both the mental math strategies and the standard algorithm in mathematics instruction, research pertaining to the development of middle school students with mathematical

learning difficulties' flexible use of number sense strategies is limited. The purpose of this study was to add to the literature by identifying the types of computation strategies used by middle school Tier II students and to implement and evaluate intervention promoting the students' development of number sense computation strategies.

## **Methods**

### **Research Design**

This project identified and described pre and post treatment differences in number sense strategies of rising 6<sup>th</sup> grade Tier II students who participated in a summer mathematics intervention program. The three research questions guiding this study were: 1) What number sense strategies do students with mathematical learning difficulties use when solving mental math questions? 2) What is the trajectory of learning number sense strategies for Tier II students participating in number sense intervention? And, 3) What are pre to post intervention gains in students' efficient use of number sense strategies?

### **Participants**

The participants in this study were 29 rising sixth grade students who were referred by their fifth grade teacher for a summer mathematics intervention program. Students from each of the six elementary schools of a Utah rural school district were invited to participate in eight tutoring sessions. Due to the limited duration of the intervention, teachers were instructed to refer their higher ability level Tier II students. Twenty-nine of the invited students participated in the intervention and 27 participated in both pre and post testing. Students attended an average of 6.9 tutoring sessions.

### **Procedure**

The individual tutoring sessions were conducted by the district math specialist and a university researcher, both which had over 25 years teaching experience. The eight sessions of one on one tutoring were conducted during two week periods at each of the six participating elementary schools. Sessions took place in the students' schools during summer vacation. Intervention sessions were 45 minutes in length and consisted of three phases. During the first 5-10 minutes of each session, students completed a daily number sense quiz. Phase II of each lesson was 10-20 minutes of number sense instruction in which one of six number sense strategies was introduced and practiced. The practice portion typically consisted of a string of problems which developed a number sense strategy and a game practicing the use of the strategy. Instruction in the first three sessions focused on the strategies of multiplying and dividing by 10's and estimation of double digit products. Instruction in the next three sessions focused on three compensation strategies used when adding and subtracting. In the seventh session students participated in a game reviewing the intervention concepts taught and the post assessment was administered to the participants during the eighth session. In the third phase of each session

instruction focused on the individual instructional needs of each student identified in pre intervention diagnostic testing. Twenty-one students were involved in the development of fraction understanding and eight were involved in the development of place value concepts.

## **Data Collection**

Data were collected using two instruments; The Number Sense Inventory (NSI) and a series of Daily Number Sense (DNS) quizzes. The NSI is version of the on-line Mathematical Reasoning Inventory for fifth grade students which is available at <https://mathreasoninginventory.com>. This inventory was modified for use in this study. The Mathematical Reasoning Inventory was developed to identify students' use of number sense strategies. Nine of the 14 test questions can be easily answered using common mental math strategies and were selected for use in this study. To detect changes in student strategies, rubrics were developed for each of the nine questions. The rubrics for the number sense questions ranged from five to eight total points for each question. The rubrics were designed to rank both accuracy and efficiency. Correct use of efficient mental math strategies ranked higher on the rubrics than student's correct use of the standard algorithms or less efficient strategies. A panel of five experts in mathematics education evaluated the ranking of each rubric with a rate of 100% agreement. The NSI was administered as an intervention pre and post test. Results of the pretest were analyzed for the frequency of use of number sense strategies. Pre and post results were analyzed to determine strategy gains and Cohen *d* effect size scores were calculated.

From the NSI pretest results, six types of mental math number sense problems were selected for strategy instruction: 1) compensation for addition of numbers close to hundreds' transitions (e.g.  $198 + 17$ ); 2) Using compensation when adding numbers with 5 in the ones place (e.g.  $185 + 25$ ); 3) Using combination of 10 when adding (e.g.  $146 + 34$ ); 4) multiplying by multiples of 10 (e.g. multiplying by 10 increases the value of a digit to the next place value position,  $210 \times 30$ ); 5) dividing by multiples of 10 ( $6600 \div 20$ ); and , 6) estimation of double digit multiplication (e.g.  $31 \times 29$ ). Seven Daily Number Sense (DNS) quizzes containing one question for each strategy were developed. Five point rubrics to evaluate students' use of strategies were developed and used in scoring responses. Quiz results were averaged and an intervention learning trajectory was developed.

## **Results**

### **Strategies Used**

The first research question was: What number sense strategies did students with mathematical learning difficulties use when solving mental math questions? Data to answer this research question were collected from the NSI pretest. In this section the results reflect only the type of strategy used and not the accuracy of use. Student strategies which could not result in a correct answer were categorized as ineffective. The results have been subdivided into the mental math

questions requiring addition and subtractions and the questions requiring multiplication and division.

Students' use of strategies with the four addition and subtraction problems is summarized in Table 1. For NSI question one ( $1000 - 998$ ) the percent of students using each strategy was: 1) compensation (adding 2 to 998) - 11.11%; 2) standard algorithm - 74.07 %; and, 3) counting on - 14.81%. For NSI question two ( $99 + 17$ ) the percent of students using each strategy was: 1) compensation (adding one to 99 and subtracting 1 from 17) - 7.41%; 2) standard algorithm - 85.19%; and, ineffective strategies - 7.41%. For the third NSI question ( $100 - 18$ ), the percent of students using each strategy was: 1) counting backwards - 18.52%; 2) standard algorithm - 74.07%; and, 3) ineffective strategies - 7.41%. For the fourth NSI question ( $15 + \underline{\quad} = 200$ ) the percent of students using each strategy was: 1) compensation strategy (adding 5 to 15 and 5 to 180) - 14.81%; 2) standard algorithm - 59.26%; 3) guess and check - 11.11%; and, 4) ineffective strategies- 14.81%. In summary, the most common strategy used was the standard algorithm which was used an average of 73.15% of the time. Students used counting on or back strategies 8.33%, compensation strategies 8.33% and guess and check 2.77% of the time. Although the majority of the students did not select the most efficient strategies, they did select effective strategies. Students only used ineffective strategies an average of 7.41 percent of the time.

Table 1  
*Percent Distribution of Strategy Use for Addition and Subtraction NSI Questions.*

NSI Questions	Standard Algorithm	Counting on/ Counting back	Compensation	Guess and Check	Ineffective Strategy
1	74.07	14.81	11.11	0	0
2	85.19	0	7.41	0	7.41
3	74.07	18.52	0	0	7.41
4	59.26	0	14.81	11.11	14.81
Average	73.15	8.33	8.33	2.77	7.41

N = 27

Student strategy use for the four multiplication and one division questions is summarized in Table 2. For the fifth NSI question ( $20 \times 15 = 300$ , what does  $21 \times 15$  equal) the percent of students using each strategy was: 1) partial products - 29.63%; 2) standard algorithm - 37.04%; and, 3) ineffective strategies- 33.33%. For the sixth NSI question ( $60 \times 40$ ), the percent of students using each strategy was: 1) multiplication by 10's - 70.37%; and, 2) standard algorithm - 29.63%. For the seventh NSI question ( $15 \times 12$ ) the percent of students using each strategy was: 1) partial products - 3.7%; 2) standard algorithm - 81.15%; and, 3) ineffective strategies - 14.81%. For the eighth NSI question ( $7000 \div 70$ ) the percent of students using each strategy was: 1) division by 10's - 40.74%; 2) standard algorithm - 48.15%; and, 3) ineffective strategies - 11.11%. For the ninth question (estimate  $18 \times 21$ ) the percent of students using each strategy was: 1) multiplication by 10's - 33.33%; 2) standard algorithm - 36.30%; and, 3) ineffective strategies - 17.78%. In summary, the most common strategy used by students when solving the

multiplication and division questions was the standard algorithm which was used an average of 45.93% of the time. The strategies of multiplication/division by 10's and partial products were used 29.63% and 6.67% of the time. Students used ineffective strategies an average of 17.78% of the time.

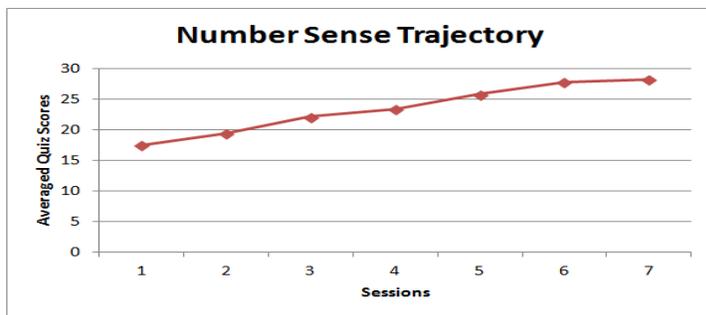

Table 2  
*Percent Distribution Of Strategy Use for Multiplication and Division NSI Questions.*

NIS Questions	Standard Algorithm	Multiplication/ Division by 10's	Partial Products	Ineffective Strategies
5	37.04	0	29.63	33.33
6	29.63	70.37	0	0
7	81.15	0	3.70	14.81
8	48.15	40.74	0	11.11
9	33.33	37.04	0	29.63
Average	45.93	29.63	6.67	17.78

N = 27

### Learning Trajectories

The student responses of the Daily Number Sense (DNS) quizzes were averaged and plotted to develop the trajectory shown in Figure 1. The trajectory indicates a steady averaged growth of 17.48 to 28.17 points. Thirty points were possible.

N = 29

Figure 1 Averaged Learning Trajectory Developed from DNS Quizzes.

The averaged growth between sessions is summarized in Table 3. The average increase between lessons was 1.78 points. The greatest increase in scores occurred after the introduction of the strategy of division by multiples of 10s in lesson 2. The second greatest increase occurred after lesson 4 in which the compensation strategy of adding numbers close to the 100's transitions was introduced. The least amount of growth occurred after the final compensation lesson which addressed adding numbers with combinations of 10.

Table 3

*Increments of NSI Quiz Scores Increase between Sessions*

Sessions	1-2	2-3	3-4	4-5	5-6	6-7	Average Increase
Increment of points increase	1.93	2.73	1.27	2.39	1.95	0.42	1.78

**Pre to Post Intervention Gains.**

Pre and post NSI scores were analyzed to determine students’ gain in the use of number sense strategies. The results are summarized in Table 4. The total number of possible points on rubrics used to evaluate the NSI questions was 62. The averaged student gain was 13.04 points which resulted in a large Cohen *d* effect size score of 1.82.

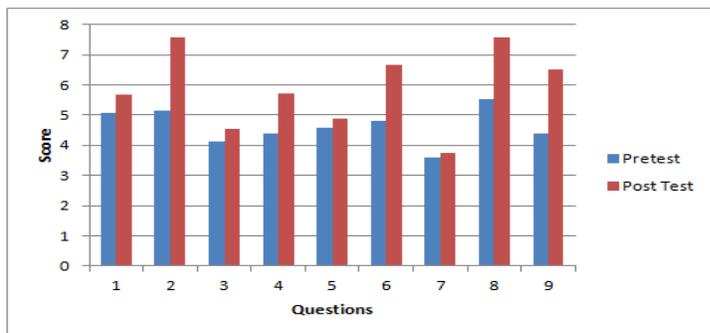

Table 4

*Summary of Student Growth Gains of NSI Rubric Scores*

	Pretest		Post Test		Growth	
	M	SD	M	SD	Gain	Effect Size
NSI rubric score	41.67	8.50	54.85	5.04	13.19	1.87

N=27

Figure 2 shows the changes of growth between the pre and post NSI for each question. The possible number of points varied from 5 to 8 points. Increases occurred for all questions. The greatest pre to post test increases occurred with questions 2, 4, 6, 8, and 9 which increased by more 1.2 points. These were the five questions which used the strategies targeted in the tutoring sessions.

N=27

*Figure 2. Pre and Post Scores for Each NSI Question*

In summary, the results of the data analysis indicated that the students experienced large growth gains for the targeted number sense strategies. The growth was steady and increased with the introduction of each new number sense strategy. Small amounts of growth were also observed in number sense skills which were not specifically targeted during the intervention sessions.

## Discussion

The result of the analysis of strategies for this study was similar to those found in the literature; students with mathematical learning difficulties tend to lack flexibility in their use of number sense strategies (Markovita & Sowder, 1994). When presented with problems which could efficiently be solved using mental number sense strategies, a large percent of the participants solved the problems using standard algorithms. This reliance on the standard algorithm was stronger for questions involving addition and subtraction (73.15%) than for questions involving multiplication and division (45.93%). Students only used three other addition/subtraction strategies: counting on/back, compensation and guess and check. Participants also used two other multiplication/division strategies; multiplication/division by 10's and partial products. Blöte, Klein and Beishuizen (2000), in a review of the literature, identified four understandings students need to enable them to consistently and effectively use a strategy: 1) how to implement the strategy effectively; 2) when to implement the strategy; 3) the value and usefulness of the strategy; and, 4) how much effort they will spend on the strategy. With this knowledge the student can evaluate which strategy would be most effective for each problem. The questions that are important for the development of intervention encouraging mental math strategies becomes; 1) Which of the four understandings do the students not have? And, 2) How do teachers help students develop the understandings needed?

The pretest analysis of the types of strategies being used by the participants suggested that to promote growth of addition and subtraction strategies, intervention introducing the new strategies was needed. Only a small number of students even attempted to use compensation strategies suggesting that the majority of students did not know how or when to use the compensation strategies. Most students are comfortable with addition and subtraction and may not have even considered the value of using alternative strategies. Yet the DNS quiz following the first session introducing compensation had the second greatest learning trajectory increment of growth. During the quizzes, students were not prompted and did not receive feedback on their use of strategies. Therefore, the increase of 2.39 points reflected, not only the students' increased ability to use the strategy, but also the increased value the student gave to its use.

In contrast, the pretest analysis of the types of strategies used for multiplication and division suggest that the participants already had developed an understanding of the value and effort required for the use of the multiplication/division by 10's strategies. Although, their attempts of use were not always successfully, 70.37% of the students used the multiplication by 10's strategy and 40.74% used the division by 10's strategy. It is safe to assume that the students had repeated exposures to these strategies in the past and that they saw value in the strategy use. The needed intervention for this strategy was instruction on how to implement the strategy. This was done by focusing students' attention on developing a stronger conceptual understanding of multiplying and dividing by 10's. The averaged increase of 1.93 points following the multiplication by 10's

and 2.73 points following the division by 10's instruction reflected students' increased understanding of how to use the strategy.

The large effect size score of 1.87 and the steady growth patterns of the number sense learning trajectory suggest that teaching and practicing of mental math strategies was an effective method for increasing Tier II students' use of mental math strategies. The steady increases of the DNS quiz scores suggest that with each lesson, the students not only learned the new strategy being taught, but also maintained and used skills taught in previous sessions. Although the greatest areas of growth by students were strategies targeted during intervention instruction, some students experienced growth in all the NSI questions. This indicates that students not only learned the strategies taught but also began to examine each question with the mindset of determining if there was an alternative strategy that might be more efficient than the standard algorithm.

EDUC 614: Schooling for a Democratic Society

Democracy in the Borderland; Empowering the Voice of the Mestizo

Armando Altamirano

New Mexico State University

November 5, 2012

## Democracy in the Borderland; Empowering the Voice of the Mestizo

### Introduction

Social Justice Education is an area that studies the impact of dominant ideologies over minoritized groups, it also reveals the necessity for educators and researchers to become involved in social change by challenging the academic inequities existent in the classroom (Apple, 2009; Sensoy & DiAngelo, 2012; Adams, Bell & Griffin, 2008). Multicultural educators Bill Bigelow (2006) and Wayne Au (2009) have stated that to challenge the existent inequalities in the classrooms, students need to be empowered in order to become successful individuals both in their personal lives and academia. Living close to the border region Mexican Americans face different struggles and necessities than students from other diverse areas of the U.S. (Au, 2009; Bigelow, 2006). I will introduce the term of mestizo to better identify the personal experiences that Mexican American students encounter in schooling and how social justice can build upon this definition to empower these multicultural students. Finally, by understanding the duality of the mestizo and its implications, we will be able to bring a better understanding of their realities and present a better academic experience that can lead them to personal transformation and action (Anzaldua, 1999; Delgado 2011).

### The Mestizo

The term mestizo has evolved throughout the years since its inception in the colonized America. According to MacLachlan and Rodriguez (1980) in their book *The Forging of the Cosmic Race: A Reinterpretation of Colonial Mexico*, the definition of mestizo changed radically during the first three centuries of the Spanish rule in the Americas. During the early sixteenth century in the new world a system of castes replaced the traditional European social hierarchies, this new system designated groups of people into seven main ethnic mixtures: European, native

Indians, Africans, mestizos (European-Indians), mulatos (European-Africans), zambos (Africans-Indians) and chinos (Asians of various mixtures). The caste system came to establish a European privileged social and cultural structure to control and stratify ethnic classes in the newly discovered Americas.

According to the caste system the order of importance of ethnics groups was from the highest echelon occupied by the European then mestizo, Indian, Asian, mulato, zambo and at last the Africans who were considered inferior to all because of their slave status. Under the caste system the mestizos were the offsprings of Europeans and American indigenous people. At first, the people that belonged to the mestizo ethnic group were taught to possess impure blood and as such they were treated as being the offspring of illegitimate families. Later on during the seventeenth century, mestizos acquired upward mobility and they joined the American Spaniards in power and facilitated the entry of other mestizos into the upper classes. Finally, during the early eighteenth century the economic development and population growth experienced by the New Spain saw to position its classes dependent on economic wealth rather than the caste system which eventually failed to determine status according to ethnic membership.

During the twentieth-century renowned Mexican writer and philosopher Jose Vasconcelos (1997) wrote his book *The Cosmic Race*, in which he brings a new interpretation to the essence of being mestizo. In his book Vasconcelos envisions a new future for the mestizos, as “the civilization developed and organized in our times by the whites has set the moral and material basis for the union of all men into a fifth universal race, the fruit of all the previous ones and amelioration of everything past” (p. 9). Not only does Vasconcelos state that this new mixed race, the new Mestizos, will surface and accomplish what all other races have not being capable

of, but he also predicts that the new mestizos will have all the superior qualities of all the previous races to help them surpass any unforeseen problem.

Adding to the definition of mestizo that originated with Vasconcelos, Gloria Anzaldua (1999) incorporates another important facet to the identity of the mestizo, their ability to be immersed in many different cultures that some times contradict each other. Moreover, for Anzaldua being a mestiza is to be “a many armed and legged body with one foot on brown soil, one on white, one in straight society, one in the gay world, the man’s world, the women’s, one limb in the literary world, another in the working class, the socialist, and the occult worlds (p. 205). Furthermore, Anzaldua states that the only restriction she has encountered as a mestiza is when society tries to label her failing to recognize the essence of the mestizo, that of duality and lack of establishment.

Another writer, Theresa Delgadillo also relates to Anzaldua’s personal reflection and talks about how the meaning of mestizo is being used along the border region of the U.S. to describe how Mexican Americans have retaken the term mestizo and have changed it to fit their own struggle. According to Delgadillo, for Mexican Americans the term mestizaje has “shifted from one that erases indigenous ancestry to one that claims it, from one that signals only racial mixture to one that celebrates cultural hybridity, from one that bespeaks narrow nationalism to one, that dismantles that striving” (p. 11).

This deconstruction of the term mestizaje and its transformation to spiritual mestizaje opens up the possibility for the critical analysis of the Mexican American experience as seen from the U.S. side of the border. This interpretation of spiritual mestizaje is centered on empowering Mexican Americans to explore and become self-reflexive of the oppression they

suffer and all its manifestations so they can intervene and live a life that honors what is most sacred to them.

### **Defining Mestizo in the Borderland**

One of the most important aspects of social justice is to become empowered and to engage in education that challenges the existent social inequalities (Apple, 2009; Sensoy & DiAngelo, 2012; Adams, Bell & Griffin, 2008). Understanding the notion of mestizos can help us empower students in the borderland in a different way by providing resources and connections that can appeal to the mestizo's sense of duality. Talking about the Mexican American experience we need to address the cultural and social struggles this community has and continues to experience even in our days (Au, 2009). Although not an identical struggle as the one suffered by the Mexican natives at the hands of the Spanish colonizers, the ethnic conflict among European whites and local mestizos or natives still continues to affect students the U.S. border region (Bigelow, 2006). Again, it is of the utter most importance to separate the myths from the reality experienced by these marginalized groups. Mestizos need to deconstruct the colonized history of their indigenous natives of North America and Mexico that they have been taught by the schools of the white colonizers (Delgado, 2011).

Reading about the history of colonization of the Americas we find that the Spanish colonization brought to extinction many of the diverse local populations from the Americas. Along the same lines, reading about the north American colonization we encounter the doctrine of "manifest destiny" that sought to expand the American ideals and its white supremacy to as many territories as possible inside and outside the American continent at any cost (Bigelow, 2009).

In the New Spain the colonizing experience was different than the one suffered by the native groups of the United States, the European groups that came to the Americas tried to cleanse the local inhabitants and eradicate them from the continent at all cost, “cleaning the earth of Indian, Mongolian and Black for the greater glory of whites” (Vasconcelos, 1987, p. 11). Anzaldúa (1999) also talks about how the process of colonization by the Anglo-American became focused on erasing the Mexican identity of the mestizos and to impose them the values and rules of the white supremacists.

In contrast, MacLachlan & Rodriguez (1980) state that although ethnic oppression and discrimination was existent among the Spaniards, the need for the American Spaniards to thrive and flourish in contrast to their European counterparts facilitated the interruption of the ethnic cleansing in favor of an economic class system that could incorporate the local labor force. At the end, “materialism, competition, and the realization that status and social position rested on economic success engendered great stress as well as opportunity” (p. 201). The final blow to the caste system occurred many centuries after the conquest, when the mestizos become the fastest growing ethnic group and their physical traits became so intertwined with the Europeans physical traits that it became almost impossible to identify the real ancestry of any individual solely based on their physical appearance (Leal, 1985).

Is not easy being a Mexican American living in the border region, it becomes easy to connect to stereotypes and disparities of both sides of the border. Mexican Americans are constantly reminded of the good and evil that lurks around the border region. Nevertheless, for yellow journalism and the sensationalist media the local violence, corruption, and murders take precedent over any other story of peace and reconstruction along the Mexican side of the border (Herrera, 2010). According to Pablo Vila (2003), this creates a conflict of identity, “the origin of

Mexican American identity—instead of being an asset on which to construct a valued social identity, can be a liability to many Mexican Americans who construct their identities not only by portraying Anglos as the "others" but also by doing the same regarding Mexican nationals” (p. 105). Living along the border region anyone can have a glimpse to the other side of the border fence and clearly view the poverty and lack of infrastructure that distinguish many Mexican cities along the border with the U.S.

### **Empowering the Mestizo**

As I mentioned before one of the main purposes of social justice is to empower and transform individuals through the use of education that challenges the existent social inequalities and conscientize the individual about how to deal with his/her personal struggle (Apple, 2009; Sensoy & DiAngelo, 2012; Adams, Bell & Griffin, 2008). Through the analysis of the mestizo experience, at the hands of the Mexican American students we can identify different ways in which we can empower Mexican American students to achieve a better educational experience.

To successfully educate the marginalized Mexican American communities should be of key importance as this is one of the fastest growing ethnic groups in the country that very soon will become the fastest enrolling group in public schools in all regions of the U.S. As we have read from Gale and Densmore (2003) one of the main functions of education is to transcend its reproduction role and to reconstruct and challenge the existent dominant groups. Furthermore Gale and Densmore agree about how today the acquisition of academic credentials is viewed as the attainment of profit and power by many dominant groups, this is why minorities such as Mexican Americans are being denied the access to academic resources and equal education.

Au (2009) and Bigelow (2006) have stated that one of the fundamental ways to empower students is by recognizing their cultural and social capital, something that is already acknowledged by the white dominant system but that nevertheless the Mexican Americans have had to fight for to be kept alive in their classrooms. For Leal (1985), literature is one of the mediums that can help Mexican American students recognize and maintain their own identity that has been traced back to their Mexican roots. From this struggle many Mexican Americans have developed the Chicano/na literature that is characterized by the presence of images from both sides of the border, Mexico and Anglo-American. Reading different excerpts from Chicano/na literature, we can see how many key symbols have helped bring unity to the Mexican American cause, how these symbols have linked Chicanos/as to their Mexican ancestry, and how these symbols have helped them in challenging the current established dominant system.

Leal (1985) and Anzaldua (1999) state that is of key importance to maintain symbols that bring the community together, is necessary to keep them alive as they become the living interpretations of the life of the Mexican American in the U.S. Furthermore, seeing it through the eyes of the mestizo Mexican Americans are rooted to different geographical areas and Mexican traditions that are evoked thorough the use of varied symbols that unite them and allow them to live with a different vision that allows them to stand up against oppressive groups.

An example of one such symbol is the remembrance of the city of Aztlan according to Leal and Anzaldua, the ancient capital of the Aztecs, is one such example, it also brings to mind the ancient tale of the black eagle that stood in one cactus consuming a serpent that fulfilled an ancient Aztec prophecy that told the Aztecs were to start building their new city in the Americas in the year of 1325. Aztlan holds a special place for Mexican Americans as it reinforces their authentic origins with the Aztecs as the land of Aztlan, it is situated somewhere in the northern

hemisphere of the U.S. From this special area the ancient Aztec forefathers came to find a new territory where they could start a new civilization in central Mexico. Understanding the duality of the mestizo is of key importance to discover their needs and relationships with others and the world, the location of Aztlan in the U.S. presents an unquestionable connection to the land established thousands of years ago even before the Anglo Americans came to the continent, even before the Spanish colonizers appeared in Mexico, the understanding that this is their rightful land is a powerful idea that can empower individuals to stand their ground against anyone that proclaims that Mexican Americans have no real connection to the U.S. land, and moreover it entitles them to the local heritage.

Leal and Anzaldua also talk about another important symbol amongst the Mexican American population, the sacred Virgin Mary or Virgen de Guadalupe. One of the main emblems of the Mexican identity, the Mexican independence war, embodied in the independence flag of the priest Miguel Hidalgo. What's more, embodied in the tunic of the Indian Juan Diego that brought together the old world and the new world, the mestizo came to be again in the existence of the Virgen of Guadalupe. Even more, Coatlicue the ancient Aztec goddess the one that gives light to all and takes all, became the new goddess and the ancient one, a duality, a mestiza. In the Mexican culture the mother figure has an important connotation of respect and nourishment at the same time not having a mother is one of the worse things anyone can have. The Virgen of Guadalupe is a strong character that illuminates and provides spiritual guidance and comfort to millions of individuals around the world, unquestionably her figure alone has made people accomplish the unthinkable or even the impossible, for the Mexican Americans is a spiritual and religious benefactor that must be recognized.

Although greatly affected by the conquest the indigenous natives of the Americas never were fully eradicated or extinguished, many of their ancient practices and traditional beliefs have been carried out throughout the years and are still alive today. Many times Aztecs were seen and described as uncivilized savages but several authors (Vasconcelos, 1997; Leal, 1985; MacLachlan & Rodriguez, 1980; Vila, 2003) have demonstrated the contrary, that actually the Aztecs had a structured political system, a stable economic structure and a clearly defined social composition. Additionally, the Aztec's highly structured society made it possible for them to train the man power necessary to build the immense pyramids over the Texcoco lake, and create Tenochtitlan a city state that harbored more than 300,000 souls and that became one of the most influential cultural and economical centers of its time (MacLachlan & Rodriguez, 1980). Along the same lines, Leal (1985) also mentions how the Aztecs build one of the most magnificent city states in the Americas, Tenochtitlan, a powerful city that traded with the major southern regions of what is today the U.S. and to the south of the continent it had influence in some northern areas of what is today called South America.

Leal stated that many of the cultural and economical values of the Spaniards also were welcomed among the American natives. According to Leal (1985) some of the commonalities we found between the Aztecs and the Spaniards were that the colonizers valued discipline and having a structured life that allowed them to find rest in the understanding of how things worked both socially and economically under a specific structure. According to Leal, Aztecs also valued being productive members of their society or being employed, to accomplish this Aztecs established a social structure where all the inhabitants fitted into specific social lifestyles that concentrated in the areas of agriculture, crafts, commerce, the militia and politics. Mestizos can accurately challenge dominant structures by demonstrating they are not the kin of an uncivilized

tribe, and to the contrary mestizos can build themselves upon the knowledge of their people, and the good personal attitudes that this group shared with the Europeans.

Another important area for the Mestizo is their family life, in the book by Arum, Beattie and Ford (2011) *The structure of schooling; Reading in the sociology of education* we find several studies that show that for the parents of Mexican Americans is very important for their children to succeed in school, although many times they fail to understand how to do so.

According to Delgadillo (2011) y Anzaldua (1999) some Mestizos have a hard time relating to their parents as they forget that they do not share the same understanding of the world as the mestizos have, the duality and understanding of both the Anglo and Mexican cultures makes the mestizos an experienced navigator of both worlds. Usually, the parents of the Mestizos only have the comprehension of one language, they also have a basic understanding of schooling, and have a hard time understanding the rules and structures of the Anglo American society and their institutions (Rogers & Orr, 2010).

Mestizos can help their parents' link to the new world and by doing so, they can also help themselves. Arum, et al. (2010) stated that the failure for the Mexican American to accept this dichotomy suffered by their parents against the Anglo American system could result in a polarization of their view of the relevance of the family's cultural and social capital. This occurs when students fail to find answers to their schooling experience at home and as they recognize many of the contradictions faced by their home and school cultures. Arum et al. states that at the end if students fail to find support for their academic development in their home's culture their interpretation of what constitutes valuable knowledge can discriminate between the real importance of their cultural knowledge compared against what is considered academic knowledge (Arum et al., 2010).

Another important area for empowering Mexican American students according to Au (2009) is the implementation of multicultural education that focuses on issues of: “racism, freedom, political power, and economic integration” (p.18). Multicultural education is very important as it teaches the students how to identify when they are being discriminated or when they are taking the role of the discriminator. We need to recognize that mestizos can safely navigate between different cultures and many times they need to become aware on how this duality affects their actions and attitudes towards others. As Anzaldua (1999) states, “seen through the eyes of the Mestizo life is full of dualities and exchanges between contradictions and similarities between different cultures and places” (p. 99). The capacity of the mestizos of being dual and having access to both cultures gives them an advantage as they have access to different scenarios and to be able to express their realities and concerns through the use of different discourses that can give them access to wider audiences.

Another advantage of the mestizos is that they have access to varied channels of information, Vasconcelos (1987) mentions how mestizos have a deep understanding about the culture and history of the Anglo American structures and also their personal home structures. Having access to varied channels of information helps mestizos become aware of how the current social and economical power struggles influence education. Moreover, when mestizos learn how to interact effectively with different discourses they can acquire access to important information that can help them find a voice and understand how racial discrimination affects them (Bigelow, 2006). Finally, I will end with a highly recognized phrase from Anzaldua (1999) “mestizos are hybrid people”, she talks about the duality of the mestizo, an individual that belongs to two nations, a native of the Mexican culture and the Anglo Western culture that became one but not the same.

## Conclusion

The mestizo is a powerful concept brought by the colonization of the Americas; the new American caste system identified these individuals as being the offsprings of Spaniards and local natives (MacLachlan & Rodriguez, 1980). Throughout the years the mestizos have risen from the lower social status to various positions in the upper statuses. Vasconcelos (1997), brought a new notion of the mestizaje by stating the importance of the amalgamate of all the races in a new one, a fifth race that could bring all the advantages of all the races in one, he called it the cosmic race. More recently, Anzaldua (1999) talks about a new notion of what is to become a mestizo and through her personal history she defines the spiritual mestizaje that lives inside mestizos. This special type of mestizaje brings together two contradictory cultures and establishes in one individual its own duality.

In the borderland the mestizo has been stereotyped and oppressed (Bigelow, 2006; Au, 2009). Furthermore, the connection of the mestizo with native Mexico has been condemned and criticized (Delgadillo, 2011). The reputation of the ancient Aztec civilization has been questioned, they have been deemed ignorant and then they have been named savage and sadistic (Leal, 1985). Nevertheless, several authors (Vasconcelos, 1997; Leal, 1985; MacLachlan & Rodriguez, 1980; Vila, 2003; Anzaldua, 1999) have demonstrated the contrary that actually the Aztec tribes have been one of the most evolved, educated and socially advanced native group of the Americas.

Finally, taking into consideration several of the symbolisms of Mexican Americans and the understanding of what it is to be a mestizo we encounter several different avenues in which we can reconstruct students and incorporate them successfully into the classrooms. At the end,

we need to bring the mestizo as a reference that we can use to empower and enhance the academic development of Mexican American students and empower them ultimately to achieve a better educational experience through their understanding of how to use their duality to safely and securely navigate both cultures (Bigelow, 2006).

EDUC 603: Curriculum for a Diverse Society

Analytic Study / Texas Technology Standards

Armando Altamirano

New Mexico State University

October 13, 2011

### Introduction

This analytic paper studies technology standards for the state of Texas with the name of technology applications Texas essential knowledge and skills (TATEKS) that have the objective of preparing and evaluating technology curricula for Texas's academic institutions. As explained by the Texas Education Agency (2011) "The goal of the Technology Applications TEKS is for students to gain technology-based knowledge and skills and to apply them to all curriculum areas at all grade levels". Educational policies such as No Child Left Behind and Race to the Top were founded in the principles and ideas expressed in documents such as the national report *Nation at risk* written in 1983. This report addresses the imperative need for the people, institutions, and the private sector to recover the economic supremacy of the country (National Commission on Excellence in Education [NCEE], 1983). The TATEKS share this foundation as technology is seen as the tool that will fix the problems and take the country up to its former glory. Moreover, twenty one years after the report was given technology continues to be seen as the instrument that will move the country successfully into the next millennia (Johnson, 2004). Likewise, scholars Bybee and Starkweather (2006) explain "technology is one of the disciplines identified as major factors influencing economic progress" (p.27). Today, the report *2010 Progress Report on the Long-Range Plan for Technology, 2006-2020* (State Board of Education [SBE], 2010), continues to focus on technology as the tool that will fix the current condition of the state and improve the quality of education and economic competitiveness in the state.

As technology is transforming the way we communicate, learn, and work, it is indispensable for curriculum theorists to understand the way new technologies impact curriculum and how the current curriculum should be modified to implement these innovative changes. In addition, these authors state that technology has become the holy grail of economics

as societies that possess the latest technologies become more productive and efficient; they explain that technology has simplified, improved, and decreased the costs of many business processes and it will continue doing so. Teaching several technology classes for many years gave me an insight in the importance of technology in the curriculum and pedagogy. Nevertheless, embarking in an in-depth analysis that allows me to understand how the technology standards originated and the context from where they were written will provide me with a clear picture of the objectives and requirements of the technology standards in the state of Texas. Furthermore, by interpreting the foundation and historical framework of technology standards I can challenge or question the purpose and focuses of these standards in the classroom. With this analysis I can determine the validity of the standards and if they are truly meeting their goals, or even more, if these goals are actually improving the quality of life amongst students or if they are limiting their progress. In addition several problems that limit the use of technology resources in academics are discussed in the analysis along several advantages unique to technology. At the end we cannot forget that technology should promote humanity and creativity and not take away the importance of the individual's expression. As explained by the report *Nation at risk* from the 1980's:

Knowledge of the humanities, they maintain [scientists], must be harnessed to science and technology if the latter are to remain creative and humane, just as the humanities need to be informed by science and technology if they are to remain relevant to the human condition. (NCEE, 1983).

Finally, an analysis is done along these lines with the purpose of determining if the TEKS meet their foundation goals.

## History

In 1981 then Secretary of Education T. H. Bell created the National Commission on Excellence and Education with the purpose of determining the condition of the U.S. academic system (NCEE, 1983). This commission produced a report know as *Nation at risk* that addressed some of the deficiencies of the U.S. educational system in the early 1980's as well as the importance of including technology in the classroom curriculum. Most of the suggestions of improvement in this report came from the initiative that:

All, regardless of race or class or economic status, are entitled to a fair chance and to the tools for developing their individual powers of mind and spirit to the utmost. This promise means that all children by virtue of their own efforts, competently guided, can hope to attain the mature and informed judgment needed to secure gainful employment, and to manage their own lives, thereby serving not only their own interests but also the progress of society itself. (NCEE, 1983)

Among the recommendations given by the commission were the ones of including a one and a half year long computer science class for high school students. The purpose of the class was to equip students to: “(a) understand the computer as an information, computation, and communication device; (b) use the computer in the study of the other basics and for personal and work-related purposes; and (c) understand the world of computers, electronics, and related technologies.” (NCEE, 1983)

In the state of Texas the incorporation of the national technology standards in the state's curriculum guides has been seen as especially important; Texas has been one of the first states in the U. S. to promote the implementation and teaching of new technologies in the classrooms (OTA, 1995). Moreover Texas has been preparing itself to meet future technological

requirements by developing long-range technology plans as described by the State Board of Education:

Recognizing the need for a consistent, systemic approach to implementing educational technology throughout Texas, the Texas Education Code, Section 32.001, requires the State Board of Education (SBE) to develop a long-range plan for technology. Texas led the nation with the first Long-Range Plan for Technology, 1988-2000, adopted by the SBOE in November 1988. Subsequent plans were adopted in 1996 and in 2006.

(SBE, 2010)

These Long-Range Technology plans formulate recommendations for the different stakeholders of the Texas educational system by targeting many of the areas that involve the use of technology in academic institutions, such as: “Teaching and Learning; Educator Preparation and Development; Leadership, Administration and Instructional Support; and Infrastructure for Technology.” (SBE, 2010) These plans are updated every two years and can be planned many years in advance. Based on these objectives the Texas Education Agency (TEA) starts the review process for the Technology Application TEKS and at the end of the process the State Board of Education discusses the changes and either refuses or implements the reviewed TEKS (Texas Education Agency [TEA], 2011). The members of the board need to be nominated by the current members of the organization and include “educators, parents, business and industry leaders, and employers (TEA, 2011)”. In addition, the TEA also pieces together many technology standards based on the National Technology Standards (NETS) and performance indicators developed by the International Society for Technology in Education (ISTE). ISTE is an international nonprofit association deeply involved in the establishment of national technology standards in education with the objective of “improving learning and teaching by advancing the effective use of

technology in PK-12 and teacher education” (ISTE, 2011). This policy affect mainly the citizen of the state of Texas as it relates to students and institutions that work with them. Although we cannot forget that whatever these kids learn in High School is going to impact their future life.

### **Analysis**

The list of technology standards pertinent for High school is divided in ten different sections: Digital Design and Media Production, Digital Art and Animation, 3-D Modeling and Animation, Digital Communications in the 21st Century, Digital Video, and Audio Design, Web Design, Web Communications, Web Game Development, Independent Study in Technology Applications and Independent Study in Evolving/Emerging Technologies (TEA, 2011). Also, the Technology TEKS share the same components stated by the NETS that include: creativity and innovation; communication and collaboration; research and information fluency; critical thinking, problem solving, and decision making; digital citizenship; and technology operations and concepts (TEA, 2011).

This paper will focus on the Technology Applications TEKS for Digital Communications in the 21st Century (see Appendix). The introductory section for the digital communication standards states that through the use of different technologies students are expected to use online tools to find answers to real world problems affecting any geographic scene, make decisions to inform and persuade, work productively to solve society’s demands, present effective products that please authoritative stakeholders, and lastly effectively use multimedia tools to share their voices and influence change (TEA, 2011).

Many of the assumptions that constitute this section make me believe that the purpose of technology is to optimize the social utility of individuals as the theory of social efficiency states. Based upon the report of a *Nation at risk* that affirms that:

The world is indeed one global village. We live among determined, well-educated, and strongly motivated competitors. We compete with them for international standing and markets, not only with products but also with the ideas of our laboratories and neighborhood workshops. America's position in the world may once have been reasonably secure with only a few exceptionally well-trained men and women. It is no longer. (NCEE, 1983)

I believe the importance and transcendence of technology in education is evaluated in this document in its capacity to generate economic hegemony and productivity. Therefore, when I read about how technology standards affirm that students should “create a solution, and evaluate the results for authentic, real-world local, state, national, and global issues” (TEA, 2011), I assume they are talking about the importance of the individual in solving economic issues affecting today’s globalized economy. Moreover, I also find a similar statement in the 2010 Texas progress report that affirms that technological resources in Texas are empowering students to become successful “ world-class communicators, competitive and creative knowledge workers: as engaged, productive, and contributing members of this 21st Century society” (State Board of Education [SBE], 2010). Again by using words such as competitive, world-class, knowledge workers, and productive members of society, I believe that the main purpose of technology stated in this document is to help individuals become more productive and competitive. This economic focus of the industrial age is discussed by Slattery (2006b) when he wrote about how antique civilizations that move from tribal and feudal societies into a capitalistic based economy rely on scientific technology in order for change to occur.

Many standards remind me of scientific management when they talk about how the student should “use innovative thinking to develop new ideas and processes for solving real-

world issues and conveying those ideas to a global audience ... generate innovative, sustainable solutions for real-world issues such as global warming, immigration, or the global economy using emerging digital tools ...examine real-world issues relating to current topics such as health care, government, business, or aerospace” (TEA, 2011). The development of innovative processes, innovative solutions, and analysis among other objectives established by the standards bring to mind notions of scientific management that focus on efficient processes, knowledge transfer, and analysis of business practices. In the same manner, scholars Bybee and Starkweather (2006) support this idea by identifying: "technology as one of the disciplines identified as major factors influencing economic progress" (p. 27). As a matter of fact, these authors state that technology has become the holy grail of economics as societies that possess the latest technologies become more productive and efficient; they explain that technology has simplified, improved, and decreased the costs of many business processes. It is evident that “Technology is radically transforming a host of other occupations. They include health care, medical science, energy production, food processing, construction, and the building, repair, and maintenance of sophisticated scientific, educational, military, and industrial equipment” (NCEE, 1983) but still the human element is the one that has the final word in making the technology work.

I will think that with the emphasis technology has received throughout the years, nowadays the U.S. should experience a great deal of technological advancements and economic profit. Nevertheless, as Champan, Masters, and Pedulla (2010) affirm the U.S. suffers from an undeniable digital divide that separates society among people that have access to technology and the ones that don't. Digital divide is an important term that acknowledges the technological inequalities experienced by many individuals. The digital divide refers to the existing imbalance

of technological resources utilized by some groups compared to other groups among the academic population (Chapman et al., 2010). Today we are experiencing an increasing worldwide demand for skilled workers that know and understand how technology works, but still many segments of the labor force lack the access to training, technological resources and the understanding of how to make this happen (Milwood & Terrel, 2005). Lastly, with the eminent raise of minorities in the U.S. is foolish to discover as Bieber, Marchese, and Engelberg (2005) demonstrate that minority groups are not encouraged to enroll in technology classes and more troubling they are not even taken into consideration in the structure of these programs. Another pitfall of the use of technologies in the classroom is time management, the strict use of computer time as a measuring tool for academics is biased. Schools implement technologies to help them manage strict schedules and activities where the outcomes are appraised in how many hours the students has used the programs instead of focusing in the quality of the interaction by constructing critical work and evoking self expression (Slattery, 2006c, p. 274). In the international arena we have seen how technology has eroded the international barriers and how many countries are taking advantage of the new global competition (Slattery, 2006b). But still we cannot overlook that, “Global transformations have brought the promise - but not necessarily the reality - of freedom from totalitarian regimes to some societies” (Slattery, 2006a, p. 284) as antiquated political systems try to limit the impact of the global media in its citizens technology demonstrates how it can be utilized to control and perpetuate the current status quo.

To conclude, Slattery (2006) states that western civilizations are in crisis, and that there is an eminent need for a new system, a system that will take into consideration the legitimacy of global diversity and its ramifications in both the cultural and economic spheres. As Slattery explains:

The modern world is coming to an end, something new needs to replace it, social criticism, expose contradictions, negative impact of modern technology, ecological sustainability, beyond materialist philosophy of modernity, celebration of otherness, revolutionary paradigm, movement toward de-centering. (2006b, p. 17)

But not only economic gains are to be obtained from technology; a variety of new technologies can also improve the way we learn and understand information. As scholars Milwood & Terrel (2005) assert:

Some propose that technology might be used solely to reduce unit costs and to "capture" a growing international market -our evidence suggests this is misguided. In our view this would miss an opportunity for curriculum and pedagogic change which would enhance the role of higher education in society and economy (p. 195).

However, we need to understand "that technology itself is merely a tool, and it is the method of implementation of technology that can lead to improvements or degradation of student outcomes" (Chapman et al., 2010, p. 239). Along these lines the report *Teachers and technology: Making the connection* mentions the importance of teaching technology by saying that:

The urgency of investing in technological literacy, broadly defined, stating that increasing the technological literacy of the public would improve decision making, increase citizen participation, support a modern workforce, enhance social well-being, and narrow the digital divide. (OTA, 1988, p. 286)

I can clearly read that institutions place too much faith in technology and forget about the necessity to follow through with equipment, training, and critical pedagogy. This is the same error that we find in the intention of using technology as an economic tool; just by implementing technology in the curricula it does not mean that gains will materialize. As Slattery explains we

are finding out the hard way that the overt assumption that the “world is a wholly knowable system governed by a finite number of universal laws which humans can comprehend by rigorous analysis and rationality direct for the personal benefit of men and woman” (2006b, p. 25) is not longer true. For example, Doyle (2009) and Robinson & Hullinger (2008) explain how even today in a highly computerized world instructors cannot be replaced with programs or automated simulations because of the complexity and dynamism required by their position. They point out about how frequently the human element is the principal cause of failure in technology education by missing the physical and mental resources necessary to deliver the material, required funding, and are inadequately trained.

Nevertheless, in good hands technology has the capacity to help students by providing alternatives to the problems of access, engagement, community, pedagogy and cost (Milwood & Terrel, 2005). For example technology could be made available to students living at distant locations where is difficult to send teachers and educational materials. As well, distant learning can help students learn in new ways by providing different engaging tools that appeal to different learning styles. Finally, as Miwood & Terrel (2005) explain distant learning lowers the cost of instruction as the Internet is available almost everywhere in the world for a fraction of the cost of sending teachers and materials to inaccessible places.

### **Evaluation**

The evaluation of the technology standards is gathered through the use of the campus Star Chart for teaching and learning that has the purpose of producing:

A profile of the campus’ status toward reaching the goals of the Long-Range Plan for Technology (LRPT) and No Child Left Behind. The profile indicators place a campus at one of four levels of progress in each key area of the LRPT: Early Tech, Developing

Tech, Advanced Tech, or Target Tech. The key areas include: Teaching and Learning; Educator Preparation and Development; Leadership, Administration and Instructional Support; and Infrastructure for Technology. Most campuses in Texas show continued improvement and are moving from lower levels on the campus chart towards the Target Tech level. (State Board of Education, 2010)

During the past decade the data gathered by this chart situates most schools in Texas as either developing or advanced tech in teaching and learning, the only problem I have with this assessment tool is that schools evaluate themselves. On the other hand I believe we should evaluate how successfully students feel with the technology curriculum and materials they have in their schools and how teachers use them. Again we lose the focus of the student and leave him/her buried out in a pile of bureaucracy and institutionalism. Finally, if we would assess technology by the economic and industrial achievement it has brought to the country it will fail miserably as global competition and outsourcing have greatly impacted the pockets and the minds of many individuals in the local economy (Knapp, 2008). Moreover the digital divide still persists and students are constantly discriminated in the use of technological resources and training; as we read from this recent study:

What does it profit students to have technology access if both they themselves as well as those instructing them do not have the training or capacity to utilize this technology efficiently? Differences in technology access among schools cannot be solved by funding alone. (Chapman et al., p. 248)

### **Conclusion**

The Texas technology standards are based on the 18<sup>th</sup> hundreds educational theories were students were prepared to live and work in factories right after the industrial revolution (Slattery,

2006b). As stated in the report *Nation at risk*, “Our once unchallenged preeminence in commerce, industry, science, and technological innovation is being overtaken by competitors throughout the world” (1983) and it’s our duty to take it back. In the same manner we read the next lines written explicitly for the state of Texas:

References also are frequently made to economic and social shifts that have made technology skills critical to the future employment of today’s students, and more broadly, to the importance of technology innovation to maintaining the economic and political dominance of the United States globally (SBE, 2010, p. 283)

The implementation of technology in the academic field has been filtered along the lines of social efficiency and scientific management. The ideal of improving the economic wealth of the country has not been met and even more academic institutions are also being questioned about the successful use of technology in their classrooms. In an article from CNN money we read about students that call themselves “The 99%” and how they are revealing their frustration and anger towards the academic and economic institutions themselves as to the extent to ask them: “Where is the university's responsibility to its customers? Hell, where is its responsibility to America?” (Primack, 2011, p. 5). Technology standards must be explored in context, understanding how the type of learner, the particular content, and the pedagogical approach influences the successful use of technology in the classroom. Ultimately society is the only one that can challenge the way technology curricula is being used in the classrooms as organizations have failed in delivering the promised educational and economic benefits.

## Appendix

### Digital Communications in the 21st Century

(a) General requirements. The prerequisite for this course is proficiency in the knowledge and skills described in §126.12(c) of this title (relating to Technology Applications Grades 6-8). This course is recommended for students in Grades 9-12. (One Credit).

(b) Introduction.

(1) The technology applications curriculum has six strands based on the National Educational Technology Standards (NETS•S) and Performance Indicators for Students developed by the International Society for Technology in Education (ISTE): creativity and innovation; communication and collaboration; research and information fluency; critical thinking, problem solving, and decision making; digital citizenship; and technology operations and concepts.

(2) Through the study of technology applications students learn to make informed decisions using digital tools and appropriate applications. By using online research and information resources, such as journals, newspapers, or authoritative databases, students will synthesize knowledge, create a solution, and evaluate the results for authentic, real-world local, state, national, and global issues. Students support and manage the work of individuals and groups to create products to inform and persuade their proposed solutions using appropriate communication skills and methods of delivery.

(3) The purpose of this course is to prepare students for the societal demands of increased civic literacy, independent working environments, global awareness, and the mastery of a base set of analysis and communication skills. Students in this course will be expected to design and present an effective product based on well researched issues in order to

thoughtfully propose suggested solutions to authoritative stakeholders. The outcome of the process and product approach is to provide students an authentic platform to demonstrate effective application of multimedia tools within the contexts of global communication, collaborative communities, and appropriately share their voice to affect change that concerns their future

(c) Knowledge and skills.

(1) Creativity and innovation. The student demonstrates the ability to analyze, evaluate, and adapt during the creative problem-solving process and demonstrates creative thinking in developing solutions to real-world issues using digital tools. The student is expected to:

- (A) generate innovative, sustainable solutions for real-world issues such as global warming, immigration, or the global economy using emerging digital tools;
- (B) gather and evaluate accurate information for feasibility and practicality as a basis for making communication decisions; and
- (C) analyze the ethical and social responsibilities as a project team when communicating with peers, stakeholders and experts.

(2) Creativity and innovation. The student uses innovative thinking to develop new ideas and processes for solving real-world issues and conveying those ideas to a global audience through a persuasive digital product. The student is expected to:

- (A) examine real-world issues relating to current topics such as health care, government, business, or aerospace;
- (B) develop innovative solutions to address the issues;

(C) create unique methods and products conveying solutions to audiences beyond the classroom such as school officials, non-profit organizations, higher education officials, government, or other stakeholders;

(D) demonstrate the effective use and importance of verbal and nonverbal communication skills when presenting ideas and solutions to diverse audiences; and

(E) use appropriate techniques to manage communication apprehension, build self-confidence, and gain command of information.

(3) Communication and collaboration. The student develops a process to effectively communicate with peers, experts, and other audiences about current issues and solutions to global problems. The student demonstrates innovative uses of a wide range of emerging technologies, including online learning, mobile devices, digital content, and Web 2.0 tools such as podcasting, wikis, and blogs. The student is expected to:

(A) participate within appropriate electronic communities as a learner, initiator, and contributor;

(B) extend the learning environment beyond the school walls using appropriate digital tools;

(C) collaborate with a variety of field experts;

(D) prepare for, organize, and participate in an informative or persuasive group discussion with an audience; and

(E) participate appropriately in conversations by making clear requests, giving accurate directions, and asking purposeful questions.

(4) Communication and collaboration. The student uses digital tools to facilitate collaboration and communication in the design, development, and evaluation of products offering solutions to real-world issues. The student designs a collaborative working environment that enables a group to investigate a local, state, national, or global issue.

The student is expected to:

- (A) design and organize resources to create an effective collaborative environment;
- (B) analyze and evaluate effective communication;
- (C) demonstrate leadership by managing project activities such as timelines, research, product development, marketing material, and effective communication skills;

(5) Research and information fluency. The student uses a variety of strategies to acquire and evaluate information relating to real-world issues. The student is expected to:

- (A) locate authoritative information from primary and secondary sources such as field experts, online full-text databases, or current news databases;
- (B) make decisions regarding the selection, acquisition, and use of information gathered, taking under consideration its quality, appropriateness, effectiveness, and level of interest to society; and
- (C) demonstrate fluency in the use of a variety of electronic sources such cloud computing, emerging collaboration technologies, data mining strategies, and mobile or other technologies.

(6) Research and information fluency. The student uses a variety of digital tools to synthesize information relating to real-world issues in student-created materials. The student is expected to:

(A) construct real-world informational materials that inform, persuade, or recommend reform of selected issues; and

(B) identify and employ a method to evaluate the design, functionality, and accuracy of the student-created materials; and

(C) use effective strategies to organize and outline presentations to support and clarify points;

(7) Critical thinking, problem solving and decision making. The student uses critical-thinking skills to conduct research, manage products, solve problems, and make informed decisions for real-world local, state, national, and global issues. The student is expected to:

(A) identify and define authentic problems and significant questions for investigation;

(B) design and implement procedures to track trends, set timelines, and review/evaluate progress for project completions; and

(C) read and use technical documentation, including appropriate help options, to complete tasks; and

(D) analyze the audience, occasion, and purpose when designing presentations.

(8) Critical thinking, problem solving and decision making. The student creates a product presenting solutions for real-world local, state, national, and global issues. The student is expected to:

- (A) create technology specifications for tasks and rubrics to evaluate products and product quality against established criteria;
- (B) resolve information conflicts and validate information by comparing data;
- (C) represent diverse perspectives in problem solutions; and
- (D) prepare and use visual or auditory aids, such as scripts, notes or digital applications, to enhance presentations;

(9) Digital citizenship. The student examines ethical and legal behavior to demonstrate leadership as a digital citizen. The student is expected to:

- (A) model safe and ethical use of digital information;
- (B) model respect of intellectual property when manipulating, morphing, or editing graphics, video, text, and sound;
- (C) use technology applications in a positive manner which supports productivity, collaboration, and continuing education; and
- (D) use professional etiquette and protocol in situations such as making introductions, offering and receiving criticism, and communicating with digital tools

(10) Digital citizenship. The student demonstrates ethical and legal behavior in the creation of student products. The student is expected to:

- (A) use collaborative tools and strategies; and
- (B) use digital tools to correctly document sources such as in bibliographies or works cited.

(11) Technology operations and concepts. The student will make decisions regarding the selection, acquisition, and use of digital tools in a multimedia classroom/lab taking under

consideration the quality, appropriateness, effectiveness, and efficiency of the tools. The student is expected to:

- (A) determine the most appropriate file type based on universally recognized file formats, such as PDF, .TXT, .RTF, and .JPG;
- (B) use compression schemes for photo, animation, video, and graphics; and
- (C) distinguish among appropriate color, sound, and design principles, such as consistency, repetition, alignment, proximity, ratio of text to white space.

(12) Technology operations and concepts. The student demonstrates knowledge through various cloud and network technologies such as web-based interactive presentations, document sharing, and online scholarly databases. The student is expected to:

- (A) use necessary vocabulary related to digital tools;
- (B) demonstrate how to retrieve and discriminate between authoritative and non-authoritative data sources; and
- (C) adopt, adapt, and transfer prior knowledge to multiple situations when retrieving, manipulating, and creating original digital projects.

**Abstract:**

One Voice in Higher Education is a community-based initiative designed to engage community stakeholders in defining and leading education reform. This initiative took place in a rural county represented by three ethnic groups, where one in three students does not graduate from high school. Extending critical pedagogy to the community that surrounds the education system, a primary assumption underlying the initiative is that individual actors within the community know what they need to know to engage in education reform, and have the tools locally to create change. A collective impact strategy was employed based on this assumption. A community foundation in partnership with a small private university coordinated an effort to engage public and private stakeholders across fifteen school districts in South Central Washington. A multi-disciplinary team used Community Based Participatory Action Research (CBPAR) and Compression Planning methods to engage community partners in collective identification of community priorities. Fifty representatives from diverse public and private agencies engaged in collective agenda-building over 14 months, culminating in an education reform implementation plan. Participants articulated five community goals and accompanying benchmarks for the education system, and devised strategies, and an implementation plan around each goal. Twenty one participants (43%) committed to active engagement in initiative implementation. Funding opportunities provided by the community foundation were designed to support collegiate, cooperative processes as opposed to traditional competitive request for proposal processes. The CBPAR methodology did not follow a smooth pathway, as the inquiry took place in a complex social and

political setting. Geographical distance, inter-agency competition for funding, and distrust caused by historical conflict between groups all contributed to initiative complexity. Further inquiry into the application of CBPAR and education reform is encouraged.

Title of the Submission:  
**Critical Thinking and Nationalism: the Road towards learning Foreign Languages**

Topic Area of the Submission:  
**Cross-disciplinary areas of Education**

Presentation Format:  
**Workshop**

Description of the Presentation:  
Teachers of Foreign Languages are not only teaching words and syntax; they are also communicating an image of a specific culture. We forget that some of the reasons why we remain hesitant while learning a language is the fact that we refuse some of what comes with a language and what we give up concerning ours. Cultures grow together, and nationalism becomes reconsidered once we start acknowledging the “other”.

Caline Georges SAAD

PhD Student at the Department of Philosophy, Université Catholique de Louvain, Louvain-La-Neuve, BELGIUM

**calinesd@gmail.com**

## **Abstract:**

### **I - Research Objectives:**

Researching Foreign Language Teaching in a political dimension brings both language and culture together, in the name of intellectual indifference.

Our objectives are as follows:

- Bringing forth the cultural dimension in Language Education
- Linking both Cultural and Political Dimensions
- Configuring Language Teaching in terms of Nationalism

### **II - Proposed Methodology:**

Our research starts with the cultural components that we communicate in our classes. What do we learn through the lessons we give? These cultural components will be highlighted to complete another perspective: the political reading of cultures.

Nationalism has been a pride that caused some countries problematic relationships with others, in the name of that same pride that is reconsidered every time a culture accepts or rejects a foreign trait.

We will read historical events together through main nationalistic moments, in Europe, as well as in the United States and the Middle East. These main moments will be used to try to draw a relationship between how fragile language teaching can be when confronted with nationalism. It is a matter of degrees and we will use examples of lesson plans where this confrontation can be innocent, and where it is not.

This last step will lead us to a more precise scheme for teaching languages.

### **III - Expected Outcomes:**

We look forward to discussing these concepts in the name of language teaching, which has become a foundation to this global world that only keeps growing bigger.

We wish to obtain, at the end of our workshop, a new definition of nationalism, which will include a specific place for foreign cultures, as well as will hopefully leave room for change in the particular culture, that is opening up to the other cultures.

### **IV - Abstract:**

Through Critical Thinking, languages are taught in a different way and for a different reason. Learners have a purpose for what they wish to know, and teachers allow them to obtain a final outcome. Learning a foreign language is mostly a means towards a bigger purpose. Once the purpose is discussed in class, cultural components appear to be necessary to understand and use the language in a more useful way. A culture only emerges versus another, and both live together as both of them grow. The learner looks at his or her

own language differently, and views the new language as a new material to use in his or her life.

This cultural dimension is a social image of a political idea: where does the “other” language stand in relation to the native language? Questioning the relationship between both languages brings forth the political reading of cultures. Languages can be taught in the name of colonization for example, or for the need to evolve in a global world. Once defined, the relationship between languages makes learning them meaningful. The profile of a bilingual student is expected to be different from that of a monolingual one, and his or her way to deal with other cultures can be said to be more politically tolerant than that of the monolingual one.

Political discussions are necessary to draw a better way to look at the languages we learn, the cultures we accept and enhance through the languages we use. Nationalism is the political form that any country accepts without reviewing what it means in terms of the way to deal with foreign cultures. We will strive to place languages in this political concept that is nationalism, to measure how effective a methodology that is based on critical thinking is in the midst of the political structures that we place languages in.

#### **Abstract**

Though there is strong professed commitment to cultural learning and intercultural competence in world language classrooms, in many courses, culture is treated as a superficial entity (Omaggio, 2001; Schulz, 2007). In particular, within beginning level language classes, cultural learning tends to focus almost entirely on products (historical facts, art forms, foods, laws, etc) and practices (patterns of behavior or social interactions), failing to delve into the underlying perspectives (beliefs, values, attitudes, and meanings ) of the culture (Schulz, 2007). Bernhardt and Berman (1999) explain that a shortage of time, students' limited target language knowledge, and a lack of background knowledge are often at the root of the problem. Additionally, in classrooms where the target language is used almost exclusively, students' limited language proficiency restricts the range of materials teachers can bring into their classes, and prevent students from practicing the intellectual conversations necessary to cultivate the skills to observe, analyze, and think critically about other cultures.

A number of studies and literature in the field of language education have emphasized the importance of intercultural competence in language learning. Language learning is not just about learning linguistic forms. Vocabulary and grammar are integrally related to how they are appropriately used in specific contexts, and learning a language entails equipping ourselves with a "powerful tool to construct new culture" (Bialystock and Hakuta, 1994, p.161). Developing cultural sensitivity coupled with language ability is especially vital in a modern global, interdependent society. It is not hyperbole to say that proper education can promote mutual understanding among the people of the world and play a critical role in the reduction of social tragedies, such as "hate crimes" both at home and abroad (Omaggio, 2001).

The cultural learning weblog is designed to promote intercultural competence from the earliest stages of language learning. Through bi-weekly postings prepared by the instructor, students examined modern Japanese socio-cultural issues, reviewing multiple web resources and exchange their opinions primarily in English. In-class discussion generally consisted of five minutes per blog posting, and functioned as an icebreaker for the online discussion completed as homework. Blog participation provided opportunities for students to engage in critical thinking

activities that promoted acquisition of cultural sensitivity, knowledge, and understanding. The blog also supplied information regarding cultural perspectives crucial to language activities and tasks carried out in the classroom. For example, the real life example of Ichiro Suzuki (a MLB player) bowing to fans is used to illustrate the significance of proper greetings and leave taking, etiquette, and humility in Japanese culture.

Through their experience with cultural learning weblog, students showed a change in attitude towards the target culture. Participants initially responded to posting with brief and judgmental comments, such as "it is bizarre." However, as the semester progressed, comments became more analytical, demonstrating deeper reflection on Japanese history, values, and customs. This change in attitude is a common objective of cultural learning: to be able to consider various perspectives, and understand that people behave in a certain way "because they are using options their society allows for satisfying basic physical and psychological needs, and that cultural patterns are interrelated and tend mutually to support need satisfaction" (Seelye, 1997, cited in Schulz, 2007, p.14).

Students' feedback was very positive. In the course evaluations, 95% of students either "strongly agreed" or "agreed" with the statement "The culture blog was effective in helping me to develop my understanding of the culture I am studying". In the anonymous questionnaire provided at the end of school year, over 90% of students "strongly agreed" or "agreed" that the blog increased their interest, awareness, and appreciation of Japanese culture, and that the blog helped them to see cultural phenomena and issues within a larger context of history, politics, and economics.

- E-mail: chinatsu.sazawa@drake.edu

#### **Abstract**

A Professional Learning community (PLC) is a group of educators who come together, share their knowledge and experiences, exchange opinions, and collaboratively attempt to accomplish selected goals to grow professionally and improve student learning outcomes (e.g., Padwad & Dixit 2008; Kristmanson, Lafargue & Culligan, 2011). Research indicates that PLCs enable teachers to join supportive professional communities, and connect to each other (Gersten et al., 2010; Huang, 2007; Thibodeau, 2008). The U.S. school culture, often steeped in a tradition of individualism, can lead to teachers feeling isolated. As a result, a large number of teachers change or leave their school and the profession early. (Dunlap, Neale, & Carroll, 2000; Thibodeau, 2008; Carroll & Fulton, 2004; Heider, 2005.) The PLC provides a support structure, and helps teachers break out of such isolation and remain in the profession. The PLC can also offer participants the place and time to acquire new knowledge, to reflect on their own beliefs and practices, and to receive feedback and advice (e.g., Gusky, 2000; Kristmanson et al, 2011; Murphy & Lick, 2001). With access to new knowledge, reflection and collaboration, the PLC encourages teachers to try something new, frequently achieving marked “teacher change” - the goal of teacher education (Bachmann, 2012).

In this session, presenters will reflect upon a case study of one PLC that focused on intercultural competence. Intercultural competence is the ability to successfully communicate and function in intercultural settings (e.g., Moule, 2008; Rathje, 2007). Existing literature emphasizes the importance of intercultural competence in this global era and also the vital role schools play in its promotion (e.g., Hammer, Bennet & Wiseman, 2003; Cheng, 2007; Moule, 2008). In the featured PLC, five world language teachers teaching different languages at the same institute, met regularly, and explored the concept of intercultural competence during the summer semester. The members shared their experiences, ideas, and teaching materials, and supported each other to design and embed new classroom cultural learning activities to promote intercultural competence.

The researcher participated in the PLC activities as a participant observer, collecting data such as field notes, audio recordings of the group meetings and individual interviews, and questionnaires. The collected data indicates that the PLC

members established a collaborative and collegial relationship and a sense of community through their PLC activities. The participants also reported sharing teaching materials and ideas, and that receiving support from their colleagues motivated them to improve their cultural instruction while incorporating new teaching materials. Despite acknowledging the positive impact from participation, some members struggled to commit time to the PLC activities due to their hectic daily schedules. The researcher will share more detailed case study outcomes as well as recommendations for future PLCs in her session.

## ***Abstract:***

Most learning models have been relied on students' individual studying activities. In those models, the efficiency of learning varies among different students, and thus is limited. In this paper, we propose a systematic group study model to improve the learning efficiency for diversity students. By using instructed in-class and out-of-class group work, the group study model has the advantages to overcome the shortages of the individual study models and can improve the study efficiency for diversity students. Furthermore, in this model, students can learn from the group as well as from the instructors, thus the teaching performance can be improved. In experimental results, we use statistical analysis to show the improvement of teaching performance and study efficiency for the proposed group study model.

*Key words:* Group Study model, diversity students, in-class and out-of-class group work.

## **1. Introduction**

In recent years, with the rise of economic uncertainty and increasing unemployment rates, university enrollment has been on the upswing. Unfortunately, many students (nearly 40%) are unprepared for the college-level mathematics courses required for a degree [1]. Although many courses typically have prerequisite courses designed to ensure that students possess the necessary knowledge and skills to be successful in a higher-level course, not all students meet prerequisite skill levels. The lacking of required content or rigor could affect a student's success in those courses [2]. Levin and Koski et al [3] proposed identity ingredients to be central for designing successful interventions for underprepared students in higher education. These essential ingredients clearly focus on enforcing underprepared students' academic and social growth by means of individual and group works.

In addition, the student population in higher education is much more diverse than that in previous years [4, 5]. Whether or not diversity benefits the group performance still remains a debatable topic. Dreifus and Hong [6, 7] proposed that diversity among a group of problem solvers is more important than individual. In their experiments, diverse groups of problem solvers outperformed the groups of the best individuals at solving problems. While, in Page's book [8], he explained why difference beats out homogeneity in that identity-diverse groups in particular have a mixed record, sometimes performing better than homogenous groups and sometimes worse. In addition, working in a well-functioning group may avoid knowledge-sharing errors [9-11].

It's generally accepted that group study is more effective than individual study [12, 13]. Group theorists have espoused multiple benefits of participating in a group as a member including: empathizing with future group members, enhancing leadership abilities, experiencing the power of group, and promoting self-awareness [14-16]. The discussion of class participation

and its assessment is broadened by the work of Vandrick et al [17], noting that class participation requires students to speak in class by asking and answering questions, making comments and participating in discussions.

Several group study strategies have been discussed in [18-24]. In [18, 22], effective classroom discussion techniques are proposed to create interactive learning atmosphere for students. In [23, 24], the instructors' roles in group discussion are discussed to further promote learner participation. In [20, 21], an evaluation is conducted on how the use of information and communication technology can support group discussion and flexible learning. However, there is a lack of systematic study on these strategies from Science Educators, and very little research testing this argument has appeared in educational journals.

In this paper, we propose a systematic group study model and evaluate the teaching performance using statistical analysis to demonstrate the successful application of the proposed model.

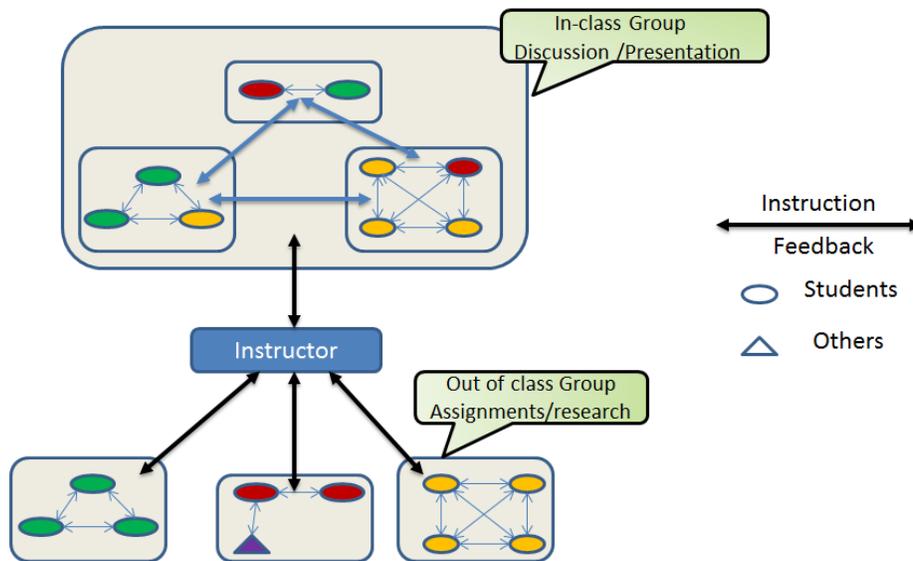

Figure 1. The pathways of the multi-way communication among participants in a group study model.

## 1. Group Study Model

A group study is a collection of individuals who cooperate on the same tasks via various ways to obtain their individual goals. In this model, the people who participate in the group discussion are not limited to the students or the instructors. Students are encouraged to search for any kinds of resources such as their supervisors, relatives, or tutors. This is especially important to those students who couldn't get sufficient support from their group members and instructors.

Several strategies are conducted in the group study model through the students consistently participating in and out of class group studies. For students, their activities may include reporting in-class group discussion results, submitting out-of-class group assignments, giving in-class presentations, and working on related research topics. For instructors, their activities may include organizing and attending group discussions, assessing, implementing, and improving group work performance. It's very important that an instructor need to attend student's group discussion. It

not only helps instructor to get instant feedback and provide immediate instructions, but also encourages the attendance of the out-of-class group homework discussions.

Figure 1 shows the pathways of the multi-way communication among an instructor, the students, and other potential participants in a group study model. In this illustration, a group consists of 2 to 4 members (no more than 4 members are allowed in a group). The black double-headed lines indicate the feedbacks and instructions between instructors and the students. The black double-headed lines indicate interactions among groups. Different colors of the group members represent different groups of participants. For example, in doing out-of-class group assignments or research, three students with green colors are in the same group. However, during in-class group discussion or presentation, these three students may select to join different groups. As you can see in our example, two “green” students are still in the same group during in-class discussion but the third “green” student has selected to partner with another “red” student. This means participants can select to join different groups during different phases of group studies.

As we know that the traditional teaching methods encourage one-way communication. Therefore, students are placed in a passive role and the instructor has difficulties in obtaining instant feedbacks, especially verbal feedbacks. Group study model can help overcome the disadvantages of such traditional teaching methods. Learning in a group can fulfill the diverse needs from diverse student audiences. Group study model makes the class offered as a combination of instructor lead and self-paced study process [25]. Generally, students can find suitable group members and become co-learners in discovering what work the best for them individually and as a group. For the students who either have trouble following instructor’s lecture, or have no problem grasping the main points of the lecture, they can enhance their understanding on the new knowledge and correct the misunderstanding of their old knowledge by attending group discussions. For students who want to develop their leadership ability, they can act as managers during their group discussions.

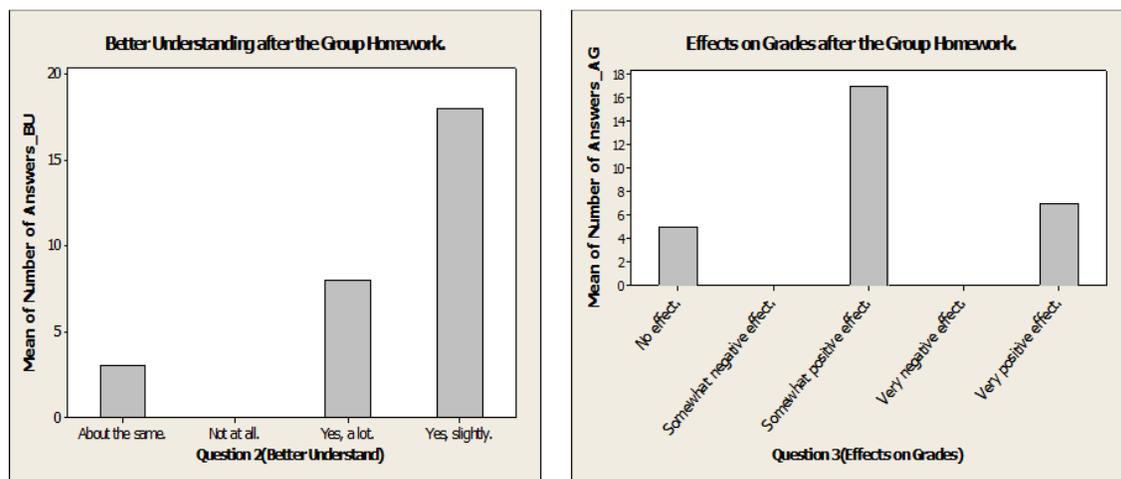

Figure 2. The effects of group homework on students’ understanding and grades. Data resource: “Survey on Group Assignment-College Algebra”.

Group study model improves teaching and learning performance. To improve the quality of group study model, the complementary strategies should be used in the same class. For example,

in-class discussions may occupy a significant amount of lecture time; students who couldn't digest the new knowledge well would have trouble to be involved into the in-class discussions; there are only limited comprehensive and advanced questions which are fit for individual homework. For However, these shortcomings can be overcome by adopting effective group discussion techniques [18, 19, 22] and by the extended out-of class homework discussions. Figure 2 shows the survey results about group homework on students' understanding and grades assigned at the last day of the college algebra class. According to the survey results, the group homework has positive effects on those who are actively involved in the group discussions; for those who are merely involved in the group discussions, the effects are limited or unclear. This is why it is important for the instructors to attend student's group discussions to promote students' involvement in the group discussions.

## 2. Experimental Methods and Quantitative Results

The Randomized Controlled Trial (RCT) [26-28] method is widely used in the areas of educational research, particularly in effectiveness research. In this method, students are randomly assigned as Before-Treatment students (BF) as the control group, and after-treatment students (AF). In the following, AF students are those who are required to do in-class group discussion and finish their group homework; BF students are those who are required to finish all of their homework problems individually. To maximize validity and minimize bias [29, 30], the instructor designs and publishes course plan at the beginning of each semester when the students and the instructor have limited knowledge of each other's. In this way, a performed double blind study [31] could ensure the random assignment.

### 3.1 Grade comparison between AF students and BF students for Trigonometry

In one Trigonometry class, students are required to finish all their homework individually. This class is used as control group. In the other Trigonometry class, students are required to do in-class discussions related to instructor's lectures and finish a portion of their homework in a group before taking the midterm tests and the final exam, except for midterm test 3. This class is used as experimental group. Both classes have more than 20 participants. The textbook, lecture notes, assigned homework questions, and exam questions are identical for both classes. Students from the experimental group work on the lecture questions with in-class discussions; and they use regular class time to finish one of their out-of-class homework questions and earn credits; the students in a group will get the same grades for the group homework. On the other hand, students from the control group obtain explanations from the instructor on all the lecture questions. To better compare the results, for midterm test 3, both groups use the same individual study strategy without using group study model.

Figure 3 shows the grade comparisons from all the exams between the experimental group and the control group respectively. The analysis is conducted using the Minitab [32] statistical analysis tool. The comparison shows that the AF medians/means of midterm test 1, midterm test 2 and final exam are significantly higher than those of BF. The differences between the two groups in mean values are significant ( $p < 0.05$ ). Also there are substantially variances in experimental groups. Outliers appear in control groups and disappear in experimental group after test 3.

There exists an inconsistent result for midterm test 3 grades ( $p > 0.05$  shown in red color in Figure 3). This is because there is no assigned group homework before the test for the experimental group. This result again shows strong evidence that doing group problems in and out-of class can improve students' grades.

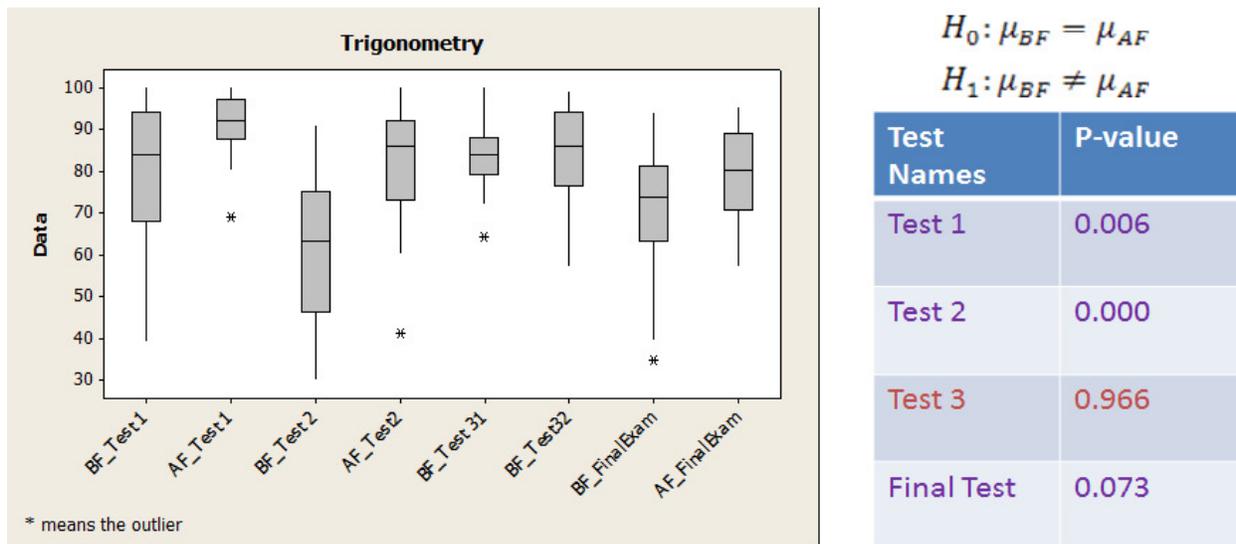

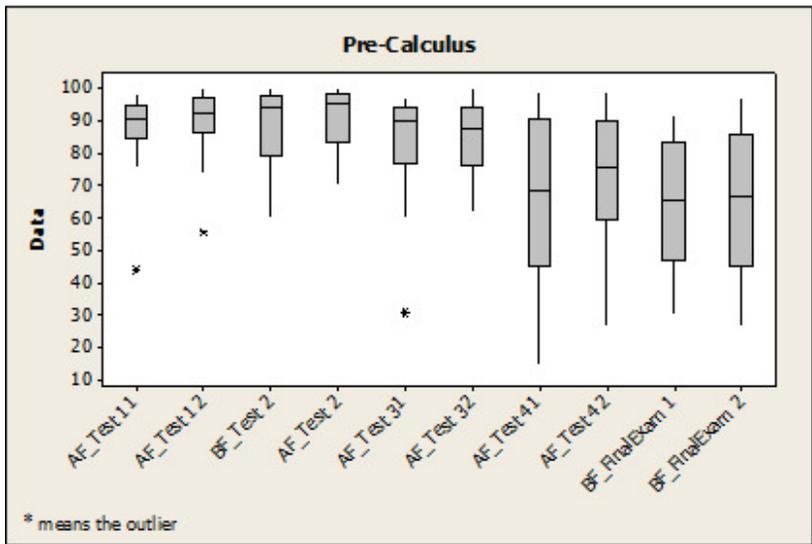

Figure 3. Comparison of student grades between the experimental group and the control group. Left: grade comparison charts; Right: p-values for each of the midterm tests and final exam. BF\_Test31 and BF\_Test32 represent the grades from the two groups for test 3 without using group study model.

### 3.2 Grade comparison between AF students and BF students for Pre-Calculus

This experiment is designed as follows. All classes have more than 20 participants. In Spring 2010 Pre-Calculus class, in-class discussions and three out-of-class group assignments are carried out before the midterm test 1, test 3, and test 4; no group study is used before test 2 and final exam. In Fall 2011 Pre-Calculus class, in-class discussion and out-of-class group assignments are carried out before all the tests except final exam. Also enhanced online individual homework is assigned except the hand in individual homework. Figure 4 shows the grade comparison from all the exams between the two classes respectively. The analysis is carried out using the Minitab tool.

Figure 4 shows that the AF median/ mean of midterm test 2 in Fall 2011 is higher than that of BF in Spring 2010. For the rest, the differences between the two semesters grades in mean values are not significant ( $p > 0.5$ ). This is due to that the same study model is used for both classes before those tests except for midterm test 2. Outliers disappear after test 3 in both classes.

In Fall 2012, in-class discussion and out-of-class group assignments are carried out before and after all of tests after test 1. From the grades of the first three tests, the level of Fall 2012 students were below those of the students in Fall 2011. However, as students work together after test 1 in groups throughout the rest of the semester in Fall 2012, their grades were generally improved and exceeded those in Fall 2011.

$$H_1: \mu_{BF} \neq \mu_{AF}$$

$$H_0: \mu_{BF} = \mu_{AF}$$

Test Names	P-value
Test 1	0.532
Test 2	0.325
Test 3	0.699
Test 4	0.588
Final Test	0.986

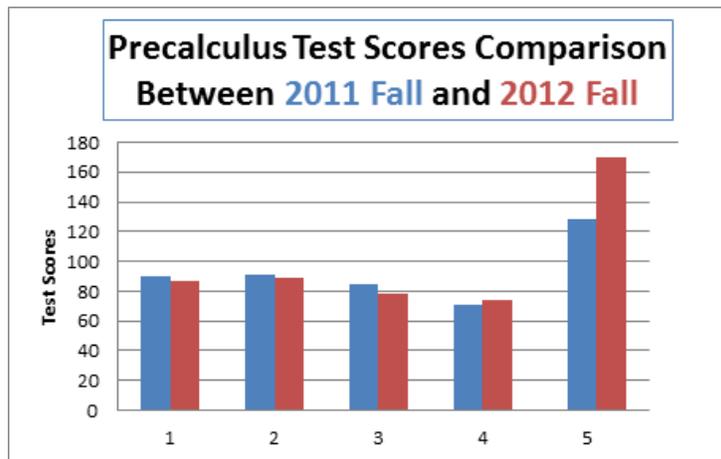

Figure 4. Comparison of student grades for all exams between two Pre-Calculus classes in Spring 2010 and Fall 2011, respectively. Top-Left: grade comparison charts; Top-Right: p-values for each of the midterm tests and final exam. AF\_Test11 and AF\_Test12 represent the grades from the two groups for test 1 using group study model. Bottom: Comparison of student grades for all exams between two Pre-Calculus classes in Fall 2011 and Fall 2012, respectively.

### 3. Future Research

Future studies are needed in order to improve the attendance of out-of-class homework, since not every student could be effectively involved in all group studies due to personality, time conflicts, or other reasons. Further research will focus on investigating the relationship between students' performance in the experimental group with their degree of participation. Other research may include improving individual student's group working skills to make the group work more productive.

# RoboParade: a Fun and Effective Way to Promote STEM Education

CJ Chung\* and Christopher Cartwright\*\*

21000 W. Ten Mile Rd, Southfield, MI 48075  
(\* ) cchung@LTU.edu (\*\* ) ccartwig@LTU.edu

## Abstract

RoboParade is an annual event in which students design, build, program, and decorate autonomous robotic floats that follow a parade route. The students must program their robots to obey a speed limit, follow a black line, and avoid other robots using sensors. RoboParade provides a hands-on experiential approach where students may improve learning science, technology, engineering and mathematics (STEM) skills. A controlled experiment shows that students who participated in RoboParade 2012 showed greater improvement on a pre-post STEM multiple choice test compared to students who did not participate.

## Introduction to RoboParade

(Figure 1) Thanksgiving RoboParade 2012 at Macomb Community College Expo Center in MI

RoboParade is a program to engage, inspire, challenge, and prepare 4th-12th grade students to pursue careers in Science, Technology, Engineering, and Mathematics (STEM). RoboParade was built on the experience and infrastructure of Robofest ([www.robofest.net](http://www.robofest.net)), an annual autonomous robotics competition originated at Lawrence Technological University (LTU) for pre-college students [Chung & Sverdlik 2001, Chung & Anneberg 2003, Chung 2005, Chung 2006, Chung 2007, Chung 2008, Chung 2009, Chung 2010, Chung & Cartwright 2010, MacLennan 2010, Chung 2011a, Chung 2011b, Chung & Cartwright 2011, Crocker 2011, Chung & Cartwright 2012].

RoboParade was developed in 2006 after recognizing the following issues from Robofest competitions:

- It seems too late for many students to develop an interest in STEM-related subjects by the time they reach late high school grades. Research has shown that early exposure to STEM initiatives and

activities positively impacts students' perception and dispositions [Dejarnette 2012; Bagiati, Yoon, Evangelou & Ngambeki, 2010; Bybee & Fuchs 2006]. Since older students lose interest in math and science [Ward-Able & Lewis 2012, Gordon 2011], [Swift & Watkins 2004] emphasize that "effective science and mathematics instruction must begin in the early grades." Students who express interest in STEM in eighth grade are up to three times more likely to ultimately pursue STEM degrees later in life than students who do not express such an interest [Tai, Liu, Maltese & Fan 2006; PCAST 2010].

- Tightly defined robotics competition rules may limit students' imagination and creativity. Fred Martin, one of the inventors of LEGO robots, suggested open-ended exhibitions might promote more creativity than fixed game competitions [Martin 2000].
- There is a need to support more local underrepresented students, especially within the city of Detroit. Statistics show that the high school graduation rate was below 50% in Detroit [Wilk 2009].
- Women are still underrepresented in fields such as engineering, computer science, and the physical sciences [National Science Board 2010, PCAST 2010].
- Some researchers found female students in particular are more likely to appreciate learning with robots than traditional STEM teaching techniques [Nourbakhsh et al. 2005, Rogers & Portsmore 2004].

Our annual RoboParade was designed to complement the competition-oriented Robofest, targeting younger students and inner city teams by providing an entry level robotics program into STEM, and freeing them from the stress of competition. The required tasks are relatively simple – line following and obstacle detection. Believed to be the world's only *autonomous* robot parade, this event has featured miniature robotic floats with moving parts, sparkling lights, and all sorts of bells and drums rolling down a parade route without remote controls (see Figure 1). RoboParade videos since 2006 can be found online at <http://www.robofest.net/roboParade.htm>

The artistic and non-competitive nature of the event seems to attract more female participants, with over 30% female participation rate as opposed to 25% in Robofest competitions [Chung & Cartwright 2012].

## **Intended Learning Outcomes**

Basic RoboParade requires an autonomous robotic float to follow a line. If it detects another robotic float in front, the robot must stop, wait, and re-start when it is cleared without any human help. In addition, the robot must observe speed limits, minimum 7 cm/second and maximum 17 cm/second. It is also required to display current average speed. Through these tasks, students are learning, experiencing, and reinforcing STEM subjects such as proportion, arithmetic operation, arithmetic mean, linear function, unit conversion, ratio, circles, logic, data analysis, speed calculation, sensors, gears, motors, force, friction, center of gravity, and many others. To join the official parade, teams must pass a qualifying test that includes a written qualifying exam. (see Appendix)

## **RoboParade 2012 Assessment Results**

### **1. Research Question**

Hypothesis  $H_1$ : Students who participate in the RoboParade have higher STEM scores than students who do not participate. RoboParade program improves STEM scores.

Null Hypothesis  $H_0$ : There is no statistical difference in STEM scores between RoboParade students and students who do not participate in the program. RoboParade students do not have higher STEM scores than non RoboParade students. RoboParade program does not improve STEM scores.

Independent variable: Group membership - participation in the RoboParade program (the experimental group) vs. no participation in the RoboParade program (the control group).

Dependent variable: STEM scores on mathematics, science, engineering, and computer technology multiple choice test.

## **2. Assessment Methodologies and Tools**

$H_1$  was tested by administering similar pre- and post-assessment tests to an experimental group and a control group (cf. Barker & Ansorge, 2007; Trudell & Chung, 2009).

An eight-item multiple choice test was developed for the anonymous pre-assessment. The following STEM topics were covered in the test:

- Five 5<sup>th</sup> ~ 8<sup>th</sup> grade level math questions relating to proportion, arithmetic operation, arithmetic mean, linear function, unit conversion, ratio, and circles based on the Grade Level Content Expectations (GLCEs) for Michigan public schools.
- One question relating to gears (engineering)
- One question relating to robot sensors (science)
- One question relating to logic and computer programming (technology)

The test also included demographic questions, which determined student grade, gender, and STEM subject interest. (see Appendix)

The post-assessment test had the same questions but they were modified while maintaining the same difficulty level. (see Appendix)

## **3. Procedure**

This research was approved by the Institutional Review Board at Lawrence Technological University. This time, we conducted pre- and post-assessments using only paper, not online, tests.

Two schools were chosen to obtain control group students: one in a suburban area and the other in downtown Detroit. Teachers from each school invited a class to complete the pre- and post-assessments.

The pre-assessment test for the experimental group was given October 12 and 13, 2012 to students who participated in RoboParade workshops at LTU. Additional RoboParade students joined the research on November 5 and 9.

The post-assessment for the experimental group was conducted the same day as RoboParade, November 17, at Macomb Community College. Four teams who were unable to attend RoboParade participated in the post-assessment on November 27.

The pre-assessment test for the control group was given October 23 and 24, 2012 during class at two schools.

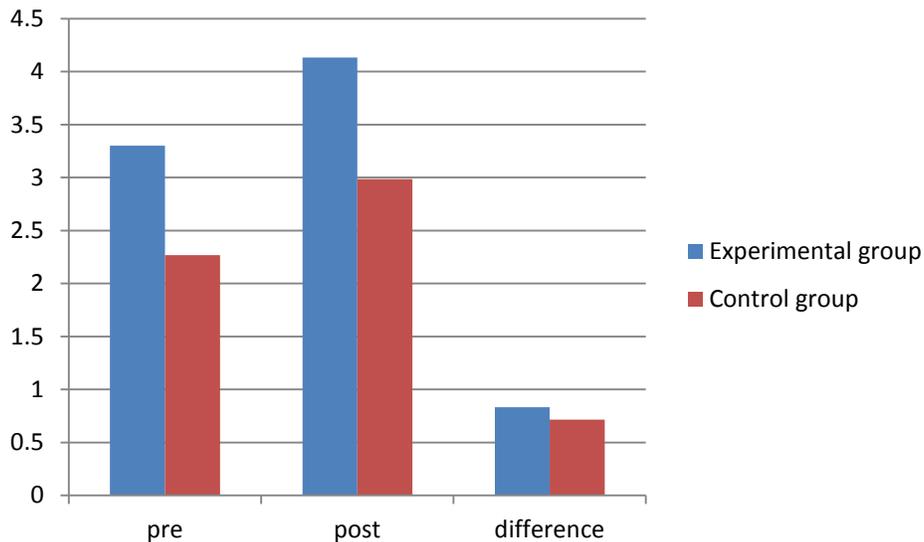

The post-assessment test for the control group was given November 29 and 30, 2012 during class at two schools.

#### 4. Results

STEM scores from 4th-10th grade experimental and control group students were analyzed. The following table shows the data from the sample populations.

		Experimental Group	Control Group
Pre Assessment	Population size	63	67
	Mean school grade	6.25	5.94
	Mean test score	3.30	2.27
	Median	3	2
	Standard deviation	1.71	1.37
Post Assessment	Population size	60	62
	Mean school grade	6.1	5.93
	Mean test score	4.13	2.98
	Median	4	3
	Standard deviation	1.48	1.38
Unpaired <i>t</i> -test probability		0.0047	0.0038
Mean test score difference (improvement)		0.83	0.72

As shown in the data above and Figure 2 below, RoboParade students' mean STEM scores improved from 3.30 to 4.13 ( $p < .0047$ ). We also found that the improvement of the Robofest group is greater than that of the control group ( $0.83 > 0.72$ ). These results suggest  $H_0$  can be rejected in favor of  $H_1$ : STEM scores are improved through participation in RoboParade programs.

(Figure 2) RoboParade 2012 STEM assessment results

## Conclusion

RoboParade is a fun activity designed to encourage students at a critical age to consider careers in STEM. RoboParade is an entry level robotics event, and targets younger students and underrepresented students (inner city and female), who tend to lose interest in science and mathematics before high school. RoboParade has been shown to be effective for STEM learning in a controlled experiment in which students that participated in RoboParade had increased gains in STEM scores compared to students who did not participate. We believe the speed display requirement and the written qualifying test asking about

speed calculation (Appendix 4) embedded into RoboParade program contributed to the greater improvement of the RoboParade group.

## Appendix

The following documents were used for RoboParade 2012 season in Michigan from Oct ~ Nov, 2012. The final Thanksgiving RoboParade was held at Macomb Community College Expo Center on November 17, 2012.

1. *RoboParade Pre-Assessment*
2. *RoboParade Post-Assessment*
3. *RoboParade Qualifying Test Checklist 2012 - List of qualifying tasks to join the official RoboParade*
4. *Written Qualifying Test*

# 1. RoboParade Pre-Assessment, 2012

This assessment can only be taken one time, once you have submitted it you cannot take it or view it again. This assessment will be completely anonymous.

---

## \* Required

Q1\*What grade are you in?

- 4th Grade or Below
- 5th Grade
- 6th Grade
- 7th Grade
- 8th Grade
- 9th Grade
- 10th Grade to 12th grade

Q2\*What is your gender?

- Male
- Female

Q3\*Are you interested in a career or job involving Science, Technology, Engineering, or Mathematics? (one or more of the four areas?)

- Not at all interested
- Probably not
- Not sure
- Somewhat interested
- Very interested

Q4\*If your dad drives 60 miles per hour for 2 hours, how many miles did he drive?

- 30
- 60
- 120
- 3600
- I don't know

Q5\*If at noon your mom's car is at mile marker 20 and at 2:00 PM your mom's car is at mile marker 100, what is the average speed of your mom's car?

- 20 miles per hour
- 40 miles per hour

- 80 miles per hour
- 100 miles per hour
- I don't know

Q6\* A toy car moves forward 15 cm for one rotation of two identical wheels. How many rotations are needed for the same toy car to move forward 75 cm?

- 5
- 15
- 60
- 75
- I don't know

Q7\* Choose one that is *not* correct

- 5.4 is greater than 13.0
- 5.4 is less than or equal to 13.0
- 1.8 is less than or equal to 1.8
- 2 is greater than or equal to 1.8
- I don't know

Q8\* What is the radius of a circle when its circumference is 30 cm?

- 3.09 cm
- 3.14 cm
- 4.77 cm
- 9.55 cm
- I don't know

Q9\* A toy car has a wheel with a diameter of 5 cm. How many rotations of the wheel are required for the car to travel a distance of 30 cm?

- .95 rotations
- 1.91 rotations
- 6 rotations
- 9.55 rotations
- I don't know

Q10\* If a big gear is driving a little gear (this is called gearing up), then the little gear will

- Spin faster, and have decreased torque
- Spin slower, and have increased torque

- Spin faster, and have increased torque
- Spin slower, and have decreased torque
- I don't know

Q11\*If you use a light sensor with reflected light mode, which of the following will reflect the greatest amount of light back to the sensor

- black electrical tape, 2cm away
- black electrical tape, 10 cm away
- white computer paper, 2 cm away
- white computer paper, 10 cm away
- I don't know

Submit

Powered by [Google Docs](#)

## 2. RoboParade Post-Assessment 2012

This assessment will be completely anonymous.

---

\* Required

Q0\*Did you take RoboParade Pre-Assessment this fall 2012 during the workshop at LTU \*or\* your school (Winans Academy, Southfield Christian, MCS, or FLIC)?

- Yes; Go on to the next question
- No; Do NOT take this test

Q1 \*What grade are you in?

- 4th Grade or Below
- 5th Grade
- 6th Grade
- 7th Grade
- 8th Grade
- 9th Grade
- 10th Grade to 12th Grade

Q2 \*What is your gender?

- Male
- Female

Q3\* Are you interested in a career or job involving Science, Technology, Engineering, or Mathematics? (one or more of the four areas?)

- Not at all interested
- Probably not
- Not sure
- Somewhat interested
- Very interested

Q4\* If your dad drives 50 miles per hour for 2 hours, how many miles did he drive?

- 25
- 50
- 100
- 250
- I don't know

Q5\* If at 1:00PM your mom's car is at mile marker 30 and at 3:00 PM your mom's car is at mile marker 150, what is the average speed of your mom's car?

- 30 miles per hour
- 60 miles per hour
- 120 miles per hour
- 180 miles per hour
- I don't know

Q6\* A toy car moves forward 10 cm for one rotation of identical wheels. How many rotations are needed for the same toy car to move forward 40 cm?

- 4
- 16
- 48
- 80
- I don't know

Q7\* Choose one that is \*not\* correct

- 12 is greater than 9.8
- 9.8 is less than or equal to 12

- 3.4 is less than 5.7
- 5.7 is greater than or equal to 9.8
- I don't know

Q8\*What is the radius of a circle when its circumference is 20 cm?

- 2.52 cm
- 3.18 cm
- 6.37 cm
- 125.66 cm
- I don't know

Q9\* A toy car has a wheel with a diameter of 6 cm. How many rotations of the wheel are required for the car to travel a distance of 48 cm?

- 1.27 rotations
- 2.55 rotations
- 8 rotations
- 15.23 rotations
- I don't know

Q10\*If a little gear is driving a big gear (this is called gearing down), then the big gear will

- Spin faster, and have decreased torque
- Spin slower, and have increased torque
- Spin faster, and have increased torque
- Spin slower, and have decreased torque
- I don't know

Q11\*If you use a light sensor with reflected light mode, which of the following will reflect the least amount of light back to the sensor

- black electrical tape, 1 cm away
- black electrical tape, 10 cm away
- white computer paper, 1 cm away
- white computer paper, 10 cm away
- I don't know

### 3.

## Qualifying Test Checklist 2012

Team-ID: \_\_\_\_\_

Team Name: \_\_\_\_\_

Test Item	Details	Pass / No Pass	Note
Line following	Clockwise, counter-clockwise		
Object Detection	Wait and restart		
Speed display			
Speed limit	7cm ~ 17cm		
Rear bumper	1" high from the floor; at least 5"x2.5"		
Length (a unit)	Less than 35cm		For a float with multiple trailers following it, each 35 cm long is OK
Written exam			

Flag Number Assigned: \_\_\_\_\_ (without passing Written exam, a team may get a flag)

Judge Signature: \_\_\_\_\_

## 4. Written Qualifying Test

### RoboParade Quiz (Type A)

Team ID: \_\_\_\_\_

Team Name: \_\_\_\_\_

Student Names: \_\_\_\_\_

---

Q1. The above toy car drove straight 8 wheel rotations for 4 seconds. What was the average speed (cm / sec)? The circumference of the wheels is 20cm. Assume there is no slip or idle rotations.

Q2. How many centimeters will it drive forward straight for 5 seconds if the average speed is 15cm per second? Assume there is no slip or idle rotations.

**Title of Submission:** CAPSTONE OPTIONS AND GRADUATION RATES: A CASE STUDY

## CAPSTONE OPTIONS AND GRADUATION RATES: A CASE STUDY

### Abstract

In a time of lower enrollments in programs designed for adult learners, graduate faculty members and program administrators are looking for ways to increase graduation rates thus retain students in programs. This paper is a case study describing how the faculty of a MA degree program at Regis University discovered factors contributing to a lower than expected graduation rate and how a change in one component of the program has helped to resolve that problem. A new and unique course was developed to provide an alternative for students to complete their capstone requirement, while retaining the academic rigor and quality of the program. The course is described as well as its impact on and contribution to an increasing graduation rate for the program.

### Background

Regis University is a Jesuit institution located in Denver Colorado. The university comprises colleges: Regis College (traditional student), Rueckert-Hartman College for Health Professions, and the College for Professional Studies. The College of Professional Studies (CPS) comprises four schools: Management, Education and Counseling, Computer and Information Sciences and Humanities and Social Science. All three colleges share the same Regis University (2013) mission:

Regis University educates men and women of all ages and faiths to take leadership roles and to make a positive impact in a changing society. Standing within the Catholic and United States traditions, we are inspired by the particular Jesuit vision of Ignatius Loyola. This vision challenges us to attain the inner freedom to make intelligent choices. We seek to provide value-centered undergraduate and graduate education, as well as to strengthen commitment to community service. We nurture the life of the mind and the pursuit of truth within an environment conducive to effective teaching, learning and personal development.

Consistent with Judeo-Christian principles, we apply knowledge to human needs and seek to preserve the best of the human heritage. We encourage the continual search for truth, values and a just existence. Throughout this process, we examine and attempt to answer the question: "How ought we to live?"

As a consequence of Ignatius Loyola's vision, particularly as reflected in his Spiritual Exercises, we encourage all members of the Regis community to learn proficiently, think logically and critically, identify and choose personal standards of values, and be socially responsible. We further encourage the development of the skills and leadership abilities necessary for distinguished professional work and contributions to the improvement and transformation of society.

Within the CPS School of Humanities and Social Sciences, the individualized Master of Arts (MA) program is an innovative program that began in 2005 to serve students who could not find a graduate degree to match their goals and interests. The MA mission and goals (Regis University, 2013) reads:

Regis University's Master of Arts degree provides an individually designed, multidisciplinary and academically rigorous program for students to plan a course of study unique to their own graduate learning needs. The MA degree is designed for each individual learner and focused on achievement of learning outcomes designated by each student. The MA is a flexible, student-centered program that enhances students' educational choices for intellectual, professional, and personal growth. A collaborative working relationship with the faculty advisor assists students to discover new perspectives and insights. Rather than take a disciplinary or occupational approach, the focus of this degree is on getting learners back in touch with foundational ways of thinking, engaging both right and left brain hemispheres. Courses and degree programs in the MA are designed to use a variety of learning activities and focused on whole brain engagement. Courses are delivered to students in the classroom, online and by Directed (Independent) Study. Goals of the MA degree are:

1. **Communication:** The student will exhibit graduate level, written, verbal, auditory, and visual, communication skills appropriate for their discipline, and will demonstrate the ability to use contemporary technology as a tool in effective communication. The student will communicate at a professional level that demonstrates mastery of his or her discipline.
2. **Content Knowledge:** The student will demonstrate mastery of the discipline content and the subject matter. Their final portfolio will demonstrate the relationship of course content to practical examples and applications. The student will provide comprehensive, in depth analysis of details, facts, and concepts in a logical sequence.
3. **Critical Thinking:** The student will demonstrate higher-level of critical thinking necessary for graduate level work. The student will present examples of problem solving or critical thinking, while drawing logical conclusions that are not immediately obvious. The student will develop genuine intellectual ideas and appropriately support them with facts, arguments, examples, world view illustrations, and reflection.
4. **Life Long Learning:** The student will demonstrate commitment to the principles of lifelong learning by setting clear and attainable goals and defining pathways to achieving success.
5. **Ethics and Diversity:** The student will demonstrate a clear understanding of and a commitment to ethical decision making in a diverse world.
6. **Service to Others:** The student will demonstrate a clear understanding of and a commitment to leadership in serving others.

The unique aspect of the MA degree is that degrees are built using the interdisciplinary content available across the College of Professional Studies. This allows students to use courses from any graduate degree programs offered by Regis, and to build Directed Study courses if no appropriate course exists. Each individual student program is built on student career goals that are discussed and documented during the first advisor meeting. There are currently 435 students divided between 1 full-time, three 0.75 and one 0.5 faculty advisors.

Each student meets with an advisor as soon as they are accepted into the program. During this meeting students write out three major learning goals for the degree. Together with the advisor courses are chosen to meet these goals. Some courses are chosen from existing courses offered at Regis University. If some of the necessary courses do not exist at Regis, students have the option of transferring in up to six credits (two courses), or designing coursework in a Directed Study format. The use of Directed Study allows students to fine tune the degree to very specific learning goals. Since the learning goals of students vary widely, so do their specializations. However, specializations are related limited to those related to the Humanities and Social Sciences

Tying these disparate degrees together are the core courses: MAPC 601 Graduate Research, MAPC 602 Ethics and Multiculturalism, which are cornerstone courses; MAPC 603 Interdisciplinary Studies, which is a keystone course; and MAPC 688/696 or MAPC 694, which are the capstone options.

The capstone options were designed originally as a two course series that would provide a forum for students to demonstrate mastery of a discipline. Students had a variety of options ranging from a creative project (art or writing) to a literature review based research project, to an internship or experiential project. These options were highly successful for some students, but were also, unfortunately, overwhelming for others. Many students were struggling to develop and complete a capstone project in 16 weeks, resulting in many students not completing their degree.

### The Problem

The MA program has been operational for eight years and has conducted regular assessments of academic performance of its students in an annual review of the quality of written work submitted in the core courses and the quality of capstone projects. Early assessments (2005 – 2007) of graduation rates were conducted, indicating that approximately 60 percent of MA students starting the program were graduating, however, in recent years no regular assessments of the rate at which students were graduating from the program were conducted. No specific, disaggregated data describing graduation rates were available until 2012. Recent program assessment data for the MA degree revealed that average time to

degree completion was 2.9 years in 2007 and 2008 while it was 2.5 years in 2009 and 2.2 years in 2010 (See table 1 below).

**Table 1. Average Years to Complete Degree**

Year	Count	Years to complete
2007	50	2.9
2008	66	2.9
2009	52	2.6
2010	29	2.2

Research conducted by Collins, Coddington and Williams (2012) involved examination of graduation rates of students in Regis University CPS master's degree programs. The MA degree was one of four master's degree programs at Regis University included in this study. One of the findings of this study was that for a period of three years (2008 – 2010) a significant number (37%) of MA students completed all but the capstone/thesis requirements for the degree and did not graduate. The authors believe that this statistic is one possible explanation for the fairly dramatic drop in average time to completion between 2008 and 2010. One of the recommendations of the Collins, Coddington and Williams (2012) study was to examine the possibility that stringent capstone requirements were a roadblock to graduation (p.22). Therefore we concluded that the problem in this case study project is that since current and reliable data regarding graduation rates for the MA degree were not examined and since a high percentage of students reaching the end of their MA degree did not graduate in 2008 through 2010, that students were not graduating at acceptable rates.

#### Analysis of the Problem

The MA faculty met in September, 2011 to discuss this problem and begin looking for a solution. While no additional data was collected to help define the source of the problem at that time, the need was confirmed through anecdotal experiences of faculty members. Discussion of possible solutions was initiated. While the faculty was interested in finding a solution they were clear about retaining the rigor and success of the program while at the same time finding a way to ensure that students succeed. The

faculty designated one member to examine models for completing master's degree requirements at similar colleges and universities and bring forward a proposal.

The models examined included some programs in which requirements were similar (two courses) to those of the MA program, while others required the development of a research proposal that did not require enrollment, followed by a 3 credit course, and yet other programs that required a comprehensive examination followed by a thesis requirement of 3 – 9 credits. This evaluation of completion requirements included both capstone projects and thesis projects. Generally, the faculty member who conducted this review found no model that that appeared to retain the rigor of a final master's project/thesis while providing students with an optional way to demonstrate mastery. Further discussion among the faculty resulted in a decision to explore possible ways to incorporate the concept of comprehensive examinations into a single course that would retain rigor and provide an alternative way to complete the capstone requirement of the MA degree.

#### Addressing the Problem

A course proposal was developed and brought to the faculty and the department chair for discussion and approval. The proposed course title was MAPC 696 MA Comprehensive Capstone. The intended purpose of the course was to infuse the concept of comprehensive examination into a single course that allowed students to demonstrate mastery of their specialization by writing comprehensive responses to questions posed by the faculty and by the student. While most master's capstone and thesis projects focus on a single component of what the student learned in their specialization, the intent of this course was to allow the student to demonstrate their learning in a broader context. Thus a new course proposal was developed. The course was designed as an accelerated classroom based course meeting one evening a week for eight weeks. The proposed course syllabus was approved by the faculty and the department chair to be offered first as an experimental course and was to be revised and approved for additional offerings. The initial course syllabus is located in Appendix A.

The course was subsequently revised to be offered in a week-end intensive format by another member of the faculty. The week-end intensive format was also accelerated in that it is offered within an

eight week term however classroom meeting times were scheduled for eight hours daily on two Saturday/Sunday weekends. The total classroom meeting time was the same (32 contact hours) as for the one evening per week schedule. Minor changes were made in the content of the course however course assignments were changed significantly to allow for a stronger focus on writing comprehensively in response to questions posed by the faculty and enrolled students. Note in the syllabus under the week 5 and six assignments that students were asked to submit appropriate and relevant questions on which to write, given their specialization. In addition, an online course companion shell was added to the course providing students with a place to engage in an ongoing asynchronous discussion between classroom sessions. The revised syllabus is located in Appendix B.

Subsequently the revised course was offered at least once each semester for a year, with additional minor refinements in language, specifically in the descriptions of each of the four required assignments. Discussion questions were added to the online course companion shell for each of the eight weeks of the course. Further, more specific requirements were added for participation in the online discussions. In the most recent course offering, (Summer 2013) the University designated this course as a pilot blended course, the intent of which was to pioneer a new format for the CPS School of Humanities and Social Sciences, and to clear the way for development of other courses into a blended format that included both online and classroom components. Thus the course underwent further revision that upgraded and refined the classroom meeting sessions as well as the online portion of the course. Note that course outcomes were refined and the course assignments were clarified and made more specific. In addition the online components of the course were expanded so that the course included at least as much asynchronous activity as synchronous. To bolster the synchronous activity of the course both distant and local students were asked to participate in the final presentations using Adobe Connect in a way that allowed all students to see and participate in responding to all presentations. The syllabus for the blended course is located in Appendix C.

## Evaluation and Discussion

The original purpose of developing and offering MAPC 694 was to offer an alternative to students for completion of their MA degree, while at the same time to maintain the rigor, quality and success of the MA program. Since the major problem identified by the faculty was that many students were successfully completing their course content requirements and failing to complete their capstone requirements, the next step for the authors was to evaluate the success of the course in addressing its purpose and objectives. In short, we wanted to determine if graduation rates were actually increasing as a result of offering students this option.

The authors collected data from student records regarding graduation rates prior to and after the inception of MAPC 694 Comprehensives Capstone. A cohort model for examination of the data was used. This model followed students who enrolled in the MA program each year from the time of their initial enrollment to the time of their graduation. The table below presents graduation rates using this model:

**Table 2. Graduation Rates by Academic year**

Academic Year	Number in Cohort	Number graduated	Rate
2006 – 07	76	47	62%
2007 – 08	88	56	64%
2008 – 09	121	82	68%
2009 – 10	102	74	73%
2010 – 11	92	75	82%

While the table indicates a clear trend toward higher graduation rates for this period, data is still not available for academic years 2011 – 12 and 2012 – 13. This data is simply not complete yet as the average time to completion of degrees for MA students is 2.2 years. Thus cohorts that include students starting during these last two years would not have been enrolled in the program long enough to provide an accurate graduation rate. However, Table 2 does clearly indicate a relatively high graduation rate is being achieved in this program.

The authors also examined data consisting of the number of graduates in each of the cohorts above and how many of those graduates completed a traditional two course capstone project and how many completed the new Comprehensives Capstone course. The table below presents this data:

**Table 3. Comparison of Students Completing Traditional vs. New Capstone Courses**

Academic Year	Traditional Capstone Students	New Capstone Students	Total
2009 – 10	48		48
2010 – 11	56		56
2011 – 12*	72 (83%)	12 (17%)	84
2012 – 13	50 (65%)	26 (35%)	76

\*MAPC 694 Comprehensives Capstone was first offered in Fall, 2011

Note that MAPC 694 Comprehensives Capstone made a significantly stronger contribution to the numbers of students completing capstones each academic year since its first offering in 2011. While it is not possible with the current data to determine the number of students who might not have completed their MA degree without the Comprehensives Capstone option, the data does suggest that the new capstone option is having a positive impact on the number of students graduating from the MA degree. The data does demonstrate that graduation rates have been steadily increasing (see Table 1) and the Comprehensives Capstone course has made a progressively stronger contribution (See Table 2) to the number of students completing capstones in the two most recent academic years.

While this paper does not present conclusive evidence that Comprehensives Capstone improved the graduation rate of the MA degree, the data does suggest that it has made a significant contribution improving the results of the degree. The authors recommend that relevant data collection and evaluation should continue in an ongoing effort to describe and document the contribution made by the Comprehensives Capstone course toward improving graduation rates for the MA program. In addition, relevant qualitative data still needs to be collected to discover whether students would have completed their degree using the traditional two course requirement and to illuminate the satisfaction of students with the course and its impact on what they took away from their MA degree.

## Appendix A. Initial Course Syllabus

### MAPC 694 MA Comprehensive Capstone

#### Course Description

Students design discipline specific deep questions focused on core competencies in their subject areas, write graduate level responses, and integrate content from course work and research as necessary to provide a comprehensive response to each question. Questions include specific connections to the Regis Mission.

#### Course Goals

Students who have completed this course should be able to:

- Articulate the role of innovation in and across disciplines
- Analyze effective leadership across disciplines
- Evaluate ethical/spiritual issues across disciplines
- Compare and contrast rhetoric and critical thought across disciplines.
- Analyze a case study within a specific discipline.

This course will explore the following issues:

- Explore the ways that specific disciplines address the main elements of the Regis mission:
  - How ought we to live
  - Service to others
  - Learning brings up closer to God.
- Create and analyze case studies across disciplines
- Create a curriculum for teaching innovative approaches and applications of discipline
- Explore and apply design thinking.
- Explore the illusions of our disciplines.
- Explore leadership across disciplines

#### Course Prerequisites:

To be completed as the last course and requires advisor approval.

#### Required Course Text(s):

Handouts and articles on e-reserve

Regis Traditions booklet

#### Core Philosophy

This course is designed to celebrate the framework that makes Regis superior to other universities, the Regis Core Philosophy. When you read the questions and assignments, be aware that they embody the principles of Jesuit teachers, many of whom gave their lives, for publicly advocating such beliefs. Principles, such as *spreading knowledge, thinking critically, embracing personal standards, being socially responsible* and *becoming leaders in a quest to improve society*, are bequeathed to us by those

intrepid global educators. Classroom discussions, debates, documentaries, group projects and essay assignments are all designed with these principles in mind. They enable you to combine knowledge with principles, and apply to both your personal life and your world through analysis, synthesis and final evaluation. Embrace this section and use it to become a better learner today for tomorrow's challenges.

**Assignments:**

<b>Week</b>	<b>Topics</b>	<b>Readings— See content for details</b>	<b>Activities</b>	<b>Deliverables and Points</b>
One	Course Overview Regis Mission Discipline break-out	Regis Tradition booklet  Hero's journey	Discussions Small group presentation	
Two	Psychological and logical fallacies	e-reserve articles on psychological and logical fallacies	Discussion and classroom activities on reading	
			Short paper due on ethics or spiritual issues	
Three	Leadership How to present	e-reserve articles on leadership	Discussion and classroom activities on reading	
			Short paper due on fallacies	
Four	Innovation	e-reserve articles on innovation	Discussion and classroom activities on innovation	
			Presentation on leadership	
Five	Foundations of discipline Review of interdisciplinary perspectives	Article on discipline presented by student	Review of journal Article in class presentation	
			Discussion on interdisciplinary links	
Six	Preparation for presentations in symposium	Articles Pick topic for final presentation	Review of Journal Article	
Seven	Case study reviews	Articles	Review of Journal Article	
			Group activities on case studies	

Eight	Final presentations NOTE: presentation at symposium is required.	Articles	Final classroom presentation	
			Final Paper	
<b>Total Points</b>				

Criteria for assessing and grading will be discussed throughout the course. All products will be assessed with an emphasis on depth of understanding and connections made between content of readings and discussions.

## Appendix B. Revised Course Syllabus

### MAPC 694 MA Comprehensive Capstone

#### Course Description

Students design discipline specific deep questions focused on core competencies in their subject areas, write graduate level responses, and integrate content from course work and research as necessary to provide a comprehensive response to each question. Questions include specific connections to the Regis Mission.

#### Course Goals

Students who have completed this course will be able to:

- Demonstrate mastery of their specialization by creating thoughtful, analytical and comprehensive responses to questions posed by the facilitator and the learner.
- Articulate the role of innovation in and across disciplines
- Analyze effective leadership across disciplines
- Evaluate ethical/spiritual issues across disciplines
- Compare and contrast rhetoric and critical thought across disciplines.
- Analyze a case study within a specific discipline.

This course will examine the following issues:

- Explore and apply the ways that specific disciplines address the main elements of the Regis mission:
  - How ought we to live
  - Service to others
- Analyze case studies within the learner's specialization and across related disciplines
- Create innovative approaches to and applications of the learner's specialization or discipline.
- Explore leadership within the learner's specialization and across related disciplines.

#### Core Philosophy

This course is designed to celebrate the framework that makes Regis superior to other universities, the Regis Core Philosophy. When you read the questions and assignments, be aware that they embody the principles of Jesuit teachers, many of whom gave their lives, for publicly advocating such beliefs. Principles, such as *spreading knowledge, thinking critically, embracing personal standards, being socially responsible* and *becoming leaders in a quest to improve society*, are bequeathed to us by those intrepid global educators. Classroom discussions, debates, documentaries, group projects and essay assignments are all designed with these principles in mind. They enable you to combine knowledge with principles, and apply to both your personal life and your world through analysis, synthesis and final evaluation. Embrace this section and use it to become a better learner today for tomorrow's challenges.

**Course Prerequisite:**

This course is to be taken as the last or next to last course. Advisor approval is required.

**Required Course Material(s):**

Handouts

Regis Traditions booklet

**Other Course Materials:**

The student will use appropriate library resources to complete the written assignments.

**Course Assignments:**

**Week 1 and 2:** Prepare a 10 page paper (APA format) that describes the specialization you have completed as part of your MA degree. You may include a description of all courses you have taken to date and an overview of how they have contributed to the development of your knowledge and skills in your field of study. You may refer back to the material you developed for MAPC 603 Graduate Interdisciplinary Study (if you took this course) as a starting point. Please email this assignment directly to the facilitator by the Friday before the first class meeting. Also, prepare a presentation of this paper to take place during the first class meeting. At the end of your presentation be prepared to discuss how your knowledge and skills might be applied in disciplines (specializations) related to your own. You may use appropriate graphics to support your presentation. (25% of final grade) Post a self-introduction on the discussion forum. Please post questions or respond to other students' postings in a way that will help them feel welcome.

**Week 3 and 4.** The second paper for this course will be a response to the following question: As an expert in my field of study, how do I expect to apply Jesuit ideals and principles in my work and/or in other facets of my life? This paper should be a minimum of 10 pages in length (APA format) and should use the Traditions Booklet that will be provided in the first class meeting as a primary resource. Please include in your discussion how you see Jesuit ideals being applied in disciplines (specializations) related to your own. You may also add other resources as you find necessary and helpful. Please include a title page and reference page in addition to the text of your paper. Please submit your paper to the facilitator by Sunday evening of Week four. Please post in the discussion forum the questions you have about this assignment and or a draft of part or all of your response to the question at any time before the paper is due. Be prepared to discuss your paper at the second week-end class meeting. (25% of final grade)

**Week 5 and 6** Students will write a question and prepare a response to that question in a written paper of not less than 10 pages (APA format) plus title and reference pages. The question should integrate the concepts of innovation and leadership into how mastery of their discipline is to be achieved. The question should be approved by the facilitator by the end of week 4. The response paper can take any format deemed appropriate by the student. You may be innovative and creative in deciding about the format of the paper. Include in your paper a discussion of how you see innovation and leadership being applied in disciplines (specializations) related to your own. Please post in the discussion forum questions you have about this assignment and or a draft of part or all of your question or your response to the question at any

time before the paper is due. Be prepared to discuss your paper at the second week-end class meeting. (25% of final grade)

**Week 7 and 8** You have been asked to prepare and present a paper at a professional conference in your discipline. In most professional conferences presentations are made to a group of people attending the conference and are interested in learning more about the topic of the presentation. Prepare a paper (APA format) that is a minimum of 10 pages not including a title and reference page that is could be presented at such a conference. You may select a topic or issue about which you have specialized knowledge in your field of study. The paper should demonstrate your ability to analyze and synthesize information (describe how you make sense of complex information), to think critically (describe what is important and why) and to apply your knowledge to the challenges of the future (describe how you would apply your knowledge in your life or in your work. You may share your paper with other members of the class for feedback prior to submitting the final copy to the facilitator. Please submit the final copy of your paper by Friday of Week 8.. The facilitator will provide final feedback and your course grade the following week. (25% of final grade)

### **Presentation Requirement**

Learners will be asked to make a presentation of their final assignment. Arrangements for presentations will be discussed in the classroom meetings

## **Appendix C. Blended Format Course Syllabus**

### **MAPC 694 MA Comprehensive Capstone**

**COURSE TITLE: MA Comprehensive Capstone**

**COURSE NUMBER: MAPC694**

**COURSE DESCRIPTION:**

Students design discipline specific deep questions focused on core competencies in their subject areas, write graduate level responses, and integrate content from course work and research as necessary to provide a comprehensive response to each question. Questions include specific connections to the Regis Mission.

**PREREQUISITE COURSES:**

This course is to be taken as the last or next to last course. Advisor approval is required.

**COURSE OUTCOMES:**

Upon completion of this course, learners should be able to:

1. Create thoughtful, analytical and comprehensive responses to questions posed by the facilitator and the learner.
2. Articulate the role of innovation in and across disciplines.
3. Analyze effective leadership across disciplines.
4. Evaluate ethical/spiritual issues across disciplines.
5. Compare and contrast rhetoric and critical thought across disciplines.
6. Explore and apply the ways that specific disciplines address the main elements of the Regis mission (How ought we to live? Service to others)
7. Create innovative approaches to and applications of the learner's specialization or discipline.
8. Explore leadership within the learner's specialization and across related disciplines.

**COURSE MATERIALS:**

**Required Resources:**

The facilitator will provide an electronic copy of the Regis Traditions booklet to be used in preparing Assignment 2. In addition, other documents or links to those documents will be provided for use in preparing Assignment 3.

**Optional Materials:**

The student will use appropriate library resources to complete the written assignments.

Documents to help you prepare for Assignment 3:

Leadership articles are listed below. You may need to copy these addresses into your browser.

### **PRE-ASSIGNMENT:**

Prepare a presentation to take place during the **first class meeting (Saturday May 11, 2013)**. The presentation should describe the specialization you have completed in your MA degree. You may include a description of all courses you have taken to date and an overview of how they have contributed to the development of your knowledge and skills. You may refer back to the material developed for MAPC 603 Graduate Interdisciplinary Study (if you took this course) as a starting point. Presentations are expected to be no longer than 15 minutes so please practice in advance. You may use Power Point or other graphics if you wish. A question and answer period will follow each presentation.

**FIRST CLASS MEETING: SATURDAY MAY 11, 2013 9:00 AM TO 5:00 PM**

**SECOND CLASS MEETING: SATURDAY JUNE 8, 2013 9:00 AM TO 5:00 PM**

### **COURSE ASSIGNMENTS AND ACTIVITIES:**

**All assignments are to be submitted in the online course Shell no later than Sunday at 12 midnight following the end of Weeks 2, 4, 6, and 8. Please submit them in the Assignment Drop Box.**

Please post a self-introduction on the discussion forum by Wednesday, May 8, 2013. Please post questions and/or respond to other students' introductions in a way that will help them feel welcome. In week 2 post a description of what you are writing in your first paper...an executive summary might be informative for other students.

**First Assignment:** Prepare a 10-page paper (APA format), not including title and reference page, that describes the specialization you have completed in your MA degree. You may include a description of all courses you have taken to date and an overview of how they have contributed to the development of your knowledge and skills in your field of study. You may refer back to the material you developed for MAPC 603 Graduate Interdisciplinary Study (if you took this course) as a starting point. Also, prepare a presentation of this paper to take place during the first class meeting (May 11, 2013) *Presentations are*

*expected to be no longer than 15 minutes so please practice in advance.* At the end of your paper and your presentation discuss how your knowledge and skills might be applied in disciplines (specializations) related to your own. You may use appropriate graphics to support your presentation. Please post a summary of your paper in the online discussion forum. **Please submit the written assignment in the online course “Assignment Drop Box” no later than the end of the day on Sunday, May 18. 23 points (23% of final grade)**

**Online discussion question for Week 2:** What led you to choose Regis University for your MA degree and how do you expect to use your degree when you finish?

The **second assignment** for this course will be a response to the following question: “As an expert in my field of study, how do I expect to apply Jesuit ideals and principles in my work and/or in other facets of my life?” This paper should be a minimum of 10 pages in length (APA format), not including title and reference pages, and should use the Traditions Booklet you received as an email attachment with the syllabus as a primary resource. Please include in your discussion how you see Jesuit ideals being applied in disciplines (specializations) related to your own. You may also use other resources as you find necessary and helpful. **Please submit your paper by the end of the day on Sunday, June 1, 2013, in the Assignment Drop Box. 23 points (23% of final grade).**

**Please read the instructions for the third assignment below. Note that you will need to select a question to write about and get approval from the instructor by the end of week 4.**

Please post in the discussion forum an executive summary of your paper or a draft of part or all of your response to the question at any time at any time during Week 3 and 4 before the paper is due.

**Online discussion for Week 3:** What are your thoughts about the phrase “How ought we to live?”

**Online discussion for Week 4:** What meaning does the phrase “Leaders in service of others” have for you?

For the **third assignment**, students will write a question and prepare a response to that question in a written paper of not less than 10 pages plus title and reference pages. The question and your response should integrate the concepts of **innovation and leadership** into how mastery of your specialization is to be achieved. **The question should be approved by the facilitator by the end of week 4.** The paper can take any format deemed appropriate by the student. You may be innovative and creative in deciding about the format of the paper. Include in your paper a discussion of how you see innovation and leadership being applied in specializations related to your own. **Please submit your paper in the Assignment Drop Box by the end of the day on Sunday, June 15, 2013. 23 points (23% of final grade).**

Please post in the discussion forum an executive summary and/or a draft of part or all of your question and response at any time during weeks 5 and 6 before the paper is due. Be prepared to discuss your paper at the second week-end class meeting.

**Online discussion for Week 5:** Give one example of a competent leader in your field of study or work. What are the characteristics, traits and or actions of this person that makes him or her a true leader?

**Online discussion for Week 6:** Give one example of an innovative practice in your field of study or work. Why is this practice considered innovative and how do you think it will advance knowledge and/or practice for the future?

The **final assignment** is based on a simulation exercise. Assume that you are a professional in your field of study. You have been asked to prepare and present a paper at a professional conference in your discipline. In most professional conferences presentations are made to a group of people attending the conference and who are interested in learning more about the topic of the presentation.

Prepare a paper (APA format) that is a minimum of 10 pages not including a title and reference page that could be presented at such a conference. You may select a topic or issue about which you have specialized knowledge in your field of study. The paper should demonstrate your ability to analyze and synthesize information (describe how you make sense of complex information), to think critically (describe what is important and why) and to apply your knowledge to the challenges of the future (describe how you would apply your knowledge in your work or in your life). This should be an example of your very best work. Be creative with this assignment and have some fun! Post a summary of your paper in the discussion forum at any time during weeks 7 or 8 requesting feedback from other students. **Please submit the final copy of your paper in the Assignment Drop Box by the end of the day on Sunday, June 29, 2013. 23 points (23% of final grade)** The facilitator will provide final feedback and your course grade later that week. Final Course grades will be submitted on the Thursday.

#### **Presentation Requirement (Included in participation grade)**

Students are asked to make a presentation of their final assignment at or near the end of the 8<sup>th</sup> week of the term. While arrangements for presentations will be discussed in the final classroom meeting, students should plan early to schedule their presentation. A single day or evening convenient for students will be scheduled for these presentations. I will likely invite your faculty advisor to these sessions so we will schedule them as early as possible. The presentations should be approximately 15 minutes in length followed by a short question/answer period. PowerPoint or other graphics are encouraged.

#### **Participation Requirement 8 points (8% of final grade)**

Students are expected to participate in the discussion forum each of the eight weeks and to attend and participate in classroom sessions as scheduled. Participation includes online discussion posts related to each of the four assignments (see assignment description) as well as your initial introduction and your responses to each of the weekly discussion questions. You will also be posting your reaction to the posts of other students. A minimum of four posts per week are required.

**Online discussion for Week 7:** What do you see as the greatest challenges to be faced in the future in your field of study or work and why do you think they are the most significant?

**Online discussion for Week 8:** What would you like others in your field of study or work to know about what you have learned in your MA degree at Regis?

Hawaii International Conference on Education

January 5 - 8, 2014

FORMAL GOAL SETTING AND PERSISTENCE

By

Dr. Robert Collins, Dr. Dorothy Williams and Dr. Jill Coddington

College for Professional Studies

REGIS UNIVERSITY

September, 2013

## **Abstract**

This research project was designed to investigate the impact of formal goal setting activities of adult non-traditional graduate students on their persistence to complete a master's degree. The researchers hypothesized that students in programs that incorporated goal setting and monitoring procedures would graduate at higher rates than students in comparable programs that did not incorporate goal setting and monitoring. Data were acquired from Regis University records describing students in eight graduate programs offered in the College for Professional Studies. The data were analyzed using selected statistical methods to test the significance of findings. The preliminary findings reported in a manuscript presented at the 2013 Hawaii International Conference on Education and published in the conference proceedings did not support the hypothesis. The researchers subsequently determined that the data used in the initial study did not appropriately represent the programs given a relatively short timeline used for the study. Therefore, additional longitudinal data were added to the original data and further analysis was conducted in this follow-up study. The secondary analysis of data from the longer timeline did not support the original hypothesis. While graduation rates for all four degrees increased, the degree program that incorporated formal goal setting still did not graduate students at a higher rate than two other degree programs. Thus, based on these results the authors concluded that formal goal setting may not play an important role in increasing graduation rates.

## **Background**

Setting and accomplishing goals has long been considered by most educators a means for reaching desired outcomes and developing successful programs. The authors of this manuscript describe a study of four graduate degree programs at Regis University in Denver, Colorado, USA that was designed to look for a connection between formal goal setting and successful completion of degrees. A preliminary study was conducted in 2012 and a manuscript describing that study was presented at the Hawaii International Conference on Education (HICE) in January 2013. This manuscript describes a follow-up study conducted in 2013 examining additional longitudinal data. Four master's degree program offered by Regis University were the focus of the study. The Master of Arts (MA) was developed in 2005 by the Regis University College for Professional Studies (CPS). The program was designed to provide an individualized graduate learning program for students based on their learning and professional goals. The program is interdisciplinary by nature as almost all of its students choose to study across more than one academic discipline. Almost all MA students enter the program with professional goals in mind. An integral part of the program is a formal goal setting process. Students work with their faculty advisor to develop and document formal goals for their program. The goals form the foundation of the students program of study as courses with appropriate learning outcomes are selected and/or designed to address the student's formal goals. The program allows students to monitor and adjust their learning goals and their degree program as they complete courses. In addition, students are required to include an interdisciplinary core course to be completed at the mid-point of the degree plan. This course includes a review of formal learning goals and the students' progress toward achievement of those goals. Thus, the MA program contains a formal goal setting and monitoring process that most other graduate degrees do not offer students. The formal goal setting design of the MA program was necessary to provide a clear focus for students who need a unique, individualized

graduate learning program. Because the MA program design is unique and because it has a strong focus on formal goal setting the authors believe that students will therefore be more motivated and will complete their degrees at higher rates than other comparable graduate degrees offered at Regis University.

Notwithstanding the design of graduate programs intended for adult learners, a growing concern for CPS and other institutions offering graduate programs for adult learners is the persistence of students to complete their degree and the reasons they do or do not complete their degrees. Not only is there a concern about whether such programs are achieving expected outcomes, but there is also a concern about the efficiency of adding new students at a higher rate to offset the loss of students dropping out.

### **Central Research Question**

This project is designed to examine the relationship between formal goal setting requirements in a MA degree program and persistence of graduate students to complete their graduate degree. More specifically, we seek to determine if formal goal setting improves the likelihood that students will complete their degree. In this study persistence of students enrolled in a MA degree program that requires formal goal setting was compared to students enrolled in other comparable degree programs.

### **Related Literature**

Since this paper is a follow-up to a research manuscript written in 2012, presented at HICE in January 2013, and published in the proceedings of that conference, the review of related literature included in the first manuscript is presented here as a convenience for the reader.

Literature in this field indicates that other researchers are strongly interested in goal setting (Dweck, 1986; Grant and Dweck, 2003; Eppler and Harju; 1997; Klein and Lee; 2006). However, much of

the literature applies to students in elementary/secondary schools and traditional age college students, while little is yet available relating to adult nontraditional learners. More research that applies directly to programs that offer accelerated, intensive and online learning formats is clearly needed.

Bandura (1986) proposed a social cognitive theory that established the foundation of continued study of self-efficacy and motivation. Bandura's research provides a useful theoretical framework for the analysis of the relationship between goal setting and self-efficacy. Schunk (1990) examined goal setting and self-efficacy using Bandura's theory. This research supported the notion that goal setting and self-efficacy are important self-regulated learning processes. Dweck (1986) and Schunk (1990) examined goal orientations and academic performance. They found support for the notion that people "...who believe they are capable select tasks at which they can succeed, persist longer, and expend effort..." (Schunk, 1990, p 82).

Other researchers (Fleming ,2002; Glynn, Aultman, and Owens, 2005; and Ironsmith, et.al. 2003) also examined motivation and academic performance. Results of these studies support a positive relationship between motivation, goal setting and academic performance.

Yet other researchers (Taniguchi and Kaufman 2005; and Metzner, Lauer and Rajeciki 2003) focused their research on factors related to persistence. Metzner, Lauer and Rajeciki (2003) found moderate support for factors that implied a dimension of commitment to future goals. Taniguchi and Kaufman (2005) found that part-time enrollment deters college completion while high cognitive ability and a high status occupational background seem to increase the chance of completion. McGivney (2004) summarized recent data in an effort to understand persistence patterns of adult learners. She reported eight factors that contribute to persistence of adult learners, the first of which was motivation. While adult learners were generally acknowledged as being more motivated than their younger traditional student counterparts, more specific reasons for motivation level of adults were reported to include: a strong desire to pursue an educational program, a desire to prove themselves capable of

learning, obtaining a qualification or to study for other employment reasons While the specific practice of setting goals was not mentioned, logic dictates that these reasons are a likely foundation for goals that adult learners may establish as they enter and pursue continued education.

In a qualitative study, Cox (2008) interviewed 15 adult students who were graduates of the University of Memphis Master of Arts in Liberal Studies degree, the purpose of which was to describe factors that contributed to persistence toward completion of their degree. Five findings were reported including (1) motivation to get a better job, (2) desire for efficacy, (3) family support and support from others, (4) student/teacher relationships and (5) Faith and religion. Cox concluded that the factors described in his study were consistent with his own experience and were also consistent with the work of Houle (1988) who described goal oriented learners, activity oriented learners and learning oriented learners in his book *The Inquiring Mind*.

A practical application of using goals to motivate learners is described by Meyer (2006) in his book titled *Attitude is everything*. Meyer has long been accepted by many in the field of motivating adults to succeed as the founder of S.M.A.R.T. Goal setting, which he describes in detail in his book. Each letter in the title represents a descriptor for defining effective goals. Thus he posits that effective goals should be specific (S), measurable (M), attainable (A), realistic (R), and tangible (T). While other motivational presenters, including the late Stephen Covey, have adopted or adapted this concept into their programs, there is little scholarly research evidence that confirms their effectiveness. However, many adult learners have been exposed to motivational programs either because they were drawn to them for personal reasons or because of on the job training and development programs. While practical application of goal setting process is beyond the scope of this study it is in need of further scholarly investigation. While this review was not exhaustive, literature related to the focus of this study were

examined. Much of the research reviewed here, however, was conducted using participants other than those on which the current study was focused: non-traditional adult graduate students.

### **Method**

The method for this project was to compare the persistence of students enrolled in the Regis University MA degree to students enrolled in other comparable Regis graduate degree programs. The purpose of the project is to determine if formal goal setting and monitoring features required in the MA program impact on the persistence of students to complete the degree. The researchers hypothesized that since students in the MA program set formal goals as part of their degree planning requirements and further that they had formal review of goal status later in their program, they would graduate at higher rates than students in other comparable degree programs that did not incorporate goal setting and monitoring activities.

Existing student data were collected for students in the MA degree and for students in eight comparable Masters degree programs. Data were compared to determine whether graduation rates for programs that do not incorporate formal goal setting and monitoring activities are different from those of the MA degree that does include formal goal setting and monitoring activities. Quantitative analytical methods including appropriate statistical tools were used to analyze the group data. For purposes of this project persistence is defined as completion of the degree as originally intended by the learner. In an attempt to hold certain variables constant, comparable programs were defined as having equal in total credit hour requirements, including a specialization and including core course requirements. The primary variable to be examined in this project was whether or not degree programs incorporate formal goal setting and monitoring activities. Other variables also included in this study that may be related to persistence are: total credits required, number of credits transferred from other institutions, grade point average (GPA), active duty military service, and gender. Therefore, it was the

researchers' intent to gather data relative to each of these variables as well as for the primary variable. Individual students were not identified in the data collection process. While persistence is defined as degree completion, the researchers acknowledge that CPS students are adults who have competing priorities, one of which is their education. Therefore they will, from time to time, step out of classes for a term or two, then return to complete their degree. A pattern often recommended to students is to remain enrolled one course per 8 week term, or two courses per semester. Doing so would allow students to graduate in six semesters or two academic years. However, the researchers estimate that a maximum of three years or nine semesters is the norm for CPS students who are reasonably persistent to graduate.

The target population of this study consisted of degree seeking graduate students from the following CPS programs: Master of Arts (MA), Master of Nonprofit Management (MNM), Master of Science in Accounting (MSA), Master of Science in Database Management, Master of Science in Information Assurance, Master of Science in Information Technology Management, Master of Science in Software Engineering, and Master of Science in Systems Engineering (MSCS).

Data were collected from records of students who began their programs from September, 2007 through August 20013. A total of 1,767 student records including all four programs were examined. The beginning date was chosen to coincide with the origin of CPS that formed the four current schools. The latest data available at the end of the Regis Summer semester was chosen as the end date to ensure that all students enrolled in these programs were considered in this study. The data acquired included: (1) term of first course, (2) term of last course, (3) number of credits completed by August, 2013, (4) term of graduation, (5) GPA, (6) gender.

When the data were collected and analyzed, the number of records in the five technology degrees did not warrant a statistical analysis of each of those degrees independently. The researchers

therefore grouped all of these degrees together as one unit of analysis. This unit was named the Master of Science in Computer Science (MSCS) and were referenced in this way in the data analysis and findings sections below. Thus, there were four data sets to be included in the analysis of data. One for each of the following: MA (Master of Arts), MNM (Master of Nonprofit Management), MSA (Master of Science in Accounting) and MSCS (Master of Science in Computer Science).

### Data Analysis

A statistical analysis of the data was conducted including calculations of mean, standard deviation and P-value tests between each of the four data sets. The data collected included a number of other fields such as gender and veteran status that may improve granularity, however, there were not sufficient numbers in each sub-category to support generalizations. Thus, the four populations as a whole were analyzed.

The first calculations made were the graduation percentages and standard deviations for each of the four degree categories. These are presented in table 1 below.

Table 1 -Graduation rates

	MSA	MNM	MSCS	MA
Graduation %	62.82974	60.89965	36.45991	50.5
Standard deviation	.49735	.49351	.5145	.49325

Further analysis was conducted to determine if there were significant differences when comparing the percentage of graduation for each of the degree programs. P-values were calculated and are presented in table 2 below.

Table 2 – P-value Comparisons\*

Degree 1	Degree 2	P-value
MSA	MNM	<b>.02579</b>
MSA	MA	<b>.01215</b>
MSA	MSCS	<b>7.3215 * 10<sup>-3</sup></b>
MNM	MA	<b>.01046</b>
MNM	MSCS	<b>51212*10<sup>-5</sup></b>
MA	MSCS	<b>4.325*10<sup>-2</sup></b>

\* **BOLD** indicates statistical significance

The MNM program not only had the highest overall graduation rate (62.8%), but was significantly better than the graduation rate for the MA (50.5%) and the MSCS (36.5%) program, the MSA program graduation rate (60.9%) was significantly better than the graduation rate for MA and the MSCS program, and the MA program graduation rate was significantly better than the graduation rate for MSCS. Note that the hypothesis of this study was that the MA program that included goal setting and monitoring would have graduation rates significantly better than the other degree programs.

### Findings

The purpose of this research was designed to examine the relationship between formal goal setting requirements in a graduate degree program and persistence of graduate students to complete their degree as compared to other degree programs at this university that do not require a formal goal setting plan.

This research was quantitative in nature for several reasons. First, quantitative studies can be reproduced in order to do future comparative analyses based on facts. Secondly, they can statistically support the hypothesis. Thirdly, if the hypothesis is supported, it can be used to generalize about the target population.

The subjects in this study were all degree seeking graduate students from the following programs: Master of Arts (MA), Master of Nonprofit Management (MNM), Master of Science in

Accounting (MSA), and Master of Science in Computer Science (MSCS). Data were accessed from those students who started their programs from September 2007 through April 2009. As previously discussed, the beginning date was chosen to coincide with the origin of CPS (College for Professional Studies) that formed the four current schools.

This research set out to address the hypothesis that students who had a formal goal setting plan would graduate at a higher rate than those who did not have a formal goal setting plan. The outcome would be success or failure to graduate.

Our initial findings did not support the hypothesis that a formal goal setting plan results in a higher graduation rate. The MA students did graduate at a higher rate (50.5%) than those in the MSCS program (36.5%), but did not graduate at a higher rate than the MNM (62.8%) or MSA students (60.9%). The same holds true for analyzing the overall graduation rates NOT including current students across the four programs. The MA students did graduate at a higher rate (58.6%) than those in the MSCS program (44%), but did not graduate at a higher rate than the MNM (70.6%) or MSA students (69.3%). What is notable is that the MNM students graduated more students than all other programs in both categories (overall graduation rate and graduation rate not including current students).

The average number of years to graduate from the shortest amount of time to the longest amount of time is as follows: The students in the MSA program took an average of 2.32 years to complete the program followed by the students in the MNM taking an average of 2.78 years. The MA students took an average of 2.92 years to graduate while the students in the MSCS program took an average of 3.31 years to graduate. Whereas the MNM students had a higher overall graduation rate as well as a higher graduation rate not including current students, the MSA students graduated in a shorter amount of time on average. This would indicate that the university might need to reevaluate the

effectiveness of a formal goal setting and/or revise the goal setting procedures in the MA degree program.

**All degree programs**

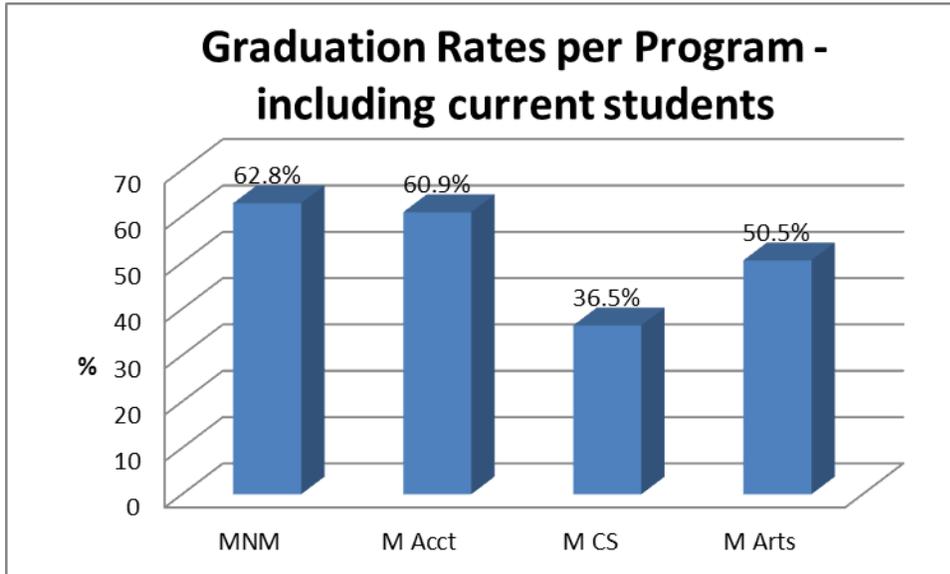

Figure 1: Graduation Rates

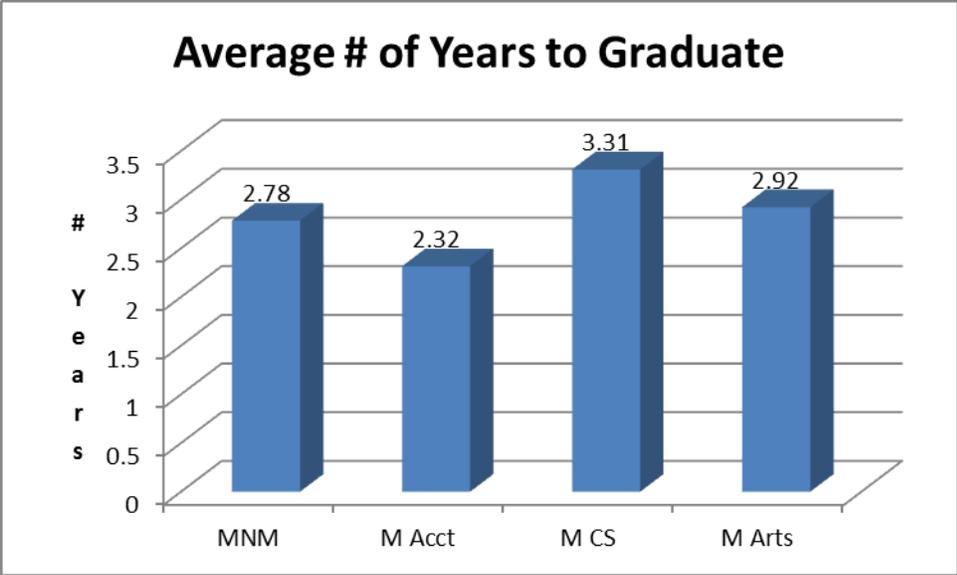

Figure 3: Years to graduate

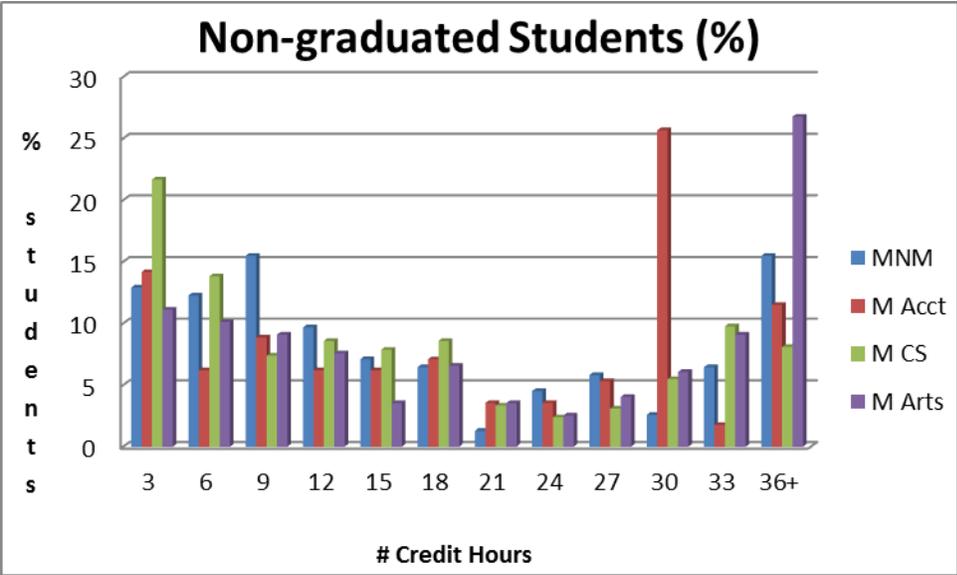

Figure 4: Percent Non-Graduated Students

## Master of Science in Accounting

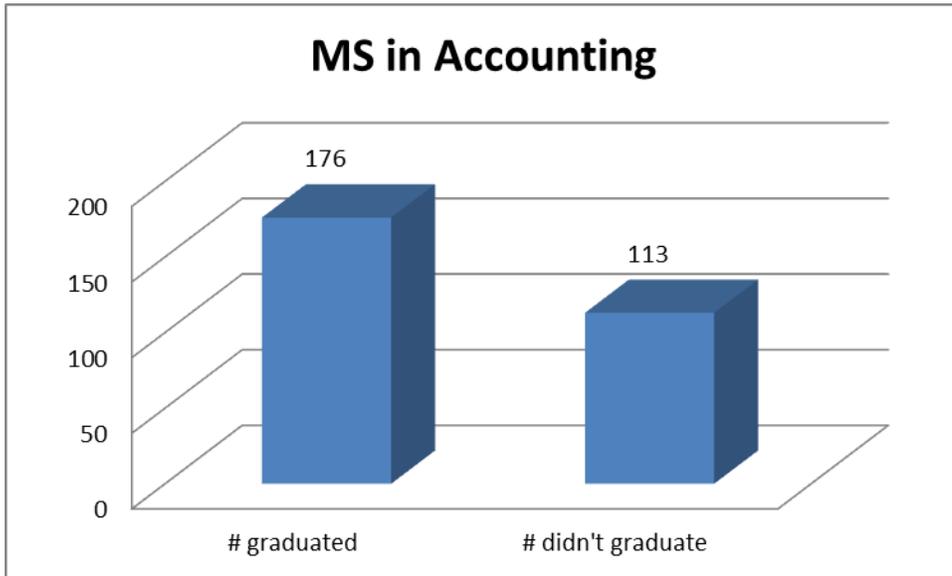

Figure 5: Number Graduated and Not Graduated

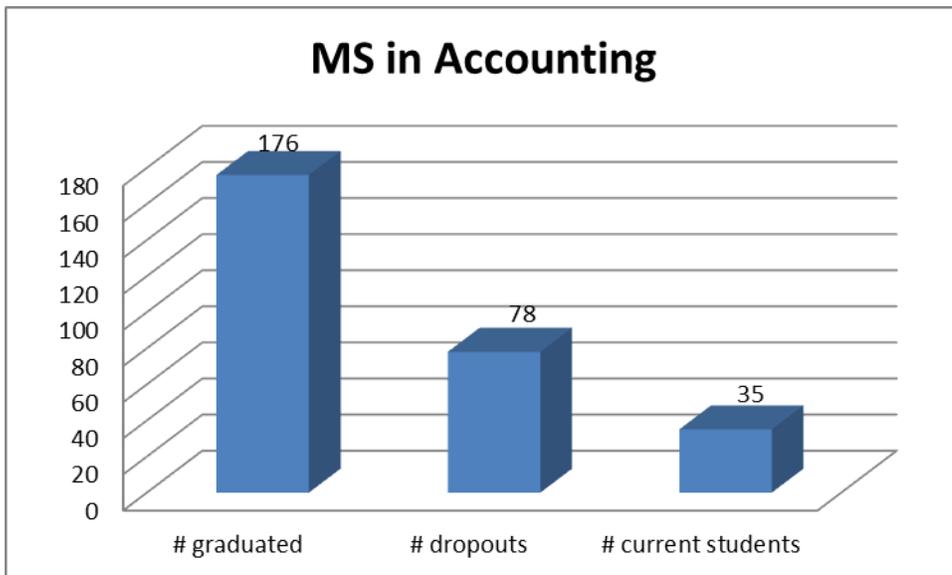

Figure 6: Number graduated, number dropouts, number of current students

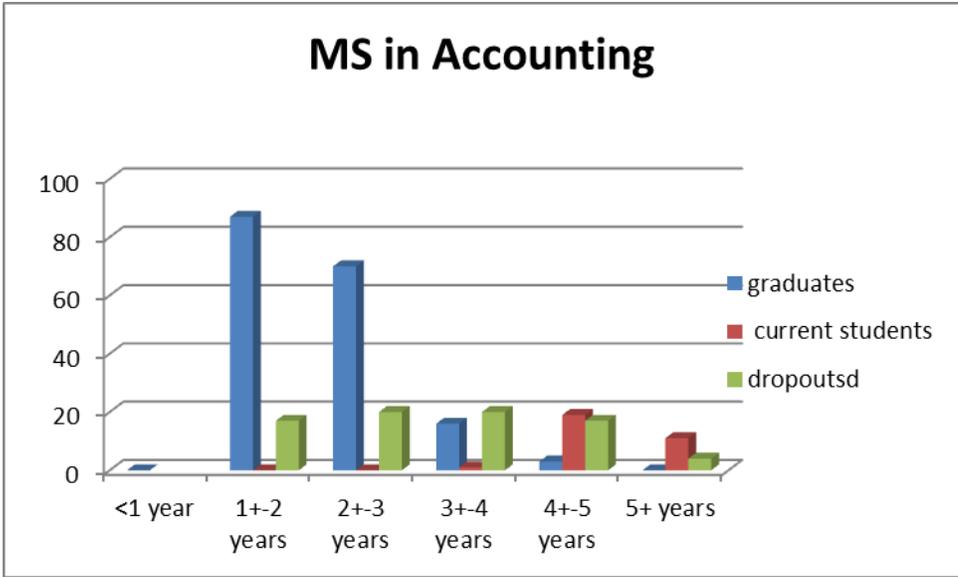

Figure 7: Years in Program

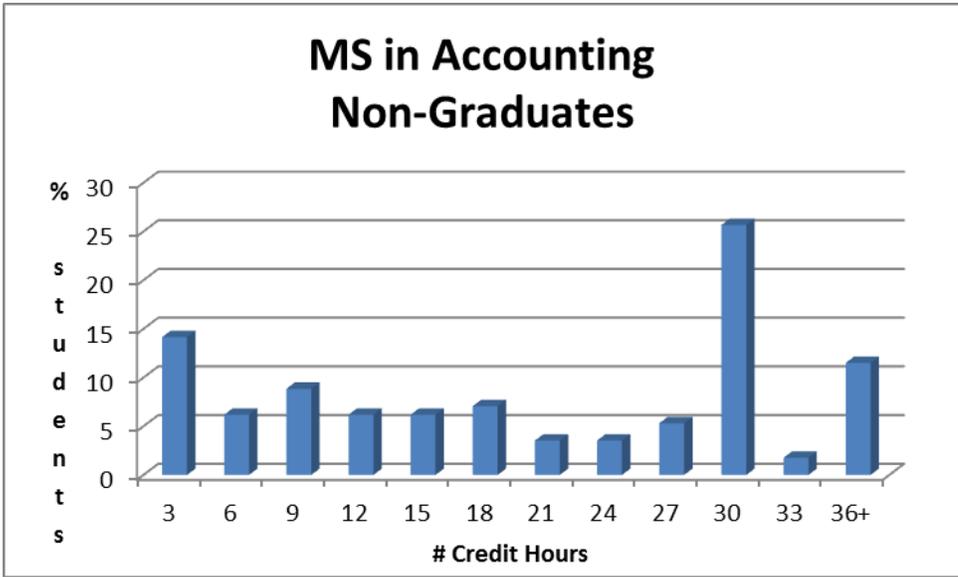

Figure 8: Percent of Students Versus Number of Credits for Non-Graduates

Figure 5 displays of the 289 students in the Master of Science Accounting (MSA) program, 176 students graduated and 113 students did not graduate. Figure 6 displays not only the 176 students who graduated, but of the 113 who did not graduate, 78 dropped out of the program (these students were

not enrolled in a class since January, 2013) and 35 students are currently enrolled in the program. Of those who did not graduate, there is a significant difference between the drop-out rate and those currently in the program with more students who dropped out. Figure 7 displays the time in the program. More students graduated in the first three years of the MSA program taking an average of 2.32 years. The drop-out rate remained consistent over the first 4 ½ years, but dropped off in year 5. There were more current students taking longer in the program. Figure 8 displays the non-graduated students and the amount of credit hours completed. Over 35% of the students have completed 30 or more credit hours.

**Master of Arts**

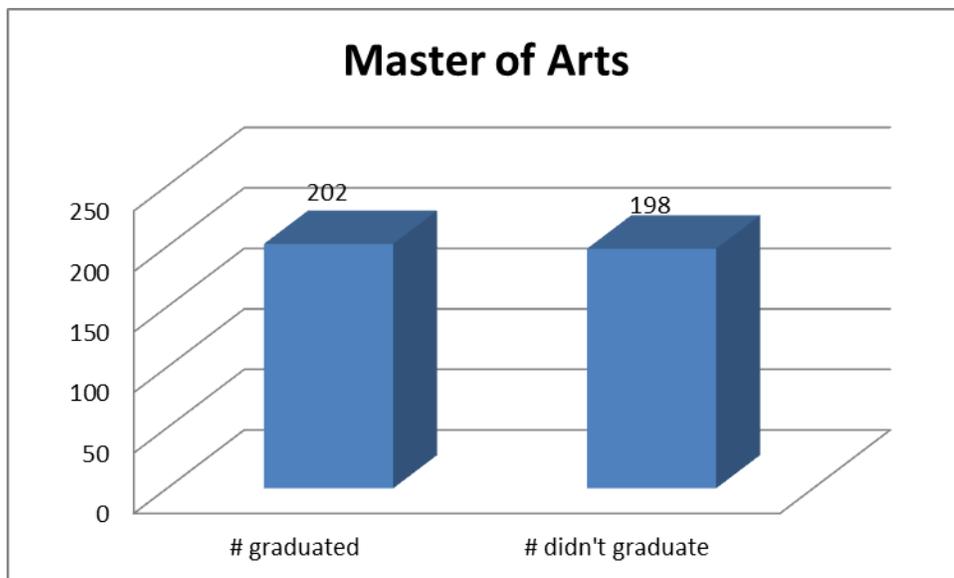

Figure 9: Number Graduated and Not Graduated

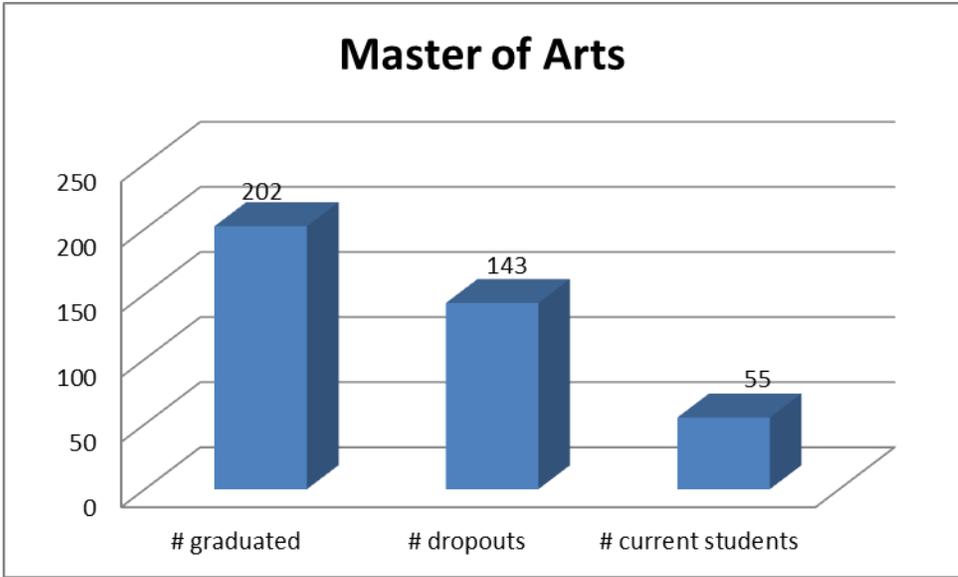

Figure 10: Number Graduated, Number of Dropouts and Number Current Students

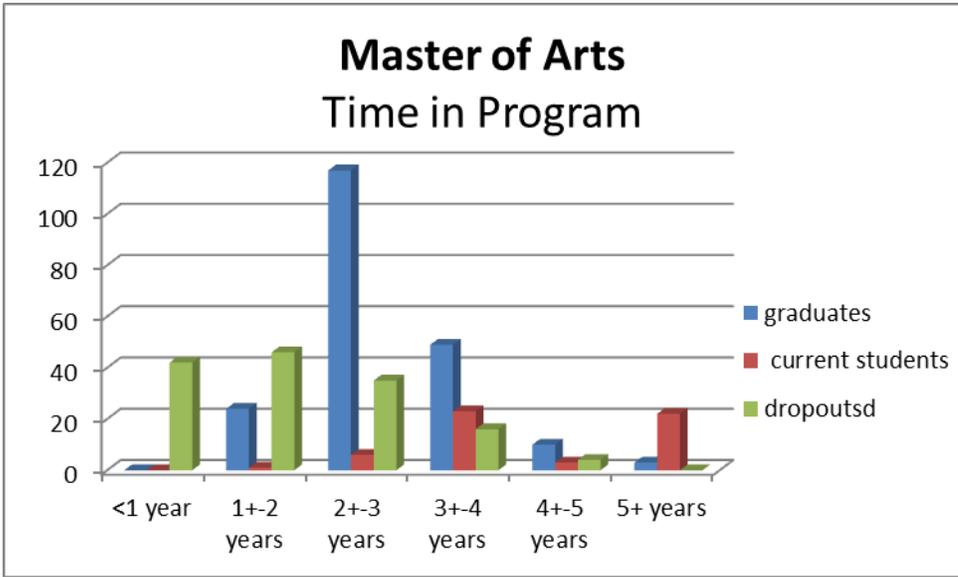

Figure 11: Years in Program

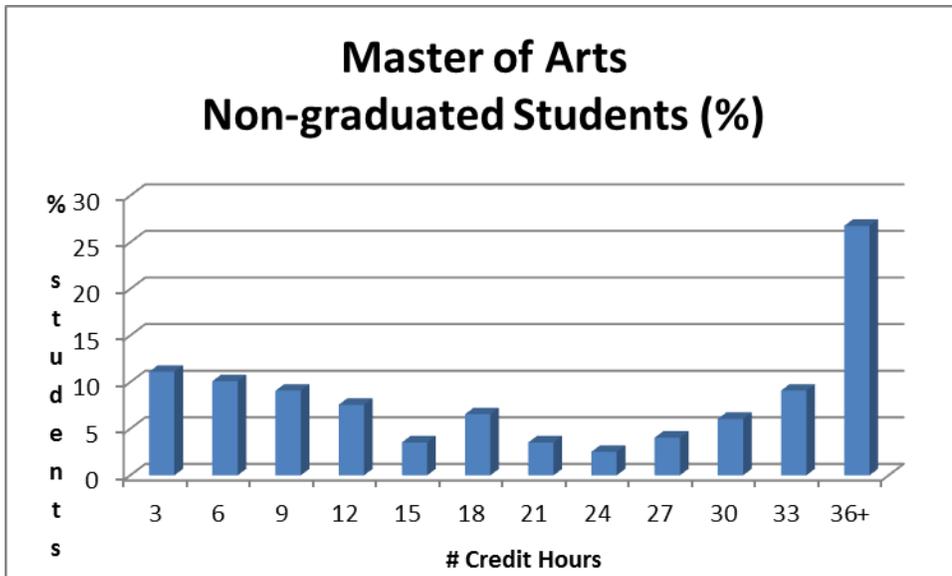

Figure 12: Percent of Students Versus Number of Credits for Non-Graduates

Figure 9 displays of the 400 students in the Master of Arts (MA) program, 202 students graduated and 198 students did not graduate. Figure 10 displays not only the 202 students who graduated, but of the 198 who did not graduate, and 143 dropped out of the program (these students have not been enrolled in a class since January, 2013) and 55 students are currently enrolled in the program. Of those who did not graduate, there is a significant difference between the drop-out rate and those currently in the program with more students who dropped out. Figure 11 displays the time in the program. More students graduated in the first three years of the MA program taking an average of 2.92 years. The drop-out rate remained consistent over the first 4 years, but dropped off in year 5. There are more current students taking longer in the program. Figure 12 displays the non-graduated students and the amount of credit hours completed. Over 39% of the students have completed 30 or more credit hours.

**Master of Science Computer Science (MSCS)**

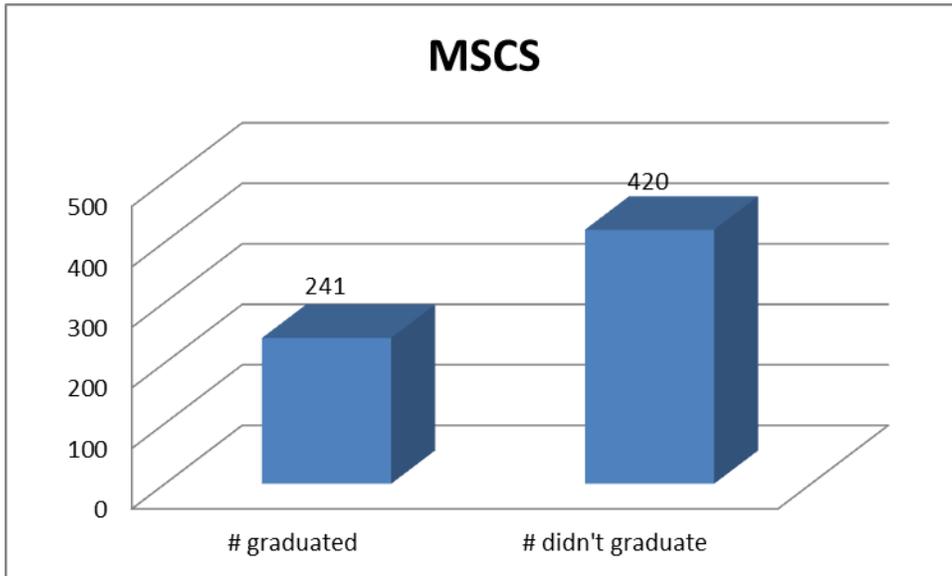

Figure 13: Number Graduated and Not Graduated

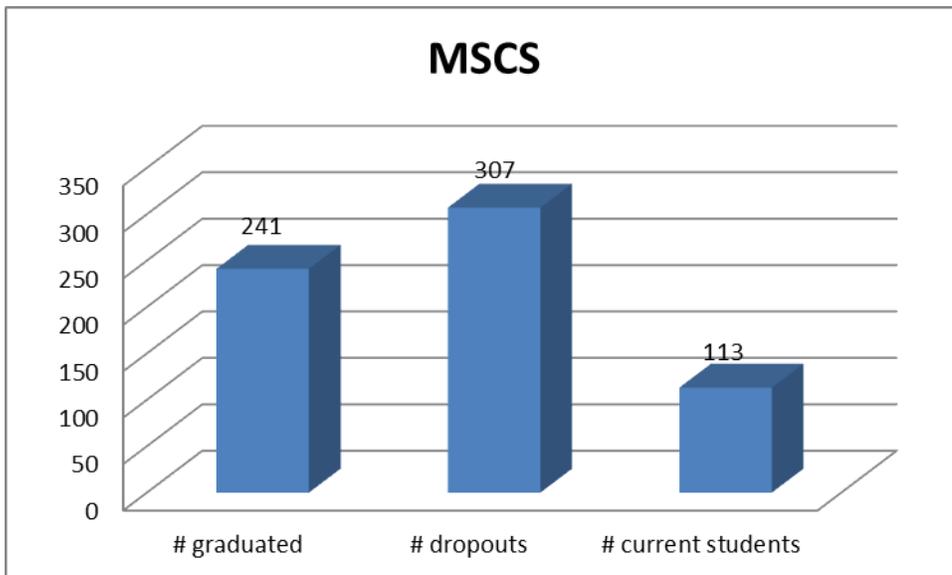

Figure 14: Number graduated, number dropouts and number current students

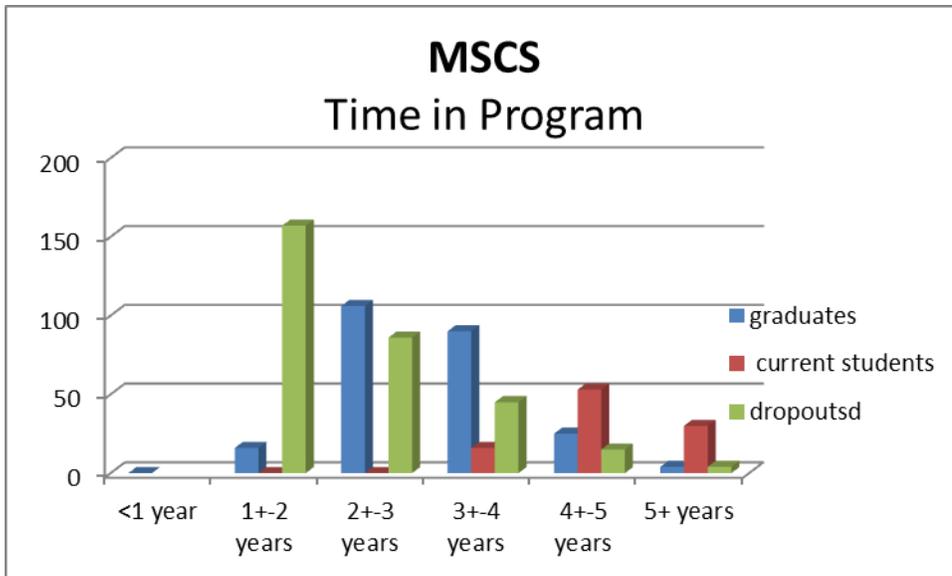

Figure 15: Years in Program

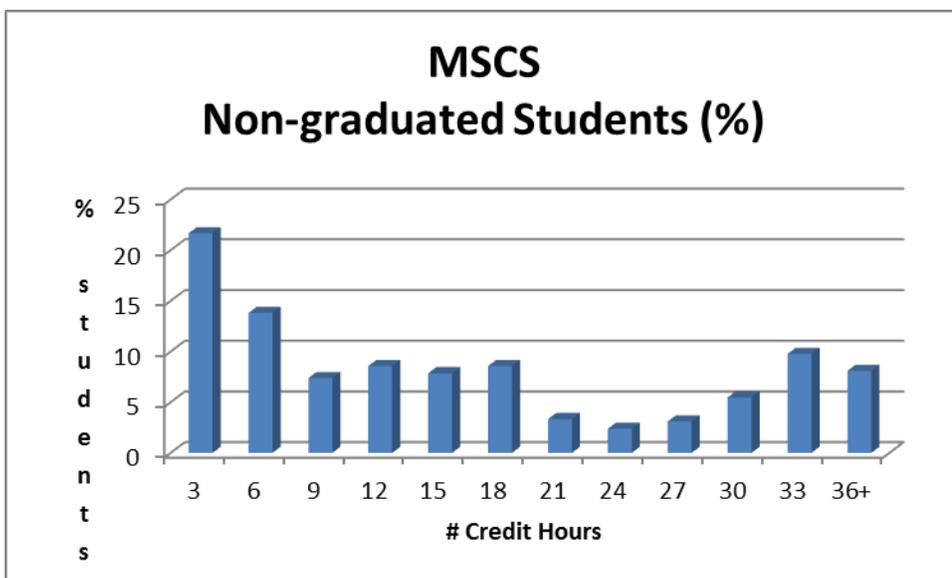

Figure 16: Percent of Students Versus of Number of Credits for Non-Graduates

Figure 13 displays the 661 students in the Master of Science Computer Science (MSCS) program indicating that 241 students graduated and 420 students did not graduate. Figure 14 displays not only the 241 students who graduated, but that of the 420 who did not graduate, 307 dropped out of the

program (these students have not been enrolled in a class since January, 2013) and 113 students are currently enrolled in the program. Of those who did not graduate, there is a significant difference (three times) between the drop-out rate and those currently in the program with more students who dropped out. Figure 15 displays the time in the program. More students graduated between 2 ½ and 4 years in the MSCS program taking an average of 3.31 years. The drop-out rate was higher during 1 ½ to 3 years of the program while those currently enrolled in the program were still active through year 5. There are more current students taking longer in the program. Figure 16 displays the non-graduated students and the amount of credit hours completed. Over 22% of the students completed 30 or more credit hours.

**Master of Nonprofit Management (MNM)**

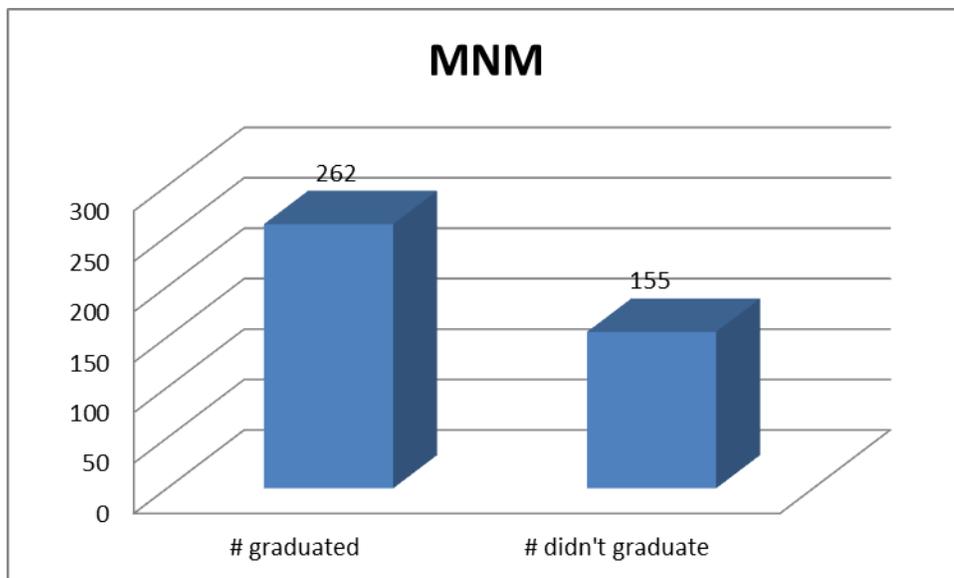

Figure 17: Number Graduated and Number Not Graduated

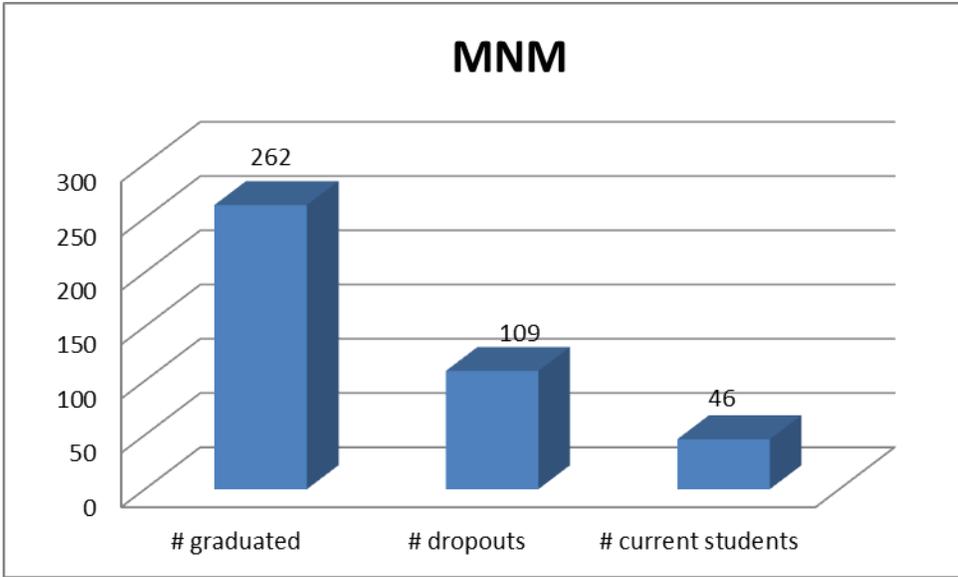

Figure 18: Number Graduated, Number Dropouts and Number Current Students

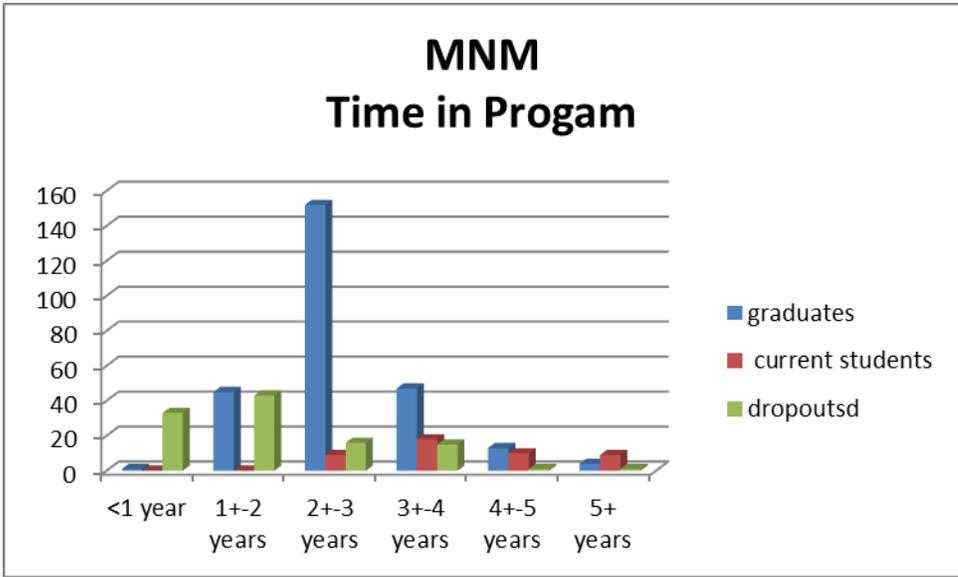

Figure 19: Years in Program

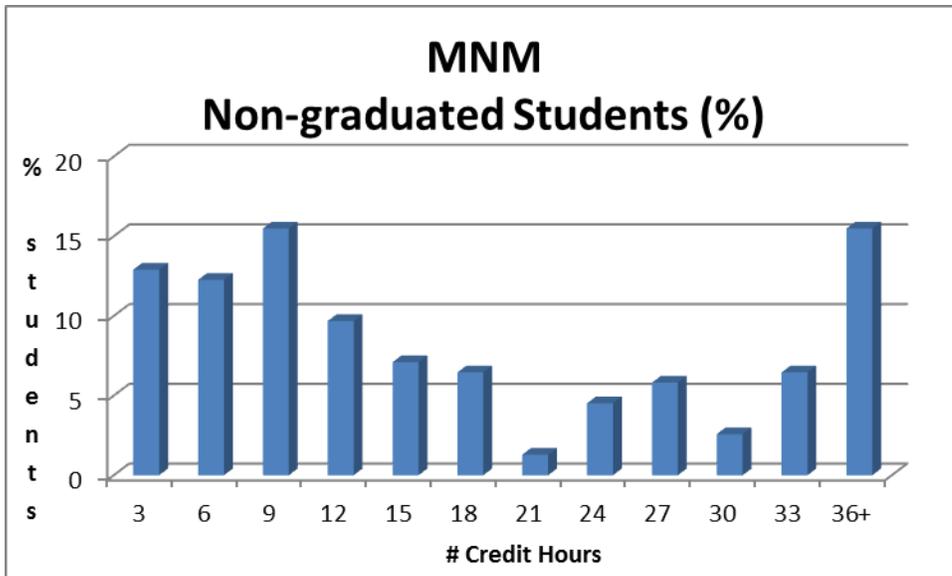

Figure 20 : Percent of Students Versus of Number of Credits for Non-Graduates

Figure 17 displays of the 417 students in the Master of Nonprofit Management (MNM) program, 262 students graduated and 155 students did not graduate. Figure 18 displays not only the 262 students who graduated, but of the 155 who did not graduate, 109 dropped out of the program (these students have not been enrolled in a class since January, 2013) and 46 students were currently enrolled in the program. Of those who did not graduate, there is a significant difference between the drop-out rate and those currently in the program with more students who have dropped out (25%). Figure 19 displays the time in the program. More students graduated between 2 ½ and 3 years in the MSM program taking an average of 2.78 years. The drop-out rate remained consistent between 2 ½ to 4 years, but dropped off after 4 ½ years. There are more current students taking longer in the program. Figure 20 displays the non-graduated students and the amount of credit hours completed. Over 24% of the students have completed 30 or more credit hours.

## **General Observations**

The number of current students in all of the programs that have been in the program for longer than the average seems excessive. These students may need to be contacted to determine why they have their path to their degree is longer than average and what is still needed to complete their degree.

The number of current students in all four degree programs with more than 30 credit hours and have not yet graduated seems excessive. These students may need to be contacted to determine why they have not completed their degree and whether they intend to do so. While this issue is more prevalent in some programs than others, all should be contacted.

The number of dropout students with 30 or more credit hours in the program seems excessive. The programs are different than the ones in this same situation who are current students. These students may need to be contacted to determine why they have dropped out and more specifically whether the completion of a thesis or capstone prevented the completion of their degree.

There is a distinct point in each program, all in the second or third year when the number of graduates is high followed by the number of dropouts being high. Intervention at this point in the program may be necessary to increase retention and graduation rates. The most likely contact time would be slightly before the dropout rates spike. This point is unique to each program so the intervention should be timed accordingly.

## **Discussion**

This research project began with a purpose of investigating the impact of formal goal setting and monitoring activities of adult non traditional graduate students on their persistence to complete their degree. The data analysis and findings indicate that the hypothesis that goal setting would increase degree completion was not supported.

The researchers believe that other variables that were not anticipated or controlled in this research likely had an effect on the findings. Initially, the limit of three years of data collected in this study was not considered to have been long enough to accurately describe the degree completion of students in any of the four data sets that were analyzed in this study. Therefore, additional data were collected and analyzed in the current study. Data were collected from Fall, 2007 through Summer, 2013, a total of six academic years. Since the analysis that included significant additional data did not change the outcome of the study the researchers now believe that other unidentified intervening variables may have significant impact on students' completion of degrees.

The researchers also acknowledge that there are several limitations of this study, the first of which is that the target population for this study was from one university and may or may not represent all adult graduate students in non-traditional master's degree programs. Other limitations include the possibility that other unidentified and controlled variables may have a more significant impact on persistence to graduate than the single variable that was tested in this study. Therefore, the researchers believe that continued research is necessary, to identify and test other relevant variables.

The results of this study are significant for colleges and universities throughout the country that have accelerated graduate degree programs for adult students, specifically, for those adult students who have gone back to school to help them achieve either professional or personal learning goals.

Most notable in this research was the spike in the number of non-graduates who dropped out of the program and did not continue taking classes in year four of their programs. This was consistent with all programs – Master of Science Accounting, Master of Arts, Master of Science Computer Science and Master of Science Nonprofit Management. In addition, it is to be noted that there is a large number of non-graduating students in all programs who were close to completing their degree, but did not. It is the

recommendation of these researchers to further analyze these two issues to look for answers to two questions. They are: (1) What are the variables that cause students who are well into their programs to drop out? (2) Do final thesis or capstone requirements create a hurdle that cannot be overcome?

### **Further Research**

The researchers believe that follow up research is needed to determine how and why students are motivated to complete graduate degrees. We offer the following recommendations to guide the design of further research.

1. Consider a replication of this study to include a larger sample population with another non-profit adult education university.
2. Consider designing a study to examine learning format as a variable. Would a student who takes his/her classes only in an online environment have a different graduation success rate as compared to only a ground-based enrollment or would a combination of online and ground-based enrollment produce an increase in graduation rates.
3. Explore the differences and similarities of learning goals among genders and whether certain graduate degrees with and without goal setting plans predict success.
4. Explore whether age group differences predict success in completion of graduate degrees with and without goal setting requirements.
5. Explore whether active, retired, or reserve military service predicts success in completion of graduate degrees with and without goal setting requirements.
6. In previous research (Collins, 2011) identified additional variables that should be considered in the planning of further research. Thirty graduate students associated with accelerated degree

programs designed for adult learners at three Jesuit Universities were interviewed. Three groups of students were selected from programs at each university, including current students, drop-outs and graduates. The purpose of this qualitative study was to look for connections between goal setting and degree completion. While the study was exploratory, a number of variables that may be associated with learner goal setting and motivation to complete degrees were identified. The variables and sub-variables were as follows:

Variables	Sub-variables
Vision	Perceived personal happiness, workplace success, career enhancement, ambition
Goal setting purpose	Personal development, work/performance, career development, hope, optimism, social support
Goal setting process	Specific, documented goals, measurable goals, challenging goals, goal assessment
Learning program selection	Goal/program congruence
Learning program initiation	Perceived urgency, timeline of goals, learner needs
Learning program continuation	Intrinsic motivation, extrinsic motivation, goal validity, self-efficacy, academic success, feedback, goal changes, value of goals, value of life-long learning
Goal Achievement	Perceived closure, impact on vision, setting new goals

Consideration of these variables in further research seems appropriate to the researchers, given that goal setting as a single variable in the current study did not appear to impact on degree completion. Thus we believe that goal setting may involve a number of variables and sub-variables that have a likely impact on the motivation of adult graduate students to complete their degree. The list of variables above disaggregates goal setting and degree completion into several discrete and we believe measurable parts that have a likely impact on learner motivation to complete degrees. Future research and analysis of these variables should include consideration of these variables.

## **Recommendations**

In response to the results of this research, it may be beneficial for the university to create intervention programs at certain points in students' graduate programs to assist the students towards graduation. Intervention may be needed after completion of the first course, after students have completed 3 years in the program and at a point when students have completed all 30 credits and have not enrolled in thesis or capstone credits.

In conjunction with advisors, faculty and staff at the university it may be important to develop methods to monitor students' progress throughout their degree programs and to put into place additional interventions designed to raise the graduation rates in the programs examined in this study.

Further analysis should be undertaken by the university to determine why some students take one class then drop out. A notable issue in this research was the percentage of students who dropped out in year four, having completed over 30 credit hours of a 36 hour program and dropped out.

The data support the point that the university might need to evaluate the thesis and capstone requirements to determine if they are a roadblock to graduation and determine if changes are needed.

Additionally, in response to this research the university may need to re-evaluate the use of formal goal setting procedures in the MA degree and determine if changes can be made that will increase the motivation of students in this program to complete their degree.

## **Final Remarks**

In conclusion, the researchers hope this study will provide interest for future studies that will continue to examine the processes of students' success in completing their graduate degrees. This research was driven by the authors' professional desires as graduate faculty and one as a graduate

advisor to have college and universities reevaluate their processes designed to offer the guidance and tools necessary to help students achieve their academic and personal goals.

Indeed, as the research suggests, there are certain times in a student's graduate work in which added support and encouragement is needed in order to help ensure success. It is important to understand that adult students are highly motivated and mature abstract thinkers. It is the responsibility of higher education to ensure that students have the assistance needed to be able to be successful.

## 6. Abstract and/or full paper:

*Leadership for Educators: Academy for Driving Economic Revitalization in Science (LEADERS)* is a National Science Foundation funded mathematics and science partnership that gathers and merges the expertise of four essential entities in the economic revitalization of the Great Lakes Region—K-12 school districts, higher education, the renewable energy industry, and informal science education sites. The LEADERS partnership *share a vision of student-centered education that knits community economic growth with science education*. Specifically, teacher leaders and district level support personnel collaborate with the university, industry partners, and informal science programs in the development of Project-Based Science activities (PBS) that unite education with community economic redevelopment. During the last 4 summers, 22 teacher leaders completed graduate courses in physics, chemistry, environmental science, and engineering. Content courses were team taught by a scientist and a science educator who modeled blending the content with PBS. When the teacher leaders returned to their respective districts, they were responsible for overseeing the design and implementation of PBS activities that connect state and national science standards with relevant applications. One major goal of the project was the development of a cadre of effective teacher leaders who deliver professional development and support to their peers.

### **Leadership Courses**

LEADERS aimed to develop teachers' leadership abilities through a series of three leadership courses and ongoing academic year professional development. The three courses focused the psychology of teaching and learning in science, use of data to improve student achievement, and creating science experiences/curriculum for all students. The leadership courses were connected to the teachers' work in the context of their own classrooms and schools as well as to the professional development sessions that they would deliver monthly to their peers during the academic year. All courses required the teacher leaders to: demonstrate a clear and deep understanding of both the teaching and learning processes in science classrooms as well as of the particular topic of the course; utilize this knowledge in helping their peers advance their professional skills; be a reflective practitioner; and help establish leadership skills within the profession. The individual courses addressed certain domains found in the Model Teacher Leadership Standards (Teacher Leadership Exploratory Consortium, 2011) and over the course of the program, all domains were taught.

The science leadership course on educational psychology was aligned with the following domains from the Model Teacher Leader Standards: Domain I: Fostering a Collaborative Culture to Support Educator Development and Student Learning; Domain II: Accessing and Using Research to Improve Practice and Student Learning; Domain III: Promoting Professional Learning for Continuous Improvement; Domain IV: Facilitating Improvements in Instruction and Student Learning; and Domain VII: Advocating for Student Learning and the Profession. The course focused on designing high quality professional development consistent with psychological principles of student learning of science, developing teachers' leadership skills, gaining skills needed to deal with school reform and change, and gaining

an increased understanding of adult learning principles and conflict management needed to work with peers as a teacher leader.

The science leadership course on research and measurement was aligned with *Teacher Leadership Domain IV: Facilitating Improvements in Instruction and Student Learning* and *Teacher Leadership Domain 5: Using Assessments and Data for School and District Improvement* (Teacher Leadership Exploratory Consortium, 2011). The course addressed the needs of teacher leaders to learn and design professional development opportunities for their peers on using assessment and data to improve teaching and student learning. The key features of the course included (1) modeling of “reflective practice based on student results”(Teacher Leadership Exploratory Consortium, 2011, p.17) and (2) knowledge about “current research on assessment methods, designing and/or selecting effective formative and summative assessment practices and use of assessment data to make informed decisions that improve student learning”(Teacher Leadership Exploratory Consortium, 2011, p.18).

The science leadership course on theory of social foundations addressed two domains: VI on *Improving Outreach and Collaboration with Families and Community* and VII on *Advocating for Student Learning and the Profession*, from the Teacher Leader Model Standards (Teacher Leadership Exploratory Consortium, 2011) that attend to the importance of outreach and collaboration with families and communities, and advocacy. These domains can be considered specifically as being important to issues of educational equity and diversity that are of prime importance in the science education policy and reform as seen through the Next Generation Science Standards (NGSS), (2013). Specifically, the course used multicultural education research and practice to address the need for science teachers to provide “equitable learning opportunities”(Lee & Buxton, 2010), to capitalize on diversity, and to ensure science learning for all in a robust manner that addressing the connections within and outside classrooms, and at school, district, state, and community levels.

### **Teacher Leader Rubric**

To research the impact of the leadership development, the LEADERS research team (faculty and graduate students) is involved in creating a teacher leadership rubric that is modeled on the seven domains of the Teacher Leader Model Standards (Teacher Leadership Exploratory Consortium, 2011). The Teacher Leadership Exploratory Consortium (2011) states that “teacher leadership is a potentially powerful strategy to promote effective, collaborative teaching practices in schools that lead to increased student achievement, improved decision making at the school and district level, and create a dynamic teaching profession for the 21st century”(p.3). The seven domains in the standards “define critical dimensions of teacher leadership” with several functions under each domain that “specifically define the range of actions or expectations for teacher leaders related to that domain”(p.5).

In this initial phase of the rubric development and testing, the teacher leaders are being assessed on a three-point scale (*developing, proficient, or accomplished*) using data from their professional development sessions with peers, interviews, and surveys. In this

process, a coding manual that contains leadership practices ranging from developing to accomplished outline the actual practices as well as the potential best practices of teacher leadership. This rubric will help clarify the leadership competencies of teacher leaders from the LEADERS grant, and could be used by others in the future to rate teachers based on national standards for teacher leadership.

This presentation focuses on the development of the 22 teacher leaders (through 3 courses) and initial research on the effectiveness of teacher leadership. Syllabi from the three courses, as well as the Model Teacher Leader Rubric, will be shared with the audience. The audience will be engaged in a discussion regarding the utility of the work nationally/internationally.

## 6. Abstract and/or full paper:

*Leadership for Educators: Academy for Driving Economic Revitalization in Science (LEADERS)* is a National Science Foundation funded mathematics and science partnership that gathers and merges the expertise of four essential entities in the economic revitalization of the Great Lakes Region—K-12 school districts, higher education, the renewable energy industry, and informal science education sites. The LEADERS partnership *share a vision of student-centered education that knits community economic growth with science education*. Specifically, teacher leaders and district level support personnel collaborate with the university, industry partners, and informal science programs in the development of Project-Based Science activities (PBS) that unite education with community economic redevelopment. During the last 4 summers, 22 teacher leaders completed graduate courses in physics, chemistry, environmental science, and engineering. Content courses were team taught by a scientist and a science educator who modeled blending the content with PBS. When the teacher leaders returned to their respective districts, they were responsible for overseeing the design and implementation of PBS activities that connect state and national science standards with relevant applications. One major goal of the project was the development of a cadre of effective teacher leaders who deliver professional development and support to their peers.

### Leadership Courses

LEADERS aimed to develop teachers' leadership abilities through a series of three leadership courses and ongoing academic year professional development. The three courses focused the psychology of teaching and learning in science, use of data to improve student achievement, and creating science experiences/curriculum for all students. The leadership courses were connected to the teachers' work in the context of their own classrooms and schools as well as to the professional development sessions that they would deliver monthly to their peers during the academic year. All courses required the teacher leaders to: demonstrate a clear and deep understanding of both the teaching and learning processes in science classrooms as well as of the particular topic of the course; utilize this knowledge in helping their peers advance their professional skills; be a reflective practitioner; and help establish leadership skills within the profession. The individual courses addressed certain domains found in the Model Teacher Leadership Standards (Teacher Leadership Exploratory Consortium, 2011) and over the course of the program, all domains were taught.

The science leadership course on educational psychology was aligned with the following domains from the Model Teacher Leader Standards: Domain I: Fostering a Collaborative Culture to Support Educator Development and Student Learning; Domain II: Accessing and Using Research to Improve Practice and Student Learning; Domain III: Promoting Professional Learning for Continuous Improvement; Domain IV: Facilitating Improvements in Instruction and Student Learning; and Domain VII: Advocating for Student Learning and the Profession. The course focused on designing high quality professional development consistent with psychological principles of student learning of science, developing teachers' leadership skills, gaining skills needed to deal with school reform and change, and gaining

an increased understanding of adult learning principles and conflict management needed to work with peers as a teacher leader.

The science leadership course on research and measurement was aligned with *Teacher Leadership Domain IV: Facilitating Improvements in Instruction and Student Learning* and *Teacher Leadership Domain 5: Using Assessments and Data for School and District Improvement* (Teacher Leadership Exploratory Consortium, 2011). The course addressed the needs of teacher leaders to learn and design professional development opportunities for their peers on using assessment and data to improve teaching and student learning. The key features of the course included (1) modeling of “reflective practice based on student results”(Teacher Leadership Exploratory Consortium, 2011, p.17) and (2) knowledge about “current research on assessment methods, designing and/or selecting effective formative and summative assessment practices and use of assessment data to make informed decisions that improve student learning”(Teacher Leadership Exploratory Consortium, 2011, p.18).

The science leadership course on theory of social foundations addressed two domains: VI on *Improving Outreach and Collaboration with Families and Community* and VII on *Advocating for Student Learning and the Profession*, from the Teacher Leader Model Standards (Teacher Leadership Exploratory Consortium, 2011) that attend to the importance of outreach and collaboration with families and communities, and advocacy. These domains can be considered specifically as being important to issues of educational equity and diversity that are of prime importance in the science education policy and reform as seen through the Next Generation Science Standards (NGSS), (2013). Specifically, the course used multicultural education research and practice to address the need for science teachers to provide “equitable learning opportunities”(Lee & Buxton, 2010), to capitalize on diversity, and to ensure science learning for all in a robust manner that addressing the connections within and outside classrooms, and at school, district, state, and community levels.

### **Teacher Leader Rubric**

To research the impact of the leadership development, the LEADERS research team (faculty and graduate students) is involved in creating a teacher leadership rubric that is modeled on the seven domains of the Teacher Leader Model Standards (Teacher Leadership Exploratory Consortium, 2011). The Teacher Leadership Exploratory Consortium (2011) states that “teacher leadership is a potentially powerful strategy to promote effective, collaborative teaching practices in schools that lead to increased student achievement, improved decision making at the school and district level, and create a dynamic teaching profession for the 21st century”(p.3). The seven domains in the standards “define critical dimensions of teacher leadership” with several functions under each domain that “specifically define the range of actions or expectations for teacher leaders related to that domain”(p.5).

In this initial phase of the rubric development and testing, the teacher leaders are being assessed on a three-point scale (*developing, proficient, or accomplished*) using data from their professional development sessions with peers, interviews, and surveys. In this

process, a coding manual that contains leadership practices ranging from developing to accomplished outline the actual practices as well as the potential best practices of teacher leadership. This rubric will help clarify the leadership competencies of teacher leaders from the LEADERS grant, and could be used by others in the future to rate teachers based on national standards for teacher leadership.

This presentation focuses on the development of the 22 teacher leaders (through 3 courses) and initial research on the effectiveness of teacher leadership. Syllabi from the three courses, as well as the Model Teacher Leader Rubric, will be shared with the audience. The audience will be engaged in a discussion regarding the utility of the work nationally/internationally.

# Therapy Dogs with Military Populations: A Primer for Counselor Educators

Debra P. Russ and L. Brie David

University of Alaska Anchorage

## Abstract

Students seeking a graduate degree in counselor education have career plans that include a variety of settings such as government offices, community agencies, and public schools. Counselor educators teach students about contemporary issues facing clients in these varied settings. Increasingly, counselors in a variety of settings are facing combat-related stress. Traditionally, focus of research and intervention was on returning veterans. Currently, counselors see deployment-related mental distress symptoms in military dependents such as children and spouses. A core element of instruction is to present the best practices for dealing with the stress that accompanies military life. Research indicates that utilizing therapy canines is a best practice for assisting in the healing of these clients. The purpose of this article is to provide information for counselor educators on how therapy dogs assist clients with military-related stress. Counselor educators are encouraged to incorporate the topic in curriculum related to the population of military personnel and their families.

Students seeking to enter the field of counselor education may desire to work in settings such as government offices, community agencies or public schools. Counselors-in-training may have dreams of assisting children and adults of all ages. It is becoming increasingly evident that counselors in many settings will work with military personnel or their dependents.

Emerging school counselors are a prime example of students that need training on military issues. The Department of Veteran Affairs (2009) reported that 43% of active service members have children and those born post 9/11 have yet to experience the nation during peacetime. Wailiski et al (2012a) noted the impact of parental deployment on children is often extreme stress. Wailiski et al (2012b) described a workshop for training school counselors to be home-front responders for children experiencing parental separation.

Students planning on working government or community agencies may also find themselves working with military populations. Returning home after a stressful tour of duty in a combat zone can be problematic for some military personnel (Lapierre, et al. 2007; Pietrzak, et al 2009) Redeployment issues run the gambit from career barriers to eating disorders (Clemens & Milsom, 2008; Warner, et al, 2007). Recent professional literature in the area of counseling also suggests that military dependents such as spouses and children are also vulnerable to emotional distress upon the return of a loved-one (Lincoln, et al, 2008; Sheppard, et al, 2010; Verdeli, et al, 2011).

### **Canines and Stress Reduction**

Yount et al. (2012) reported that the presence of a therapeutic dog is effective in decreasing stress in children with attachment disorder, reducing stress in healthy adults, and assisting adults with hypertension. The authors also noted that of the 40% of veterans from Iraq and Afghanistan diagnosed with Post-Traumatic Stress Disorder (PTSD), 60 % of the diagnosed Veterans still met the criteria for PTSD. Yount et al. posit that there is an absolute need for adjunctive treatments for PTSD are explored to measure if outcomes are improved. It appears that the use of therapeutic dogs is an effective complement to traditional counseling. Yount et al

conducted a study of veterans training therapy dogs and found significant improvements in their mental health function, including:

- Increase in patience, impulse control, emotional regulation
- Improved ability to display affect, decrease emotional numbness
- Improved sleep
- Decreased depression, increase in positive sense of purpose
- Decrease in startle response
- Decrease in pain medications
- Increased sense of belongingness/acceptance
- Increase in assertiveness skills
- Improved parenting skills and family dynamics
- Fewer war stories and more in the moment thinking
- Lowered stress levels, increased sense of calm (Yount et al., 2012, p. 65).

The benefit of trained canines for stress reduction has been articulated by other researchers. Shubert (2012) reported that therapy dogs were employed soon after the 2001 bombing of the World Trade Center, an act that began military combat campaigns in Iraq and Afghanistan. The dogs assisted with calming first-responders to the incident. Ritchie and Amaker (2012) noted the rise in the visibility of therapy dogs. The authors posit that canines specifically trained to assist children and adults with PTSD have proven to be effective. The authors collected anecdotal reports from clients at a veteran center. The quotes include:

I used to take five different medications for my PTSD. Now I take two.

I could not be in malls or other crowded places. Now, with my dog, I can tolerate them, knowing he will rescue me.

When my husband returned from Iraq, he was a jerk. Since we got our dog, we have reunited as a family.

When I have a nightmare, he puts his muzzle into my face, and the nightmare stops (p. 6).

### **Canines in Curriculum**

Counselor educators can serve as advocates for military populations. Reynolds and Osterlund (2011) reported that counselor education curriculum could be enhanced to foster not only awareness of the issues facing military but also treatment strategies. Chandler et al (2010) noted that creating awareness of the use of therapy dogs is not strong enough to be effective. Counselors need to be trained in matching techniques with theoretical approaches. Students in school counseling programs can also benefit from curriculum that includes therapy canines. Cole (2012) concluded that an essential role of school counselors is to partner with military families. Additionally, working with military children fulfills the American School Counselor Association (ASCA) standard for acting as “collaborators, supporters, and leaders (p.6)”.

Operation Iraqi Freedom (OIF) and Operation Enduring Freedom (OEF) have been the longest combat campaigns in American history. It is estimated that nearly 3 million military personnel have served at least one tour of duty and approximately 2 million children have experienced a deployed parent. There is ample evidence cited in professional literature of the immediate mental health needs of military populations affected by deployments. One intervention that is showing an increase in use and effectiveness is the therapy canine. Reports indicate that therapy dogs can reduce military-related stress in both children and adults. Using

therapy canines is emerging as a best practice for counseling military populations. Infusing the topic of therapy canines into counselor education curriculum aimed at military populations aligns with standards in the field of counseling and counselor education.

Alaska's Exemplary Program: The Rural Alaska Honors Institute  
Let's Dig in the Dirt!

Begun in 1983, RAHI – the Rural Alaska Honors Institute - is a six-week college-preparatory summer bridge program on the University of Alaska Fairbanks campus for Alaska Native and rural high school juniors and seniors. Students take classes that earn them 7-10 college credits. A program of rigorous academic activity combines with social, cultural, and recreational activities to make up the RAHI program of early preparation for college. Students are purposely stretched beyond their comfort levels academically and socially to prepare for the big step from home or village to a large culturally western urban campus.

All of this effort and activity support the principal goal of RAHI: promoting academic success for rural students in college. RAHI boasts thirty-one years of successfully educating over 1,500 students. Of these students, 688 have received degrees ranging from a medical doctor, eight lawyers, two PhDs, two doctors of pharmacy, two doctors of physical therapy, 73 masters, 334 bachelors, 172 associates, and 93 certificates. This semester, over 250 alum are presently attending college.

This summer eight students continued their RAHI adventure by flying into a remote Alaskan lake to participate in an archaeological dig into one of the oldest archaeological sites in the nation. During the two weeks, these students learned proper archaeological practices, actually excavating items, identifying and cataloging them, culminating in a video. This video (3 minute version and a 20 minute version) is completely produced by the students, highlighting what they found interesting and incorporating various Alaska Native cultures into their daily dig.

If there is an appropriate format, I propose to show the video, with an explanation of the program, site, and lessons learned about participating in an archaeological dig in a remote site, with minors, extremely limited electricity, very limited cell phone coverage, food preparation for people in a remote site, tent living, interaction with various animals of the region, and how to interact with tribal members.

RAHI understands the importance of indigenous knowledge from various remote regions and ensures students have a support system of incorporating academia and Native culture. All of this effort and activity support the principal goal of RAHI in promoting academic success for rural students in college. This presentation and video will present findings showing that early engagement in RAHI, utilizing Indigenous Knowledge Systems, leads to successful higher educational degree.

## Why Did We Leave No Trace?

At the edge of the Arctic Ocean, we traveled out onto the ice pack in search of food and furs. After spring arrives, throughout the summer we would travel inland towards the Alaska's Brooks Range, searching, always searching...for food. Through the mountain passes, the bush planes flew in suitable weather and the bear, moose, and caribou would migrate. We, like the animals, have become nomadic again, following the animals in season and fishing in mountain lakes and streams.

We shared our life together, living on the edge of the Arctic Ocean. Mark grew up in Barrow, Alaska, the farthest north Inupiaq Eskimo community. Denise joined him as his wife and together they started their family. For ten years we lived a subsistence lifestyle. We will show a power point presentation and discuss ways in which we lived on the land, with winter temperatures dropping to -50F and summers of mosquitoes chasing us and the caribou across the tundra. Always moving, but leaving no evidence of being there...

## Abstract

Attracting STEM teachers to rural schools is a challenge many districts face. The Grambling State University Alternative Teacher Certification Project is designed to attract STEM teacher candidates to “hard to staff” school districts in the north Louisiana region. The Project has modified its recruitment plan to include an increased focus on current social media recruiting strategies. Social media recruiting strategies have been successful in attracting STEM teacher candidates to the Project. These strategies provide an effective platform for recruiters to build two-way communication and consistently engage potential teacher candidates. This platform facilitates the trajectory of contact to applicant to teacher candidate. Additionally, the appeal of lower cost to organizations also makes social media an attractive recruiting method.

1. **TITLE: Collaborative Teacher Inquiry in Grade 9 Mathematics: Using a Conceptual Framework to Improve Student Achievement**
2. **TOPIC AREA:** Mathematics teacher education
3. **PRESENTATION FORMAT:** **paper session**
4. **DESCRIPTION:**

This paper describes a project that focused on the improvement of instructional strategies in Grade 9 Applied level mathematics. Participants included teachers, department heads leaders, and administrators from 12 secondary schools in two Canadian urban school districts. A conceptual framework helped participants to focus on obtainable goals for school improvement. Student achievement on provincial large-scale assessment tests increased over 109% in the four years. The strategies and teaching practices will be described in the presentation.

# **Collaborative Teacher Inquiry in Grade 9 Mathematics: Using a Conceptual Framework to Improve Student Achievement**

## **Introduction**

The Collaborative Teacher Inquiry Project focused on the improvement of instructional strategies in Grade 9 Applied level mathematics, with the goal of improving student achievement and engagement in mathematics. The Learning Consortium is a partnership between the University and four urban school districts in the Greater Toronto Area. From these four school districts, 12 schools participated in the project, which spanned from December 2008 to May 2010. We had five of the 12 schools continue and we added five more schools from December 2010 to June 2012. Participants included teachers, department heads/curriculum leaders, and administrators.

The purposes of this project were to: 1) improve the teaching and learning of Grade 9 Applied mathematics and 2) investigate collaborative inquiry as professional development strategy.

## **Literature Review**

The connections between the vision of communities of practice and the vision of reform-minded professional development for teachers are clear. Schlager (2000) states that research is converging on a common set of effective professional development characteristics and strategies that stem largely from concepts about communities of practice. In a meta-analysis of professional development initiatives, Wilson and Berne (1999) concluded that “effective efforts all (a) involve communities of learners redefining teaching practice, (b) seek to activate (rather than deliver) teacher learning, and (c) privilege teachers’ interactions with one another” (p. 194).

Recent innovations in professional learning for teachers have included a wide variety of collaborative approaches to professional development. Terminology that has been used to characterize such efforts includes artisan communities, collaborative learning communities, communities of practice, and professional learning communities (DuFour, 2004; Haberman, 2004; Talbert & McLaughlin, 2002) among a host of other, lesser-used terms. Such a widespread lexicon is indicative of the range of the theoretical stance of researchers.

## **The Ten Dimensions of Mathematics Education Framework**

There is no single set of attributes that characterizes what good mathematics programs should contain but we can identify central tendencies that distinguish various teaching approaches. The Ten Dimensions of Mathematics Education is a framework that breaks down the essential components of a successful mathematics education program (McDougall, 2004; Ross, McDougall, Hogaboam-Gray & LeSage, 2003). The dimensions overlap and together constitute an orientation to instruction that differs from traditional practice. The Ten Dimensions are (1) Program Scope and Planning: Teachers consider curriculum strands, expectations, outcomes, process, and key concepts when planning a mathematics program; (2) Meeting Individual Needs: Teachers engage all students in complex problem solving, providing appropriate levels of support; (3) Learning Environment: Teachers use appropriate physical classroom organizations and student groupings to promote learning; (4) Student Tasks: Student tasks are intricate, open-ended problems embedded in real life contexts; many of these problems do not afford a single solution. Skill and procedural work can be engaging and meaningful; (5) Constructing Knowledge: Teachers use different instructional strategies and questioning techniques to help students construct knowledge; (6) Communicating with Parents: Communication about student achievement and the mathematics program is through a variety of media; (7) Manipulatives and Technology: Mathematical problems are undertaken in reformed classes with the aid of manipulatives and with ready access to mathematical tools - calculators and computers; (8) Students' Mathematics Communication: Instruction in reformed classes focuses on the construction of mathematical ideas through student communication – oral, written and physical; (9) Assessment: Transparent and authentic assessment is integrated with everyday events and taps a wide variety of abilities through diagnostic, formative and summative strategies; and (10) Teacher Attitude and Comfort with Mathematics: Teachers attitudes towards mathematics and comfort with the subject matter affects student learning.

### **Method**

The participating schools created an implementation team of administrators and teachers. This team met to discuss mathematics improvement in their school as part of the Learning Consortium's project. The participants attended in-service sessions, were visited by the principal investigator and director of the consortium, and completed personal reflections about their participation in the Collaborative Teacher Inquiry Project. There were three professional

development days, focusing on assessment, technology and data analysis in each of the fourschool years.

### **Data Sources**

The University research team interviewed the teachers and department heads/curriculum leaders in the schools to learn about their understanding of mathematics improvement, mathematics teaching and learning, and school success. We also attended some meetings of the mathematics implementation teams at their schools. Their discussions were about the collaborative inquiry process, and implementation plans for each school. We used a survey to learn about the areas for improvement.

### **Interviews**

We interviewed the teachers and department heads/curriculum leaders involved in the project. The participants had an opportunity to indicate that they did not want to participate in the research component of the project. Each interview was 45 minutes in length. They were audiotaped and transcribed.

### **Attitudes and Practice for Teaching Math Survey**

The survey instrument has been used in a number of other mathematics reform studies. This self-assessment survey now consists of 20 Likert (agree-disagree) items. The survey provides a simple and practical starting point for collecting information about teacher's current attitudes and practices surrounding the Ten Dimensions.

The project teachers and administrators then completed the Attitude and Beliefs Survey to determine how their current practices fared with respect to current mathematics education trends (McDougall, 2004; Ross, McDougall, Hogaboam-Gray & LeSage, 2003). Each of the 20 Likert (agree-disagree) questions on the survey is related specifically to one or more of the Ten Dimensions and the higher the score on each dimension, the more the educator's attitude and teaching practices are aligned to reform trends. A low score may be impetus for the educator to focus on that particular dimension for personal growth. An overall score is given to the educator and a high score in this capacity means that the educator corresponds with current mathematics thinking and is an indicator of how open the educator is to change (McDougall, 2004; McDougall, Ross & Ben Jaafar, 2006).

### **Findings**

Each school identified two dimensions from the Ten Dimensions of Mathematics Education (McDougall, 2004). This section will identify the findings from the schools that focus on four dimensions of the study. The staff at Ada Lovelace School was eager to improve their teaching practices. The teachers mentioned being open to professional development days and enjoy sharing their experiences with other educators. The teachers praised the opportunity to work with the Learning Consortium and select a specific topic to focus on.

At David Hilbert School, teachers set their own goals and create annual learning plans. For the teachers, selecting one or two of the Ten Dimensions of Mathematics Education keeps them focused on their goals for professional growth. Teachers also seek out other opportunities to improve their practices including Honours Specialist courses and workshops.

The teachers at Evariste Galois School mentioned that technology and student tasks were their primary dimensions. The head of the department stated: “We selected two dimensions to work with. The first dimension we chose was student-based activities; the other one was incorporating more technology into the classroom” (EG1, Interview).

The teachers at Srinivasa Ramanujan School have very similar teaching philosophies and professional goals. All participants felt that student motivation was lacking in the Grade 9 Applied classes at their school and wanted to select dimensions that would help to improve this component.

In the Collaborative Teacher Inquiry Project, teachers identified their professional development goals using the Ten Dimensions of Mathematics Education framework. The Attitudes and Beliefs Survey was administered to help teachers and administrators identify the two dimensions that the school and teachers would focus on for the duration of the project. Some schools used these dimensions to keep them focused on their goals for professional development. One school felt that the dimensions identified ten areas that they could focus on and improve.

The Learning Consortium’s Collaborative Teacher Inquiry Project sought to improve the teaching and learning of Grade 9 Applied mathematics by encouraging teachers to work collaboratively on areas of foci as outlined by the Ten Dimensions of Mathematics Education. As a result of this project, teaching teams were able to set goals and definitions of student success for students at their school. Their discussions led to shared initiatives to create new culminating and EQAO preparation tasks, among others. The Ten Dimensions of Mathematics Education allowed participants to focus on obtainable goals for school improvement as opposed

to trying to improve their mathematics program in a general context. Although teachers and administrators face many challenges, opportunities such as the Collaborative Teacher Inquiry Project provide support and encouragement for professionals seeking to improve their mathematics programs and ultimately help students reach their full potential.

## **Discussion**

The primary benefits of the project are that the teachers and administrators have collaboratively investigated, discussed and implemented evidence-based teaching and assessment strategies and techniques in the Grade 9 Applied mathematics course, and have seen improvement in the achievement of their students as a result. The teachers and administrators have learned strategies that proved successful for other teachers in the school boards as they planned and implemented improvement in Grade 9 Applied mathematics courses.

Teachers identified their professional development goals using the Ten Dimensions of Mathematics Education framework. The Attitudes and Beliefs Survey was administered to help teachers and administrators identify the two dimensions that the school and teachers would focus on for the project. Some schools used these dimensions to keep them focused on their goals for professional development. All schools felt that the dimensions identified ten areas in which they could focus on and improve.

The teachers and administrators were particularly impressed with the over 100% increase in provincial large-scale scores for the Grade 9 students. Some schools increased over 250% in two years, based on using the strategies and teaching practices taught and supported by the professional development activities. In the session, these strategies will be described in more detail.

***Abstract for:***

***Do You Have Great Expectations for Your Teens?***

The Great Expectations for Teens (GET) program is a 54 hour fortune 500 college and career readiness process that builds and reinforces the 10 life and leadership skills top colleges and employers say they want and need in students and employees. Research shows that employers are facing an ill-equipped emerging workforce deficient in the “soft skills” areas of leadership, teamwork, critical thinking, problem solving and decision-making. Economists Drs. James Heckman and Flavio Cunha explained in the America’s Promise Alliance report (2007) that these soft skills are just as essential to a young person’s success as the more frequently cited academic indicators. In fact, both federal and international commissions have concluded that these skills are essential prerequisites for high school graduates to enter the workforce and college successfully. Unfortunately, there exists today a significant gap between the level of soft skills that future workers need and the level of these skills that they now possess. The data showed that young people lack not only the skills themselves but important opportunities to develop them.

The Great Expectations for Teens program addresses all these concerns and more. Results analyzed at 5 levels and from 2 perspectives (college & career readiness) found the following:

- The cumulative growth rate (i.e. of all students combined) averaged 181% per key skill area, more than twice the Adult industry average.
- 93% of participants reported significant improvements in their *school grades* as a direct result of the program
- 100% of participants reported a significant increase in their *personal aspirations, standards and expectations* as a direct result of the program
- Student growth rates in each of the 10 key skill areas exceeded the related ASTD industry average in 100% of all cases (self-confidence & self-esteem 150%, Leadership & Character Development 200%, Interpersonal & Social Skills 180%, Oral Communications Skills 190%, Public Speaking Skills 230%, Goal Setting & Goal-Execution Skills 180%, Appearance & Demeanor 140%, Positive Mental Attitude 150%, Thriving Under Pressure 150% and Avoiding the 10 Major Life Derailers 160%).

1. **TITLE:** What's the Big Idea? Developing a Fat Pedagogy in Higher Education
2. **TOPIC AREA:** Higher Education
3. **PRESENTATION FORMAT:** Panel Session
4. **DESCRIPTION:** Weight-based oppression is a growing problem that is manifested across societal institutions resulting in economic, medical, and psychosocial hardship for those who experience this form of discrimination. The emerging field of Fat Studies brings attention to this social justice issue via scholarship, teaching, and activism. In this panel we elucidate the basic principles of the field and share our experiences teaching about this topic in various higher education contexts. We will conclude with key tenets of what we are calling a "fat pedagogy," inviting participants to share how they might incorporate this pedagogical approach into their own courses.

### **Session Summary**

Due to growing cultural discourses surrounding “bodies at risk” and a “society at risk” (Azzarito, 2007), obesity has become a central issue in schools where students’ bodies are increasingly turned into political sites of privilege and oppression through the (self)regulation, disciplining, degradation, and surveying of bodies (Monaghan, 2010; O’Brien, Hunter, & Banks, 2007). These repressive forms of power are not only informing but governing the way students regard, learn about, live with, and relate to their bodies and the bodies of others (Wright & Harwood, 2009). A growing body of literature points to the harmful consequences of this dominant obesity discourse within educational contexts and the need to develop teaching strategies that disrupt weight-related intolerance, insensitivity, and discrimination (Boling, 2011; Cameron et al., in press; Evans & Rich, 2011; Evans, Rich, Davies, & Allwood, 2008; Guthman, 2009; Mansfield, & Rich, 2013; Puhl, 2011; Puhl & Heuer, 2009; Russell, Cameron, Socha, & McNinch, in press)

The objectives of this session are: 1) to bring attention to weight-based oppression as an important social justice issue for educators in higher education; 2) to highlight the emergent field of Fat Studies and how educators are endeavoring to disrupt weight-related oppression, intolerance, insensitivity, and discrimination within their classes; and 3) to outline the key tenets of what we are calling a ‘fat pedagogy.’ To conclude, we will argue that educators need to seriously consider sizism, especially given its links to classism, racism, sexism and ableism. Drawing on insights from critical pedagogy and social justice education, we will argue that now is the time for critical educators to work to disrupt fat oppression and embrace people of all sizes and shapes.

### **Paper/Presentation Summaries:**

**Title: Inclusion of Fat Studies in a Difference, Power, and Discrimination Curriculum**  
**Presenter: Patti Lou Watkins, Oregon State University, USA, [pwatkins@oregonstate.edu](mailto:pwatkins@oregonstate.edu)**

Until recently, differences based on body weight, shape, and size have received little attention in diversity discussions, nor have they been the focus of diversity-oriented college classes. However, weight-bias has a long history in western culture (Rothblum & Solovay, 2009), increasing exponentially over the past decade (Andreyeva, Puhl, & Brownell, 2006). Furthermore, it intersects with bias based on other areas of difference, especially gender and race. Consequently, scholars now recognize weightism as a social justice issue on par with racism (Puhl, Andreyeva, & Brownell, 2008). College courses have begun to integrate lessons on weightism, with several focused solely on this topic (Watkins, Farrell, & Doyle-Hugmeyer, 2012). These courses reflect the emergent, interdisciplinary field of Fat Studies which is akin to Women’s Studies and fields of inquiry based on race that evolved from grassroots activism and political movements to resist discrimination. Like Queer Studies, Fat Studies reclaims the historically pejorative word “fat” as a form of resistance to inequities perpetrated around this category of difference.

This presentation depicts the development and dissemination of a Fat Studies course that is part of a university’s Difference, Power, & Discrimination curriculum. This upper division/graduate class, cross-

listed between Psychology and Women, Gender & Sexuality Studies, typically enrolls students from these majors along with students from the Colleges of Education and Public Health & Human Science. As the catalogue states, “the course frames weight-based oppression as a social justice issue, exploring forms of activism used to counter weightism perpetuated throughout various societal institutions.” Consistent with critical pedagogy (McArthur, 2010), students themselves engage in activism projects to promote social justice beyond the classroom. Qualitative data derived from written assignments illustrate course content and its impact on students, including changes in beliefs and behavior surrounding weight with respect to themselves and others. Employing standpoint theory (MacDonald, 2002), students were encouraged to scrutinize their own life experiences to create an understanding about systems of oppression through personal testimony. As such, they came to recognize weightism as a structural, systemic social justice issue rather than maintain the traditional view that fat bodies are inherently flawed. This transformative pedagogical approach allowed students to resist hegemonic discourse, potentially empowering those whose bodies have been marginalized and creating allies among those whose bodies have conferred privilege. Further, many students vowed to conduct their future careers as teachers, counselors, and health care workers in ways that counteract weightism.

**Title: Experiences Incorporating Fat Pedagogy into Fashion Design Courses to Bring Attention to Weight-Based Oppression in Higher Education**

**Presenter: Debbie Christel, West Virginia University, USA, [Deborah.Christel@mail.wvu.edu](mailto:Deborah.Christel@mail.wvu.edu)**

As a professor traditionally trained in fashion design I teach courses that involve in depth analysis, contact and conversation about the shape, size and aesthetics of the human body. This offers a multitude of opportunities to address weight based oppression in fashion and merchandising in higher education. This presentation will incorporate resources and assignments used in classes, and student responses drawn from these assignments will be used to exemplify their receptivity to these Fat Studies ideas. Clothing and personal appearance are universal aspects of daily life and used as a means of aesthetic expression. However, not all humans have equal access and the opportunity to express themselves through clothing. Studies demonstrate that frustration experienced during clothes shopping is a common experience for plus size consumers (Moin, 2011; Colls, 2006; Chowdhary & Beale, 1988; McReaddy, 1988; Cooper, 1998). In addition, other types of frustration for fat women exist in the form of “limited selection of styles, virtually no contemporary styles, and apparel retailers' and manufacturers' reluctance to be affiliated with large sizes” (McReaddy, 1988, p. 20). The fashion industry offers certain styles in limited sizing which in turn structures our society in such a way that only certain sizes can participate in choosing and wearing fashionable clothing.

Incorporating Fat Pedagogy into apparel design courses may reduce the bias and negative assumptions about fat bodies. A few techniques that were well received by students included the use of fat mannequins and a strict ‘no-body talk’ policy. In response to these techniques students report feeling more accepting of their bodies and other bodies. Through the experience of teaching design techniques for fat bodies, students have also reported an interest in working for plus-size retailers. Without Fat Pedagogy in Fashion Design courses (and other majors), students may not consider providing services or working for this demographic. There is a growing need for educators to consider incorporating anti-oppressive teaching practices that may greatly impact how society views fat bodies.

**Title: Teaching the Fat Body: A Consideration for the Social Sciences****Presenter: Cat Pausé, PhD, Massey University, New Zealand, c.pause@massey.ac.nz**

That we live in a thin world has been asserted by Fat Studies scholars and fat activists for decades (Pausé, 2012). Slim bodies are constructed as moral beings; as disciplined, active, attractive, and successful (Jutel, 2005). Fat bodies are constructed as immoral beings; as undisciplined, lazy, disgusting, and undesirable (Murray, 2008). The anti-fat attitudes that result from these beliefs influence the everyday lives of individuals of all sizes, including within the classroom. In both the interactions between the classroom participants (teacher-student, student-student, student-teacher) and the treatment of bodies within the subject material, normative messages of bodies, and the subsequent reinforcement of anti-fat attitudes, are common. Educators interested in issues of social justice must allow body size to have a place beside the commitment to issues of gender, race, ability, sexual orientation, etc (hooks, 1994; Freire, 1970).

How do those of us not teaching courses in Fat Studies incorporate body size social justice into our classroom (Watkins, Farrell, & Doyle Hugmeyer, 2012)? How may we recognize that the bodies of our students, and the bodies involved in our subject area, are political? In this presentation, I consider ways that those in the social sciences may include consideration of fat politics into the classroom (Koppelman, 2009). Working from a feminist perspective, theoretical and methodological frameworks for incorporating social justice into University teaching will be examined. Special attention will be given to exploring how social media may be used as a tool for engaging in fat pedagogy (Harding & Kirby, 2009).

**Title: A Modest Pedagogy: Challenging Obesity Discourses in the Health Sciences****Presenter: Erin Cameron, Lakehead University, Canada, emcarte1@lakeheadu.ca**

Increasingly, weight-based bullying has shown to negatively impact students' self-esteem, perceptions of safety in schools, and school achievement (Weinstock & Krehbiel, 2009). Given the growing body of evidence around the negative impacts of weight bias and stigma in educational contexts (Puhl & Heuer, 2009), more needs to be done to work towards addressing the [in]justices of an educational climate that privileges certain body types and marginalizes others. As such, creating safe learning spaces for all students, regardless of size, and employing teaching strategies that disrupt weight-based oppression is, therefore, ever more important. To date a handful of studies have examined various teaching strategies to address weight-based oppression (Boling, 2011; Escalera, 2009; Guthman, 2009; Koppelman, 2009), but there is a growing need for more novel studies that are broader in scope and based in a range of perspectives (Watkins, Farrell, & Hugmeyer, 2012).

Informed by feminist, poststructural, and critical theory, this study details the "modest pedagogy" (Tinning, 2002, 2011) approach taken in a graduate course titled "Obesity Discourses in Society, Education, and Health Care" and provides a critical analysis of the student experience and perceived effectiveness of this approach, drawing upon reflective journal entries, reading responses, and open-ended semi-structured student interviews. As a result, this paper will illustrate the effectiveness of engaging different rhetorical frames and analytic voices of critique and truth, voices of rage about injustices, and personal voices of lived stories and culture in teaching about issues of weight, obesity, and fatness, using a critical lens. Moreover this paper will argue that education institutions serve as powerful pedagogical sites where teaching practices serve to train students' perceptions of what's

valued, privileged, and normal in the name of health and life. As such, there is a growing need for critical educators for social justice to consider issues of weight, obesity, and fatness and to consider using anti-oppressive teaching practices that disrupt body-related intolerance, insensitivity, and discrimination.

## 6. Abstract:

### **Effect of Quality of Teacher Toward Early Childhood Development**

Bondan Sikoki, Nasirudin, Fita Herawati, Ni Wayan Suriastini

Quality of teacher is one fundamental aspect of academic activity, beside the learning facilities and learning method. A teacher's individual characteristic not only affect his/her job but also student's development, this is especially important in the early stage of child development.

This paper aims to to document quality of teacher in the play group and kinder garden and to learn about the association between quality of teacher and child capacity development. This paper used data from study of 360 play groups and kinder gardens conducted in Yogyakarta City and Bantul district of Indonesia, based on interview with the school principals/caretaker and teachers of those facilities, and also with 1,800 parents about their children.

Analysis was conducted based on school's qualification standards regarding teacher qualification and competence standard. Evidence showed that teacher with D2/PGTK (teacher college) qualification count for 67.52% in kindergarten, 44.59% in playgroup. While for competence standard, the study found that teacher competence on understanding children development was still very low, that is on average below 50% for all age groups, regarding children development on religious and morality value, cognitive, gross motor skill, fine motor skill, language and social emotional aspects.

Under-qualification and under-competence of teacher will be compared with data of child capacity development from 1,800 children of 360 play groups and kinder gardens reported by the parents to see how those quality aspects affect the child capacity development. It is expected that teacher quality will affect more on child cognitive and motoric development than on value, language and social emotional aspects .The preliminary result showed that teacher quality on understanding child development correlates positively with cognitive, fine motor skill, language and social emotional development of the children. Teacher who understand child development of their student development improved cognitive skill of the children 1.79 time better. On fine motor skill the improvement is 1.81 times, language skill 1.63 times and social emotional skill 1.73 times better than child with teacher who have less understanding child development.

Efforts on increasing teacher's awareness on child development in play groups and kinder gardens urgently need to be in placed not only by the government but also by the other stakeholders such as universities, private sectors, CSOs, including the community its self. It requires joint effort towards improvement of the quality and standard of kinder garden and play group in Indonesia.

### **Title**

Analytics in Education: A Beacon of Enlightenment for Excellence

### **Topic Area**

Educational Measurement and Evaluation

Educational Policy and Leadership

### **Presentation Format**

Paper Session

### **Presentation Description**

The presentation will address the critical need of analytics in both K-12 and Higher Education to enable educators from both levels to use data that has been empirically analyzed to show the strengths and weaknesses of educational teaching and learning methods. It will also address teaching methods that embrace analytics in the teaching approach.

Analytics in Education:  
A Beacon of Enlightenment for Excellence

By E. George Beckwith, Ed. D.

National University

San Diego

October 2013

### Abstract

Analytics is defined as “The use of data, statistical analysis, and explanatory and predictive models to gain insights and act on complex issues.” Review of the literature on Analytics in higher education validates that many colleges and universities have demonstrated that analytics can help significantly advance a college or university in such strategic areas as resource allocation, student success, and finance (EDUCASE Center for Applied Research, 2012). There are other areas, however, that have great potential for advancing the effectiveness of an educational institution, such as degree cost, resource optimization, and multiple administrative functions, that have not used analytics methods to enlighten educational leaders on more effective utilization.

Even in the areas where some colleges and universities have used analytics effectively, the majority of both Higher Education and K-12 institutions have not embraced analytics to aid in their strategic planning of their educational programs, teaching and learning strategies, or educational costs—both from the institution’s or student’s/parent’s points of interest. Other fields such as Science, Technology, Engineering, Medical/Health, and Business/Management are, on a large scale, actively using analytics to guide their strategic planning and decision making. Education needs to follow their example. This paper reviews the current analytics success stories at both K-12 and Higher Education institutions and addresses the potential for analytics to significantly change how these, and potentially other, institutions use available data to make critical strategic decisions about education.

## Introduction

*What in the world is analytics?*

There is a ring of familiarity about the term “analytics” but ask anyone to define it and note the momentary pause before a response is received. Wikipedia (2013) defines it as follows: *Analytics is the discovery and communication of meaningful patterns in data. Especially valuable in areas rich with recorded information, analytics relies on the simultaneous application of statistics, computer programming, and operations research to quantify performance. It favors data visualization to communicate insight.* EDUCAUSE, a nonprofit membership association created to support those who lead, manage, and use information technology to benefit higher education defines analytics more precisely and briefly: *Analytics is the use of data, statistical analysis, and explanatory and predictive models to gain insights and act on complex issues (2010).* The New Media Consortium (NMC), in their 2012 Horizon Report stated that *the goal of analytics is to enable teachers and schools to tailor educational opportunities to each student’s level of need and ability in close-to-real time. Analytics that are used in education are increasingly being labeled learning analytics.*

Learning analytics is not just analysis. Though it does use descriptive and predictive models to gain valuable knowledge from data, it does not stop there. It uses the insight gained from analysis to recommend action and/or to guide decision making and communication. Analytics is not, therefore, so much concerned with individual analyses or analysis steps, but with the entire methodology (Wikipedia, 2009). Tools and techniques once confined to research laboratories are being adopted by forward-looking industries to generate business intelligence for improving decision making (U.S Dept. of Ed., 2009). U.S. Dept. of Ed report (2009) found that

higher education institutions are beginning to use analytics for improving the services they provide and for increasing student grades and retention. The McKinsey Global Institute (Norris and Baer, 2013) did an analysis across 20 sectors and in every category except talent, found that *education* was the least prepared for ease of data capture, capacity for IT intensity, the data-driven mind-set, and was least likely to have overall data availability.

### *Analytics Not New to Education*

To imply, however, that educators have not and are not using analytics techniques will quickly raise objections by many educators who will argue, probably fairly, that the core concept of analytics (or learning analytics) is not new to educators and that it has been in existence for several decades in education theory and practice (Yuan, 2013). They will tell you that good teaching practice has, for a long time, involved the paper and pen recording of information that is analyzed and reflected upon for decisions regarding interventions pertaining to individual students or classes. At the same time, rather than the narrow focus on individual students and classes, researchers in the educational data mining field and analytics have an extensive history of developing tools and techniques to make use of data to improve teaching and learning as well as education as a whole (Yuan, 2013).

There is a gap, however, between what technology is capable of doing and what people can do, without analytics techniques, with existing data sources and tools. According to Yuan (2013), it has only been in recent years, due to the increasing use of technology in education, that more and more personal information and detailed records on learning activities and assessment have become available. He postulates that the development of new technologies and tools that lower the technical and cost barrier of taking on such data analysis makes it possible for

educators to gain insight from various sources to achieve efficiency and effectiveness and improve students' performances.

### *Increased Use of Analytics in Education*

Even so, analytics is beginning to be increasingly used in education, particularly at the district and government office levels (U.S. Dept. of Ed, 2009). However, the complexity of student performance measures presents challenges when educators try to understand and use analytics to discern patterns in student performance, predict graduation likelihood, improve chances of student success, etc. For example, in a study involving districts known for strong data use, 48% of teachers had difficulty posing questions prompted by data, 36% did not comprehend given data, and 52% incorrectly interpreted data (U.S. Dept. of Ed., 2009). To combat this, some analytics tools for educators adhere to an over-the-counter data format (embedding labels, supplemental documentation, and a help system, and making key package/display and content decisions) to improve educators' understanding and use of the analytics being displayed. Analytics is also being used increasingly in higher education.

### *EDUCAUSE Analytics Findings*

EDUCAUSE, a nonprofit membership association created to support those who lead, manage, and use information technology to benefit higher education, has done some revealing research on analytics (EDUCAUSE, 2010). They cite the case of Professor Donaldson who teaches introductory chemistry at a large state university which they do not name. He uses an analytics program linked to the learning management system (LMS) that helps him monitor the progress of the more than 500 students in his lecture class by compiling and analyzing

information like the number of times class notes are viewed, the frequency of contributions to the discussion board, and quiz grades (EDUCAUSE, 2010). He uses an application dashboard, from which he can see an indicator beside each student's name, reflecting the program's assessment of the likelihood that the student is on track to earn a C or better in the course. He can instantly see which student or students are at an elevated risk by a color code in which statistically, green denotes high likelihood, yellow suggests possible risk, and red indicates an elevated risk. Based on the information from his dashboard, Donaldson can then send an e-mail to notify students if they appear at risk, congratulate them for work well done, or suggest ways to get more from the class.

EDUCAUSE (2010) believes that colleges and universities can utilize the power of analytics to advance and promote such critical areas as student recruitment policies, course catalog offerings, hiring needs, and financial decisions. In a teaching and learning context, data from such sources as the learning management system, college application forms, and library records can be used to build academic analytics programs that use algorithms to construct predictive models that can identify students at risk for not succeeding academically (EDUCAUSE, 2010).

### *Close-to-Real Time Analytics*

The New Media Consortium, in international community of educational technology practitioners to include hundreds of U.S. Colleges and Universities advocates using analytics in close-to-real time and by doing so enable faculty to more precisely understand students' learning needs and to tailor instruction appropriately and far more accurately and far sooner than is now possible (NMC Horizon Report, 2012). By offering information in near real time, learning

analytics can support immediate adjustments, suggesting a model of curriculum that is more fluid and open to change.

*The U.S. Department of Education Report on Data Mining and Learning Analytics*

Learning analytics, as it is currently contrasted with data mining, focuses on applying tools and techniques in large scales such as in courses and schools and postsecondary institutions, but both are being used to research and build models in several areas that can influence online learning systems in areas such as user modeling (U.S. Dept. of Ed., 2009). User modeling encompasses what a learner knows, what a learner's behavior and motivation are, what the experience is like, and how satisfied users are with online learning. Analytics can be used to detect when an online student is having academic problems and nudge her/him to address and correct the problem. Since the data is being collected in real time, multiple feedback loops operating in different times scales, continuous improvement should be possible immediately to the student prior to the next problem and daily to the teacher for the next day's teaching, monthly to the principal for judging progress, and annually to the district and state administrators for overall school improvement (U.S. Dept. of Ed., 2009). The focus on "data" however requires that all involved with analytics—particularly, learning analytics—that visual data analytics closely involve humans to make sense of the data from initial pattern detection and model building to sophisticated dashboards that present data in a way that allow humans to act upon it. It follows that making visible students' learning and assessment activities opens up the possibility for students to develop skills in monitoring their own learning and to see directly how their effort improves their success (U.S. Dept. of Ed., 2009).

*Analytics and Data Mining Challenges*

The U.S. Department of Education report, though supportive of the potential of analytics and data mining for education institutions, also noted challenges. One, of course, is the costs associated with collecting and storing the data as well as the computation techniques costs, but another is the technical challenge that educational technology systems are not interoperable, so bringing together administrative data and classroom level data will be a major challenge. Attempting to integrate and combine data about student performance—online tracking, standardized tests, teacher generated tests—to form one simplified picture of what a student knows can be difficult while meeting acceptable standards for validity (U.S. Dept. of Ed., 2009).

Yuan (2013) points out that education is a complicated system and cannot be run as a business and that learning is a complex social activity and all technologies, irrespective of how advanced and innovative they may be, are not able to capture the full scope and nuanced nature of learning. He references Melanie Booth, special assistant to the Western Association of Schools and Colleges President, who has warned that analytics needs to be complemented with well guided teaching, learning, and assessment principles for otherwise, its measures may be meaningless (Yuan 2013). He also notes that ethical issues about the use, re-use, and merging of data, both public and private, is already being raised and will have to be addressed as analytics programs increase. In addressing these challenges, Yuan (2013) concludes that educators must have the knowledge, skills, and tools for using analytics in practice to make informed decisions and take action. He believes that educators and technologists, working together, can explore new tools and techniques to use data effectively to bring real changes in teaching and learning in order to transform the accountability, efficiency and relevance of education.

Finally, the 2012 NMC Horizon report states that as higher education institutions evolve in their use of learning analytics, they will need to address the issue of data privacy and determine what extent of information to share with students and other institutions.

### *Utilizing Existing Data—Implementing an Analytics Program*

Large stores of data already exist at most colleges and universities. By analyzing this data, analytics applications have the potential to provide a predictive view of upcoming challenges, both for the institution and for students. The resulting data-driven decisions can support optimal use of both economic and pedagogical resources while offering a structure for improved educational outcomes.

Jay Liebowitz (2013) concluded that analytics are needed in the education market to help insure student, faculty, and institutional success. He cites the case of a school system in Tennessee that used analytics to identify “at risk” students during their early schooling and beyond and used the data to improve their high school graduation rate from 25 percent in 2005 to 80 percent in 2012. Analytics helped them determine the right networking and support services intervention to help the at risk students succeed (Lamont, 2013). Liebowitz (2010), understanding that many educational institutions may need help in determining what needs to be done, as well as where to start when it comes to implementing analytics. He proposes three actions:

1. Instill an “Analytics IQ Culture” within the education sector. As Norms and Baer (2013) point out, the culture and behaviors (data-driven and mind-set) of institutions must change to optimize student success.

2. Gather resources (both in talent, financial, and moral commitment) to use analytics to tackle strategic issues that are at the heart of the institution. These include both student and faculty related issues.
3. Address outcome measures versus simply system and output metrics.

To assist those institutions who may feel some outside help is required, companies like Panorama Education, a startup supported by Facebook CEO Mark Zuckerberg and his wife Priscilla Chan, can help them implement an analytics system (Lunden, 2013). Zuckerberg was quoted as saying “The company is an exciting example of the way technology can help teachers, parents and students make their voices heard” (Lunden, 2013). The company has analytics expertise working with some 4,000 schools covering more than one million students. The idea behind such companies is to work with school districts to identify issues, conceive of what questions need to be asked, and how to ask them (Lunden, 2013). The approach is to work with educators to gather data, in the areas of greatest interest, by the use of easy to administer surveys conducted by the educational institution’s own personnel. When data has been gathered and organized, the analytics company, like Panorama Education, helps the educators figure out what the data means and how to use it in academic decision making.

### *Integrating Analytics with the Degree Qualification Profile*

According to Lumina officials (Hebel, 2010), the degree profile addresses, regardless of their majors and fields of study, what college graduates should know and what they should be able to do. The bottom-line, however, is that students should be able to apply what they learn, and what they learn should be measured in terms of clear outcomes. What better way to measure **and determine** what students have learned that by applying learning analytics to the available

data. Said in another way, what students can do with the learning they have acquired is called learning outcomes, which the institution should not only measure, assess, document, but should also use analytics techniques to make future academic decisions. When anyone asks the faculty and/or the institution what the value of a given degree at their institution is, the response should be in analytic terms of assessed and proven learning outcomes at each degree level, to include how each degree—Associate’s, Bachelor’s, and Master’s—in a given field, relate and reinforce learning as the levels increase. The dashboard technique used by Professor Donaldson, noted above, in which he not only used analytics techniques to assist him in monitoring and in quickly identifying at risk students, but also to communicate to the student that he/she may be in academic trouble and seek help (EDUCAUSE, 2010). The use of analytics in assessing a student’s academic program as a whole could greatly improve students’ ability to plan for the continuation of her/his careers from degree level to the next.

### *Evaluating DQP Using Analytics*

The Western Association of Schools and Colleges (WASC), the North Central Association of Colleges and Schools' Higher Learning Commission, and the Council of Independent Colleges, a private-college association, which is a regional accreditor of higher education, all plan to evaluate Lumina's proposed framework (Hebel, 2011). Perhaps, at the same time, WASC, which accredits about 160 four-year colleges (Hebel, 2011), could incorporate aspects of analytics into their advocacy of DQP and model the integration of analytics and DQP for the institutions it accredits.

*Summary and Conclusions*

There are examples of places in both K-12 and Higher Education where analytics is being used effectively to both enhance teaching and learning while, at the same time, substantiate that learning has occurred and has improved (See Professor Donaldson, page 4, and Jay Liebowitz, page 5). Analytics is being used to identify low performance students while, in near real time, helping them improve so they do not fail and do not drop out. Further, analytics can provide very complex and large quantities of data in visual graphs and terms that everyone with education issues—especially educators, parents, and politicians-- can agree upon and understand. Analytics strongly supports the national Degree Qualification Profile (DQP) effort initiated by the Lumina Foundation whose objective is to better define and demonstrate the value of a college degree. The Western Association of Schools and Colleges (WASC), which accredits the majority of schools and colleges in the western United States, supports Lumina's DQP initiative. The writing is on the wall that accreditation agencies will be looking more and more for the type of data, that analytics can provide, to show the worth and quality of academic degrees. Education has long been under demands from politicians and the public alike to address perceptions that American educational institutions are failing our students and that the value of a college/university degree is questionable in the marketplace.

Educators, at the same time, have tried to make the case that they are not only preparing students to obtain a good job but are also preparing them to be capable citizens, life-long learners, and successful adults. Educators, however, have not been very successful in combating the low test scores and declining job market statistics used by politicians,

parents, and other critics with statistics of their own to highlight those schools and colleges where students are learning and are being well prepared for the market place.

Many educators will agree that technology, such as the world-wide-web/Internet that can provide access via mobile computer capable devices to academic information and courses to anyone anytime, has changed how students learn and interact with other students and their world. It has also changed how teachers and professors impart knowledge to them and guide them in their academic efforts. In such a world with access to all types of information in every imaginable format, how can we, as a society, know what is being taught, learned, and mastered by our students? We are beginning to understand the challenge this question presents and we are also beginning to accept the obvious-- that time in the classroom and a passing grade do not necessarily produce a graduate who can be a success in the job market or in life.

We are also learning that at-risk students and dropouts need immediate, real-time intervention and that analytics can identify the problem in real time and allow that intervention to take place. There are signs that educators—both faculty and administrators—as well as our lawmakers and politicians are coming together to recognize the challenges and potential that today's technology innovations and applications present to our education system to include K-12 and Higher Education. One such sign is the U.S. Department of Education's announcement in March of this year that they will begin to consider academic programs based on what a student knows and can do rather than "seat time" in the classroom (Kamenetz, 2013). College leaders say that by focusing on what people learn, and not how or when they learn it, and by taking advantage of the latest technology, they can save students time and lower costs. Analytics anyone?

### Abstract

Analytics is defined as “The use of data, statistical analysis, and explanatory and predictive models to gain insights and act on complex issues.” Review of the literature on Analytics in higher education validates that many colleges and universities have demonstrated that analytics can help significantly advance a college or university in such strategic areas as resource allocation, student success, and finance (EDUCASE Center for Applied Research, 2012). There are other areas, however, that have great potential for advancing the effectiveness of an educational institution, such as degree cost, resource optimization, and multiple administrative functions, that have not used analytics methods to enlighten educational leaders on more effective utilization.

Even in the areas where some colleges and universities have used analytics effectively, the majority of both Higher Education and K-12 institutions have not embraced analytics to aid in their strategic planning of their educational programs, teaching and learning strategies, or educational costs—both from the institution’s or student’s/parent’s points of interest. Other fields such as Science, Technology, Engineering, Medical/Health, and Business/Management are, on a large scale, actively using analytics to guide their strategic planning and decision making. Education needs to follow their example. This paper reviews the current analytics success stories at both K-12 and Higher Education institutions and addresses the potential for analytics to significantly change how these, and potentially other, institutions use available data to make critical strategic decisions about education.

## Introduction

### *What in the world is analytics?*

There is a ring of familiarity about the term “analytics” but ask anyone to define it and note the momentary pause before a response is received. Wikipedia (2013) defines it as follows: *Analytics is the discovery and communication of meaningful patterns in data. Especially valuable in areas rich with recorded information, analytics relies on the simultaneous application of statistics, computer programming, and operations research to quantify performance. It favors data visualization to communicate insight.* EDUCAUSE, a nonprofit membership association created to support those who lead, manage, and use information technology to benefit higher education defines analytics more precisely and briefly: *Analytics is the use of data, statistical analysis, and explanatory and predictive models to gain insights and act on complex issues (2010).* The New Media Consortium (NMC), in their 2012 Horizon Report stated that *the goal of analytics is to enable teachers and schools to tailor educational opportunities to each student’s level of need and ability in close-to-real time. Analytics that are used in education are increasingly being labeled learning analytics.*

Learning analytics is not just analysis. Though it does use descriptive and predictive models to gain valuable knowledge from data, it does not stop there. It uses the insight gained from analysis to recommend action and/or to guide decision making and communication. Analytics is not, therefore, so much concerned with individual analyses or analysis steps, but with the entire methodology (Wikipedia, 2009). Tools and techniques once confined to research laboratories are being adopted by forward-looking industries to generate business intelligence for improving decision making (U.S Dept. of Ed., 2009). U.S. Dept. of Ed report (2009) found that higher education institutions are beginning to use analytics for improving the services they provide and for increasing student grades and retention. The McKinsey Global Institute (Norris and Baer, 2013) did an analysis across 20 sectors and in every category except talent, found that *education* was the least prepared for ease of data capture, capacity for IT intensity, the data-driven mind-set, and was least likely to have overall data availability.

### *Analytics Not New to Education*

To imply, however, that educators have not and are not using analytics techniques will quickly raise objections by many educators who will argue, probably fairly, that the core concept of analytics (or learning analytics) is not new to educators and that it has been in existence for several decades in education theory and practice (Yuan, 2013). They will tell you that good teaching practice has, for a long time, involved the paper and pen recording of information that is analyzed and reflected upon for decisions regarding interventions pertaining to individual students or classes. At the same time, rather than the narrow focus on individual students and classes, researchers in the educational data mining field and analytics have an extensive history of developing tools and techniques to make use of data to improve teaching and learning as well as education as a whole (Yuan, 2013).

There is a gap, however, between what technology is capable of doing and what people can do, without analytics techniques, with existing data sources and tools. According to Yuan (2013), it has only been in recent years, due to the increasing use of technology in education, that more and more personal information and detailed records on learning activities and assessment have become available. He postulates that the development of new technologies and tools that lower the technical and cost barrier of taking on such data analysis makes it possible for educators to gain insight from various sources to achieve efficiency and effectiveness and improve students' performances.

### *Increased Use of Analytics in Education*

Even so, analytics is beginning to be increasingly used in education, particularly at the district and government office levels (U.S. Dept. of Ed, 2009). However, the complexity of student performance measures presents challenges when educators try to understand and use analytics to discern patterns in student performance, predict graduation likelihood, improve chances of student success, etc. For example, in a study involving districts known for strong data use, 48% of teachers had difficulty posing questions prompted by data, 36% did not comprehend given data, and 52% incorrectly interpreted data (U.S. Dept. of Ed., 2009). To combat this, some analytics tools for educators adhere to an over-the-counter data format (embedding labels, supplemental documentation, and a help system, and making key package/display and content decisions) to improve educators' understanding and use of the analytics being displayed. Analytics is also being used increasingly in higher education.

### *EDUCAUSE Analytics Findings*

EDUCAUSE, a nonprofit membership association created to support those who lead, manage, and use information technology to benefit higher education, has done some revealing research on analytics (EDUCAUSE, 2010). They cite the case of Professor Donaldson who teaches introductory chemistry at a large state university which they do not name. He uses an analytics program linked to the learning management system (LMS) that helps him monitor the progress of the more than 500 students in his lecture class by compiling and analyzing information like the number of times class notes are viewed, the frequency of contributions to the discussion board, and quiz grades (EDUCAUSE, 2010). He uses an application dashboard, from which he can see an indicator beside each student's name, reflecting the program's assessment of the likelihood that the student is on track to earn a C or better in the course. He can instantly see which student or students are at an elevated risk by a color code in which statistically, green denotes high likelihood, yellow suggests possible risk, and red indicates an elevated risk. Based on the information from his dashboard, Donaldson can then send an e-mail to notify students if they appear at risk, congratulate them for work well done, or suggest ways to get more from the class.

EDUCAUSE (2010) believes that colleges and universities can utilize the power of analytics to advance and promote such critical areas as student recruitment policies, course catalog offerings, hiring needs, and financial decisions. In a teaching and learning context, data from such sources as the learning management system, college application forms, and library records can be used to build academic analytics programs that use algorithms to construct

predictive models that can identify students at risk for not succeeding academically (*EDUCAUSE, 2010*).

### *Close-to-Real Time Analytics*

The New Media Consortium, in international community of educational technology practitioners to include hundreds of U.S. Colleges and Universities advocates using analytics in close-to-real time and by doing so enable faculty to more precisely understand students' learning needs and to tailor instruction appropriately and far more accurately and far sooner than is now possible (NMC Horizon Report, 2012). By offering information in near real time, learning analytics can support immediate adjustments, suggesting a model of curriculum that is more fluid and open to change.

### *The U.S. Department of Education Report on Data Mining and Learning Analytics*

Learning analytics, as it is currently contrasted with data mining, focuses on applying tools and techniques in large scales such as in courses and schools and postsecondary institutions, but both are being used to research and build models in several areas that can influence online learning systems in areas such as user modeling (U.S. Dept. of Ed., 2009). User modeling encompasses what a learner knows, what a learner's behavior and motivation are, what the experience is like, and how satisfied users are with online learning. Analytics can be used to detect when an online student is having academic problems and nudge her/him to address and correct the problem. Since the data is being collected in real time, multiple feedback loops operating in different times scales, continuous improvement should be possible immediately to the student prior to the next problem and daily to the teacher for the next day's teaching, monthly to the principal for judging progress, and annually to the district and state administrators for overall school improvement (U.S. Dept. of Ed., 2009). The focus on "data" however requires that all involved with analytics—particularly, learning analytics—that visual data analytics closely involve humans to make sense of the data from initial pattern detection and model building to sophisticated dashboards that present data in a way that allow humans to act upon it. It follows that making visible students' learning and assessment activities opens up the possibility for students to develop skills in monitoring their own learning and to see directly how their effort improves their success (U.S. Dept. of Ed., 2009).

### *Analytics and Data Mining Challenges*

The U.S. Department of Education report, though supportive of the potential of analytics and data mining for education institutions, also noted challenges. One, of course, is the costs associated with collecting and storing the data as well as the computation techniques costs, but another is the technical challenge that educational technology systems are not interoperable, so bringing together administrative data and classroom level data will be a major challenge. Attempting to integrate and combine data about student performance—online tracking, standardized tests, teacher generated tests—to form one simplified picture of what a student knows can be difficult while meeting acceptable standards for validity (U.S. Dept. of Ed., 2009).

Yuan (2013) points out that education is a complicated system and cannot be run as a business and that learning is a complex social activity and all technologies, irrespective of how advanced and innovative they may be, are not able to capture the full scope and nuanced nature of learning. He references Melanie Booth, special assistant to the Western Association of Schools and Colleges President, who has warned that analytics needs to be complemented with well guided teaching, learning, and assessment principles for otherwise, its measures may be meaningless (Yuan 2013). He also notes that ethical issues about the use, re-use, and merging of data, both public and private, is already being raised and will have to be addressed as analytics programs increase. In addressing these challenges, Yuan (2013) concludes that educators must have the knowledge, skills, and tools for using analytics in practice to make informed decisions and take action. He believes that educators and technologists, working together, can explore new tools and techniques to use data effectively to bring real changes in teaching and learning in order to transform the accountability, efficiency and relevance of education.

Finally, the 2012 NMC Horizon report states that as higher education institutions evolve in their use of learning analytics, they will need to address the issue of data privacy and determine what extent of information to share with students and other institutions.

#### *Utilizing Existing Data—Implementing an Analytics Program*

Large stores of data already exist at most colleges and universities. By analyzing this data, analytics applications have the potential to provide a predictive view of upcoming challenges, both for the institution and for students. The resulting data-driven decisions can support optimal use of both economic and pedagogical resources while offering a structure for improved educational outcomes.

Jay Liebowitz (2013) concluded that analytics are needed in the education market to help insure student, faculty, and institutional success. He cites the case of a school system in Tennessee that used analytics to identify “at risk” students during their early schooling and beyond and used the data to improve their high school graduation rate from 25 percent in 2005 to 80 percent in 2012. Analytics helped them determine the right networking and support services intervention to help the at risk students succeed (Lamont, 2013). Liebowitz (2010), understanding that many educational institutions may need help in determining what needs to be done, as well as where to start when it comes to implementing analytics. He proposes three actions:

1. Instill an “Analytics IQ Culture” within the education sector. As Norms and Baer (2013) point out, the culture and behaviors (data-driven and mind-set) of institutions must change to optimize student success.
2. Gather resources (both in talent, financial, and moral commitment) to use analytics to tackle strategic issues that are at the heart of the institution. These include both student and faculty related issues.
3. Address outcome measures versus simply system and output metrics.

To assist those institutions who may feel some outside help is required, companies like Panorama Education, a startup supported by Facebook CEO Mark Zuckerberg and his wife Priscilla Chan, can help them implement an analytics system (Lunden, 2013). Zuckerberg was quoted as saying “The company is an exciting example of the way technology can help teachers,

parents and students make their voices heard” (Lunden, 2013). The company has analytics expertise working with some 4,000 schools covering more than one million students. The idea behind such companies is to work with school districts to identify issues, conceive of what questions need to be asked, and how to ask them (Lunden, 2013). The approach is to work with educators to gather data, in the areas of greatest interest, by the use of easy to administer surveys conducted by the educational institution’s own personnel. When data has been gathered and organized, the analytics company, like Panorama Education, helps the educators figure out what the data means and how to use it in academic decision making.

### *Integrating Analytics with the Degree Qualification Profile*

According to Lumina officials (Hebel, 2010), the degree profile addresses, regardless of their majors and fields of study, what college graduates should know and what they should be able to do. The bottom-line, however, is that students should be able to apply what they learn, and what they learn should be measured in terms of clear outcomes. What better way to measure **and determine** what students have learned than by applying learning analytics to the available data. Said in another way, what students can do with the learning they have acquired is called learning outcomes, which the institution should not only measure, assess, document, but should also use analytics techniques to make future academic decisions. When anyone asks the faculty and/or the institution what the value of a given degree at their institution is, the response should be in analytic terms of assessed and proven learning outcomes at each degree level, to include how each degree—Associate’s, Bachelor’s, and Master’s—in a given field, relate and reinforce learning as the levels increase. The dashboard technique used by Professor Donaldson, noted above, in which he not only used analytics techniques to assist him in monitoring and in quickly identifying at risk students, but also to communicate to the student that he/she may be in academic trouble and seek help (EDUCAUSE, 2010). The use of analytics in assessing a student’s academic program as a whole could greatly improve students’ ability to plan for the continuation of her/his careers from degree level to the next.

### *Evaluating DQP Using Analytics*

The Western Association of Schools and Colleges (WASC), the North Central Association of Colleges and Schools' Higher Learning Commission, and the Council of Independent Colleges, a private-college association, which is a regional accreditor of higher education, all plan to evaluate Lumina's proposed framework (Hebel, 2011). Perhaps, at the same time, WASC, which accredits about 160 four-year colleges (Hebel, 2011), could incorporate aspects of analytics into their advocacy of DQP and model the integration of analytics and DQP for the institutions it accredits.

### *Summary and Conclusions*

There are examples of places in both K-12 and Higher Education where analytics is being used effectively to both enhance teaching and learning while, at the same time, substantiate that learning has occurred and has improved (See Professor Donaldson, page 4, and Jay Liebowitz, page 5). Analytics is being used to identify low performance students while, in near real time, helping them improve so they do not fail and do not drop out. Further, analytics can provide very complex and large quantities of data in visual graphs and

terms that everyone with education issues—especially educators, parents, and politicians-- can agree upon and understand. Analytics strongly supports the national Degree Qualification Profile (DQP) effort initiated by the Lumina Foundation whose objective is to better define and demonstrate the value of a college degree. The Western Association of Schools and Colleges (WASC), which accredits the majority of schools and colleges in the western United States, supports Lumina's DQP initiative. The writing is on the wall that accreditation agencies will be looking more and more for the type of data, that analytics can provide, to show the worth and quality of academic degrees. Education has long been under demands from politicians and the public alike to address perceptions that American educational institutions are failing our students and that the value of a college/university degree is questionable in the marketplace.

Educators, at the same time, have tried to make the case that they are not only preparing students to obtain a good job but are also preparing them to be capable citizens, life-long learners, and successful adults. Educators, however, have not been very successful in combating the low test scores and declining job market statistics used by politicians, parents, and other critics with statistics of their own to highlight those schools and colleges where students are learning and are being well prepared for the market place.

Many educators will agree that technology, such as the world-wide-web/Internet that can provide access via mobile computer capable devices to academic information and courses to anyone anytime, has changed how students learn and interact with other students and their world. It has also changed how teachers and professors impart knowledge to them and guide them in their academic efforts. In such a world with access to all types of information in every imaginable format, how can we, as a society, know what is being taught, learned, and mastered by our students? We are beginning to understand the challenge this question presents and we are also beginning to accept the obvious-- that time in the classroom and a passing grade do not necessarily produce a graduate who can be a success in the job market or in life.

We are also learning that at-risk students and dropouts need immediate, real-time intervention and that analytics can identify the problem in real time and allow that intervention to take place. There are signs that educators—both faculty and administrators—as well as our lawmakers and politicians are coming together to recognize the challenges and potential that today's technology innovations and applications present to our education system to include K-12 and Higher Education. One such sign is the U.S. Department of Education's announcement in March of this year that they will begin to consider academic programs based on what a student knows and can do rather than "seat time" in the classroom (Kamenetz, 2013). College leaders say that by focusing on what people learn, and not how or when they learn it, and by taking advantage of the latest technology, they can save students time and lower costs. Analytics anyone?

EXAMINING THE DURABILITY OF ENVIRONMENTAL EDUCATION SELF-EFFICACY BELIEFS  
IN PRESERVICE TEACHING

**Abstract**

This research examined the outcome of a year two intervention which aligned two instructional contexts, to impact preservice teachers' Environmental Education (EE) self-efficacy beliefs and their use of inquiry-based instruction. The intervention immersed candidates in inquiry-based pedagogies and EE content across a science content course and a general methods course. It was found that the teacher candidates' EE self-efficacy beliefs increased over the first half of the intervention and then decreased towards the end. The analysis of 14 units of instruction showed a lack of certain inquiry-based elements across all units. Practical and theoretical implications are considered.

*Keywords:* environmental education, self-efficacy, inquiry-based instruction

## EXAMINING THE DURABILITY OF ENVIRONMENTAL EDUCATION SELF-EFFICACY BELIEFS IN PRESERVICE TEACHING

### ***Introduction***

History records a worldwide interest in environmental issues dating back to the 1940s. However, it was not until the 1960s that environmentally focused legislation was passed to address such issues (Carter and Simmons, 2010). By the 1970s the National Science Teachers Association put forward a call to address environmental literacy in the school curriculum. Further impetus supporting EE curricula standards came about as a result of the 1983 *A Nation at Risk* report, and as a result, environmental education (EE) standards were developed by the North American Association for Environmental Education (NAAEE).

To facilitate the development of environmental literacy in K-12 education, McDonald and Dominguez (2010) argued for purposeful integration of EE methods and skills into teacher preparation programs. While there is no one way to teach EE, there are many purposeful approaches that can be taught to teacher education candidates. These approaches are often mediated by a variety of factors including teacher training and disposition, student disposition, curricular goals, available resources and time for instruction (Winther, Sadler and Saunders, 2010). Favored in teacher education preparation programs are methods that use inquiry-based techniques which view preservice teachers as learners, reflect pedagogical content knowledge (PCK), actively engage and model appropriate content pedagogies (Bell, 2003) and impart engaging activities in classrooms. Finally, approaches that include training with EE project curricula and those that reach across subject area departments are also encouraged in order to move preservice teachers from EE learners to EE teachers.

### Teacher Self-Efficacy Beliefs

A strong determinant of future instruction behavior is the teachers' self-efficacy beliefs (Bandura, 1997; Pajares, 1996). In his theory of social learning, Bandura (1977) first defined

## EXAMINING THE DURABILITY OF ENVIRONMENTAL EDUCATION SELF-EFFICACY BELIEFS IN PRESERVICE TEACHING

*personal efficacy* and *outcome expectancy* as two components of self-efficacy. *Personal efficacy* refers to the belief that an individual can successfully perform a particular action or behavior, while an *outcome expectancy* refers to an individual's estimate that a given behavior will lead to certain outcomes. Self-efficacy tends to be a domain specific belief rather than a global or domain general belief (Bandura, 1986, 1997). Stronger self-efficacy beliefs allow for higher goal setting and committed actions toward the goal (Bandura 1993, 1989; Pajares, 1996). These beliefs can be developed through one's mastery experiences, the vicarious experiences of others, the social persuasion of others and one's emotional state while engaged in behavior (Bandura, 1986). Given that self-efficacy beliefs often mitigate one's motivation to act in as well as on particular domains or contexts (Pajares, 1996), we focus on the preservice elementary teachers' environmental education efficacy beliefs in this research.

According to Bandura (1989, 1993), perceived control of the environment is another important aspect of efficacy beliefs. Those with stronger efficacy beliefs find ways to exercise control over the selection, construction and behaviors exhibited in environments, thus limiting the inherent constraints contained therein. The interplay of self beliefs, behavior and environments is what Bandura (1983) referred to as triadic reciprocity involving the sequentiality of mutual influence (Bandura, 1983, p.167). In later work, he stated that, "It is important to understand how certain determinants produce change in the first place regardless of how the resultant changes, in turn, affect the subsequent operation of the determinants. (Bandura, 1993, p. 168)." With this suggestion, the remaining discussion will focus on the interplay between the EE self-efficacy (i.e., personal attributes) and EE instruction (i.e., behaviors). In this study, the instructional context (i.e., environment) will serve to inform the relationship between these two determinants.

## EXAMINING THE DURABILITY OF ENVIRONMENTAL EDUCATION SELF-EFFICACY BELIEFS IN PRESERVICE TEACHING

### *Inquiry-Based Instruction*

Domain general pedagogies are insufficient instructional experiences for preservice teachers (Lee, Hart, Cuevas & Enders, 2004). Instead, content-specific pedagogies and inquiry-based instruction are needed to develop mathematical and science understandings. In science, inquiry refers to the diverse ways in which scientists study the natural world and propose explanations based on observations or evidence (NRC, 1996). At classroom level, inquiry refers to the activities of students in which they develop scientific understandings and abilities to do science. According to the most recently released framework for K-12 science education, students should be engaged in the following practices in science classrooms: 1) asking questions; 2) developing and using models; 3) planning and carrying out investigations; 4) analyzing and interpreting data; 5) using mathematics and computational thinking; 6) constructing explanations; 7) engaging in argument from evidence; and 8) obtaining, evaluating, and communicating information (NRC, 2012, p. 42).

Inquiry-based instruction has been established as an important aspect of mathematics and science student learning. In addition, inquiry-based pedagogical techniques have been found to be major factors influencing elementary preservice teachers' self-efficacy and outcome expectancy expectations (e.g., Narayan & Lamp, 2010). Furthermore, changes in self-efficacy were found to be positively correlated with changes in the use of inquiry-based instructional practice among elementary and middle school science teachers (Lakshmanan, Heath, Perlmutter, & Elder, 2011). However, students might not benefit from inquiry learning experiences uniformly. In Avery and Meyer's study (2012), for instance, it was found that one group of teacher candidates improved their outlook on science teaching while the other group worsened after the intervention. Given the established connection between inquiry-based instruction and

## EXAMINING THE DURABILITY OF ENVIRONMENTAL EDUCATION SELF-EFFICACY BELIEFS IN PRESERVICE TEACHING

efficacy beliefs, the research will focus on an attempt to increase in preservice elementary teachers' environmental education efficacy beliefs and proliferate inquiry-based practices.

In this study, there are two instructional contexts in which self-efficacy beliefs were measured. The Environmental Education Intervention (EEI), coined by the researchers was the latest phase of program reform meant to better align key courses in a teacher education program, in order to increase preservice teacher self-efficacy beliefs and use of inquiry based practices in K-8 settings.

### *Instructional Contexts: The Environmental Education Intervention (EEI)*

The EEI consisted of two courses implemented over a two year period. The first was a sophomore level course, entitled Investigations in Mathematics and Science (IMS II). It was designed to replace traditional science lecture based classes (e.g., biology) for elementary level teacher certification. Co-designed and co-taught by content area and education faculty, the course used inquiry-based instruction to teach key science concepts. The second course was entitled Managing the Teaching and Learning Environment (MTLE). It incorporated general methods, technology integration, assessment and a field experience. It was co-taught by education faculty.

Utilizing the literature base on best practices, the EEI was designed to (a) familiarize preservice teachers with the scope and substance of EE standards; (b) expose preservice teachers to EE content, appropriate EE pedagogy and available EE resources; and (c) support the design of lessons which would address EE standards for K-8 students. The alignment actions included the addition of the following learning experiences across the two courses (see Table 1):

IMS II was designed to help candidates develop (a) fundamental understanding of integrated mathematics and science content including EE; and (b) skills in critical thinking and

## EXAMINING THE DURABILITY OF ENVIRONMENTAL EDUCATION SELF-EFFICACY BELIEFS IN PRESERVICE TEACHING

scientific inquiry. The course required collaborative work in which candidates defined questions, designed and carried out investigations using available resources and appropriate apparatus and techniques to collect and analyze data, communicate scientific procedures and explain findings in oral and written form.

The MTLE course revisited the EE standards, namely Agriculture and Society; Integrated Pest Management; and Threatened, Endangered and Extinct Species. Preservice teachers were provided with EE related resources, including a daylong workshop on the state level EE standards and a supplemental EE curricular program entitled, "Food, Land and People." Finally, during the lesson planning portion of the course, preservice teachers were directed to find ways to address the EE standards in their unit planning and subsequent classroom instruction.

During the field experience, preservice teachers were strongly encouraged, but not required to design and implement a unit in accordance with the EE standards. The unit of instruction was expected to (a) address a core concept and several essential questions, (b) utilize developmentally appropriate pedagogies, and (c) align standards and objectives with instructional activities and assessments. The MTLE course exposed preservice teachers to both general and specific pedagogies. While, EE standards were offered as a framework through which the preservice teachers would explore various science pedagogies, they were also expected to use graphic organizers, visuals, elaborative rehearsal techniques, etc., based on the Information Processing Model, to teach both declarative and procedural knowledge.

### *Research Questions*

Over the two year intervention, the researchers expected preservice teachers to develop greater EE self-efficacy beliefs as a function of the instructional activities and environments that they encountered. The researchers also expected that as preservice teachers became more

## EXAMINING THE DURABILITY OF ENVIRONMENTAL EDUCATION SELF-EFFICACY BELIEFS IN PRESERVICE TEACHING

efficacious, they would choose to incorporate EE content and pedagogy into their planning and instruction. The questions to be addressed include: (a) Do preservice teachers EE self-efficacy beliefs increase across the intervention? and (b) To what extent do the preservice teachers transfer their own inquiry learning experiences to their unit lesson planning in the MTLE course?

### ***Methods: A Mixed Methods Design***

This study uses both qualitative and quantitative evidence to inform practice and thus fits the description of a mixed methods approach. The mixed methods approach is touted to be problem-centered and application-based (Creswell, 2002). The researchers felt this approach was aligned with the needs of the study as they sought to promote EE self-efficacy beliefs and EE focused and inquiry-based instructional practice.

The Environmental Education Efficacy and Beliefs Instrument (EEEBI), which consists of the Personal Environmental Teaching Efficacy (PETE) and Environmental Teaching Outcome Expectancy (ETOE), was administered as a pre-post measure. The scale was administered on three occasions, at the start and end of the sophomore year IMS II course as well as the end of the junior year MTLE course. The candidates (N=35) completed the EEEBI on all three occasions.

The EEEBI was first adapted from the Science Teaching Efficacy Belief Instrument (STEBI-B) (Enochs & Riggs, 1990), by replacing “science” with “environmental education” (Sia, 1992). It has been used in more recent EE research studies (e.g., Moseley, Reinke, & Bookout, 2002; Moseley, Huss, & Utley, 2010). This 23-item instrument required students to respond to each question with a five-point Likert Scale (strongly disagree = 1 to strongly agree = 5). There are two sub-scales in the EE teaching efficacy instrument: Personal Environmental

EXAMINING THE DURABILITY OF ENVIRONMENTAL EDUCATION SELF-EFFICACY BELIEFS  
IN PRESERVICE TEACHING

Teaching Efficacy (PETE) and Environmental Teaching Outcome Expectancy (ETOE). The reliability coefficients ( $\alpha$ ) for the PETE were 0.8-0.92 and 0.7-0.75 for the ETOE subscales.

In addition, the units of instruction were analyzed using constant comparative methods (Creswell, 2002; Strauss & Corbin, 1994). Open coding was used to extract relevant information from each unit. In addition, selective coding was used to determine the occurrences of EE –focused content and inquiry-based elements. The units (N=14) information collected included (1) name and grade identifiers (2) the unit title (3) the unit topic (4) the standards (5) the lesson objectives, and (6) the lesson activities. Once the information was extracted from the units, it was analyzed to note the manner and frequency with which the units addressed three PA EE standards, namely Threatened and Endangered Species (TEES), Agriculture and Society (AS), and Integrated Pest Management (IMP). In addition, the researchers looked for instances of inquiry--based instruction. The eight elements of inquiry were adopted from practices considered essential for K-12 Science curriculum in the new framework for K-12 science education (NRC, 2012, p 42).

The first author (Richardson) gathered and categorized the unit information in an MS Excel database. In order to validate the information extracted from the units, the second author (Liang) provided a confirmatory analysis of the database categories and content, to include the EE standards addressed for each unit as well as the inquiry elements presented in each unit. In addition, the two authors independently coded the lessons from a common unit, with numbers 1 through 8. The numbers corresponded to each of the eight elements of inquiry. The two authors convened to resolve any coding discrepancies and to establish independent rater agreement. Finally, the first author proceeded to code the remaining units.

***Results***

## EXAMINING THE DURABILITY OF ENVIRONMENTAL EDUCATION SELF-EFFICACY BELIEFS IN PRESERVICE TEACHING

### *Preservice Teacher EE Self-Efficacy Beliefs*

The EEEBI was administered on three occasions: prior to the integrated Math and Science content course during the sophomore year, after the IMS course, and after the methods course during the junior year. To determine the within-subject differences between the pre and the post tests, repeated measures MANOVAs were performed on the two subscales using the PASW Statistics 18.

The repeated measures ANOVA analyses results are presented in Table 2. There were statistically significant changes ( $p < 0.01$ ) on the Personal Environmental Teaching Efficacy data subset over time. Pair wise comparisons further revealed a statistically significant improvement (at  $p = 0.002$ ) on the PETE sub-scores over the IMS content course while revealing a significant decline over the methods course ( $p = 0.003$ ). No statistically significant changes were found on the Environmental Teaching Outcome Expectancy subscores over time (see Table 2 & Figure 1)

### *Instructional Unit Content*

The units of instruction were analyzed. While ten of the units focused on science content, three units addressed social studies topics and one unit was dedicated to mathematics. The science units were further classified according to their EE standard focus. It was determined that seven of the 10 science units focused on one or more of the three predetermined EE standards, Threatened and Endangered Species (TEES), Agriculture and Society (AS), and Integrated Pest Management (IMP). Specifically five units addressed TEES. One unit focused on TEES and AS. Finally, one unit covered IMP.

The seven EE focused units spanned 1<sup>st</sup> through 8<sup>th</sup> grades. Specifically there was one 1<sup>st</sup>, two 5<sup>th</sup>, two 6<sup>th</sup> and one 8<sup>th</sup> grade units. When each lesson was reviewed for inquiry elements, one of the units showed no evidence of inquiry instruction. It was excluded from

## EXAMINING THE DURABILITY OF ENVIRONMENTAL EDUCATION SELF-EFFICACY BELIEFS IN PRESERVICE TEACHING

further analysis. The remaining 6 units or 43% of all units reviewed exhibited one or more elements of inquiry instruction. Across the 6 units, 61 lesson segments were analyzed. Lessons segments per unit ranged from 6 to 14.

The frequency with which each of the eight inquiry elements occurred across all lessons was also noted in Figure 2. Obtaining, evaluating and communicating information was the element identified most often (n=15) while constructing explanations and engaging in argument from evidence were each identified slightly less often (n=11). To the contrary, using mathematics and computational thinking (n=1) along with planning and carrying out investigations (n=2) were noted least often. Sample of inquiry elements from various lessons are noted in Table 3.

### **Discussion**

The research findings were mixed. While there was a rise in preservice teacher EE self-efficacy beliefs in year one of the intervention, the increase was not sustained in year two, as the data reflected a return to their initial efficacy levels prior to the IMS II course.

It appeared that the IMS II, an inquiry-based integrated science (including EE) content course, appeared to have a greater impact on participant EE teacher self-efficacy beliefs than the MTLE course. This result is consistent with what has been reported in the literature (Narayan & Lamp, 2010; Richardson and Liang, 2008).

At a unit level of analysis, 50% of the units addressed the predetermined EE standards. In addition, 43% of the units addressed one or more inquiry- elements. To the contrary, at the lesson level, the average number of identified inquiry- elements peaked at 21%. Furthermore, the distribution of elements addressed across any one lesson was uneven. Specifically, there were certain inquiry elements that received little attention, while others were cited more often.

## EXAMINING THE DURABILITY OF ENVIRONMENTAL EDUCATION SELF-EFFICACY BELIEFS IN PRESERVICE TEACHING

In most cases, the EE-themed units primarily focused on knowledge acquisition rather than knowledge construction types of activities.

What then mitigated the drop in EE self-efficacy beliefs and the lack of EE focused inquiry-based instruction? The answer may be the instructional environment. According to Bandura's model of triadic reciprocity (Bandura, 1983), the environment, personal beliefs and behavior, "[they] involve sequentiality of mutual influence (p.167). Previous research (Liang and Richardson, 2008) supports that assertion that the IMS II course provided an environment conducive for EE self-efficacy development, due to its EE infused inquiry-based instruction, as self efficacy is best developed within specific domains (Bandura, 1986, 1997; Pajares, 1997).

During the IMS course preservice teachers were explicitly taught EE related content through inquiry-based instruction. They also participated in problem-based learning by conducting a stream study at a local arboretum. Throughout the course they were actively engaged in collaborative investigations around EE standards. Finally, they were also exposed to innumerable EE informational and curricular resources as part of the overall learning process. Gunning and Mensah (2011), in their research with preservice teachers of science, has determined the instructional environment as critical to increasing teacher self-efficacy to teach science.

The converse appears to be true regarding the MTLE methods course. At first glance, the list of activities seems more than sufficient to support preservice teacher EE self-efficacy development and subsequent EE-focused and inquiry-based instruction. In hindsight, the reasons for regression of EE self-efficacy may be attributed to domain general nature of the MTLE instructional environment.

## EXAMINING THE DURABILITY OF ENVIRONMENTAL EDUCATION SELF-EFFICACY BELIEFS IN PRESERVICE TEACHING

As stated earlier, preservice teachers were reintroduced to a shared repository of EE resources established as part of the EEI. The MTLE course focused more on universal models of unit development and lesson planning with considerable attention given to classroom management, technology integration, and student assessment. The Information Process Theory (IPT) was the overarching pedagogical framework for the course. Preservice teachers were encouraged to access students' prior knowledge, utilize graphic organizers, conduct demonstrations and simulations, plan projects, engage in elaborative rehearsal, pose questions, and offer feedback, in order to foster student encoding and information retention.

Once the lesson plan content was analyzed to determine the frequency and manner in which preservice teachers addressed EE standards, it became clear that the preservice teachers' pedagogical choices were very much situated by the MTLE course. Specifically, regardless of the content presented in the lessons, the units employed the instructional strategies emphasized by the MTLE course rather than those emphasized by the IMS II course, suggesting a lack of automatic transfer of inquiry learning experiences in the IMS into the MTLE course context.

Beyond the data analysis, researchers speculated that the preservice teachers encountered competing priorities, set forth by the IMS course, the MTLE course, the cooperating teacher in those local schools. The cooperating teachers often dictated the content of the units. The researchers felt they could not require implementation of EE content due to the needs and wishes of the cooperating teachers hosting the preservice candidates. Although the MTLE instructor negotiated the field experience with the school teachers to facilitate EE adoption, researchers recognized that the teachers may not allow candidates to include EE content in their classes for any number of reasons.

## EXAMINING THE DURABILITY OF ENVIRONMENTAL EDUCATION SELF-EFFICACY BELIEFS IN PRESERVICE TEACHING

Furthermore, if a preservice teacher team was not approved to teach an EE topic by the cooperating teacher, the MTLE instructor allowed the teams to opt out of an EE-themed unit. Bandura suggests that perceived environmental constraint can mediate beliefs and behaviors (Bandura, 1983). In this case, the preservice teachers may have encountered environmental constraints that seemed insurmountable, thus choosing to persist less in conducting EE-focused and inquiry-based instruction.

The research indicates that aligning preservice teacher courses to meet mutual goals is a useful programmatic paradigm. Doing so will encourage the integration of various lesson planning models into a larger conceptual framework, thus assuring that preservice teachers have a flexible rather than a situated view of lesson planning across instructional contexts. In addition, a more unified set of priorities needs to be negotiated among the stakeholders. Certainly, more should be done to make certain preservice teachers are able to exercise their options to create EE-focused inquiry-based units in their field placements.

### **Limitations**

The EEI offers a viable medium for the explicit development of EE self-efficacy beliefs and EE-focused inquiry-based practices for preservice teachers. It unites two formerly disparate courses, within a teacher training program, to prepare teachers for quality science and mathematics instruction. Finally, for preservice teachers the EEI illuminates the relationship between course knowledge and subsequent classroom instruction (i.e., praxis). Despite the progress that has been made, the research represents work in progress. The analysis of data has provided the researchers with valuable insights, but no definitive proof of the intervention's effectiveness in raising self-efficacy beliefs or shaping teacher behaviors. The work described here represents a macro-analysis of the initial implementation of the intervention. Previous

## EXAMINING THE DURABILITY OF ENVIRONMENTAL EDUCATION SELF-EFFICACY BELIEFS IN PRESERVICE TEACHING

research by the authors has explored the impact of the IMS course sequence. This is the first attempt to look across the entire intervention (IMS II and MTLE). Certainly, as the intervention evolves and its implementation activities are solidified, causal links between beliefs and practices can be explored and substantiated.

As it has been stated that instructional context is an important determinant, it would be helpful to conduct a micro analysis of preservice teacher efficacy beliefs as the courses progress to determine at what point the critical shift in beliefs occurred during the intervention. Also, it would be wise to chart student's perceptions of the various instructional contexts might support or hinder the practice of EE focused and inquiry-based instruction.

Living la vida loca: How the life experiences of seven young Mexican women impacted their decision to drop out of high school, graduate, and/or pursue a higher education

This project examined the life experiences of seven young Mexican women and the impact these experiences may have had on the decisions they made about their schooling. The study explored various factors as possible reasons for dropping out, including family and cultural influences, school and social influences, and personal motivation and self-esteem. Qualitative methodology was used in creating case studies of the seven participants. Each young woman was between the ages of 18 and 20 and had attended school at least through the ninth grade. Data collection methods included in-depth interviews with the participants and their parents, as well as review of their cumulative school files. Results indicated that the challenges these young women faced growing up created a sense of "craziness" that forced them to make choices about their futures, including their schooling. In some cases, school contributed to the craziness and they had to choose between managing their personal responsibilities or completing their high school education. Recommendations for schools include creating an environment in which all students can reach their fullest potential by having more options to choose from, such as a flexible school schedule and having the ability to take on more ownership of course selection that directly applies to their area of interest, even if it is a non college-bound focus. Schools also must ensure their environment is respectful of students and empathetic to each individual circumstance as well as culturally responsive to the wide-range of diversity within the student population.

# THE SAT, TUTORING, AND EQUITY

Iris C. Rotberg

## Abstract

For decades, the SAT has been critiqued because of the inherent advantage that affluent students have in taking the test. In recent years, however, the inequities have compounded as children from affluent families take intensive private tutoring for the SAT, sometimes at a cost of many thousands of dollars. This is well beyond the SAT cram courses that their parents' generation took. It means that children from low-income families and, increasingly, children from middle-income families cannot begin to afford the tutoring that affluent parents routinely provide to their children. Intensive tutoring frequently raises SAT scores by 200 to 300 points, a gain that provides a substantial advantage in competing for college admission and for academic scholarships. That is why tutors can charge over a hundred dollars an hour for their services. Moreover, affluent parents increasingly buy tutors even for children who initially score very high to give them the few extra points that will increase their chances of admission to the most prestigious schools.

There is a lot of hand-wringing by higher education officials about the widening socioeconomic divide in higher education, with children of the rich concentrated in elite schools while children from lower-income families increasingly attend community colleges. Eliminating the SAT clearly would not solve the basic societal problems that lead to the polarization—increasing poverty rates, growing gaps in income and wealth, and the rising costs of higher education. But it would be an easy fix to eliminate at least one significant factor, the SAT. And colleges and universities would lose nothing of value. They now gain little information from the test scores because the comparisons between students have become virtually meaningless.

The paper elaborates on these points and provides data on the broader social and educational context as well as on the costs of tutoring and the distribution of test-score gains.

## **Teaching for Transfer: Critical Discussion of a Psychological Skills**

### **Abstract**

Educational psychologists (e.g., Klausmeier, 1966; Resnick, 1987) have long supported the notion that one of the major goals of formal education is to develop life skills that are applicable to the 'real world'. Recently, the National Research Council (NRC, 2012) advanced a comprehensive call for greater and more explicit emphasis on the teaching of 'life skills' (a.k.a., '21<sup>st</sup> Century Skills') in the schools. This call not only implored educators to incorporate life skills into school curricula, but, also to 'teach for transfer'; teach various life skills in a deliberate manner such that cognitive transfer is made possible. Transfer is often described as the ability to adapt something that one has already learned in one situation (e.g., learning math at school) to a new situation (e.g., calculating sales taxes on a purchase; Robins, 1996). Psychological skills are specific cognitive strategies (e.g., goal setting, imagery, self-talk, etc.) taught to athletes and other performers that are intended to: enhance performance (e.g., Weinberg & Gould, 2003), increase motivation (e.g., Harwood, Cumming, & Fletcher, 2004), increase perceptions of enjoyment (e.g., Jackson, Thomas, Marsh, & Smethurst, 2001), and, increase self-satisfaction (e.g., Locke, 1996). It would seem reasonable to believe that 'teaching for transfer' of psychological skills may result in positive effects on human performance and experience across various life performance domains (e.g., academics, sport, social relationships, work, etc.). Thus, the general purpose of the current research was to examine the nature and extent of the transfer of psychological skills within and between performance domains in a freshman college population. The focus of this panel session is conceptual: Researchers will present the theoretical and research-based underpinnings of the design of the workshop series, discuss population-specific moderators of the design, and overview delivery methods and preliminary results. The

unique challenges of designing psychological skills workshops for a college freshman population will also be discussed.

Keywords: Cognitive transfer; Teaching for transfer; Psychological skills training

The roles and capacity expected for dietitians have been expanded as the dietitians' career path has been diversified during the last decade. To assess if dietetics education in Korea meets such societal needs, the curricula of dietetics education in Korea were analyzed, focusing on the emerging trend. The curricula were collected from a total of 74 universities via the respective university homepages. The grouping was made with the subjects excluding those mandated by law and resulted in five major categories of new subjects: functional foods, food management, practicum/internship, restaurant management, and exercise/weight management. The subjects regarding food culture, nutrition communication, and food coordination were being offered in a few universities. In addition, the curricula in dietetics education were compared among Korea, U.S.A. and Japan. The features of dietetics education in U.S.A. and Japan, distinguished from that in Korea, were extracted although there was some limitation in direct comparison due to the different education and credential systems among the countries. It is suggested that dietetics education in Korea should be re-engineered to more actively accommodate societal needs and some futuristic aspects of the dietetics education in U.S.A. and Japan should be benchmarked.

## Demographic Differences in Knowledge about HPV at a Rural University

### Introduction:

As the most common STD in the United States, Human Papillomavirus (HPV) can lead to devastating health consequences such as infertility, cancer, and mortality. These negative health consequences are preventable with the HPV vaccine. Knowledge of the sexual health risk and the vaccine is not universal among the age group targeted for the vaccine. Rural areas have been found to have poorer health behavior and health outcomes. Very little is known about factors influencing knowledge about the HPV virus and vaccine in rural universities.

### Methods:

A cross sectional study was administered to undergraduate students in general studies courses at a small rural university in Appalachia. Knowledge of sexual health and the HPV vaccine was measured along with demographics and health behaviors. Independent samples t-tests were used to measure differences in knowledge scores among specific demographic groups. Bivariate correlation was used to measure the relationship between knowledge and number of sexual partners.

### Results:

Participants consisted of 157 students (58% male). Independent sample t-test showed that females ( $M=3.86$ ,  $SD=1.33$ ) had a significantly higher sexual health knowledge than males ( $M=3.17$ ,  $SD=1.44$ ;  $t(149)=2.97, p=.003$ ). The majority (86%) reported having a regular doctor, however no significant difference was found between participants who reported having a regular doctor  $t(149)=-.812, p=.418$ . Bivariate correlation between knowledge and number of sex partners showed no significant relationship. ( $r=-.48$ ;  $p=.56$ )

### Discussion:

Findings in this study show a need to increase educational efforts, particularly in the male population. Additionally, while it was encouraging that such a high percentage had a regular doctor, it is concerning that this did not increase their knowledge of sexual risk or the HPV vaccine. Thus interventions are needed to encourage health care providers to use their role to educate this population about risk and vaccination. Additionally, the finding that number of sexual partners was not related to knowledge shows that students who have more sexual partners (i.e. greater sexual health risk), they do not necessarily have greater knowledge about these risks. This population should also be targeted for education and promotion of the HPV vaccine.

Abstract

Smoking is currently one of the most detrimental causes of preventable chronic disease. Lower levels of education attainment are linked with poor health outcomes in adulthood. Further, adults who smoke generally have lower levels of education. Smoking in adolescence is linked with poor educational outcomes such as dropout and academic performance. Little is known about the influence of perceived academic importance on adolescent smoking intensity. Utilizing secondary data collected through the Not-On-Tobacco intervention, this study explored the influence of perceived school importance, nicotine dependence, gender, race, and grade on smoking intensity in a sample (N=197) of adolescent smokers seeking cessation. Results showed that perceived school importance  $t(191) = -2.96, p < .003$ , nicotine dependence  $t(191) = 9.84, p < .000$ , grade  $t(191) = 3.54, p < .00$ , and gender  $t(191)=2.52, p < .02$  were all significant predictors of smoking intensity. Due to the established relationship between smoking and poor educational performance and the relationship between both smoking and education and poor health outcomes, these findings identify a need to emphasize the importance of educational attainment in intervention efforts.

Smoking continues to be one of the most detrimental yet preventable causes of chronic disease despite ongoing tobacco prevention and cessation efforts in the United States [1, 2]. Although adolescent tobacco use shows a modest decrease, 2009 national data indicate that 46% of 9<sup>th</sup> through 12<sup>th</sup> graders reported ever trying smoking [3]. Furthermore, about 20% of high school aged adolescents are current smokers, having smoked at least once in the past 30 days [3]. These figures are alarming since early smoking initiation increases the likelihood of adult tobacco dependence [4]. Smokers also have poorer overall health status and spend more financially on medical care compared to non-smokers [3].

Another demonstrated predictor of health behavior is education. In general, higher levels of education show positive associations with health and increased life expectancy, and negative associations with health risks and health disparities [5]. Of critical importance to the present study, research indicates a negative relationship between years of education attained and smoking among those over age 25. Cutler, Deaton, and Lleras-Muney (2006) found that adults with more years of education were less likely to smoke [6]. Education also influences smoking cessation. Adults with lower education levels were less likely to have successful smoking cessation attempts [4]. With youth, the relationship between years of education attained and smoking status is difficult to examine because young people are still in the process of completing their schooling.

In contrast to educational attainment, the academic experience of youths still in school has potential for multi-dimensional examination of the relationship between substance use and education through other constructs such as academic performance, academic-related behaviors, and attitudes towards academics [7]. Low academic

achievement in high school can have serious implications for high school completion and college matriculation because it is related to school dropout, and thus, educational attainment [5].

Cigarette use is negatively related to academic achievement among adolescents. In a national sample of 8<sup>th</sup> grade students, a low level of academic achievement, based on self-reported average letter grade, was associated with an increase in cigarette use over time. Students with high academic achievement were less likely than those with lower levels of achievement to use cigarettes or increase cigarette use over time [7]. High school juniors who reported smoking at least one cigarette in the past 30 days had a lower odds of completing high school and matriculating into a four year college compared to non-smokers [8]. Students who smoke also have difficulties performing well in school and being in the school environment as a result of substance use behaviors [7].

Other academic-related behaviors are also associated with substance use. This includes school misbehavior variables such as classes skipped, days of school skipped, school suspensions, and staying after school for misbehavior [7]. Students who are absent from school, with or without permission, are more likely to engage in health risk behaviors like smoking [9]. Studies exploring smoking intensity and academic performance have found that young adolescents who reported smoking daily or several times a week were more likely to report missing school than those who never smoked or were infrequent smokers [10, 11].

There is little research on associations among attitudes toward academic achievement and smoking. One study found that 8<sup>th</sup> grade students reporting higher cigarette use had lower levels of school bonding and felt less commitment to school and

school effort [7]. Additionally, there is minimal knowledge on the relationship between academic achievement and smoking intensity among youths. Very little is known about how adolescent smokers perceive the importance of school and how these perceptions may be related to smoking intensity. The purpose of this study is to explore the relationship between perceived school importance and smoking intensity among high school students enrolled in a smoking cessation intervention. We hypothesized that higher levels of perceived academic importance would have a negative relationship with smoking intensity.

## **Method**

### **Participants**

Participants for this study included teens who voluntarily participated in the Not-On-Tobacco (*N-O-T*) school-based smoking cessation program [12]. Participant data for the present investigation were derived from a larger, multi-state database of N-O-T studies spanning 1997 to 2009 (N=8,855). Specifically, the analytic sample (N=197) included baseline data from participants from two studies in which data were available on two primary measures of interest: school importance and nicotine dependence. Consistently, participants were recruited for the enrollment across studies using flyers, school announcements, and word of mouth by N-O-T program facilitators [13]. Inclusion criteria for the analytic sample included teens between the ages of 14-19, in the 9-12 grades, and who smoked at least one cigarette per day on weekdays/weekends. The study was approved by the West Virginia University Institutional Review Board.

### **Procedures**

Not-On-Tobacco is a 10-session school-based smoking cessation program delivered by trained facilitators [12]. N-O-T is a gender-tailored intervention specifically for teens

and is delivered in same-gender groups of approximately 8-12 participants each led by same-gender facilitators. Program content and methods cover salient developmental issues for teens including peer pressure, coping skills, and decision making in addition to cessation strategies [12, 14-16]. N-O-T is a federally recognized Substance Abuse and Mental Health Administration (SAMHSA) evidence-based Model Program, a National Cancer Institute (NCI) Research Tested Intervention Program, and an Office of Juvenile Justice and Delinquency Prevention (OJJDP) Model Program. Studies on program effectiveness indicate end-of-program intent-to-treat quit rates between 15% and 19% [12] and cost-effectiveness analysis indicate N-O-T is a highly cost effective option for school-based tobacco intervention (compared to brief intervention) [17]. All studies followed equivalent protocols.

### **Measures**

Each participant was given a battery of standard assessment measures at baseline that assessed demographic information, smoking history, nicotine dependence, and school performance. The criterion variable, smoking intensity, measured average number of self-reported cigarettes smoked per day. Smoking intensity was created by combining two items that asked the number of self-reported cigarettes smoked per day Monday through Friday and the number of self-reported cigarettes smoked on Saturday and Sunday, then taking the average over 7 days.

$$[(\# \text{ cigarettes weekdays } * 5) + (\# \text{ cigarettes Sat \& Sun } * 2)] / 7$$

Studies examining smoking intensity among adolescents have not consistently used a survey item or group of items to characterize smoking intensity. However, Eppel and colleagues (2006) conclude items querying number of cigarettes smoked per month have

lower test- retest reliability, so measuring smoking intensity based on weekly self-reported cigarette use may be a more reliable measure of smoking intensity [18].

**School Performance Measures** Seven measures of perceived school performance were obtained from the baseline data collected from participants (See table I). A factor analysis with varimax rotation was performed and three of the measures of school performance “How important is regular school attendance to you?,” “How important is it to you to get good grades?,” and “How much did you enjoy attending school last semester?” factored together (See table I). The remaining perceived school performance measures did not factor together and were therefore not used in this study. The three school performance measures were combined to create a composite score for the underlying factor, perceived school importance, which ranged from 3 (not at all) to 15 (very important). Additional predictors included age, grade, race, sex, and nicotine dependence. Nicotine dependence was measured using the teen Fagerstrom Tolerance Questionnaire (mFTQ) [19], including seven items for a composite score ranging from 0-9 (with 0 being no dependence and 9 being substantial dependence). Race was dichotomized to form two categories, those who identified as whites and those who identified as any other race because there were so few non-white students in the final analytic sample.

### **Statistical Analysis**

Data analyses were conducted using STATA 10.0IC [20]. Initial variable exploration checked for percentage missing, normality, and outliers. Ordinary Least Squares (OLS) multiple regression models were tested. Missing data for each variable of interest was less than 3% and were deleted listwise from the analysis. Post-hoc model fit tested Gauss-Markov assumptions and model fit were assessed.

## Results

A total of 197 participants completed baseline evaluation assessing school importance and nicotine dependence with no missing data. Participants were primarily female (61.42%) and Caucasian (89.34%). Most students were in the 9<sup>th</sup> (30.46%) and 11<sup>th</sup> (29.95%) grades. Average smoking intensity was 11.67 cigarettes per day.

OLS multiple regression was performed between smoking intensity as the criterion variable and perceived school importance, nicotine dependence, race (white vs. non-white), grade, and gender as predictor variables. Assumptions were evaluated including normality, outliers, linearity, multicollinearity, and homoscedasticity. School importance had a slight negative skew that worsened with transformation. Therefore, the variable was not transformed. One outlier that exhibited significant influence on the other variables was not included in the final analysis.

A significant regression equation was found ( $F(5, 191) = 25.49, p < .000$ ), with an adjusted  $R^2$  of .38. The adjusted  $R^2$  value of .38 indicates that the model accounts for more than a third of the variability of smoking intensity. School importance  $t(191) = -2.96, p < .003$ , nicotine dependence  $t(191) = 9.84, p < .000$ , gender  $t(191) = 2.52, p < .02$ , and grade  $t(191) = 3.54, p < .00$  were significant predictors of smoking intensity. Race  $t(191) = 0.437, p > .50$  was not significant. Based on coefficient scores, for every unit increase in perceived school importance, there is a predicted 0.45 decrease in smoking intensity when controlling for covariates. Additionally, for every unit increase in nicotine dependence there is a 1.78 predicted increase in smoking intensity when controlling for covariates. Males displayed increased smoking intensity over females  $\beta = 1.82$ . For every unit increase in grade, there is an expected 1.19 increase in smoking intensity (See table II).

## Discussion

This cross-sectional study explored the relationship between perceived school importance and smoking intensity among a sample of smoking high school students seeking cessation. Consistent with previous N-O-T studies [21, 22], nicotine dependence was the best predictor of smoking intensity at baseline among the variables in our model. However, the regression model in this study shows that even when controlling for nicotine dependence, perceived school importance is a significant predictor of smoking intensity. In addition, grade also influences a student's smoking intensity, although this result is expected due to maturation and increased use as teens age. Consistent with previous NOT studies [23], gender was also a significant predictor with males having higher levels of smoking intensity than females.

It should be noted that participants are unique among teen smokers due to enrollment in a cessation program (N-O-T). As predicted, perceived school importance has a significant influence on smoking intensity. This finding is noteworthy due to the established positive relationship between smoking and high school dropout [24, 25] and the established positive relationship between education and health [5]. These findings could drive intervention efforts to both prevent or decrease smoking and promote education importance and performance. Due to the negative relationship between educational attainment and smoking [6], increasing perceptions of school performance may be critical among teen smokers. Particularly with teens seeking cessation services, emphasizing the importance of academic performance could have a lasting impact on their success with cessation and health throughout the lifespan.

Limitations include the fact that participants were all enrolled in a cessation program, which could bias their results. Therefore the findings are not generalizable to all adolescent smokers. A more diverse sample including adolescent smokers not seeking cessation would be required to generalize results to a population beyond those students included in this study. Future studies should examine longitudinal school performance measures and smoking intensity among adolescent smokers pre- and post-intervention. Studies that monitor adolescents over time may provide insight into temporality and causality. Further studies may also be conducted to analyze changes in school performance measures and smoking intensity among adolescent smokers exposed to various smoking cessation interventions.

**Funding**

This work was supported by United States Department of Health and Human Services Centers for Disease Control and Prevention, [U48 DPO00052] (Prevention Research Center Program); American Lung Association of Gulf Coast FL; FL Office of Tobacco Control; and the American Lung Association of New Jersey.

### **Acknowledgements**

The authors would like to acknowledge the Translational Tobacco Reduction Research Program (T2R2) and the West Virginia Prevention Research Center at the Robert C. Byrd Health Sciences Center at West Virginia University. We would also like to acknowledge study participants and the schools where data collection occurred.

DEPARTMENT OF EDUCATION**

**TITLE OF PRESENTATION: Muckleshoot Indian Tribe: Best Practices in Tribal Education Partnerships**

**TOPIC AREA OF THE SUBMISSION: Indigenous Education/Best Practices in American Indian Education**

**PRESENTATION FORMAT: Panel Session**

**DESCRIPTION OF OUR PRESENTATION:**

Since the late 1950's, when Muckleshoot Tribal women began conducting early childhood education classes in kitchens and garages of community member homes, the Muckleshoot Tribe has focused on the importance of education for its members and endeavored to develop substantive partnerships that have enabled Tribal members to be successful in their academic and career pursuits. From this history of dedication to education, this paper will discuss some of those partnerships and their purpose.

## **Muckleshoot Indian Tribe: Best Practices in Tribal Education Partnerships**

Since the late 1950's, when Muckleshoot Tribal women began conducting early childhood education classes in kitchens and garages of community member homes, the Muckleshoot Tribe has focused on the importance of education for its members and endeavored to develop substantive partnerships that have enabled Tribal members to be successful in their academic and career pursuits. From this history of dedication to education, this paper will discuss some of those partnerships and their purpose.

### **Federal Head Start**

With initial funding beginning in 1965, the Muckleshoot Head Start Program is one of oldest, continuous, Native American Head Start programs in the United States. The program serves 90 children ranging in ages from 3-5. The program also provides significant services to the families of those children. As a part of the program's holistic mission to prepare the student academically, physically, socially and behaviorally for the leap into K-12 education, the program has developed relationships with local speech and language, occupational and physical therapists. These professionals provide contracted services to the students who may face development delays or those who may need certain augmented services in order to progress.

The Muckleshoot Indian Health Clinic also provides special walk-in dates for the Head Start program related to hearing and immunization evaluations which are necessary for program admission purposes.

The Head Start Program maintains relationships with the two local school districts whose boundaries adjoin the Reservation as well as, the Muckleshoot Tribal School. Through these relationships the Head Start faculty is able to prepare students for the transition to kindergarten. By knowing the academic and social expectations of the receiving school the program is able to insure that the Head Start graduates will be well prepared for that transition. Additionally, the program does a Kindergarten Visit for its prospective graduates. The students visit the a kindergarten class in the school district to which they expect to transfer and are able to observe what goes on in those classes. The students and parents appreciate these field trips as the trips serve to sooth the jitters on the first day of kindergarten.

At the Washington State level, the Muckleshoot Head Start Program has a long standing relationship with the Office of the Superintendent of Public Instruction (OSPI) through its involvement in the USDA/OSPI-Child & Adult Care Food Program. This program plays a vital role in improving the quality of day care by making it more affordable for many low-income

families. Each day, 3.3 million children nation-wide, receive nutritious meals and snacks through CACFP.

### **Muckleshoot Tribal School**

The Muckleshoot Tribal School is jointly funded by the Bureau of Indian Education and the Muckleshoot Indian Tribe. The school began in 1984/85 and as it was housed in a community center that was not designed to be a school, meeting the mission of K-12 education was often challenging and very creative. Since the school's beginning in 1984, it has maintained close and strong connections with the BIA/BIE. The school flourished and by 2005 when there was no additional space to add a portable buildings, the Tribe began to negotiate with the BIA for building a new school, designed to function as such. In 2009, on September 9<sup>th</sup>, the Muckleshoot Tribe proudly opened on a 37 acre site, the 113,000 square foot, K-12 Muckleshoot Tribal School.

However, before the permanent location of the Tribal School was completed the Tribal leadership forged an agreement to provide additional services to the Native students of the community. In 2005 the Muckleshoot Indian Tribe developed their first inter-local agreement with a public school district. This agreement with the Enumclaw School District, one of the two school districts which shares boundary lines with the reservation, provides numerous benefits to the students and administration of the Muckleshoot Tribal School. These benefits include:

- Access to dual enrollment for students in both school districts to take classes not offered in their school.
- The Muckleshoot Tribal School is able to use the ESD substitute teacher and non-certified employees list when absences need to be filled.
- Shared access to certified staff for in-service training.
- Administrative assistance in accessing FTE state funding.

In 2010, the inter-local agreement was extended through 2014.

As a result of this cooperative relationship, in June 2010 the Puget Sound Educational Service District, presented the Muckleshoot Tribe with both a PSESD Community Recognition Award and the PSESD Regional Recognition Award. In the words of the Puget Sound ESD Deputy Superintendent, Janice Watson, "Each year, we ask superintendents to nominate deserving community individuals or groups that have made a profound impact in the schools." From the group of community awards a regional winner is selected. The Muckleshoot School Board Chairperson at that time Anita Pedro, made this comment, "We sincerely appreciate this recognition. It's taken a lot of hard work from everybody. Our relationship with Enumclaw is really strong, and I think it is getting stronger."

The Tribe also has a long standing relationship with Auburn School District. Current Tribal Chairperson, Virginia Cross served as an employee in the role of the Indian Education Specialist of the Auburn School District for 22 years, and following Ms. Cross, Tribal member Denise Bill, Ed.D, filled the position for a number of years as well. These two tribal members set the ground work for the Muckleshoot/Auburn School District relationship. The Tribe now has a formal grantor/grantee relationship with the school district. The grant from the Tribe allows the school district to fund additional certified teachers who offer remedial assistance in foundational subjects such as reading and math at the elementary level. The grant also provides for the funding of Indian Culture Specialist who provides an afterschool program that focuses on regional tribal traditions, history and dance. It is a popular activity for the elementary students it serves and has grown over the past three years.

Correspondingly, the Tribe has a grantor/grantee relationship with the Enumclaw School District. Through this grant the Tribe augments the salary of the Indian Education Specialist, Cathy Calvert, Ed.D, ABD, a Muckleshoot Tribal member, as well as the Indian Education Assistant position in the ESD. The grant also provides for the augmentation of the operational funding of the Indian Education Office within the ESD.

Through the Washington State Indian Education Department and other OSPI departments, the Muckleshoot Tribe has maintained a close working relationship with the Office of the Superintendent of Public Instruction (OSPI). The Tribe's Department of Education was pleased to be fully involved in the project, "Since Time Immemorial: Tribal Sovereignty in Washington State," a ground-breaking curriculum initiative made possible through federal, state, and tribal funding. This project seeks to build lasting educational partnerships between school districts and their local tribes via elementary, middle, and high school curriculum on tribal sovereignty.

### **Adult and Higher Education**

The Muckleshoot Tribal College and Muckleshoot Scholarship Program offer access and affordability to Tribal members seeking to broaden their academic and career horizons through college degrees, certificates, workshops and training programs.

The Muckleshoot Tribal College offers a higher education learning center type of environment in that it brings together under one umbrella a number of degree opportunities through MOU and MOA agreements with local, regionally accredited higher education institutions. These colleges and universities provide on-site instruction leading to degree and certificate programs for Muckleshoot Tribal members. Members of the extended community are also able to enroll

in these programs at their own expense. Agreements currently exist with both public and private institutions.

The Muckleshoot Scholarship Program focuses on the affordability aspects of a college education for Muckleshoot Tribal members. The Tribe provides its enrolled members the ability to attend the regionally accredited college or university of their choice with Tribal financial assistance. The Scholarship Program has formed relationships with colleges and universities from Maryland to Alaska as they assist Tribal members in pursuing their academic and career goals.

Additionally, the Scholarship Program provides instruction and advisement in the process for submitting the Financial Aid Free Student Application (FAFSA), thus helping students maneuver the Federal process for accessing sources of financial funding.

### **Department of Education**

In June of 2008 the Muckleshoot King County Library Branch opened on Muckleshoot Reservation Land. This wonderful event was the culmination of a vision by Muckleshoot leadership that saw this resource as so important that they donated the land for the building of the facility. The Department of Education was involved in the design selection and took an active role in insuring that the structure would fit with environment and cultural aesthetic of the Muckleshoot Reservation. This was accomplished by developing a strong relationship with the King County Library System and King County, Washington, government offices. The Muckleshoot Planning Office under the strong and able leadership then of Steve Taylor, also provided strong support and collaboration to this endeavor.

NIEA and USDOE Listening Opportunities- The Tribe has also developed relationships and with other TEAs, professional education organizations and the Federal government through opportunities like responding to the request for feedback from Tribal Officials on reauthorization of the Elementary and Secondary Education Act (ESEA) from the U.S. Department of Education. Comments were presented by Joseph Martin, Muckleshoot ATOM-Education, on July 15, 2010, at the regional Tribal Leaders Consultation meeting in Puyallup, Washington at Chief Leschi School. These comments included the following:

- The purpose of education must be redefined to include the Tribal perspective.
- We must endeavor to strengthen Tribal control in all education systems. Specifically, our treaty rights set forth our sovereign legal status and contain a provision for the education of our Tribal members.

## **The ESEA Standards and Assessment**

- We do not support the implementation of Common Core Standards because they are both culturally biased and culturally exclusive.
  - Curriculum and assessment must be culturally-based and approved by local Tribes.
  - Tribes have the following concerns regarding current forms of student assessment:
    - They tend to narrow the curriculum.
    - They tend not to accommodate diverse learning styles.
    - They tend to be standardized and force assimilation.
  - Assessment should:
    - Measure and highlight abilities and needed areas of improvement. Results of assessment should not measure failure.
    - Integrate the evaluation of the critical knowledge that Tribal communities believe all Tribal citizens must possess, i.e. mastery of Tribal language, thorough understanding of Tribal history, treaty rights, cultural traditions, etc.
    - Be designed to assess the system and not to penalize the student.
  - States should be prohibited from implementing high stakes testing.
  - Title III funding under ESEA should be expanded to provide further restoration of Native American languages.
  - Funding under Title VII must be maintained as a stand-alone funding source and used to address the educational needs of Native American students.
    - We believe that merging Title VII into Title I will undercut the federal government's trust responsibility to support high-quality academic and cultural education for Native students.
    - We believe that eliminating Title VII as a stand-alone funding source could also lead to decreases in funding needed to keep Native students on the path to college and career success.
  - Restoration and full funding of the Esther Martinez Native American Languages Preservation Act.
  - Restore full funding to Head Start.
  - Maintain full funding of NACTEP (Native American Career and Technical Education Program).
  - Establish a study to explore the American Indian Youth Dropout issue-- the highest among any ethnic group in the nation.
-

The Tribe has also strongly asserted at previous US Department of Education listening sessions that impact aid funds, as represented through the ESEA, Title VII Section 701, Indians, Native Hawaiians and Alaska Natives, must be used solely and exclusively in the education of Indians, Native Hawaiians and Alaska Native children and these educational goals must be defined by the Parent Advisory Committees as mandated in the ESEA.

Thank you for this opportunity to share our perspective. These views are based upon our belief that Federal treaty obligations to our Native Nations are based upon the principles of educational opportunity, equity and the critical importance of all Native education being rooted in our heritage languages, cultural practices, values and traditions.

**1. Title of the submission :** Three Steps of Predicting of Basic Science Process Skill Based on Eye Movement

**2. Name(s) of the author(s):** Yeram Kim / Jaeyoung Kim / Donghoon Shin

As predicting is defined as stating the outcome of a future event based on a pattern of evidence (SAPA), predicting is an important skill for science learning and problem solving as it utilizes other basic science process skills such as observing, classifying, measuring and inferring. This study was aimed to analyze elementary school student's eye movement of predicting in science problem solving situation.

Forty students of 6th grade from South Korea participated and solved two problems designed to assess their predicting skill. They required predicting skill as participants predicted the gradual change of a shape and temperature change. SMI's Eye tracker was used to collect and analyze eye movement data.

Among 40 students, 15 students (group A) got all right answers, 17 students (group B) got only half right and 8 students (group C) got all wrong answers. Group A spent little time on reading questions but fixated on keywords of the question. They showed active eye movements between clues, discovered the tendency and checked its accuracy. Group B fixated on the keywords and clues but had difficulty finding the tendency. Group C spent long time on understanding the questions but missed the keywords and clues. They showed a lot of meaningless saccades and busy saccades.

These results suggest a 3-step-predicting-process. Six cognitive strategies that participants used in the process of predicting were found during process analysis. Three steps of predicting and cognitive strategies would help develop teaching methods in scientific predicting problem solving process.

**Title of Submission: Exploring Teachers' Pedagogy for English Language Learners in Mainstream Classrooms**

**Name: Judy Nation**

**Affiliation: University of Alberta**

**Edmonton, Alberta, Canada**

**Email address: [nation@ualberta.ca](mailto:nation@ualberta.ca)**

**Abstract**

In Alberta the influx of immigrants and refugee families from many countries has resulted in an increasing number of minority students entering mainstream classrooms. Students may have limited English skills and in some cases none at all. These students are only able to communicate in their first language. This situation is posing challenges for mainstream teachers in addressing the academic needs of these students. Teachers who are not versed in the student's first language are at a disadvantage. This study examined the pedagogy of three teachers who were teaching mainstream classes that contained at least 50% English language learners (ELLs). Teacher pedagogy related to teaching ELLs comprises a critical factor in facilitating student success in school.

The purpose of this study was to explore the pedagogy of three teachers who taught ELLs, how they adapted their instructional strategies, and the supports they deemed necessary to effectively teach ELLs. The research consisted of an interpretive case study conducted over a period of three months in the spring of 2011. Through one-on-one interviews, three teachers described the pedagogical approaches they used when teaching ELLs of varying linguistic and cultural backgrounds and experiences. In addition to the semi-structured interviews, field notes, and classroom observations, my own reflective research journal also provided data for the study.

In analyzing the data several themes were identified which were organized into three headings: (a) challenges faced by teachers, (b) instructional approaches employed by teachers, and (c) supports the teacher participants identified as necessary for teaching ELLs.

Recommendations are made in regard to university preparation programs for pre-service teachers, the need for on-going in-services for practicing teachers and increasing the resources for teachers to support their teaching of ELLs in mainstream classrooms.

## 6. Abstract:

This study aimed at (1) examining early childhood pre-service teachers' self-concept in music and music teaching efficacy, and the actual level of understanding of musical content knowledge and (2) investigating the relationships among them. The subjects consisted of 201 undergraduate students, majoring in early childhood education and had taken at least one music-related class at colleges in Gyeongnam, Korea. As for the method of this study, SCIM (Self-Concept in Music Scale) which was originally developed by Svengalis (1978) and modified by Phillips (2002), the scale of 'Understanding of Musical Content Knowledge' developed by Kim et al. (2011), and MTEBI (Music Teaching Efficacy Belief Instrument) which was originally developed by Riggs and Enochs (1990) and modified by Bang and Park (2005) were used. The data was analyzed using SPSS 18.0.

The results of this study are as follows. First, the mean score of early childhood pre-service teachers' self-concept in Music was about the average, actual understanding of musical content knowledge was high on harmony and low on Melody in terms of the variables, and their music teaching efficacy was over the average. Second, early childhood pre-service teachers' self-concept in music and music teaching efficacy, and the actual level of understanding of musical content knowledge were positively correlated. In addition, early childhood pre-service teachers' music teaching efficacy exerted a statistically significant influence on the self-concept in music and the actual level of understanding of musical content knowledge, explaining 19% of music teaching efficacy.

6. Abstract and/or full paper.

This study examines the effects of exposure to violent scenes in various media on students' aggressive behavior toward student peers on the Internet and in school. A total of 2079 junior high school students (1118 males, 961 females) and 928 high school students (528 males, 400 females) were asked to respond to the questionnaire twice within approximately a six-month interval (2-wave panel survey). The question items were how frequently they were exposed to violent scenes on television, in video games, on the Internet, and in books, comics, magazines, and newspapers in the previous month and whether they had experienced 10 aggressive behaviors toward peers on the Internet, and 12 such behaviors in school in the previous month. Results of the Poisson analysis,

categorized by school level and gender, mainly indicated that the aggressive behavior of both male and female junior high school students had increased toward peers in school, as they were exposed more frequently to violent scenes in video games, on the Internet, and in books and comics. The aggressive behavior of male high school students had decreased on the Internet, as they were exposed more frequently to video games and printed media such as books, comics, and newspapers. In contrast, female high school students, who were exposed more frequently to television and video games, showed more aggressive behavior toward peers on the Internet.

## **SOCIAL BACKGROUND CHARACTERISTICS AND JOB SATISFACTION OF GREEK PRIMARY AND SECONDARY SCHOOL TEACHERS**

**e-mail:** [akoustel@pe.uth.gr](mailto:akoustel@pe.uth.gr)

During a weekday most people spend about half of their time<sub>2</sub> working (Moghimi, 2006). Based on the results of many studies in last decades, seems that job satisfaction is one of the most critical factors that has been of concern to many reasearchers in order to improve the quality of working environment. Many researchers argue that drawing attention and improving teachers' job satisfaction could have an effect on school, on students' learning outcomes and on teaching quality (Zigarelli, 1996; Heller, Clay & Perkins, 1993; Kantas, 1998; Michaelowa, 2002; Organ & Bateman, 1991). One issue that has been much investigated is to what extent job satisfaction has a compensatory function for teacher with different social background. Although many studies have shown an impact of social background characteristics on teacher's job satisfaction, others have found that personal characteristics have negative effect (Iqbal & Akhtar, 2012; Koustelios, 2001). The purpose of this research is to ascertain whether there is an effect or not of teacher social background characteristics on different aspects of teacher satisfaction among primary and secondary teachers in Greece. The Greek educational system is highly centralized (i.e. IACM/FORTH, 2003)

There is no consesus on giving a specific definition to job satisfaction. Nevertheless, Lawler (1973) suggested that the meaning of job satisfaction

include all those things and feelings persons actually get from their jobs. Numerous instruments have been developed to measure job satisfaction in education (e.g. 'Job Descriptive Index' (JDI) (Smith, Kendall, & Hulin, 1969), 'Minnesota Satisfaction Questionnaire' (MSQ) (Weiss, Dawis, England, & Lofquist, 1967) and 'Employee Satisfaction Inventory' (ESI) (Koustelios, 1991; Koustelios & Bagiatis, 1997)). These days a new instrument Teachers' Satisfaction Inventory (TSI) has been developed to measure teachers' satisfaction in primary and secondary education in Greek schools. TSI is a multidimensional construct consisted of five latent factors; 'principal', 'colleagues', 'job itself', 'students', and 'working conditions' indicating an excellent content, construct validity and a satisfactory reliability.

The total sample of this study was 429 teachers coming from 28 schools in primary and secondary education from different parts of Greece. The analysis of structural equation modeling was conducted to investigate how the facets of TSI are affected by the dependent variable; age, gender, educational status, job status, family status and years of teaching experience. Mplus (Muthén & Muthén, 2010) software was conducted to analyze the data.

Findings of the present statistical analysis confirm that Greek teachers are; satisfied with the interpersonal relations with their colleagues, principal and their students; with job itself, and working conditions. Furthermore, this study shown that gender and family status can be significant predictors variables for job itself and working conditions. In addition teachers' experience can affect the relations of teachers with their students.

This study may help the educational leaders in understanding and identify the characteristics of primary and secondary education level providing ideas about teachers interaction with teaching and learning environment, and could also influence job satisfaction of teachers. Last but not least, may be offered advices for authorities and researchers to improve teaching quality in an educational system where centralised actions are dominated.

### *Paper Summary*

There is a growing recognition that students' enter classrooms with preconceptions which act as filters for new learning (Petrovic & Ruhf, 2008; Smith, diSessa, & Roschelle, 1993). Because this prior knowledge can interfere with concept mastery, it is imperative that instructors have a way to determine students' prior understandings and to determine whether these understandings have altered after instruction. Concept inventories can potentially provide this information. Previous research (e.g., Wuttiptom, Sharma, Johnston, Chitaree, & Soankwan, 2009) has indicated that "conceptual surveys" (p. 632) have a number of advantages including easy administration, objective scoring, and being able to be analyzed with statistics. In addition, "The development of multiple choice tests on students' misconceptions has the potential to make a valuable contribution, not only to the body of work in the area of misconceptions, but also to assist in the process of helping science teachers use the findings of research in this area" (Treagust, 1988, p. 160).

Confusion about astronomical distances has been found in previous research (e.g., Miller & Brewer, 2010; Trumper, 2001). Using open-ended questions, Miller and Brewer (2010) found that the percentage of students underestimating astronomical distances increased as the distance of an object increased. For example, 33% of the students in their sample underestimated the distance to the Moon but 99% underestimated the distance to the closest galaxy. The problem did not seem to be one of scale as much as it was a change in scale. The researchers noted that for about a third of the participants, the issue was not so much their estimation of astronomical distances as it was their, "...underestimating the enormous leap in distance between objects in the solar system and between interstellar objects" (p. 1557).

Students' understanding of astronomical distances has also been measured using multiple choice tests (e.g., Sadler, 1992). While these tests, with distractors taken from previous research on misconceptions, "...have the potential to provide instructors with more rapid yet still useful feedback..." (Petcovic & Ruhf, 2008, p. 251), there are multiple issues that must be considered. For example, the common use of questions where students select a best estimate or quantity for a particular astronomical distance can confuse, "...the students' intuitive conceptions about astronomical distances with their ability to understand large numbers" (p. 1551). There is also a broad realization that meaningful learning of science content requires conceptual understanding rather than memorization of facts and formulas (Bransford, Brown, & Cocking, 2000; Lightman & Sadler, 1993). Incorporating questions where students could have memorized a specific distance (e.g., Earth to the Sun) may be a measure of memory rather than conceptual understanding of distance (Miller & Brewer, 2010).

There is also a tendency in multiple choice tests to order the distractors sequentially with the largest (and correct) choice as the last one (Miller & Brewer, 2010), a pattern that test savvy

students soon detect. In addition, such an arrangement prevents students from overestimating; thereby failing to give them the opportunity to demonstrate whether they would overrate an astronomical distance. There is a need to include questions with distracters that are larger than the correct answer in assessments. Trumper (2001) used well-known objects such as balls and food to assess students understanding of distances between the Sun and Earth and between the Sun and the closest star. Even when objects such as these are used in questions, they are typically arranged in ascending order (Miller & Brewer, 2010). Trumper (2001) found that respondents underestimated distances when these objects were included in questions, even when something more tangible was used as a point of reference. According to Miller and Brewer (2010), the issue is not so much a lack of knowledge as it is due to understandings, "...based on personally experienced distances in the everyday world, whereas most distances in astronomy are vastly larger" (p. 1551).

The purpose of the current study was to develop a reliable and valid Size, Scale and Structure Concept Inventory (S3CI) that could assess undergraduate students' conceptual understanding prior to and after instruction in an introductory astronomy course, detect the presence of previously documented misconceptions, and evaluate instructional effectiveness. The current instrument was patterned after concept inventories developed in other disciplines such as the Force Concept Inventory in physics (Hestenes, Wells, & Swackhamer, 1992). The S3 Concept Inventory is comprised of 24 multiple choice questions designed by the researchers and evaluated by other content experts. This concept inventory was devised to cover the following content areas: size, scale, and structure. For the purposes of question development, size was operationally defined as an understanding of the relative and absolute dimensions of astrophysical objects, such as stars, galaxies, and the universe itself. Scale was defined as an understanding of the distances between objects in the universe, including the tremendously large differences between distances within a structure (e.g., the Solar System) and between structures (e.g., to the nearest star). Finally, structure was defined as an understanding of the geometry of astrophysical objects, as well as their relative positions in the universe, both hierarchically (e.g., stars are located within galaxies), and in distance from Earth. Additionally, it included an understanding of how these objects' positions evolve in time.

Within the three areas, previously documented misconceptions were targeted. Table 1 lists commonly found misconceptions in each of those areas.

Table 1:  
Common Misconceptions in Astronomical Size, Scale and Structure

<b>Content Area</b>	<b>Misconception</b>
Size	<ul style="list-style-type: none"> <li>a. Students think that planets and stars have similar sizes.</li> <li>b. Students think that all stars have the same size and luminosity.</li> <li>c. Students underestimate the physical size of astrophysical objects.</li> <li>d. Students confuse the size of the Milky Way galaxy with the size of the universe.</li> </ul>
Scale	<ul style="list-style-type: none"> <li>a. Students think that the distance to the nearest stars is only a few</li> </ul>

	<p>times larger than the size of our Solar System.</p> <p>b. Students underestimate the distances between galaxies.</p>
Structure	<p>a. Students think that the Earth, Solar System, and/or nearby stars are not part of the Milky Way galaxy.</p> <p>b. Students think that most objects outside our Solar System are approximately the same distance from Earth.</p> <p>c. Students underestimate the aspect ratio of the Milky Way galaxy's stellar distribution.</p> <p>d. Students think that the distances between galaxies are not changing with time.</p>

The researchers used both numerical and analogical questions to try and determine students' understanding of these key concept areas and attempted to arrange distracters so that the largest option was not always the last option. When possible, a numerical question was paired with a non-numerical question to assess students' understanding of the same concept. An example of paired questions from the current concept inventory can be found in Appendix A.

Researchers developing multiple choice assessments in higher education have tended to use Classical Item Analysis (Libarkin & Anderson, 2006), which was also used in the development of this concept inventory, with a focus on item difficulty and item discrimination. Classical theory comes from the work of Gullikensen (1950) and has been more recently labeled as Classical Reliability theory or True Score theory (Suen, 1990). In this theory, information about identifiable factors of individual test questions provide a guide for, "...the improvement of the test, and thus maximize the ultimate reliability of the total score" (Suen, 1990, p. 71). It is recognized that a major limitation of using this theory is that both item difficulty and discrimination are dependent upon the participants (Fan, 1998), which was why care was taken to obtain a sample that would be similar to the group of students who might use the inventory in the future.

Experts in teaching introductory astronomy courses were shown an initial version of the concept inventory and asked to complete a feedback form, noting whether each question assessed a particular concept; a ratio of agreement will be calculated for the purposes of content validity. In fall, 2013, the concept inventory was piloted in an introductory astronomy course with a sample of convenience (n = 44) taken from a small private liberal arts institution in the northeastern United States. Students completed each inventory twice, once at the start of the astronomy course and again in the last couple weeks of the course. Estimates of internal consistency reliability were determined using the Kuder-Richardson Formula #20 (KR20). Results from these analyses as well as an item analysis with instrument modifications will be presented. Implications and suggestions for future concept inventory development will also be discussed.

Appendix A  
Numerical and Non-Numerical Question Pair

The nearest stars (not including the Sun) are about \_\_\_\_ farther away than the Sun from Earth.

- a. 40 times
- b. 4,000 times
- c. 400,000 times**
- d. 4,000,000 times

Using a scale model where the Earth is a ball about the size of your hand (5 inches or 12 cm.), about how far away would you have to put the nearest star outside our solar system?

- a. across a football field/soccer pitch
- b. across town
- c. a one-hour airplane flight
- d. on the other side of the Earth
- e. on the Moon**

## Implementation of Inquiry-Based Activities in Undergraduate Engineering Courses

### *Paper Summary*

Students in college level science (Jasien & Oberem, 2002) and engineering programs (Miller, Streveler, Olds, Chi, Nelson, & Geist, 2006; Prince & Vigeant, 2006; Self, Miller, Kean, Moore, Ogletree, & Schreiber, 2008) have been found to hold multiple misconceptions about heat, temperature, and energy. For example, Prince and Vigeant (2006) found that many engineering undergraduates viewed heat and temperature as equivalent while Self et al. (2008) determined that almost 30% of chemical and mechanical engineering seniors could not, "...logically distinguish between temperature and energy in simple engineering systems and processes" (p. S2G-1).

Persistent misconceptions have been hard to alter. As noted by Self et al. (2008), "It is very difficult to repair many of these robust misconceptions through simple lecturing..." (p. S2G-6). Yet, previous research (e.g., Walczyk & Ramsey, 2003) has found that lecture and recitation predominate in college science and mathematics courses. Carlton (2000) has noted that instructors need to provide thought-provoking questions and experiments that encourage the interpretation of evidence to help students' really learn key tenets in thermal physics, rather than focusing on rote knowledge from textbooks.

One promising strategy for altering misconceptions is the use of inquiry-based activities (Nottis, Prince, & Vigeant, 2010). Previous research has shown that these kinds of activities can be effective in altering undergraduate engineering students' misconceptions about heat transfer (Prince, Vigeant, & Nottis, 2009) and thermodynamics (Nottis, Vigeant, Prince, & Silva, 2013). For example, Nottis et al. (2013) found that while the mean pre-test scores on the Concept Inventory for Engineering Thermodynamics (CIET) (Vigeant, Prince, & Nottis, 2011) were similar for the activities (Yes) and no activities groups (No), after instruction, the inquiry-based activities group had a significantly higher mean score than the no activities group on the post-test,  $F(1, 749) = 23.57, p < .01, \eta^2 = .03$ . The mean score for the activities group increased approximately 15 percentage points from pre- to post-test while the no activities group only increased about 10 percentage points.

Since previous research has shown that inquiry-based activities can be a successful way to alter misconceptions in undergraduate engineering courses, it would be anticipated that faculty would readily use such methodologies. However, this is not always the case. For example, in one study looking at inquiry-based activities in thermodynamics, it was revealed that only 23.1% of the entire sample and 48% of the group using inquiry-based activities actually used and completed the Reversibility activities as recommended (Nottis et al., 2013). These results are consistent with other research that has found that, "Implementation of an educational innovation often meets with limited success" (Abrami, Poulsen, & Chambers, 2004, p. 202).

Wright and Sunal (2004) tried to uncover barriers that discouraged faculty from trying new and innovative pedagogies. The researchers surveyed faculty in mathematics, science, and technology at 30 institutions and found nine key barriers to implementation of new instructional methods including faculty unwillingness, students' unacceptance of non-traditional pedagogies, and failure on the part of institutions of higher learning to provide ongoing instruction in new methods. Walczyk, Ramsey and Zha (2007) attempted to get more detailed information about impediments to implementation by using a researcher developed survey, the *Incentives and Supports for Instructional Innovation Survey (ISIIS)*. This self-report evaluation was sent via the internet to science and mathematics faculty in Louisiana. One key finding was that about a fourth of participants were at institutions where there were either no policies regarding the importance of teaching or the weight of teaching had not been conveyed to faculty for key personnel decisions like tenure. In addition, a minority of faculty had received any pedagogical training while in graduate school. Without such training, "...faculty are unlikely to use innovative approaches to instruction or understand the need for them" (Walczyk et al., 2007, p. 97). This observation was also supported by previous research (e.g., Wyckoff, 2001). A more recent study added to the base of information by identifying the most frequent barriers for implementing new instructional innovations as lack of instructor time and faculty concerns about content coverage, departmental norms, fears of student resistance, class size and room layout, and the inflexible structure of the university semester (Henderson & Dancy, 2011).

It is not enough to develop new instructional strategies that are more effective for promoting student learning than traditional methods. To significantly improve STEM education, effective instructional practices must be widely adopted by faculty. It has been noted that the biggest barrier to improving STEM education lies in getting faculty to actually use existing strategies that research has demonstrated to be more effective than traditional methods. Therefore, the purpose of the current study is to use feedback from participating faculty (3 Mechanical Engineers and 5 Chemical Engineers) in the development of a set of inquiry-based activities focusing on the heat transfer concepts of rate versus amount of heat transferred and thermal radiation that faculty finds to be more adoptable than the present activities. In the coming academic years, variations specifically developed to be more adoptable by requiring less faculty time, less experimental equipment, and less class time, will be assessed in class by participating faculty and both instructor and student outcomes will be assessed. This presentation will focus on the initial feedback, the changes made to the existing activities, and plans for the future.

c) PAPER

Over the past few decades, reform efforts in mathematics education have called for classrooms where all students have access to engaging mathematics and high-quality instruction. Classroom discourse, technology, and worthwhile mathematical tasks have emerged as key components in developing this type of instruction and in how students learn mathematics. In this paper, we present Techno-Mathematical Discourse as an organizing framework for examining the interactions among these three emerging components.

### **Techno-Mathematical Discourse**

The convergence of classroom discourse, technology, and worthwhile mathematical tasks gives rise to *Techno-Mathematical Discourse* (see Figure 2). This discourse is unique, in that students use technological representations (e.g., virtual manipulatives) to mediate discussion while engaging in worthwhile mathematical tasks (Vygotsky, 1978). As an emerging construct, the techno-mathematical discourse framework provides a means for analyzing and interpreting aspects of social learning with technology during mathematics instruction.

*Figure 2.* Theoretical Framework of Techno-Mathematical Discourse (TMD)

In Techno-Mathematical Discourse, technology enhances the communication of mathematical ideas and supports students' learning of mathematics concepts. When learning mathematics concepts with technology in a discourse community, students have access to multiple modalities of mathematical representations. First, technology tools, such as virtual manipulatives, provide dynamic pictorial and symbolic representations of mathematics concepts. Second, the dynamic visual displays serve as common experiences about which students can engage in meaningful classroom discussions incorporating both verbal and gestural (i.e., embodied) interactions. Students' understanding of mathematical concepts is strengthened when they make connections among representations in pictorial, symbolic, verbal, and embodied modalities (Clark & Paivio, 1991). Of course, the strength of the techno-mathematical discourse is influenced by the affordances of the available technology tools, by the quality of the worthwhile mathematical tasks used for instruction, and by the teacher's ability to orchestrate the classroom discourse.

The following sections of this paper briefly describe the theoretical underpinnings related to the components of Techno-Mathematical Discourse: classroom mathematical discourse, technology in the form of virtual manipulatives, and worthwhile mathematical tasks. We conclude with examples of existing research related to Techno-Mathematical Discourse.

### **Theoretical Underpinnings of Classroom Mathematical Discourse**

We define classroom mathematical discourse as “the ways of representing, thinking, talking, agreeing, and disagreeing about mathematical ideas” (National Council of Teachers of Mathematics [NCTM], 2007, p. 46). Mathematical discussion, as described in this definition, reflects current mathematics education reform efforts, which call for classroom communities focused on the communication of mathematical ideas (NCTM, 2000). Here, the terms discourse and discussion are used interchangeably. Educational researchers have identified multiple characteristics of classroom mathematical discourse, including explanation, argumentation, and defense of mathematical ideas (Walshaw & Anthony, 2008). Sherin (2002) describes two elements of classroom mathematical discourse: process and content.

the *process* of mathematical discourse refers to the way that the teacher and students participate in class discussions. This involves how questions and comments are elicited and offered, and through what means the class comes to consensus. In contrast, the *content* of mathematical discourse refers to the mathematical substance of the comments, questions, and responses that arise. (p. 206)

The use of discourse and communication as a means to learn new concepts is emphasized by Vygotsky in his seminal work in sociocultural theory, *Mind in society: The development of higher psychological processes* (1978). Here, he describes learning as a socially constructed phenomenon and asserts three major tenets: (a) higher mental processes are determined by how

and when they occur, (b) higher mental processes first occur on the social plane (i.e., between people), and then occur on the individual psychological plane, and (c) higher mental processes are mediated by cultural tools and signs. (e.g., symbols, speech, and writing). Therefore, students develop understanding as they interact with other individuals through verbal or nonverbal communications or written words. This study considers technological representations (i.e., virtual manipulatives) as mediating cultural tools for mathematical learning.

Anna Sfard (2007) refers to the socially constructed phenomenon of learning as *commognition*—a combination of communication and cognition. She further asserts that thinking can be defined as “the individualized form of the activity of communicating, that is, as communication with oneself” (p. 569). Therefore, in order to deeply understand complex concepts, some form of discussion must take place—even if that conversation occurs within one individual. Piccolo, Harbaugh, Carter, Capraro, and Capraro (2008) also describe rich meaningful communication in the classroom setting as consisting of “interactive and sustained discourses of a dialogic nature between teachers and students aligned to the content of the lesson that addresses specific student issues” (p. 378). In other words, meaningful classroom discourse contributes to students’ understanding by promoting effective communication and articulation of thought.

The culture of a classroom also plays a considerable role in shaping classroom mathematical discourse. Sociomathematical norms (Yackel & Cobb, 1996) develop within a classroom and constitute what interactions are valued and what counts as an acceptable mathematical explanation. Through these interactions, students analyze and evaluate the mathematical thinking and strategies of others and deepen their own mathematical understanding. Students must organize and consolidate their mathematical thinking in order to communicate

effectively with their classmates and with the teacher (see Chapin, O’Conner, & Anderson, 2009; Cobb, Wood, & Yackel, 1993; Huang, Normandia, & Greer, 2005; Imm & Stylianou, 2012; Piccolo, Harbaugh, Carter, Capraro, & Capraro, 2008; Sfard, 2007).

### **Theoretical Underpinnings of Virtual Manipulatives**

Over the past few decades, technology has developed new ways to think about and to represent mathematics (Moreno-Armella, Hegedus, & Kaput, 2008). These new “cognitive technology tools” (Pea, 1985) enhance the learning of mathematics concepts by expanding representational possibilities and by amplifying and reorganizing students’ approaches to problem solving. An elaboration of the NCTM technology principle states,

Electronic technologies—calculators and computers—are essential tools for teaching, learning, and doing mathematics. They furnish visual images of mathematical ideas, they facilitate organizing and analyzing data, and they compute efficiently and accurately....

When technological tools are available, students can focus on decision making, reflection, reasoning, and problem solving. (NCTM, 2000, p. 24)

With the advancement of computer capabilities, virtual manipulatives have emerged as cognitive technology tools for use in mathematics classrooms. A virtual manipulative is defined as “an interactive, web-based visual representation of a dynamic object that presents opportunities for constructing mathematical knowledge,” (Moyer, Boylard, & Spikell, 2002, p. 373). Based on this dynamic nature, virtual manipulatives seem to be a combination of *manipulative models* (e.g., base-ten blocks, fraction bars, counting bears), which allow for concrete examples of mathematical relationships and operations and *static pictures*, which provide an image for a learner to internalize (Lesh, Post, & Behr, 1987). These “computer based

renditions of common mathematics manipulatives and tools” (Dorward, 2002, p. 329) provide teachers and students with expanded tools for thinking about mathematics concepts.

Computer-based representations vary in their level of cognitive fidelity (Zbiek, Heid, & Blume, 2007). Some representations offer manipulative tools that truly reflect the user’s actions and choices without dictating solution paths. Other representations include concept tutorials (with or without manipulative tools) to guide students to a predetermined understanding of the mathematics. Still, others present an electronic figure, either static or in motion, very similar to a textbook or worksheet, and Kay (2012) identifies some virtual manipulatives as open-ended and others as structured. Additionally, a recent meta-analysis of research on virtual manipulatives (Moyer-Packenham & Westenskow, 2012) identified five affordances offered by specific design features and elements of different virtual manipulatives: focused constraint, creative variation, simultaneous linking, efficient precision, and motivation. The varying characteristics of virtual manipulatives have implications for their instructional use.

The simultaneous linking of representations afforded by virtual manipulatives is based on Dual Coding Theory (Clark & Paivio, 1991; Paivio, 2007; Sfard, 1991; Skemp, 1987), which posits that learning occurs in two different manners: verbal and nonverbal. The verbal system deals with learning modes related to the linear functions of language (i.e., spoken word, written words and symbols). The nonverbal system deals with nonlinguistic learning modes and mental imagery (i.e., geometric figures, diagrams). Each system alone can process a limited amount of information at a time (Clark, Nguyen, & Sweller, 2006). However, the combination of verbal and nonverbal inputs results in increased ability to make connections between representations and to attend to more complex ideas. For example, students may use the Fractions—Rectangle Multiplication applet from the National Library of Virtual Manipulatives (<http://nlvm.usu.edu>) to

visualize the meaning of multiplying fractions. This applet enables students to manipulate the size of each factor and to observe simultaneous changes in pictorial (nonverbal) and symbolic (verbal) representations of the product. Virtual manipulatives have the capacity to combine representations from both systems, and thereby, increase working memory capacity. In these ways, technology tools enhance the mathematical content presented to students.

### **Theoretical Underpinnings of Worthwhile Mathematical Tasks**

The mathematical content and tasks presented in a lesson significantly affect the richness of classroom discourse. In order for rich discussions to take place, students must be presented with tasks worth talking about (Iiskala, Vauras, Lehtinen, & Salonen, 2011; Lack, 2010; Mendez, Sherin, & Louis, 2007; Sherin, 2002). Worthwhile mathematical tasks, as defined by NCTM (2007) promote communication, engage students' intellect, develop mathematical understandings and skills, represent mathematics as an ongoing human activity, and embed mathematics in meaningful contexts. For example, instead of having students simply memorize multiplication facts or mathematical vocabulary, worthwhile tasks embed the multiplication facts and vocabulary in "meaningful contexts that help students see the need for definitions and terms as they learn new concepts" (NCTM, 2007, p. 33).

A worthwhile mathematical task is one that engages students' intellect and calls for problem solving and mathematical reasoning. According to Smith and Stein (1998), tasks vary in their level of cognitive demand. Tasks with lower levels of cognitive demand involve reproduction of memorized facts and algorithmic procedures with no connection to the concepts underlying the procedures. They have clear solution paths and require no explanation of mathematical thinking beyond a description of the procedure used. Tasks with higher levels of cognitive demand (i.e., worthwhile mathematical tasks) involve multiple solution paths and/or

multiple possible solutions. Students must analyze the task and present solutions in multiple representational forms. Smith and Stein note that tasks with higher levels of cognitive demand likely produce anxiety for some students due to the uncertain and unpredictable nature of the problem. This anxiety is a sign of cognitive disequilibrium experienced by students as they come to understand new concepts (Piaget, 1952). By presenting non-routine problems that require students to actively engage in mathematics (as opposed to mindlessly following procedures), worthwhile mathematical tasks represent mathematics as an “ongoing human activity” (NCTM, 2007, p. 33) and provide opportunities for students to make deep connections between mathematical ideas.

Other research has been conducted on the engagement potential of mathematical tasks. For example, English (1998) interviewed third-, fifth-, and seventh-grade students from classrooms implementing worthwhile mathematical tasks (i.e., reform-based practices) about their perceptions of the quality of different types of tasks posed in their classrooms. Overall, the students felt that interesting, meaningful, and relevant tasks provided them with the best learning experiences. They rated tasks as more engaging if the tasks involved deductive reasoning and provided some type of structural support for problem-solving (e.g., hints, diagrams). Students also rated spatial reasoning tasks and tasks based in a real-world context as more engaging overall. However, the perceived mathematical complexity of the problem seemed to have more influence on the students’ ratings of engagement than any of the previously identified factors. If the task seemed either too simple or too complex, students were reluctant to rate it as engaging. Together with Smith and Stein’s (1998) framework for levels of cognitive demand, these findings suggest that the effectiveness of mathematical tasks greatly depend on designing the task to reflect students’ interests and experiences, to provide sufficient representational support,

and to match the mathematical complexity to students' ability levels. Worthwhile mathematical tasks play a key role in the students' mathematical discussions and in the development of students' mathematical understandings and skills

### **Existing Empirical Research Related to Techno-Mathematical Discourse**

Research on the impact of technology in education has expanded over the past few decades. Technological developments constantly emerge presenting opportunities to improve classroom practices and learning. A great deal of research has been conducted in an attempt to verify the usefulness of such technologies. This synthesis of research findings focuses on the use of technology in elementary through high school classrooms as a representational tool for developing mathematical concepts. Major themes related to classroom discourse with technology will be discussed in three sections: (a) the impact of dynamic representations on the content and nature of mathematical discourse, (b) the impact of computer feedback on student collaborations, and (c) shifts in the teacher's role as facilitator of mathematical discourse.

**Impact of dynamic representations on classroom discourse.** Technology has the potential to produce dynamic representations of mathematics concepts. The dynamic nature of these representations has a profound impact on the level of classroom mathematical discourse. For example, Ares, Stroup, and Schademan (2008) describe a lesson using networked classroom technology—a wireless network of graphing calculators that collects students' solutions and displays them collectively on a screen at the front of the room. In this particular lesson, students used their calculators to “maneuver an elevator” by determining how many levels it would move up or down in one-second intervals. The collective resulting position-time graphs were then displayed on the front screen. Different tasks throughout the lesson gave specific parameters causing the students to focus on different mathematical relationships (e.g., end on the  $-2$  floor

using any combination of movements, the fourth movement must be to go up three floors). The researchers noted that the collective representation encouraged students to interact with each other and comment on the various solutions. Students focused on the mathematics represented dynamically on the visual display and used it as a basis for their mathematical discussions. Additionally, the visual display mediated a shift in the discourse from conceptual to more formal language (e.g., “they all go up at the same time” to “each line has the same slope, so they are all parallel to each other).

Similarly, Sinclair (2005) and González and Herbst (2009) each report on studies with dynamic interactive geometry software (Geometer’s Sketchpad and Cabri Geometry, respectively). In Sinclair’s (2005) study, students worked in pairs with Geometer’s Sketchpad to complete a sequence of tasks on proving congruency (e.g., applications of reflection and rotation). The dynamic nature of the software enabled the students to test conjectures and receive immediate feedback. Just as observed by Ares, Stroup, and Schademan (2008), the students in Sinclair’s (2005) study used the visual representations to fuel their mathematical discussions. However, these students displayed varying degrees of effectiveness in their discussions. As noted above, they engaged in productive discourse by explaining their thinking and asking thoughtful questions. But at other times, students’ discourse actually hindered the development of mathematical ideas. Due to this variation in productivity, Sinclair emphasizes the need for follow-up classroom sessions after time spent in the computer lab to solidify understanding and to ensure that all students have appropriate opportunities to learn the content.

González and Herbst (2009) report a more positive view of student discourse when working with dynamic interactive geometry software. Students in this study also completed a sequence of tasks to investigate congruency. However, instead of applying transformations (as in

the previous study) these tasks required them to experiment with midpoints and angles. The measuring and dragging features of the Cabri Geometry software enabled students to quickly and accurately assess the results of their experiments. The interactive features of the software tools supported all students' learning in the lesson. In whole-class discussions, advanced students described how they used the tools to prove their conjectures and pointed out new ideas. At the same time, other students who did not fully understand the technical terms for the geometrical relationships could still participate in discussions because of the support of the technological representations. Therefore, this study confirms previous findings (e.g., Ares et al., 2008; Sinclair, 2005) that interacting with dynamic representations enables and encourages students to talk deeply about mathematics.

**Impact of computer feedback on student collaborations.** As mentioned briefly in the previous section, the ability for technology to give dynamic feedback to students, either verbally or nonverbally, also contributes to the level of classroom mathematical discourse. Studies have shown that valuable visual feedback provided by graphing software programs, among other technologies, prompt productive problem-solving student discourse. For example, Gibbs (2006) documented students' attempts to graph particular quadratic functions with varying scales. When the computer-produced graph did not visually match the graphs students had previously drawn, discussions ensued regarding the discrepancies and how to reconcile them. Likewise, other studies report positive effects on problem-solving discussions as a result of feedback from dynamic computer diagrams. (González & Herbst, 2009; White, 2006).

More recently, Evans, Feenstra, Ryon, & McNeill (2011) conducted a study comparing effects of virtual and physical tangram puzzles on student discourse. Using a multimodal approach (speech, gesture, gaze, and actions) to analyze the discourse of 7- to 8-year-old

children, the researchers identified more co-references (i.e., shared reference points) among the students when using the virtual manipulative tangrams. They determined that discourses associated with the virtual manipulatives tended to be of more collaborative nature, perhaps due to a forced focus on a common screen and having to negotiate control of the mouse. However, students using the physical tangram pieces had the option to handle the pieces individually without permission from the rest of the group. The focus on a common display to promote active mathematical discourse aligns with previous findings (Ares et al., 2008; White, 2006).

**Shifts in teacher's role as facilitator of mathematical discourse.** With the addition of technology to the classroom environment, the role of the teacher in facilitating mathematical discourse shifts slightly. During whole-class discussions, the teacher becomes responsible for orchestrating students' interactions with the technology as well as interactions with each other (Ares et al., 2008; González & Herbst, 2009). Furthermore, the teacher's modeling of appropriate discourse practices becomes even more imperative as students work in small-group collaborations on the computers (Sinclair, 2005; White, 2006). During these small-group collaboration sessions, the teacher's roles of intervening when necessary (Baxter & Williams, 2010), and questioning to extend students' thinking (e.g., Brodie, 2011; Gibbs, 2006; Hufferd-Ackles, Fuson, & Sherin, 2004; Piccolo et al., 2008) become even more imperative as students work with dynamic technological representations.

### **Summary of Research on Techno-Mathematical Discourse**

The research on the impact of technology on classroom mathematical discussions begins to shed light on how particular technologies influence students' mathematical discussions and the development of mathematical understanding. Most of the studies in this area have examined a single technology tool (e.g., networked graphing calculators, Geometer's Sketchpad, Cabri

Geometry) and have been conducted with secondary students in a small number of classrooms. These studies used a variety of methods and analysis, including case studies (Gibbs, 2006; Sinclair, 2005), a discourse analysis (Gonzalez & Herbst, 2009), and a mixed methods micro-genetic analysis (Ares et al., 2008; see Siegler, 2006). Only one study (Evans et al., 2011) employed an experimental design and examined elementary students' discussions while using different types of tools (e.g., virtual tangrams compared to physical tangrams). The Techno-Mathematical Discourse Framework provides a way to examine variations in factors related to how students interact with each other and with technology in mathematics classrooms. For example, research can examine the influence on Techno-Mathematical Discourse of (a) different discourse formats (e.g., whole-class, small-group), (b) various types of technology tools (e.g., different types of virtual manipulatives), and (c) various types of mathematical tasks used in classroom instruction (e.g., non-routine, problem-solving, practice). More research on the effects of these variables will strengthen the knowledge base in this field of research.

**Abstract**

Media literacy, when used with a wide variety of modes and genres, can function as a unifying component that works as a springboard to address diversity in the classroom and to rebalance the power structures between students and teachers that often arises as the result of cultural, political, and ideological conflict. This Presentation will explore how the incorporation of media literacy can serve as a connector between the academic, social, and cultural experiences both students and teachers bring to the classroom.

## 0. Introduction

With the advent of globalization in recent decades, interactions between individuals who speak different first languages (L1s) have been increasing. These interactions can be either between a *native speaker* and a *non-native speaker* of a given language of interaction (NS–NNS) or between non-native speakers (NNS–NNS). The involvement of non-native speakers in communicative interactions means that their utterances may have features derived from the phonetic and phonological characteristics of their L1, that is, may be delivered in different *foreign accents*. These accents can be a potential obstacle to the clear perception and understanding of the utterances. This is particularly true in interactions between non-native speakers, with no native speaker involved. Although good perception and understanding of an interlocutor's utterance is a fundamental requirement in successful communication, little is known about how foreign accents affect listeners' comprehension (particularly that of non-native listeners).

The present study is a part of a larger research project that aims to examine the potential influences of foreign accents on L2 speech comprehension. Research on the comprehension of accented speech in the fields of second language acquisition and applied linguistics has been so far limited to NS–NNS interactions, and more specifically to the effects of foreign accents on native speakers' comprehension. In contrast, much less has been done to look at how different foreign accents—that is, the accents of people with different L1s when speaking an L2—affect the comprehension of those learners' utterances by L2 learners with another L1. The ultimate goal of the project is to reveal which characteristics of accented speech cause difficulty for perception and understanding in NNS–NNS interactions. As an initial phase, we

conducted a questionnaire survey on how much difficulty a particular language learner group (here, Japanese learners of English) feels in understanding accented L2 English speech from speakers with a variety of L1 accents.

## 1. Previous Studies

In the studies examining the influence of foreign accent on speech comprehension, three aspects of foreign accents are often focused on (Derwing & Munro, 2005). *Intelligibility* is the extent to which a listener actually understands an utterance, often measured by a dictation/transcription task using accented speech samples. *Accentedness* is a listener's subjective evaluation of how different a speaker's accent is from that of a L1 speaker. *Comprehensibility* is the listener's subjective evaluation of how easy or difficult a particular utterance is to understand. The latter two aspects are often measured by scalar judgments of accented L2 speech.

As mentioned above, previous research on the effect of foreign accents has mainly focused on the perception of non-native speech by native speakers. For instance, Munro and Derwing (1995a) conducted a study in which they asked 18 native speakers of English to transcribe and make judgments on the comprehensibility and accentedness of L2 English speech by 10 Mandarin-L1 speakers. They found that while the native speakers judged some of the L2 utterances to be heavily accented, the perceived accentedness did not necessarily affect their transcription performance or their comprehensibility ratings of the Mandarin speakers. (The transcriptions in question were orthographic transcriptions by people with no special linguistic training, not phonetic transcriptions.) Isaacs and Trofimovich (2012) analyzed the correlations between 19 measures of L2 speech (ranging from phonetic to discourse-level measures) and native speakers' comprehensibility ratings, examining how the linguistic characteristics of the L2 speech affected comprehensibility from the perspective of the listener. The results of the correlational analyses, together with introspective reports from three ESL teachers, showed that five of the speech measures could be considered influential. *Word stress* errors differentiated the comprehensibility ratings of L2 speeches across all three levels of L2 proficiency. *Lexical richness* (type frequency) and a measure of fluency (*mean length of run*) distinguished the lower level learners from others, while *grammatical accuracy* and a discourse-level measure, *story breadth*, separated high-proficiency learners from others.

In contrast to the above work with native listeners, only a few studies have examined L2 learners' perception of accented speech. Tara, Yanagisawa, and Oshima

(2010) compared the listening performance of two groups of Japanese learners of English, of different proficiency levels. The participants listened to a series of English passages spoken with either a Received Pronunciation or a strong Hebrew accent, and answered multiple-choice questions accompanying the passages. The results indicated that regardless of the learners' proficiency level, Hebrew accents negatively affected the speakers' intelligibility scores. In a similar vein, Munro, Derwing and Morton (2006) investigated how listeners' L1 backgrounds affect the intelligibility and comprehensibility of accented speech as perceived by them. Listeners from native Cantonese, Japanese, Mandarin, and English backgrounds rated accented English speeches from native speakers of Cantonese, Japanese, Polish, and Spanish. The results showed that listeners from different L1 backgrounds tended broadly to agree on the comprehensibility of the accented speeches. They also showed that comprehension among the Japanese listeners was helped a little by their own accent, while no such benefit was evident for the Cantonese listeners. They concluded that the properties of an accented utterance itself, rather than listeners' language background, may be the key in L2 speech perception.

Yuan, Jiang, and Song (2010) conducted a rating study to examine how L2 utterances delivered in the accents of different L1s affect listeners' perception of the accentedness of the speech. Eight Chinese learners of English who spoke it at a near-native level judged the accentedness of English speeches produced by L2 English speakers with eight different L1s, taken from a large database of English speech samples spoken by individuals with different L1s (CSLU Foreign Accented English Corpus; Lander, 2007). The Chinese learners' ratings of accentedness were then compared with accentedness ratings provided for the same speeches by three native English speakers. The overall results indicated that the Chinese learners were less sensitive to foreign accent, though the ratings of the English native speakers and the Chinese learners were correlated. One particularly important finding is that the Chinese learners found utterances spoken by individuals with particular L1 backgrounds more heavily accented than those by speakers of other L1s. Specifically, English utterances with Cantonese and Mandarin accents were judged less accented than those with Japanese, German, and Vietnamese accents, which in turn were judged less accented than utterances with French, Spanish, and Russian accents. Given that the accent heaviness of the selected speech samples as judged by the native English speakers was the same across L1s, these results suggest that foreign accents derived from different L1s may have different degrees of impact on L2 learners' perception and judgment of accented speech.

As shown by the studies cited above, there is some evidence that foreign accents affect various aspects of L2 speech comprehension by L2 learners, and further research is needed to better understand these influences. Of particular interest and value will be comparative investigation of the effect of foreign accents derived from different L1s. It is possible that foreign speeches with the same degree of accentedness (based on native speakers' judgments) will have different impacts on L2 speech perception if they come from different languages (with their various phonetic and phonological characteristics). Yuan, Jiang, and Song (2010) showed that this is indeed the case in the matter of judgment of the heaviness of accents. It is an open question at this stage whether or how foreign accents derived from different L1s affect measures of the comprehensibility and intelligibility of L2 utterances.

To address this open question, we conducted a questionnaire survey asking low-level Japanese learners of L2 English to listen to a series of accented English speeches from speakers of various L1 backgrounds and to judge their comprehensibility. As well as addressing the issue of the effects of different L1-based accents on L2 speech comprehension, the results of the survey are expected to serve as an empirical basis for later investigation into which characteristics of foreign accents cause particular difficulty for perception and understanding by non-native speakers.

## 2. The Present Study

### 2.1 Participants

A total of 103 Japanese learners of English participated in the questionnaire survey. The English proficiency of the participants was considered low, based on the results of the Oxford Quick Placement Test (Oxford University Press, 2004), which put them in a range from A1 to B1 on the Common European Framework of Reference (CEFR). Data from 22 participants were removed from the subsequent analyses, for any of the following reasons: a) failing to answer one or more questions, b) providing multiple answers for one or more questions, c) self-reported lack of concentration during the task, or d) self-report of having lived in an English-speaking country for more than one month.

### 2.2 Materials

The speech samples were taken from the CSLU Foreign Accented English Corpus (Lander, 2007), the same database used in Yuan, Jiang, and Song (2010). A total of 36 speech files from speakers of six different L1s (six speech files each for Arabic, Indonesian, Japanese, Korean, Mandarin, and Vietnamese) were selected. Half of the

speech files were judged strongly accented and the other half weakly accented, based on the average of three native speakers' ratings on the four-point scale of accentedness contained in the database (with an overall average of 3 for the strongly accented speeches and 2.33 for the weakly accented speeches). In each speech file, the speaker talks about himself/herself for up to 20 seconds in the form of leaving a message on an answering machine. For files that ended abruptly in the middle of the speech, the first author cut the last part of the file (not more than three seconds) so that the speech would end naturally.

### 2.3 Procedures

The questionnaire survey was conducted in university classes taught by the second author. The participants were asked to listen to a series of speeches and make a judgment as to how easy or difficult each speech was to understand on a nine-point Likert-type scale (1 = *very easy to understand*; 9 = *very difficult to understand*). The task started with a brief explanation of the research project, the task itself, and some ethical matters related to participation in the survey. After completing three practice items and confirming that they understood the procedure, the participants listened to 48 speech samples in total, presented in a randomized order (Japanese speech samples were repeated three times to check the consistency of participant judgments). To avoid order effects, two sets of speech samples were prepared, in opposite order. Between each pair of samples, there was a 10-second blank, during which participants were instructed to mark down their judgments. After completing half of the items, they took a few minutes' break. Finally, the participants were also asked to write open-ended comments about the task (e.g., their own criteria for ease or difficulty of perception and/or comprehension of the L2 speeches) at the end of the survey. Overall, it took about 30 minutes to complete the task.

## 3. Results

Table 1 shows average comprehensibility rating scores by accent thickness (strong vs. weak) and by the speaker's L1.

Table 1

*Mean Comprehensibility Ratings and Standard Deviations by Accent Level and L1*

	Mandarin	Japanese	Korean	Indonesian	Arabic	Vietnamese
Weak Accent	4.13 (1.89)	4.97 (1.50)	4.52 (1.96)	5.26 (1.74)	5.65 (1.69)	6.26 (1.52)
Strong Accent	4.75 (1.75)	4.04 (1.98)	4.89 (1.85)	5.33 (1.78)	6.03 (1.64)	6.06 (1.62)
Difference	0.62	-0.93	0.37	0.07	0.38	-0.20

*Note.* The figures in the parentheses are the standard deviation values. Difference = Strong Accent – Weak Accent.

The rating data were subjected to a two-way ANOVA with L1 and Accent Level as the within-participant factors. As the L1 effect and the L1 x Accent Level interaction violated the sphericity assumption, corrected F-values are reported. The main effect of L1 was significant,  $F(3.28, 262.58) = 67.33, p < .001, \eta^2 = .124$ , while the main effect of Accent Level was not,  $F(1, 80) = 0.56, n.s., \eta^2 = .000$ . The interaction between L1 and Accent Level was also significant,  $F(4.39, 351.39) = 14.50, p < .001, \eta^2 = .019$ .

Subsequent analysis of the simple effects showed that the effect of Accent Level was random. As shown in Table 1, speeches with weaker Mandarin, Korean, and Arabic accents (based on the native speaker judgments of accentedness) were judged more comprehensible than those with stronger accents. The trend was opposite, however, for speeches with Japanese and Vietnamese accents. For speeches with Indonesian accents, the participants found little difference in terms of the difficulty of comprehension.

In contrast, the effect of L1 was clearer. Regardless of accent level, speeches with accents based in particular L1s were judged more comprehensible than those with accents derived from other L1s. More specifically, the present participants (Japanese learners of English with a low proficiency level) found speeches in Mandarin, Japanese, and Korean accents easier to comprehend than those in Arabic and Vietnamese accents, and Indonesian-accented speeches came in between.

#### 4. Discussion and Conclusion

The present study attempted to examine the effects of accents based in different first languages on second-language speech comprehension. One major finding of the questionnaire survey administered is that the participants (Japanese learners of English) found utterances in some foreign accents more difficult than those in other foreign accents, almost regardless of the strength of the accents. For the Japanese learners, English speeches spoken in the accent of their native language (Japanese) were highly comprehensible (cf. the *interlanguage speech intelligibility benefit*: Bent and Bradlow,

2003). They also found English speeches containing accents from languages used in countries geographically close to Japan (Mandarin and Korean) as comprehensible as the Japanese-accented speeches. Also notable is that with the Japanese-accented speeches, Japanese learners judged more heavily accented speeches to be more comprehensible than less-accented ones. The exact causes of this language effect are not clear from the results of the survey. It might be that Japanese learners are more familiar with English utterances spoken by Japanese and other East Asian people than those by people in other parts of the world simply because they are more frequently available for the community of Japanese learners. Our tentative conclusion at this stage is that speakers' L1s have effects on L2 speech perception that are no less strong than the effects of degrees of accentedness.

As mentioned above, the results of the present survey provide an empirical basis for investigation into which characteristics of foreign accents cause particular difficulty in the perception and understanding of accented L2 speeches by non-native speakers. Together with what we have learned from previous studies, such as Munro, Derwing, and Morton (2006), we now know that L2 learners generally find speeches by other learners with the same L1 more comprehensible. One unique finding from our survey is that learner comprehension of L2 speeches containing accents from languages other than the listener's L1 varies to a certain degree as a function of the speaker's L1s. Future studies will address why this happens by examining the effects of individual accent characteristics using more fine-tuned measures like reaction time (Munro & Derwing, 1995b).

## Abstract

Land grant universities provide information and educational programs to clientele, including the general public, farmers, and homeowners. Typically, this has been done through conferences, grower meetings, commodity meetings, field days, extension bulletins, and websites. With the changing technology in communications, mobile devices have become crucial tools for disseminating information. The objective of this paper is to describe some of the ways tablets, smartphones, and apps are used in extension education.

Keynote is an iPhone/iPad/iPod touch app to create and deliver oral presentations. With the Keynote Remote app, an iPhone or iPod touch can be used as a remote control to control a Keynote presentation running on an iPad. Zapd, an iOS app website builder, was used to create the mobile website "Micro-hydroponics" about noncirculating hydroponic vegetable systems. RSS news readers and news aggregator apps (Feedly, Pulse, and Zite) help find articles, websites, and videos about cutting edge technological developments in horticulture which are disseminated to extension personnel and clientele. Mind mapping apps (SimpleMind+) create mind maps of the topics that will be covered in a presentation. Through demonstrations and hands-on activities, clientele learn about QR (quick response) codes and generate them using websites (TAG.CX) or mobile apps (QRS+). Clientele used mobile devices with QR code readers (i-nigma) to scan QR codes to get relevant information to supplement discussions. In conclusion, the use of mobile devices for extension education is expected to continue to expand rapidly in the foreseeable future as extension personnel and clientele obtain mobile devices, apps, and receive training.

## Introduction

Mobile devices, such as smartphones and tablet computers (tablets), are increasingly being used to complement the use of laptops and desktop computers. In some instances, mobile devices are replacing computers for specific tasks.

Their small size makes these handheld mobile devices portable and convenient to carry and use. They are powerful, have an array of software, and their touch screen makes them easy to use.

Mobile apps (applications) are software that run on mobile devices such as smartphones and tablet computers. There are over 868,000 apps available for download in the US App Store (Apple Inc.) (148Apps.biz, 2013) for iOS devices, covering a gamut of topics. Many apps are free, whereas others have a cost associated with them.

With the rising importance of mobile devices in everyday life, we are also seeing their expanding use in agriculture and horticulture (Cunha et al., 2010; Delgado et al., 2013). The diverse range of software applications for these devices make them powerful tools for education (Hlodan, 2010), extension (Drill, 2012), and research activities (Young, 2011).

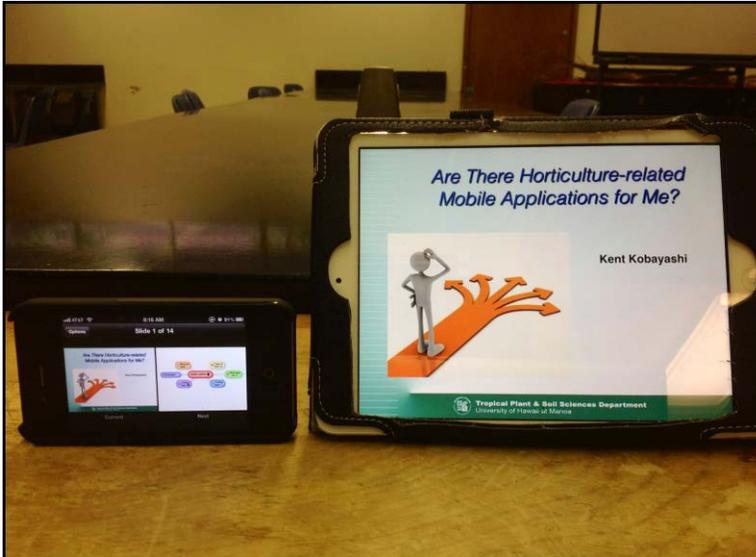

Land grant universities provide information and educational programs to clientele, including the general public, farmers, and homeowners. Typically, this has been done through conferences, grower meetings, commodity meetings, field days, extension bulletins, and websites. With the changing technology in communications, mobile devices have become crucial tools for disseminating information. The objective of this paper is to describe some of the ways tablets, smartphones, and apps are used in extension education.

### **Keynote and Keynote Remote**

Similar to Microsoft PowerPoint, Keynote is an Apple software for creating presentations. It is available as mobile apps, enabling the iPhone and iPad to also create presentations. Using an iPhone, iPad, or iPad mini for presentations is convenient due to the light weight and ease in holding and carrying these devices during a presentation. This allows the instructor to walk around the classroom, facilitating mingling among the students and increasing teacher-student interaction. The mobile devices are connected to a projector via an adapter and a VGA cable.

Another method for presentations is to the use of Apple TV, a digital media device that allows using a projector to show presentations on an iPad. The projector and iPad are linked wirelessly using AirPlay. In addition, a software such as Reflector, which runs on a Macintosh laptop, can be used for presentations if an Apple TV device is not available. The laptop is connected to the projector via a VGA cable. Using AirPlay, the iPad is wirelessly connected to the laptop, and what appears on the iPad then appears on the laptop and projector.

Keynote Remote is a mobile app that can be used on an iPhone to enable it to be used as a Bluetooth remote control unit for an iPad. The iPad is set up to run the Keynote presentation. The iPhone is used as a remote control (Figure 1).

**Figure 1.** Using an iPhone, running the Keynote Remote app, to control a Keynote presentation on an iPad. Swiping the iPhone screen advances the slide. Note: a preview of the next slide can be seen on the iPhone.

### **Website builder apps**

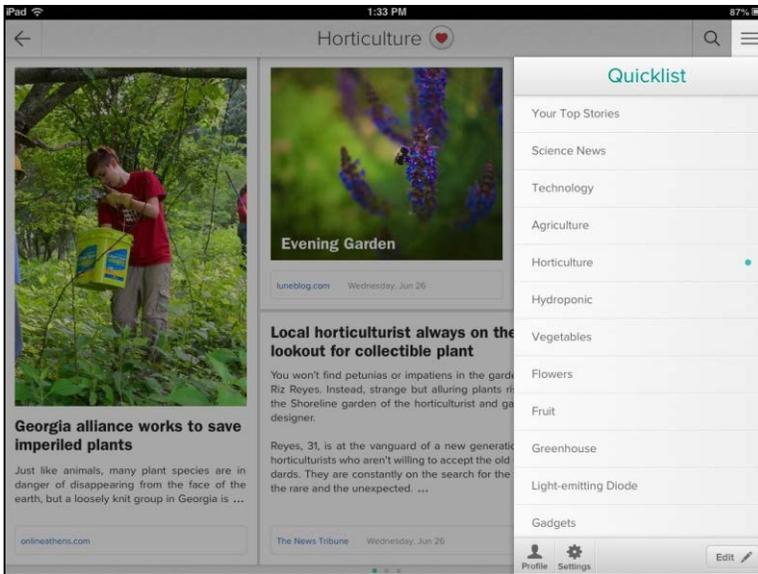

Zapd is a website builder app for creating webpages. Using an iPhone or an iPad, you can easily create a webpage by simply inserting text, images (photographs), and links (Figure 2). Other web creator apps include Weebly and Simpl.

**Figure 2.** A webpage created using the iPhone/iPad app Zapd. Text, photographs, and links are easily added to the webpage.

### **RSS news readers and news aggregators**

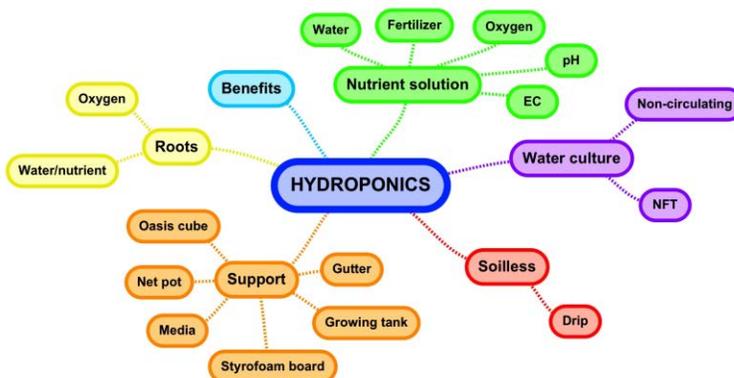

RSS (Really Simple Syndication) news readers and news aggregators are applications that can collect news articles and videos from multiple news sources and deliver them into one location for easy viewing. It eliminates the need to search the Web for specific websites to obtain news. Examples of RSS news readers and news aggregators include Feedly, Pulse, and Zite (Figure 3).

**Figure 3.** Zite news aggregator app evaluates news stories that match your interests, in this example, "horticulture". It then delivers them automatically to your iPhone or iPad.

## Mind Mapping

Mind mapping is a technique for organizing thoughts, ideas, and relationships. It starts from a central idea or topic and branches out like a spider web to related subtopics (Figure 4). Mobile mind mapping apps enable the creation of mind maps on iPhones and iPads. Mind mapping apps include iMindMap and SimpleMind+.

**Figure 4.** Mind map on hydroponics created using the iPhone/iPad app SimpleMind+. Presenting such a mind map previews a presentation for the audience.

## QR Codes

Mobile apps can be used to create and scan QR (quick response) codes (Figure 5). Scanning of QR codes provides information to the user including web links (URLs, Uniform Resource Locators), contact information, additional relevant information, text messages, and e-mail. There are many mobile apps for scanning QR codes such as i-nigma QR Code reader, QRS+ code generator/scanner, Norton Snap QR code reader, and Microsoft Tag.

**Figure 5.** QR (quick response) codes can be created and scanned using iPhone/iPad apps. When QR codes are scanned, they provide pertinent information such as links to websites, contact information, additional relevant information, and text messages.

## Conclusion

This article was limited in its scope to Apple (iPhone, Pad, and iPod Touch) products. There are also extension education related apps for other brands of smartphones and tablet computers with different operating systems such as Android and Windows 8 that were not covered in this article. The use of mobile devices for extension education is expected to continue to expand rapidly in the foreseeable future as extension personnel and clientele obtain mobile devices, apps, and receive training.

## **Aim of the Paper**

I suggest that a reformed science-education may help to align society's disinterest in science more closely to its fascination with scientific-products. Within an aim of scientific-literacy, the curriculum for such a science-education should represent the character of science as both interpretive and experimental, and foster an understanding of both the standard account of science as well as science(s) indigenous to the pupils being instructed.

## **The Issue**

A growing disinterest in scientific-study and scientific-careers is being blamed on the way in which science is taught (Burnsed, 2011; Gay, 2002; Mitchell & Hoff, 2006; Wolff-Michael & Lee, 2004). In stark contrast to this expanding disinterest, science's epistemological hardiness and reliability, as well as its immense contribution to humankind's development, allows it to still enjoy a hegemonic status (Carter, 2008, p. 175). Certainly, societies are increasingly charmed with products of science, many of which have become cultural staples.

## **The Theoretical Framework of this Paper**

In attempting to account for this contradiction of a world seemingly disenchanted with science education and careers yet enamoured by its products, I have invoked Geertz' proposition of two sciences: "...an experimental science in search of law...[and] an interpretive one in search of meaning" (1973, p. 5). This was Geertz' explanation to

describe anthropology's shift from the dominant use of positivist methodologies such as behaviourism, towards relativist methodologies which suggested that persons create meaning from their enmeshment within symbolic webs of significance often inherited through history (Geertz, 1973, p. 5). Geertz' two sciences then can be succinctly represented as a positivist-experimental vs a relativist-interpretivist position

Earlier, in 1959, Snow had proposed two cultures which Hess later (1993 as cited in Franklin, 1995, p. 165) aligned to the character of Geertz' two sciences. Snow's two cultures are indicated as "literary intellectuals at one pole-at the other scientists, and as the most representative, the physical scientists"(Snow, p. 169). For sure, physical scientists have long been considered positivists whilst literary intellectuals are often considered as relativists (Berg, 2004, p. 2&7; Tomal, 2010, p. 3). Interestingly, Geertz has described this dichotomy of positivist-relativist positions in terms of two "sciences": a term normally associated with positivist methodologies. In contrast, Snow has done so as two "cultures": a term generally associated with interpretivist viewpoints thought discordant to positivist thinking. The argument itself then, is also framed in positivist-interpretivist terms.

I am suggesting that this positivist-relativist dichotomy is embedded too within scientific-philosophy and lies at the root of the inarticulation between society's high interest in scientific-product as compared to its low interest in scientific study and careers. Whether defined in terms of cultures or sciences, Snively and Corsiglia (2001) support that this positivist-relativist dichotomy is really about "the nature of reality and knowledge, [and] definitions of science" (p.7).

Positivist philosophy suggests a fixed, and universal reality or world, measurable through the collection of empirical data, (often in quantitative forms). Such data can be used to generate theories, or “explanations as regularities” (Jones, 2011, p. 202), about the way the world works. These theories can be later applied to predict and control systems towards the development of specific products, technologies, or outcomes. Processes are not important here since “to be able to ‘drive’ the system does not require understanding how the ‘engine’ works...[it is facilitated by] an instrumentalist rationality, whereby scientific thinking itself has become an ideology; the ends justifying the means” (Jones, p. 202).

Relativism has long been thought to stand opposite to positivism, and uses qualitative inquiry to interpret and represent the meanings that individuals construct as they interact with the world about them (Merriam, 2002, pp. 3-4). These meanings are determined as “inhabitants make sense of their surroundings through symbols, rituals, social structures, social roles and so forth” (Berg, 2004, p. 7).

This essay aligns an ‘experimental-science’ more closely to a positivist view or the utilization of science as *theories, products or technologies*. Note that technology in modern spaces is often thought to be digital. Within this essay though technology refers to the historic meaning, in which science is applied to make some useful product, which may not necessarily be digital. An ‘interpretive-science’ I align closely to qualitative methodologies and the *process* by which scientific experimentation occurs, how science makes meaning as it comes to know, and how it acculturates others into those methods.

Notably, the essay draws harsh lines between interpretivist and experimental science

really only to facilitate the ease of the discussion. It is deeply appreciated that these two sciences are entwined along a continuum and may be occurring simultaneously at many times in the scientific-endeavour.

### **Summarising the Purposes of this Paper**

The seeming contradiction between society's disinterest in science-education as compared to its high interest in the products of science may simply therefore be a manifestation of the philosophical condition of science. Certainly, little headway has been made in settling the relativist-positivist divide existing at science's philosophical-core. Franklin (1995) suggests that generally, "no one has provided the social engineering to bridge the [relativist-positivist] gap more than sporadically in the interim, confirming the tenacity of an opposition" (p.166). In the absence of a truce, the dichotomy of interpretivism and positivism appear to have been separately, and possibly unwittingly, embraced within different spheres of the scientific-enterprise. For instance, even though the research process of science may be prevalently interpretive, science-as-experiment might dominate the societal-mind because of society's avid use of technological products.

The outcome of this battle seems to result in an array of numerous sciences defined at various points along the philosophical continuum between the positivist-interpretivist poles: with scientists in each camp defending that point, and the lay-people with scientific-literacies insufficient to make sense of the battle caught unwittingly in-between. On such a playing field, I disagree with the assertion of Geertz (Geertz, 1973,

p.5) quoted at the start of this section: in this situation at least, eclecticism might *not* be self-defeating. An eclecticism where the personalities of interpretive-science and experimental-science openly co-exist, their individual contributions to the nature of science and the scientific endeavour recognised, accepted and harnessed, might help to begin to resolve these contradictions. A science-pedagogy recognising the character of science as both experimental and interpretivist might help to produce a society with stronger scientific-literacy, more aware of the capabilities of science, more realistic in their demands of science, more demanding in the levels of accountability to which science is held, and generally demonstrating more interest in science and its endeavours. Moreover, an interpretivist-science resists an exclusionary, standard account of science by welcoming the cultural ways of doing science and coming-to-know, to which students under tutelage are enculturated in their communal lives.

Title: Advising for the Online Student

Topic Area: Advising and Distance Education

Presentation format: Panel Session

Description: This session will be an opportunity for participants to learn about one advising system developed for online learners. The presenters will first discuss the elements of an online advising system for online students in our department. The second part of the session will focus on an open discussion among participants to discuss best practices of advising online learners.

## ABSTRACT

With the growth of online education, a new and growing population of students need academic advising. Unlike a traditional student on a residential campus who has ready access to an advisor, many adult learners use online courses and programs to restart their education. As such, these online learners initially need advising on the direction of their education, what options are available in their education, and transferability of their previous credits (Steele, 2005). After acceptance into an online program, these online learners need effective advising that leads to successful degree completion.

A well-known, but complicated critical component of success for online students includes support services—such as advising (Ludwig-Hardman & Dunlap, 2003). Providing effective advising to online students can be problematic for many reasons. Online students expect to have a timely response to their questions and concerns; it is easier for advisors to procrastinate in answering a student's question through e-mail or telephone when there is no physical presence of the student (Lorenzetti, 2004). Additionally, online students can feel isolated and alone (Angelino et. al, 2007); and without classmate chatter about upcoming advising appointments and enrollment dates, they can easily miss crucial deadlines. Because the advisor may be the only consistent point of contact between the online learner and the institution, institutions need to explore how advising is factored into the overall degree experience (Lorenzetti, 2004; Morris & Miller, 2007).

A key strategy to reduce stress and isolation in online learners is active communication initiated by the institution (Lorenzetti, 2004). The ITAM Department at Central Washington University has devised a system of central advising from their home campus to ensure online learners have all the information available to them for successful degree completion. This centralized advising begins with helping online learners identify their readiness for online learning; online learners also receive time management advice; counsel on continuation of their program; quarterly schedules and program course flow, and assistance with technology.

In addition to this centralized advising system, each online learner is assigned a personal advisor. Because the online learner has access to the centralized advising

system 24/7, individual time with the assigned advisor can be more productive in the areas of career guidance and personal issues related to successful degree completion.

The first part of this interactive and engaging session will be spent on learning the mechanics of the central advising system and personal advising that online students receive through our department. The second part of this session will be opened to participants to discuss best practices of advising online learners.

Title: Best Practices for Departmental Roles in Online Class Retention

Topic Area: Higher Education and Distance Education

Presentation Format: Panel Session

Description: While much research addresses specific pedagogical techniques for online course retention, this panel session will explore some of the reasons for lowered retention rates in online classes at the departmental level and provide specific departmental strategies which can be easily implemented for greater student success in the online class environment.

## ABSTRACT

While much research has been published on effectiveness of online classes, online class pedagogy, and other class specific tools, little research has addressed department best practices when offering online classes or fully online programs.

From the department perspective, effectiveness in online classes is important to retention rates within the department. Student retention rates in online classes has been one of the greatest weaknesses in online education (Carr, 2000; O'Brien & Renner, 2002). Attrition rates for online classes tend to be 20 percent higher than those of traditional classrooms (Frankola, 2001; Diaz, 2002). Chief Academic Officers at all types of institutions believe that lower retention rates for online courses are a barrier to the wide-spread adoption of online education (The Sloan Consortium, 2012). Despite these lower retention rates, 3.9 million students took an online course in 2007 (Allen & Seaman, 2008), while over 6.7 million students took at least one online course during fall 2011. As a result, we believe it is the job of departments, not only individual faculty, to determine strategies to manage retention rates.

Gibson (1998) reported three categorical factors to explain attrition in online courses: student factors (i.e. motivation, persistence attributes), situational factors (i.e. family and employer support, life changes), and educational system factors (quality of instructional materials, difficulty, and tutorial support. While two of these factors have little to do with the course, the last factor, educational system factors, is what we will address in this panel session. Since extensive research has been reported on how to create an effective online course, we believe there are educational system factors related to individual departments that can be addressed to alleviate retention issues.

In the Information Technology and Administrative Management Department at Central Washington University, a number of best practices have been put into place to increase students understanding of their online class, allowing the student to spend less time figuring out the class and more time focused on the material.

In this panel discussion we will demonstrate and discuss the use of master courses, training and mentoring of non-tenure track faculty, templates used in our LMS system, and the use of master syllabi and department banners. We believe these departmental-based methods increase students' ability to quickly familiarize themselves with their online class, resulting in greater online class student success. The last part of the session will be a focused participant discussion on methods their departments use to address student retention challenges in online classes.

## Abstract

Title of the Submission: The Relationship Between Fitness and Motivation to Learn Among College Students

Primary Lead Author: Mark Mann, Ph.D.  
Department of Kinesiology  
Texas Woman's University  
[mmann2@twu.edu](mailto:mmann2@twu.edu)

Topic area of the submission: Health Education

Presentation Format: Paper Session

Abstract: This paper examines the relationship between fitness habits of college students and their motivation to learn. In the K-12 setting, the literature review regarding this topic demonstrates mixed results, with most studies indicating a strong relationship between the two. In this study, data from 256 college students were collected to determine if the students' scores on the motivation to learn inventory differed based upon the hours of fitness that they engaged in per week. The self-reporting method of data collection from the participants in this study produced a statistically significant ( $P = .03$ ) but weak correlation between fitness habits and motivation to learn (Pearson  $R = .14$ ). Thus, raising questions about the relative weakness of the relationship between the variables themselves for college students when compared to the stronger relationship between the variables for students in high school. Secondly, from a wellness practitioner perspective, questions about what additional curricular content or wellness opportunities might be needed to increase intrinsic motivation for fitness participation, to match, generally speaking, a college students' known desire to learn in the classroom.

## The Relationship Between Fitness and Motivation to Learn Among College Students

The relationship between Physical Fitness and Motivation to Learn has been discussed since the 1980's. While most research has been conducted in the K-12 setting, there is a growing interest in trying to understand the decreased levels of physical activity among college students. In high school, 91% of students report regular vigorous or moderate physical activity. In college, that number decreases to 58% (Douglass). In American high schools, since budgetary considerations have caused school districts to cut physical education program hours in K-12 education, certain research professionals in the field have questioned the value of such cuts, and have researched the link between physical education, academic achievement, and motivation to learn. Such researchers have reasoned that if there is a strong relationship between the level of physical fitness and academic achievement, then it does not make sense to cut such programs, as academic achievement and motivation to learn would be negatively affected. What this group of researchers discovered (Grissom, 2005) was a positive relationship between the level of physical fitness and academic achievement at the K-12 level.

In this study, we will investigate whether a relationship exists between motivation to learn and physical fitness among undergraduate college students at a public university in the Southern United States. Generally speaking, the study doesn't intend to prescribe a specific form of exercise, or make a determination regarding the type of exercise that is reported by the students, but, first and foremost, as a research question, to determine whether the students' anticipated decreased fitness activity level can be strongly correlated to a decrease in their motivation to learn as a college student. If the answer to the research question is yes, then, that would inform the researcher to argue in a similar fashion as the proponents of high school physical educators do when making the case for retaining physical education courses. However, if the answer to the research question is no, that is, there is not a strong correlation between motivation to learn and fitness activity level, then, the university level physical educator must still look for ways to engage the college student in wellness activities for their own sake.

## Literature Review

To solidify that high school students desire to learn and physical fitness levels are strongly related to each other, Grissom (Grissom, 2005) conducted research with 884,715 fifth, seventh, and ninth graders comparing their fitness standards of aerobic capacity using the Fitnessgram test with their SAT scores on reading and mathematic achievement. Analysis of variance between groups showed that reading and math scores improved significantly as the physical fitness scores increased. In another study, released by the Texas Education Agency in January 2009, the state's 2.4 million students in grades 3-12 were evaluated on the relationship between physical fitness and academic achievement. Fitnessgram tests results were compared to results of the same students on state academic achievement tests across several grades. It was determined that physically fit students were more likely to do well on academic achievement tests, have good attendance, and fewer disciplinary referrals.

With regard to college aged students, researchers estimate (Stevenson, Lochbaum, 2008) that over 50% of the adult population in the United States do not engage in the recommended levels of physical activity. As practitioners look for ways to engage college students in healthy lifelong fitness habits, and lifestyles, Stevenson found that the mastery approach goal orientation significantly mediates sense of competence ( $r=.41$ ,  $p<.05$ ) on leisure time exercise autonomy ( $r=.55$ ,  $p<.05$ ). Just how practitioners create opportunities for college students to be more intrinsically motivated, and have a mastery goal orientation is a matter of discussion. One suggestion (Kilpatrick, 2004) is to expand the focus of curriculum and fitness planners to have lifetime physical activity interventions that include recreational sport activities in their offerings. For example, Kilpatrick's study has shown that female students engage in physical activity for differing reasons. When offerings are limited (students are given exercise program opportunities exclusively) such programs will appeal to women with the desire to participate for reasons of weight management, appearance, and ill health avoidance. However, a large

group of students might be left out who are motivated to participate in programs that offer them a sense of affiliation, enjoyment, challenge, and a sense of revitalization. For these groups of students, lifestyle activities and recreation sport participation can motivate them to participate.

## Method

### Participants

A total of 386 individuals participated in a series of research questionnaires including the Motivation to Learn Inventory (University of Arkansas, 2010), as well as collection of basic demographic information such as age, gender, marital status, and education level. Of those participants, 168 females and 88 males. The remaining 130 respondents did not identify gender and, therefore, their data were not retained. The participants were students at a mid-western university and were from a variety of academic majors as well as age levels.

### Instrumentation

#### Motivation to Learn Inventory

Gender and marital status were measured through self-identification. Participants selected either “male” or “female” as a gender designation. Participants also completed the Motivation to Learn Inventory. A total of 25 questions were presented with responses indicated on a 5 point Likert scale. Responses were coded using Latin alphabet characters (N = Never, S = Sometimes, A = Always, etc.) and transformed into continuous data points 1 through 5. Questions included statements such as “I feel frustrated with learning new things.” Identified in the Motivation to Learn Inventory is a sub-scale measuring Motivation to Learn when challenged and despite fatigue. Questions 5, and 19-24 of the Motivation to Learn Inventory make up the sub-scale. No transformations were required to calculate the sub-scale. Instead of averaging the items, a total score was calculated to perform the Pearson R correlation and determine the relationship between the variables. The total score instead of the average of the sub-scale was used to not minimize the differences between the scores on those inventory items as answered by the participants.

In the analysis of the motivation to learn inventory, the higher scores represent higher levels of motivation to learn when challenged and despite fatigue. This particular subsection of the inventory best reflects classroom and grade related eustress that would lead to academic success. The second important data collected in the Motivation to Learn (MTL) Inventory was the minutes of exercise per week that each participant engaged in. This data was used to compare the participant's physical activity with their score on the motivation to learn subscale.

## Procedure

Data were collected via convenience sampling. Graduate students were tasked with collecting completed survey data from friends, neighbors, family, and work colleagues. Additional participants were identified as well in public locations and various higher learning campuses. The surveys contained additional demographic information, as well as aggression and cultural opinion data, not used in this research. A total of 386 individuals completed the survey, and of those 256 identified their gender as either male ( $n = 88$ ) or female ( $n = 168$ ). The remaining 130 surveys in which participants did not identify a gender were not utilized in this study. A Pearson R, for all participants, for males, and for females, was calculated to determine if there was a significant relationship between the participants' motivation to learn (academic achievement related variable) compared to the number of hours per week that they exercised (physical fitness variable). An alpha level of .05 was used for all calculations to test for statistical significance. Because data was analyzed using SAS, the P value was used to indicate statistical significance. The P Value was determined significant below .05 as well.

## Results

### Preliminary Analyses

Detailed results are presented in Table 1 for the Motivation to Learn (MTL) subscale (when challenged and despite fatigue) and the hours of reported minutes of exercise per week. The recommended weekly exercise for adults is 30 minutes per day for five days a week. (150 minutes). The males' mean average of reported exercise per week was 27.87 minutes above the recommended average, and the women's' mean

average was 38.87 below the recommended average. The females' motivation to learn (MTL) mean score was slightly higher (24.78 vs. 24.31) than the men's.

Table 1

*Exercise and Motivation to Learn (MTL) Data for all participants, and male and female participants. Descriptive Statistics.*

Source	N	Exercise Mean	Exercise SD	MTL Mean	MTL SD
All participants	256	134.94	159.22	24.66	3.69
Males	88	177.87	191.65	24.31	4.00
Females	168	111.13	134.53	24.78	4.00

\* $\alpha = .05$

In Table 2 below, we note the Pearson R and P values when we compare (1) the reported Minutes of Exercise per week data with (2) the Motivation to Learn (MTL) sub-scale data for all participants, and for male and female participants.

Table 2

*Exercise and Motivation to Learn (MTL) Data for all participants, male and female participants. Correlation Data between MTL and Exercise.*

Source	Pearson R Value	P, $\alpha$
All Participants	.14	.03*
Males	.14	.20
Females	.09	.25

\* .03 is statistically significant

#### Discussion/Conclusions

The results from this study reveal that there is a statistically significant but weak

correlation ( $R = .14$ ) between the variables of exercise and motivation to learn among college students. The lack of a strong relationship between the variables investigated here means that the high school students (where  $R = .41$ ) did show a stronger relationship between these two variables than among the college students ( $R = .14$ ). Students in college stay motivated to learn, but, as expected, they either become less motivated to exercise or the relationship between their exercise and their motivation to learn further widens. One way, perhaps, to increase student motivation to exercise is to broaden opportunities to students that will appeal to a mastery goal orientation and offer lifestyle fitness opportunities and recreational sport opportunities that is more appealing to those with differing goals from the traditional exercise offerings at a college. Although motivation to learn can be both intrinsic and extrinsic, future research in the form of a longitudinal study should be conducted to determine if intrinsic motivation can narrow the gap between motivation to learn and exercise by viewing exercise as motivation to live a healthy life and meet a broad range of needs that people have through college and into adulthood. In this study, we did not investigate the scope or type of exercise offerings that the students were offered at the specific school where the survey was conducted. Had more offerings been available, the results could have been different. Further research identifying the “ideal” environment for fitness activities could produce differing results.

Family Conferencing as a Means of Enhancing Aboriginal Content and Delivery

Marney L. Paradis

301146355

Simon Fraser University

**Abstract**

Aboriginal students face a myriad of educational difficulties due to both the lasting legacy of colonialism and to the lack of culturally-relevant experiences in the classroom. Educators must be willing to examine the historical implications of separating the student from communities and families, and be willing to engage extended family members fully in the classroom experience. Family conferencing is a system of immersing relevant community persons into a student's academic life through the process of negotiation and accommodation.

### **Family Conferencing as a Means of Enhancing Aboriginal Content and Delivery**

For many thousands of years, Aboriginal peoples occupied the lands in which I now live. I give thanks and acknowledgement to the Kwanlin Dün First Nation and the Ta'an Kwäch'än Council, for graciously and hospitably sharing their sacred spaces.

Like most of my fellow countrypersons, I am not a descendent of the First Peoples who have lived on this land for several thousands of years. My ancestors were European, and though I hope they lived peacefully and with profound respect for their Aboriginal kin, the inherent nature of being of European descent in America means they were part of colonialism. In degrees, this may also mean that I serve as a participant in the perpetuation of colonialist practices.

Working with and for Aboriginal peoples, I am acutely aware of my non-Aboriginal status. The common, every day practices that I do working with First Nation youth who are identified as being "at-risk" actually require great consideration, prudence and planning. I am cognizant of the notion that my participants are in their individual quandaries as a result of poor personal choices, societal barriers, and of course, a lifetime of conflicting cultural epistemologies. The inner discord that has developed within each young person is not solely due to a single factor, in spite of society's attempts at generalization and indiscriminate blaming. Rather, it is the manifestation of many generations of cultural shaming, governmental misappropriation, and the attempted assimilation of Canada's Native peoples into colonialist society.

The end result of this endeavor is found in the collective experience of many young people: disenfranchised, little interest in engagement, but with profound potential. It is within this promise-to-be that there is capability and a remarkable capacity to change. They are

exploring the history of their parents and grandparents, grasping at the injustices of the past. These young people comprehend a great deal, and appreciate the value systems inherent in Aboriginal knowledge. They crave the familiarity of their ancestors.

To bring traditional teachings to them, and to have their cultural values normalized and accepted requires a great deal of change within the educational system. Starting with the identification of curriculum discrimination and working toward the system's embracement of Aboriginal values, agents within the educational sphere must adopt methods of delivery and a relevant content that meet the needs of First Nation peoples. This means working toward culturally relevant teaching practices through the inclusion of the Aboriginal community. As our Indigenous students typically have large extended families, this curriculum overhaul could be partially achieved through family conferencing, which serves to generate familial interest and involvement in student's school life. With the adoption of family conferencing, educators can effectively generate curriculum change through the edification of Aboriginal cultural and the adoption of holistic, person-centered engagement practices.

This essay explores colonialist practices within educational systems, and demonstrates how Western teaching practices perpetuate cultural discrimination through the absence of Aboriginal curriculum. The context of what constitutes Aboriginal teachings is discussed, as are the various ways that teachers can be inclusive of alternative value systems. The crucial role of extended family in the lives of Aboriginal children is considered, and the traditional method of interacting with family through parent-teacher interviews is examined. Lastly, the recommendation of conferencing as a platform for family inclusion is suggested as a means to bring the First Nation perspective into the classroom.

### **Toward Aboriginal Content and Delivery**

For over 130 years, residential schools across Canada performed the government's mandate of Indigenous assimilation. Through the systematic stripping of cultural identity, belief systems, language and familial connections, young First Nations people emerged from educational institutions largely bereft of their cultural knowledge. Indian and Northern Affairs states that these institutional exploitations left Aboriginal peoples with "lateral violence, suicide, depression, poverty, alcoholism, and absence of parenting skills and the capacity to build and sustain healthy families and communities" (as cited in Belanger, 2012).

The legacy of residential schools has had a detrimental effect on the lives of Indigenous people and has led to severe distrust within the educational system today. The reasoning behind this suspect is clear: many characteristics of residential schools mirror what we offer our students today, including mandatory curriculum in an institutional setting, language of instruction which is that of majority, the white experience is the benchmark of normalcy, and there are little or no opportunities to experience Aboriginal cultural traditions.

In spite of our increasing awareness of the harmful effects that residential schools had and continue to have on our Aboriginal peoples, we nonetheless maintain our epistemological ethnocentrism (Witt, 2006). Our perceptions of Aboriginal children's success or failure is gauged against that of the dominant Canadian culture, specifically that of the white, middle class child. Cultural teachings are assessed according to Eurocentric acceptance, with the Western worldview assumed to be a global perspective (Chun-yan, 2008). These expansive notions of what constitutes a "typical" experience and make up the bulk of our school's cultural formations are deeply removed from small, northern communities in Canada. Yet our centrally developed

curriculums continue to instruct our Aboriginal youth in a manner that is not conducive to their developmental, cultural or holistic needs.

The result of the disconnect between First Nation youth and the educational system is apparent. Aboriginal students indicate feelings of marginalization (Gunn, Pomahac, Striker, and Tailfeathers, 2011), and poor relationship developments within the school (Gunn, Heffernan, Beaudin, and Tailfeathers, 2004). Statistics Canada(2006) reports that 34% of Aboriginals have not completed high school. Archibald indicates that high levels of absenteeism, originally a form of resistance, occur on a regular basis (as cited in Nguyen, 2011). Blame for perceived failures of the young person is placed on the families (Hare and Pigeon, 2011). First Nation peoples, in turn, may be unwilling to engage in a system that they feel does not honor their circumstance (Witt, 2006) or work toward overcoming the struggles they face on a daily basis.

In spite of such systemic discrimination, First Nation peoples have repeatedly ascertained the importance of passing on traditional Aboriginal teachings to their young, recognizing that this shared knowledge is the foundation of their success in learning (Hare and Pigeon, 2011). Nguyen (2011), stresses this point, arguing for Aboriginal teaching space across educational spheres. Quoting Dr. Marie Battiste, she writes "This struggle demands an urgent agenda to effect educational reform....and to protect and enhance Indigenous heritage and livelihood damaged by colonial assimilation projects, neglect, diminishment, and racism." (p.85).

If one accepts that a key tenet in overthrowing epistemological ethnocentrism and countering the effects of colonialist thought is in the adoption of curriculum focused within traditional Aboriginal teachings, then one must also dispense with the notions of Aboriginal enrichment projects. This common practice, often called the "beads and feathers approach" (Gunn et al., 2011) is the predominant method of bringing traditional knowledge into the

classroom. In essence, it is the inclusion of selective aspects of Aboriginal knowledge into Eurocentric curriculum, such as the adoption of a morning prayer circle or the creation of a cultural-awareness day.

Through the practice of Aboriginal enrichment, entire Indigenous cultures are minimized, deeply spiritual belief systems glossed over in the guise of edification. The appropriation of culture to utilize as one desires, regardless of presence or lack of malevolent intent, is a staple of colonialist practice. Celia Haig-Brown (2010), potentially recognizing appropriation as cultural exploitation, posits the following question: "What does it mean and what happens when one (attempts to or) does occupy culturally based concepts, beliefs, values, and thought processes for purposes other than what may have initially been intended by the originators?" (p. 931).

Although most educators would be unlikely to view cultural activities as sinister in nature, one should always bear in mind that if the peoples who are being portrayed, discussed or culturally explored are not directly involved in the design and delivery of the subject matter, there is the very real possibility that one is engaged in exploitative and oppressive teaching practices.

Harrison and Greenfield (2011) state that "it is not only a question of transmitting syllabus information *about* Aboriginal people, teachers also need to analyze what *knowledge* and *perspectives* are appropriate to include in the curriculum and what the pedagogy *does* to students in terms of their expectations and images and how they talk about Aboriginal people" (p. 69).

To engage our young citizens in a culturally appropriate manner requires serious forethought as to how it may be interpreted by the classroom. As an educator, I must ask myself: "Am I providing an honest reflection of the circumstance and cultures of Aboriginal peoples, or am I providing my *interpretation* of the circumstance and cultures of Aboriginal peoples?" As we are all constructs of the culture of our individual lives, so too are our thoughts the construct

of how we understand the world around us. Certainly, my definitions and assessments of Aboriginal peoples would likely not mirror an Aboriginal's definition and assessment of him or herself. Here, as educators, we must question if the best interests of our Aboriginal students are being served by indoctrinating them into our stereotypes of what a Native person is.

The control and dissemination of Aboriginal knowledge is theirs and theirs alone. If one does agree that ownership of a people's culture is left to the originator of said culture, then so too must one agree that this power should be both implemented by the originator and manipulated in a manner that is befitting to the originator. In other words, the practice of traditional teaching and cultural exercise should be managed in entirety by First Nation peoples. In support of this entitlement, the United Nations, recognizing the unique struggles of the world's Indigenous peoples, drafted the Declaration on the Rights of Indigenous peoples. This instrument reflects a growing international consciousness toward the inherent rights of Aboriginal peoples. Of note, Article 31 states the following:

Indigenous peoples have the right to maintain, control, protect and develop their cultural heritage, traditional knowledge and traditional cultural expressions, as well as the manifestations of their sciences, technologies and cultures, including human and genetic resources, seeds, medicines, knowledge of the properties of fauna and flora, oral traditions, literatures, designs, sports and traditional games and visual and performing arts. They also have the right to maintain, control, protect and develop their intellectual property over such cultural heritage, traditional knowledge, and traditional cultural expressions. (United Nations, 2008).

While not a legally binding document (and one in which Canada opted out of signatory agreement), this Declaration proposes a worldwide movement toward acknowledging the harms

inflicted by colonial advancement. It also recognizes the sensitive nature of misappropriation, and accepts notions of great damages done to entire peoples when stripped of culture and traditional knowledge.

Although there are concerns that peoples frequently lose the right to control their culture in the offerings of Aboriginal enrichment activities, there are those who believe that it is an appropriate means of providing culturally relevant teachings in the classroom. A widespread argument in defense of Aboriginal enrichment practices is that it exposes our students to Indigenous culture where otherwise there would be none (Haig-Brown, 2010; Harrison et.al. 2011), and for that purpose alone the practice should be vindicated. In addition, some teachers feel that enrichment activities provide students with an alternative perspective, opening the window to different worldviews and providing students with opportunities to explore different cultures (Vize, 2009). Nonetheless, practicing cultural activities that are not inherently owned can be a form of misappropriation, and can continue to perpetuate stereotypes about Aboriginal peoples.

Short of a traditional knowledge immersion system, educators are often left frustrated with trying to bridge culturally relevant teaching with the Western knowledge system (Saunders and Hill, 2007; McGregor, 2010). As previously indicated, teachers and schools must be extremely sensitive to the rightful ownership of the material being presented. This respectful approach carries with it a tremendous amount of responsibility, with educators being required to be knowledgeable in both Western and Indigenous ways of learning (McGregor, 2010). As this is often not possible, teachers are required to outsource, bringing in community members to serve as cultural educators. Although challenging, supporting skilled First Nation community members within classrooms can be highly rewarding. The wealth and depth of Aboriginal

knowledge that is often shared by a single family can provide schools with multiple opportunities to engage in enriching and relevant subject matter. By positioning community within the school, teachers are, in essence, creating a normalcy that is outside of the dominant cultural group.

Reimagining curriculum as a delivery within Aboriginal contexts requires an examination into what constitutes Aboriginal content. Are teachings that are effective in meeting the needs of Vuntut Gwitchin students going to generate interest in those with a Cree background? Is it possible to honor Indigenous customs in a manner that is befitting to differing heritage? It is difficult to justify using a broad brush to paint an egalitarian image, as the complexities within each Indigenous group is great. Utilizing knowledge of a particular sub-group (i.e. Tlingit women) and ascribing it as Indigenous knowledge in the name of cultural inclusiveness may be interpreted as being antithetical and servicing the needs of a principal group (Moore and Muller, 2010).

There is also the question of ambiguity in cultural representation. A portion of curriculum could be focused on Aboriginal identity, but the lines may be blurred when it comes to encouraging Indigenous teachings in areas that may be seen as uncompromising to the dominant cultural group (Hossain and Pratt, 2008). In 'core' subjects such as math or science, traditional knowledge is often quickly demoted or may be viewed as inferior. Within Western thought, science is the process and outcome of determining truth and non-truths through empirical studies, and traditional teachings are rarely given the opportunity to produce an alternative method of scientific query (Linkson, 1999; Michie, 2002). In addition, many educators view science as a universal worldview and outside the realms of cultural perspectives (Morey and Kitano, 1997). Described frequently as fragmentation or compartmentalization, science has essentially served as a dichotomizing means of viewing oneself with the world;

through isolating parts of the world, science effectively removes context and relationship (Linkson, 1999). There appears to be little room for culture, given that the relationships that are so valued in Aboriginal knowledge are precluded for the sake of Eurocentric perceptions of truth and non-truths.

Many scholars do, however, argue that science is entrenched in culture. There is the recognition that the notion of an absolute or final product is crafted within Eurocentric values, given that these values place high importance on finding an end goal, rather than significance placed on the complex relationships in the natural world (Sterenberg and Hogue, 2011). Brandt (2007) describes how Aboriginals view the world in terms of processes as opposed to the Western perspective of science as product, with the product being knowledge. Aboriginal science may also include the spiritual, and be entrenched in oral history and ceremony (Sterenberg, 2011). Gayle Ball, a 26 year-old woman of Tahltan First Nation decent, described her peoples relationship with the land as being a part of science. She illustrated the important role of cycles within her people's belief system, stating that all beings within the universe are intricately connected. This is why, she elaborates, that when we use something for our personal use (i.e. a tree), we must treat it with profound respect, and offer something sacred to the earth for surrendering it. We are, in essence, a part of the very thing that we are utilizing, and should be very careful to respect and honor this relationship (Gayle Ball, personal communication, December 13, 2012).

Understanding the importance Aboriginal peoples place on natural cycles and on complex relationships does not have to exist outside of Eurocentric science. It is possible to bridge union between the two, if educational systems are prepared to understand Aboriginal knowledge as a holistic means of teaching truths. A simplistic example of this can be found in

explaining universality to young people, and how we are all commonly connected through similar atoms that have been in existence for eons. Carl Sagan attributes this to all matter being formed of ancient stars (1980), and arguably the ancestral homage of all peoples is not outside the realm of astrophysics, being bound by the same laws of nature as today. A synergy is possible, if educators are prepared to examine content to be more inclusive of Aboriginal values.

While not entirely symbiotic, an aspect of science that is highly inclusive of Aboriginal knowledge is in the Western world's practical use of the natural world, in such fields as "ethnobotany, ecology, pharmacology, and medicine"(Sririman, 2011, p. 218). Adoption of the rich and deeply informative Aboriginal understanding of the physical world has certainly proved beneficial to the study of science. Again, however, we are reminded that appropriation of Indigenous knowledge includes both the utilization of garnered information without informed consent and the dissemination of this knowledge in a manner that fails to recognize and honor the original owner.

In essence, the content of a curriculum that is inclusive of Aboriginal representation and interests must include both Aboriginal perspective and Aboriginal knowledge. If the educator is non-Aboriginal, he or she must be aware that what is being taught is not Aboriginal perspective, but is a "non-Aboriginal teacher's perspectives on Aboriginals" (Harrison and Greenfield, 2011, p. 70). Schools can circumvent this scenario through active recruitment of Indigenous community members who are committed to entering school settings on a recurring basis, for significant periods. Perspectives must also be inclusive of Aboriginal knowledge, and in particular, traditional teaching.

To reach our young, Aboriginal students, educators must find ways to decolonize their classroom learning experience. As discussed, this process can be initiated if educational systems

recognize the inherent Eurocentric values in current curriculum and work toward deconstructing this through the adoption of Aboriginal content and Aboriginal delivery. This process may be extremely challenging, as it requires the surrendering of teacher-controlled delivery through the espousal of First Nation community members as core classroom facilitators. As educators, we must be flexible in our approach, ensuring the interests of the Aboriginal community is transparent in our classrooms.

### **Family Conferencing as Engagement**

Aboriginal students, like all students, are typically involved in a school setting that has a teacher at the head of the class, with limited or no parental interactions throughout the duration of the school day. Unlike other children, however, Aboriginal students often have an extensive expanded family that they rely on heavily to do the tasks that are, for non-Aboriginals, delegated as parental roles. In effect, numerous individuals contribute to raising a young member of an Indigenous family, creating multitudes of complex, deep relationships founded on interdependence and connectivity (Smith, 1997). These meaningful links to their familial community have always been a primary source of social capital and a valuable means of sharing resources (Daly and Smith, 2005; McTurk, Robinson, Lea, Nutton, and Carapetis, 2011).

Johnny Brass is a member of Saskatchewan's Key First Nation. He describes Aboriginal's familial philosophies as being founded in respect. From the time a child is very young, he or she is taught to think of extended or distant family members as very close, transforming a distant cousin into a brother or sister. Close family friends become uncles and aunts, and community Elders become grandmothers and grandfathers. Parents, recognizing individual strengths of certain extended family members, rely on these connections to help educate and discipline their young (Johnny Brass, personal interview, December 13, 2012).

Although Eurocentric culture is often quick to condemn parents for what is perceived as "pawning" their children off on family members, this cannot be further from the truth. Aboriginal peoples owe a great deal of their survival and cultural endurance to expanded familial relations. From 1884, when anti-potlatch laws were enacted and residential schools became responsible for education, Aboriginal peoples remained resilient in their convictions (First Nation Initiatives, n.d.). Potlatches were done in secret with small numbers of extended family. Children placed in residential schools gained whatever cultural knowledge they could from extended family and friends. On top of this, Aboriginal peoples continued to share resources amongst the community as they had for thousands of years. Their continued reliance on one another was one of their greatest assets in combating colonialist practices, and it continues to this day. Aboriginal attachment to their extended families is, as Johnny Brass says, "a society living within each person" (Brass, personal communication, December 13, 2012).

In understanding Aboriginals intimate and deeply rooted connection with family, we can see that educational systems are not fulfilling their duty to provide family interactions within schools. An Aboriginal child's identity is thoroughly entrenched in family, and unless a school setting is openly and actively encouraging family involvement on a daily basis, they are in effect perpetuating colonialist attitudes. According to John Ralston Saul, our schools are rooted in industrialist, dated theories and are in serious need of personalized education (2002). These school philosophies were fashioned in an era that did not, and could not, foresee the need for cultural inclusion and family involvement. The resulting system of hegemonic constructs greatly diminished the roles of cultural values and continues to relieve families of the power of self-determination and self-actualization.

The level of partnerships between schools and communities or teachers and families serves to either engender or minimize student success. Family-education collaboration has been recognized for a very long time in serving as a determinant in learning outcomes, and this has largely been done through the scheduled times of parent-teacher conferences. Lemmer describes this form of school-home interaction is the most widely used means of communication between parents and teachers in the world (as cited in Allen, 2008; Berger, 2008; Hiatt-Michael, 2001; Olsen and Fuller, 2008). Lemmer further reports that while parent-teacher conferences are extensively documented as being beneficial (as cited in Jeynes, 2010), they are known to show little advantage in cross-cultural situations (as cited in Guo, 2010).

As was discussed previously, teacher's understanding of First Nation culture is negligible. They may likely have an appreciation of cultural content, but may not have the knowledge scope that could be required to successfully engage in culturally relevant or appropriate discourse with a parent. As Witt (2006) attests, there is difficulty for non-Aboriginals to acquire Indigenous knowledge, as the nature of the learning and knowing process necessitates lengthy requirements. Teachers may not understand the depth and pervasiveness that expanded family relationships hold in a student's life, and parents, in turn, may not adequately convey the prominent role that these networks hold. Parent-teacher conferences cannot sufficiently represent the key players who host considerable guidance in the young person's life.

Parent-teacher conferences may also contribute to the enduring systemic oppression that Aboriginal peoples face. Rarely are these meetings held to highlight some advancements made by the student; most conferences serve to shed light on behavioral and academic issues. Again, the culpability of inadequacy is placed on the Aboriginal. The discussions may also be dominated by the teacher's concerns, giving parents little room to voice their wants and needs

(Lemmer, 2012). In addition, the parents may fear judgment, and may consider themselves as outside of the normative group (Jordan, Reyes-Blanes, M.E. Peel, H.A. Peel, and Lane, 1998). The structured schedule with narrow time-slot availability, the parents squeezed into children's chairs sitting across the desk from the teacher, the static, objective discussions surrounding a child who may not even be present, the limited opportunity for parental concerns: these standard methods of engaging in quasi-dialogue do little to address the needs of the family and the child (Lemmer, 2012; Minke and Anderson, 2003).

In spite of the apparent problems within the overall institution of parent-teacher conferences, many scholars contend that it is one of the better methods of engaging families with the schools, as parental involvement is generally thought of as a crucial step toward a successful school experience (Epstein, 2001; Jeynes, 2010; Lemmer, 2012; Peel, 1995). The educational system as a whole has known for years that a significant factor in student's positive school experience is found in the interactions with the student's family. The question now remains - how can educators coalesce the Aboriginal student with a personalized, family-centered approach to teaching?

To advocate for the betterment of our Aboriginal students, we must engage with family in a meaningful and culturally relevant manner. This means that as educators, we must be prepared to work within and for each student's expanded family and the larger First Nation community in general. Working toward this goal should be something that educators are persistently trying to achieve, and a possible introduction in meeting this objective is to expand upon the parent-teacher conferences with the implementation of family conferencing.

Family conferencing is a means of ensuring the people who are most involved in the child's life have the opportunity come together and develop a working plan that outlines how the

child's best interests can be met. Originally crafted in New Zealand by the Maori people, conferencing is a holistic approach for families to create action plans that outline individual strengths of family members and identify how these assets can be used in the interest of the child. Hayden (2009) describes the conference as an "approach to planning and decision making that involves the wider family network in partnership with, and supported by, the statutory and other agencies" (p207). Traditionally, family conferencing has been used in cases where a social worker is involved in a child's life, and is initiated as a means of stabilizing the young person's care and safety plans (Mireille Simon, personal communication, December 7, 2012). Since family conferencing is based on restorative principles, however, it by no means must be isolated to families in a stage of difficulty; in keeping with harmonious philosophies, it can be used to provide a platform from which all families can work toward a common goal.

How are family conferences different from parent-teacher conferences? According to Minke and Anderson (2003), the following apply to family conferences:

- (1) all parties prepare in advance,
- (2) students are active participants,
- (3) teachers concentrate at least as much on receiving as on giving information,
- (4) teachers focus on family and child strengths, and
- (5) the conference is a conversation; teachers are not "presenters" (p.52).

The process involves numerous stakeholders involved in the child's life, including parents and siblings, the child's close extended family members, family friends, and the family conference specialist (Yukon Family Conference Program, n.d.) As this conferencing proposal is removed from those youth identified as "at-risk" and is more of a generalized means of engaging Aboriginal students, a social worker may or may not be present. Being geared toward getting the

young person and family involved in the education system, this conference will also host the views of the educator and conceivably the principal . Last, but certainly not least, a First Nation representative who can advocate on and speak for the cultural needs of the young person should also be present.

After several weeks of preparation, participants come to the conference prepared to enter into balanced and judgment-free discussions about how to meet the needs of the clients. The groundwork before the conference may be the most imperative aspect of successful conference delivery, as it gives the specialist the opportunity to equip participants with the skills necessary to navigate a holistic discourse practice. They may enter the conference better prepared to hear what may be asked of them, and they are ready to offer ways that their individual roles may better serve the young person.

During the conference, the educator has the opportunity to describe to the family what is required for that particular student's success. In turn, the family can outline what the school system can do to better encourage, involve and represent the child. As it is in all family conferences, there is an allotted private time for families only (Yukon Family Conference Program, n.d.). During this period, the family discusses ways that the child can be better supported in school, and ways in which each family member can engage with the school.

The end result of the conference is a plan of action outlining how family members can support the student in school. It is important to note that the conference action plan, though placing greater responsibility on the family, is not indicative of submission on behalf of the family. Within an action plan, family members can offer ways that they can assimilate themselves into the schools, pending the school's flexibility to meet *their* needs. In other words, a child's aunt can engage the classroom in teaching about the worth of regalia in ceremonies,

under the stipulation that the teacher lessens control over the content of the teaching and sanctions full rights to develop the cultural expression as the aunt sees fit. The child's family can exercise cultural rights in the classroom in exchange for a proliferation of support for the student.

Family-focused and family-led conferencing need not be seen as a burden for teachers, however. Conferencing is a skill that must be developed, but it is done so by doing things *differently*, rather than working harder (Minke and Anderson, 2003). Citing her previous work, professor Betty Simmons identifies three working assumptions that educators must master as they enter a conference:

I) *Assume good will*. The participants in any family conference will most likely have nothing but positive intentions for the child and for the outcome of the group.

II) *Assume competence*. Having alternative perspectives doesn't necessarily denote ineptitude.

III) *Assume a shared responsibility*. All members of a group have a role in the development of an action plan, and each role is valued. (Howe and Simmons, 1993).

Strong communication skills that are utilized in a transparent and holistic manner are extremely important for teachers engaging with families, particularly when it is across cultures (Jordan, et al., 1998; Peel, 1995). The aforementioned assumptions, taken with consideration and reflection, are a good means of ensuring respectful relationship. If family conferences are conducted in a manner that is beneficial to all of those involved, the temporary goal could be for all participants to leave feeling "connected, optimistic, respected and empowered" (Minke and Anderson, p. 50).

In spite of the qualitative support of family conferencing, there is indication in some studies that illustrate its limitations. University of Portsmouth Professor Carol Hayden (2009) had the opportunity to test the perceived effectiveness of family group conferencing when compared to intervention strategies done through a state welfare agency. 78 cases were

examined, with 41 of these being conferencing (30 convened), and the "key independent variables were level of attendance, number and type of exclusion, age, and sex" (p. 211). The results of her data indicate that conferencing did not play a significant role in reducing absenteeism in school and did not necessarily denote a growth in positive behavior toward and within schools. She does specify, however, that this could be a result of the fact that the young people were often "severe" cases, and had undergone conferencing after being involved in numerous other attempts at intervention. Hayden also questions if the lack of resources available to conference specialists was a precursor for the minimal levels of success (2009). It should be noted that family conferencing in the United Kingdom is unlikely to mirror conferencing done in Canada. Although the principles and objectives may be similar, the participants are certain to be different.

Studies that have been conducted in America and Australasia indicate conferencing benefits youth who may be on the fringes of the education system, which is inclusive of Aboriginals. Research conducted by Minke and Anderson (2003) indicate that participants feel an improved sense of communication between family and school, and educators experienced an increased understanding of the family's capabilities. Many participants also report feelings of empowerment and a strengthened ability to take on responsibility (Walton, Roby, Frandsen, and Davidson, 2003). They also reported a lack of trust in the current system and an eagerness to try family conferencing as an alternative to conventional routines (Waites, MacGowan, and Pennell, 2004).

**Conclusion**

There is a considerable amount of literature devoted to the difficulties Aboriginal peoples face within the education system. A significant portion of this focuses on the myriad of ways that school institutions and agents can better support these students. This essay has explored a few methods that can be used to work toward Aboriginal student success. It is important to address the detrimental role that colonialist practices continue to play in hindering Indigenous learning process, including the teaching practices that oppress and reject Aboriginal culture within the blanket curriculum and particularly within the Eurocentric truth-based courses such as math and science. It is also crucial to recognize the essential role of context and place in knowledge delivery, as it is far too simple to recreate stereotypes in absence of critical consideration of content. A means of wedding Aboriginal curriculum to educational systems is in garnering the active support of the First Nation community through the amelioration of family conferencing. In adopting a family-focused means of critical engagement, educators are recognizing the powerful role that extended family has within each young Aboriginal student, and teachers are thus capable of accessing the First Nation content and delivery that is needed as a means of deconstructing cultural hegemony.

*Abstract: Prior studies examined how students use quantitative reasoning and multiple representations to model mathematical relationships. In this paper we will discuss how students attend to the structure of an equation and how they reason about the expressed quantities. The assessment was adapted from the elementary project, Measure Up, and administered to Grade 5 and Grade 12 students. Findings from this research can add to the understanding of a quantitative reasoning trajectory.*

The elementary grades mathematics project, Measure Up, being conducted at the Curriculum Research & Development Group at the University of Hawai‘i, has given us insight to alternative curricular approaches for the learning of mathematics. In contrast with the more typical, counting approach (Devlin, 2009) to mathematics instruction, Measure Up uses a measurement context to develop critical mathematical topics (Dougherty & Venenciano, 2007). Findings on prior studies of the effects of this curriculum show that third grade students are capable of using algebraic symbols and generalized diagrams to solve problems (Dougherty & Slovin, 2004). Another study implies that the Measure Up fifth and sixth grade students are better prepared for algebra compared to non-Measure Up students in the sixth and seventh grades (Slovin & Venenciano, 2008). Furthermore, the findings from the later study study show that Measure Up students are capable to correctly justify how they arrived at solutions on

tasks that required the interpretation of letters as specific unknowns (i.e., not assigned values or as objects).

The mathematics of Measure Up has been adapted from the work of the El'konin-Davydov Russian curriculum (Davydov, Gorbov, Mukulina, Savelyeva, & Tabachnikova, 1999). One aspect of the Measure Up work examines how the presentation of abstract concepts, such as mathematical properties and proofs, could be used to develop concrete concepts, such as numeric applications. An underlying premise is that in order for children to truly learn mathematics, they must learn to think theoretically and use abstractions with understanding. Thus, by focusing instruction on the structure of the mathematics and the development of quantitative reasoning skills, we conjecture that students will have a more robust understanding of the mathematics.

Prior studies have examined how students use quantitative reasoning and multiple representations to model mathematical relationships. Thompson (1993) noted challenges Grade 5 students had with conceiving of a quantitative difference apart from the arithmetic operation of subtraction. Ng and Lee (2009) presented a model used in Singapore schools as a structure for students to solve word problems. This heuristic was found to support children's integration of text with pictorial and symbolic representations. Other researchers have studied students' abilities to use algebraic symbols and generalized diagrams in problem solving (e.g., Sfard, 1991, 1995; Dougherty & Slovin, 2004). Studies with older students include understanding of quantitative reasoning focused on the thinking that drives mathematical modeling (Doerr & Tripp, 1999), and how students generate algebraic models (Izsak, 2010). Our research focuses on how students in their final semester of a college track mathematics program integrated their early understanding of quantitative relationships with recent learning of high school mathematics.

The CCSS (CCSSI, 2010) document identifies *students' abilities to reason abstractly and quantitatively* as one of the Standards for Mathematical Practice. The data analysis in this study uses this lens to identify aspects of decontextualizing-contextualizing in students' reasoning. In an attempt to uncover the abstract and quantitative reasoning abilities students have developed we investigate the following question, *How do students use a length model to represent an equation?* Reference to

*representing an equation* refers to how the quantities given in an equation can be represented on the line segment in a manner that preserves the relationships indicated by the equation.

### **Method**

Thirteen students were interviewed in the spring of 2013. Six had participated in the elementary mathematics project, Measure Up. Seven students were selected to form an equally diverse group that matched the first group in three areas; their seventh grade achievement scores in mathematics and language arts, and social economic background. All were twelfth grade students attending a school in a metropolitan area and all completed algebra in eighth grade and the same high school sequence of courses, which included a full year of geometry and three years of an integrated mathematics program. Matching the groups based on seventh grade data served as a means to focus our research on the effects of how the secondary school mathematics experiences were subsumed, with regard to quantitative reasoning.

The assessment instrument in the current study was developed from the Measure Up curriculum. Existing data from the Measure Up project provide responses from Grade 5 students' work. Using the same tasks with the students in Grade 12 allows us to analyze consistencies in students' responses, on the individual student level and on the Measure Up or non-Measure Up subgroup level.

The interview structure allowed for both independent and small group work. Students were organized into groups of three or four, resulting in two groups of students with Measure Up experience and two groups with no Measure Up experience. One group was interviewed per day, during a lunch break that was approximately 35 minutes. The same interviewer conducted each interview. Each interview began with students working on problems independently for ten minutes. This was followed by another ten minutes during which the students sat as a group to discuss their thinking, adjust their answers if they could make them stronger, write notes about the problem, and ask questions of each other. This type of exchange among students is an instructional technique regularly used by their high school mathematics teachers and therefore was expected to promote deeper consideration of the mathematics. To help distinguish changes in their responses due to this interaction, students used pen on independent work and pencil for the group work.

The interviewer prompted the students to continue talking about the mathematics by asking follow-up questions if a student's response was unclear or incomplete. The interviews were audio recorded and transcribed. Two observers were also present during the interviews and took written notes.

The assessment instrument used in the interviews consisted of three tasks with two subparts each. The tasks were taken from the Grade 5 Measure Up curriculum. The first task (see Fig. 1) directed students to mark and label a line segment such that it represented the equations  $X = A - (B - C)$  in the first subpart, and  $X = (A - B) - C$  in the second. Following each equation and accompanying line segment is a request for an explanation of the reasoning about the labels created by the student. This gives students the opportunity to clarify the purpose of their markings and labels and say how these relate to the equation.

Mark and label each line segment with  $X$ ,  $A$ ,  $B$ , and  $C$  so that it is a representation of the equation.

a.  $X = A - (B - C)$

Explain your reasoning for how you labeled the line segment.

b.  $X = (A - B) - C$

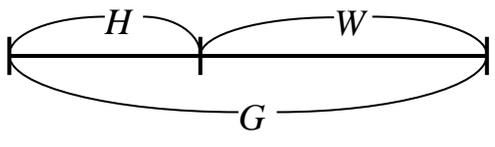

Explain your reasoning for how you labeled the line segment.

*Figure 1.* Tasks 1a and 1b from the Senior Interview Tasks assessment instrument

The second task (see Fig. 2) showed equations and a line segment indicating how quantities were related, and directed students to assess quantitative relationships based on these conditions. This report focuses on these first two problems.

a. What is  $\frac{W}{D}$  if  $\frac{H}{D} = y$  and  $\frac{G}{D} = r$ ?

b. How many *Es* are in *W* if  $\frac{D}{E} = t$ ?

*Figure 2.* Task 2a and 2b from the Senior Interview Tasks assessment instrument

## Results

Preliminary analysis of the data indicated recurring features in both Grade 5 and Grade 12 students' responses to the assessment tasks. We developed a classification, specific to each problem, based on written and audio responses. The following characteristics emerged as strategies the students used to respond to Problem 1a—

- a. considered the distributive property or other manipulation of the equation, and then address the line segment representation
- b. used the line segment as a number line by labeling points along the segment
- c. used the line segment as a quantity of length
- d. attended to the part-whole concept in subtraction
- e. used multiple representations to consistently model the mathematics

For Problem 2, several students responded by either leaving both subparts blank, writing a note to indicate their confusion and asking for clarification of the letters in the equation, or by making a guess that did not appear to have a sensible mathematical connection. Some students responded productively in the following ways—

- a. applied algebraic manipulation to the equation
- b. wrote an answer (without showing or writing about how the answer was found) and talk about their thinking

## **Discussion**

The interviews were conducted during the final semester of students' studies in a college-bound sequence of mathematics courses. Every Grade 12 student likely possessed the ability to solve an equation using fundamental algebraic manipulations however several responses indicated some struggle with consistent reasoning as students transferred an algebraic equation to a representation of the quantities on a line segment. This was evidenced by how the relationships among the quantities were depicted.

Although most of the same characteristics were evident in the students' work on Problem 1a, regardless of their grade level, in general, Grade 5 students' responses were executed with greater consistency with regards to the representations of the quantitative relationships. Further research is needed to explore how later mathematics instruction may be used to support the continued development of students' quantitative reasoning with regard to the structure of relationships in equations and in linear representations.

### **Abstract**

The roles of the professionals within the school building are ever adjusting to the new demands. The increase in ELL population, the introduction of Common Core, the decrease of funds and support personnel, among other issues, impact the roles of all professionals in the building. The leaders of each school are faced with a challenge in supporting their staff and educating their students within these challenges. Different models of leadership, i.e., collaborative, distributed etc. attempt to provide guidance on best practices in doing this. We postulate that the school counselor is an underutilized resource within the school. In presenting the Competencies of School Counselors, published by the American Counselor Association and the California Standards of Educational Administrators (CASELs) we display a clear parallel between the roles and expectations of these professionals in the building. The impetus behind this is to share with educational leaders the appropriate ways to use the school counselor. The effectiveness of this model is dependent on an appropriate collaborative relationship between the professionals in the building. Thus we will guide participants in understanding the basis of a collaborative relationship, and through scenario we will present evidence to support an the inclusion of the School Counselor in an expanded leadership team in order to assist the principal in meeting the vast requirements of the building and maximize the skills of professional school counselors within the building.

## Abstract

This panel session is designed to *first* present the components of the *Pathways to ACT Mastery Model* based on related research. *Second*, the presenters will share the results of instructional strategies, activities and resources that were used in the implementation of the model with secondary students. Additionally, the panel of presenters will outline how the *The Pathways to ACT Mastery Model* directly relates to the College Readiness Standards for English, Math, Reading and Science. The presenters will use highly interactive activities and resources that focus on the Common Core Standards and ACT's College and Career Readiness System. The team of presenters who include specialists in the ACT Prep areas of focus (Math, Science, Reading, and English), will demonstrate the use of selected resources and strategies that are outlined in their *ACT Prep Instructional Modules* that they developed.

These *Instructional Modules* guide the implementation of activities for the specific focus areas according to the description outlined in the reference, "Alignment of Common Core and ACT's College and Career Readiness System, June 2010" (<http://www.act.org/commoncore/pdf/common>). The other team members will present various activities that they have used to provide opportunities for the students to *apply and transfer* the content knowledge gained from the four content areas. Specific ACT test-taking strategies that have been used with the secondary students will also be presented. Additionally, results that demonstrate the impact of using the *Pathways to ACT Mastery Model* will be provided. Finally, student feedback and artifacts from the implementation process will be shared.

## **ABSTRACT**

This paper aims to explore how do presidents of Taiwan and America show their respective democratic values by figuring out the differences of inaugural addresses between Eastern and Western countries. Data were collected from presidential inaugural speeches in Taiwan and in America, that is, President Ma, Ying-Jeou's and President Barack Obama's inaugural speeches were analyzed in this paper.

Paul Gee's (2005) method of discourse analysis was used in this study to analyze the presidential inaugural speeches. Seven building tasks, i.e. significance, activities, identities, relationships, politics, connections, and sign systems and knowledge are the tools of inquiry used in analyzing and interpreting the data.

The results of the study are as follows. (1) President Ma and President Obama had different perspectives on maintaining foreign relations with other countries and core values of their countries respectively. (2) President Ma and President Obama showed their democratic values by paying attention to some general issues such as economy, constitutions, environmental protection, gaining mutual trust between the government and the people, and maintaining good relationships with foreign allies.

In conclusion, by analyzing and comparing the two nations' presidential inaugural addresses, the democratic values and ideologies of President Ma and President Obama can be better understood, thus leading to more understanding about the cultures and histories of the two countries.

## Data-Driven Instruction Cycle: A Model for Professional Development

### Motivation for project

School districts are rising to meet the challenge of implementing the Common Core State Standards for Mathematics (CCSSM). The efforts of one district in our area include increased attention to the interpretation of assessment data, both from large-scale and classroom-level assessment tools. We collaborated with the district to design a professional development program to support K-5 teachers in using such assessment data to guide their instruction in the context of CCSSM. Key elements in the motivation for the project include: (1) addressing a need identified by the district teachers, (2) ongoing activities throughout the academic year, and (3) attention to both the content and practice standards within CCSSM. These elements guided our design of the professional development model.

### Model

The prominent need identified by the district was an increase in teachers' ability to interpret and use results of assessments in their planning for instruction. We consider assessment and instruction inextricably linked, and summarize this interaction in the Data-Driven Instruction Cycle diagram presented in Figure 1. One can enter the cycle at any point; to match the design of the project, we begin with *Assessment* at the top center. We use this term broadly to refer to results of formative, summative, or district- and state-level assessment activities. Data may have been collected informally by a classroom teacher or as part of a more systematic assessment sequence. *Analyzing* these data focuses on trends across students or across grades and may generate questions to be answered. Through this analysis, specific *focus areas* can be identified, which then guide the *design and implementation of instruction*. The instructional plans include plans for further assessment, which begins a next iteration of the cycle.

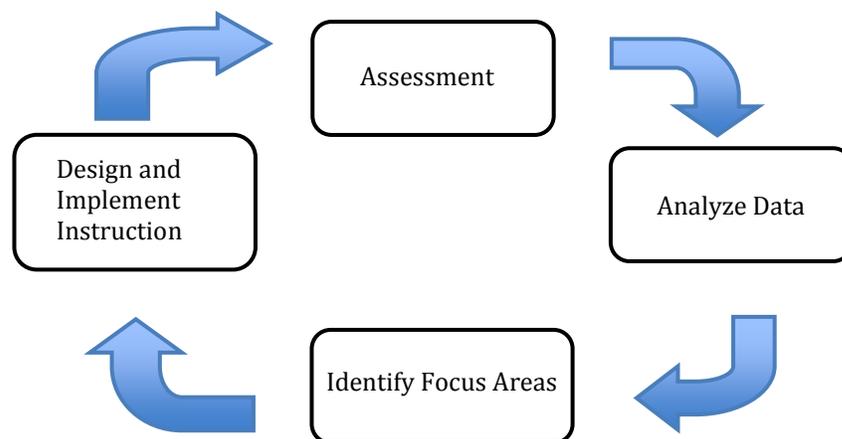

Figure 1: Data-Driven Instruction Cycle

Our design of the project attends to the five *critical areas* identified by Kanold and Larson (2012) as required for professional development in the context of CCSSM: collaboration, instruction, content, assessment, and intervention. *Collaboration* refers to building teams capable of supporting change across classrooms, and perhaps across schools. *Instruction* includes a shift to more fully incorporate both the practice and content standards. *Content* is a key area of focus, as specific grade-level objectives are revised to allow for deeper treatment of fewer concepts. *Assessment* focuses on conceptualizing assessment as a means within a teaching-assessing-learning cycle rather than as an end. Finally, *intervention* refers to developing responses appropriate both for when students *do* learn the intended curriculum and when they *do not*.

Specifically, the project aimed to develop an effective and replicable professional development model that prepares teachers to: (1) interpret assessment data to inform mathematics instruction, (2) create effective lesson plans that include regular use of formative assessments, and (3) develop effective instructional techniques aligned with the district concept map (revised to align with CCSSM).

### **Participants and Project Activities**

Our implementation goal was to support teachers as they interpreted results of district- and state-level assessments in order to plan prior to the 2012-13 academic year, and provide continuing support as they moved through the year. Teachers identified by the district as potential change agents were invited to participate. Seventeen teachers agreed to participate; Table 1 shows the grade level and school assignment for the teachers. In addition, six district math coaches participated in project activities.

\*The fourth teacher at School 1 taught a 4<sup>th</sup>/5<sup>th</sup> combination class.

Workshops. The teachers and coaches participated in four group sessions across the 2012-13 academic year: a 5-day summer workshop August 2012 (30 hours), one-day workshops in October 2012 (6 hours) and February 2013 (6 hours), and a 2-day workshop June 2013 (10 hours). The sessions encouraged active participation and coordination across schools and grade levels. A brief description of the focus of each workshop is given below.

The August 2012 workshop introduced the Data-Driven Instruction Cycle and focused on interpretation of district- and state-level assessments. Participants were provided with assessment data on their previous year's students and district personnel facilitated an analysis discussion. As a group, themes and implications were identified and aligned with district curricular objectives. The workshop introduced the participants to Smith and Stein's (2011) *5 Practices for Orchestrating Productive Mathematics Discussions*, a professional development resource aimed at supporting teachers as they facilitate mathematics discussions in their classrooms. Participants engaged in a mathematical task and discussion facilitated by project team members. Group reflection focused on instructional decisions made by the team member within the discussion. Participants worked in grade-level groups to identify specific instructional goals as indicated by the assessment data analysis and to create tasks to address these goals. Goals and tasks were then shared and coordination across grade levels discussed. The National Council of Teachers of Mathematics *Essential Understanding* series was provided to the teachers as a content resource.

The October 2012 and February 2013 one-day workshops were designed to delve deeper into specific content in terms of both the district curriculum objectives and CCSSM. This district at the time was in the process of realigning their curriculum objectives with CCSSM; there was much agreement between the district and CCSSM, but assessments and grade-level objectives were being revised. The October workshop focused on algebraic concepts and specifically on recognizing algebraic properties within elementary work on number and operations. This content focus matched the district's curriculum guide, so that teachers were planning lessons primarily focused on number and operations during the fall. Sample student work from the district was provided and examined to assess the level of algebraic thinking evidenced. The February 2013 workshop was similar in design and focused on geometric concepts to again match the district curriculum guide. Both workshops engaged participants in examining CCSSM for specific standards and progressions across grade levels; that is, a particular focus of the participants' work was to identify vertical alignments within CCSSM and attend to instructional goals that support students' development along such progressions.

Learning Mathematics for Teaching (LMT) Assessment: The LMT instrument (Hill, Schilling, & Ball, 2004) focuses on the group of teachers and so allows for evaluation of the design of the professional development intervention. The August 13 2012 pre-assessment established a baseline measure for these teachers in Number and Operations, Algebra, and Geometry. The August 17 2012 post-assessment indicates overall change in scores in Number and Operation and Algebra. The February 8 2013

post-assessment indicates changes in scores in Geometry. The June 2013 assessment covered all three areas and allows for analysis of change over time.

Case Studies: Case studies were selected in terms of willingness to participate, schedules, schools, and grade levels. The four teachers from School 1 and a 1<sup>st</sup> grade teacher from School 5 were selected as case studies. Observation cycles included a pre-interview, class observation, and post-interview. A total of twelve observation cycles were conducted across the five case studies. The pre-interviews focused on the teacher's planning for the lesson, to include any use of assessment data and references to the *5 Practices* (Smith & Stein, 2011). Post-interviews focused on decisions made during the implementation of the lesson and any formative assessment information the teacher used to guide those decisions.

The case study data can be viewed as a small-scale version of the larger professional development model, in that each observation cycle was an opportunity to enact the Data-Driven Instruction process. Our analysis of the case study data is ongoing; we begin with a class observation video to identify possible on-the-spot decisions made by the teacher based on student responses. Interview data can then be analyzed in terms of the teacher's reflections on these choices.

Additional Interventions: The project team was also established as a resource for all participants. The district coaches were involved in planning for the workshops. Non-case study teachers were encouraged to invite team members to visit classrooms; such visits may have included observations or model teaching. For example, a team member presented teaching demonstrations in geometry in teachers' classrooms to address perceived needs in this area. In addition, the project team sent out regular "pulse checks" to encourage teachers to consult assessment data in the course of planning for instruction.

### **Preliminary Results**

Teachers' scores on the LMT increased from pre- to post-assessment in all areas, although only the change in Geometry was statistically significant. These results are not surprising, as we can expect K-5 teachers to have extensive knowledge of Number and Operations, and so have less room for increase in this area. It is not surprising that Geometry is an area with the greatest potential for growth for elementary teachers.

The design of the professional development model included an early emphasis (August 2012 workshop) on Number and Operations, a focus on Algebra in the first intermediate workshop (October 2012) and a later focus on Geometry (February 2013). This sequence aligns with the district curriculum, in that more algebraic and geometric concepts are planned for later in the academic year. Teachers were supported across the academic year as they analyzed assessment data in all three areas and integrated their analyses into instruction.

Our preliminary conclusion is that project activities can have a positive effect on teachers' mathematical knowledge for teaching as measured by the LMT assessment instrument. Coordination of content and pedagogy within project activities, aligned with the district curricular calendar, can maximize the effect on classroom instruction.

A major objective of the project was to develop teachers' ability to interpret and use assessment data as part of their instructional planning. We have evidence from the case study data that teachers are able to articulate their interpretations of assessment data and how these interpretations guided their instructional choices. Teachers typically made statements similar to "They have a very good understanding of addition . . ." or "They weren't real strong in their fraction knowledge." Such statements may have been supported with specific evidence from district assessment sources, such as: "The 4<sup>th</sup> graders have come in with a lot of information on the basics of multiplication." Statements such as this last example were connected to how having that information from district assessments guided planning for current lessons.

A second theme within the interview data relates to instructional practices. The August 2012 workshop introduced the *5 Practices* framework (Smith & Stein, 2011) for planning for mathematical discussions. Teachers were able to articulate how these practices framed their planning for a lesson as well as how the framework supported their formative assessment observations within the lesson. For example, one teacher shared how she had anticipated what her students might do with a particular task; within the lesson, she observed variations of what she had anticipated, and was able to articulate how these observations changed her plans for the remainder of the lesson. We hypothesize that the *5 Practices* supported her not only in her instruction, but may also have provided her with language to articulate how she was able to integrate assessment and instruction.

Our preliminary conclusion is that the planning framework can support teachers' implementation of instructional strategies that have potential to develop mathematical practices within the Common Core Standards. Explicit support of teachers' use of the framework can contribute to the integration of assessment data and instructional planning. This preliminary conclusion is supported by the positive reaction to the teaching demonstrations in non-case study classrooms; teachers felt empowered to replicate the approach to teaching modeled by the team member.

### **Discussion/Invitation for feedback**

We view this as a work-in-progress in terms of designing a replicable professional development model. We are encouraged by the preliminary results, yet acknowledge that these participants were carefully selected and thus represent a unique group of potential change agents in their respective schools. Adjustments to the model will be needed to address a larger audience. Our initial findings support other work related to professional development; for example, Blank, et. al. (2007) found that effective programs engage teachers in specific pedagogical practices and specific content. Our use of the *5 Practices* and *Essential Understandings* series provided means by which teachers could articulate challenges and choices within their work. Further, Reeves (2010) advocates focusing on student learning and reflection on decisions made within collaborative teams. Our focus on interpretation of district assessment data allowed teachers to design instruction to best meet the needs of individual students.

**Title:** *Academic content combined with English in secondary schools: Bolstering urban teachers' knowledge and skills for the instruction of English Learners*

**Author:** Anthony J. Trifiro, Ph.D.

**Affiliation:** Arizona State University

**Address:** Department of English, TELAC Program MC 0302, P.O. Box 870302, Tempe, AZ 85287-0302

**Email:** [anthony.trifiro@asu.edu](mailto:anthony.trifiro@asu.edu)

**Format:** Paper Session (Paper 2): **Preparing Teachers for Multicultural Classrooms: OELA/NPD Grantees**

### Abstract:

Academic Content Combined with English in Secondary Schools (ACCESS), funded by OELA/NPD/U.S. Department of Education, provides secondary mainstream teachers of English learners (ELs) a cohort based professional development program. ACCESS, as a university-school district program supports mainstream teachers requiring additional professional development through graduate courses tailored to meet the district needs. Participants completing the full program met the Arizona Department of Education course requirements for full ESL endorsement. The program provides a robust professional development that is coherent to the needs of the district and secondary teachers instructing in an urban school district.

Recent changes in Arizona state mandated policies includes the implementation of Sheltered English Immersion (SEI) as statutory mandate (A.R.S § 15-756.01) for all teachers as well as that all instruction in Arizona schools is in English, Prop 203. The Arizona context of restricted language policy and governance over teacher preparation for ELs has impacted teacher preparation for ELs and SEI (Arias, 2012). ACCESS's professional development model includes preparation that develops cultural and linguistic awareness, instructional knowledge (Lucas, Villegas & Freedson-Gonzales, 2008; Tellez-Waxman, 2006; Walqui, 2008) and opportunities to reflect on the situational context of ELs in Arizona as means to develop affirming dispositions ( McAllister & Irvine, 2002; Villegas & Lucas, 2002; Walker, Shafer & Liams, 2004). The ACCESS program utilizes the following research: Cochran-Smith & Lytle, 1999; Echevarria, Vogt, & Short, 2009; Garet, Porter, Desimone, Birman & Yoon, 2001; Faltis & Coulter, 2008.

The research informed ACCESS's curricular and programmatic aspects for developing secondary mainstream teacher's knowledge and skills. The curricular framework focused heavily in developing teachers' understanding of second language acquisition (Lucas, Villegas & Freedson-Gonzales, 2008) and parents and community (Villegas & Lucas, 2002). Through individual and collaborative assignments participants built a greater understanding of assessments, biliteracy and the practical application of scaffolding as part of lesson modification (Walqui, 2008). From 2008 through 2012, 99 teachers completed extensive professional development of ESL coursework from

12 urban schools. Approximately 83% percent completed the entire 18 credit program. Of those who completed the entire program, over 50% entered into a graduate Masters program in Curriculum and Instruction. Participants represent a wide variety of curricular content areas of instruction, however the majority of teachers in the program instruct English (n=27), math (n=22), social studies (n=14) and science (n=10). While yearly cohorts ranged from 15 to 24 teachers with varying levels of teaching experience, more than half of the program's participants had from one to five years of teaching experience.

The ACCESS program evaluation utilizes qualitative and quantitative data including pre and post surveys, an in-depth post participation survey with emphasis on knowledge, skills and practice of previous cohorts 2008 through 2011, interviews of teachers and administrators, and teacher observations using a SIOP protocol (Echevarria, Vogt & Short, 2009).

For the overall program evaluation, participants completed a pre-assessment at the program's orientation and a post-assessment at the last class meeting. In comparing pre and post data that asks participants to provide an overall proficiency level on various dimensions related to the instruction of English learners, the data reveal that overall participants perceive their understanding and skill level to be higher post professional development in most areas. This also corresponds to the in-depth of study of four cohorts completed in 2011. In review of participants' responses to open-ended questions, it is noteworthy that teachers post-training utilize course language and provide a rationale for implementing a particular strategy or for allowing students to use their first language in class. Interviews with participants indicate that teachers are more cognizant of EL instructional needs, role of pacing, and language levels in addition to other instructional strategies. The in-depth study completed in 2011, indicates that teachers post professional development understanding of what is important to know about teaching ELs includes an increased awareness of the socio-political tensions surrounding instructing ELs from the student/parent/school perspective.

The data which was triangulated from a number of sources, indicate an overall understanding of the importance of EL students' language and culture, the need for scaffolding and the importance of advocacy for EL students. The grant's result is significant for both teacher professional development and university partnership programs focused on teacher development and for districts seeking to ameliorate instruction for ELs in order to improve academic success.

## TL3C as An Innovative Approach to STEM Education and Supporting Teachers in 21<sup>st</sup> Century Classrooms

### Abstract:

Mesa Community College's Mission states "MCC excels in teaching, learning, and empowering individuals to succeed in our local and global community." The Teachers of Language Learners Learning Community (TL<sup>3</sup>C) Project is designed to directly support this mission by focusing on teaching and learning that empowers current and preservice teachers and paraprofessionals to support a community need. At the national level, between 1979 and 2008, the percentage of school-aged English language learners (ELLs) has increased from 9 to 21 percent of the population in this age range (The Condition of Education, 2010). Locally, K-12 schools work with students from 66 countries speaking 50 different languages at varying proficiency levels.

The TL<sup>3</sup>C Project has partnered with existing school districts that represent this diversity and are focused on both language development and the acquisition of content-specific knowledge. While linguistic diversity provides rich opportunities for language learning, it also presents a need for highly qualified teachers and programs that ensure that all students are provided with an equitable education. In an effort to support this community need, the TL<sup>3</sup>C has two goals:

1. Increase the pool of effective teachers of language learners (TLLs).
2. Improve instruction and support TLLs in various programs at local Title I schools.

We propose to share the progress we have made in addressing goal 2, specifically in regard to STEM education. By providing STEM training by professors, highly qualified teachers, and leaders in the teaching community through the Arizona Geographic Alliance (AzGA), we are providing support to teachers working with CLD students. The AzGA is a network of professors, teachers and community partners highly experienced and knowledgeable in training teachers to effectively teach core-content aligned to state and national standards through curriculum integration (i.e. GeoMath, <http://alliance.la.asu.edu/geomath/general.html>). These trainings support teaching content using current best teaching practices and strategies for language learners. The outcome is professional development for inservice teachers by top Arizona educators in teaching best-practices while utilizing STEM lessons aligned to English Language Proficiency Standards and the newly adopted Common Core State Standards (CCSS).

To date, fifteen lessons have been created. All TL3C lessons are teacher-created and teacher-tested. Each lesson contains a lesson plan, adaptations for English learners, handouts, answer keys and resources for teachers. We propose a hands-on workshop in which we would walk participants through three lessons in a hands-on, engaging, and interactive format. Participants would leave with access to TL3C lesson materials.

Lights! Camera! Thermo! – Student-developed video for learning in engineering thermodynamics

#### Abstract

Current college students are accustomed to documenting and sharing their experiences through text, photo, and video, thanks to the ready availability of all of these through personal portable devices. The democratization of video production and access has led to the possibility to both teach and learn with video as never before. This work seeks to capitalize on student expectations and the current technological environment to bring the benefits of both teaching and learning with video into core technical undergraduate engineering courses. Specifically, in this work we ask student teams to create short, targeted, easy to understand videos about concepts in thermodynamics, and then invite them to watch the faculty-vetted library of videos developed by their peers at their own and two collaborating institutions. We are studying changes in students' conceptual learning as a result of participation in this program, and are building a repository of accurate, engaging, videos for thermodynamics learning that will ultimately be shared with other instructors and the public.

Title:

Scholarly Encyclopedias: The Missing Link in student research processes?

Authors:

Abstract:

For students, the most difficult part of doing research papers is the start: narrowing topics, understanding context and developing vocabulary - exactly where scholarly subject encyclopaedias can help. Results from a recent survey at our institution showed that teaching faculty undervalue encyclopedias; a follow-up workshop built awareness and appreciation of these rich resources. We explore the benefits of scholarly subject encyclopedias and how to integrate them into academics' teaching resources and students' research practices.

A recent comprehensive study on student research habits has shown that students find the start of the research process most troublesome (Head and Eisenberg, 2009). Without the background knowledge possessed by their instructors, deciding on and narrowing a topic is difficult, and even finding good keywords to search with is problematic as students encounter new topic areas each with its own particular jargon. Often they resort to the tools they know best, Google and by extension Wikipedia which in general provide results that will not satisfy university or even high school teachers. Separate studies indicate that faculty are often less than complimentary about students' abilities to find, read and use information to complete assignments (Blau, 2012; Bury, 2010; Gullikson, 2006; Hrycaj & Russo, 2007; McAdoo, 2008; Raven, 2012; Saunders, 2012; Webber, Boon, & Johnston, 2005).

This gap between the sources and information students find and use, and what faculty wish they would use is the subject of a number of projects at our institution and elsewhere (Avdic & Eklund, 2010; Becker, 2009; DaCosta, 2010; Griffiths & Brophy, 2005, Purdy, 2012) Faculty would like students to use scholarly articles and monographs, which students find difficult to understand, particularly in their first year in a discipline (French, 2005; Joliffe & Harl, 2008; Manarin, 2012). When students arrive in the library struggling with a research question, librarians often suggest scholarly encyclopedias a starting point. At our institution, these suggestions are often met with some variation of "My prof told me we can't use encyclopedias". Given that libraries are still acquiring scholarly, subject encyclopedias in significant numbers (East, 2010; Korah, Cassidy, Elmore & Jerabek, 2009), this prohibition requires some exploration to unpack the divide between sources librarians know will help students and what faculty allow students to use.

Faculty, as experts, rarely need to consult subject encyclopedias in their own disciplines, having mastered the threshold concepts and vocabulary long ago, and having developed an understanding of what, and often more to the point who, is important in their disciplines (Matteson, 2012). Having been immersed in a discipline, they may not remember what it's like to not know the terms and themes, and therefore may not realize the value of subject encyclopedias for novices. As well, they may conflate all encyclopedias with the World Book, or Wikipedia, and consider them inadequate resources for postsecondary students. However scholarly subject encyclopedias function as the very "facilitative intermediaries" (Dove & Becker, 2012, p.169) students need most to gain an understanding of information in a new discipline.

Scholarly subject encyclopedias serve as entry points to a discipline. They provide generally brief entries on key aspects, people, milestones, theories and issues, usually written by experts in the field. These entries are designed as introductions with the particular audience of those new to a discipline in mind, and this is reflected in the language with definitions provided for unfamiliar terms and in the level of depth provided. As well, the entries generally have a structure that is more familiar and more accessible to students than journal articles. In most encyclopedias the entries include references to key sources, and links to other useful entries to allow for targeted browsing within a subject. These links have been greatly improved with the advent of electronic reference tools and not only work within encyclopedias but among different titles by the same publisher (Dove & Becker, 2012). While most are available online with a subscription, there are also a few freely available examples such as the Stanford Encyclopedia of Philosophy. Despite these characteristics of both cognitive and technical accessibility, the potential of scholarly subject encyclopedias to serve as gateways to disciplinary knowledge is not widely recognized by teaching faculty.

This lack of understanding can be seen in a recent survey of faculty at our institution that indicated faculty did not value subject encyclopedias very highly. The same survey indicated general dissatisfaction with student research skills, particularly in first year. This dissatisfaction extended to students' ability to read scholarly articles, the resource most faculty rated most important for students to use. Subject encyclopedias might well serve as the bridge between students and the scholarly conversations evident in peer-reviewed articles. Indeed, faculty who attended a workshop on the survey results saw the potential for these resources when a select few were demonstrated.

Seeing the challenge of reconciling faculty expectations with student needs as chiefly one of raising awareness, librarians at our institution are implementing a multi-pronged campaign. In the Fall of 2013 we will be delivering workshops to faculty, to introduce them to resources in their subject areas, and providing easy links for inclusion in course websites. We will also be asking faculty to help provide annotations for these subject encyclopedias as a way of familiarizing them with the content of the resources, and encouraging students to access them.

In addition, in the research classes we teach students, which are integrated into the curriculum, subject encyclopedias will be highlighted as appropriate sources with explicit instruction around what parts of the research process they can help with. This will be complemented by a new discovery system on our webpage which will make the content within online encyclopedias easier to access. We anticipate that

growing awareness of the information in these sources may lead to increased use and perhaps new ways of incorporating and using content from the sources to support teaching.

## Virtual Clinical Practice: An ESL Virtual Classroom

The recent report from American Association of Colleges for Teacher Education's (AACTE) Professional Education Data System (PEDS) (2013), reminded us that in all teacher preparation programs in four year universities, clinical practice is a critical part of those programs. It is important to note that not only are teacher candidates expected to complete a student teaching experience at the conclusion of their program of study, but in addition, they are required to engage in a substantial amount of field experience when they are enrolled in their methodology courses. Additionally, the report indicated that there is an abundance amount of technology that is embedded throughout each of programs.

Many of our online pre-service teacher candidates who are required to complete two English as a Second Language (ESL) methods courses, struggle to find quality English language development or ESL classrooms that are taught by highly qualified and effective ESL teachers. Rural areas may be homogenous and they may lack language minority groups or even teachers who are knowledgeable about ESL research-based best practices. To alleviate this problem, one of the College's administrators collaborated with one of the college's full time online faculty members as well as the university's academic web services to develop a virtual ESL Classroom. The Virtual ESL Classroom consists of an avatar ESL teacher in action. She is replicating a Sheltered Instructional Observation Protocol (SIOP) lesson plan in which she is teaching the students how to extract iron from everyday cereal. She gives direct instruction on magnets and extraction; provides engagement opportunities for students to interact with one another in their group setting, and she interacts with the virtual students. An accompanying video window shows a real teacher that narrates and comments on the lesson. This virtual site provides our learners with an equitable experience. They witness the same instructor that is employing effective and research based best practices with a diverse group of students.

The 10 minute video will be shown to the participants followed by a discussion on the possibilities of varied applications of the Virtual ESL Classroom, including a simulated real-world experience and possible asynchronous discussions.

# **An Overview of IntelliMetric and Applications of Automated Essay Scoring to Writing Instruction and Chinese Language Content**

## **Introduction**

Automated Essay Scoring (AES) engines have demonstrated the capability to accurately score written essay and short response content with quality at least parallel to human scorers, delivered more rapidly and typically at significantly reduced cost. Shermis and Burstein (2003) summarized the various AES engines in use at the time. Shermis and Burstein (2013) have similarly summarize the current status of AES engines from a contemporary perspective.

AES engines emulate the processes carried out by human scorers in writing assessment. AES engines seek to identify features of scored essays that are associated with high rater assigned scores, developing models that emulate the results of the scoring process used by human raters. AES systems are "trained" with a set of previously scored responses drawn from expert raters or scorers. These papers are used as a basis for the AES engine to "learn" the rubric and infer the pooled judgments of the human scorers. The AES engine internalizes the characteristics or features of the responses associated with each score point and applies this intelligence to score essays with unknown scores.

AES engine utilize the same holistic scoring approach commonly employed by human raters to evaluate large-scale writing assessments. At a high level, the holistic score of a response represents the overall impression that it makes on a reader. The score provided by this reader (rater) is typically based on a formal scoring rubric, which focuses on the discourse elements, content, organization, word use, and grammar/mechanics of the response as a whole. To

become proficient and reliable in scoring responses to a given prompt, expert raters are provided anchor papers specific to the prompt, are given scores to those papers, and are taught why each paper should receive a certain score. The human raters are given additional scored papers for training and are ultimately asked to score some papers on their own. If the human scoring is acceptable with regards to a set standard of agreement with other raters, the human rater is then allowed to score new essays for that particular prompt.

Much like human scorers who are generally trained to score a specific prompt, AES engines create a unique solution for each prompt. This process leads to higher levels of agreement between the scores assigned by AES engines and those assigned by human scorers.

### **Overview of the Scoring Process**

AES engines typically use a multi-stage process to evaluate responses. First, the scoring engine is exposed to a subset of responses with known scores from which it derives knowledge of the scoring scale and the characteristics associated with each score point. Second, the model reflecting the knowledge derived is tested against a smaller set of responses with known scores to cross-validate the model. Third, after making sure that the model is scoring as expected, the model is applied to score novel responses with unknown scores. Responses that appear off topic, are too short to score reliably, do not conform to the expectations for edited American English or are otherwise "unusual" are identified as part of the process.

## **Applying AES to Improving Student Writing**

### **INTRODUCTION**

Over the years and decades, administrators and teachers alike have contended that students learn to write proficiently through practice. Numerous writing curricula have been designed around this principle, backed by substantial amounts of public and private funding to ensure implementation. However, is this basic principle actually true? Is this core belief true for all students, regardless of age, gender, or ethnicity? What is the best, most efficient and optimal way to improve writing?

Finally, if students practice writing often, does it actually improve their writing skills?

A significant amount of time and effort have gone into researching this principle, documenting writing programs and concrete evidence to either support or negate it. While the answer to each of these questions may not be a resounding, unequivocal answer of "yes", research and analysis has identified a number of examples which support this principle.

### **CURRENT RESEARCH**

While there may be some disagreement amongst researchers and educators on the best strategies and techniques to improve writing ability, existing researchers agree that two of the factors that will improve writing ability are:

- 1) increasing the amount of writing that students do
- 2) receiving timely and appropriate feedback on this writing.

### **Practice**

Students learn to write by writing. Studies have shown that the amount of writing that students do is positively related to writing ability (Chircop, 2005; Coe et al., 1999; Boersma, Dye, Hartmann, Herbert, & Walsh, 1997; Cotton, 1988). Writing-intensive programs that require multiple drafts and a high volume of written work, such as those using writing portfolios or software to leverage success in writing, have been particularly effective in increasing writing aptitude across a wide range of students of varying abilities (Chircop, 2005; Boersma et al., 1997). These programs have also proven to be effective regardless of gender, ethnicity, or English language proficiency (Han, 2009).

Writing effectively in a variety of modes is a skill that every student must possess. However, in many schools, the amount of writing instruction provided to students is lacking. According to an NAEP report, many students are spending a negligible amount of time completing writing assignments. The National Commission on Writing advocates doubling the amount of time students spend writing, with writing skills being taught at all grade levels and across all subject areas (2003). Researchers agree that students

must be given daily opportunities to write in order to become proficient writers (Boersma et al., 1997).

### **Effective and Timely Feedback**

Timely feedback received in response to student writing is also essential in increasing writing ability. Studies have indicated that when feedback is received often, and in the early stages of writing, it is more likely to be judged by the student as valuable. This feedback then has a positive effect on the quality of the writing (Cowie, 1995). Feedback that is given later in the writing process, or after the final draft has been submitted, is often not followed in future drafts and writings (Cowie, 1995). The use of peer editing and evaluation in providing immediate feedback has also been shown to be beneficial in creating high-quality writing. When such procedures are used, students receive punctual, clear feedback, helping them correct errors (Cotton, 1988). Timely and appropriate feedback is vital in increasing student writing ability.

### **Assisting Writing Instruction using Automated Essay Scoring (AES) Technology**

For nearly fifty years, researchers have attempted to utilize developing technology to independently rate a piece of writing. Since the mid 1960's, experimenters have used modeling techniques, regression, and statistical analysis to quantify and identify the features of writing. Overall, experimentation has had varying amounts of success in evaluating the quality of a piece of writing independent of a human rater. Over the years, a multitude of tools have been devised by assessment companies to accomplish this feat.

Developed by Vantage Learning in 1998, IntelliMetric® is an automated essay scoring tool that uses Artificial Intelligence and Natural Language Processing to score writing on a pre-established scale or rubric. It has been used successfully to score open-ended essay-type assessments across a variety of topics and genres, providing detailed, descriptive feedback to users in a matter of seconds.

In order to establish the standards and features of "good writing", IntelliMetric® is "trained" with a set of

previously scored responses containing "known score" marker papers for each score point. These papers are used as a basis for the system to infer the rubric and the pooled judgments of the human scorers. Relying on Vantage Learning's proprietary CogniSearch™ and Quantum Reasoning™ Technologies, the IntelliMetric® system internalizes the characteristics of the responses associated with each score point and applies this intelligence in subsequent scoring. It is essentially a learning engine that internalizes the characteristics of the score scale through an iterative learning process. In essence, IntelliMetric® internalizes the pooled wisdom of many expert scorers.

IntelliMetric® is trained to score essays much the same way as expert human raters are trained. Experts are provided anchor papers specific to the prompt, are given scores to those papers, and are taught why each paper should receive a certain score. The human raters are given additional scored papers for training and are ultimately asked to score some papers on their own. If the human scoring is acceptable with regards to the standard, the human rater is then allowed to score new essays for that particular prompt. Similarly, IntelliMetric® is trained using a set of essays which have already been scored. This training allows the scoring engine to recognize what discourse elements of an essay written to a specific prompt are desirable. The IntelliMetric® engine learns what it means to be an essay earning each score point on the rubric. As a result of this training, a prompt-specific model is created. This model can be used to score an infinite number of additional essays submitted to that prompt. Every IntelliMetric® model must go through this rigorous process, starting with expert human scoring, training, and validation. If the new model meets the criteria of acceptable performance data (measured in terms of score agreement with experts), the model is available for use to provide immediate scoring.

## **RESEARCH METHODOLOGY**

The purpose of this research was to determine if the frequency of writing, coupled with the immediate feedback offered by the writing program utilized, resulted in an improvement in writing quality. In order to determine an improvement in writing quality, the total score improvement, from first submission to final submission to the same writing task (or prompt) was used. Users were permitted to submit their responses an unlimited number of

times. The total improvement per prompt indicates the difference between the average scores of the first and final submissions. To determine overall writing ability improvement over time, the difference in the average score of responses submitted at the inception of the program compared with the average score of responses submitted at the end of the school calendar year was calculated.

### **Data Collection**

The data was collected through student usage of a writing platform scored using IntelliMetric. From January 2011 through May 2011, over 800 students submitted nearly 7,000 written submissions across the thirteen unique writing prompts.

Each response was evaluated on a 6-point scale, developed from a pre-established scoring rubric. In addition to a Holistic Score, each response was evaluated on five domains:

**Focus & Meaning (Focus):** The extent to which the response establishes and maintains a controlling idea (or central idea), an understanding of purpose and audience, and completion of the task.

**Content Development (Content):** The extent to which the response develops ideas fully and artfully using extensive, specific, accurate, and relevant details. (facts, examples, anecdotes, details, opinions, statistics, reasons, and/or explanations)

**Organization:** The extent to which the response demonstrates a unified structure, direction, and unity, paragraphing and transitional devices.

**Language Use, Voice & Style (Language):** The extent the response demonstrates control of conventions, including paragraphing, grammar, punctuation, and spelling.

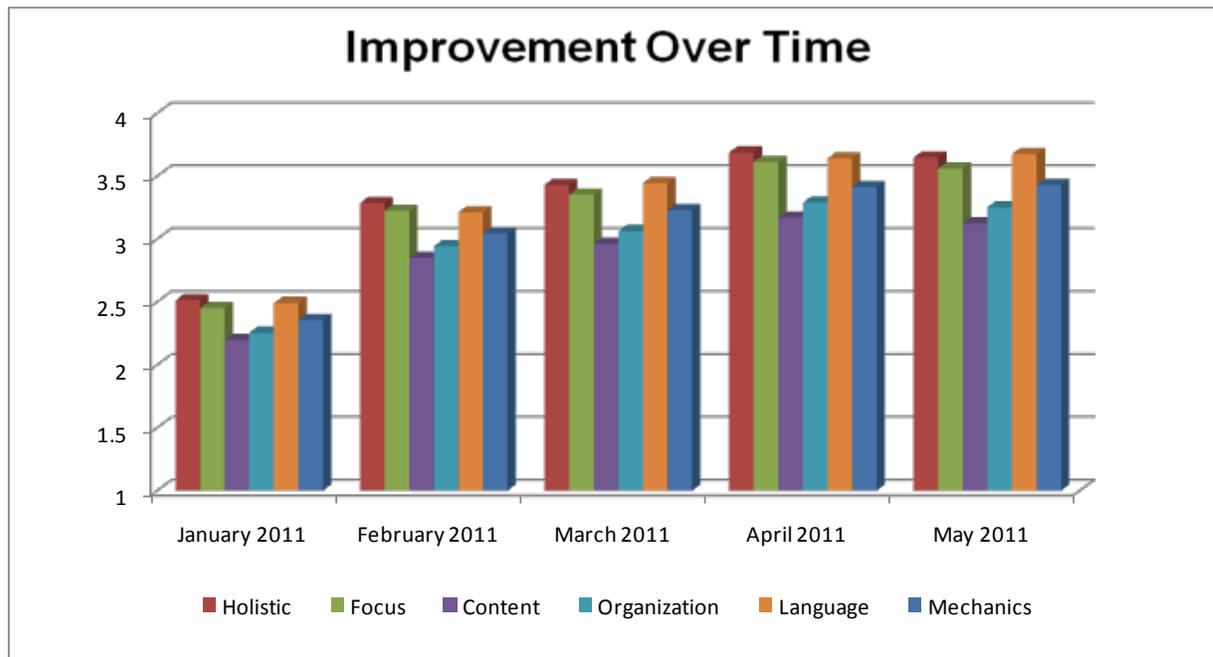

**Mechanics & Conventions (Conventions):** The extent to which response demonstrates an awareness of audience and purpose through effective sentence structure, sentence variety, and word choice that creates tone and voice.

## **RESULTS**

### **Writing improvement over time**

The writing program utilized for this research study required users to submit responses throughout the semester as part of their course study . Nearly all students using the program at the beginning of the time period continued to use the program until the end of the semester. The improvement in writing score over the length of the program is displayed in Table 1 below. Improvement in writing score is based upon the average score of all responses submitted during the time period. All responses were scored by IntelliMetric® on a 6-point scale. The holistic score, plus its corresponding five domain scores, are shown in the table.

**Table 1. Improvement over time (average submission score across all users)**

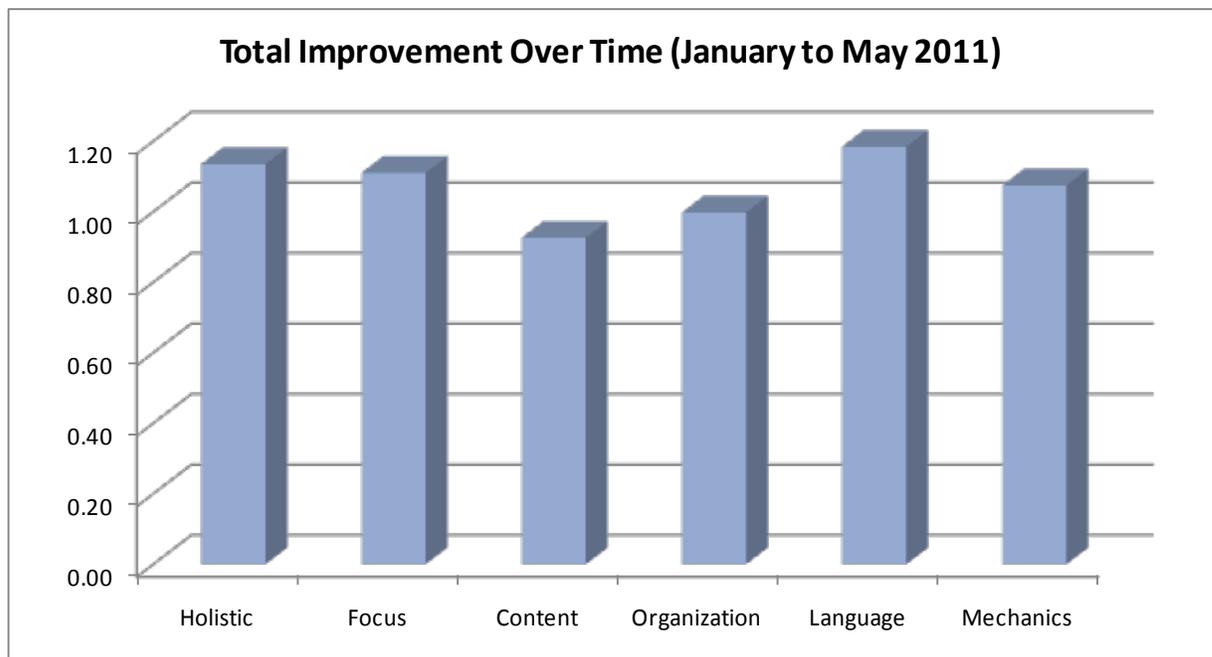

Overall, the table shows that the holistic score and every domain score increased over time. The greatest improvement in scores occurred after the first month of the program (from January 2011 to February 2011), with additional improvement noted over the next few months. The improvement in scores leveled off in May 2011, but increased slightly for the "Language Use, Voice, and Style" domain.

The total score improvement, after five months of usage of the writing program, is shown in Table 2. To determine the following calculations, the average score of the writing

submissions in January 2011 for each of the scores (holistic plus five domains) was subtracted from the average score of the writing submissions in May 2011. All responses were scored by IntelliMetric® on a 6-point scale. The holistic score, plus the corresponding five domain scores for a given writing submission, are shown in the table.

**Table 2. Total improvement in writing submission score**

Total score improvement over five months time ranged from 0.93 points on the "Content" domain to 1.18 points on the "Language Use, Voice, and Style" domain. This score improvement represents an increase of 42% to 48% in score on a 6-point scale.

**Writing improvement (First Submission versus Final Submission)**

For each of the prompts utilized in the writing program, in order to determine individual student writing improvement, the paired scores of each student, based on their first submission and final submission scores to the same writing task (or prompt) was used. The total improvement for each

prompt indicates the difference between the average scores of the first and final submissions. Users were permitted to submit their responses an unlimited number of times. While the majority of students submitted two or three revisions, some students submitted as many as five to ten or more revisions.

The writing improvement for students, across each prompt, is shown in Table 3. The average writing improvement across all prompts is shown as the final row of data.

**Table 3. Writing improvement, by prompt.**

<b>Writing Prompt</b>	<b>First Submission Score</b>	<b>Final Submission Score</b>	<b>Difference in scores</b>	<b>Percentage Increase</b>
Conflict	3.61	4.37	0.76	20.94%
Crisis at Canoe	2.89	3.12	0.23	8.04%
Customer Complaint	2.95	3.66	0.71	23.96%
Customer Concern	3.29	3.80	0.51	15.53%
Leadership & Followership	3.48	3.76	0.28	8.03%
Letter of Interest	3.77	4.06	0.29	7.75%
Motivation	3.43	3.91	0.48	14.02%
Organizational Change	3.51	3.85	0.34	9.66%
Performance Evaluation	3.51	4.07	0.56	16.06%
Personality	3.39	3.90	0.50	14.86%
Restaurant Mishap	3.28	4.04	0.76	23.15%
Saving Money at the Office	3.69	3.88	0.18	4.95%
Who Done It?	3.04	4.02	0.98	32.19%
<b>Average of all prompts</b>	<b>3.37</b>	<b>3.88</b>	<b>0.51</b>	<b>15.13%</b>

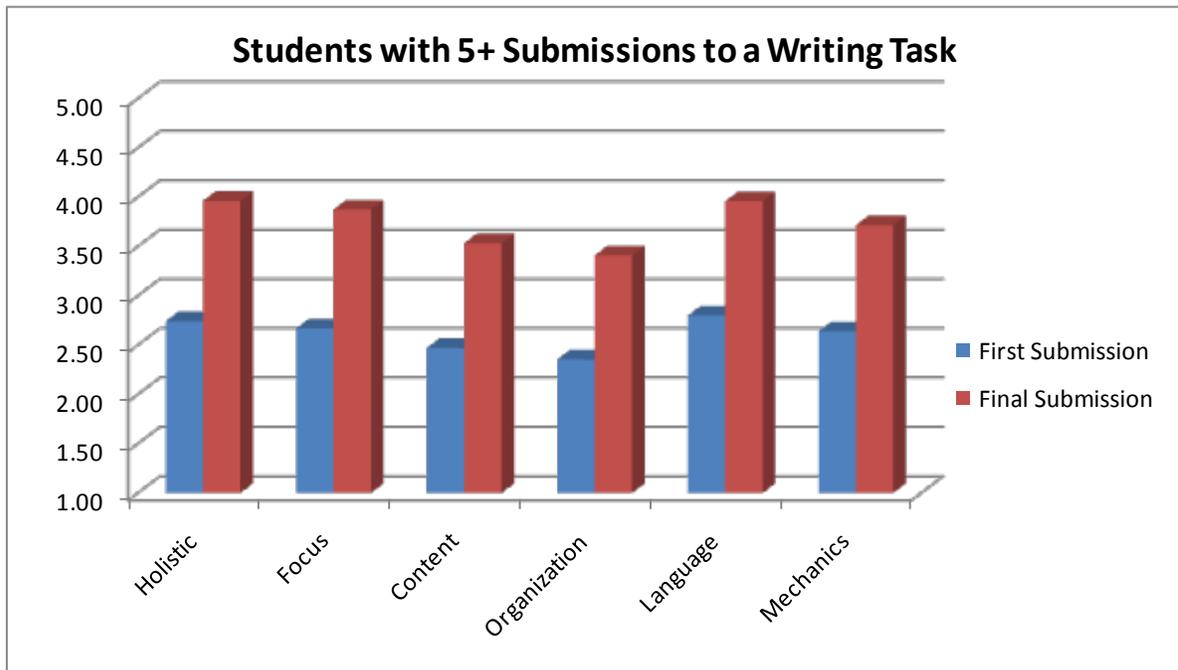

Score improvement was noted for every one of the thirteen prompts, ranging from a 4.95% increase in score (on a 6-point scale) for the writing task "Saving Money at the Office" to a 32.19% increase in score on the writing task "Who Done It?".

**Writing improvement for students submitting multiple submissions**

Some students utilized the writing program to a much greater extent than others. While many students may have only submitted two draft responses to a given writing task, some students submitted many additional responses. A

meaningful percentage of students submitted as many as ten or more revised submissions to the same writing task. The writing improvement for all students who submitted five or more responses to a specific writing task is shown in Table 4. To calculate the overall improvement in writing quality, the paired scores of each student, based on their first submission and final submission scores to the same writing task (or prompt) was used. The total improvement for each prompt indicates the difference between the average scores of the first and final submissions.

**Table 4. Writing improvement for students submitting five or more submissions to a writing task.**

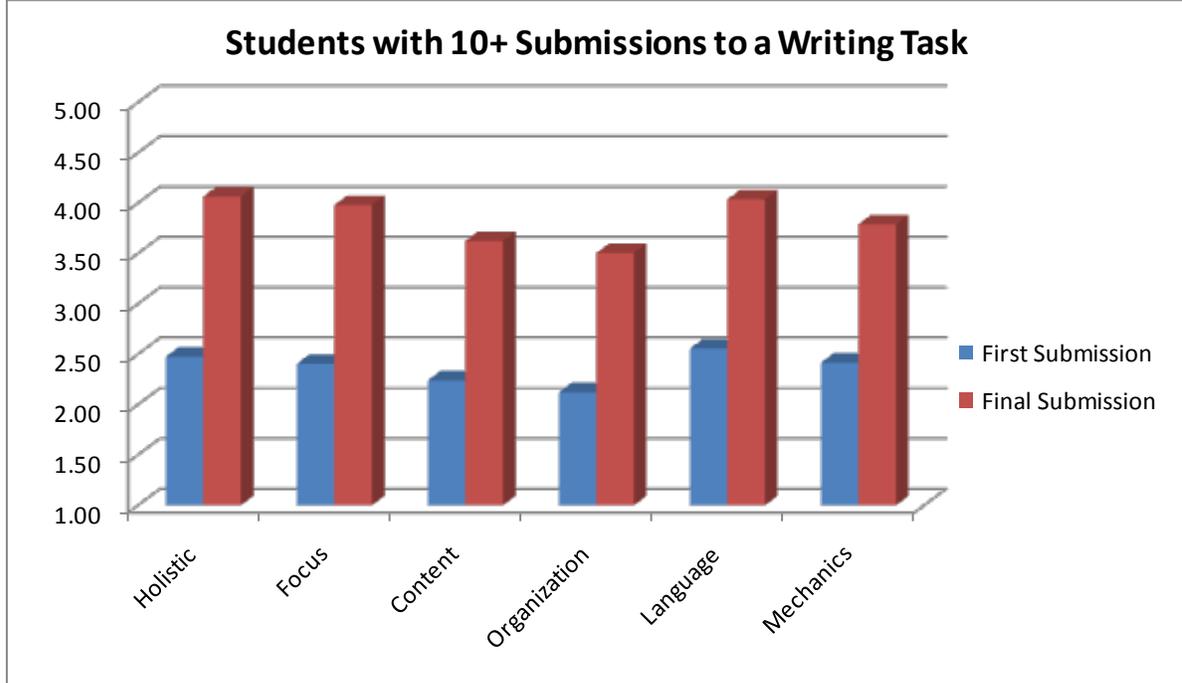

A score improvement ranging from 1.05 to 1.22 points on a 6-point scale was found. This score improvement translates to an increase in writing score of between 40.82% and 44.49% from first submission to final submission.

The writing improvement for all students, regardless of prompt, which submitted ten or more responses to a specific writing task, is shown in Table 5. To calculate the overall improvement in writing quality, the paired scores of each student, based on their first submission and final

submission scores to the same writing task (or prompt) was used. The total improvement for each prompt indicates the difference between the average scores of the first and final submissions.

Table 5. Writing improvement for students submitting ten or more submissions to a writing task.

A score improvement ranging from 1.37 to 1.59 points on a 6-point scale was found. This score improvement translates to an increase in writing score of between 56.83% and 64.23% from first submission to final submission.

Overall, the data indicates that the students who submitted their writing more often, and utilized the prescriptive feedback provided by the writing program, had the greatest improvement in writing scores for a given writing task.

## CONCLUSION

The data presented in this paper confirms that student usage of the writing program results in an improvement in writing ability and the quality of writing submitted. After just five months of usage, regardless of draft or writing topic, an improvement of 42% to 48% across the writing domains, on a 6-point scale, was noted.

The ability of the program to leverage IntelliMetric® to automatically and instantly score any essay further allowed users to submit multiple submissions to each writing topic. Improvement, from first submission to final submission, was noted for each of the thirteen current writing topics, based on the results of all students. This suggests that

the personalized feedback offered by features of the writing platform was effectively utilized to improve the quality of student writing.

The users who took the most advantage of the instant scoring and revision features of the program had the greatest increase in writing scores. Students who submitted at least five submissions to the same writing topic had the greatest increase in scores. Some students were able to increase their score more than two points on a six point scale, which indicates substantial improvement.

### **Applying AES to Scoring Chinese**

While AES engines have demonstrated success in scoring text written in English, there have been a number of studies evaluating the effectiveness of the models applied to text written in other languages. The remainder of the paper will discuss and evaluate the performance of an AES engine in scoring essays written in Chinese.

#### **Data Collection**

Responses from 613 essays were gathered for use in this study. Essays were written to the same prompt, which focused on Environmental Protection, hand written in Chinese by native speakers who were residents of mainland China, then transcribed into electronic files (in Chinese) for processing.

each essay was subsequently scored holistically by two human native speaking raters, on a six-point scale (scores ranging from 1-6). An AES model was created from the essays submitted as a training set. In addition to the training set, a separate set of 120 essays with human scores were randomly withheld for model validation purposes. A total of 613 essays were used in the evaluation: 493 for model building, and 120 for testing. Table 6 provides the score distributions for the training and validation sets:

Table 6. Counts and Percentages for Training and Validation Sets

Human Scores	1	2	3	4	5	6	Total
Training Counts	39	67	65	112	142	68	493
Training Percent	7.9%	13.6%	13.2%	22.7%	28.8%	13.8%	
Validation Counts	20	6	8	14	40	32	120
Validation Percent	16.7%	5%	6.7%	11.7%	33.3%	26.7%	

### Evaluation

To determine the accuracy of the model on Chinese essay data, three different measures were compared.

**Overall Mean Scores.** The overall means of the human scores and AES scores were contrasted. A general rule of thumb suggests that an accurate model will yield scores in which the overall mean calculated by the AES engine is not significantly different from the overall mean of the human scores.

**Agreement Rates.** Agreement rates between the human and AES engine scores were also calculated. Scores are designated as "exact" if the AES model and human rater agree with each other. Scores are designated as "adjacent" if the AES engine has exact or adjacent agreement with the human score. Finally, scores are designated as discrepant if the human and AES engine scores differ by two or more (non-adjacent) points.

**Pearson Correlations.** The Pearson Correlation between the AES scores and human scores were also calculated. For the purposes of automated essay evaluation, correlations of .70 are considered minimally acceptable, .80 very good and .85 excellent.

### Results

To calculate the agreement rate between the human rater scores and the machine scores on the Chinese data, the human rater score was averaged. If this resulted in a decimal-level score, the score was rounded to the nearest whole number. None of the differences in mean scores

between the individual and rounded human scores were statistically significant.

### **Training Set**

The agreement rates and Pearson correlations between the human-human comparisons and the average human rater score and the AES model are shown in Table 7.

Table 7. Agreement Rates and Pearson Correlation between Two Human Raters and Human versus AES on Chinese N = 493

Comparison	Exact	Adjacent	Discrepant	Pearson Correlation
Human-Human Agreement	43%	100%	0%	0.95
Human - Machine Agreement	49%	96%	4%	0.86

### **Additional Validation Set**

The agreement rate and Pearson correlation between the average human rater score and the AES model score on the Chinese Data are shown in Table 8.

Table 8. Agreement Rates and Pearson Correlation between Two Human Raters and Human versus AES on Chinese, N = 120

Comparison	Exact	Adjacent	Discrepant	Pearson Correlation
Human-Human Agreement	56%	100%	0%	0.96
Human - Machine Agreement	61%	99%	1%	0.93

### **Summary of Results and Discussion**

Overall, the results indicate that AES is accurate in scoring the Chinese essays. In all score comparisons, all calculated scores were either exact or adjacent at 99% for the validation set. Indeed, there was only one discrepant essay in the validation set.

The Pearson correlations between human and AES scores were also very high, ranging between 0.86 (for the training set) and 0.93 (for the additional 120 essay validation set), indicating that the linear relationship was very strong. However, the Pearson correlations between the two human raters for both the training set and additional validation set exceeded the Pearson correlations attained by comparing AES with the average human rater score. Although overall agreement between AES and the human raters was nearly equivalent to the agreement amongst the two raters, the small amount of discrepant scores resulted in a reduced Pearson correlation.

It is possible that the atypical finding of a higher correlation for the validation set than the training set is most likely due to the distributions of 5's and 6's in validation set being higher (33% 5's and 27% 6's for validation, contrasted to 29% 5's and 14% 6's for training).

Similarly, the exact agreement for human raters on the 120 validation essays was higher than for the training sets (56% versus 43%). These results suggest that in the end the Training and Validation samples were fundamentally different.

For both the training set essays and the validation set essays, the exact agreement between the AES model and the human raters exceeded the agreement between the two human raters.

The quality of the training set is of the utmost importance in any AES modeling process. It is vital that all of the following criteria are addressed to optimize the models created:

- Include at least the minimum number of training papers
- Provide sufficient coverage across each score point including the tails
- Include multiple raters if possible
- Ensure the human markers are well calibrated

Despite potential concerns with data quality and rater training and performance, AES engines can produce a functional model, with the promise of producing models of

the same quality as that seen with English language scoring with enhanced data and rater training.

# Innovative Materials For Implementing A Modeling Approach To Algebra For Struggling Students

## **Abstract**

*This paper describes the development of materials for a course for struggling ninth-grade students who need support while enrolled in an algebra course. The materials, called A Modeling Approach to Algebra (Olson, Olson, Slovin, Venenciano, and Zenigami, 2013b), focus on modeling, one of the conceptual categories of the high school standards, and the Standards for Mathematical Practice from the Common Core State Standards in Mathematics (CCSSM) (National Governors Association Center for Best Practices, Council of Chief State School Officers, 2010). This paper describes the materials development, piloting, revisions, implementation, and ongoing research related to the project.*

## **Introduction**

The rigor of the content in the Common Core State Standards in Mathematics raises the bar for student achievement at most levels. This is a pressing concern for students whose studies in the middle school or high school are currently underway. Supporting students as their schools transition to more rigorous standards is of particular interest for teachers and their students involved in first-year high school mathematics. In Hawai'i, the state mathematics specialist for the Department of Education has targeted support efforts at the Algebra I level because this course has traditionally served as the anchor for the high school mathematics courses that follow. Furthermore, with one in three students entering high school in Hawai'i not succeeding in Algebra I, there is a need to improve the success rate (Gottlieb, personal communication, Spring 2011). The Hawai'i Department of Education has initiated a course, *Modeling our World* (MOW I), to create a foundation for students who, as identified by their former teachers, might struggle

with Algebra I. The coursework focuses on the modeling cycle as described in the Common Core Curriculum Standards for Mathematics (CCSSM) (National Governors Association Center for Best Practices, Council of Chief State School Officers, 2010), and students engage in the mathematics content through a series of investigations built around engaging problems. It is intended that the course be taken concurrently with Algebra I to enhance learning for students.

The Curriculum Research & Development Group (CRDG) at the University of Hawai‘i, with its long history of successful curriculum development materials, was contracted by the Hawai‘i State Department of Education to develop the curriculum materials, *A Modeling Approach to Algebra* (AMAA), to support students enrolled in MOW I. Pilot and revision phases followed the initial development. This paper describes the research and development, piloting, and implementation of AMAA.

### **Components of AMAA**

**Curriculum.** The Common Core State Standards for Mathematics, together with previous CRDG projects, including *Algebra I: A Process Approach* (Rachlin, Matsumoto, Wada, & Dougherty, 2001) and *Reshaping Mathematics for Understanding* (Slovin, Venenciano, Ishihara, & Beppu, 2003), formed the research base for the development of AMAA. The state mathematics coordinator selected specific standards embedded in the Common Core State Standards of Mathematics aligned with modeling as the structure around which the curriculum materials were to be established. These standards are listed in Table 1.

Table 1

Common Core Standards of Mathematics used as a basis for A Modeling Approach to Algebra

---

#### CCSSM Standards used as a basis for AMAA

---

Numbers and Quantity, N.Q.1: Use units as a way to understand problems and to guide the solution of multi-step problems; choose and interpret units consistently in formulas; choose and interpret the scale and the origin in graphs and data displays.

Algebra – Seeing Structure in Expressions, A.SSE.1: Interpret expressions that represent a quantity in terms of its context. (a) Interpret parts of an expression, such as terms, factors, and coefficients. (b) Interpret complicated expressions by viewing one or more of their parts as a single entity. For example, interpret  $P(1+r)^n$  as the product of P and a factor not depending on

P.

Algebra – Creating Equations, A.CED.1: Create equations and inequalities in one variable and use them to solve problems. Include equations arising from linear and quadratic functions, and simple rational and exponential functions.

Algebra – Creating Equations, A.CED.2: Create equations in two or more variables to represent relationships between quantities; graph equations on coordinate axes with labels and scales.

Algebra – Reasoning with Equations and Inequalities, A.REI.3: Solve linear equations and inequalities in one variable, including equations with coefficients represented by letters.

Algebra – Reasoning with Equations and Inequalities, A.REI.10: Understand that the graph of an equation in two variables is the set of all its solutions plotted in the coordinate plane, often forming a curve (which could be a line).

Functions – Interpreting Functions, F.IF.2: Use function notation, evaluate functions for inputs in their domains, and interpret statements that use function notation in terms of a context.

Functions – Interpreting Functions, F.IF.4: For a function that models a relationship between two quantities, interpret key features of graphs and tables in terms of the quantities, and sketch graphs showing key features given a verbal description of the relationship. Key features include: intercepts; intervals where the function is increasing, decreasing, positive, or negative; relative maximums and minimums; symmetries; end behavior; and periodicity.

Functions – Building Functions, F.BF.1: Write a function that describes a relationship between two quantities. (a) Determine an explicit expression, a recursive process, or steps for calculation from a context. (b) Combine standard function types using arithmetic operations. For example, build a function that models the temperature of a cooling body by adding a constant function to a decaying exponential, and relate these functions to the model. (c) Compose functions. For example, if  $T(y)$  is the temperature in the atmosphere as a function of height, and  $h(t)$  is the height of a weather balloon as a function of time, then  $T(h(t))$  is the

temperature at the location of the weather balloon as a function of time.

Functions – Building Functions, F.BF.2: Write arithmetic and geometric sequences both recursively and with an explicit formula, use them to model situations, and translate between the two forms.

Functions – Linear, Quadratic, and Exponential Models, F.LE.1: Distinguish between situations that can be modeled with linear functions and with exponential functions. (a) Prove that linear functions grow by equal differences over equal intervals and that exponential functions grow by equal factors over equal intervals. (b) Recognize situations in which one quantity changes at a constant rate per unit interval relative to another. (c) Recognize situations in which a quantity grows or decays by a constant percent rate per unit interval relative to another.

Functions – Linear, Quadratic, and Exponential Models, F.LE.2: Construct linear and exponential functions, including arithmetic and geometric sequences, given a graph, a description of a relationship, or two input-output pairs (include reading these from a table).

Functions – Linear, Quadratic, and Exponential Models, F.LE.5: Interpret the parameters in a linear, quadratic, or exponential function in terms of a context.

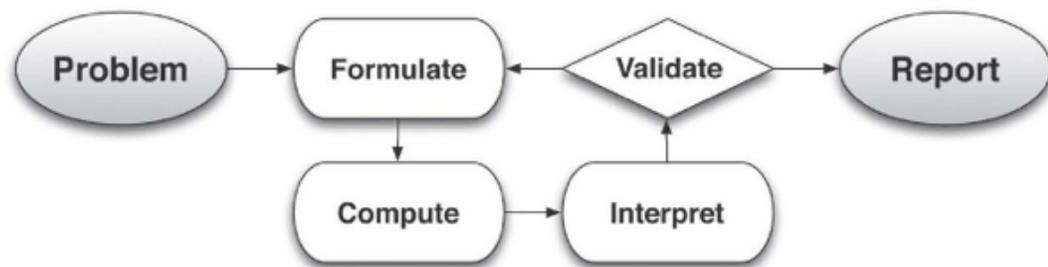

Statistics and Probability – Interpreting Categorical and Quantitative Data, S.ID.6: Represent data on two quantitative variables on a scatter plot, and describe how the variables are related. (a) Fit a function to the data; use functions fitted to data to solve problems in the context of the data. Use given functions or choose a function suggested by the context. Emphasize linear, quadratic, and exponential models. (b) Informally assess the fit of a function by plotting and analyzing residuals. (c) Fit a linear function for a scatter plot that suggests a linear association.

Statistics and Probability – Interpreting Categorical and Quantitative Data, S.ID.7: Interpret the slope (rate of change) and the intercept (constant term) of a linear model in the context of the data.

---

The AMAA curriculum materials are organized to align with the five units outlined in the CCSSM for the Traditional Pathway: High School Algebra I. An introduction to the course of study, Unit 0, prepares students for the types of problems and learning experiences in AMAA, many of which may differ from their prior school mathematics experiences. The contents of AMAA units are briefly described below.

Unit 0, Getting Started with Modeling, introduces students to expectations of active learning used throughout the course. Through engaging in problem solving in the investigations, along with an emphasis on validating and communicating results, students have opportunities to explore interesting mathematical concepts and engage in behaviors outlined in the Common Core State Standards for Mathematical Practice (CCSSM, 2010). These behaviors deepen students' understanding of the content and contribute to establishing behaviors that help form a positive learning environment. Furthermore, students are encouraged to use the basic modeling cycle in Figure 1 (CCSSM, 2010, p. 72) to help them organize their thinking and develop confidence and proficiency with modeling. The modeling cycle serves as a means for organizing students' problem solving throughout the course.

**Figure 1**

In Unit 1, Relationships Between Quantities and Reasoning with Equations, students work with concepts they will continue to use in their mathematics studies throughout high school. Investigations in this unit require students to create mathematical models and work with given models to solve a variety of non-traditional and real world problems. Students have the opportunity to build on concepts first introduced in the middle grades such as slope and functions, to reinforce and deepen their understanding of these, to develop more fluent skills related to solving equations and inequalities, and to extend their experiences to new contexts and problems.

Students begin to develop habits of mind essential for success in mathematics, including analyzing and explaining solutions.

Unit 2, Linear and Non-Linear Relationships, extends students' experiences from the previous units to more deeply investigate relationships between quantities. They build and interpret functions that model these relationships in the context of real world and non-traditional problems, and they continue to solve problems that will help them strengthen needed skills. Students add graphs to other forms of representations to visualize trends and patterns.

In Unit 3, Data and Decision Making, the investigations give students the opportunity to judge how well a model fits the data. Students establish consistent procedures in order to collect reliable data from which they generate a model, and analyze data to make predictions and decisions. Students work with lines of best fit and use regression techniques to describe approximately linear relationships between quantities. A capstone project, introduced midway through the unit, allows students to apply the ideas and concepts that they have learned in the unit.

Unit 4, Expressions and Equations, investigations focus on the concepts of generalizing, representing data with mathematical notation, modeling the dynamics of real world interactions, and algebraic reasoning. The mathematics extends some ideas developed in earlier units and provides students with opportunities to explore and work with quadratic and exponential expressions. A major project, making connections to changes in our environment that involve modeling, is an integral part of the unit.

Unit 5, Quadratic Functions and Modeling, investigations begin with a focus on the shape of the quadratic graph and associated equations and move to examining relationships in families of parabolas. Students work with quadratic functions to explore several relationships in specific situations and quadratic functions are used to extend ideas already explored in prior lessons. The project for Unit 5 asks students to examine ways they can connect the mathematics lessons in which they were engaged to situations they might have encountered and to think how a model might explain the nature of the connection or help find a solution. CCSSM standards that served as a basis for Units 1 – 5 are shown in Table 2.

Table 2

## CCSSM Standards Central to AMAA Units

Unit	CCSSM Standards Central to AMAA Units*
1	Numbers and Quantity, N.Q.1 Algebra – Seeing Structure in Expressions, A.SSE.1 Algebra – Creating Equations, A.CED.1 Algebra – Creating Equations, A.CED.2 Algebra – Reasoning with Equations and Inequalities, A.REI.3
2	Algebra – Reasoning with Equations and Inequalities, A.REI.10 Functions – Interpreting Functions, F.IF.2 Functions – Interpreting Functions, F.IF.4 Functions – Building Functions, F.BF.1 Functions – Linear, Quadratic, and Exponential Models, F.LE.1 Functions – Linear, Quadratic, and Exponential Models, F.LE.2 Functions – Linear, Quadratic, and Exponential Models, F.LE.5
3.	Statistics and Probability – Interpreting Categorical and Quantitative Data, S.ID.6 Statistics and Probability – Interpreting Categorical and Quantitative Data, S.ID.7
4	Algebra – Seeing Structure in Expressions, A.SSE.1 Algebra – Creating Equations, A.CED.1 Algebra – Creating Equations, A.CED.2
5	Functions – Interpreting Functions, F.IF.4 Functions – Building Functions, F.BF.1

\*Note. Features of Functions – Building Functions, F.BF.2 were used throughout the materials, but no effort was ever made in the lessons to translate between explicit and recursive formulas. Hence, the materials cannot claim to fully address that standard.

**Materials.** The curriculum materials include Student Pages for students and Teacher Notes and Annotated Student Pages for teachers. Features of these are described in Olson, Olson, Slovin, Venenciano, & Zenigami (2013a). These materials are also available in digital form for the teacher through the use of the PublishView feature in the TI-Nspire teacher software™

developed by Texas Instruments. In the PublishView format the Student Pages, Teacher Notes and Annotated Student Pages are all linked for easy accessibility. In addition, interactive tables and graphs are provided in TI-Nspire documents that are linked to many of the lessons and can be sent to students' TI-Nspire handhelds, when available.

Also available, but only in PublishView, are Unit Assessments that contain supplemental assessment files and Practice Problems. Keeping in line with the goals of the course to help students build their conceptual knowledge, the Practice Problems are organized by the type of process they require in order to be solved rather than directly tied to any one lesson. The categories of Processes, Procedures, Reverse Thinking, Global Comprehension, Example and Non-Example, Errors and Misconceptions, Justifying Multiple Answers, Application of Algebra Procedures, Qualitative, and Divergent are taken from Friedlander & Arcavi (2012). Practice problems are available for the following content in algebra, Problem-Solving Strategies, The Real Numbers, The Language of Algebra, Equations and Inequalities in One Variable, and Graphing, although practice for every process is not available for each selection of content.

### **Implementation**

**Design and Pilot.** The first draft of the AMAA materials was designed from September 2011–August 2012. During the summer of 2012, a five-day training for teachers considering whether to pilot the materials was offered. During the school year 2012–2013, teachers in six schools on four islands piloted the materials. During that time, members of the development team observed MOW classrooms, consulted with those teachers, and conducted follow up professional development. In addition to the 2012–2013 school year pilot, classroom-based research was conducted in a five-week summer class for students entering ninth grade held as part of the CRDG Summer School. Students engaged in selected AMAA lessons from Units 0–5, and researchers collected data on students' solution approaches and explanations, the models they used, and questions asked by the students and the teacher.

**Revision.** Revision of the materials was based on classroom visits to piloting classes, survey forms and responses to reflection prompts completed by piloting teachers, and data from the summer class at CRDG. In June 2013, the revision of Units 0 – 4 was completed and the materials from these units were used to provide professional development for teachers preparing to teach from the AMAA materials during the school year 2013–2014. By October 2013, Units 4

and 5 were revised to complete the course materials. Over 40 teachers in over 15 schools involving about 1700 students are currently using the materials.

**Case Study of Implementation.** Project personnel are currently studying the implementation of the revised AMAA materials during the 2013–2014 school year at two schools. The two schools were selected because of proximity, willingness of teachers and school leaders to be included in the study, and because the students have access to TI-Nspire calculators and the teachers are use the classroom connected TI-Nspire Navigator system. There are four teachers and approximately 300 students involved in the case study.

### **Summary**

The curriculum materials *A Modeling Approach to Algebra* are designed to support struggling ninth-grade students while inspiring all students in the study of mathematics at the Algebra I level. The materials are organized around the Algebra I units associated with the traditional pathways and address specific common core state standards in mathematics that are associated with modeling. Following piloting and revisions, the materials are now in use by students and teachers in Hawai‘i.

**Abstract:**

Historical figures can be emulated with programmable 3D avatars and endowed with simple conversational abilities. An example of this is Freudbot (Heller & Procter, 2011). Students can interact with these intelligent actor agents in 3D virtual worlds such as Second Life, conversing with them about their work, life, and colleagues. This paper will present a self-contained 3D virtual world, complete with an historical figure, situated in an enriched, scriptable, interactive learning environment that the student can log into and converse with using their own avatar. The entire e-learning environment can be stored and distributed to students on a modestly sized USB drive or "stick".

We will present a demonstration of a virtual world, using the OpenSim "sim on a stick" platform. A student would be able to log into this world and meet Freudbot, where they could talk to Freud or interact with some of the objects in the office. This is part of an ongoing research initiative to improve the performance and accessibility of conversational agents in distance education.

### **Abstract**

*This paper describes some of the benefits of using rich mathematics tasks in Grade 8 mathematics classrooms. Through surveys, interviews, and observations, we found that these benefits include: 1) student engagement, 2) the integration of multiple strands, concepts, and expectations, and 3) differentiated instruction.*

**Keywords:** elementary school, mathematics education, student tasks, teacher education

### **Research Objectives**

The Collaborative Teacher Inquiry Project is a partnership between the University and eight elementary schools in an urban education school district. Administrators and teachers work together with university professors and graduate students to improve and refine educational approaches in Grade 8 mathematics. The goals of this project are to: 1) improve the teaching and learning of Grade 8 mathematics and 2) investigate the Ten Dimensions of Mathematics Education as a conceptual framework for improvement in elementary school mathematics.

Successful mathematics programs are often quite complex. To make it easier to envision and comprehend, components are classified, identified, and described (McDougall, 2004). The National Council of Teachers of Mathematics suggested teachers to use “mathematics tasks that engage students' interests and intellect” (NCTM, 2000, p. 1). McDougall (2004) listed the following as characteristics of rich mathematics tasks (p. 25):

- Present students with a problem to solve
- Allow for multiple possible solutions and/or multiple answers
- Enable all students to participate at their own level
- Allow students to generate and select appropriate problem-solving strategies and/or procedures to solve problems
- Involve multiple representations or models, such as manipulatives, drawings, numbers, or words
- Present math in a context that makes connections to other math topics, other math strands, other subject areas, and the real world
- Lead students to consider important mathematical ideas
- Expect students to reflect on and communicate their thinking
- Often result in unexpected and ingenious solutions

The relationship between mathematics tasks and teaching and learning has been studied by a number of researchers (Kilpatrick, Swafford, & Findell, 2001; Sullivan, Clarke, Clarke & O'Shea, 2009). The 1999 Video Study conducted by Trends in International Mathematics and Science Study (TIMSS) reported that their observed mathematics classes (from seven different countries) spent at least 80% of class time on mathematics tasks (Hiebert et al, 2003). The purposes of using mathematics tasks in classrooms include, but are not limited to: introducing new mathematical ideas, practicing previously learned skills, and assessing mathematical abilities (Walls, 2005). Given the importance of mathematics tasks in the classrooms, an investigation into teachers' perspectives regarding the selection and implementation of mathematics tasks may generate new insight into this essential learning component.

## **Method**

As part of the Collaborative Teacher Inquiry Project, administrators and Grade 8 mathematics teachers from the participating schools met four times at the University. During these sessions, they shared insights regarding mathematics improvement within their schools. In the first session (October 18, 2012), two Dimensions from the Ten Dimensions of Mathematics Education (McDougall, 2004; Ross et al., 2003) were identified by each participating school as their collective focus for mathematics program improvement.

A survey (McDougall, 2004), consisting of 20 Likert (agree-disagree) items, was completed by all participating administrators and teachers. The items on this survey assess attitudes and practices in mathematics education. The scores indicate how the participant's attitudes and practices are aligned with the current mathematics trends (McDougall, 2004; Ross et al., 2003). After completing this survey, teachers reflected upon these results and identified areas for their personal growth. Collectively, the teachers within each school identified their school's goals by selecting two dimensions out of the ten dimensions.

The University team individually interviewed the administrators and teachers involved in this project. The interview consisted of 30 questions, and they are categorized into topics on learning environments, visions of successes, challenging circumstances, and goals in mathematics. At any moment during the interviews, the participants could choose to discontinue. Each interview was approximately 45 minutes in length. They were audiotaped and transcribed.

## **Findings**

### *Student Engagement*

For one teacher, a major goal for Grade 8 mathematics is for students to engage with the

learning process. In order to “make math as fun as possible”, she designs lessons where her students work in groups and compete in friendly manners (T3, Alpha School, Interview). The principal at the school also stressed the need for mathematics to be engaging to students. The learning process should be fun, dynamic, and at the same time, challenging:

I wanted math to be fun, where people can experience, and where it is not just the emphasis on the right answer. That it is about challenging students to really think deeply about whatever problem they have been presented. To me, math is very dynamic and I wanted my classroom to be that way, whether it is working with groups or in pairs, that you are pushing the students' thinking. There is not just that one way of thinking mathematically, but you can use a variety of strategies to get to an answer... The math classroom needs to reflect that. If I see a classroom [where students are] just sitting, to me, that is not engaging. And I find that frustrating. (P, Alpha School, Interview)

Several teachers have listed engagement of all students as an advantage to using rich mathematics tasks. “Student tasks are closely related to engagement in the classroom. Again, it is getting away from the traditional teacher at the front, looking at the board; everyone looking at the front, side by side” (T3, Alpha School, Interview). Another teacher stated: “We chose student tasks [as our dimension of focus] because, again, speaking from the engagement piece, we want them to be collaborative, to enjoy what they are doing” (T1, Omega School, Interview).

The benefits of selecting and implementing engaging mathematics tasks were also highlighted during one of the professional learning sessions at the University. The mathematics implementation teams watched a video clip, which showcased an expert mathematics teacher facilitating her class through the uses of rich tasks. The video clip also included many students' anecdotes about their mathematics goals and successes. After watching the documentation, the implementation teams reflected and discussed their observations. During an interview, one teacher recounted how the video clip encouraged her to look at rich tasks as a tool for student engagement. She recalled: “I watched the samples on the video that show us how engaged kids

are. I like that” (T2, Omega School, Interview).

### *Subjects and Strands Integrations*

Some teachers want to draw connections within mathematics strands, and amongst academic subjects. A teacher expressed the view that “all the subjects that [they] teach support mathematics. Language, visual arts, science and technology, and drum and dance” (T2, Theta School, Interview). Likewise, another teacher found it difficult envisioning mathematics as discrete, unconnected components (T1, Theta School, Interview). “Intertwining” the subjects and “integrating the strands” within mathematics are seen as solutions to this issue.

A few teachers have noted the usefulness of rich mathematics tasks in integrating several mathematical ideas. Prior to selecting a suitable mathematics tasks for her class, one teacher consults the Ontario Mathematics Curriculum (2005) and identifies the expectations and learning goals (T2, Alpha School, Interview). After establishing the overall and specific learning objectives for a unit, a suitable task which addresses all the goals is selected and implemented. Another teacher looked at rich tasks and strands integration as great ways to use instructional time wisely. Rather than spending “too much time” covering each mathematics expectation, clustering several expectations and selecting a task which addresses them is ideal (T3, Beta School, Interview). She described this point of view:

For teaching a certain unit, I look at the curriculum. I look at the expectations that I’m going to be touching upon. So that by clustering [the expectations] together, I’m able to say, “Hey, wait a second. I’m actually able to meet quite a few expectations from this one activity.” So coming up with rich tasks and things that will touch upon several expectations at once is the way to do it. Don’t spend too much time, a month or so, focusing on one specific unit and then running out of time. I tend to cluster and plan ahead. (T3, Beta School, Interview)

Aside from attempting an integration of strands and units within mathematics, an integration of mathematics with language arts was also attempted by some schools and some

teachers. A few ways in which this was accomplished during mathematics lessons included the introduction of picture books (T2, Sigma School, Interview), and the writing of mathematics journals (T1, Delta School, Interview). At Gamma School, the teachers planned to incorporate elements of language arts expectations into their mathematics program. In doing so, the teachers hope to highlight mathematics as more than numbers, and language arts as more than words. A teacher described this:

So we are trying to use cross-curricular approach with math as much as we can. So if we can get language integrated in somehow because we all know application is language based...They also have to learn math is not just about numbers. It is more than that. (T2, Gamma School, Interview)

Another teacher echoed similar sentiments:

I like to integrate mathematics with real-world topics that make sense for kids, not just numbers on a page. They should integrate geometry with language, make kids see problems, and make connections. I think it is important to make it interesting for students. (T3, Theta School, Interview)

### *Differentiated Instruction*

Several teachers have indicated that the utilization of differentiated instruction can help all students improve in mathematics (T1, Theta School, Interview; T1 Omega School, Interview). A teacher observed that, in recent years, there has been “a push for differentiated instruction, which allows students who do not learn well in the traditional ways to find success” (T1, Theta School, Interview). For one teacher, after observing and understanding her students, reasoned that differentiated instruction can assist her in meeting students’ “diverse needs, because everyone is working at different levels and times” (T2, Gamma School, Interview). A teacher from Beta School reflected upon his uses of differentiated instruction in his classroom:

I tried differentiated instruction, doing different things. I like to expose students to different stations to do things so they can do it different ways. I don’t use one way to teach something because of different students’ backgrounds. (T2, Beta

School, Interview)

One principal described ways in which her administration team supports her teachers in meeting students' individual needs:

One is differentiated instruction- understanding that our kids learn differently. We try to communicate that to our teachers through materials or through our [professional development]... We have our model school coach come in and co-teach with our teachers so all our lesson plans will have those concepts. We want people to use manipulatives, to be taking multiple approaches to do performance-based assessment, to try different ways to show learning that is not always through written tests. (P, Beta School, Interview)

The principal continued and suggested a way to support differentiated instruction:

To do rich tasks, things that are higher in the Bloom's Taxonomy scale rather than just the recall. To go deep, so that the mathematical application could be understood... We don't want the drill-skill type of approach and tons of photocopying, everything is all in the textbooks. We want people to use manipulatives, to be able to do performance-based assessment, to try different ways to show learning from kids that are not always through written tests. (P, Beta School, Interview)

Rich mathematics tasks can support differentiated mathematics instruction. With multiple entry points, rich mathematics tasks allow students of varying mathematics abilities to feel successful (T1, Sigma School, Interview). A teacher stated: "I would want to specifically work on more of the rich tasks, open-ended tasks, so all the kids kind of have their starting points" (Sigma School, T1, Interview). Another teacher elaborated:

By encouraging the students and by giving them tasks that challenge them. Giving a task that your higher-level learners can have success and your lower level learners can have success. Being able to plan an activity where everybody be able to achieve some level of success in. (Epsilon, T2, Interview)

Multiple entry points, multiple possible solutions, and multiple representations contribute to "higher order thinking skills like asking questions, not just providing answers" (T1, Omega School, Interview). "There are many different ways to answer the problem and work through it.

This is all awesome” (T1, Omega School, Interview).

### *Collaboration*

While identifying the benefits and uses of rich mathematics tasks, the theme of collaborative practice emerged. The selection of suitable mathematics tasks often required many hours of dedication, and the consultation of numerous resources. Working collaboratively with other teachers, co-designing units, and co-planning common activities were some solutions to this challenge. A teacher commented on this arrangement: “You do the same strands. If you run into problems, you can ask your colleagues. Or if you do the same thing, why not work together and have common activities at the same time?” (T2, Omega School, Interview). Another teacher supported this arrangement: “We knew that we could use each others' strengths and expertise to assist with writing and implementing rich tasks” (T4, Sigma School, Interview).

Several teachers suggested that opportunities to exchange resources amongst teachers from different schools would assist them in locating and sharing excellent ideas. As one teacher voiced: “For goodness sake, just give us a good bank of tasks...Why am I coming up with a rich task when I know there are people that are really good teachers out there that have them?” (T3, Omega School, Interview). Aware of this need, a wiki space was created and monitored by the University team. This wiki space serves as a forum where teachers and administrators in the Collaborative Teacher Inquiry Project share ideas and resources.

## **Discussion**

### *Impact of the Project*

Through this project, the teachers in the eight schools had opportunities to reflect upon and become more aware of their task selection and task implementation tendencies. Some of the benefits of rich tasks were frequently noted and expressed. Such benefits (student engagement,

subject integration, and differentiated instruction) also align with the implementation teams' visions of student success, as well as their goals for their mathematics programs. At the same time, difficulties in tasks selection and tasks implementation were also reported. The lack of time for lesson preparation poses some challenges, but a collaborative approach to lesson planning has shown to be effective.

### Abstract

*This paper describes the journey of a group of Grade 8 teachers as they examine ways to improve the teaching and learning of elementary mathematics. As part of their participation in the Collaborative Teacher Inquiry Project, the team selected the Dimensions of Assessment and Evaluation, and Student Tasks as their professional development focus. The surveys, interviews and observations highlighted some of the successes and challenges experienced when attempting to improve teaching practices and student learning. The study also suggests that the collaborative approach to professional learning can sometimes be effective.*

**Keywords:** elementary school mathematics, mathematics education, teacher education

### Research Objectives

There are numerous benefits to collaboration within the teaching community. Through the interplay of collaboration, classroom enactment, and reflection, teacher's knowledge is increased (Krajcik, Blumenfeld, Marx & Soloway, 1994). Working collaboratively combines teachers' skills and resources, such that new methods and new approaches can be explored (Curtis & Curtis, 1990). The sharing of one's expertise and perspectives lend to a greater sense of trust and respect within the learning community. Gable and Manning (1997) noted that these interpersonal communications help establish effective professional relationships. The increase of interpersonal communications may also lead to positive changes in a school's atmosphere. Most importantly, collaboration amongst teachers may result in improved student achievements

(Goddard, Goddard, & Tschannen-Moran, 2007).

The Collaborative Teacher Inquiry Project (2012- present) aims to understand educational practices in Grade 8 mathematics, and utilizes the Ten Dimensions of Mathematics Education (McDougall, 2004) as a framework to improve elementary mathematics programs. A partnership with the University, department heads, curriculum leaders, administrators, and teachers from eight local schools in Central Canada worked collaboratively to discuss and improve teaching implementations in Grade 8 mathematics. This paper describes one Grade 8 mathematics implementation team's journey, as the team examines ways to improve the uses of student tasks and assessment strategies.

### **Method**

#### *School Context*

Founded in 1973, Silver Birch Middle School (pseudonyms were used for the school, the principal, and the teachers) is located in a metropolitan city in Central Canada. Currently, Silver Birch Middle School is home to approximately 310 Grades 6 to 8 students, with about 25 students in their Second Language program. The school also hosts the region's Gifted and Behavioural programs.

According to the school's website, the staff at Silver Birch Middle School strives to create an environment where students can build strong academic and social skills. Many extra-curricular events (e.g. sports team, music festivals, field trips) are organized and promoted to students. With regards to numeracy, 52% of their Grade 6 students achieved level 3 and level 4 (meets provincial standard and exceeds provincial standard, respectively) in a recent provincial large-scale assessment examination. The school aims to improve this achievement by 10%, raising their Grade 6 students' level 3 and level 4 achievement to 62%.

### *Data Collection*

The Grade 8 mathematics implementation team at Silver Birch Middle School consisted of one principal and four Grade 8 mathematics teachers. The Ten Dimensions of Mathematics Education (McDougall, 2004), a conceptual framework that identifies components in a successful mathematics program, was utilized in this project. During the first year of this project (2012-2013), four workshops were held at the University, where implementation teams from eight of the selected schools met and discussed teaching successes and challenges. At the first meeting (October 18, 2012), administrators and teachers identified two dimensions of focus for their schools' mathematics programs. To assist this process, participants completed a 20-item, Likert scale survey. Based on the elements identified in the Ten Dimensions framework, the scores on this survey reflect the participant's attitudes and practices in relation to current mathematics education trends (McDougall, 2004; McDougall et al., 2003). After the first session, three additional professional learning days took place at the University. Assessment, student tasks, and technology were the primary focus of these sessions respectively.

The University team interviewed administrators and teachers to further understand their teaching practices, goals, and challenges. The structured interview consisted of 30 questions that guide participants in their reflection on learning environments, visions of successes, challenging circumstances, and goals in mathematics. The participants had opportunities to indicate if they did not want to participate in the interviews, or any of the research components associated with this project. Each interview was approximately 45 minutes in length. They were audiotaped and transcribed.

### **Findings**

#### *Formation of the School Improvement Plan (SIP)*

During the individual interviews, the principal and teachers involved in this project each stated that their School Improvement Plan was a result of the collaborative contributions of the administrative staff, the persons of responsibility (POR), and all of the teachers. As one teacher stated: “We are all participating in the development of our school's improvement plan. It is a direct input from all the teachers from this school. That is why it is an integral part of our everyday work, and an absolutely organic component to our teaching” (T3, Silver Birch Middle School, Interview). Though established at the beginning of the school term, the plan was often seen as a changing, fluid document. This concept was reinforced in a teacher's recount: “We are always discussing, always communicating, we are also sharing ideas. For me, it is always fluid” (T4, Silver Birch Middle School, Interview).

As a guide for the creation of the School Improvement Plan, the four pillars of Student Success (Ministry of Education, 2008) were utilized. These pillars are: (1) Literacy, (2) Numeracy, (3) Pathways, and (4) Community, Culture and Caring (Ministry of Education, 2008). Combined with an examination of student data, the school improvement team created a preliminary plan for their superintendent. From then on, a continuous refining process took place, and better strategies and more detailed steps were discovered and discussed during staff meetings (Principal, Silver Birch Middle School, Interview). A teacher described the process:

We broke off into smaller groups based on subjects, grades and stuff. We kind of listed where we were and where we needed to go. And after we collaborated, we came back together and we discussed some more and we came back to our boss, the principal and vice principal and they looked at it. (T1, Silver Birch Middle School, Interview)

#### *Plans for Success*

When asked about their vision of success in Grade 8 mathematics, the principal described his as a learning process that is fun and deeply meaningful. Mathematics education, he believes,

should not emphasize the correct answers only. Rather, students need to experience math - its dynamic and applicable nature (Principal, Silver Birch Middle School, Interview). To attain this goal, one teacher suggested the use of manipulatives and rich tasks to engage students in their learning. “I want them to be excited when they know math is coming up” (T1, Silver Birch Middle School, Interview). Similarly, another teacher noted:

[One of] the goals for our students this year is to really focus on making a very clear display of their knowledge. Having to explain their responses and show their thinking in a variety of ways. Not just pencil and paper, but with manipulatives and other materials they are given. (T2, Silver Birch Middle School, Interview)

In order to assist students in clearly displaying their mathematical knowledge, “there needed to be considerations for multiple intelligences and non pencil and paper activities” (T2, Silver Birch Middle School, Interview). To achieve this, the staff realized that “new ways and new strategies for supporting [their] students” were necessary (T4, Silver Birch Middle School, Interview). Participation in the Collaborative Teacher Inquiry Project was one avenue in which new ideas for teaching and learning mathematics could be explored.

#### *Assessment and Evaluation*

Based on their Grade 8 mathematics program goals, the implementation team at Silver Birch Middle School identified two Dimensions of focus for the school year. One Dimension was Assessment and Evaluation. Knowing that assessment is highly emphasized by the Ontario Ministry of Education, and realizing the importance of assessment to student achievements, the teachers wanted to utilize different forms of assessment to aid student learning. For one teacher, she is determined to “get away from only quizzes and tests” (T1, Silver Birch Middle School, Interview). Her motivation for doing so is a realization that students learn and express their understanding differently.

Another teacher hoped that, through this project, more collaboration and discussion regarding assessment would arise within the school:

The assessment part, we all do different things, and we want to streamline it so that it is consistent. All of us, not just you do one thing and I do another. That we are all on the same page and we are making sure that we are assessing our students properly. (T4, Silver Birch Middle School, Interview)

To facilitate more discussions amongst Grade 8 teachers, their teaching schedules were carefully planned, to ensure more common prep time. During common prep time, teachers often worked in pairs to look through the available resources, plan out an upcoming unit, and discuss diagnostic options. A teacher described a recent team meeting:

As a group, we do long range plans. We go through chapters, we look through what resources we have. More recently, we sat down and really planned out a unit together. Discuss rich tasks. We talked about the diagnostics, and of course, the cumulative [assessment] tasks at the end. (T1, Silver Birch Middle School, Interview)

### *Student Tasks*

Another Dimension selected by the implementation team was Student Tasks. The principal recounted how, during the first professional development workshop at the University, the teachers were introduced to several rich student tasks. After investigating the tasks, they wanted to see more of these types of activities in their mathematics classes. One teacher was determined to “find rich tasks that simultaneously meet several of the outlined specific expectations outlined by the Ministry of Education” (T2, Silver Birch Middle School, Interview). For this teacher, successful integration meant searching beyond what was available in textbooks, and using technology such as SmartBoard and Geometer's Sketchpad.

The four professional development sessions at the University provided the team with numerous teaching ideas and resources. After trying out a rich student task that integrated

different subjects (mathematics and visual arts) and multiple mathematics expectations (geometry, patterns, and rotations), the teachers introduced it in their classrooms. Many students were engaged in this task, and the final projects were displayed in the hallways of the school as an encouragement for their accomplishments.

In addition, a wiki space (<http://grade8project.wikispaces.com>) was created to facilitate the sharing of ideas and resources amongst the implementation teams. Maintained by the University research team, the wiki space made resources more conveniently available.

#### *Guidance from the Administration*

Throughout the professional development process, the collaborative efforts amongst the administrative staff and the teachers have contributed greatly to the success they have experienced. Viewing his leadership role as one similar to a “lead teacher”, the principal aims to meet the mathematics goals of the province by setting the goals and the direction, and providing the needed support within his school (Principal, Silver Birch Middle School, Interview). To demonstrate his support, he joined his Grade 8 staff during common prep, and listened as they shared their teaching ideas, successes, and challenges. Together, they “explored new teaching methods and resources” (T4, Silver Birch Middle School, Interview). In addition, he would “occasionally sit in and observe parts of the teachers' mathematics lessons” (T4, Silver Birch Middle School, Interview). The observations and one-to-one discussions afterwards were ways to provide “individual teachers with more specific support and guidance” (Principal, Silver Birch Middle School, Interview).

One teacher described the administrative team at this school to be “quite positive”, with “no resilience to help” (T3, Silver Birch Middle School, Interview). Another teacher echoed similar sentiments:

If there is anything we don't understand or whatever, the door is always open to our administration to talk about it. They accept our own ideas as well. If we have our own idea, they will help us explore it. (T4, Silver Birch Middle School, Interview)

### *Collaborative Efforts Amongst Staff*

Similarly, a lot of continuous, collaborative efforts and supports were evident amongst the Grade 8 teachers at Silver Birch Middle School. Weekly meetings amongst the teachers were scheduled, and “common prep periods were planned” (T1, Silver Birch Middle School, Interview). During their weekly meetings, the teachers “talk about what [their] big goals are and what [they] are working on. The needs of [their] learners” (T2, Silver Birch Middle School, Interview). During their common prep periods, the Grade 8 team had opportunities to “lay out [their] plans” (T1, Silver Birch Middle School, Interview). When weekly meetings and common preps were difficult to arrange due to schedule conflicts, “Lunch and Learn”, informal discussions during lunch times, were occasionally held (T4, Silver Birch Middle School, Interview). These sessions gave “teachers opportunities to explore specific teaching topics of interest” (T4, Silver Birch Middle School, Interview).

A beginning teacher found the support provided by the administration and teaching staff to be especially beneficial:

I think the challenging thing for me is just the lack of experience, but everyone has been very supportive, especially those in my groups. With the planning and stuff. (T1, Silver Birch Middle School, Interview)

Another teacher summarized the support for one another within their school:

We are constantly sharing information. We never said no, especially with this team that we have. I think we are very good at that, where we are constantly supporting each other. (T4, Silver Birch Middle School, Interview)

## **Discussion**

### *Impact of the Project*

Through this project, the participants became more aware of their teaching practices. By identifying two Dimensions, the implementation team was able to focus their attention and resources. As a result, the team received specific and clear guidance. For the Assessment and Evaluation Dimension, the team identified their desire to explore different forms of assessment. Information and examples on different forms of assessment was investigated during one of the professional development sessions at the University, and the team discussed those concepts further during weekly meetings and common prep times. For the Student Tasks Dimension, the team noted the importance of incorporating and integrating different types of activities. Student tasks were explored during one of the professional development sessions at the University, and more resources were readily available on the project's wiki space.

In addition, the principal and teachers at Silver Birch Middle School expressed the importance of tackling mathematics education improvement collaboratively. The principal noted:

What I like about this project is the emphasis of a Grade 8 team, and it is not just individuals. In our case, four teachers together experiment and try things as a team. We can be successful, and you will see the results of that with time. (Principal, Silver Birch Middle School, Interview)

The sense of teamwork and collective success was also echoed in the teachers' reflections. Through the participation in the Collaborative Teacher Inquiry Project, a teacher is convinced that schools could be more effective and more successful in their mathematics programs if there is “intensive teacher support from JK all the way up to Grade 8” (T2, Silver Birch Middle School, Interview).

The Ten Dimensions of Mathematics Education (McDougall, 2004) was an effective framework for identifying appropriate areas for investigation and implementation of new teaching practices. The survey (Ross et al., 2003) provided the data to identify the dimensions as

well as providing teachers and administrators with mathematics vocabulary to talk about mathematics improvement. The wiki was also an important source of support as teachers could share and download activities and resources to further their own understanding of mathematics instruction.

## Perceived difficulties of schooling for North Korean defectors in South Korea

### Abstract

The study presents qualitative accounts of tensioned sense of place of North Korean youth defectors who live in South Korea and explores in what ways those youth experience tensions in their sense of place. Employing positionality as analytic lens, we examine how two aspects of positionality – place identity and affordances of place—get played out in the youth tensioned sense of place.

In a recent couple of decades, South Korean society has been in a rapid transition from a monolithic, homogenous society (with one language and one ethnicity) toward a multicultural society. One group (of concern in this study) among this influx of people coming from other nations for work, study, or marriage is North Korean defectors (NKDs). Studies continuously report problems and concerns (such as under achievements, high dropout rates, and psychological problems) over NKDs' adjustment within South Korean education system. To look further into this concern from NKDs' perspective, this study explores NKDs' perceived difficulties as they try to participate in schooling in South Korea. Drawing upon NKDs' perceptions, this study tries to problematize how education is framed and practiced in South Korea.

Informed by pedagogy of place, this study is particularly tries to problematize and reframe “place” as shifting, dynamic, permeable, polyvocal, heterogeneous, and non-dichotomous for further educational dialogue in South Korea (Franzosa, 2007; Greenwood, 2010; Somerville, 2010). Employing focus group interviews with North Korean defector students, parents, and their teachers, the study explored how education in this new place, South Korea is framed and perceived. Participants (26 students, 8 parents, and 10 teachers) were invited from an elementary and a middle schools in Seoul, South Korea that are known to serve a relatively larger number of NKDs and provide extra support programs for them. Analysis went through open, axial, and selective coding processes to explore perceived difficulties in learning by students, parents, and teachers and to examine what the perceived difficulties reveal about how education is being framed and practiced in South Korea. Preliminary findings indicate a complicated, interconnected network of perceived difficulties for North Korean defectors as they try to participate in schooling in South Korea. A comparative examination describes systematic differences between two different places, the North and the South, showing how an education system is intertwined within multiplicity of a place including geopolitical, historical, cultural, social, and linguistic dimensions.

The study will present three contradictions identified from the interviews and further examine questions the contradictions pose to discuss what and how these contradictions tell us about “this new place” for NKDs.

- First, *trying to catch up, yet falling further behind*. While “catching up” with South Korean education as an urgent goal and put a concerted effort into it, yet, NKDs expressed concerns and “expect” further “falling behind” as the

students reach higher grade levels. Even after putting their concerted educational effort into, “catching up” is not working out.

- Second, *seeking individualized support, yet wishing to conceal NKD identity*. To better support schooling of NKDs, all participating groups pointed out individualized approach is most needed. However, there exists strong desire to hide or ignore their identity as a NKD. These students are caught in between asking for help to catch up academically and staying quiet to fit in socially.
- Third, *“catching up” with school takes more than a school*. South Korean students would go to cram schools after school, on weekends, and/or during school breaks. Thus schooling alone is not enough for NKDs to catch up with schooling in South Korea. To play catch up, NKDs are pressured into an extremely complicated, competitive educational environment.

NKDs’ experiences of denied historicity, differences treated as deficits, rhetoric of accountability in education provide grounds for educators to problematize and reconceptualize “place” for education, that is to “reintroduce reality as dynamic, heterogeneous, and non-dichotomous” (Gough, 2006, p. 628).

## **Tensioned sense of place: Cases of North Korean youth defectors**

South Korean society has been in a rapid transition from a monolithic, homogenous society toward a multicultural society. This shift has been recent, in fact became visible within a couple of decades, with an influx of people from other nations for work, study, marriage, or seeking refugee status. This shift in the society has affected classrooms as well. To examine the recent multicultural education concern, this study draws on pedagogy of place. The study begins with the belief that the process of learning is informed by learner's sense of place: It is important to document and explain what students' sense of place is and thus how it might matter in educational contexts (Gruenewald, 2003). Thus the purpose of this study is to understand what sense of place North Korean youth defectors develop. In particular, we look into cases of tensioned sense of place where North Korean youth defectors talk about their place experiences. As Proshansky et al (1983) argued, "when a physical setting becomes dysfunctional that a person becomes aware of his or her expectations for that setting. What was routine and in the background suddenly becomes the "figure" in the thinking of those using the setting" (p.75). Thus the exploration of tensioned positionality would guide us to better understand (taken for granted) conditions and/or expectations that shape and support the youth' sense of place development. In this study we try to understand how North Korean youth defectors experience tensions in sense of place and to describe tensioned nature of their sense of place.

We view "place" as a complicated, ecological system that includes physical, biological, social, cultural, and political factors with history and psychological state of the person who share the location (Ardoin, 2006; Gruenewald, 2003; Lutts, 1985). As Gruenedwald (2003) articulated, "place, in other words, foregrounds a narrative of local and regional politics that is attuned to the particularities of where people actually live, and that is connected to global development trends that impact local places"(p. 3). Thus, to frame youth sense of place stories expansively and connectively, linking a "place to places beyond" (Massey, 1991, p.29), it is critical to seek out and address historicity (decolonization) and positionality (reinhabitation) in their stories (Gruenedwald). This study attempts to understand youth sense of place by employing positionality as an analytic lens: an interplay between place identity and place affordances. It examines how two aspects of positionality get played out in tensioned sense of place.

The study, informed by phenomenology and ethnography (Katz, 2003), explores North Korean youth defectors' ecological relationship with their place. The study was carried out with 5 informants who attend the Crossroad School, an alternative high school, established particularly for North Korean defectors in South Korea. It focuses on stories of the informants who were selected purposefully, based on their residential history and educational backgrounds. While many of them are new to South Korean society (less than a year), yet many of them have lived in the country for several years. Some of students came to Crossroad, after unsuccessful

experiences with “mainstream” schools. Ethnographic methods of data generation were used including interviews (individual & focus group), participant observation (in science classes where the researchers have taught for a year), and going along (Kusenbach, 2003).

Positionality is explored through the interaction between “who I am in a place” and “how I live where I am”. Thus place experience is viewed as a cyclic and continuous process between the two aspects. When there is a discrepancy between who the youth is (including what the youth wants in and from a place) and the affordances of the place (including what the youth think they can do and what they actually get to do in that place), a tension emerges in sense of place. As a result, youth positionality becomes tensioned. Based on our preliminary analysis, we have learned that there are four conditions that affect youth’ sense of place development, thus when limited, they become sources of tension: 1) leveraging place history (continuity of activities and cultural repertoire), 2) environmental knowing (familiarity with the setting and understanding), 3) environmental competence (knowing how to navigate and knowing how to engage), and 4) developmental trajectory. Stories showed that when these components are lost or ill-provided, tensions emerged in children’s sense of place and their positionality became diminished. Further by examining internal conditions in the youth’ sense of place and their diminished positionalities, we will further look into how the youth managed to cope with the inconsistencies and tensions that emerged in their sense of place development in a new place.

By exploring youth sense of place when it sits in tension, we will be able to develop an understanding of what aspects of sense of place matters and how they matter in the youth’ place relationship. The stories of tensions will allow us to look into aspects that might have been taken for granted (which still act significantly in shaping sense of place). Also, they led us to understand how these factors could support the youth sense of place development in a new place, South Korea. The study also will be able to present a conceptual framework which will guide us to examine how (displaced) youth interact and nurture their relationship with a place. It will provide an analysis on how the content and context of a new place (i.e., South Korea) might frame North Korean youth defectors’ sense of place. Using two constructs of identity and affordances, dialectical youth-place interactions can reveal the place-specific (or context-specific) particularities of youth place interaction.

6. Abstract:

### Enhancing Health through Cultural Based Nutrition Education

Ni Wayan Suriastini, SurveyMETER, Indonesia  
Bondan Sikoki, SurveyMETER, Indonesia

Delivering the Integral Education of child nutrition involving children and parents and culture based education has not been done in Indonesia. As a breakthrough local wisdom and universal values were integrated in nutrition education for children aged 3-6 years and their parents. The nutrition education modules given in four sessions consist of four themes. At each meeting three themes were delivered to the children and parents namely nutrition information, values and self empowerment exercise. A total of 12 local wisdom and universal values integrated in four meetings of nutrition education. Those 12 values are Self Control, Joy, Healthy Living,

Discipline, Concern for All Life, Discretion , Understanding, Cooperation, Sacrifice, Caring, Service to Others and Independent. This learning system has been implemented every Sunday since October 23, 2011 in Yogyakarta.

This paper observed integration of the values into nutrition education system using M-O-A, social marketing theory. The social marketing theory toward sustainability change requires three conditions: Motivation, Opportunity and Ability.

In this integral nutrition education, Motivation developed together by growing inner Will Power and wisdom of the children and parents. It introduces local cultural values to construct will power. In addition, it's also based on expression of universal value peace, love and harmony to develop Wisdom.

Meanwhile, Opportunity is given through involvement of parents as children's nearest stakeholder in the program. The parents are given the same education material as the children. Through this system, children are more likely get opportunity, support and help from parents to change their behavior toward healthy live. The education material for parents delivers in form of explanation, demonstration and exercise. The same education material delivers to the children through songs, movement, story telling, game and coloring.

On the other hand Ability developed through nutrition knowledge and holistic health, which deliver integrated with local culture and universal values to help the internalization of the information. In addition, the program also provided stress management skill through self empowerment exercise. The exercise help preparing body, mind and soul die-jest information clearly. This skill increase the Will Power to change behaviors and became self independent and self empower facing global challenge of daily live.

The impact of the program is demonstrated in the results of a longitudinal study on the group who received education and who were not getting education program showed not only an impact on parental knowledge on nutrition and improve the state of health but also strengthens the characters of the child. In addition to increasing knowledge about nutrition and health of the children, the program also change the child's behavior and habits. About 77% of parents reported changes in knowledge, attitudes or habits of the child after the nutrition education program into a better direction. These positive changes are not only related to diet and health, but also in aspects of child's personality such as more sociable, could more concentrate , children become more independent, more creative, and more confident.

## Cross-Cultural Investigation of Barriers to and Support for Student Success

By Natalia Gajdamaschko, Faculty of Education, Simon Fraser University, Canada  
and

Ildikó Takács, Department of Ergonomics and Psychology, Budapest University of  
Technology and Economics, Hungary

**Abstract:** *This study uses Q-methodology to investigate graduate students' theoretical perspectives concerning educational practice, based on their educational experiences in different countries - Canada and Hungary. Q methodology, as a small-sample, intensive methodology, assists in obtaining understandings concerning the subjectivity of participants that are not possible through more traditional means. It may also, as demonstrated in this paper, be very useful in conducting cross-cultural studies. Four factors emerged as a result of our study representing diverse views on education by graduate students from the two countries. All students from Hungary merged into one factor with few Canadian students sharing similar views. The findings are considered in the light of deepening our understanding of diversity of cross-cultural views on education.*

We believe that Q-methodology could be especially useful in the situation of cross-cultural comparison of students' attitudes. Our study is designed to lead to new insights into the possibility of using a Q methodology-based assessment tool to capture student attitudes in cross-cultural investigation of transitional challenges students face when they move to post-secondary studies. This study is the first in a set of investigations. We concentrated here in attempting to understand a broader context of cross-cultural differences in attitudes towards educational ideas and theories, before we will move into more concrete analysis of the barriers to academic success of university students in our follow up study.

We choose Q methodology to study students' success and barrier in the post-secondary institution internationally because we believe that it is a way to study the "subjective" part of behavior and learning activities of students. Q sorting discloses the implicit structures of their discourses, and these may then be interpreted with the aid of quantitative techniques (correlation and factor analysis). Q methodology makes it possible to correlate persons instead of tests or responses (Stephenson, 1953), thereby allowing the participants' perceptions to form the basis of the resultant factors. Rather than trying to define "independent variables" and to test them on a student population in a classroom, we can "analyze them instead from the point of view of the persons who did the rating, because theirs are the actual operations at issue" (Stephenson, 1953, p. 40).

The power of Q methodology lies in its ability to gain insight into the self-understandings of the participants in the study. This is particularly useful when dealing with views/attitudes which are held in a manner that conflates the normative, expressive and discursive functions. This methodology can assist in obtaining understandings concerning the interpretative subjectivity of participants that is not possible through traditional positivistic research methodology (Brown, 1993; Brown, 1980).

Our study, like many recent Q studies is designed to lead to new insights into the possibility of using a Q methodology for cross-cultural comparison of attitudes.

### **Research Questions:**

-What are the strengths and weaknesses of the Q methodology in exploring cross-cultural differences in attitudes towards education

-What can we learn from the Q methodology findings in terms of deepening our understandings of cross-cultural ideas about education?

One of the major requirements for creating a good Q methodology -based classroom assessment tool lies in identifying a concourse. The concourse is the communication about the topic of interest, in this case educational philosophy. From this concourse, a sample of statements is drafted that represents the diversity of the community. The analysis of the sorts yields information about student beliefs, attitudes, etc. For our study, the relevant concourse is the array of ideas, attitudes, feelings, values and perceptions that different individuals may associate with the core idea of education's purpose. We choose the statements that accompanied diverse theories and practices in current North American education. (please, see Attachment #1).

### **Implementing the Q Study**

First, we identified the topic we wished to explore as the theoretical perspectives of educational stakeholders in education. Second, in order to obtain a series of statements that represented the discourse on the topic, we borrowed heavily from Egan's analysis of the main competing ideas in contemporary educational thought. Our main concern during the statement generation phase was to insure that the resultant set of statements represented the issues that educational stakeholders might hold. Third, the participants in the Q study were asked to rank 42 statements on a scale ranging from +3 ("agree with most strongly") to -3 ("disagree with most strongly").

We administered Q sorts to a total of 22 graduate students, participants in the Masters Class in the Summer semester of 2013 at the Faculty of Education in Canada and participants in the Master Class in the Fall semester of 2013 in Hungary. The "person" sample therefore included respondents from different levels of educational system in British Columbia (graduate students) and graduate students in the Master of Counseling Program in Hungary.

Fourth, the Q sorts were the subjected to factor analysis of the rankings that allowed for the extraction of a few "typical" Q sorts (factors) that captured the common essence of several individual Q sorts. These "typical" Q sorts were then interpreted by investigators to give a verbal explanation to the discourses uncovered by the statistical procedure.

### **Interpretation**

We used PQ Method software with varimax rotation to analyze the Q sorts. A four-factor solution shows the best correspondence of participants' views. The factor-loading matrix is shown

in Table A. The factor loadings for each Q sort indicate its correlation with the factor. For example, Q-sort 22 has a significant loading of 0.84 into the Factor 2, with all scores above 0.43 significant at  $p < 0.01$ .

Using the z scores and the weighted average placement for each statement by each factor, we determined the educators' perspectives of the four factors. In doing so, we focused on the statements placed in the +3/+2 and -3 /-2 categories in the different factors. We also focused on distinguishing statements for each factor, that is, those that are statistically different from the placements of the other factors. The Appendix shows the weighted average placement (rank) of each statement by each factor. These average weighted placements are constructed through z scores that calculate the average placement of each statement by the educators who loaded significantly on the factor.

Our analysis of the factors that emerged and their weighted averages yielded the following description of the four perspectives of educators in our study.

### **Factor 1. Education Should Focus on the Interiorization of Cultural Tools.**

This factor is based on the educational theories of Lev Vygotsky. Education is primarily an organized activity assisting the young to make sense of the world by use of mediating intellectual tools that in turn profoundly influence the kind of sense that we make. Our educational development, then, cannot adequately be understood in terms of becoming appropriately socialized, or merely through the knowledge we accumulate, or in terms of psychological stages but requires an understanding of the role played by cognitive/cultural tools available in the socio-cultural realm in which the child lives.

The students who comprise Factor 1 favor the idea of conceptual development in education and they value the wide range of cultural tools that, in their view, should be a part of schooling. This is the only group who sorted positively (+3) Statement 13, *Teaching concepts is important for the content of the concept and also to develop the ability to think in concepts*. In discussing the role of the teacher this group of educators agreed strongly (+3) with Statement 11, *I believe a central role for the teacher is to mediate understanding for the student, moving them from an early grasp of a subject to full comprehension through whatever means proves effective*. And they disagree with the idea that teaching should be merely facilitating, thus they sorted negatively (-2) Statement 27, *Students are their own best teachers*.

They also consider the introduction of psychological/cultural tools by a teacher to be the major source of development of a child's mind and therefore they disagreed (-1) with the Statement 10, *True understanding of anything can only come from direct experience*.

### **Factor 2. Hungarian students' attitudes.**

This factor seems to be based on ideas of Hungarian students who mainly comprised the Factor 2. This is the only factor who strongly agreed (+3) with the Statement 33 *We can't expect kids to be good at everything, but every child is good at something*.

This group is the only one that strongly agreed (+3) with the Statement 23, *We must be critical of traditional curriculum and its role in maintaining traditional power dynamics. Real world change and freedom from oppression is possible by teaching students the skill of critical thinking*

And, unlike Factor 4, they strongly disagreed with the statement 38 *An ignorant teacher could still be a successful teacher.*

### **Factor 3. Socialization (Dewey): Education Should Focus on Socializing the Child**

This Factor emerges from the idea that education's primary role is the socializing of the child. This view of education is based on the idea that the central mandate of schools is the socialization of the young into a set of dominant attitudes. School is seen primarily as a social agency and the curriculum is mostly made up of such constructs as life skills and work preparation courses. This idea is related to the now popular notion that schools are the places where the young are prepared for life in the economy. They agree strongly with the Statement 4 that *Schools should aim to produce good citizens not just future experts in particular fields.*

This group of educators, unlike any the other groups, strongly believes that teachers are important socializers in our society. They are the only group that sorted strongly positively (+3) the Statement 5, *The best way affect change of any social issue is through education*

### **Factor 4. The ignorant teacher could be a good teacher.**

This idea is based on the notion that education should follow the natural and spontaneous development of the child's whole self and has its roots in the work of Jean-Jacques Rousseau. Thus, this is the only group who strongly agreed (+3) with the Statement 21, *I believe the best teachers relinquish their power.*

Similarly, this is the only factor who strongly believe (+2) that *An ignorant teacher could still be a successful teacher* (Statement 38). The key to learning is that it follows an underlying natural development. Thus this group is the only one that agreed with the Statement 29, *Schools destroy children and their natural wonder with the world.*

## **Discussion**

From the analysis of the Q sorts, four factors emerged in our study. Our analysis of the factors easily mapped onto ideas central to current educational discourse. The factors thus provide some evidence that this discourse is diverse and differ from country to country.

Our study is designed to lead to new insights into the cross-cultural comparison of transitional challenges most students experience when they move to post-secondary studies in Canada and Hungary. Cross-cultural investigation leads to better understanding what factors may serve as both barriers to, and supports for, students' academic success. This understanding should help receiving institutions better support students through programs, policies and services that are known to enhance student academic success

### Appendix 1 Factor Q-Sort Values for Each Statement

No.	Statement	Factor 1	Factor 2	Factor 3	Factor 4
1	I believe that teachers should be role models	1	1	1	-1
2	The main goal of education is to equip students with the knowledge and skills best suited to ensuring their success as citizens.	0	1	0	-2
3	A large part of curriculum should be subjects that have real world relevance: the environment, technology, sex education, household duties and so on.	0	2	1	-1
4	Schools should aim to produce good citizens not just future experts in particular fields.	0	0	3	0
5	The best way affect change of any social issue is through education	2	1	3	-1
6	I believe that the role of the teacher should	-2	2	1	1

	be to facilitate the child's own active discovery. Teaching is not 'teaching' at all. It is an act of guiding and appreciating.				
7	An ideal education emphasizes individual differences among learners and takes into account their natural learning abilities. We have to recognize the importance of students' varying learning styles.	1	2	0	0
8	Having universal curriculum is ridiculous. Each child should be free to form their own curriculum based on individual interests and aptitudes	-1	-2	-1	0
9	Each child's individual potential should guide the teacher's activities	0	0	-1	-1
10	True understanding of anything can only come from direct experience	-1	-1	2	2
11	A central for the teach is to mediate understanding for the student, moving them from an early grasp of a subject to full comprehension through whatever means proves effective.	3	2	1	1
12	The development of any student is reliant what they are taught.	2	-1	-1	-2
13	Teaching concepts is important for the content of the concept and also to develop the ability to think in concepts	3	2	0	-1
14	Every culture has its own array of tools and traditions for understanding any subject. Schools should make use of these tools and traditions.	2	1	2	3
15	Language plays a significant role in development of a child in the development of a child. It's not only a tool for communication.	3	3	3	0
16	I believe the best teachers care for their students first and foremost. Everything else comes later.	1	0	0	0
17	We cannot hope to teach a student until we form a relationship with that student. We must know what is happening outside of the classroom in the student's life if we are going to be successful inside of it	1	-1	0	1
18	Devising curriculum for any individual student is easy when we take the time to form a relationship with that student first	0	0	1	2

19	A central concept of any pedagogy should be happiness	-1	-1	0	1
20	We must care about the whole child, not just the mind. It is more important to feel loved	0	0	2	0
21	I believe the best teachers relinquish their power and give power to minority voices in the classroom	-1	0	0	3
22	The plurality of students voices all be given a place in the classroom	1	1	-1	2
23	We must be critical of traditional curriculum and its role in maintaining traditional power dynamics. Real world change and freedom from oppression is possible by teaching students the skill of critical thinking	1	3	1	-1
24	Education is often used to oppress but it also has the potential to free the oppressed	2	0	0	0
25	Who creates curriculum has a direct bearing on who succeeds in educational system and who fails	1	0	0	3
26	Teachers are completely unnecessary and often impede student	-3	-3	-3	-1
27	Students are their own best teachers	-2	-1	-1	2
28	When a student is motivated to learn from real world situations, that is real education	0	1	1	0
29	Schools destroy children and their natural wonder with the world	-2	-2	-2	1
30	There is no need for children to attend school. They are capable of learning everything the need outside of formal education	-3	-3	-2	-2
31	A priority for our educational system should be excellence in those most able to attain it.	-1	-2	-2	-3
32	Curriculum should be constructed primarily on the grounds of on the grounds of intellectual and cultural, rather than more generally social, values	1	-1	-1	-3
33	We can't expect kids to be good at everything, but every child is good at something	0	3	1	0
34	Children's own developing needs should be central to the curriculum	-1	1	0	0
35	Contrary to the popular belief that education always must be always be pleasurable, I believe that the difficulties a child encounters in the classroom provide the real	2	1	2	1

	opportunities for learning				
36	Teaching does not cause or determine learning. Learning is always unpredictable and self-determined	-2	-1	-1	1
37	Programs that promote brain health, such as nutrition programs, are a vital part to successful education	0	0	2	-2
38	An ignorant teacher could still be a successful teacher True knowledge is constructed in the exchange between student and teacher.	-3	-2	-3	2
39	Literature and history, the sciences and mathematics should receive most curriculum time. Subjects like Latin, Greek, and art history have to be present in the curriculum if we are to produce educated people	0	-1	-2	-1
40	I believe that assessment of knowledge can take many forms. A dance or drawing could be adequate substitutes for a written paper	-1	0	-1	0
41	I would feel comfortable with a student submitting a high school level paper in 'texting'	-2	-2	-2	-2
42	I strongly disagree with the brining play activities into the activities into the classroom. The benefits of play are exhausted once formal schooling begins	-1	-3	-3	-3

# DEVELOPMENT OF A Q METHODOLOGY-BASED COURSE ASSESSMENT TOOL TO CAPTURE SHIFTS IN STUDENT THEORETICAL FRAMEWORKS DUE TO PARTICIPATION IN A VYGOTSKY MASTERS CLASS

By Natalia Gajdamaschko and Jason Lapenskie, Faculty of Education, Simon Fraser University, Canada.

**Abstract:** *This study uses Q-methodology to investigate graduate students and practicing teachers' theoretical perspectives concerning educational practice, based on their participation in a Vygotsky Master Class. Q methodology, as a small-sample, intensive methodology, assists in obtaining understandings concerning the subjectivity of participants that are not possible through more traditional means. It may also, as demonstrated in this paper, provide evidence in support of theoretical work. Four factors emerged at the beginning of the Vygotsky seminar representing diverse views on education by graduate students. After the seminar, all students in the cohort merged into one factor. The findings are considered in the light of Lev Vygotsky's work, which provides an alternative way to theorize the relationship between learning and development. Vygotsky maintains that the highest level of conceptual development and understanding is always connected to what is happening in a social practice, such as teaching, that requires the participants to have self-descriptions that are constitutive of their involvement. Our findings challenge teachers to reflect more deeply on their practices.*

A Masters Course in Vygotsky theory has been taught at the Faculty of Education of Simon Fraser University for the last decade by one of the authors of this study. This seminar level course is situated within a two year masters program offered by SFU. The course is designed to mirror current discourse on Vygotsky theory in North America with the need for a careful examination of the intercultural appropriation of Vygotsky and clear recognition of the pitfalls of such appropriation.

The benefit of providing embedded Q methodology- based assessment into the Vygotsky Masters course would be to integrate the learning experiences of students with course assessment. Such an integration becomes more complicated when the course is mainly theoretical in nature and aims at unsettling the previous theoretical frameworks of students. The main criterion to be assessed then becomes not a conceptual understanding in itself, but a dynamic of conceptual change.

Q methodology, as a small sample, intensive methodology typically assists in obtaining an understanding of the subjectivities of the participants that is not possible through more traditional means (e.g., traditional R-surveys or tests and assignments that contribute to the grading process). It may also provide support in understanding theoretical frameworks, thus assisting in observing the occurrence of changes in theoretical positions of participants.

The power of Q methodology lies in its ability to gain insight into the self-understandings of the participants in the study. This is particularly useful when dealing with theoretical views which are held in a manner that conflates the normative, expressive and discursive functions. This methodology can assist in obtaining understandings concerning the interpretative subjectivity of participants that is not possible through traditional positivistic research methodology (Brown, 1993; Brown, 1980). Traditional positivist research methodologies remain prominent in educational research.

Our study, like many recent Q studies (see a sample in the annotated literature review in the attachment), is designed to lead to new insights into the possibility of using a Q methodology based course assessment tool to capture shifts in students attitudes due to participation in a particular course.

**Research Questions:**

- What are the strengths and weaknesses of the Q methodology in documenting a conceptual shift in students taking my Vygotsky Masters class?
- What can I as an instructor learn from the Q methodology findings in terms of changes in my teaching?

We chose Q methodology because we believe that it is a way to study the “subjective” part of behavior and learning activities of students in my class. Q methodology makes possible the analysis of educational discourses that students engage in prior to entering my Masters course and after the course of study. Q sorting discloses the implicit structures of their discourses, and these may then be interpreted with the aid of quantitative techniques (correlation and factor analysis). Q methodology makes it possible to correlate persons instead of tests or responses (Stephenson, 1953), thereby allowing the participants’ perceptions to form the basis of the resultant factors. Rather than trying to define “independent variables” and to test them on a student population in a classroom, we can “analyze them instead from the point of view of the person who did the rating, because theirs are the actual operations at issue” (Stephenson, 1953, p. 40).

One of the major requirements for creating a good Q methodology -based classroom assessment tool lies in identifying a concourse. The concourse is the communication about the topic of interest, in this case educational philosophy. From this concourse, a sample of statements is drafted that represents the diversity of the community. The analysis of the sorts yields information about student beliefs, attitudes, etc. The pre- and post-course sorts illustrates that some of the graduate students ideas, attitudes, etc. have changed after completing the course. For our study, the relevant concourse is the array of ideas, attitudes, feelings, values and perceptions that different individuals may associate with the core idea of education’s purpose. We choose the statements that accompanied diverse theories and practices in current North American education. (please, see Attachment #1).

**Implementing the Q Study**

First, we identified the topic we wished to explore as the theoretical perspectives of educational stakeholders in education. We were particularly interested in that area of contemporary educational discourse that concerns competing theoretical ideas about education and the appearance of new ideas from Vygotskian theory, for example the idea of "mediation" or “psychological tools.” Second, in order to obtain a series of statements that represented the discourse on the topic, we borrowed heavily from Egan’s analysis of the main competing ideas in contemporary educational thought and from our analysis of a set of 2-year Masters degree courses currently taught at the Faculty of Education. Our main concern during the statement generation phase was to insure that the resultant set of statements represented the issues that educational stakeholders might hold. Third, the participants in the Q study were asked to rank 42

statements on a scale ranging from +3 (“agree with most strongly”) to -3 (“disagree with most strongly”).

We administered Q sorts to a total of 10 graduate students, participants in the Vygotsky Masters Class in the Summer semester of 2013 at the Faculty of Education. Because this research project sought to not only uncover existing replicas or models of individual perspectives on education, but also to see if those perspectives change due to participation in the Vygotsky seminar, we administered Q-sorting twice - before and after the seminar. The "person" sample therefore included respondents from different levels of educational system in British Columbia (graduate students). Among them were three working at the college level, three currently teaching in the ESL system and four teaching in the public school K-12 system.

Fourth, the Q sorts were subjected to factor analysis of the rankings that allowed for the extraction of a few “typical” Q sorts (factors) that captured the common essence of several individual Q sorts. These “typical” Q sorts were then interpreted by investigators to give a verbal explanation to the discourses uncovered by the statistical procedure.

### **Interpretation**

We used PQ Method software with varimax rotation to analyze the Q sorts. A four-factor solution shows the best correspondence of participants’ views. The factor-loading matrix is shown in Table A. The factor loadings for each Q sort indicate its correlation with the factor. For example, Q-sort 10 has a significant loading of 0.83 into the Factor 1, with all scores above 0.43 significant at  $p < 0.01$ .

Using the z scores and the weighted average placement for each statement by each factor, we determined educators’ perspectives of the four factors. In doing so, we focused on the statements placed in the +3/+2 and -3 /-2 categories in the different factors. We also focused on distinguishing statements for each factor, that is, those that are statistically different from the placements of the other factors. The Appendix shows the weighted average placement (rank) of each statement by each factor. These average weighted placements are constructed through z scores that calculate the average placement of each statement by the educators who loaded significantly on the factor.

Our analysis of the factors that emerged and their weighted averages yielded the following description of the four perspectives of educators in our study (see Table 1 on page 5).

#### **Factor 1. Education Should Focus on the Interiorization of Cultural Tools.**

This factor is based on the educational theories of Lev Vygotsky. Education is primarily an organized activity assisting the young to make sense of the world by use of mediating intellectual tools that in turn profoundly influence the kind of sense that we make. Our educational development, then, cannot adequately be understood in terms of becoming appropriately socialized, or merely through the knowledge we accumulate, or in terms of psychological stages but requires an understanding of the role played by cognitive/cultural tools available in the socio-cultural realm in which the child lives.

The students who comprise Factor 1 favor the idea of conceptual development in education and they value the wide range of cultural tools that, in their view, should be a part of

schooling. This is the only group who sorted positively (+3) Statement 13, *Teaching concepts is important for the content of the concept and also to develop the ability to think in concepts.*

In discussing the role of the teacher this group of educators agreed strongly (+3) with Statement 11, *I believe a central role for the teacher is to mediate understanding for the student, moving them from an early grasp of a subject to full comprehension through whatever means proves effective.* And they disagree with the idea that teaching should be merely facilitating, thus they sorted negatively (-2) Statement 27, *Students are their own best teachers.*

They also consider the introduction of psychological/cultural tools by a teacher to be the major source of development of a child's mind and therefore they disagreed (-1) with the Statement 10, *True understanding of anything can only come from direct experience.*

### **Factor 2. Unschooling.**

This factor seems to be based on ideas of unschooling. Unschooling is an educational method and philosophy that rejects compulsory school as a primary means for learning . Unlike Factor 1, Factor 2 mostly doesn't see the role of schooling as important in mediating child development. This group is the only one that agreed with the Statement 30, *There is no need for children to attend school.* And they strongly disagreed with the statement that represents the Vygotskian idea of "teaching leads development" (Statement 25, *Who creates curriculum has a direct bearing on who succeeds in education systems and who fails).*

### **Factor 3. The ignorant teacher could be a good teacher.**

This idea is based on the notion that education should follow the natural and spontaneous development of the child's whole self and has its roots in the work of Jean-Jacques Rousseau. Thus, this is the only group who strongly agreed (+3) with the Statement 21, *I believe the best teachers relinquish their power.*

Similarly, this is the only factor who strongly believe (+2) that *An ignorant teacher could still be a successful teacher* (Statement 38). The key to learning is that it follows an underlying natural development. Thus this group strongly agreed with the Statement 29, *Schools destroy children and their natural wonder with the world.*

### **Factor 4. Socialization (Dewey): Education Should Focus on Socializing the Child**

This Factor emerges from the idea that education's primary role is the socializing of the child. This view of education is based on the idea that the central mandate of schools is the socialization of the young into a set of dominant attitudes. School is seen primarily as a social agency and the curriculum is mostly made up of such constructs as life skills and work preparation courses. This idea is related to the now popular notion that schools are the places where the young are prepared for life in the economy. They agree strongly with the Statement 22 that *When a student is motivated to learn from real world situations, that is real education.* And they maintain that *The main goal of education is to equip students with the knowledge and skills best suited to ensuring their success as citizens* (Statement 2).

This group of educators, unlike any the other groups, strongly believes that teachers are important socializers in our society. They are the only group that sorted strongly positively (+3) the Statement 1, *I believe that teachers should be role models.*

**Discussion on study results and possibility of using Q-methodology based assessment tool in graduate seminars in educational field.**

From the analysis of the Q sorts, four factors emerged in our Masters class prior to the start of the semester. Our analysis of the factors easily mapped onto ideas central to current educational discourse. The factors thus provide some evidence that this discourse is diverse – and even include the idea of “unschooling.”

Our study shows that today’s educational practice represents an amalgam of often divergent views concerning learning, teaching, the curriculum and the child. The finding of these four perspectives in this relatively small group of educators should not be considered as necessarily generalizable to the entire population of educators in our society. Yet, we do show

some evidence that graduate students in education hold diverse and at time incompatible ideas about educational theories prior to engaging in their study of Vygotskian theory.

We also found that after the Masters class all students shifted into Factor 1. However, some of our students had already conceptualized according to the Factor 1 from the beginning. The results that were obtained are not surprising but confirm that Vygotsky theories are providing substantial influence in the educational discourse in North America.

Our study indicates some promising possibilities for using Q-methodology as an evaluation tool in graduate seminars in the field of education. Pre-and post-seminar Q-sort comparisons reveal that some but not all the graduate students shifted their perspective on educational issues as a result of participation in the Vygotsky Masters class. Realignment of students' attitudes with Factor 1 that represents mostly Vygotsky's theory and notions of education could therefore be interpreted as a positive evaluation of their work in the course.

However, a few questions remain unanswered by the study. One of them is to what extent are the graduate students' results influenced by the topics of the seminar prior to engaging in graduate work?

In addition, our study revealed that quite a few statements from our concourse held no discriminatory value --e.g. they were interpreted by a majority of study participants as neutral and not related to their own attitudes towards education. And, although we invested serious efforts in analyzing the concourse and attempted to create a balanced Q-sort statement matrix, more work needs to be done in the next study to refine the concourse matrix and to make sure that it represents the educational discourse and Vygotsky theory ideas more fully.

But even with these limitations, we believe that the power of Q methodology-based assessment and evaluation is its ability to provide a strong starting point for discussions in the Masters classroom based on newly gained insights of participants' self-understandings. As a result, classroom dialogs become more structured and productive and students gain deeper understanding of competing educational theories.

**Sample of the annotated literature on Q methodology-based assessment of classroom practices:**

Wilson, D. D. (2007). Revealing shifts in attitude among undergraduates participating in academic service learning programs. *Operant Subjectivity*,30(1/2), 23--51.

“The primary goal of the current investigation was to examine how (or whether) participation in the course and the practicum might be associated with changes in the students’ attitudes towards teaching and learning” (p. 28). They compared pre-and post-term factor structures for evidence of attitude change. The results show that while marked shifts in attitude did occur during the class, the mindsets that the undergraduates brought with them into the program influenced the nature of those changes.

Popovich, M., Masse, N. Pitts, B. (2003). Revisiting student writer apprehension: A new interpretation of the Riffe and Stacks's writing apprehension measure. *Operant Subjectivity*, 26(3). The goal of this study of entry level media writing students at a Midwestern university was to determine whether their attitudes toward writing changed during the interval from beginning to end of their first (100 level) college journalism class. A well-conceived and tested empirical tool for measuring writing apprehension was adapted for use as a Q sort. An individual assessment of writing apprehension was obtained by using Q methodology to provide a personalized (subjective) measure of attitudes as opposed to analyzing group norms, thus confirming and extending previous research on the phenomenon conducted by Riffe and Stacks. The application of Q methodology provided a deeper understanding, that supported, but in some instances, altered, the interpretation of previous observations. Data from the Pre- and Post-Class Q sorts were compared to assess the impact of the class on student attitudes toward writing. This study demonstrates the realignment of student confidence and career goals that accompanies increasing acquaintance with the realities of the chosen profession provided by the initial professional class.

Abstract:

**ABSTRACT**

While little is known about the role of Curriculum Directors, their position has historically been associated with the work of teaching and learning. Due to the growing sense of urgency created nationally by the legislation of No Child Left Behind, there is a present need to more deeply understand the role of Curriculum Directors as a key position in school improvement.

This descriptive multiple case study examines the role of Curriculum Directors in Wisconsin public school districts to advance teaching and learning. The perspectives of four Curriculum Directors with a reputation for playing a key role in school improvement are included in the study. The Public Education Leadership Project (PELP) Coherence Framework elements are used to provide a lens through which to analyze the work of the Curriculum Directors (Childress, Elmore, Grossman & Johnson, 2007). These framework elements include culture, structures, systems, resources, and stakeholder relationships.

The purpose of this study is to contribute to a limited body of research on the role of Directors of Instruction by examining the emerging role of Curriculum Directors, the actions and behaviors of Curriculum Directors, and the role Curriculum Directors play in district improvement. The focus of the research is to determine the ways in which Curriculum Directors in high performing public school districts use the elements identified in the PELP Coherence Framework (Childress, et al., 2007) to advance teaching and learning in their schools.

From the research emerged several key findings about the school improvement actions of Directors of Instruction. First, all four Curriculum Directors utilized the elements of culture, structures, systems, resources, and stakeholder relationships from the PELP Coherence Framework in their work to advance teaching and learning (Childress, et al., 2007). Second, the actions of the Curriculum Directors varied, as did the contexts within their respective school districts. Third, the complexities of the Curriculum Directors' roles in each district were exposed through the themes that emerged in the cross-case analysis.

This is one of the first research studies done on the role of Curriculum Directors. This qualitative study has contributed to a currently limited body of research on the ways in which Directors of Instruction go about the work of school improvement. Examining the practices of Curriculum Directors provides practical insight for school district leaders on the central problem of increasing the achievement levels of all students. The PELP Coherence Framework utilized in this study expands the reader's understanding of its usefulness in the work of successful organizations. The descriptive case studies provide an in-depth understanding of the essential role Directors of Instruction play in school improvement, and a practical perspective for looking systematically at how to improve coherence within learning organizations. Collectively, these insights provide a foundation for future research and inquiry.

“Increasing Achievement by Improving Climate”

## ABSTRACT

This three year quantitative study focused on the impact of selected interventions from an integrated middle school social emotional learning program. The school specific program was created and based upon best practices and the premise that a school's learning climate can be changed negatively or positively dependent upon the adult staff's beliefs and expectations, and thus affect student achievement as such. Specifically, this study looked at the length of implementation of certain program interventions and their impact on: 1) Reading achievement as demonstrated on the Illinois State Achievement Tests; and 2) an increase in positive student learning climate as demonstrated through discipline data. Descriptive statistics demonstrated that the longer a class participated in the program, the fewer discipline instances there were. They also showed that the longer the participation, reading achievement improved for the class as a whole, as much as 3.8%, as shown through state standardized testing. Analysis of the data concerning student achievement shows the following behaviors (dependent upon the class) were reduced from 33% to 100%: Skipping class, insubordination, classroom disruption and tardiness. With regards to improving school climate, the following behaviors (dependent upon the class) were reduced from 33% to 100%: Aggressive behavior, harassment or intimidation, inappropriate comments, and verbal threats. Implications and recommendations for further research include replicating this program and study (with age appropriate changes made) at the elementary and high school levels.

**Key words:** Climate, social and emotional learning, effective schools, reading achievement, 40 developmental assets, middle school

## **Increasing Achievement by Improving Climate**

### **Introduction**

In July of 1966, James S. Coleman published the results of his landmark study entitled “The Equal Educational Opportunity Survey”. This study investigated the equality of educational opportunities, and he reported that family background and peer influences, not the school, were the major determinants of student achievement (Coleman, 1966).

In response to this report, Edmonds (1979) and Brookover and Lezotte (1977) determined to research the characteristics that positively impacted student achievement in successful schools. They did this by comparing successful schools to unsuccessful schools. Through their research, they found that there were unique processes and qualities that were similar in those schools in which students were successfully learning, regardless of their family backgrounds. With their studies, the effective schools movement was born and they were able to define seven correlates of effective and successful schools (Brookover & Lezotte, 1977; Edmonds, 1979). These correlates consist of having: 1) A clear and focused school mission; 2) a climate of high expectations for student success; 3) instructional leadership; 4) frequent monitoring of student progress; 5) an opportunity to learn; 6) a safe and orderly environment; and 7) positive home-school relationships.

Brookover and Lezotte (1977) also determined that the learning climate in a school explained as much of the student achievement differences as did his or her socioeconomic status. Continued research in effective and successful schools has shown that the school learning climate is highly associated with levels of student achievement.

Studies and reports published in the 1980s focused on what educators needed to do or change so as to achieve school success, increase student achievement, and demonstrate increased accountability. One such report, “A Nation At Risk” (National Commission on Excellence on Education, 1983), concluded that the decline of American student performance was often due to inadequacies in the way that the educational processes were conducted. The 1990s brought forth additional research relating to these educational processes including the molding of student character (Search Institute, 1990), and the handling of student behavior and discipline (Colvin, Kameenui, & Sugai, 1993), as well as what kind of an impact these processes had on student achievement. As a result of these historical initial studies on student achievement and school effectiveness, these research topics continue to be on the forefront today.

Throughout education’s history, as well as our nation’s history, the emphasis on increased student achievement and accountability has never been higher than is found in all perspectives of education today. This increased emphasis has steadily manifested itself every year through the passage of new and unfunded federal mandates such as the “No Child Left Behind Act” (U. S. Government, 2001), as well as new and unfounded individual state mandates.

In Illinois, one such mandate is the Children's Mental Health Act of 2003 (Illinois State Board of Education, 2013). It requires all school districts to have a K-12 social and emotional learning program that is aligned to ten standards that the Illinois State Board of Education has adopted. Each standard includes goals, age appropriate benchmarks, and performance descriptors that focus on quality social and emotional instruction in which students learn to recognize and manage their emotions, demonstrate caring and concern

for others, establish positive relationships, make responsible decisions, and handle challenging situations constructively (Illinois State Board of Education, 2013). The rationale for this act is that a quality student social and emotional learning program that is implemented with fidelity, can result in positive outcomes such as: 1) Students feeling connected to the school; 2) a reduction in student absenteeism and suspensions; 3) improved student academic outcomes; and 4) a safe, caring, participatory and responsive school climate will result (Illinois State Board of Education, 2013).

A meta-analysis of K-12 school-based social and emotional learning programs involving over 270,000 students demonstrated that those who have participated in these programs improved standardized test scores by up to 11 percentile points as compared to control groups, and there was a decline in disruptive behaviors (Durlak, Weissberg, Dymnicki, Taylor, & Schellinger, 2011).

### **Background of the Study**

The Indian Creek School District is a rural PK-12 school district, located approximately 75 miles west of Chicago, Illinois, and it encompasses the communities of Shabbona, Waterman, Lee, and Rollo. The district's mission statement is "Striving for excellence in learning" and all schools in the district subscribe to this mission statement. Teachers are partners with the administration in serving that mission. Historically, the district has been a fairly homogeneous middle class district; however, data from 2008-2009 (the baseline data year of this study) through 2011-2012 (the last year of this study), reveal that the district's demographics, including those at Indian Creek Middle School have changed significantly.

One of these changes is with regards to dropping enrollments at both the district level and the middle school level. During the 2008-2009 school year, the district had a student enrollment of 873 students of which 194 were at the middle school level; however, by 2011-2012 the district population had dropped to 803 students, with 187 of them in the middle school.

In addition, the middle school's demographics have seen a rise in the student mobility rate (by 0.80%), a rise in students who have limited English proficiency (by 1.6%), and a rise in students who fall into the low income category (by 7% which now means that 24.5% of all middle school students, grades 6-8 are in this category).

### **Need for the Study**

With the passage of the 2001 "No Child Left Behind Act" (U.S. Government, 2001), the accountability bar for student achievement is to be raised by 7.5% for every year until 2014 (the year by which all students are to be at the 100% achievement level). An additional requirement listed in this act is that all public schools are to establish a safe learning environment. Various researchers have noted that a high frequency of student discipline incidents is a negative construct that hinders teachers from teaching, and as a result, students are unable to develop the needed skills to successfully pass state standardized testing (Howard, Howell, & Brainard, 1987; Hernandez & Seem, 2004). Coupling this mandate with the 2003 Illinois social and emotional learning program mandate, as well as research that has indicated that if schools have minimal student discipline problems, students have a better opportunity to learn (NCES, 2005; Howard et al, 1987), this study was needed to determine if an aligned integrated middle school

social and emotional learning program would have any impact on discipline reduction or reading achievement, as increasing student reading achievement is a yearly district goal.

It is important to note at this time, that during the 2007-2008 and 2008-2009 school years, each school in the Indian Creek District went through a social and emotional learning curriculum audit, determining which of the mandated Illinois standards, goals, and descriptors were already in place and which standards needed to be added where, as well as which areas needed strengthening through the additional curriculum integration of goals, descriptors, best practices and research-based strategies. In 2009-2010, this newly revised social and emotional learning program was implemented at Indian Creek Middle School. It was also during this time frame that Illinois required each school district to create and prepare a “Response to Intervention” program that was to include both behavioral and academic learning interventions for students at all grade levels.

Previous to this timeframe, as a part of their middle school philosophy, Indian Creek Middle School already had various aspects of a social and emotional learning program in place. After the curriculum audit in this area, the revised program maintained its former name of “RECS” which stands for “Respect, Effort, Courtesy, Safety”. With this former program, students who had no detentions or suspensions during a quarter were invited to attend an end-of-the quarter RECS rewards activity (i.e. attending a semi-pro baseball game, attending an all school bowling party, etc.). With the new program, this has not changed, nor has the fact that every expectation for middle school students was and is related to one of the four RECS words. During any teachable moment, staff will speak with students about their conduct and choices in terms of RECS—respect,

effort, courtesy, and safety. While these practices continue, as a result of the newly revised social and emotional learning program, additional strategies have been included such as: 1) As a part of advisory or a class, specific pertinent social and emotional topic lessons are taught (i.e. independence, resiliency, self-esteem, anti-bullying) as a part of advisory or integrated into a class lesson; 2) the AIMSWEB behavioral screener is used to target individual strategies towards the individual needs of students); 3) small group skills set work is provided by an outside source; 4) whole group skills set work is provided by the social worker in areas such as conflict resolution, good problem-solving, effective decision-making, etc.; 5) leadership skills are explored through an exploratory class; 6) community service participation projects have been increased; and 7) there is class integration for teaching life skills such as being respectful of diversity, being organized, and making healthy lifestyle choices.

### **Purpose of the Study**

The purposes of this three-year longitudinal study were to determine if the newly revised integrated social and emotional learning program at Indian Creek Middle School was successful in reducing discipline instances, and to also determine if there was any relationship between middle school student discipline incidents and middle school reading achievement as measured by Illinois state standardized testing. Because increased reading achievement is a yearly district goal, student progress in this area is frequently monitored through teacher-made tests, textbook company assessments and standardized testing procedures that include AIMSWEB, NWEA's "Measures of Academic Progress", and the Illinois State Achievement Tests, with results being shared with parents.

## Conceptual Framework

The conceptual framework for this study is made up of certain assets from the 40 developmental assets (Search Institute, 1990) that compliment each of the seven correlates of effective schools (Brookover & Lezotte, 1977; Edmonds, 1979). In 1990, the Search Institute (Search Institute, 1990) released this developmental framework of 40 skills, experiences, relationships, and behaviors that have demonstrated that the more of them that a child is able to acquire, the better his or her chances are of succeeding in school and becoming a happy, healthy, and contributing member of the community and society. Among those assets that complement the effective schools research are: 1) The school provides a caring, encouraging environment; 2) parents are actively involved in helping the child succeed in school; 3) the school provides clear rules and consequences; 4) the young person feels safe at home, school, and in the neighborhood; 5) adults model positive, responsible behavior; 6) there are high expectations for the young person; 7) the young person is actively engaged in learning; and 8) the young person is motivated to do well in school. Additional important assets include: 1) the young person acts on convictions and stands up for her or his beliefs; 2) the young person tells the truth even when it is not easy; 3) the young person accepts and takes personal responsibility; 4) the young person has empathy, sensitivity, and friendship skills; 5) the young person has a knowledge of and comfort with people of different cultural, racial, ethnic backgrounds; and 6) and the young person seeks to resolve conflict non-violently. All of the above stated assets easily work in tandem with the seven correlates of the effective schools research (as explained below).

The first correlate of an effective school is that of “having a clear school mission”. As previously noted the mission statement of Indian Creek Schools is to “strive for excellence in learning”. This clear mission of excellence is defined by having a staff and leadership team that share an understanding of and commitment to accountability, instructional goals, priorities, and assessment procedures (Lezotte, 1991). It also includes the commitment of motivation for both students and staff.

Having effective instructional leadership is considered to be a second correlate of an effective school. The principal is a positive role model, and is not the only leader, but rather a “leader of leaders” (Lezotte, 1991, p. 3), one who collaborates with teachers on decisions regarding instructional goals.

This correlate is enacted on a daily basis in the Indian Creek School District through the use of whole faculty study groups (Murphy & Lick, 2005). Since the 2007-2008 school year, all administrators and certified staff have been a member of a whole faculty study group (WFSG) since the 2007-2008 school year. Each of these groups of four to six members studies data pertaining to a specific student improvement focus, whether it is behavioral or academic. After data analysis, the WFSG offers hypotheses as to why the data says what it says, and strategies for improvement to the whole school. All staff and the principal then determine which strategies are right for implementation in their school. Strategies are planned for and implemented, data is then collected and analyzed again, and the cycle begins anew, with the emphasis on continuous school improvement and increased student achievement. It was through the study of WFSGs and the results of Indian Creek Middle School’s social and emotional learning curriculum

audit that new interventions, strategies, processes, and best practices were integrated into the existing middle school social and emotional learning program.

A third correlate of an effective school (and one of the developmental assets) is that of there being high expectations for success. This concept emphasizes having a school climate in which the staff believes and demonstrates that all students can achieve mastery of the school's essential curriculum (Lezotte, 2001). Similar to the third correlate is the fourth correlate (and again one of the developmental assets) is that of having “a safe and orderly environment” (Lezotte, 2001). This means that the school is one in which all are free from physical harm and all are able to show respect for human diversity. These schools are places where undesirable behaviors are eliminated and where desirable behaviors are taught and modeled by all.

The fifth correlate of an effective school is that of frequent monitoring of progress (Lezotte, 2001). For Indian Creek Middle School, this means the monitoring of student achievement, as well as negative student behaviors that impact that achievement, and the school climate. In 2008-2009 an in-district data warehouse was created so that student discipline incidents could be monitored more discreetly due to increasing instances of discipline. These increasing instances were impacting teachers' ability to keep a safe and orderly environment, as well as the school's learning climate, even though teachers worked to keep all students on task, while providing them with multiple opportunities to learn {correlate number six “providing students with opportunities to learn and time on task” (Lezotte, 2001)}. Data that year indicated that more bullying instances (threats, harassment, aggression, intimidation) were occurring which impacted the learning climate, and thus student achievement. As defined by the general assembly in Illinois

school code, bullying is any behavior that causes physical, psychological, and emotional harm to a student and that interferes with his or her ability to learn and to participate in school activities. These behaviors were critical to monitor as being bullied shows that it can lead to academic problems such as a decrease in school performance, absenteeism, truancy, dropping out, peer problems, and health problems (Bonds & Stoker, 2000; Horne, Bartolomucci, & Newman-Carlson, 2003).

The seventh correlate of an effective school is that of having a positive and strong home-school relationship in which parents are actively involved in their child's education (Lezotte, 2001). The schools in the Indian Creek School District have worked diligently to be a partner with parents. For the baseline data year of this study (2008-2009) and the ending year of the study (2011-2012), the Illinois School Report Cards for Indian Creek Middle School indicate that it had and maintained 100% parent contact.

The conceptual framework for this study pertaining to the impact of a newly revised aligned and integrated middle school social and emotional learning program is appropriate as research has determined that when school improvement processes based upon the effective schools research are implemented, student achievement either improves or at the least, remains the same (Association of Effective Schools, 1996).

### **Research Questions**

The guiding research questions for this study were:

1. As a result of the revised and integrated middle school social and emotional learning program, by grade level, will there be a decrease of discipline instances?
2. As a result of the revised and integrated middle school social and emotional learning program, by grade level, will there be an impact on reading achievement?

3. By grade level, will discipline instances diminish the longer that a grade level has been exposed to the revised and integrated middle school social and emotional learning program?
4. For the top 30 regular education discipline offenders in the 8<sup>th</sup> grade class of 2011-2012 who have had three years of the revised and integrated middle school social and emotional learning program, is there any relationship between the number of their discipline instances and their reading achievement from their first year of interventions to the last year?

### **Null Hypotheses of the Study**

1. By grade level, there will be no decrease in discipline instances as a result of the revised and integrated middle school social and emotional learning program.
2. By grade level, there will be no impact on reading achievement as a result of the revised and integrated middle school social and emotional learning program.
3. By grade level, the number of discipline instances will not diminish the longer that a grade level has been exposed to the revised and integrated middle school social and emotional learning program.
4. There will be no statistically significant correlation between the discipline instances and the reading achievement for the top 30 regular education student discipline offenders in the 8<sup>th</sup> grade class of 2011-2012, as measured from their first year of the interventions to the last year.

### **Methodology**

While all types of discipline instances were monitored through use of an in-house data warehouse (begun during the 2008-2009 school year), for the purpose of this three

year longitudinal study, those discipline data that most negatively impacted school climate (threats, harassment, aggression, or intimidation) and those that most negatively impacted student achievement (disrespectfulness to teachers, disruptions, insubordination, missing or late work, cheating, being tardy, or skipping class) were studied. Descriptive statistics on these behaviors were performed on middle school grade level data for the 2009-2010, 2010-2011, and 2011-2012 school years to determine if the percentage of discipline instances had gone up or down in each of the following areas: Threats, aggression, intimidation or harassment, inappropriate/disrespectful comments, disrespectfulness to a teacher, classroom disruptions, insubordination, missing or late work, being tardy, or skipping class. Descriptive statistics were also performed (again on middle school grade level data for the same time period) to determine if the number of years of social and emotional learning program interventions that a middle school grade level had received had any impact on their number of discipline instances. Then, descriptive statistics (on middle school grade level data for the same time period) were performed to determine if the number of discipline instances had any impact on the middle school grade level's reading achievement. Finally, a test for the Pearson product moment correlation coefficient was performed on data from the top 30 regular education discipline offenders from the 8<sup>th</sup> class of 2011-2012 (representing 48% of the class). This was done so as to determine if there was a correlation between their discipline instances and reading achievement.

### **Findings**

There were four null hypotheses in this study that encompassed four research questions. The first null hypothesis was rejected. It stated that there would be no decrease

in discipline instances as a result of the revised and integrated middle school social and emotional learning program. Descriptive statistics demonstrated that the longer a class participated in the program, the fewer discipline instances there were and thus a more positive learning climate was present. With regards to improving school climate, the following behaviors (dependent upon the class) were reduced from 33% to 100%: Aggressive behavior, harassment or intimidation, inappropriate/disrespectful student comments, and verbal threats.

The second null hypothesis was also rejected. It stated that there would be no impact on reading achievement as a result of the revised and integrated middle school social and emotional learning program. Descriptive statistics demonstrated that the longer a class participated in the new program, reading achievement either stayed the same or it improved for the class as a whole, as shown through state standardized testing. For the class that had only one year of the program, their reading achievement went up by a .80 percentile rank; for the class that had two years of the program, their reading achievement stayed flat and they did not regress, and for the class that had three years of the program, their reading achievement went up by 3.80 percentile ranks. Analysis of the behavioral data concerning student achievement shows the following behaviors (dependent upon the class) were reduced from 33% to 100%: Skipping class, missing or late work, disrespectfulness to a teacher, insubordination, classroom disruption and tardiness.

The third null hypothesis was rejected too. It stated that by grade level, the number of discipline instances would not diminish the longer that a grade level was exposed to the revised and integrated middle school social and emotional learning program. Descriptive statistics and data charts demonstrated that after about one and one-

fourth full school years of the social and emotional learning program, discipline by class began to decrease overall. The class that participated in the program for one year increased its discipline instances by 3, while the class participating in the program for two years reduced its discipline instances by 30. The class that participated in the program for three years reduced its discipline instances by 39.

The fourth null hypothesis was accepted. It stated that there would be no statistically significant correlation between the number of discipline instances and the reading achievement for the top 30 regular education student discipline offenders in the 8<sup>th</sup> grade class of 2011-2012 (representing 48% of the class), as measured from their first year of the new revised and integrated middle school social and emotional learning program to the last year. The Pearson product moment correlation coefficient showed a very low positive correlation ( $r = .24$ ). While the P value of this correlation coefficient at .05 was not statistically significant, the very low positive correlation could mean that because students were now spending more time on task and less time was being used for discipline, a more positive learning climate was present. In turn, this offered additional time and opportunities for success for all students in the area of reading achievement; however, the relationship is very weak.

### **Conclusions**

Specifically, this three year longitudinal study looked at the length of implementation of certain social and emotional learning program interventions and their impact on: 1) Reading achievement as demonstrated on the Illinois State Achievement Tests; and 2) an increase in positive student learning climate as demonstrated through discipline data. The findings of this study indicate that while a statistically significant and

strong correlation between decreased discipline instances and increased reading achievement could not be found (when using individual student cases), data for classes as a whole indicated that the longer a class participated in the newly revised social and emotional middle school program, the more apt it was to show no regression or an increase in reading achievement, as well as a decrease in the class number of discipline instances. Discipline instances specifically monitored for this study were those that impacted school climate (verbal threats, harassment or intimidation, aggression, and inappropriate/disrespectful student comments), and those that impacted student achievement (disrespectfulness to a teacher, classroom disruptions, insubordination, missing or late work, being tardy, or skipping class).

As a result of this study, it is recommended that middle schools that would like to see a decrease in student discipline and an increase in reading achievement perform some type of an audit that concentrates on what they are doing in terms of: 1) Providing a social and emotional learning program; 2) eliminating specific student behaviors that negatively impact the school climate; and 3) eliminating specific student behaviors that negatively impact student achievement. Recommendations for further research include replicating this program and study (with age appropriate changes made) at the elementary and high school levels.

## **Stereotype Threat for Female Students in Engineering Education: Data Mining in Media Databases and students' Drawings**

Pao-Nan Chou, Assistant Professor  
Department of Education  
National University of Tainan, Taiwan  
pnchou@mail.nutn.edu.tw

### **Poster Abstract**

In the field of engineering education, female college students are regarded as one of minority groups. From a student admission's perspective, male college students dominate in the engineering schools. The unbalanced population may influence the overall development of engineering education, which is one of elements in STEM (Science, Technology, Engineering and Mathematics). In the literature, some scholars attribute this phenomenon to society's stereotype threat for female students.

The purpose of the current research is to explore how a stereotype threat exists in online media databases and students' drawings. Two studies were conducted to fulfill the research objective. One quasi-experimental study analyzed current media databases, including Google Image and Yahoo image. A content analysis were performed to compare the ratio between male and female engineering images. The findings show that male engineer images dominate in the media databases. About 90 percent of searched engineer images are male.

Another qualitative study examined 150 elementary students' drawings regarding the engineer image. The content analysis was also used to observe the drawing contents. The results show that almost 95 percent of students perceived that engineer should be male. Students' drawings contain several stereotype information regarding the definition of an engineer.

### **Biracial College Student: How do They Self-Identify and What Attitudes Do They Hold?**

One of the fastest growing sub-groups of color at today's colleges and universities is the bi-racial/multiracial population. This trend is predicted to continue. In fact, it is estimated that one in five new students will identify as bi/multiracial by 2050 (Brown, 2009).

While race is often thought of as static (Gossett, 1997) and is used to delineate group membership, researchers of identity theory suggest that biracial individuals may identify along a continuum of racial identities (Root, 1996; Renn, 2008; Rockquemore & Brunsma, 2002, 2008). How one chooses to self-identify is impacted by parenting/family practices and experiences (Katz & Kofkin, 1977; Rollins, 2009; Lyda, 2008), physical appearance (Renn, 2000), cultural knowledge, and peer culture (Renn, 2008). Root (1996) suggests that multiracial individuals are constantly negotiating multiple perspectives in order to feel socially accepted in mainstream cultural domains. Whether or not one's self-identity is validated by others may have an impact on the biracial students' sense of efficacy (Bracey, Bamaca, & Umana-Taylor, 2004).

As this population of bi/multiracial people grows, some of "the ways we do things" are being challenged. The new U.S. Department of Education guidelines require colleges to report students who claim membership in more than one racial category as belonging to "two or more

racess” (Schmidt, 2010). Heated arguments were held regarding the addition of a “two or more races” category to the 2000 U.S. Census (Thornton, 2009). Some multicultural groups feel this addition does not go far enough. They advocate for the addition of a “biracial” category to the Census form. And while there are racial tensions in this country among various racial/ethnic groups, what attitudes do biracial students hold regarding the state of race in the United States? As this population increases, greater attention should be directed toward an understanding of the attitudes and perspectives held by this community. Increased knowledge can assist parents, communities, employers, and college and universities to create a welcoming environment for this growing population.

Several racial identity theories have been developed and studied. The conceptual framework for this study was built around racial identity theories of Root (1996), Kristen (2004) and Rockquemore & Brunisma (2002) which consider factors that impact how the biracial individual self-identifies.

Maria Root proposed a theory of identity formation that relies on the individual’s abilities to be comfortable with their definition of themselves at any given moment while crossing identity borders (Root, 1996). Renn (2008) identifies five patterns of identity ranging from a mono-racial identity, to multiple monoracial identities, a distinctly multiracial identity, no racial identity, to a situational identity. Rockquemore & Brunisma (2002) proposes a “mixed race” identity model with four categories: border identity where individuals define themselves as belonging to a third and separate category, a singular monoracial identity, a transcendent identity in which one rejects the notion of race and its categories, and a protean identity in which individuals changes their being as they move from group to groups and through various social contexts of everyday life.

A number of studies have focused on the Black/White biracial population (Rockquemore & Brunnsma, 2002; Brown, 2001), while fewer studies have considered the variety of multiracial mixtures. Additionally, studies that have focused on the biracial college student population are limited. Attending college and the exposure to a broader more diverse group of peers may lead biracial students to explore, define and redefine themselves and how they chose to self-identify (King, 2008).

The overall purpose of the descriptive study was to explore the experiences of biracial students attending a predominately white research university. More specifically, the objectives of this study were to examine:

- How biracial college students view their racial identity.
- Factors related to student's parental/family upbringing.
- The attitudes held by biracial college students regarding race in the United States.
- The level of interaction which occurs between biracial students and others on the college campus.
- Recommendations of biracial students for creating a welcoming inclusive college environment for biracial students.

The population for this study included college students at a predominately white research university in the northeastern United States. Two hundred and forty eight (248) students indicated a willingness to participate in the study. Two hundred and one (201) of those who agreed to participate actually completed the survey.

This presentation will present the results of the study, including quantitative, as well as, qualitative responses. The results of this study will be discussed in relation to existing literature

on the subject. Conclusions will be drawn and recommendations based on the findings will be offered. This presentation is intended to not only present results of the study, but also to stimulate a critical discussion on the topics. Therefore a ninety (90) minute session is requested to allow adequate time for discussion and debate.

The Virtual Manipulatives Research Group at Utah State University

*Abstract*

*This project focused on building theory and knowledge about the nature of young children’s ways of thinking and interacting with virtual manipulatives using touch-screen mathematics apps. To conduct cutting edge research on novel topics such as this requires researchers to develop new and different tools to be used to answer unique questions, collect new kinds of data, and analyze the data in different ways. During the project, researchers interviewed 90 children ages 3 to 8 while the children interacted with mathematics apps on iPads. A variety of research tools needed to be developed to conduct the research. These tools included: interview protocols, procedures for app selection, observation protocols, parent surveys and interaction protocols, and data analysis protocols. This paper reports on the processes researchers used to develop the research tools for the project.*

A virtual manipulative is defined as “an interactive, Web-based visual representation of a dynamic object that presents opportunities for constructing mathematical knowledge” (Moyer, Bolyard, & Spikell, 2002, p. 373). Until recently, virtual manipulatives have only been available through mouse-driven apps for the computer. In the past few years, the iPad has emerged as a platform for virtual manipulative apps. A meta-analysis on virtual manipulatives by Moyer-

Packenham and Westenskow (2013) revealed that the research conducted to date shows that virtual manipulatives produce positive moderate effects (0.35) when compared with other instructional formats. Five key affordances of virtual manipulatives have been found to impact learning: focused constraint, simultaneous linking, efficient precision, motivation, and creative variation. Today there are few studies that examine mathematics learning on the iPad. Some of the current studies conducted in the past few years include Paek, Hoffman, Saravanos, Black, and Kinzer's (2011) study with 59 second-grade students. Children in the study demonstrated significant learning gains in both the mouse-driven and iPad touch-screen modalities when playing a virtual manipulatives multiplication game. Barendregt, Lindström, Rietz-Leppänen, Holgersson, and Ottosson (2012) designed and piloted an iPad app intended to help develop conceptual subitizing skills, and concluded that the app helped different students develop different skills in subitizing. These studies are part of a growing body of research on virtual manipulatives apps for the iPad.

### **Summary of the Study**

The purpose of the project on which this paper is based was to build theory and knowledge about the nature of young children's ways of thinking and interacting with virtual manipulative apps on the iPad. The participants were 90 children, ages 3 to 8 including 30 preschool children ages 3-4, 30 children in kindergarten ages 5-6, and 30 children in grade 2 ages 7-8. Children participated in 20-30 minute interviews and interacted with six different mathematics apps under the direction of an interviewer. The interview rooms were equipped with two-way mirrors, audio observer booths, and built-in video cameras. Interactions during the interviews were recorded using a wall-mounted camera and a wearable Go-Pro camera to capture children's manipulations of the mathematics apps.

Results of the study indicated that children's learning improved in terms of speed and accuracy between pre- and post-tests. Researchers identified app affordances that supported or hindered children's learning, which is informative to designers of mathematics learning apps for young children. To conduct this study, researchers created a variety of research tools that were not readily available because research on children's interactions with virtual manipulative apps is still in its infancy. In the sections below, we describe our development process used to create research tools for the study. Schubert (2009) suggests that the development of these tools be

based on current theories related to the phenomenon of interest and the researcher's own experience with observing the phenomenon.

## **Developing Research Tools for Cutting Edge Questions**

### **Selecting and Pilot Testing Apps with Children**

The first activity of the research team was to select the apps for inclusion in the research project. The mathematics concepts of seriation, subitizing, skip counting, and place value were selected for study with young children because these concepts are critical foundations to later mathematics learning. Seriation, the ability to sort and order objects according to a defined attribute (often by length or size), is a logical reasoning task that is commonly used in kindergarten mathematics assessments and early numeracy tests. Perceptual subitizing, is the ability to perceive an amount instantly, without counting. When children learn to conceptually subitize, they use their perceptual subitizing skills to combine groups to compose an amount, learn how numbers are composed and decomposed, and gain a visual understanding of quantity. These skills are interdependent with later mathematics skills, such as skip counting (e.g., 2, 4, 6, 8, 10, ...) and understanding the base-10 place value system (Sarama & Clements, 2009). Current research indicates the existence of consistent relationships between counting, number relationships and basic operations, and later mathematics achievement (Clements & Sarama, 2007).

Research team members reviewed a variety of different mathematics apps for inclusion in the interviews in the study. These apps were then tested with 12 children in informal interactions. During the informal interactions, researchers took notes while observing how the children interacted with the apps. These notes included information on app affordances, difficulties children had with the apps, ease of use, and learning opportunities presented by the apps. These notes were used to help determine which apps would be used in the interviews with the children. Base-10 blocks, used for counting and place value, were selected for the pre- and post-tests in preschool, kindergarten, and grade 2 so that researchers could examine children's learning progressions across all age groups of children. The other apps that were selected for each age group represented different concepts including seriation for preschoolers, subitizing for kindergarteners, and skip counting for second graders. Appendix A shows the apps that were selected by the research team.

### **Developing Interview Protocols to Use with iPads**

The next phase in the development of our research tools was to create and refine three different interview protocols for each of the three age groups. Interviews were designed to last 20-30 minutes, and included two brief learning sequences on two different mathematics concepts. Each interview included: a pre-test, two learning activities, and a post-test for each mathematics concept. The following table shows the progression of each interview with each age group and includes the mathematics app names that were used during the interviews.

**Sequence of the Interviews**

<b>Interview</b>	<b>Grade Pre</b>	<b>Grade K</b>	<b>Grade 2</b>
<b>App #1 (pre)</b>	Pink tower: free moving	10 Frame	100s chart
<b>App #2 (learning)</b>	Pink tower: tapping	Hungry guppy	Frog number line
<b>App #3 (learning)</b>	Red rods	Fingu	Counting beads
<b>App #1 (post)</b>	Pink tower: free moving	10 Frame	100s chart
<b>App #4 (pre)</b>	Base-10 blocks	Base-10 blocks	Base-10 blocks
<b>App #5 (learning)</b>	Base-10 blocks: 1-5	Base-10 blocks: 11-20	Zoom number line
<b>App #6 (learning)</b>	Base-10 blocks: numerals	Base-10 blocks: numerals	Place value cards
<b>App #4 (post)</b>	Base-10 blocks	Base-10 blocks	Base-10 blocks

A draft of the interview protocols for each age group was developed, and members of the research team piloted the first draft of the interview protocols with children in local schools. The results of piloting the protocols with children helped researchers to refine the tasks in the kindergarten protocol and alerted the researchers that the grade 2 protocol tasks and apps were too difficult. Many of the apps originally chosen for grade 2 did not meet the needs of the children or the study and were changed. Wording changes were made to the kindergarten protocol. A completely revised protocol for grade 2 was piloted using a new set of apps and tasks. Final revisions were made to all of the protocols during a team meeting.

Next, members of the research team were trained as interviewers using a final draft of each of the protocols. These interview training sessions were conducted in the clinical rooms at the university where the interviews in the study would take place. Some members of the research team took the interviewer’s role in the training sessions; other members of the team took the child’s role. This allowed team members to practice their interviewing skills and to become familiar with the interview protocols.

The final step in constructing the interview protocol was to conduct clinical pilot interviews with 10 real children in the interview rooms. These clinical pilot interviews also allowed the observers to try out their observation protocols. It also allowed the technical team opportunities to test the camera recording equipment for the wall-mounted video cameras and the wearable GoPro video cameras. This pilot process allowed each researcher to understand and practice his or her role for the pending interviews. Final revisions were made to the interview protocols during these sessions. Appendix B shows a portion of the interview protocol for the kindergarten place value concept.

### **Developing an Observation Protocol for the Clinical Setting**

The research team also developed an observation protocol for the purposes of capturing information in real time during the interview and of supplementing the video data. Researchers constructed the observation protocol based on notes taken during the interview protocol piloting and training. The observation protocol included sections for the pre-test, activity A, activity B, and post-test for each mathematics concept. Therefore, there were eight segments of time that occurred during the interview that were captured on the observation protocol. The observation protocol asked observers to make note of verbal utterances (including terminology), counting and number strategies used, purposeful or unhelpful movements (hand gestures or virtual manipulatives), errors and correction of errors, affective responses, and interviewer actions and responses. The observers were also asked to make note if anything unique or noteworthy happened during the interview. A draft version of this protocol was created during the research group's training session and tested during the 10 clinical pilot interviews with children. Based on these two piloting experiences, the observation protocol was refined and finalized for use with the interviews.

### **Developing a Parent Survey and Interaction Protocol for the Clinical Setting**

Important research tools for interacting with the parents of the children in the study were the parent survey and the interaction protocol. The parent survey requested background and demographic information about the child, parents, and the availability and use of personal touchscreen devices at home and at school. The interaction protocol guided the researchers on what to do and say while interfacing with the parents and children.

The interaction protocol ensured that the interaction with the parent and child began by explaining the interview procedures to the parent and child, showing the parent and child the

interview room and the observation booth, and asking the parent to read and sign consent forms. Parents had the option of staying with their child in the interview room or observing their child from the observation booth. During and after the observation, parents were asked to complete the background and demographic survey about their child. At the end of the interview, researchers gave parents a one-page summary of the research being conducted in the project and gave each child a small toy for participating in the project. The interaction protocol detailed each of these steps so that each interview was conducted in a similar manner.

The parent survey and interaction protocol were developed as researchers met to determine efficient and standardized procedures for conducting the interviews and collecting information from the parents. Draft versions were created for the research team's training sessions and tested during the 10 clinical pilot interviews with children. Based on these two piloting experiences, and meetings and discussions by the research team, the survey and interaction protocol were refined and finalized for use with the interviews.

### **Developing Protocols to Analyze iPad Interaction Data**

Over a five-month period, 90 children participated in clinical interviews. Upon completion of the interviews, researchers developed several different analysis protocols. With large amounts of cataloged video data, it was important to develop analysis protocols that would be useful in answering a variety of questions. Unique protocols were developed for each age group to accommodate the different apps and tasks used with each group.

Researchers developed one type of analysis protocol to examine speed and accuracy in the pre- and post-test portions of the interviews. To develop the first analysis protocol that focused on changes in speed and accuracy, groups of researchers met to identify actions in the video data indicating measures of speed and accuracy that could be identified in both the pre-test and post-test portions of the interviews. Because there were different apps and tasks used with each group, a different speed and accuracy protocol was created for each age group. Next researchers tested the protocols by examining three interviews within each age group. After testing each protocol, the research team made adjustments to these analysis protocols before coding the entire set of 90 interviews for speed and accuracy indicators.

A similar process was used in the development of protocols to examine children's learning progressions throughout the interviews. Researchers reviewed the literature on children's learning progressions and trajectories for developing mathematical competencies in

counting, skip counting, place value, seriation and subitizing (Sarama & Clements, 2009). Next, researchers identified the possible competencies that children had the opportunity to learn and exhibit using each app. Therefore, the analysis protocols were based on the elements of the learning progression that the children had the opportunity to learn or exhibit when interacting with each iPad app during the interviews. For example, a child was not expected to exhibit a particular mathematical competency if there was no opportunity to interact with the mathematics apps to demonstrate that competency. The analysis protocols also accounted for affordances of each app to support or hinder the child's learning. Researchers tested the learning progressions protocols on three interviews from each age group before making adjustments and coding the entire set of 90 videos. To ensure that the protocols accurately captured the data for our research questions and to ensure reliable and accurate coding, between 10-20% of the videos were double-coded by two researchers for each type of analysis protocol.

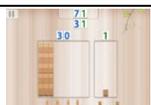

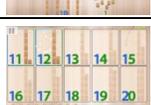

### **Summary**

This paper focused on the processes our research team used to develop new tools for novel and unique research situations. When research questions are on the cutting edge of any field, new tools are often needed for the collection and analysis of the data. We hope that this paper provides a glimpse into the processes for creating high quality tools for novel research situations.

**APPENDIX A**  
**Mathematics Apps Selected for the Pre-test, Post-test and Learning Activities**

	Base-10 Concepts		Seriation/Subitizing/Skip Counting	
Preschool	Pre/Post Montessori Numbers (Quantity: 1-9)		Pre/Post Pink Tower (Free Moving)	
	Activity A Montessori Numbers (1 to 20: 1-5)		Activity A Pink Tower (Card #12)	
	Activity B Montessori Numbers (Numerals from Quantity: 1-9)		Activity B Intro to Math (Red Rods)	
Kindergarten	Pre/Post Montessori Numbers (Quantity Activity: 10-99)		Pre/Post Friends of Ten (Teaching Tool)	
	Activity A Montessori Numbers (1 to 20: 11-20)		Activity A Hungry Guppy (Dots: four dots of the same color)	
	Activity B Montessori Numbers (Numerals from Quantity: 10-99)		Activity B Fingu (Level 1)	
Grade 2	Pre/Post Montessori Numbers (Quantity: 100-999)		Pre/Post 100s Board	
	Activity A Math Motion Zoom (Levels 2-4)		Activity A Number Lines (Skip Counting Test)	
	Activity B Place Value Cards (3-digit problems without zeros)		Activity B Skip Counting Beads	

## APPENDIX B

### Portion of the Kindergarten Interview Protocol

#### Kindergarten- Ages 5 to 6

##### Base Ten Activities A and B

**Activity A-** Montessori Numbers-"1 to 20" Activity, Difficulty Level 11 – 20 (3 minutes)

Turn sound on. Listen to the app say each number.

**SAY:** Here we have some more ten sticks and ones. We'll use them to build some more number models.

**SAY:** Can you build the model of the number 11 here? **SHOW**

*\*Let the child build with all ones if this is the method they choose.*

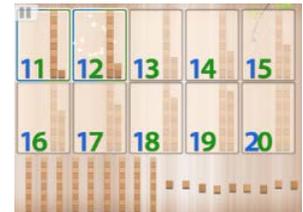

**SAY:** Can you build the model of 15 here? **SHOW**

*\*If the child begins building the 10 with ones*

**SAY:** Can you think of a faster way to build 10?

**SAY:** Can you build the model of 20 here?

*\*If the child begins building the 10 with ones* **SAY:** Can you think of a faster way to build 10?

---

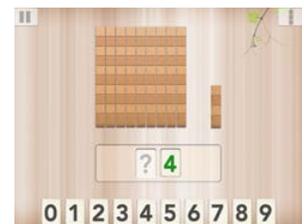

**Activity B-** Montessori Numbers-"Numerals from Quantity" Activity, Difficulty Level 10 -99 (3 minutes)

**SAY:** In this activity we'll count the base ten blocks and then move the numerals to show how many there are. I will do this first.

**SHOW:** Count the blocks aloud and touch each one.

Move the correct digit "cards" to the correct digit places.

**SAY:** Now it's your turn. Can you count the blocks out loud? Then choose the right numerals to match the number of blocks?

*\*Bring up a new problem by touching "replay." Make sure that students only work on identifying quantities equal to or less than 50. If a number higher than this is generated exit to the main menu and re-enter.*

*\*Student work for 4 minutes or complete 3 problems, whichever comes first, before moving to the posttest.*

*\*Allow the student to work for two minutes before giving a correction. Choose from those below.*

## Helping Those with Learning Differences: Priceless

The problems facing America's public schools are legion. Woefully inadequate performance on standardized mathematics and reading examinations, (2011, Hu) a steady decline in respect afforded teachers by societal mores; draconian cutbacks in financial assistance to primary and secondary education nation-wide are just a few. The list goes on. Often missed in this mix of educational maladies is the perfect storm that is raging in classrooms across the country in the treatment and teaching of children with learning differences. The focus of this presentation is to share an intervention strategy that has been used successfully at SPOTS, Special Programs in Occupational Therapy Services, an occupational therapy practice in Brooklyn and Manhattan, New York. This strategy, of storytelling can be adapted to all kinds of learning environments to help children who struggle with social marketing. That is the complicated process of social perspective taking that allows a child to initiate, gain and sustain relatedness and friendship with peers. It is this mutual reciprocity that allows the child to move from egocentric behavior into social citizenry that is so important in the day to day experiences of children at school. The community socialization process that occurs naturally as a part of the child's school years is often undervalued in its critical role in academic achievement. Current research has informed us that social skills are a significant predictor of future academic functioning and academic achievement (2012, Malecki, Kerres, Elliot).

Alarming, an increasing number of gifted young children and adolescents who excel in many academic subjects are burdened with communication, physical and social obstacles that to them are daunting (2010, Cole, Donahue; 2004 Gutman, McCreedy, Heisler). Though estimates of the extent of this problem remain stable between 6-10 percent, classrooms previously unaffected are growing. Reinforced is the decade ago estimate of 10 percent of children's non-verbal learning deficiencies being so severe that they typically experience daily and long term social rejection (1996 Duke, Nowicki, Martin). Such children can be identified through their excessive anger or jealousy, impulsivity, poor social skills and misreading of interpersonal cues. They might also exhibit difficulty making eye contact with others, obsessive-compulsiveness, an inability to share, hyper sensitivity to joking or clueless reactions to playful kidding as well as hypersensitivity to noise and touch or other sensory enriched experiences that typically abound in busy schools. These obstacles constitute an unending nightmare for such children. When one realizes that approximately 65% of communication requires accurate interpretation of nonverbal cues such as tone of voice, facial expression, posture and body language we better understand the pain and confusion these children suffer (1996, Duke, Nowicki, Martin). We know that the gaining of prosocial skills is critical. Prosocial skills, those engaging behaviors that make one socially desirable, are often listed as commercially available social curriculums. Skills like "greeting, introducing self, asking for help and answering questions or joining another in play

and sharing” are targeted and taught (2002, Williamson, Dorman). However, these bright children may master the mechanics; they cannot translate and sustain using the rules into playful, flexible interactive self and social regulation.

An antidote to this growing problem may be found in the healing power of simple story telling that is so much a part of most children’s formative years. Story telling can derive from books aimed at evoking discussions and interactions, such as the one developed at SPOTS, *The Dad & The Dog: Nera*. (2013, Mirabella, McCreedy). Or stories can be spontaneously created emphasizing and using the children’s experiences within real-time social experiences. No matter what story is used, the process is best when it is interactive, child directed and allows each child to plump the depth and intensity of their feelings without threat of suffering the negative consequences of exploring and expressing their emotions in a less structured social environment.(2013, Mirabella, McCreedy).

Children with sensory processing dysfunction may have learning disabilities and non-verbal learning challenges combined with diagnosis such as Aspersers’ syndrome, ADHD, Tourette’s syndrome, Obsessive-Compulsive Disorder and many other neurological conditions (2006, Miller). It has been increasingly more accepted that engagement in physical and social activity-based approaches to remediation of regulatory and social competency issues are more effective than participation in more traditional social problem-solving and instructional approaches.

Sensory processing refers to one’s ability to receive and interpret sensory information from one’s body or the environment and make adaptive responses. Adaptive responses include the ability to self-regulate behavioral responses to meet the activity demands in novel and familiar environments as well as to adjust one’s reactions to sensory, social and cognitive cues. The sensory systems include unconscious and conscious responses to apparent and hidden sensory receptors. These sensory systems include: tactile (touch), visual (eyes and eye muscle motility), auditory (hearing/vestibular responses, including movement and balance), proprioceptive (body position and reading body cues to move with precision) and praxis or motor planning (the ability to plan and execute coordinated movement). Sensory receptors reactions and capacities are quickly interpreted internally as emotional reactions as well. For example, within seconds of triggering sensation, responses can be emotionally experienced as joyful, fearful, calming, anxious, exciting and/or overwhelming.

It is not surprising that when a child is dysregulated or struggling with self-regulation that their capacity to access, describe and communicate their feelings about their personal experiences is so challenging and that expressing them to others in a secure and comfortable manner can be a seemingly insurmountable task for them.

Unfortunately, the instructional approach (a standard social curriculum to help all children negotiate social dilemmas) used by teachers, learning specialist and social workers in far too many schools, focuses on isolated skill training and most often than not does not result in

generalized positive behavior on the playground (2013, Crimmins, 2001, Gresham, Sugai, & Horner). It is unfortunate because it elevates the interest of maintaining a harmonious and successful classroom over the best interests of the children themselves. In particular, it does not address the individual crises of the bright but maladroit, socially awkward child who far too frequently is left to his or her own resources to make it through the day. These children suffer the individual crises of social behaviors that target them for the social ills of bullying and /or isolation.

To put it another way, many of the intervention techniques formulated to address the requirements of the child with learning differences comprise little more than cookie-cutter curriculum, a one-size-fits-all approach. (2002, Williamson & Dorman). As noted in other studies, the child knows the rules and often has a superior grasp of the mechanics and use of basic manners. However, implementing the social skills to fit in and comply with the rules of the social sandbox is another story (2004, Gutman, McCreedy, Heisler). In contrast, what is needed for these children is an activity-based, individualized intervention to meet the specific social challenges naturally occurring wherever children are taught to become effective citizens in their respective environments. This is especially true when addressing problems in social competence, such as self-regulation, communication and social decision making. Social competence, as a term used for this paper is derived from the Williamson/Dorman model. It is defined as developing a child's three foundational social-skill capacities for generalized successful engagement: cognitive, communicative and physical skills. Self-regulation dimensions of managing arousal, attention, physical control, flexibility and affect are addressed in activities that accompany the story-telling techniques. Communication skills of discourse, use of language, sending clear messages, taking turns, persuading others to listen to one's ideas and matching emotions to context and audience interests are practiced. Each story session helps the participants with social decision making such as noticing the social dynamic in the social group. A few of these social dynamics are: providing relevant social cues, correcting tangential options, making choices on activities or topics by popularity and interest in real time and evaluating the outcome of play and participation in real-time.

All students require a nurturing, comfortable and safe environment in which to express themselves, an environment where there are no wrong answers to questions about their thoughts, feeling and fears, only sincere responses that help them transition from a structured environment to less formal, more real-world surroundings, such as the playground, the cafeteria, the bus line, the theater or museum (1994, Friedberg). The child with learning differences needs a boost and most likely regular attendance in a specialized group opportunity that requires skilled planning and adult coaching. Many occupational therapists, teachers and learning specialist have found that the use of the child's unique interests, especially when employing literature as part of these group interventions, is a critical tool to help them make just such a transition to feeling confident to move in, join and leave the complex dance of social engagement (2013, Parham, Fazio).

By using story-book characters as proxies who confront the same types of obstacles they themselves encounter on a daily basis, children with learning difference can explore and discuss their most intimate emotions at a safe distance. Example .... Caregivers of all kinds – including teachers, occupational therapists and parents – can ask insightful questions about the stories to tap into natural experiences in a non-threatening manner and by doing so facilitate the teaching of critical social skills ( 2009, Sabes, Hacker). Finding story books that contain dilemmas that are relevant and specific to a particular group of children takes expertise. It is a skill worth developing. The book piloted at SPOTS, *The Dad and The Dog: Nera* , contains suggestions for discussions with children derived from questions arising from the story. The group leader using storytelling techniques must help plan restorative games, play activities, physical challenges, and the degree of structure and discussion topics based on the unique needs of the children present. The group goals, the gross motor activities, the degree of cooperation needed and the focus of the play should be designed with the child's age, developmental skill and social challenges specifically considered. Storytelling inherently facilitates improvement of listening, auditory memory, imagination and emotional interaction. Variations of its use abound.

Questions that come with their own formula-like answers are the equivalent of forcing the foot to fit the shoe. It is hard enough for children with learning differences to verbalize their feelings in socially acceptable ways. To force feed those conventionally acceptable solutions to what are extremely difficult problems adds yet another obstacle to how they view and react to the world. Instead, they should be given the opportunity to interpret the stories and answer questions about the characters in their own words and ways. Over time the children themselves will learn what inappropriate and appropriate behavior is. They experience the comfort of knowing others have similar feelings or challenges and expanded confidence with discussion of hard to talk about subjects. Storytelling in this way, following a child's lead, is essentially a restorative process and an excellent learning strategy (2013, Mirabella, McCreedy).

Is such a tailored approach expensive? Yes. Is it time-consuming? Certainly. But it's also far more effective than the imposition of a generalized solution to unique problems. Or to paraphrase a popular advertising slogan: The effort involved in doing so, considerable; the results, priceless.

Peter Mirabella and Paula McCreedy have published a short story, *The Dad & The Dog: Nera*, about the misadventures of a beloved rescue dog that has been used for several years in an activity-based storytelling program to help children between the ages of 7-9 years of age gain social competencies. This story and others served as reading for a pilot program for the publishing of the book and the preparation of this paper.

## Flipping the Classroom: Creating a Blended Learning Environment

### Abstract

**Background:** Educators recognize that today's students are demanding a learning environment that provides tools for engagement and adds variety to the learning experience. Blended learning is the combination of traditional face-to-face classroom teaching methods with any of a variety of computer-mediated methods.

**Purpose:** The purpose of the study was to examine the effects of blended learning on student comprehension/achievement and self-efficacy and explore the effects of blended learning using lecture capture in a “flipped classroom” model.

**Objectives:** Study objectives included to evaluate the effects of a flipped classroom environment on student comprehension and self-efficacy.

**Methods:** Preliminary findings were from a convenience sample of 43 undergraduate senior nursing students. A lecture recording using personal lecture capture was provided to students via computer access prior to the class. Classroom time was devoted to reinforcing concepts using critical thinking challenges, discussions, and case studies to promote active learning and student engagement. Five sessions using the flipped classroom model were conducted. At the beginning and end of each flipped classroom session, a pre- and post-test of lesson content was administered to measure the effect of blended learning on content comprehension and achievement. Due to technical difficulties, only four sessions were used in the statistical analysis. At the beginning and end of the course, a self-efficacy questionnaire was administered to measure the effects of blended learning on self-efficacy.

**Results:** Post-tests were significantly higher than pretests for each flipped classroom session indicating increased comprehension and achievement. No significant difference was noted between pre- and post survey of student self-efficacy although a higher mean was obtained on the post survey.

**Conclusion:** The flipped classroom environment may increase comprehension and achievement in nursing students. The relationship of self-efficacy and blended learning needs to be further explored especially in regards to the flipped classroom environment. Additional research using lecture capture in a flipped classroom environment is needed.

## ***Connecting Theory and Application for Minority Students Through Motivation and Summer Research Initiative***

### **Abstract**

*Hostos Community College of the City University of New York “CUNY” has partnered with senior colleges in CUNY and the Goddard Institute of Space Studies “GISS” in New York City to expand the educational horizon of our students enabling them to compete and win in global markets. The latter is possible through collaborative research initiatives that develop and improve critical thinking and creativity skills, hands-on, team oriented, and interdisciplinary learning via collaborative research projects. Innovative educational programs must begin at an early stage of students’ education with the theoretical and practical applications needed to become front-runners in this competitive world. There is an imperative need to introduce students to a research environment where students can experience career relevance as a way to motivate them to keep pursuing these fields. Conducting research as part of internships with faculty members, students will be empowered to develop skills and will be motivated to succeed within STEM areas. Our summer Internship Initiative aims to narrow the gap between theory and application by making the theory relevant to existing research projects making the learning process exciting and interactive for students, thus increasing retention in the STEM areas.*

*This project has been supported by a grant from the United States Department of Education (US DoE -CILES #P031C110158).*

**Introduction:** So what is “motivation”? In the Wikipedia dictionary, it defined motivation in the following way (wikipedia, 2010):

*“Motivation is a psychological feature that arouses an organism to act towards a desired goal and elicits, controls, and sustains certain goal-directed behaviors. It can be considered a driving force; a psychological one that compels or reinforces an action toward a desired goal. For example, hunger is a motivation that elicits a desire to eat. Motivation is the purpose or psychological cause of an action.”*

How important is the motivation? The literature is filled with the answers and we will not discuss this in detail since it is not the purpose of the current article. We will simply mention one instance by Ormond (Ormond, 2003) where some key reasons of motivation were listed which includes:

- Provide direction
- Increased energy and overall effort
- Increased initiative and drive
- Enhanced cognitive processing abilities
- Highlight reinforcing consequences
- Overall improved performance

All of the above criteria are extremely important for all students but in particular for students majoring in STEM education. We need to motivate our engineering students so they can be successful in their student’s life. But as we see, motivating, by nature, is not an easy task and when it comes to STEM education, this becomes an even more difficult job. On top of this, the group of students that we are working on are in most part full time worker and have family responsibility. Most of them are minority students and thus have many other social, economical, and political problems in their personal and professional life. Especially students in the evening classes, after a long day of work, cannot concentrate in the class and even if they understand the lecture, it is difficult for them to retain the knowledge and manipulate it in the future (especially during an exam). In fact, one student from our calculus I class made the following comment:

*“It is really difficult for me to keep my eyes open and keeping concentration after the first 20 minutes of the lecture is almost impossible for me. Gradually, as the semester goes on, the classroom becomes my bedroom.”*

The comment above is aligned well with actual finding. McKeachie (McKeachie, 1994) pointed out the following:

*In a typical 50-minute lecture class, students retain 70% of what is conveyed in the first 10 minutes but only 20% from the last 10 minutes. If we really want to get our message across, we need to orchestrate “the material” in a multi-faceted way across the range of student learning style.*

At this point a short description of our college is necessary to understand our student's body. The City University of New York (CUNY) is a leading urban public university serving more than 480,000 students with 23 campuses in New York City. CUNY has a diverse body of students, like most urban universities in the US. Hostos Community College (HCC) is the smallest campus within the CUNY system with more than 6,000 students. HCC is located at the heart of the South Bronx and takes pride in its historical role in educating students from diverse ethnic, racial, cultural and linguistic backgrounds, particularly Hispanics and African Americans. Hostos community college is a "Hispanic Serving Institution (HSI)". Usually, in a typical class, 60% of the students are Hispanic, 30% are Black and 10% are other ethnicity. So how to teach such a diverse body of students?

A single method of teaching cannot be appropriate for all the students. Susan and Linda (Susan & Linda, 1998) described this fact as follows:

*By now it is axiomatic to point out that student bodies are increasingly diverse, not only in terms of ethnicity and gender, but also in terms of age, nationality, cultural background, etc. This diversity can affect classroom settings in many ways, including the diversity of learning styles.*

It is also pointed out that African-American and Mexican-American students are more likely to prefer working with others to achieve common goals (Banks, 1988). It is also known in the literature that the metaphor of dialogue is more appropriate in that it emphasizes the interactive, cooperative, relational aspects of teaching and learning (Tiberius, 1986).

So we need to rethink our traditional way of teaching where students are thought of as an empty bag and we fill them up with as much knowledge as quickly as possible. On the other hand, we also need to think about how much of this knowledge is in fact retained by our students for the long run.

How can we motivate and encourage such groups of students? The answer is not simple, of course. In this article, we describe how hand on experience side by side with theory is helpful for students to stay focused. This is not a secret at all and it is well known throughout literature that application of theory motivate students in many ways. Since we have been charged with preparing a well-trained student population in the STEM fields to meet many challenges and stay competitive in the global markets, we need to rethink the way we traditionally teach our students. This is even more true for a "Hispanic Serving Institution" where majority of the students belong to minority groups.

Consequently, innovative educational programs must begin at an early stage of students' education with the theoretical and practical applications needed to become front-runners in this competitive world. There is an imperative need to introduce students to a research environment where students can experience career relevance as a way to motivate them to keep pursuing these fields. By conducting research as part of internships with faculty members, students will be empowered to develop skills and will be motivated to succeed within STEM areas (Bailey & Alfonso, 2005). Therefore, the Summer Internship Initiative will narrow the gap between theory

and application by making the theory relevant to existing research projects making the learning process exciting and interactive for students, thus increasing retention in the STEM areas (Engle & Tinto, 2008).

We will give an example right way. In a lecture of calculus I, for the topic of optimization, we bring cardboards, scissors, bowls and water to demonstrate some of the optimization problems. One such problem is to find out the size of the square that needs to be cut out from each corner of a given cardboard so that the box made out from this process has the maximum volume. All students were given cardboards and scissors and they all had hands on demonstration of the problem. It seems that majority of the students understand the problem right away and quite a few numbers of them already knew how to attack the problem. This was an eye opening experience for us as a teacher. Couple of students actually came to us and said

*“This is probably the first class in the semester where they did not fall asleep. Why not every class be like this one?”*

As a teacher, we have the responsibility to “finish the syllabus” – whatever that means. Since majority of the students are engineering students, they need to take all the calculus sequence (from calculus I to calculus IV). Thus it is important for us to finish the syllabus for calculus I. So there is always a struggle between finishing the syllabus on time and doing hands on experience in class which takes time and effort both in instructors and students part. So we need to choose a middle path.

The summer research presented us with a new opportunity. In the summer research we do not have the pressure of finishing any syllabus and we can work more freely and independently. Of course, on the flip side of the coin, we can only reach a very limited number of students in such a way. But the students that we were reached have a long term, fruitful motivation to continue in their STEM field. Whatever the students were learning in theory in the spring term, they are given hands on experience in this summer research initiative. A few examples of connection between topics in theory and experiment in the summer research are given the following table.

Theory in the spring term	Corresponding research topic in the summer research initiative
Matrix multiplication (linear algebra)	Image compression
Geometry of 2D (college algebra)	Image processing
Optimization and derivative (calculus)	Application in industry (maximizing profit, workers input etc.)
Heat equation (differential equation)	Hand on experience with heat equation with computer model
Integral calculus (calculus II and III)	Use of “Mathematics” software to solve real life problems in integral calculus.

For this kind of summer research initiative, we need collaboration from different colleges and agencies. In fact, Hostos Community College of CUNY has partnered with senior colleges in CUNY and the Goddard Institute of Space Studies “GISS” in New York City to expand the educational horizon of our students enabling them to compete and win in global markets. The latter is possible through collaborative research initiatives that develop and improve critical thinking and creativity skills, hands-on, team oriented, and interdisciplinary learning via collaborative research projects.

The major goal of this summer research initiative is to introduce minority engineering students to a research environment in a team setting. For Hostos Community College team, for the summer of 2012 and 2013 we have two undergraduate students, two high school students, two high school teachers and one faculty member directing the whole team. This is an ongoing project and as time goes on, we will be able to reach more and more students.

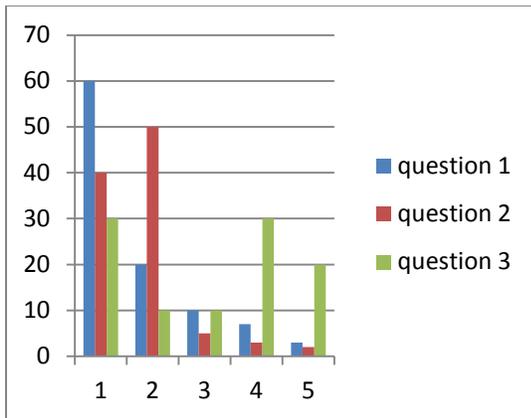

Some of the hands on experience that was done in the summer research were included the following:

1. Students took digital photo of various kinds and plot the graph of how much space each photo takes when saving in the computer. They compare different places the photos were taken vs. different time of the day.
2. Use different kinds of image compression technique including “singular value decomposition”, JPEG compression, JPEG 2000 compression and compare this with each other. They use “Mathematica” software for this project.
3. Create a computerize picture from a given set of data which gives them the range of RGB (red, green and blue) values.
4. Attend different seminars and museums including American museum of natural history.
5. The end result of the project is presented at a research summit in NASA and also a showcase presentation in the City College of New York.
6. A research paper is also written by all the members of the team and in some instances submitted in various journals for possible publication.

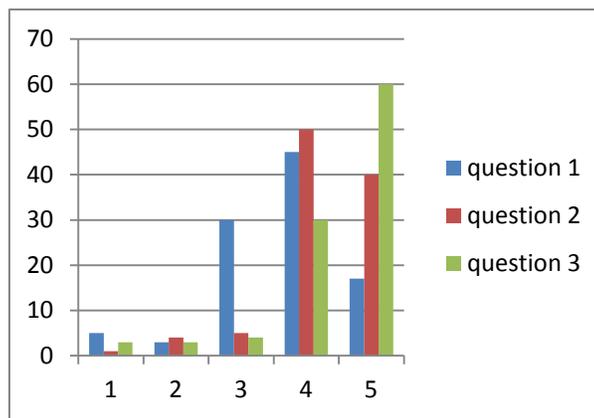

Before and after each summer research, we conduct a very brief survey to analyze how they think about the STEM program and how the summer research influence their decision. To make it simple, we only asked the following three statements measured in the scale of 1 to 5 (5=strongly agree, 4=agree, 3=neither agree nor disagree, 2=disagree, 1=strongly disagree)

1. I will do very well in my career in the STEM field.
2. I really like my subject and want to study further and get a graduate degree.
3. I will encourage my siblings to pursue a STEM career.

A bar graph of both before and after the summer research is given below where all the data are given in percentages:

Before Summer Research

After Summer Research

Here, in the horizontal axis is the scale of the response which is between 1 to 5 and in the vertical axis, the percentage of the students who select the corresponding response is given. So for example, before the summer research, only about 5% of the students agree that they will pursue a graduate degree in the STEM field while after the summer research, this number increase to 50%. This is a dramatic change. In general, we see from the bar graph above that the concentration of the students before the summer research is between the responses 1 to 3 and there is an obvious shift toward the responses 4 to 5 after the summer research. Although the sample size is not big enough to make a general remark, we do see the effect of summer research on our STEM minority students.

This research initiative not only motivated undergraduate students but also encourage high school students to choose engineering as their future major. At the same time, the knowledge and experience of team effort can be carried to a classroom by high school teachers. This is a win-win situation for all the members of the team.

## 6. Abstract

The basis of democracy is the common fact of value-experience, as constituting the essential nature of each pulsation of actuality. Everything has some value for itself, for others, and for the whole. This characterizes the meaning of actuality. (AN Whitehead in Modes of Thought)

**In his work, Alfred North Whitehead understands that the vibrancy of civilizations require ongoing renewal through the reformulation of ideals which lure human cultures into richer possibilities. In the absence of such renewal, including in the current period of mass environmental destruction, civilizations can decay and possibilities for renewal diminish. Whitehead also criticizes how modernist notions of knowledge, value and learning are trapped in assumptions which limit learning because they fail to understand the physical in human value-experience; and he sees the separation of the body from recognition of worth in value-experience based on metaphysical assumptions in western civilization as at the basis of an ecological bifurcation. From the perspective of this Whiteheadian analysis, ecological understanding requires physical, non-cognitive prehending that does not separate value from fact but is the basis of value-experience.**

**Can the notion of an ecological democracy that recognizes the actualization of value-experiences in all things provide the conceptual bases of education for ecological civilization? On what bases might educational systems construct learning processes to advance an ecologically based civilization. This presentation recommends a reconceptualization of the foundations of human learning including through physical prehending (bodily feelings) within Whitehead's process philosophy and from which such ideals and education approaches to advance vibrant ecological civilizations can be re-imagined**

This work anticipates the Tenth International Whitehead Conference, to be held June 4-7 in Claremont, California 2015 titled SEIZING AN ALTERNATIVE: TOWARD AN ECOLOGICAL CIVILIZATION

Proceeding submission for the 12<sup>th</sup> annual Hawai International Conference on Education.

1. Title of Submission: **Doodling and Learning in Schools: Examples and Possibilities**

submission ID: "1361" and "1044"
6. Abstract

Although it is associated with dawdling and may be viewed as a means to escape learning, doodling may in fact have the potential to support learning. What are some possible relationships, therefore, between doodling and learning? The argument against doodling as an educational vehicle is that it may be too unstructured and too unreflective to give shape to learning processes or events. However, it may be that doodling can provide access to some unreflected apprehensions or feeling through which to support the generation of creative thinking and analysis.

The first presentation in this session called ***Doodling to Teach and Learn: Celebration of a Career*** is a multimedia presentation by a teacher from Saskatchewan, Canada who explores her 30 years of experiences integrating doodling across the curriculum from grades one to 12. This expose' will recommend the use of doodling as a creative approach to assist teachers inspire and communicate with students and to provide students the means to appreciate, reflect, upon and think through possibilities in their learning.

The second presentation, called ***the Basis of Learning Possibilities in Doodling: Whiteheadian Considerations***, analyses the possibilities of creativity in doodling as learning viewed from the perspective of the work of Alfred North Whitehead who provides a framework for thinking of human experience in terms of feelings as non-cognitive apprehending. From the perspective of five distinct kinds of such feelings including physical feelings,

conceptual feelings, transmuted feelings, propositional feelings and intellectual feelings, this presentation examines how doodling may support learning access to non-cognitive “prehensions” of possibility and assessments of what might be worthwhile and mediated into productive educational relations.

# **Impact of Science and Technology Professional Development Programs on Integration Levels and STEM Dispositions of Middle School Teachers**

## **Introduction**

The Hawaii FIRST (Fostering Inspiration & Relevance through Science & Technology) Pre-Academy program is supported by Act 111 of the Hawaii State Legislature to provide a variety of science and technology middle school program enhancements throughout the State of Hawaii. Data were requested from teachers at the 51 Hawaii middle schools involved in the project. Data were gathered from 202 teachers in spring 2011, 147 teachers in spring 2012 and 134 in spring 2013 for the Hawaii FIRST project. Teachers from forty different schools submitted data. This paper focuses on the trends in the measured indices over time as well as differences between whether or not teachers participated in the project and the impact of the different activities.

## **Overview of Activities and Outcomes**

The Hawaii FIRST Project offered middle school teachers statewide a wide range of activities from which educators could select one or more. Activities analyzed were:

- Taking part in Research Experiences for Teachers
- Taking part in Workshops
- Taking part in Energy Monitoring Activities

- Taking part in Digital Fabrication Activities
- Taking part in Water Quality Activities

## **Instrumentation**

The surveys administered to Hawaii FIRST teachers contained questions about participant activities, perceptions of the impact of the Hawaii FIRST program, and attitudes toward science, technology, engineering, mathematics as well as STEM careers. The STEM Semantics Survey is the primary instrument used to assess general perceptions of STEM disciplines and careers using Semantic Differential adjective pairs from Osgood's (1962) evaluation dimension. This survey was created by adapting Knezek and Christensen's (1998) Teacher's Attitudes Toward Information Technology Questionnaire (TAT), which was itself derived from earlier Semantic Differential research by Zaichkowsky (1985).

The five most consistent adjective pairs of the ten used on the TAT were incorporated as descriptors for target statements reflecting perceptions of STEM subjects. A fifth scale representing interest in a career in STEM was also created. Each of five scales consisted of a target statement such as "To me, science is:" followed by five polar adjective pairs spanning a range of seven choices. For example, "To me, science is: exciting \_ \_ \_ \_ \_ \_ \_ \_ unexciting." Internal consistency reliabilities for middle school student perceptions of science, math, engineering, technology, and STEM as a career ranged from alpha = .85 to alpha = .95 for the 2013 subjects. These numbers are in the range of "very good" to "excellent" according to guidelines provided by DeVellis (1991).

Three measures of technology integration were included in the survey items. Stages of Adoption of Technology (Christensen, 1997), the Concern's-Based Adoption Model Level of Use (CBAM-LoU) (Griffin & Christensen, 1999), and the Apple Classrooms of Tomorrow (ACOT) teacher stages instrument (Dwyer, Ringstaff, & Sandholtz, 1991). Hancock, Knezek, and Christensen (2007) found that these three single-item instruments, taken together, produce a Technology Integration scale with an internal consistency reliability of Alpha = .84 for a typical set of preservice or inservice teachers.

In addition, two questions were added to the survey by the project personnel to determine whether the respondents believed that participation in this program increased teacher retention. The first question (coded Tools 1) asked about the retention of teachers in the schools in general. The second question (coded Tools 2) was more personal regarding whether they believed this program made them more inclined to remain in teaching.

## **Longitudinal Trends**

Trends in the three years of data gathered in the spring of each of the years, 2011, 2012 and 2013, are shown in Table 1. While the changes have a small effect size of <.2, stages of adoption of technology, and semantic perception of science, mathematics, and engineering trended upward to more positive while CBAM Levels of Use and semantic perception of technology trended downward. It is possible that the downward trends were due to a reduction in funds for the most recent year.

Table 1

*Means and Standard Deviations for Technology Integration and STEM Disposition Measures*

Measurement Indices	Spring 2011			Spring 2012			Spring 2013		
	N	Mean	SD	N	Mean	SD	N	Mean	SD
CBAM Levels of Use	202	5.34	1.73	147	5.33	1.73	134	5.18	1.98
Stages	201	4.79	1.23	147	4.94	1.05	134	4.96	1.15
ACOT	201	3.60	.97	147	3.52	.98	134	3.62	.94
Science Total	20	6.31	.95	147	6.20	1.16	134	6.41	.95
Mathematics Total	201	5.36	1.23	146	5.40	1.36	134	5.47	1.35
Engineering Total	198	5.62	1.17	145	5.56	1.11	133	5.71	1.08
Technology Total	196	6.34	.87	146	6.26	.99	133	6.10	1.04
Career Total	200	6.18	1.04	146	6.14	1.07	134	6.19	1.06
STEM Total	184	5.97	.76	147	5.91	.80	134	5.98	.83

**Benefits of Participating in the Program**

The teachers were categorized by whether or not they had previously participated in the Hawaii FIRST initiative. There were three technology integration measures and six attitudinal measures related to STEM. As shown in Table 2, those who participated in the program were significantly higher on Stages of Adoption of Technology and ACOT Teacher Stages. They were not significantly higher on CBAM LoU. However, the effect size for CBAM LoU is .96 which is large according to guidelines by Cohen (1988), and which is considered to be of sufficient magnitude to be educationally meaningful (Bialo & Sivin-Kachala, 1996).

Regarding the STEM Semantic measures, three out of six were significantly ( $p < .05$ ) higher for the teachers participating in the program. A Cohen's  $d$  effect size was calculated on each of the measures with the average effect size found to be  $ES = .46$ . This surpasses the  $ES = .3$  criterion for the point at which the magnitude of an effect becomes educationally meaningful (Bialo & Sivin-Kachala, 1996).

All of the eight measures were higher for those who participated in the project. This is very unlikely to have happened by chance (binomial probability = .008). This indicates that teachers who participated in the project have higher STEM dispositions and also higher level of technology integration, than their peers who did not participate in this activity.

Table 2

*Oneway analysis of variance for indicators for those who are part of Hawaii FIRST versus those who are not part of the program*

		N	Mean	Std. Dev.	Sig.	Effect Size
CBAM LoU	Did not participate	9	4.44	1.81		
	Participated	125	5.23	1.99		
	Total	134	5.18	1.98	.126	.96
Stages	Did not participate	9	4.00	1.23		
	Participated	125	5.03	1.12		
	Total	134	4.96	1.15	.005	.88
ACOT	Did not participate	9	2.78	1.30		
	Participated	124	3.68	.88		
	Total	133	3.62	.94	.003	.81
Science Total	Did not participate	9	5.95	1.77		
	Participated	125	6.45	.86		
	Total	134	6.41	.95	.065	.36
Mathematics Total	Did not participate	9	5.07	1.87		
	Participated	125	5.50	1.31		
	Total	134	5.47	1.35	.176	.27
Engineering Total	Did not participate	9	5.07	1.15		
	Participated	124	5.76	1.07		
	Total	133	5.71	1.08	.032	.62
Technology Total	Did not participate	9	5.89	1.15		
	Participated	124	6.12	1.04		
	Total	133	6.10	1.04	.265	.21
Career Total	Did not participate	9	5.27	1.59		
	Participated	125	6.25	.99		
	Total	134	6.19	1.06	.004	.74
STEM Total	Did not participate	9	5.46	1.07		
	Participated	125	6.01	.80		
	Total	134	5.98	.83	.026	.58
Tools1	Did not participate	9	4.11	1.06		
	Participated	125	4.27	.92		
	Total	134	4.26	.93	.308	.16
Tools2	Did not participate	9	3.44	1.13		
	Participated	125	4.15	.95		
	Total	134	4.10	.98	.018	.68

Analysis of variance was conducted related to whether or not they had attended each of the program activities. It was expected that those who attended these activities would have higher dispositions toward the content areas covered in these activities, and therefore a one-tailed test of significance was used. Overall findings indicated only one significant finding for the Research Experience for Teachers with ACOT being significantly higher ( $p=.035$ ) for those who attended the Research activity (Table 3). As shown in Table 4, both ACOT ( $p=.018$ ) and Engineering ( $p=.027$ ) were higher for those who attended project workshops. For the Energy program, both Science ( $p=.042$ ) and Engineering ( $p=.0005$ ) were significantly higher than those who did not attend this program (Table 5). As shown in Table 6, there were no significant differences for the Digital Fabrication program. For the Water Activity (aquaponics, etc.) two of the technology integration measures, Stages ( $p=.037$ ) and ACOT ( $p=.022$ ), were significantly higher for those who attended (Table 7).

	Total	134	4.10	.98	.450

### Correlations with Retention Indices

The Tools items and STEM scales were correlated with each other to determine the strength of their relationships. Tools 1 assessed whether teachers believed the Hawaii FIRST Program activities helped retain teachers in general throughout the state, while Tools 2 asked whether the teacher completing the survey felt the Hawaii FIRST activities helped keep them personally interested in staying in the teaching profession. As shown in Table 8, Tools 1 was significantly ( $p=.01$ ) positively correlated with all scales on the STEM Semantic. Tools 2 was significantly ( $p=.01$ ) positively correlated with all but the Science scale. The Science scale was also significantly correlated with Tools 2, but at the less significant  $p=.05$  level. Since the results presented in the previous section demonstrated that teachers who took part in Hawaii FIRST activities had higher dispositions than those who were not in the program, and since findings of the current section demonstrate that higher dispositions are associated with greater belief that the activities help retain teachers, then we can infer that participation in Hawaii FIRST activities leads to greater belief that these activities help retain teachers.

## Discussion

The first year (2010-11) there were more funds for the project which is reflected in the number of teachers still in the project three years later versus the size of the groups joining in 2011 (two years in project) and 2012 (one year in the project). It is likely the lack of access in the third year is reflected in the lower reported CBAM Levels of Use. Regarding gender differences in the third year data (2013), the males tended to be higher on eight out of nine attitudinal measures (binomial  $p < .04$ ). This was not true in the previous year when females and males were equally balanced with females being higher on half of the items and males being higher on the other half of the indicators.

## Conclusion

STEM dispositions have remained relatively consistent across three years of the Hawaii FIRST project. There appears to be a slight downward trend in the Concerns-Based Adoption Model Level of Use (CBAM LoU) indicator, which we attribute to reduced funding during the past two years of the program, contrary to the first year when federal stimulus funds were received to start the program. Dispositions among those who took part in specific workshop activities tended to be higher on relevant measures for those who participated than for those who did not. Similarly, group means for STEM dispositions and technology integration measures across those who participated in programs were significantly higher ( $p < .05$ ) than for those who did not. STEM dispositions for those who took part in the Hawaii FIRST activities tended to be positively correlated ( $p < .05$ ) with stronger belief that these activities help retain teachers in general, and also specifically help retain the person completing the survey.

*Abstract: The cultural-social theory of cognitive development identifies the importance of social relationships in successful cognitive development and academic achievement in children. This study has continued previous research in a tertiary bridging program at a regional university and examines the role that poor student-teacher relationships had in acting as a barrier to successful academic achievement in secondary school. The major contributors to the poor student-teacher relationships were identified as the perception of a lack of care and support from teachers and differential teacher behaviour based upon the teachers' perception of student academic ability. The impact of these poor relationships resulted in a lower level of academic engagement, ability to cope with the curriculum complexity and academic achievement. The implications in terms of the current standards for Australian teachers is discussed.*

## **Introduction**

This study continues research that has been conducted at a regional university in Queensland, Australia in relation to students enrolled in a tertiary bridging program. The program is conducted on-campus and is normally completed in one full-time semester. About 50% of students are between the ages of 18 to 22 years of age at the time of enrolment. Only 10% of the students in this age group are academically qualified for tertiary study while 41.2% failed to successfully complete secondary school. These statistics indicate that a substantial number of students who have experienced poor outcomes and demonstrated limited academic engagement in secondary school, have attempted to continue on to tertiary study within five years of leaving secondary school.

Previous research (Whannell, Allen, & Lynch, 2010; Whannell & Allen, 2011) targeting these students has established that the nature of the student-teacher relationships which existed during the last 2 years of secondary schooling were of a poor quality when compared to that of

family and peers. The poor quality of the student-teacher relationships were identified as one possible explanation for the poor academic outcomes for these students during their secondary schooling. This report presents findings from an examination of the qualitative data relating to student-teacher relationships and identifies specific causes for their poor quality.

## **Theoretical Context**

The cultural-social (Bandura, 1989; Bruner, 1964; Vygotsky, 1960) and bioecological (Bronfenbrenner, 1986; Bronfenbrenner & Ceci, 1994) theories of cognitive development hypothesise that the process of cognitive development is dependent upon an appropriate cultural and social context before cognitive development may occur at an optimal rate. While these theories provide robust support for role that social relationships have in terms of the quality of academic outcomes, they do not describe, in-depth, the reasons why teacher-student relationships may be dysfunctional. This review of the academic literature has attempted to identify common themes as to why dysfunctional social relationships may exist between students and teachers at the secondary school level.

Vygotsky argued that “higher mental functions appear first on the ‘interpersonal’ (i.e. social) plane and only later on the ‘intrapsychological’ (i.e. individual) plane” (Wertsch, 1979). This view presents learning and cognitive development as being constructed initially as a result of social interaction between people. The proposal is that learning and cognitive development are understood in the first instance as a social construct, before being internalised to become a personal construct.

Bandura (1989) proposed that “behaviour, cognition and other personal factors, and environmental influences all operate as interacting determinants that influence each other bidirectionally” (p. 2). The conditions for cognitive development were identified as a result of influences at both the individual and the social level. The individual’s “expectations, beliefs, self-perceptions, goals and intentions” were identified as giving “shape and direction to behaviour” whereas the relation between the individual and the social context was identified as “human expectations, beliefs, emotional bents and cognitive competencies are developed and modified by social influences that convey information and activate emotional reactions through modelling, instruction and social persuasion” (p. 3).

Thus we see the social context of the learner as influencing the learning process in two ways. First there is the social interaction between the learner and others, including parents, teachers and peers, and second, there are the social outcomes, such as positive reinforcement from parents for good academic results. The proposal that learning occurs as a part of the social context of the learner has been tested empirically over a number of years. Studies have examined the relationship between speech within a social context and learning. It has been demonstrated that “exploratory talk” improves group reasoning (Wegerif, Mercer, & Dawes, 1999). Mercer (2008) established “that adults can guide children in how to use talk effectively,

as a cultural and psychological tool, and there is evidence that this can make a significant contribution to children's self-regulated learning and their intellectual development" (p. 99). A relationship has also been established between language and achievement where it was demonstrated that "forms of oral language...are important for subsequent performance on school-based measures of reading and writing" (Pellegrini, Galda, Bartini, & Charak, 1998, p. 52).

Bruner (1964) adopted the view that cognitive development for an individual was a two way process. He proposed that cognitive development was influenced from the outside by cultural and social factors and from the inside by the nature of the cognitive frameworks which already exist. At a pedagogical level, he expressed the view in relation to the culture within which education occurs that "to empower human beings to go beyond their 'native' predispositions, it [education] must transmit the 'toolkit' the culture has developed for doing so" (Bruner, 1997, p. 17).

The competing theories of cognitive development so far described have significant support in educational environments around the world. However, the ability of a student to learn is not simply dependent upon his or her level of cognitive development and/or the cultural-social context within which the learning takes place. The particular circumstances of the individual also play a significant, perhaps major, role in determining the potential for a person to learn. In recent years there has been a large amount of research which has investigated, at the level of the individual, why learning does or does not take place.

The potential for a student to learn successfully has been related to an educational construct called engagement. Engagement with school has been identified psychologically with interest, feelings of connectedness and motivation and behaviourally with attendance, participation in activities, effort and social interactions (Woolley & Bowen, 2007). Academic engagement has also been defined in respect of a number of different aspects of the individual, namely behavioural engagement which is related to participation in academic activities, emotional engagement which involves the emotional reactions to the educational environment, and cognitive engagement which involves the willingness to exert the effort to comprehend complex ideas (Dunleavy & Milton, 2008; Fredricks, Blumenfeld, & Paris, 2004). Student engagement is also stated to operate "at cognitive (thinking), affective (feeling) and operative (doing) levels" and that "it follows from this that when students are strongly engaged they are successfully involved in tasks of high intellectual quality and they have passionate feelings about these tasks" (Woodward & Munns, 2003, p. 3).

Engagement with school and learning for each individual is in a constant state of flux and is dependent upon the particular context and environment that an individual is in (Finn & Rock, 1997). The individual's particular level of engagement "may stem from opportunities in the school or classroom for participation, interpersonal relationships, and intellectual endeavours" (Fredricks, Blumenfeld, & Paris, 2004, p. 61).

The empirical literature indicates that the student's emotional and psychological engagement with school are primary factors associated with a high level of learning and

achievement. It is also apparent that in studies which have examined academic engagement, correlations have been found between the level of engagement and a variety of social context factors, indicating that the engagement construct cannot be considered only in terms of the student, but must also include a consideration of the social context within which the education occurs.

## **Method**

The questionnaire used in the initial quantitative study (Whannell, Allen, & Lynch, 2010) was provided to all students in the Semester 2 2009 cohort of the bridging program. It was completed by respondents during a lecture of a compulsory course in week three of the semester. One hundred and fifty one responses to the questionnaire were received with 81 of the respondents being between 18 and 22 years of age. A 75% response rate was achieved. The quantitative analysis of the data from the questionnaire established that the student-teacher relationship was the only social influence which directly correlated with academic achievement. The quality of family relationships was found to be associated with the level of engagement with school, while peer relationships associated with the participants' capacity to cope with the complexity of the curriculum. It was concluded, based upon the quantitative data, that the quality of relationships between the participants and teachers during the last two years of secondary school were substantially poorer than those with both the family and peers (Whannell, Allen, & Lynch, 2010).

This qualitative study aimed to further develop these findings and to determine if there were any commonly cited reasons for the poor quality of the student-teacher relationships which existed for the participants during the last two years of secondary school. The qualitative data was obtained from the original questionnaire which included the following question which allowed participants to make comments about their student-teacher relationships:

Do you have any comments you would like to make about your relationships with teachers?

The data available from the questionnaire was further developed by the use of 13 semi-structured interviews with respondents who had completed the initial questionnaire. The questions utilised in the interview relevant to the student-teacher relationship are listed below:

- How would you describe your experience at school in general terms?
- What specific events, if any, had a significant impact, either positive or negative, on your achievement at school?
- What people, if any, had a significant impact, either positive or negative, on your experiences at school?

- How well did you cope with the course content when you were at school?
- Is there anything else that you would like to say about your experiences during your pre-tertiary school years?

Participants were purposively selected for the interviews based upon the responses made to the initial questionnaire. Participants who had scored poorly on the questionnaire in relation to the quality of the student-teacher relationship were identified and then participants were further stratified by age and gender. Table 1 shows the age and gender of the interview participants.

Age	Males	Females
18	2	2
19	0	2
20	1	1
21	2	1
22	0	2

**Table 1 – Interview Participants by Age and Gender**

In the discussion which follows, where data from the questionnaire comments has been referred to it will be identified by a reference of the form (Q\*\*) indicating the questionnaire source to which the data refers. Where an interview has been referenced a reference in the form (I\*\*) will be used. All comments are shown verbatim as provided by the study participants.

## Discussion

An analysis of the questionnaire comments identified a total of 53 references made by 42 respondents in relation to the nature of the student-teacher relationship. Of these comments, 14 respondents made a total of 15 positive comments while 28 respondents made a total of 38 negative comments. Of the 15 positive comments, only two were identified which did not include a negative qualifying component.

*In Years 11 & 12 my teachers treated us more as adults rather than children. It was our choice to be there, and we chose the subjects. (Q12)*

*Felt more adult-adult than student-teacher. (Q136)*

One interview participant responded positively in relation to the support provided by teachers when asked what people had a significant impact on their school experiences.

*Positive, probably the teachers because they helped you with anything, like if you just went up and asked them they'd help you. (I-KMM)*

All other positive statements included a negative qualifying component, normally reserving the positive statement to only a particular teaching sub-group.

*I got along with most of my teachers. (Q123)*

*All through I didn't get much help at school they didn't pick on me they were nice. (Q13)*

*I got on well with younger teachers as I feel I could relate and understand them more. (Q132)*

*Some of my teachers were good some were bad. (Q16)*

It is apparent that in the statements above which have been viewed as positive, the respondents have usually not attributed any qualities to the teachers or nominated a reason as to why the relationship was viewed as positive. Only four comments were viewed as containing information which could be viewed as describing the particular qualities of the teacher which the respondent had related to in a positive way.

*50/50 – Some teachers were very helpful and others gave out minimal help. (Q30)*

*Most of my teachers were respectful and understanding. But then again there was always the really inappropriate teacher. (Q58)*

*I went to school in a bad area. However, I found most of my teachers were very friendly in Years 11 and 12, and actually wanted to assist me. (Q90)*

*The teachers you have make a big difference. I had a couple of really good teachers and yeah, they impacted on me and, you know, you learn, I can't find the words. (I-CGM)*

A number of negative comments were made in relation to the lack of “care” demonstrated by teachers.

*School wasn't for me. I felt the teachers didn't actually care. Which is why I'm here at TPP hopefully going to be a teacher one day and make school a warm place. (Q107)*

*It was bland, repedative [sic]. The staff couldn't care less about you... (Q128)*

*I had big classes and found none of my teachers knew my name or cared about the quality of my learning experience. (Q157)*

*I didn't mind attending. I wanted to learn but felt the teachers didn't care. (Q81)*

One interview participant described the “support” role of the teacher in wider terms than those related to academic work.

*Definitely some of my teachers, they were very supportive and I had a great form tutor as well. He was again, very supportive and also really easy going. You could talk to him about anything, if you were having problems with anybody. (I-AMY)*

The issue of the “caring” and “support” aspects of the relationship between the teacher and student has been researched extensively (Collier, 2005; McCroskey, 1992; Ruddick, 1980; Teven & McCroskey, 1997; Wentzel, 1997) and have been demonstrated to have an important role in relation to student engagement and academic performance. For example, Wentzel (1997) supports the role of caring in student engagement with the observation that “with respect to schooling, this explanation translates into the notion that students will be motivated to engage in classroom activities if they believe that teachers care about them” (p. 411). Wentzel described the caring aspect of teaching as Pedagogical Caring and described the term as “perceptions of caring teachers are related to students’ academic efforts and to their pursuit of prosocial and social responsibility goals” and established that students described the caring teacher in terms “that correspond closely to dimensions of effective parenting” (p. 415). The similarity between the caring aspect of the teaching role and that of the role of the mother has also been examined by other researchers (Collier, 2005; Ruddick, 1980).

The particular qualities of the individual caring teacher were described by Wentzel (1997) as including “democratic interaction styles, developing expectations for student behaviour in light of individual differences, modelling a ‘caring’ attitude toward their work, and providing constructive feedback” (pp. 415-416). The characteristics of the caring teacher have also been described in terms of empathy, understanding and responsiveness (McCroskey, 1992). Empathy may be defined as “the capacity to see a situation from the point of view of another person and feel how they feel about it” and understanding as “the ability to comprehend another person’s ideas, feelings and needs” (Teven & McCroskey, 1997, p. 1). Teacher responsiveness has been defined in terms of the teacher reacting “to student needs or problems quickly, when the teacher is attentive to the student, when the teacher listens to what the student says” (McCroskey, 1992, p. 111). It is also not a sufficient condition that the teacher possesses these qualities. “It is *not* the caring that counts; it is the *perception of caring* that is critical. If a teacher cares deeply, but does not communicate that attribute, he or she might as well not care at all” (Teven & McCroskey, 1997, p. 1). The verbal behaviour of teachers has been demonstrated to play “a significant role in shaping students’ perceptions of those teachers” and that teachers are perceived as having a higher level of credibility by “using more explicit, verbally caring messages directed towards their students” (Teven & Hanson, 2004, p. 50).

Klem and Connell (2004) have also demonstrated the link between the “caring” aspect of the teacher and improved engagement and academic achievement. They established that:

students who perceive teachers as creating a caring, well-structured learning environment in which expectations are high, clear, and fair are more likely to report engagement in school. In turn, high levels of engagement are associated with higher attendance and test scores (p. 270).

A relationship between the desire to learn and the perceived level of care from teachers was identified by two study participants.

*I didn't mind attending [school]. I wanted to learn but felt that the teachers didn't care. At times I felt that a teacher would pick on me because I was the only one in class who wanted to learn. (Q81)*

*Teachers. How they treated us, like they didn't care. They seem that way. But then some teachers did care...I don't know, just didn't seem right and then I just thought the way if they're going to be like that, then why should I bother. (I-DCM)*

A number of respondents who made comments relating to the lack of care on the part of teachers included references to the issues of responsiveness, empathy and understanding which have been described as being a part of the “caring” aspect of the teacher-student relationship.

*Some teachers at high school didn't understand the way I learn. I tried to explain how hard it was throu [sic] it feel like they didn't really care. Only some... (Q112)*

*I was not a bad student – just different, and they did not like that. (Q29)*

*I was always a bright student but I have ADHD the teachers and I found it hard to get along and sometimes it would affect my marks. (Q76)*

The characteristics which have been described in relation to the construct of Pedagogical Caring (Wentzel, 1997) would suggest that the teaching methods employed would cater to the differences which are found amongst the learning styles of students. A number of respondents made adverse comments in relation to the learning and teaching methods employed, both at the teacher level and at the school level.

*Can't say I like the teachers or the majority of students. Teaching methods didn't suit my learning style. (Q150)*

*I'm very visual person at school if it was more in picture and diagram I would retain more information. (Q112)*

*Teenage years are a hard time to be glued to such an institution. I felt lost and not ready to learn their way or at their pace. (Q57)*

*I feel at school, students are placed in a box. If you don't naturally take the learning method in place then you were left behind, also I would of enjoyed school if there was flexibility with learning style and gave me real work/study life expectations. (Q9)*

Skinner and Belmont (1993) investigated the relationship between classroom structure, autonomy support and involvement with student motivation and engagement. Classroom structure was described as that which is provided by the teacher clearly communicating their expectations to the student. Autonomy support was described as referring to the amount of

freedom a student is given to determine his or her own behaviour, whilst involvement referred to the quality of the interpersonal relationship which exists between the student, teachers and peers. Their research demonstrated that “teacher involvement was central to children’s experiences in the classroom and that teacher provision of both autonomy support and optimal structure predicted children’s motivation across the school year” (Skinner & Belmont, 1993, p. 571). The aspect of this research which is of particular relevance to the comments made by the bridging program students is the reciprocal nature of processes which occur between the teacher and student. The teacher behaviours when directed towards a student promote student engagement, whilst student engagement promotes the teacher to respond with behaviours specifically directed to the student to promote further engagement.

Skinner and Belmont (1993) also identified that adverse teacher behaviour towards disengaged students had the ability to exacerbate the situation for those students. “These findings suggest that students who are behaviourally disengaged receive teacher responses that should further undermine their motivation” (p. 571). This view is also supported by Klem and Connell (2004) based on a review of the literature relating to the effect of the student-teacher relationship on engagement and achievement. They established that “studies show students with caring and supportive interpersonal relationships in school report more positive academic attitudes and values, and more satisfaction with school. These students also are more engaged academically” (p. 262). Of particular interest in the findings was that “teacher measures of student engagement focus on behaviours tied directly to performance such as paying attention, staying focused, doing more than required” and that “teacher support associated highly with student engagement” (p. 270).

Thus, the literature indicates that a bi-directional relationship exists between student engagement and the amount of support which is provided by teachers to students. Where a student does not engage with the classroom environment, the literature indicates that the student will receive less support and direct interaction from the teacher which will further reduce the level of academic engagement. This directly supports the relationship between student engagement and the student-teacher relationship described by participants in this study.

Two respondents directly related their level of engagement with the nature of their relationship with the teacher.

*I enjoyed going for the social aspects but some of the work I found boring. Also I didn't get on with some teachers and so I didn't try hard. (Q113)*

*I liked going to school. I was a social butterfly and liked all my classes except Science. I tried but my teacher didn't like me so I stopped trying. (Q35)*

The relationship between the nature of the student-teacher relationship and its effect on student behaviour has been demonstrated where the student perception of teacher support and school belonging predicted increased academic self-efficacy, positive school affect, and

academic achievement (Roeser, Midgley, & Urdan, 1996) and intrinsic motivation for school (Battistich & Solomon, 1997).

A number of the questionnaire respondents targeted the school and the teacher with adverse comments in relation to the focus of education being directed at the high achiever.

*My educational experience was of a low standard. The teachers appeared to give up early on majority of the students, my schooling was reflective of this, having no motivation to succeed career wise. (Q157)*

*Good, but at times felt like they paid more attention to the people with high grades. (Q8)*

*But then there was just a group of girls that didn't clash with and the teachers didn't, if you weren't one of the brighter students you were shoved to the back of the room and they didn't really help you much. (I-WJM)*

*Like, it was a very broad class. Like, you had your high achievers, your intermediates and your lower achievers but he still tried to, he didn't ignore the lower achievers which a lot of teachers do. (I-KJA)*

*Getting everybody to participate, because they mainly just choose the same people every time...Because they're smarter I would say, from my point of view...I just felt like they were mainly working with the students that already knew everything. Well that's how I felt. (I-KAT)*

There are a number of research studies that report on the differential treatment students receive from teachers based upon the teachers' perception of the student's ability level and/or achievement (Dusek, 1975; Rosenthal, 1994; Trouilloud, Sarrazin, Martinek, & Guillet, 2002). The result of differential behaviour on the part of the teacher towards students has been described as follows: "The teachers' expectancies may cause some students to be treated in a manner that may bias their interest in school and related activities and may contribute to their doing poorly in terms of academic achievement" (Dusek, 1975, p. 680). The expectancy effect based upon student performance on the teacher manifests itself in the classroom where "teachers appear to teach more and to teach it more warmly to students for whom they have more favourable expectations" (Rosenthal, 1994, p. 178).

Goldenberg (1992) disputed the impact of teacher expectations in a case study examining teacher expectancy when he observed that "what really matters for student achievement is what teachers do – or, as it turned out, fail to do" (p. 541). When the comments made are examined, we see that it is the actions taken by teachers when acting on their expectations which are often described. The teacher actions described in the current study included "he didn't ignore the lower achievers which a lot of teachers do" (I-KJA), "if you weren't one of the brighter students you were shoved to the back of the room and they didn't really help you much" (I-WJM), "at times felt like they paid more attention to the people with high grades" (Q8) and "the teacher appeared to give up early on majority of the students" (Q157). This variation of behaviour on

the part of the teacher based upon their expectancy of academic performance by students has been clearly demonstrated in previous studies (Babad, 1995; Chaikin, Sigler, & Derlega, 1974; Rosenthal, 1994). In a meta-analysis of studies done in relation to the effects of teacher expectancy on student academic performance the major aspect of teacher expectancies which influenced student performance were described as “teachers’ affective behaviours (e.g. warmth, support, smiling) and the socioemotional climate they create for high- and low-expectancy students [and the] amount and quality of teaching behaviours directed at particular students” (Blanck, 1993, p. 135). These particular aspects correspond very closely to the two primary issues which have been identified within this study in relation to the nature of the student-teacher relationship, namely the caring and support of students by teachers and the differential behaviours demonstrated by teachers based upon their expectancy of student academic performance.

Another consequence of teacher expectancy and teacher differential behaviour towards students is the effect on the students’ self-expectancy of academic performance. There is clear evidence which indicates that where a student perceives differential teacher behaviour which indicates that they lack academic ability, the student may also adopt that expectancy. The adoption of the expectancy on the part of the student has been identified as leading to reduced levels of academic engagement and achievement (Haynes & Johnson, 1983; Smead & Chase, 1981).

## **Conclusion**

While the socio-cultural literature describes the relationship between students and teachers as being pivotal to educational success, many of the participants in this study have not perceived these relationships to be of an appropriate quality to support their educational aspirations. The principal factors identified which have damaged the student-teacher relationship for the participants was a perceived lack of care and support from teachers and differential behaviour by the teacher based upon the teachers’ perception of the participants lack of academic ability.

It is not suggested that teachers do not care for students and/or knowingly differentiate their behaviour based upon student academic ability. Rather, it is proposed that the major implication for practice that this study has, is that teachers must be sensitive to their behaviours in the classroom and look to identify where those behaviours may be negatively impacting students. An additional challenge for teachers is that their behaviours are interpreted based upon students’ perceptions, which may or may not be accurate. The opportunity for open and robust communication between the student and teacher appears as essential to ensure that inaccurate perceptions are able to be dealt with at the earliest opportunity.

Previous research (Cantwell, Archer, & Bourke, 2001; Archer, Cantwell, & Bourke, 1999) has demonstrated that the quality of academic outcomes during undergraduate study for

students who have gained access to university by non-traditional means is comparable to that of students who enter university by traditional means. This indicates that the academic potential of both groups of students is comparable. When viewed in this way it raises the question as to why the participants in this study had such a negative secondary school experience and demonstrated such poor academic outcomes.

The participants in this study have described the behaviour which attracts positive attention from a teacher in terms of high academic ability and achievement. One possible explanation of the teachers' behaviour is that, in a classroom which contains students of widely ranging academic capacity, the work of teaching is made easier when teaching is directed to students who are engaged with the content, who understand it well and achieve good academic results. It presents a much more challenging situation to the teacher to engage with students who are perceived to be of lower academic capacity and who progress at a slower rate. A related scenario is that, in a classroom with a substantial number of students, the limited teaching time available is directed towards those students who will benefit most from the teachers' efforts. That is, the more academically capable students who are able to engage best with the content.

It is not suggested that, where a teacher demonstrates these behaviours, they are being done so consciously to the detriment of the lower achieving students. What is proposed is that teachers, who are working in the time challenged and stressful situation the classroom often presents, will unconsciously choose their behaviours to achieve what is perceived as the maximum result for their efforts. This will orient them towards working with the more academically able students.

While the capacity for teacher behaviour to negatively influence the academic outcomes of students has been described for many years (Goldenberg, 1992; Dusek, 1975; Rosenthal, 1994), it appears that the situation still exists where students, such as the participants in this study, are not achieving to their full academic potential for this reason. The current Australian Professional Standards for Teachers (Australian Institute for Teaching and School Leadership, 2012) include specific standards which require teachers to cater to the individual differences of students, that all students have the opportunity to engage with the curriculum and all students be given the opportunity to achieve to their maximum potential. This study provides strong evidence for the need for such requirements and for teachers to work diligently to ensure that this occurs in their classroom. In particular, teachers need to be aware of the impacts that their in-class behaviours, even unconsciously driven ones, may have on students.

One factor which is relevant to understanding why the participants in this study have returned to continue their education are the changes which may have occurred during the move from late adolescence to early adulthood. The potential exists for this life stage transition to influence the attitudes of the participants towards their previous educational experiences. These changes may then be reflected in their decision making in relation to engaging in further education. The potential exists for further longitudinal research to be conducted that examines this area for academic underachievers in secondary school with a view to understanding how to assist them to reengage with higher education.

## ABSTRACT

### THE IMPACT OF FACEBOOK ON UNDERGRADUATE ACADEMIC PERFORMANCE: IMPLICATIONS FOR EDUCATIONAL LEADERS

by Dr. Andria Moon

This study explored the impact of Facebook use on undergraduate academic performance. Online social network sites such as Facebook serve as a significant resource and potential distraction for undergraduates. Vital to the lives of many college students, Facebook and other online social network sites are here to stay. These sites serve a beneficial purpose as colleges and universities use them to communicate with students, as well as faculty use for academic purposes. The purpose of this study was to investigate what impact Facebook use had on undergraduate academic performance. Specifically, the researcher aimed to explore if the impact of Facebook use significantly affected undergraduate student academic performance. The study exercised quantitative methodology surveying 400 undergraduate students using a Web-based survey at one Midwestern Institution. The goal was to determine if relationships exist between academic performance (cumulative college GPA) and ACT score, high school GPA, extracurricular activities, academic preparation, Facebook use (hours per week spent on Facebook), community service, communication, paid work, video gaming, watching television, and recreational Internet use. Multiple regression analysis was used to analyze the results of the survey. The study findings did not indicate a strong relationship or correlation between Facebook use (hours spent per week on Facebook) and academic performance (cumulative college GPA). However, Internet use, extracurricular activities, and community service did have a relationship with academic performance (cumulative college GPA). A significant point from the present research is that 97% of the respondents were Facebook users. An implication from the present study for educational leaders, faculty, and student affairs professionals is that most

college students check Facebook during their academic preparation. The study found that that 86.3% of undergraduates in the study check their Facebook account during their academic preparation (studying, writing papers, conducting group work, working on projects, researching information, etc.). Educational leaders, faculty, and student affairs professionals should be aware of students' habits and behaviors on Facebook.

## Reforming Teacher Education Programs: A Response to Changing Student Demographics

### Abstract

An analysis of recent demographic data indicates that minority students may not be in the minority for very long (Tavernise, 2012); a fact that will undoubtedly have significant implications for 21<sup>st</sup> century American public schools and teacher education programs. This research paper will use a qualitative historical methodology to explore past reforms of American teacher education programs to determine appropriate recommendations for the 21<sup>st</sup> century. The authors will utilize Berger & Luckmann's (1967) Socially Constructed Theory and Gay's (2010) Culturally Responsive Teaching approach as conceptual frameworks to recommend appropriate reforms for American teacher education programs. Research findings will include pre-service teacher preparation and professional development/in-service teacher training, conducted in the past decade. Additionally, the latest statistical data from the US Department of Education will also be reviewed to reveal the scope of 21<sup>st</sup> century student diversity and educational needs.

## The Changing Face of Education

Today's K-12 public education classroom is rich in diversity (including race, ability, and languages). As such a teacher may find the classroom a new and challenging place from year to year, as new students are enrolled annually. By the year 2021 the American Public school system is projected to have 53,113,000 students enrolled in K-12. That number is up from the actual count in 2010 of 49,484,000 students (USDOE, 2010). This is good news for teachers as more students can mean more jobs and job security. However, more students can also mean more student needs. This is the current and future reality of public education; especially since as of July 2011, what was once the majority is now the minority in terms of birth rate in the United States (Tavernise, 2012). Given this cultural shift, the first section of this paper begins to explore the needs of students by identifying who they are and who their typical teacher may be.

Research question:

1. In light of the changing student demographics in the United States, what are appropriate reforms that can be made to 21<sup>st</sup> century American teacher education programs?

## Conceptual Framework

The conceptual framework for this paper lies in two widely known concepts. The first is Berger & Luckmann's (1967) Socially Constructed Theory, where one examines societal change as pathways to understand both the precursors and outcomes of reform. Given the historical nature of this paper the authors selected this framework to guide the research methodology. Thus educational reform pathways were established via the lens of social change. The second

framework comes from Gay's (2010) Culturally Responsive Teaching, where teachers approach the educational process with an open, kind, and understanding heart. Given the change in race and ethnicity regarding student demographics a Culturally Responsive approach was warranted to determine appropriate reforms for teacher education programs.

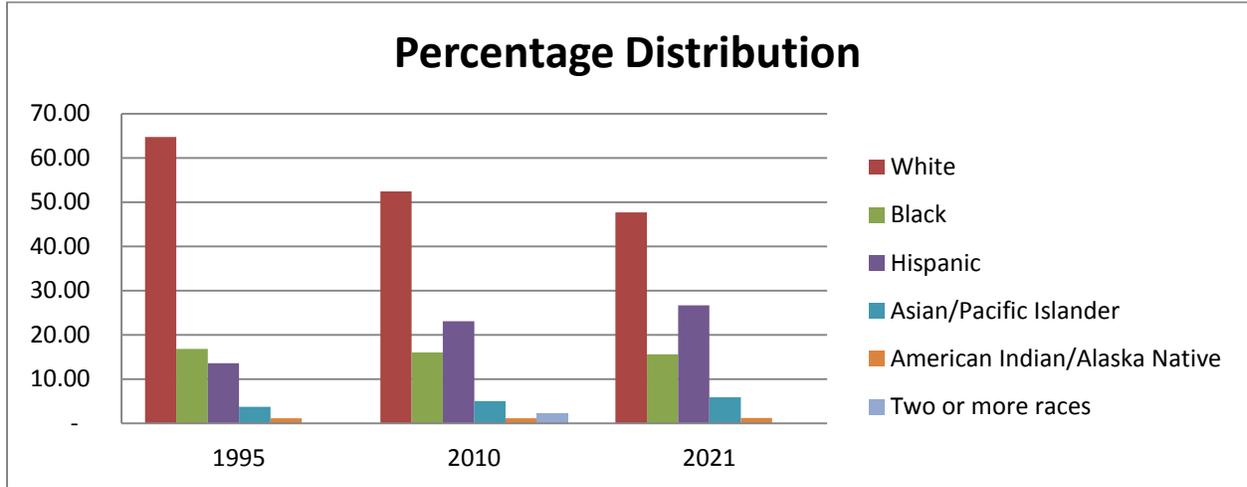

### Methodology

This paper historically looks at educational reform in the past to help determine an appropriate trajectory of reform in the present and near future. Both primary and secondary sources were utilized to develop a clear narrative of educational reform. This narrative was then compared to the current demographics to recommend an ideal reform for teacher education programs. Once the data was collected and analyzed a proposal for a new kind of teacher education program was developed.

### Results

According to a 2010 U.S. Department of Education Common Core of Data report entitled "State Nonfiscal Survey of Public Elementary and Secondary Education", the face of education is changing. The White and Black student populations in public K-12 schools are decreasing while the Hispanic, Asian/Pacific Islander, and Biracial populations are growing, and have been since 1995. Looking into the future we see these trends progressing, and by 2021 we may actually see the White student population drop below 50 percent and the Hispanic population grow to almost 30 percent, thereby making this group the next largest population, as depicted in the table below.

Table 1. Student Demographics & Projections

*SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "State Nonfiscal Survey of Public Elementary and Secondary Education," 1995-96 through 2010-11; and Projections of Education Statistics to 2021.*

As the number of Hispanic students rise and the number of White students decrease in our public schools, an examination of how student's needs were met may be in order. Howe & Lisi (2014) examine the role of privilege and cultural identity in society and the classroom, they write, "Privilege that is linked to identity has its grounding in the United States in the very beginnings of this country. ...In fact, diverse groups of people in this country, today, do not start on a level playing field" (p. 146). While many have recognized a similar truth, it is in this characterization of privilege and identity that we are able to recognize how a profound shift in student demographics may have an effect on teaching and learning.

Moreover, as the number of Hispanic students increase we should also expect to see an increased awareness and interest in the development of a Multicultural Curriculum. Traditionally, minority students have experienced an education that largely did not discuss or honor the richness of their

cultures. In *How Minority Student Experience College: Implications for Planning and Policy*, Watson, Terrell, Wrights, Bonner II, Cuyjet, Gold, Rudy, & Person (2002) interviewed minority undergraduate students at seven higher education institutions, their findings were largely not unique to higher education and many of these truths had a firm foundation in the K-12 system. They wrote,

A related theme to the individual viewed as the spokesperson for an entire group was the notion that students often believed they were not seen as individuals, but as generic parts of a larger group. Students were concerned about their assigned responsibilities as spokespersons for their respective minority community and for their race. Students believed assumptions were often made about them based on their minority group membership. They also had qualms about their institutions' proclivities for lumping all minority students into categories" (Watson, et al., 2002, p. 69).

Therefore minority students have been spotlighted in classrooms to be the bridge between the learning environment (i.e. society) and the specific culture the learner represents. This has been a problem for many students because it singled them out from the rest of the class even more. Also, the added pressure to provide accurate information for the class may be overwhelming. The student, in this scenario, has become the resident expert in the absence of any further elaboration of the topic by the teacher's lecture or lesson plan. Although this study was conducted with college students, this resident-cultural expert practice is not foreign to K-12 schools (Gay, 2010; Nieto & Bode, 2011).

In considering the role of educational administration and social justice in the classroom, we have found that minority students have largely been tracked based on the perception of their ability due to race. Marshall & Oliva (2006) shared that, “inequitable outcomes [in K-12 students] are not merely the results of deficiencies in students, nor the communities from which they come, as was often assumed to be the case. Instead, inequitable outcomes often results from systematic organizational practices and policies...” (p.6). Looking back at the increasing trend of minorities in general, this statement from Marshall & Oliva demands a significant change from school administrators and teachers who continue to participate in this unfortunate and inequitable practice. However, damaging a school’s policy and practices may be, it is likely that these policies and practice remain in place today due to habit and not harm.

These damaging school policies and practice may also have a profound effect on minority students regarding test scores. Novak & Fuller (2003) revealed that the more diverse the school, the more likely the school would have a harder time meeting AYP. Their study compared California public schools’ AYP scores over 2 years. They found “...that the percentage of schools hitting their AYP growth target [was] strongly related to the number of student subgroups. In addition, schools serving lower income families and their children, on average, [were] less likely to have achieved their AYP growth targets” (Novak & Fuller, 2003, p. 4). These researchers also noted that Latinos (a.k.a. Hispanics) were heavily populated in poorest schools.

### Demographics of Public School Teachers

Though Novak & Fuller (2003) argue that the demographics of students matter when looking at AYP, we felt it necessary to look at teacher demographics, to understand who the average K-12

teacher is and how well he or she may be prepared for a classroom of diverse student needs. We came across a U.S. Department of Education's National Center for Education Statistics questionnaire for Public School Teachers. The questionnaire is a part of the School and Staffing Survey for the 2007-08 school year, entitled a "Public Teachers Questionnaire" was issued and published in 2009 by the U.S. Department of Education's National Center for Education Statistics.

Of the high school teacher participants who completed the questionnaire, 58% were female, 83% were White, 26.4% teachers were between the ages of 50-59, and 46% had a Master's degree. In understanding that the average high school teacher may be an older white female teacher with a graduate degree, we believe that the need to provide professional development to address the increase of the linguistically and culturally diverse learners in schools.

With the current and projected increase in student race and ethnicity for K-12 schools (Tavernise, 2012), we believe that the changing face of education needs to be addressed by teacher preparation programs and on-site teacher professional development opportunities. Moreover, the rise in more disabled students in the classroom, as well as the number of students participating in ELL programs speaks to the need to the need to prepare and educate teachers for the needs of their future classroom.

## Teacher Practice, Teacher Education, and Culturally Responsive Pedagogy

One of this paper's authors worked for 31 years in rural, Title I school districts in Alaska and Oregon. Additionally, this same author served as a building principal, a district Title III Director, and a district Human Resources Director. As a result, this author has had ample opportunity to observe classroom teachers, observe and conduct professional development training, observe and direct a Title III program, and interview new teacher candidates.

This observation and experience strongly suggests that a significant majority of current classroom teachers have not been properly prepared to offer a culturally responsive classroom experience to their students. Villegas & Lucas (2002) championed the idea that we need to train teachers on culturally responsive practices to meet the needs of the growing diversity in the classroom. They wrote,

All of us involved in the education of teachers at our institutions must engage in dialogue to develop a collective vision of teaching and learning in a multicultural society.

We need to examine and revise the curriculum in light of that vision. We need to spend time coordinating the desired responsive teaching qualities with the courses we teach and the field experiences we offer. We need professional development that will help us model the responsive teaching qualities reflected in the revised curriculum. (p. 30)

In effect they have called for a more reflective and proactive approach to preparing teachers and students to ensure that education is an enriching experience for both parties. Moreover, Title

III/ELL programs are often viewed by teachers in much the same way as special education program intrusions—Good for students, but yet another imposition on the classroom teacher, primarily due to lack of effective professional development for working with special populations and the time and effort needed to implement change. This is an important factor, as classroom teachers are the actual people who carry out the reforms in direct contact with students. Finally, pre-service teacher preparation, even for prospective English Language Learner (ELL) teachers, while providing preparation for teaching English language development, is much less visible with regard to Culturally Responsive Pedagogy. The following table of research findings supports these observations.

Table 2. Research findings

		<p>in teaching diverse students.</p> <p>3. Uses Gay's framework of Culturally Responsive Pedagogy (2000) as a basis for developing relationships with students.</p>
--	--	---

What this suggests is that there is a clear need for solutions to address these perceived deficiencies. Current classroom teachers (as noted above by Reese, 2007) have significant educational and societal expectations to meet, and therefore benefit from being properly prepared and trained to address them. Finally, the research suggests that university teacher education programs need to make the necessary adjustments to more fully train prospective teacher candidates in culturally responsive pedagogy.

### Recommendations

Based on the foregoing, we recommend the implementation of (or improvement to) Culturally Responsive Pedagogy for teacher education programs; given the rapidly changing and increasingly diverse educational environment that is occurring in classrooms today and will continue in the near future.

We recommend that teacher education programs be substantially revised to more fully incorporate Culturally Responsive Pedagogy as part of its teacher preparation efforts. We envision the implementation of Culturally Responsive Pedagogy to include: (1) coursework specifically aimed at Culturally Responsive Practices for teacher education students, (2) applying these practices in field experiences, (3) participation in community-based observations and

school-based observations, and (4) developing service learning experiences for their future students.

Coursework is a key part of any teacher education program, and it is likely that making adjustments to both core and elective offerings by adding courses about Culturally Responsive Pedagogy and Practices can be accomplished as part of a general program review, periodic individual course adjustments, or other routine process. Certainly, instructors and curriculum specialists developing these courses should have expertise in the area of Culturally Responsive Pedagogy and Practices, and should be able to translate that expertise into effective course designs.

Additional components of the coursework aspect of the program should include opportunities for reflective book studies (Eick & McCormick, 2011), as well as participation in professional forums for program development, as outlined by Potts & Shlichting (2011). While the forums described by Potts & Schlichting (2011) were aimed at teacher-education faculty, including teacher education students would offer additional perspective in these discussions and may yield positive results.

Perhaps the more challenging (but also most rewarding) part of adding Culturally Responsive Pedagogy and Practices to a teacher education program is to be found in providing for field experiences. Catapano & Huisman (2010), and Noel (2010) both recommend a community based field Experiences. Capatano & Huisman (2010) focus on the idea that teachers need to

understand the communities they will be teaching in. Noel (2010) notes that these programs should seek to include the community in program design and implementation.

Many teacher education programs make provision for classroom observation. We suggest that this include a significant reflective component, as suggested by Taylor (2010). Schon (1984) has written very effectively about the value of reflective practice for professionals; Taylor (2010) notes that this is a necessity for teacher education instructors in conducting their work. We recommend extending this practice to pre-service teachers. As such, it may be necessary to explicitly teach reflective practice skills to pre-service teachers, however, the time spent doing this is time well spent. Pre-service teachers can already begin to use reflective practices that will benefit them and their students over their career.

Wong (2011) notes the value of service learning, such as tutoring diverse students, in providing for practical application of Culturally Responsive Pedagogy. Service learning puts pre-service teachers in the community, working directly with students and others, in both applying and practicing what they have learned in the classroom.

Blending these components to create a more comprehensive program makes good sense. Pre-service teachers will have a better foundation to work from than coursework alone; we believe that providing opportunities for community interactions would significantly enhance the teacher education program in ways that classroom observations cannot provide alone. Additionally, and more importantly, doing these things can work toward significant social change. It sets the stage for this social change in the classic manner outlined in Berger & Luckmann (1967). In time, this

approach to teacher education could grow to become the widely accepted manner of teacher preparation.

### Conclusion

By attending to our current demographic realities, teacher education programs should reflect this change in student populations and attend to these new needs in culturally responsive ways. In modifying a teacher education program to include coursework in Culturally Responsive Pedagogy and Practices, along with opportunities for reflection and professional engagement, and engagement in community- and classroom-based observations and service learning, college and university teacher education programs can help to create needed social change. This Culturally Responsive approach to the changing demographics of our society will be a significant step towards meeting the needs of all students and our diversified American community at-large.

**Title:** Digital Citizenship: The Rules of Netiquette

**Description:** This workshop aims to address the rise of digital citizenship and how it will affect both teaching and learning. In this workshop, a university professor and secondary school teacher will introduce and prepare participants to the issues surrounding digital citizenship such as the idea of privacy, cyber bullying, the impact of social media has on graduates, and the negatives and positives of social and the impact it will have on the education professional arena.

**Co-Authors:**

1. Dr. Deborah R. Lemon
2. Sabrina Jafralie, M.A. in Theological Studies

**Affiliation and University:**

1. Social Media and Online Community Learning - Ohlone University
2. Department of Integrated Studies – McGill University

**Email:**

1. drlemon@drlemon.com
2. sabrina.jafralie@mail.mcgill.ca

## **Digital Citizenship: The Rules of Netiquette**

This workshop addresses the rise of digital citizenship and how it affects both teaching and learning. In this workshop, a university professor and secondary school teacher will introduce and prepare participants to recognize the issues surrounding digital citizenship including the concept of privacy, cyber bullying, the impact of social media has on graduates, and the negatives and positives of social media and the impact it is having on the education professional arena. Currently, scholarly literature dictates that digital citizenship is the fastest area in educational technology and has a huge impact on all levels of teaching from primary to university.

In this workshop, professors Lemon and Jafralie will present the concept of digital citizenship and outline what this concept entails. Also, participants will be introduced to the changes happening and trends in digital citizenship. The workshop will focus on the changes to the laws of privacy in an educational context, the evolution and legal implications of cyber bullying from secondary to higher education and lastly, the role and impact of social media has on graduates entering the workforce, and most importantly, education's role in teaching students how to safely and effectively navigate the social media stream.

Title of Submission: **Sexual Abuse Prevention Education**

Topic area of submission: Cross-disciplinary areas of Education (Safety, Adult Education, Counseling, and Policy)

Presentation Format: Panel Session

Description of Presentation: This study surveyed 165 parents within the South Whittier school district. Parents surveyed were asked 24 questions pertaining to child sexual abuse understanding and their views on child education on child sexual abuse prevention (CSAP). The significance of this research is to understand what parents' beliefs are regarding CSAP, in order to see what educational tools parents can be provided in building communication and protecting their children from sexual abuse.

Paper Author: Sandra E. Ascencio

Claremont Graduate University  
[sandra.ascencio@cgu.edu](mailto:sandra.ascencio@cgu.edu)

**Abstract: Sexual Abuse Prevention Education**

Since 1977, child sexual abuse prevention (CSAP) programs have been conducted in the United States, Canada, and other countries (Chen & Chen, 2005.) But, since the 1990's the CSAP programs have been on a decline (Finkelhor, 2009). Sex crimes, like overall crime has decreased since the 1990's but it is hard to tell if prevention programs like CSAP have influenced the decline that is currently seen (Finkelhor, 2009). In addition, there are few published reports on parents' awareness of CSAP (Chen & Chen, 2005).

The highest risk ages for sexual abuse are between the ages of 7-13 years old (Kenny, 2009). 30% of reported sexual abuse takes place before 9 years old (Kenny, 2009). In a study by Lampert and Walsh, the age onset for child sexual abuse was marked at 8 years old in the United States but the age onset for abuse in Australian studies was marked at 10 years old (2010).

The significance of this research is to understand what parents' beliefs are regarding CSAP, in order to see what educational tools parents can be provided in building communication and protecting their children from sexual abuse.

The population surveyed was made up of 165 parents that had a child or children attending elementary school in the South Whittier school district in Los Angeles County, California. A survey and consent form were submitted, reviewed and accepted by the Claremont Graduate University IRB for use and distribution. A total of two South Whittier elementary schools participated and allowed for this research project. Parents were approached prior to or after school and asked if they would voluntarily and confidentially agree to take a survey on safety for their children. Parents that were interested were asked to enter the library in order to fill out the questionnaire. The questionnaire is made up of 24 questions and uses Likert scale measurement.

To understand the awareness of parents on CSAP, the age parents feel it is appropriate to educate children on CSAP, to correlate parents' previous exposure to victims of abuse, and the comfort parents feel in discussing child sexual abuse a variety of statistical analyses were performed: descriptives, frequencies, t-tests, correlations, factor analysis, multivariate regressions, and path diagrams.

# Pupil Size and Fixation Time of Elementary Students on Classifying Test

## <abstract>

Information about where students gaze or how to gaze during problem-solving allows us to understand their cognitive process clearly. Difference of cognitive process is obvious among students as well as more outstanding especially between a successful group and an unsuccessful group.

In this paper, differences of eye movement between two groups of elementary school students are presented during classifying test.

SMI (SensoMotoric Instruments)' iView X™ RED 120 Hz was used in order to collect eye movement data. Nineteen elementary school students answered two classifying problems while their eye-movements were recorded. Participants were divided by classifying test into two groups (successful students, unsuccessful students).

Pupil size and fixation time proportion were analyzed to establish differences between the successful group and the unsuccessful group. The current study showed that ( i ) the average of pupil sizes of the successful tended to be larger than that of the unsuccessful during classifying test; (ii) the more difficult problems were, the larger pupil size of the successful were while there was no change in condition of the unsuccessful; (iii) the successful group's fixation time proportion on critical clues that were useful to problem-solving was higher than that of the unsuccessful.

The findings from these analyses suggest that cognitive load occurs when more difficult problems are given to the successful in spite of no change in same situation of the unsuccessful. Furthermore, a more useful information search takes place on problem-solving of classifying test of the successful group than that of the unsuccessful. The divide between them allows us to not only distinguish unsuccessful students from successful students in classifying learning but also develop teaching and learning strategies that educate classifying learning effectively.

## 1. Introduction

Doing a great job on reasoning inductively helps students to improve not only intellectual functioning but also scholastic achievement (Csapó, 1997; Klauer *et al.*, 2002; Sternberg, & Gardner, 1983). Classifying activity, one of inductive reasoning, plays an important role in science education because not only provides it a theoretical frame that contributes to developing concepts but also it can structuralize field of inquiry systematically (Klauer, & Phye, 1995). Especially classifying creatures is required to constant concentration such as discovering characteristics of them and determining the criteria for classifying (Byun *et al.*, 2013; Cho *et al.*, 2005; Klauer *et al.*, 2002). We can know whether students' attention concentration takes place or not by confirming students' classifying activity. Moreover, classifying test can make it possible to judge whether students solve problems effectively because scientific problem-solving process is represented in classifying activity.

Cognitive process during problem-solving can be learned through where participants gaze or how to gaze (Chuang, & Liu, 2012; Tang, & Pienta, 2012). Attention linked to cognitive processing is indicated by eye movements directly and objectively (Rayner, 1998) because preconscious mechanisms lead to early visual attention processes (Terburg *et al.*, 2011). Eye tracking is used in this research for reasons as follows. First, eye-tracking extracts physiological parameter, pupil response, of participants (Kim *et al.*, 2007) and we can get information about not only at which point participants gaze but also how they respond through it; thus, it helps us to measure learning effect and improve student's learning (Shin, & Shin, 2012, 2013). Second, eye-tracking enables us to detect more accurate and subtle data related to student's attention as well as cognitive processing in comparison to traditional assessment methods (Tai *et al.*, 2006). Third, there are several researches which study the difference of science problem-solving between novices and experts using an eye tracker. Differences of cognitive process are represented by eye movements on these studies.

Fixation occurs when information is important and interesting (Holmqvist *et al.*, 2011) and the more information is complex, the more fixation time is (Goldberg, & Kotval, 1999; Henderson, 1992; Holmqvist *et al.*, 2011); thus, degrees of cognitive load can be expressed by fixation time. Pupil size expands and contracts by mental state and by the amount of cognitive load (Holmqvist *et al.*, 2011; Kahneman, & Beatty, 1966). In study of education, useful information about cognitive load is obtained by extension of pupil size (Holmqvist *et al.*, 2011; Van Gerven *et al.*, 2002).

Changes of pupil size on mental workload, emotion and anticipation, drowsiness, diabetes, age, pain and drugs are researched (Holmqvist *et al.*, 2011). However, there are little studies about eye movements on classifying problems between a successful group and an unsuccessful group until the present; therefore, the current study was performed. In this paper, differences of eye movement between two groups (successful students, unsuccessful students) of elementary school students are presented during classifying test.

## **2. Method**

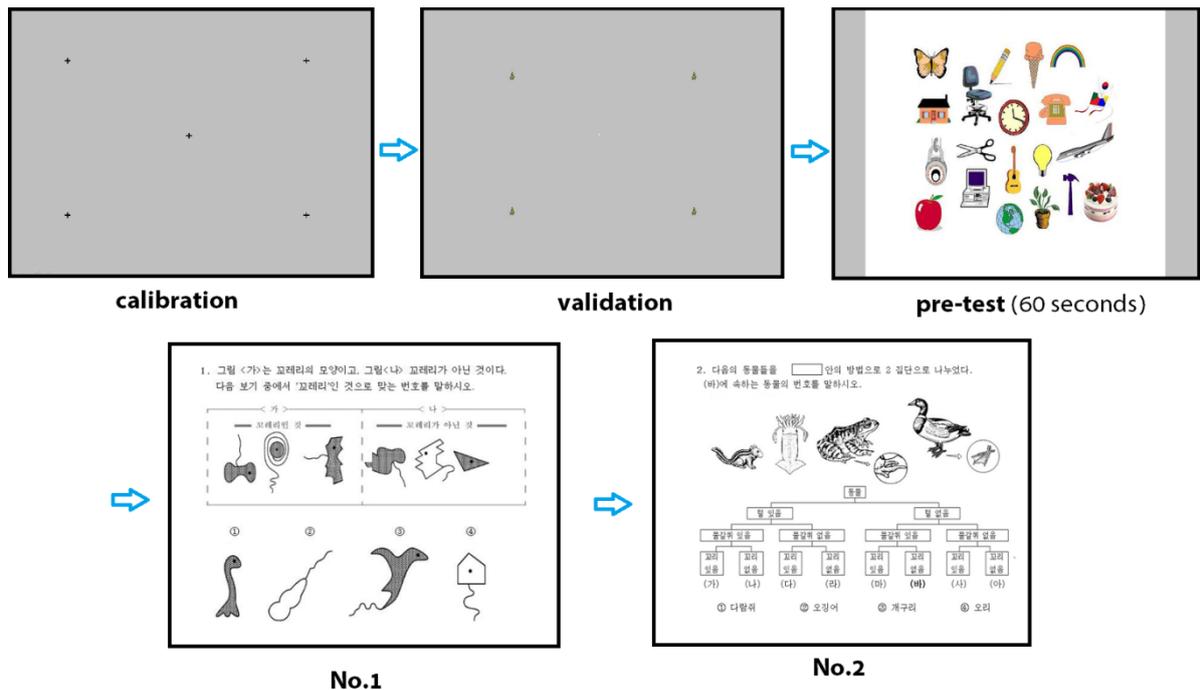

### 2.1. Participants

The participants were nineteen 6<sup>th</sup> grade Korean students and they all volunteered to participate in this experiment. It was divided by two groups (six successful students and thirteen unsuccessful students) depending on classifying test. We got their guardian's consent.

### 2.2. Experimental design

An expert group consisted of two experts of science education and three masters of science education in elementary school. They took part in seminar four times for selecting problems, designing an experiment, analyzing the conclusion. First experiment was designed using SMI (SensoMotoric Instruments)' Experiment 3.2 program. A pilot test was performed for suitability and validity targeting five elementary school students of a general class (Holmqvist *et al.*, 2011; Shin, & Shin 2012, 2013). After analyzing the pilot test, a presentation method was redesigned.

<Fig 1>

<Fig 1> Experiment design

### 2.3. Apparatus : table-mounted eye-tracker

An eye tracker that tracks individual's eye movements is a noninvasive measure; it is suitable to an experiment of elementary school students (Holmqvist *et al.*, 2011; Shin, & Shin, 2012, 2013; SMI, 2011a). Image processing based on computer and infrared rays make it possible to monitor movements of pupil and to measure pupil size. SMI (SensoMotoric Instruments)' iView X™ RED was used in order to collect eye movement data. The velocity of eye movement was 120 Hz as well as stimuli were presented on a monitor whose size was 1680 x 1050 pixel (width x height). After analyzing data using BeGaze 3.2 software, discussions and the conclusion were drawn. Participants' pupil size and fixation time proportion (FTP) were analyzed to find the difference of cognitive process between successful students and unsuccessful students.

### 2.4. Procedure

After listening to operator's brief instruction, participants sat in front of the eye tracker attached to monitor. First, participants' eye movement was calibrated by designated five targets on monitor. Calibration is positively necessary due to individual variation of eye radius and shape (Choi *et al.*, 2012; Holmqvist *et al.*, 2011; Shin, & Shin 2012, 2013). Second, validation was repeated until pupil deviation of x and y axis was less than 0.5° because maximum deviation of pupil should be lower

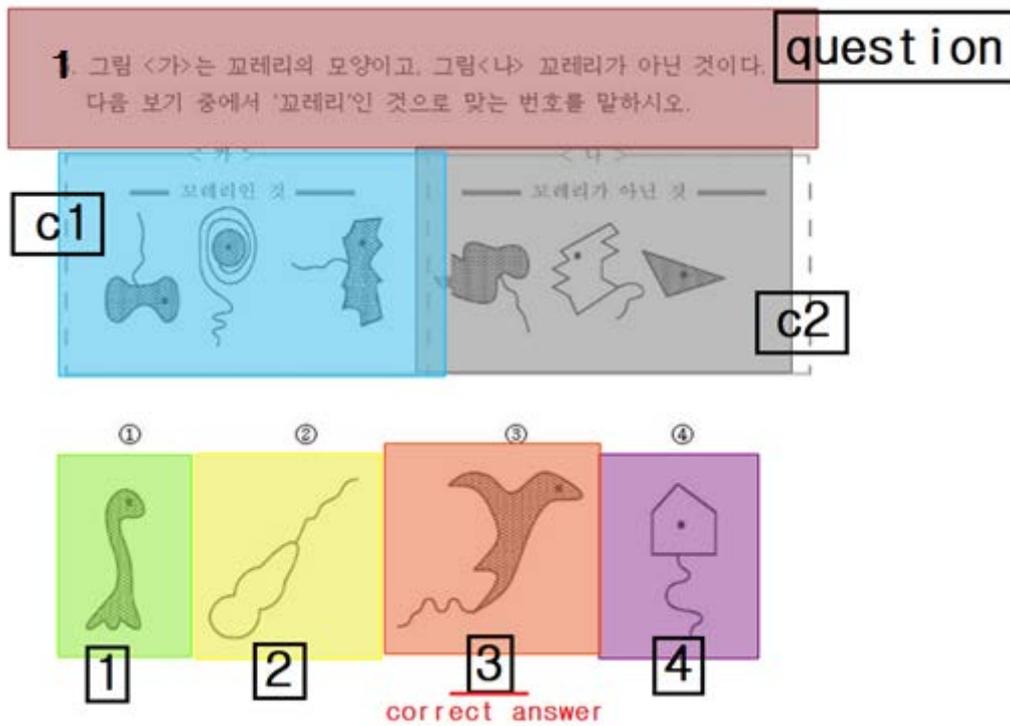

than 0.5° in x and y axis (Holmqvist *et al.*, 2011, Shin, & Shin 2012, 2013; SMI 2011b). Then, for sixty seconds, a pre-test was presented for participants to adapt the current experiment. After seeing a classifying problem, participants answered the problem orally. Pressing the space bar, they could move on to the next step.

## 2.5. Stimulus materials

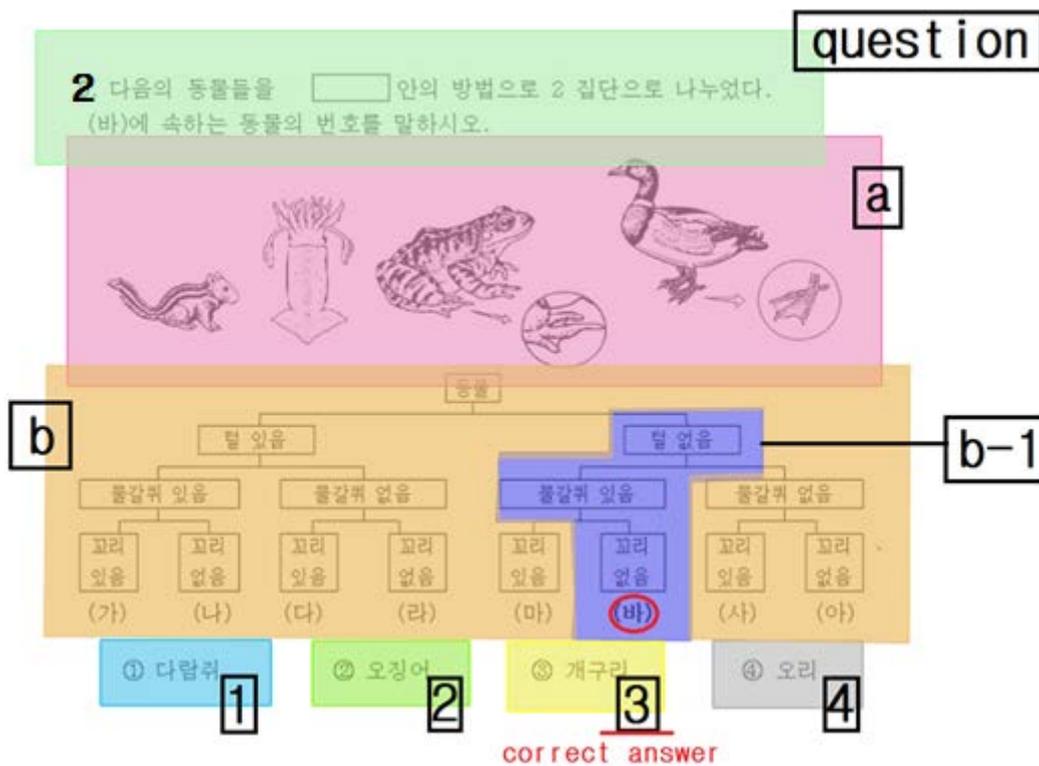

Nineteen elementary students in Korea answered two classifying problems while their eye-movements were recorded. It was selected as two classifying problems which were adequate to eye tracking system through a preliminary inspection of TSPS (Test of Science Process Skill) developed by Kwon & Kim (1994). Students generally have troubles in No.1 and higher cognitive load is demanded during solving No.1 than No.2 because not only is mellinark an imaginary animal but also it is not observed directly; it is not easy to connect with conceptual elements in long-term memory. Difficulty of No.2 is lower because animals in No.2 can be seen easily as well as often learned in school, though.

## 2.6. Data analyses

All data of eye movements are separated by setting up minimum fixation duration; fixation and saccade (Shin, & Shin, 2012; SMI, 2011b). Minimum fixation duration in current study was configured to 200ms because recent studies mostly did like this (Choi *et al.*, 2012; Cook *et al.*, 2011; Liu, & Shen, 2011; Shin, & Shin 2012; Tsai *et al.*, 2012;) as well as the average of fixation time on pilot test was 200ms.

<Fig 2> Classifying problem No.1

<Fig 3> Classifying problem No.2

In the first problem, participants should find a mellinark on condition that it was presented examples of mellinark and non-mellinark. A mellinark is a meaningless word to measure classifying ability. In the second problem, participants should find the animal corresponding to red circle on <Fig 3>. Clues that were helpful to solve the problem were located in 'b-1'.

### 2.6.1. Pupil size

Pupil sizes of all participants were measured while they solved No.1 and No.2. Pupil sizes for problem solving were averaged individually. Individual pupil size during problem-solving was averaged per groups (the successful and the unsuccessful). Then, we compared the successful to unsuccessful.

### 2.6.2. Fixation time proportion (FTP)

AOI (area of interest) was configured as <Fig 2> and <Fig 3>. The FTP of all participants was abstracted using BeGaze 3.2 and the averages per AOI were analyzed.

## 3. Results

Successful students got the right answer in two classifying problems while unsuccessful students did not do that. 38.46 percent of the unsuccessful group said incorrect answers in all problems and the rest of them said correct answers in a single problem. Only one student of the unsuccessful group gave the correct answer in No.1. Therefore, it was considered that classifying ability of successful students was better than unsuccessful students.

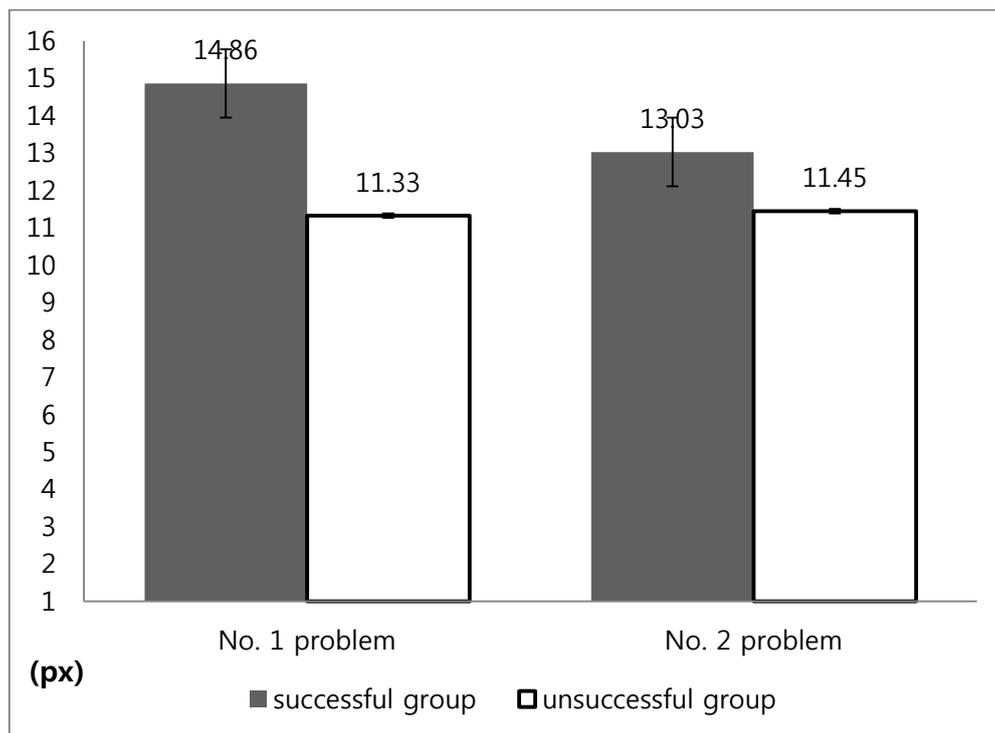

**<Table 1> Results of participants' problem-solving**

Problem	Participants																		
	Successful students						Unsuccessful students												
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
No.1	O	O	O	O	O	O	X	X	X	X	X	X	X	O	X	X	X	X	X
No.2	O	O	O	O	O	O	O	O	X	O	X	O	O	X	X	X	O	O	X

O : correct, X : incorrect

### 3.1. Pupil size

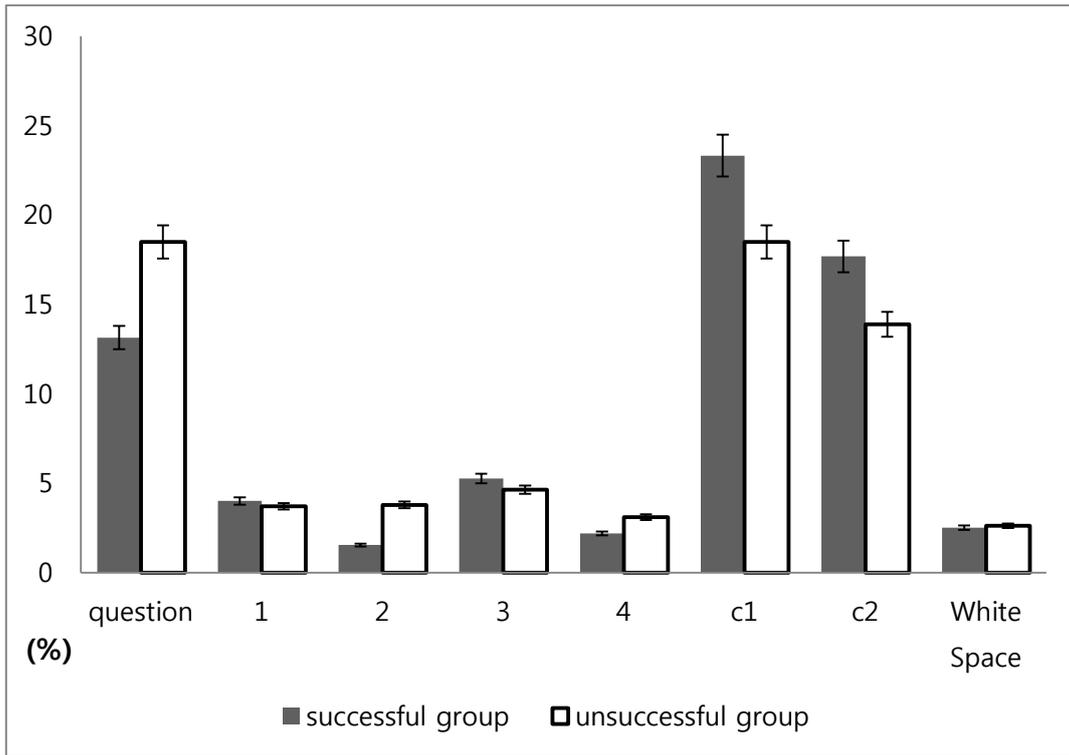

The average of the successful group's pupil size was larger than that of the unsuccessful group's pupil size in both problems. There was no change of the unsuccessful group's pupil size regardless of level of difficulty. Otherwise, the successful group's pupil size was larger in No.1 which was more difficult to students. It was considered that the successful group had different cognitive load depending on level of difficulty while the unsuccessful group had similar cognitive load steadily regardless of level of difficulty.

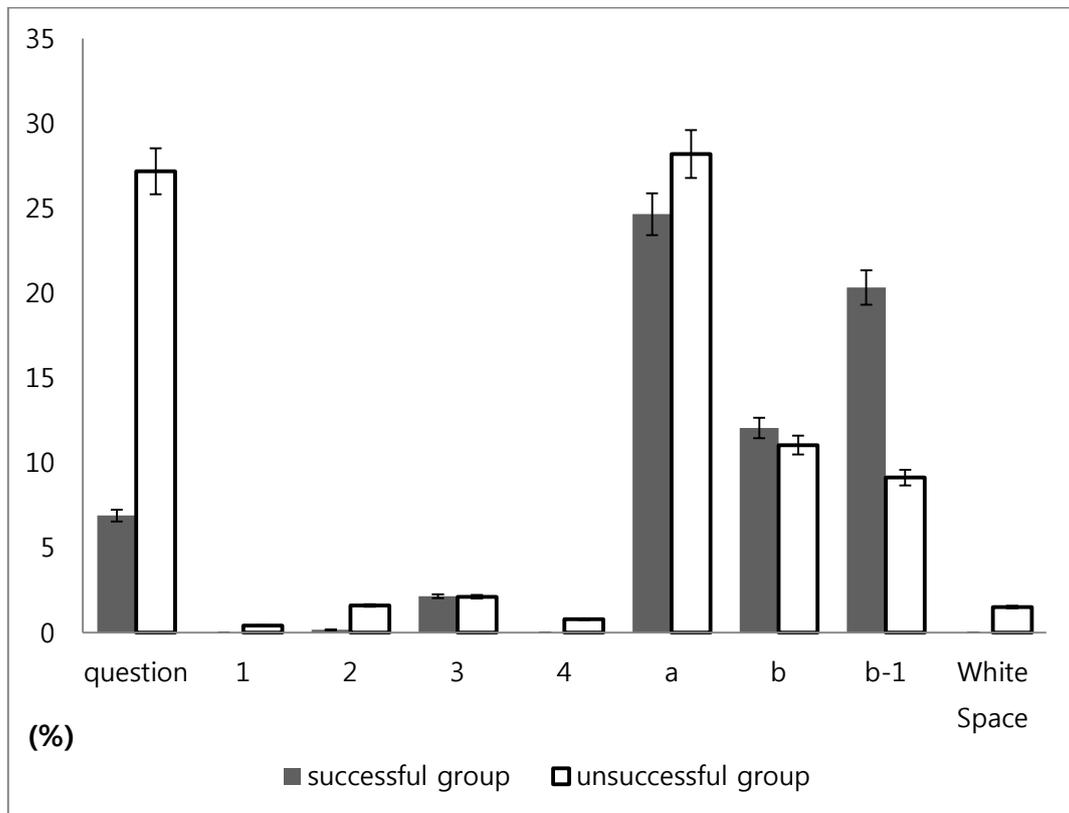

<Fig 4> The average of pupil size

### 3.2. Fixation time proportion (FTP)

In the first problem, the successful saw 'c1' and 'c2' which were clues to solve the problem longer by 4.83 percent and 3.8 percent. They stared at 'example 1' more than the unsuccessful by 0.29 percent and 'example 3' that was a right answer by 0.63 percent. Although watching all areas due to difficulty, the successful group's FTP on unnecessary areas was less than the unsuccessful group's and they focused on clues that helped to solve the problem. In the second problem, the successful group stared at 'b' and 'b-1' more than the unsuccessful group. Especially, they saw 'b-1' more by 11.19 percent; it means successful students did efficient eye movement because the problem could be solved in case of seeing 'b-1'. They never watched 'example 1', 'example 4' and 'white space' which was extrinsic to correct answer.

<Fig 5> FTP in No.1

<Fig 6> FTP in No.2

#### 4. Discussion

Larger pupil size of the successful during problem-solving of classifying presented in current study is thought of as higher cognitive load occurs to the successful (Holmqvist *et al.*, 2011; Kahneman, & Beatty, 1966; Van Gerven *et al.*, 2002). It may be because successful students have more prior experiences by similar activities (Kuhn *et al.*, 1995). As we cannot rule out the possibility of individual variation, difference of pupil size among individuals should be debated later.

In current study, when more difficult problems are given, variation of pupil size occurs to the successful group contrary to the unsuccessful. Members of the successful group may rely on problems in accordance with level of difficulty as appeared by alteration of their pupil size. On the other hand, we can predict that unsuccessful students count on their own cognitive model regardless of problems' difficulty from the result that there is no change of pupil size according to problems. Although not only external motive but also inner motive are demanded for problem-solving (Kim, & Lee, 2004; Bandura, 1992), unsuccessful students' inner motive that should appear as pupil size may not be caused easily (Holmqvist *et al.*, 2011; Kahneman, & Beatty, 1966). If we discover what makes unsuccessful students characterize and their cognitive strategy, it is helpful to enhance unsuccessful students' inner motive and cognitive model.

The higher FTP of the successful group on critical clues means their cognitive load of key points increases, because fixation time are direct and objective measures of cognitive load (Goldberg, & Kotval, 1999; Henderson, 1992; Holmqvist *et al.*, 2011; Tang & Pienta, 2012; Rayner, 1998). Moreover, during problem-solving, staring at clue which helps to getting the correct answer stands for effective perceptual progress; therefore, it can be construed as more useful information search takes place on classifying test of the successful group. In contrast, lower FTP of the unsuccessful group is regarded as inefficient perceptual progress. They not only need to find features of visual elements in bottom-up attention but also need a cognitive strategy that finds clue by purposive and active top-down attention.

Division between them allows us to differentiate the unsuccessful from the successful in classifying learning and develop teaching and learning strategies that educate classifying learning effectively.

## 5. Conclusion

The current study allows us to know dissimilarity between successful students and unsuccessful students during problem-solving of classifying through analyzing pupil size and FTP. Both pupil size and variation of successful students' pupil size according to level of difficulty let us recognize successful students have plentiful preliminary knowledge of classifying test as well as their cognitive load is changed depending on level of difficulty. In addition, it is discovered that unsuccessful students need to know an efficient cognitive strategy such as top-down attention. It is helpful to develop effective teaching and learning strategies in classifying with these conclusions.

# A Buddhist Perspective: Environmental Sustainability for a Healthy Society

Rev Mangala Pirya Sraman<sup>1</sup>

Siam and Mahachulalongkornrajavidyalaya University

## Introduction:

The present environment Crisis today is unprecedented in whole history of mankind: Pollution, deforestation, loss of bio-diversity, water depletion, land degradation and climate change. The interactions of living and non-living systems have been attempting to create a congenial human habitat but this balance has been removed by the excessive exploitation of natural resources.

## Environmental Sustain:

Now a day, human civilizations are facing not only environmental crisis but also a multi-dimensional crisis having intellectual, Socio-political, Economic, moral and spiritual tones. Renowned scientist and environmentalist Capra says:

*“It is a crisis of intellectual, moral and spiritual dimension; a crisis of scale and urgency unprecedented in recorded human history”<sup>2</sup>*

UNESCO has developed many environmental educational projects for a healthy society borrowing from the world’s religions and specially emphasizing on Buddhist Insights into environmental education. Taplow announced in 1992 that scientific knowledge, technological capabilities, spiritual values and cultural exchange of information are to promote sustainability of the environment, if Buddhist contributions are applied both in making a diagnosis of the malady, the potential prognosis for the future and presenting path ways for a recovery and healing of the environment.<sup>3</sup>

---

<sup>1</sup>Who is also known as Bcr Titu Barua from Bangladesh is an International Master of Business Administration (IMBA) student at Siam University, and an International Master of Arts Program (IMAP) student at Mahachulalongkornrajavidyalaya University.

<sup>2</sup> Capra, F, “*The Turning point, Science, Society and the rising culture*”, Simon and Schuster, New York, 1982. P.22

<sup>3</sup> Toplow, “*Court Declaration: A Dialogue on Cultures*”, UNCED, Buckinghamshire, 1992. P.26

If someone asks why? Then it is because, Buddhism offers resources for dealing with Multi-Dimensional crisis having moral overtones and other three ethical concerns which has global ethics, projection for the future generations and ethics beyond humans including human lives, animals, plants and ecosystems. According to Buddhism the reasons for the degradation are human greed (Lobha), human anger/aggression (Dosa) and Delusion (Moha). Being greedy (Lobha), one does not concern about others. Being aggressive one does not love, sympathize and care for others. Being lost or deluded one does not understand what is good and bad. If the objects of the man's greed, aggression becomes the nature then a non-violent and gentle attitude towards nature is impossible.<sup>4</sup> A monk named Sankicca says thus for Non-Violence:

*“I do not recollect any such wishes that these beings perish that they be destroyed or that they suffer anguish and pain”<sup>5</sup>*

Schumacher in his book ‘Small is Beautiful: A Study of Economics as People Matter’ said that Buddhism has environmental philosophy, sustainability and ethics covering nature, humans, animals and ecosystems as an inter-connected system.<sup>6</sup>

### **Buddhist Ecological Integration on Nature:**

Human can control nature to their advantages. Nature is essential as it provides resources, which are ample of human needs, Nature Provides unlimited Economic growth and material process. Human being can never be separated from nature because they are dependent and inter-connected to each other. Human has no way of surviving if the nature is destroyed for nature supplies every basic need of Human Beings.

Technology can solve some of the human although not all the human problems and if technology could provide ever solution for every problem then spirituality would not be necessary. According to Olsen, Dunlop and Lodwich, Social interactions need to be improved to mutual connectivity. Personal achievements should be

<sup>5</sup> Theragatha, tr, “*Psalms of the early Buddhists*”, Mrs. C.A.F. Rhys Davids, PTS, London, 1903 – 1913. Verse: 603. Also see: A.II.p.72-73, Vin.II. 110. J.144.

<sup>6</sup> Schumacher, E, F. ‘*Small is Beautiful: A Study of Economics as if People Matter*’, ABACUS Sphere Books, London, 1971. P.37-47

developed to group achievement and large scale organizations are the key roles of their development.<sup>7</sup>

If the achievement of the Environment and its Sustainability is expected then the behavior of the entire society towards the Bio-Sphere must be transformed because

*“We are, what we think, all that we are, arises with our thoughts, with our thoughts, we make the world”<sup>8</sup>*

According to Se Silva, Buddhist perspectives on the Environment Crisis’s Alternative visions are based on 5 features known as:

- 01.Maintenance of Ecological integrity
- 02.The integration of Conservation and Development
- 03.Satisfaction of basic human needs
- 04.Achievement of Equity and Social justice
- 05.Provision of social determination and cultural diversity

To live in Peace, Harmony, and Happy with natural world for the survival and well-being of the human beings at the fittest. A new Ethic must be embraced with plants, animals, Human beings, non-human beings, beings we see and do not see and people we like and dislike. Without dividing the world into ‘Nature and Human’ Buddhism claims ‘Sentient being (Humans and Animals and other creatures with life) and Non-Sentient Beings (Plants, Environment, anything without life but connected to the living beings)’. Non-Sentient beings are greatly linked to human life, being irresponsible and violent towards them would have indirect moral and karmic Relevance according to Causal Theory perspective.

*“When this is, that is, from the arising of this comes the arising of that, when this is not that is not, from the stopping of this comes that”<sup>9</sup>*

---

<sup>7</sup> Olsen, Marvin, E. Lodwick, Lora, G, and Dunlap, Riley, “*Viewing the World Ecologically*” West view Press, Boulder, Colorado, 1992. P.

<sup>8</sup> De Silva, Padmasiri, “*Buddhist Perspective on the Environmental Crisis, Pacific Ecologist*”, winter 2002, See Also “*Thinking Disorder*” Olsen, M, E. Lodwick, G.E. Dunlap, R.E. ‘*Viewing the World Ecologically*’ Westview Press, Boulder, New York, 1992.

<sup>9</sup> D, Dhammacakkapavattana Sutta, P.01, See also: S.V.420f. Vin.I.10f

The five precepts<sup>10</sup> of Buddhists provide a basic ethical appearance for the Buddhists to prevent the destruction of any life (Panatipata) to arising of any social conflict. In internal sense five precepts are for humans, animal life and the nature to reject violent and to cultivate the positive values of (Metta) Love and (Karuna) compassion.

To comprehend a non-violent attitude promoting more meaning to the current environment covering the irresponsible exploitation of natural resources, Sutta Nipata says the following.

*“Whatever breathing beings there may be, no matter whether they are frail with none expected, be they long or big or middle-sized or be they short or small or thick as well seen or unseen or whether they are dwelling far or near, existing or yet seeking to exist may beings all be of a blissful heart.”<sup>11</sup>*

Buddhists are advised to be cautious of even unintentional harm to any living beings and nature. Buddhists monks and Nuns are highly condemned for travelling during rainy seasons and are strongly emphasized to be aware of not injuring any sentient and non-sentient beings.<sup>12</sup> Worshiping the Bodhi tree is considered an important Buddhist practical ritual, because Buddha attained Enlightenment under the root of the tree. Veneration, gratitude and kinship with nature are part of the nature orientation in Buddhist teachings and disciplinary rules. The most important insight on Human-nature orientation in Buddha’s teaching and disciplinary rules connects directly with spirituality. Buddha asked the monks to go to Empty places, forest, woods, groves, meadows and foothills to meditate for spiritual solace.<sup>13</sup>

Buddhist scriptures does not directly talk about conservation, although the materials in Buddhist Scriptures, specially Buddhist Life styles and the development of Non-Violent and Compassionate life orientation, are essential to society’s concern with proper conservation and development. The Buddhist

---

<sup>10</sup> 1. Not Killing any living beings to protect environment and maintaining a natural balance over the world ecology. 2. Not stealing which means not to harm the outer and inner layers of others life. 3. No Sexual Misconduct which emphasizes on respecting sustainability of a family and its dignity. 4. Not lying and being sincere which means to be honest, truthful, keep one’s own promises and using the language correctly. 5. Avoiding Intoxication which will bring loss of consciousness and alter our behavior and act in un-social ways.

<sup>11</sup> Sn.V. P.143-152

<sup>12</sup> Vin. I. P.137

<sup>13</sup> D. XXII. P. 375. Mahasatipatthana Sutta.

Human-nature orientation combines the inter-connectedness of all life, the inter-dependence of all beings and a network of relationship referring to Biotic Communities.

*“Nature is both random, contingent, blind, disastrous, wasteful, clumsy, ugly....but nature is also elderly, prolific, efficient, fit, exuberant, diverse, renewing in the midst of death”<sup>14</sup>*

A householder is expected to possess wealth, just like a bee that collects honey without harming the flower for everything is connected ecologically and socially.<sup>15</sup> Thich Nhat Hanh, who is well known as a ‘Socially Engaged Buddhist’ says:

*“We should deal with nature in the way that we deal with ourselves, harming nature is having ourselves and harming ourselves is harming the nature. If we know how to deal with ourselves and follow human beings, we would know how to deal with nature”<sup>16</sup>*

This is an important message which highly emphasize on the interdependence and the interconnectedness of all forms of lives starting from sentient to non-sentient.

### **Environment: Culture**

A very interesting emphasized theory in the present society is the modern Environmentalism which is based on environmental planning and conservation that demonstrates cultural context. Different societies try to demonstrate this in different ways considering their own traditional environmental knowledges. They are the shared values, shared assumptions, mutual understandings and goals demonstrates in the way of their life, rituals, arts, music, flexibilities and innovation embodied in their own particular traditional knowledge to preserve their culture, and according to IUCN Stockholm Conference in 1992 suggests that:

*“The government of all the nations should take in the account, the very large reservoir of environmental knowledge, philosophy and experience within local cultures and uphold the*

<sup>14</sup> Rolston, Holmes, ‘Disvalues in Nature’ *Monist*, 75/2, 1992. P.08

<sup>15</sup> D.III. P.189

<sup>16</sup> Hanh, Thich Nhat, ‘The Individual, Society and Nature’, Fred Eppsteiner, ed. “The Path of Compassion: Writings On Engaged Buddhism”, Parallax Press, Berkley 1988. P.40-46

*idea that this knowledge may provide a significant basis for future environment management planning and policies.”<sup>17</sup>*

Buddhist teachings such as Arts, rituals, cultural stories like Jataka tales, chanting sacred suttas, being generous, metta, karuna, mudita and upekkha, build a very rich sustainable society rooted in culture. Whoever follows the teaching undergoes changes and does not have to worry about planning and conservation for; there is always an ‘Alternative Path for environmental improvement’.

Emphasizing only one particular culture in the nation might be contradictory to the notion of sustainable ethics where global citizens interact and share their inter-faith. Therefore the plea for ecological and cultural pluralism has to be considered to connect the essence of environmental justice. A sustainable society needs to respect with sincerity and authenticity so that the conflicts are reduced to lower degree and no destruction of traditions are supported. Buddhists therefore emphasize on inter-faith dialogue to avoid conflicts and to learn more about other cultures from other different faiths.

### **Environment: Education**

Environmental Education is the most useful strategy to gain a healthy and a practical environmental, ethical and sustainable society. Normally the state regulations and legislation are used to protect the environment but in this lost world, the treats of the environment are so powerful that Education and public participation is a must. People’s participation via education is a very valuable contribution, not only to the present crisis but also for the future.

A part from governmental organization, Non-Governmental organizations introduce a diverse formal and informal education promoting global, national and local society. These days most schools whether governmental or Non-Governmental support integrated courses on environmental issues by introducing faculties, arts, Science and ecology. When education and public participation take place, then there is always a possibility to develop a secular modern environmental ethics based on human welfare and human rights where religions in the world can

---

<sup>17</sup> De Silva, Padmasiri, ‘*Buddhist Perspectives on the Environmental Crisis*’, Pacific Ecologist, Winter 2002, Also see about the “*thinking Disorder*”, Olsen, M.E, Lodwick, G.E, Dunlap, R.E, “*Viewing the World Ecologically*”, Westview Press, Boulder, New York, USA. 1992. P. 161-174.

offer profound platform for transforming environmentalism into human ways of life. Because all the religions are culturally roots in one or another, in stories, myths, poetry, arts and folk dramas.

Education leads the environment to think the right way. Just imagine an individual with Educational Background establishing himself/herself to think in the right way and transforming accordingly. Normally people think in the wrong way and we all often do this when we are depressed, worried and frightened then we change our attitude to be Pessimistic about the Society. But Buddha said, mind is the main cause of all un-satisfactoriness.

*Mind is the forerunner of (all evil and all good) states. Mind is chief; mind-made are they. If one speaks or acts with wicked mind, suffering follows one, even as the wheel follows the hoof of the draught-ox. But if one speaks or acts with pure mind, Happiness follows one, even as one's shadow that never leaves.*<sup>18</sup>

We sometime experience a feeling of isolation, separation and loneliness, lost, depressed, unloving, and unfair. When we judge the experiences of our own lives from the position of permanent separation from everything else then the outcome is fear, worry and anxiety. The way in which we perceive the world will fraught with an attitude arising from that fear and anxiety. Things will be completely different, if we educate our mind and avoid all unwholesome actions. Isolation, separation, loneliness, lost, depressed, unloving, unfair and even fear, worry and anxiety are mind made things. We have to educate our Mind through Buddhist Meditation.

Whenever we talk about Environment, religion is something that cannot be skipped, for its environmental knowledge, philosophy, experience, interdependent and connectivity.

To hope for a brighter environment, education is very important and therefore, Buddhism point out 10 important factors that are considered as the highest way of

---

<sup>18</sup> Dhp Verse: 02. P.01

living taught in Mahamangala Sutta, when the Devas (Deities) approached Buddha and asked what the great blessing are.<sup>19</sup>

1. Not to associate with fools, to associate with the wise, and to honor those who are worthy of honor
2. To reside in a suitable locality, to have done meritorious actions in the past, and to set oneself in the right course
3. Vast-learning, perfect handicraft, a highly trained discipline, and pleasant speech
4. The support of father and mother, the cherishing of wife and children, and peaceful occupations
5. Liberality, righteous conduct, the helping of relatives, and blameless actions
6. To cease and abstain from evil, forbearance with respect to intoxicants, and steadfastness in virtue
7. Reverence, humility, contented, gratitude and the opportune hearing of the dhamma
8. Patience, obedience, sight of the Samanas<sup>20</sup> (Sanctified Ones), and Dhamma discussions at due seasons
9. Self Discipline, celibacy, perception of the Noble Truths, and the realization of Nibbana<sup>21</sup>
10. He whose mind does not flutter by contact with worldly contingencies, Sorrow less, Stainless, and Secure

As Buddhist followers, putting these great prosperous factors into our daily practice, would demonstrate oneself as a good Buddhist. Because these factors not only talk about Education and Public Participation, but also about Preservation and handling things with conditional situation.

### **Environmental Protection:**

To protect environment, it is necessary to practice the Buddhist Concept of ‘Oneness and Co-Existence’, ‘Compassion and life Protection’ and simplicity in

---

<sup>19</sup> SnA.I.174, see also: S.VV.P.258-269. Khp.V.

<sup>20</sup> Samana is defined in difference context but here it means Religious types of people who do wholesome deeds

<sup>21</sup> Nibbana is the goal of all Buddhists.

their daily life. Kalyana Mitta<sup>22</sup> is very important while talking about protection for he/she shall be there to guide us to think positive.<sup>23</sup>

With wholesome speech, one abstains from frivolous talk, double-talk, and harsh speech. That is environmental protection from speech. Abstain from killing, stealing and sexual misconduct means protecting environment from unwholesome deeds. When one's mind is free of defilement with no jealousy and anger, one protects the environment by right mindfulness.

Protecting environment starts from our mind development because if our mind is at peace and healthy with compassion and environmental awareness, then we can save the earth due to the connectivity and interdependent of the world. A Mahayana Buddhist nun Chuehmen claim 12 advises to protect environment with inner beautiful mind.

01. Speak quietly – Do not disturb others
02. Keep the ground clean – Do not litter
03. Keep the air clean – Do not Smoke
04. Respect oneself and others – Do not commit violent acts
05. Be polite – Do not intrude upon others
06. Smile – Do not face others with an angry expression
07. Speak kindly - Do not utter abusive words
08. Follow the rules – Do not seek exemptions or privileges
09. Be mindful of you actions – Do not act unethically
10. Consume consciously – Do not waste
11. Be grounded – Do not live aimlessly
12. Practice Kindness – Do not create malice<sup>24</sup>

If we start to transform our minds, through discipline and wholesome deeds having concern and care for oneself and other, by following the above mentioned 12 advices, then we can hope for a fully protected environment here after.

---

<sup>22</sup> Kalyana mitta means a good friend, who stands beside during the sad and happy moment of life, sharing and caring for each other.

## **Buddhist Ethics:**

Ethics play an important role in the philosophy of Environmentalism which attempts to develop a spiritual perspective combining discipline in Arts, Science and other sub-fields like Bio-ethics. Ethic emphasizes the virtues that human beings need to develop their life style to live peacefully in the society. It also emphasizes duties that demonstrate the consequences of one's own action.

Buddhist ethics should be practiced with respect to sentient and non-sentient beings worldwide for a sustainable life style. Buddhist ethic claims that being ethical means being exemplary to the others by 'Virtuous' character such as **Compassion, Gentle, Humility, Mindfulness and Responsibility**.

**Compassion** means to extend one's compassion to all sentient and non-sentient beings, just like a mother who protects her only child at the risk of her life, so as the compassion should be practiced alike.<sup>25</sup> **Gentleness** means to be positive counterpart to the first precept of not harming or killing any sentient or non-sentient beings. **Mindfulness** means to maintain oneself individually or personally. **Responsibility** means to be active with the attitude of caring for natural Environment.

Buddhist Ethics both individual and social become meaningful and expressive only when freedom and free will are guaranteed for the achievement of the ultimate goal which lies beyond the causal conditioning of empirical phenomena.<sup>26</sup>

Buddhist ethical conducts are to build on the vast concept of universal love and compassion for all living beings. The Buddha gave his teaching for the good of many, for the happiness of many, out of compassion for the world. That is why, he sent the first 60 Arahants<sup>27</sup> to 60 directions to teach the dhamma that is good in the beginning, good in the middle and good at the End.<sup>28</sup>

According to Buddhism true ethical life aims at promoting moral, honorable and peaceful conduct abstaining from destroying life, from stealing, from dishonest dealing, from illegitimate sexual intercourse and engaging to help others to lead a

<sup>25</sup> Metta Sutta, see also: Sn.VV.P.143-152. Khp.IX.

<sup>26</sup> PhD, Gnanarama, Pategama, Ven, 'Essentials of Buddhism' Singapore, 2000, P.105

<sup>27</sup> Arahant means people who are fully awoken or people who has destroyed all defilement and who achieved liberation.

<sup>28</sup> Vinaya Pitaka (Mahavagga)

peaceful and honorable life. The promotion of above ethics will manipulate every place on earth to be friendly, peaceful, harmonious and pleasant.<sup>29</sup>

Buddhist ethics either physical or mental are all about self discipline in body, verbal and mind, self-improvement and self purification. It has nothing to do with beliefs, prayer, worship or ceremony.<sup>30</sup>

One good disciplinary discourse given by Buddha is Sigalovada Sutta, which draws our attention to show the great respect for the people in personal life, family and social relation.<sup>31</sup> Applying Buddhist Ethics, we move ourselves into harmony, stabilization and development in the society because these ethics mentioned above are expressions of humanity, a process of survival with wisdom and aiming towards human development.

Buddhist Ethics are meant to cultivate good wholesome deeds, emphasizes on equality, right action, pleasant speech and honesty. Therefore if these principles are taught into basic education among common people, the conflicts of enmity and hatred shall disappear and a harmonious and sincere society can emerge or develop building a strong solid relationship and purification of mind for the benefit and well-fare of the society in order to improve social morale promoting peace, safety, sustainability and even helping to create a healthy develop world.

### **Allowing Others the Right to Differ:**

If an individual lives alone at the corner of his/her home, then that person will not have any problem with differing opinions but once that person chooses to live in the society, she/he must learn to respect and allow other people to share and experience every one's opinions, although they do not conform the same opinion.

We are living in a hunting world, where the strong takes advantages of the weak and rich takes advantages of the poor. As a Buddhist we should stop acting thus. If we cannot accept others differences then we have to learn why. We should express our opinions gently and politely without imposing our personal views by forces which would only create conflict instead of creating a peaceful society.

---

<sup>29</sup> Shakya, Ratana, Manik, '*Buddhist Education for Recovering the society*', Global Recovering: The Buddhist Perspective UNDV Conference Volume, 7<sup>th</sup> International Buddhist Conference on the United Nations Day of Vesak Celebration 23-25 May 2010, Thailand. P. 179

<sup>30</sup> Rahula Walpola, '*What the Buddha Taught*', the Gordon Fraser Gallery Ltd, London and Bedford, 1959. P.49

<sup>31</sup> D.I. P.31, Sigalovada Sutta

Differences might be able to arise in any society in the world but we have to learn those differences and have to develop a mutual punctuation to build a peaceful society to live in harmony being together with the differences. Whatever it is, Buddhism introduces four sublime states which manipulate the society into a peaceful society to live. They are as follow:

- 1) Metta (Loving-Kindness)
- 2) Karuna (Compassion)
- 3) Mudita (Appreciative joy)
- 4) Upekkha (Equanimity)<sup>32</sup>

**Metta** (Loving-Kindness): Metta is a multi-significant term meaning loving-kindness, friendliness, goodwill, benevolence, fellowship, amity, concord, inoffensiveness and non-violence.<sup>33</sup>

**Karuna** (Compassion): It means to diminish the suffering of others. When individuals experience enlightenment, they report that all beings are known as one. Therefore, it is natural to extend compassion to everyone, because we are all one. As we help others and aid them in their healing process, all beings benefit, even us.<sup>34</sup> Compassion is an important virtue in Buddhism, where a person is advised to use it in his/her meditative practice where he/she must envision extending compassion gradually in all directions and to all the beings on earth.<sup>35</sup>

**Mudita** (Appreciative Joy): Mudita means finding joy in the happiness and success of others. It mostly requires a deliberate effort to identify oneself with the joys and successes of others.<sup>36</sup>

**Upekkha** (Equanimity): Upekkha is the quality of being emotionally calm, balanced and even, especially when confronted with difficult situations.<sup>37</sup> Buddhist

<sup>35</sup> Sahni, Pragati, Dr. *Environmental Ethics in the Jataka: Further reflections*, Buddhist Approach to Environmental Crisis, International Buddhist Conference on the United Nations Day of Vesak Celebrations, MCU, Bangkok, Thailand, 2009, P. 138

<sup>36</sup> Nyanaponika Thera, Natasha Jackson, C.F. Knight, and L.R. Oates, *Mudita: the Buddha's Teaching on Unselfish Joy*, <http://www.accesstoinight.org>, 2005–2013, retrieved: 17/09/2013.

in terms of equality talks about freedom, Freewill and Responsibility. Therefore, freedom is to be understood as freedom to choose any moral or immoral action whether good or evil, freewill as purposive willingness and responsibility is one's own responsibility for the retributive effect of their action. Therefore, accepting others idea in respect of individual's moral behavior shows the freewill and freedom of choice and the corresponding responsibility as essential constituents of the path of true realization. Everyone's opinion is precious for him/herself. We should provide chances for everyone to seek their own rights. Since our birth to death, we defend ourselves with our personal opinion and due to the un-acceptance of differences, we get fight so therefore to avoid conflict, we have to be diligent to be the protector of ourselves, and therefore dhammapada says thus:

*“Oneself indeed is one's savior, for what other savior there be?  
With oneself well restrained one obtains a savior difficult to  
find”<sup>38</sup>*

Buddha's allowance of freedom of thought and tolerance is surprising to the students of the history of religions. Once, upali, a prominent and wealthy householder, in Nalanda who was a well-known lay disciple of Nigantha Nātaputta<sup>39</sup> was purposely sent to meet Buddha by Mahavira himself and to defeat Buddha in the concept of Karma for Buddha's views were different from Mahavirā. But unexpectedly after the discussion was over, upali was convinced that the views of the Buddha were right and his master's views were wrong and thereafter he begged the Buddha to accept him as a disciple (Upasaka). But Buddha asked him 'to reconsider it and not to be hurry, for considering carefully is good for well-known man like him'. When upali pleaded again and again then Buddha advised him to continue to respect and support his former religious beliefs as he used to.<sup>40</sup>

If the teachings of any faith are true and experimented and if they can solve people's problems, beneficial and helpful for the society then it is not so necessary

---

<sup>37</sup> David N. Snyder, Ph.D, 'Upekkha', The Dhamma Encyclopedia, <http://www.dhammadawiki.com>, modified on 6 August 2011, Retrieved: 17/09/2013.

<sup>38</sup> Dhp Verse:160

<sup>39</sup> One of the famous teachers during the time of the Buddha.

<sup>40</sup> M.II. P.56, Upali Sutta

to know, which religion said that. It is necessary to follow that teaching and get the best benefit out of it. Even Buddha himself said this:

*Oh Monks, this view which is pure and clear, if you cling to it, if you fondle it, if you treasure it, if you are attached to it then you do not understand that the teaching is similar to a raft which is for crossing over and not for getting hold of.*<sup>41</sup>

Therefore Buddha's teaching is mean to carry man to safety, peace, happiness, tranquility and the attainment of Nibbana, the supreme goal of all Buddhists.

For there to be peace, the heart and mind which form the basis of human action should be at rest because most of the turmoil we suffer from is due to our inability to control our mind. Each time our mind comes to contact with sights, sounds, tastes, smells and physical contacts causes Un-satisfactoriness. It also causes bodily, tension in numerous physical illnesses. Only by developing one-pointedness the ability to keep the mind from constantly wandering, we can free ourselves from much of these problems and have more inner peace and physical well being of oneself and others.

### **Constant Reflection on Kamma (Action):**

Kamma is whatever we do, if we do something good, we get good result. If we do something bad then we get bad result. Kamma is something we cannot escape. Until we have achieved our result. Wherever we might be, under the water, or inside the cave or above the mountain, or even next birth or birth after next, we cannot escape from Kamma. Dhammapada<sup>42</sup> Yamakavagga says Thus:

*Here he is happy, hereafter he is happy; one who performs meritorious deeds is happy in both existences. Happily he exclaims: I have done meritorious deeds." He is happier still when he is reborn in a higher world (suggati).*<sup>43</sup>

---

<sup>41</sup> M.I.P.260, (PTS), See Also Rahula Walpola, 'What the Buddha Taught', the Gordon Fraser Gallery Ltd, London and Bedford, 1959. P.11

<sup>42</sup> Dhammapada is simply known as the Handbook of all Buddhists and none Buddhists. Which contains moral advises for life.

<sup>43</sup> Dh.p. Yamaka Vagga, Verse: 18, P. 20-22, Idha nandati pecca nandati-katapunno ubhayattha nandati, punnam me katanti nandati-bhiyyo nandati suggatim gato.

If we do good things, if we are kind and generous, we constantly reflect that we have helped someone; we did something good for the others, off course we have to reflect without expecting something in return because expectation only brings more unhappiness in life.

If we do bad, if we lie, gossip about others, if we kill any living beings, if we steal, if we do misconduct, frequently scold others, use harsh speech at others and entangle with immoral behavior then every reflection over our own experience in the society makes us sad and unhappy. That is why we do not even want to remember them.<sup>44</sup>

Every individual in the society must keep in mind that whatever they do, whether good or bad, does have its own result and no one can escape from it unless one's wholesome action is greater than unwholesome action<sup>45</sup> which turns to be ineffective kamma.

So whatever you are conscious of right now. That is kamma. You can witness the results of your own life. Confusion, happiness, doubts, worries, fears and desires come from having been born, from having performed particular actions and from having been conditioned by our society to believe, accept or fear according to its value.

When talking about kamma and its result 'Vipaka'. It is not necessary to expect something immediately out of whatever good actions you do like donating a home for homeless, practicing metta instead of being harsh, giving food to the poor, providing clothes, dwellings for the poor, etc. Kamma will take its place according to the four karmic functions<sup>46</sup>. When you know certain things are unwholesome and wrong then give them up. When you know certain things are wholesome and good then follow them and practice accordingly.<sup>47</sup>

Modern society contains numerous types of people, where some are unhappy, depressed, seeking happy feeling and wanting to get away from Un-pleasant

<sup>46</sup> Immediately Effective kamma, Subsequently Effective kamma, Indefinitely Effective kamma and Ineffective kamma.

<sup>47</sup> Rahula Walpola, *What the Buddha Taught*, the Gordon Fraser Gallery Ltd, London and Bedford, 1959. P.03.

movements. That is the transformation of individuals in the society, where they try to change their attitude being tired of their previous actions. Buddha said that any action that brings adverse consequences to the doer as well as others in the society and produces overall suffering is wrong and should be avoided.<sup>48</sup>

The teaching of the Buddha draws our attention to causal origin of such human behavior that is generally productive. Regarding the origin of the unwholesome behavior, the Psychological and causal explanation provided by the Buddha are (Lobha) Greed, (Dosa) Hatred, and (Moha) Delusion/Lost.<sup>49</sup> As long as we are trapped with these three origins, we will always perform something unwholesome. The root of all unwholesome is ignorance (avijjā) and false views (micchā ditthi). It is an undeniable fact and as long as there is Doubt, perplexity, and wavering, no progress is possible.<sup>50</sup> Therefore clear your doubt by reflecting on the triple gems known as Buddha, Dhamma and Sangha.<sup>51</sup> And follow the advice given in Dhammapada such as:

*Sabba pāpassa akaranam – Kulalassa upasampadā,  
Sacitta pariyodapanam – Yetam buddhāna Sāsanam.*<sup>52</sup>

“Avoid all types of unwholesome deeds, engage to do wholesome deeds, purify your mind.” This is the teaching of all the Buddhas. Therefore people frequently should be aware of the activities they are performing in their daily life.

### **Conclusion:**

The Buddhist ideas and practices like life Transformation, loving kindness, compassion, appreciative joy, indifference, and precepts, way of life, culture, causality, non-violence and humanity are to be propagated to all levels of the society in the world without the consideration of colors, race and differences. Because education is the basic universally accepted floor and one of the essence instruments to educate the future generations and to benefit the people with global perspective. The above mentioned Buddhist teachings are made known in main

## **Poster Session Proceedings Submission ID # 1095**

This poster presentation will provide pertinent information regarding a unique population of at-risk students who are identified as having a disability as well as who are concurrently in the foster care system. Emphases will be placed on statistical data, historical legislation, issues/barriers in service provision, and implications for future research for children and youth with disabilities who are currently serviced, may enter, or will be exiting/transitioning from the foster care system.

### **Abstract**

There are approximately 600,000 children in foster care where 70 percent, are school age (Emerson & Lovitt, 2003). These children and youth are approximately 10.6 years of age on average (Jackson & Muller, 2005). Fifty percent of young children in foster care have been diagnosed with speech or language delays, emotional behavioral disorders, and learning disabilities as compared to three percent of the general population (Scarborough, et al., 2004; Stock & Fisher, 2006) whereas an average of 40 percent of children in foster care also receive special education services (Geenen & Powers, 2006a; van Wingerden, Emerson, & Ichikawa, 2002). Additional efforts are now required to provide timely identification, provision of special education services, and other supports for the growing population of children and youth with disabilities in foster care. Because recent legislation has been passed to ensure that this at-risk population of children and youth are receiving appropriate social services and comprehensive education, implications for future research and supports are also needed. The central focus of this presentation will provide educational programming and necessary research directions essential in improving outcomes and the quality of life for this vulnerable population.

**Topic Area:** Higher Education, Secondary Education, Elementary Education, Cross-disciplinary areas of Education, Other Areas of Education

**Presentation Format:** Workshop Session

**Description:** Too many educational games rely on a quiz format, and don't encourage deeper exploration. Games excel at having players do the same thing repeatedly, creating an environment where practice and exploration is expected, thus encouraging learning. The approach presented in the "Edugaming Framework" eschews the quiz, facilitating the use of educational content as gameplay and resulting in engaging and effective educational games. Come to this workshop to learn this approach to educational game design.

## **Edugaming: Keeping the Quiz Out of Educational Games to Create Effective Learning Environments**

**Mary Rasley and Steve Weitz**

### *Abstract/Workshop Summary:*

In this interactive workshop, participants will have a hands-on opportunity to design tabletop games that provide engaging educational content. The goal of these games is to have the player utilize the educational concepts being reinforced in the actual game-play, causing the player to think about and apply the concepts repeatedly through play, leading to a deeper understanding of those concepts. No computers will be used in this workshop. This workshop's content is built on work funded through Advanced Technological Education (ATE) grant #1003154 *Merging Computer Science and Digital Arts: an Interdisciplinary Gaming and Simulation Curriculum* from the National Science Foundation.

The workshop will begin with a short presentation on game design and education, focusing on why quiz-based games are ineffective as educational tools. This presentation discusses the "Edugaming Framework" which takes educational concepts and creates games from them. The focus of this framework is in keep quizzing out of games, while ensuring that the content itself becomes the core gameplay element in a game.

After this short presentation, the exercise will begin. The exercise will use a basic shell of a poor educational game. Participants in the workshop will break into groups and, using this shell and the "Edugaming Framework" concepts, redesign the game into one that is more effective for learning. Participants will be guided in this redesign by a handout (included below), which includes questions to guide their thinking when making changes to the game.

At the end of the workshop, groups will present and discuss their design decisions, demonstrating the changes they have made to the game. This concludes with a summary of the "Edugaming Framework" and the concepts that allow game to be used as effective learning tools.

### *Workshop Goal:*

Participants will learn the Edugaming Framework and how to apply it to game creation through an exercise in which they will redesign a poorly crafted educational game.

# **Edugaming: Keeping the Quiz Out of Educational Games to Create Effective Learning Environments**

**Mary Rasley and Steve Weitz**

## **“Thinking outside the game” exercise sheet:**

Using the game that we have provided for this exercise and thinking in terms of the Edugaming Framework, work in groups of 4 or 5 people to redesign the game. Use the following questions as a guide.

### **Player Movement**

- What are the consequences of making dice determine the way the player moves around the game?
- What other means beyond dice could be used to dictate movement?
- Are there ways we can allow the player to have control over their movement?

### **The Game Board:**

- What are the consequences of having a single path that the player uses to move around the game?
- What changes could be made to the board?
- What changes could be made to the board to allow the player more control over the path they follow in the game?

### **The Cards:**

- When a player draws a card, what outcomes could occur?
- What other options could they be given at that point?
- Is there something else the card could provide to the player?
- Can the question on the card be broken down further into separate elements?

### **Resources:**

- In the current game, is there anything that a player has at the end of the turn that they did not at the beginning of the turn (typically referred to as “collecting a resource”)?
- What things are the players doing during a turn that could result in collecting a resource?
- Are there additional actions that can be added to acquire resources?

### **Player interaction:**

- How are players interacting in the game?
- Are there other ways the players could interact with each other?
- Are there actions that one player can take on his or her turn that influences or is influenced by another player’s turn?
- Can the social aspects of the game be enhanced?

### **Collaboration or Competition:**

- Does the game present opportunities for collaboration or competition? If so, how?
- Which aspect makes gameplay more fun/interesting for this game: collaboration or competition?
- Are there mechanics we can introduce that would enhance collaboration or competition?

# **Edugaming: Keeping the Quiz Out of Educational Games to Create Effective Learning Environments**

**Mary Rasley and Steve Weitz**

## **Explanation of the Edugaming Framework**

### **What existing educational games do not do well and why**

Games excel at having a player do the same thing over and over again. In an educational game, the goal is to encourage learning by providing opportunities in the game for players to practice what they have learned. Games create an environment where practice and exploration is expected. The engagement that comes through a game allows a student to explore the topic in a “safe” environment where they can try various solutions to problems and attempt a variety of strategies to “win” the game. Effective games create an environment of “flow” as described by Mihaly Csikszentmihalyi (Csikszentmihalyi, 1990), which results in complete immersion in an activity.

Quiz games do not do this. While quiz games do have repeated activities in them, those activities are unrelated to the educational content. For example, a Jeopardy-style game has players “buzzing in” to try and answer a question first - enforcing the idea of speed and timing. However, the actual questions/answers are fact based, and are inherently only something the player deals with once. This reinforces knowledge at the “remember” and “understand” levels of Bloom’s Revised Taxonomy (Anderson, 2001). They do not call upon the player to apply that knowledge in a meaningful way (the higher levels of Bloom’s Taxonomy). Common educational board games, where a player moves over squares on a board, draws cards and answers questions, has a player repeatedly rolling dice, moving a player piece, and picking up a card - all activities performed multiple times - but the actual question on the card is only seen by the player once. Having the player see and answer these questions multiple times would also not be beneficial, as the player would know the answer to that particular question, removing any challenge from the game.

### **What well-structured games can accomplish**

Well designed and structured educational games can support Thorndike’s original and amended Laws of Learning (Thorndike, 1922). By their very nature, they encourage “motivation” or readiness in the student by engaging them in the activities presented in the game. By having a player perform the same activities in subsequent turns, the game provides “exercise” or repetition which results in “feedback” or skill improvement through the practice of the activities and concepts employed in the game. Successes achieved in the game provide “effect” or internal reward which encourages the student to play the game again. The experience of playing an educational game may be viewed by the player as memorable thus providing “intensity” or an external stimulus. Finally, games provide “freedom” to the player via choices in the game, which allow them to progress in the manner they want, placing them in control of the learning situation.

The goal for an educational game should be to have the content itself form the play; rather than asking questions to be answered, the players should be utilizing the content as a means to progress through the game. In this way, the game presents an opportunity for players to immerse

themselves in the content. Players can use what they have learned and apply it to reach goals throughout the play of the game. This approach allows an opportunity for the game to involve the player in learning the concepts at the higher levels of Bloom's Taxonomy. The game itself allows the player to make mistakes and learn from them with no concern for grades. This type of game design allows for repeated play and multiple outcomes, which draws the player back to play the game again and again. This gives the student an intrinsic motivation to play, as he or she is challenged to play the game repeatedly to achieve a "win" in the game. Repeated play of the game results in practice with the concept rather than mere memorization of an answer.

### **The Edugaming Framework**

To facilitate the creation of games that foster a deeper learning of educational content, the Edugaming Framework was designed to break down content into core elements that can form the play in a game. The first step of the framework is to identify the concept or learning that needs to be reinforced through the game, focusing it down to something that is highly specific. Educational games frequently try to do too much within a single game – often asking questions on a variety of related topics, because these topics will likely appear on a test. However, this does not lead to understanding a concept at a level that is useful in real world scenarios. Since games excel at having players practice an activity, the goal is to tightly focus the game on a single concept in order to allow the best possible reinforcement. For example, rather than emphasizing "basic math skills" in a game, one can use "arithmetic" as the concept. However, that can be further narrowed to addition, subtraction, multiplication and division. At the beginning of the design process, it is going to be difficult to take all of these into consideration, so narrowing further to focus upon addition alone would provide a simpler starting point. Once the foundation of the game has been developed, incorporating other elements of arithmetic beyond addition will become easier.

Breaking the concept down into its smallest component parts is the second step of the framework. Concepts often contain pieces within them that work together systemically. By identifying those pieces and analyzing them so that they cannot be further reduced, individual components are uncovered. These components can then become elements of the game. Systems thinking is important in this step. Through consideration of the components and their interactions, the designer can begin to visualize how a good game mechanic can emerge from the pieces.

Often, individual components can be exposed from the same questions that would be asked in a traditional, poorly-designed educational game. With the addition example given earlier, a quiz question asking the player to give the answer for an equation would reveal components. The equation " $5 + 2 + 8 =$ " reveals six components: a 5, a 2, an 8, two addition operators and an equal sign. This can actually be reduced into two components for use in the game. The 5, 2 and 8 are all numbers, meaning that "numbers" is one component that is integral to the game. To be more specific, they are positive, whole numbers - if it is important to reinforce negative numbers, decimal points, or other aspects, those too could become components, but are not for this example. The act of adding, represented here by an addition sign, is another component. The equal sign is merely there to indicate that utilizing numbers and addition will reveal an answer - this is understood by simply having the numbers and the addition operator so the equal sign is implied by the problem.

With the component pieces isolated, the third step requires the designer to examine those elements to find the relationship between them that is important to reinforce. Obviously, educators

do not teach simply for the knowledge itself, but rather as a foundation to utilize the knowledge for practical purposes. Continuing with the addition example, an understanding that numbers can be combined is critical to many real world applications. The fact that numbers can be added together is clear, but the true importance comes from the knowledge that numbers can be combined and thus manipulated to form a separate value. Ultimately, the manipulation of numbers at this simple level is the important relationship with these components. This direct manipulation of numbers should be the activity the player is doing throughout the game in order to reach the game's goal, rather than answering questions. It is important to note that while the components and their relationships are fairly obvious in the addition example, the same technique works in nearly all areas. If the components are not clear, additional thought must be given so that the educational goal is identified.

Once the important relationship is determined, it can be used to form the backbone of the game in the fourth step of the framework. The backbone of the game needs to be an activity with no single right answer. At no point in time should the player be asked a question that has only one possible solution. The goal of this step is to create a basis for a game that causes the player to face choices in order to progress through the game. These choices are based on solving problems within the content area. This forces the player to think through the problem and consider multiple approaches to determine their own solution. Problem solving within the content area becomes the Core Game Mechanic.

A game mechanic is any rule or combination of rules within a game that form different game actions; sometimes these are actions that the player takes or actions that occur automatically as the game progresses. Moving a player piece to a space on a board based on the number rolled on dice is a mechanic. Drawing a card is a mechanic. Rotating and placing pieces so that they interlock within a puzzle game is a mechanic. A core game mechanic, such as that established in step four, is more specific and more important, however. Core game mechanics refer to the mechanic that is most crucial to the game, and that which all other mechanics should in some way help to reinforce. Typically, core game mechanics are an action the player performs - an action that is done throughout the game and is the main focus for the player. With the addition example, the core game mechanic involves a continuous combination of numbers via addition. No specific equations with singular solutions are presented to the player; instead, the player obtains and combine numbers to achieve a goal. There are multiple ways that this can be achieved. Perhaps the player chooses directions to move on a board, landing on numbered spaces, and then adding the numbers on each space to reach a goal. Perhaps the player draws cards with numbers on them and combines those numbers during the game. There are many options here, all revolving around number combination. While the basis for the core game mechanic is established with step four, in order to have the core game mechanic be fully supported, additional game mechanics need to be created via step five.

Building the mechanics that form the game is the fifth step of the framework. Regardless of the core mechanic that is exposed in the fourth step, numerous questions must be answered in the fifth to actually build the game. Other aspects of gameplay must be considered at this point. The creation of a game results from asking questions. In the addition example, how are the numbers acquired by the player? Do the numbers get immediately combined, or can they be saved for combination at a later time? What goal is the player trying to reach? If numbers are being combined, should the goal be a specific value that is reached? If the goal is not a value to be

reached, but rather a physical space on a board, how does the combination of numbers help the player reach that goal? Regardless of what the goal is, how does the combination of numbers allow the player to reach that goal? It may become clear through this process that additional mathematical concepts are needed to strengthen the manipulation of numbers - for example, allowing for subtraction to be used would give players more options to manipulate their numbers. This would also raise additional questions as to how subtraction can be implemented in the game. Step five of the framework is the largest of the steps, requiring the most creativity and experimentation.

Finally, step six revolves around refining the game. As designers create different rules for a game and modify them, it is important to actually play parts of the game to ensure they work properly and to discover new questions about how the game should function. Having a list of rules and imagining how the rules work together can only bring the design so far - it is necessary to play the game to see if it is engaging, to find elements that could be improved, and to ensure that the various parts of the game interrelate. This is all done via iterative playtesting. After creating parts of the game, it is played, problems are found, ways to fix those problems are determined, the changes are incorporated, and the steps are repeated. Iterative playtesting is so vital to the game creation process that it has been highlighted as the sixth and final step of the framework: build, playtest, iterate.

By following the Edugaming Framework, educational games can be developed that avoid quizzing, relying instead on a high level of incorporation of content into gameplay. This will give students who play the game practice with the important aspects of the concepts, resulting in a deeper understanding of the content. Ultimately, this will allow them to answer the same types of questions that may have previously been asked in a traditional test - the difference being that the correct answer comes from true insight, rather than memorization. It also encourages more engagement of the player, so that more practice time is invested in the concepts being taught.

### **Abstract**

This research was designed to study the effect of a professional development program in place-based science education on teacher and student learning in rural elementary schools in Thailand's northern Lampang province.

A professional development program in place-based science education was subsequently designed and implemented in 2010 to provide a support network for teachers to develop and teach lesson plans that connected science to the local community resources and daily lives of the students. The study focused on five schools, seven teachers, and their students from diverse cultural backgrounds who spoke multiple languages.

The data examined in this study included principal, teacher, and student interviews before and after training; teacher lesson plans; researcher, peer, and outsider observations of teaching; student work and projects; standardized student test scores in science; and interviews with parents. The key findings suggested that teachers were able to improve their science teaching by connecting science to the local knowledge in the community. Because it was very important to connect science taught in the Thai National Curriculum with local funds of knowledge, the support of the administrators and community was critical to the success of the place-based science education lessons.

## **Introduction**

If students can make the connection between science knowledge and real life it is believed that they will be able to learn about science more efficiently and effectively (AAAS, 1990). To reiterate, this research project was designed to determine the effects of a professional development program in place-based science education on teacher and student learning. In other words, could place-based education techniques enable teachers to help students make these connections in just such a manner? A study was designed to understand and evaluate this approach in Lampang Province, northern Thailand. The program involved the researcher working with elementary school teachers in five rural schools to develop a model place-based science curriculum to study teachers' and students' learning performance in place-based science education classrooms.

## **Background of Study**

In Thailand, there are few examples directly referred to as place-based education but there are programs that are similar where in-service teachers connect local knowledge into the curriculum and lesson plans. For example, Bartlett and Jatiket (2003) reported that Manas Burapa, an elementary teacher from Wat Nong Moo School in the Nakhonsawan province (in the center of Thailand close to Bangkok), developed lesson plans by using rice fields as a classroom to teach about ecosystems. Although other teachers questioned whether students could pass the tests, Burapa proceeded with lessons anyway. The teacher believed that students learn from real experiences through hands-on learning in the local community. Rather than learning from a curriculum specified book, the students used the rice field as a classroom to teach about insect life cycles, the nitrogen cycle, and the difference between organic farming and farming with insecticides and chemical fertilizers.

During the learning processes, the students were able to talk about and come up with local stores of knowledge about the rice fields. The teacher was able to see that students learned by connecting scientific knowledge and local knowledge that made learning more meaningful and applicable to real life. Moreover, the rice field lessons helped the students connect with the local farming practices that are part of their intergenerational lifelong learning. The teacher's assessment of this project suggested: (1) the successful involvement of parents and local community members in school activities (e.g. guest speakers, helping students analyze problems

in the rice field, and sharing experiences; (2) students who learned how to plan projects, write, and record reports about the ecosystem; (3) improvement in student achievement on paper tests and participation in the activities; and (4) students who learned about ethical responsibility on how to care for the local environment. The teacher learned from an assessment by his students who said they enjoyed learning outside the classroom and learning more about local insects and ecosystems. Other students said they wanted to learn outside the classroom and hoped their teacher would teach this style forever because the activity made them interested in the subject. Although it was hot in the rice fields, the students enjoyed the freedom to learn more than in a classroom. Similar expressions were also expressed in this study. The researcher reported on these sentiments as well as reporting positive student academic outcomes resulting from the use of the natural environment as a classroom.

Most rural schools in Thailand have inadequate in-classroom resources to fulfill their teaching mandates, lagging far behind their urban school counterparts. On the other hand, they do have a rich inventory of rice fields and open spaces immediately adjacent to their schools that may be used as outdoor classroom space, if teachers and schools decided to use them for that purpose. In the classroom, the teaching and learning tools supplied are neither sufficient nor up-to-date, and they do not meet student needs. Scientific principles are presented hypothetically in isolation from culture – an approach that is beyond everyday students' needs. The communities in rural school areas are populated by farming families that practice traditional agriculture-based farming methods that have been passed down over generations. Because of this, local residents have little interest in learning and applying science unless they see it as applicable to their everyday practices. Rural elementary teachers are generally not well trained and not proficient in teaching science. For these reasons students in these areas are unable to learn science concepts effectively or to achieve impressive test scores in science.

Other challenges have arisen from these schooling deficiencies. When teachers neglect to adapt the curriculum to the community, students lose their connection to the community, and many move away from rural areas and go to the city to study or work and do not return (Klechaya & Chinn, 2009; Chinn et al., 2010); and in doing so all of that energy, effort, and time devoted to schooling is lost as well. While it is understood that some students might stay and others might leave their rural communities independent of the schooling they receive, this study assessed whether education played a role in students understanding, respecting, and caring for their community.

In a pilot study conducted by the researcher using place-based education techniques, primary school students investigated sources of water pollution in the community and how these sources as well as the use of insecticides in the rice fields could harm fish populations. Students learned how protecting water resources is important for families and future generations. This approach provided an opportunity for students to develop a sense of ownership and responsibility to the environment and local community. The researcher's proposition was that even if students leave their community to go to higher education in urban areas, they may be more likely to return if they are connected and attached to their community or they may support their community from afar with resources or advocacy.

According to the Office of Education Council (1999a; 2004), the student exodus out of rural areas to urban centers in part arose due to educators in the Thailand Ministry of Education who had been prepared in Western teaching techniques. Because of this they gave little thought to adapting local school curricula to local community cultures. Western teaching techniques with their focus on learning content and test taking can be characterized as primarily urban; students reflect the highly urbanized cultures of many Western nations. Western ideas have had a powerful influence on Thai education because many in modern Thai society believe that education can help Thais have a prosperous, materialistic life. This influence explains why so many in the Thai Ministry of Education have been trained in Western education approaches.

Western influence on Thai education not only influenced teaching techniques but also educational administrative techniques. Specifically, Thai educational practices and curricula for all urban and rural schools in the country were uniformly standardized and administered by the Ministry of Education in Bangkok in the 1990s (Office of Education Council, 1999b). This centralized control was subject to continuous change based on political changes in leadership. Unfortunately, it became apparent that this type of administration was not successful in rural areas because the National Curriculum was not relevant to the needs of the rural population. In fact, the centralized policy was so politically unpopular that in 1999, the National Education Act reversed the policy, decentralizing the education authority, and returning it back to the districts to develop relevant education programs, provided they met the requirements of the overall national standards and policies.

According to Ampra and Thaithae (2001), when the local districts were given the management authority to implement in the basic education curriculum of 2001, the schools were able to create curriculum suitable for their locales. Almost instantaneously, school management

became more responsive and efficient. However, in the rural areas, the schools still faced a lack of financial resources and professional staff. Because of the difficult economic situation in rural areas, instead of teaching the students to become good members of their communities, teachers continued to feel pressure to focus on teaching the students to pass national tests so that their students might continue on to study in more prestigious schools elsewhere. If successful, the local school would become well known academically, with increased numbers of students, which, in turn, would attract more money for the school and the teachers. At the time of this writing, however, while national tests focus on academic achievement, they do not assess the quality of the relationship between the school curriculum and the local community. In addition, the National Curriculum of 2001 has not included goals like the moral and ethical development of the student or their preparation as contributing members of local or national communities.

## **Methodology**

### **Purpose of the Study**

This qualitative case study explored the application of place-based education at the local, rural level to determine its potential to reduce or eliminate the achievement gap between rural and urban areas, and to be replicated in all rural schools in Thailand. Specifically the study collected data regarding the following:

1. The ways in which preparing teachers with teaching strategies can help Thai rural students make the connection between science knowledge and their own lives in rural communities and improve learning outcomes.
2. The ways that Thai teacher and student attitudes toward place-based education changed.
3. The steps involved in developing and assessing the implementation of a model of place-based science curriculum for elementary school teachers in rural Thai areas.
4. The nature and scope of student learning and achievement in place-based science education classrooms.
5. The field-testing of a researcher-developed place-based science professional development program for rural teachers and a place-based science curriculum for schools in rural areas in Lampang Province.

The study's outcome has theoretical and practical significance. It contributes to the development of theory about the optimum uses and applicability of place-based education techniques in teaching and learning about science. The study informs researchers about an approach to overcoming resource restrictions of rural schools. The study assesses improvement in teaching performance and job satisfaction when a creative curriculum is developed. Finally, the study provides a set of in-depth case studies from which stakeholders—including policy makers, scientists, and educators—may gain rich insights about connecting academic knowledge to real life at the community level.

### **Research Question**

Based upon the results from the pilot project in one school that demonstrated how PBE was an effective curriculum organizing principle, the following research question was developed: In the context of rural Thai elementary schools, how do teaching and student achievement change as a result of the teachers' participation in a place-based science professional development program?

### **Qualitative Research Design**

According to Creswell (2007), qualitative research and mixed methods are most appropriate to use as research methods when there is a need to explore a problem or issue. This researcher believes that it is the best tool available to explore and understand the rich and deep meaning people and groups attribute to human problems based on published research studies. This methodology has greatest relevance for exploring the type of questions posed in this research study (Creswell, 2007; 2009; Denzin & Lincoln, 2000; Fontana & Frey, 2000; Gelo, Braakmann & Benetka, 2008).

Specifically, this research study focuses on a number of small schools in Lampang Province in rural, northern Thailand, that have not been studied before except in the researcher's pilot study, and about which little information exists in scholarly literature. In addition, because so little documentation exists about this specific subject matter, exploratory investigation is the best way to approach this inquiry. Data come in part, from interviews gathering the voices of village and community leaders, school teachers, village and district-level education leaders, and students. In addition, professional histories of school curricula were gathered and reviewed. Field

notes were written based on participant observation of classroom teaching and student learning conducted by this researcher in Thailand. Data collected on student learning included observations of students during classroom instruction and artifacts produced by the students. Although mixed methods were not central to this qualitative study, standardized test scores were collected and evaluated in the context of overall student achievement. From these data sources, themes have been identified describing place-based science curricula that participants have found to be the most promising for student achievement, professional teacher development, and rural school curricula.

### **Data Collection Site**

Open-ended observation and open-ended interviewing of the selected participants in Lampang Province in rural, northern Thailand took place first hand by the researcher because observation of individuals in their own social settings offered valuable insights into their motivations (Creswell, 2005).

### **Sampling and Selection of Participants**

Sampling involves selecting individuals to study who have something in common that can be studied by a researcher (Creswell, 2005). In this study, the researcher used a “purposeful sampling technique” where the particular settings, persons, and events were intentionally chosen in order to get information that is not available from other sources (Maxwell, 1996). The researcher recruited 7 elementary school teachers from 5 different schools and villages in Lampang Province, 120 elementary school children from the same 5 schools and 10 mixed gender community members from the same five communities as volunteers using the following selection criteria:

1. Rural schools in Lampang Province in northern Thailand;
2. Elementary school teachers and students in grades 1 through grade 6;
3. Diversity of grade levels in elementary school from grade 1 to grade 6;
4. Diversity of ages of teachers, students and community members;
5. Diversity of gender in teachers, students and community members;
6. Diversity of occupations of community members; and
7. Diversity of education of teachers and community members.

Through open-ended and semi-structured interview techniques, these participants talked about their experiences using both traditional and place-based education techniques and their respective connections between science knowledge and real life. Other data sources in the study included a pilot study and researcher's field notes of observations made about the participants during the interviews.

The researcher selected small schools (< 500 students) in the same educational administrative district with their voluntary cooperation. The researcher selected a sample from the following groups of participants:

1. 7 volunteer teachers (1 male and 6 females) from different schools and villages in Lampang Province. Teachers who taught Grade 1-6 from the following 5 schools: WTT Elementary School, PW element Elementary School, BHP Elementary School, PCW Elementary School and, PNT Elementary School.
2. 120 students participated in Grade 1-6 from 5 schools.
3. 10 mixed gender community members (2 from each school, all over 30 years old, and residents in the villages where the schools were located) who volunteered and were purposely sampled from a larger group to participate in the study.

### **Documents, Field Notes, and Self-Memos**

The researcher relied on the analysis of documents as part of the observation set; these included class notes, student assignments, student evaluations, teacher lesson plans, curriculum plans, and curriculum evaluations. These data were collected to investigate possible connections between these documents and other elements of the observation set that were expressed in different ways.

Field notes enabled the researcher to record the ideas and reflections of the researcher that emerged while collecting data. According to Bogdan and Biklen (1998), field notes can be invaluable resources, because recording what the researcher experiences, sees, and thinks can help to focus the observation collection. For example, in this study, the researcher created a chart demonstrating similarities and differences between participants.

Similar to field notes, the researcher used self-memos to record descriptions, summaries, and feelings about the issues that emerged in this study. These memos function to connect personal reflections with research strategies and techniques (Maxwell, 1996). Recording observations in self-memos was useful in the sense that frequently when being presented with participant experiences, the researcher understood how they fit into the broader picture, especially in the beginning of the interviews. It was determined only afterwards while reviewing notes that patterns began to emerge.

### **Data Analysis**

The researcher trained the teachers to teach science by using the place-based science education approach. The teachers then taught the students and the researcher noted patterns about what was observed and responded to by the participants who experienced the actual process of place-based instruction. These findings were compared to existing notions about place-based education that were formulated elsewhere.

For this study, analytic categories and relationships were drawn between the data from interviews and observations to answer the central research question. The qualitative data collected from each data source were analyzed separately and then the results were merged to look for additional confirmatory or contradictory results. The categories related back to the research question: In the context of rural Thai elementary schools, how do teaching and student achievement change as a result of the teachers' participation in a place-based science professional development program? These may provide some insights into findings and the application of place-based education in the Thai context

## **Results**

The teachers learned how to connect local knowledge and academic knowledge so as to make classroom learning more meaningful, whether in science or other disciplines. The place-based education model helped teachers to develop a curriculum that used community resources for student learning. Teachers also learned how to use multiple-assessment techniques to measure student learning and academic achievement. A variety of assessments was used, not only standardized test scores. These assessments were more authentically related to the goals of helping students apply science skills from the National Curriculum in their completion of science projects. For example, by students studying weevil or frog behavior in-depth, teachers were able to observe student learning in science that connects to the community. The artifacts that students created (e.g. graphs, journals, poster displays) were further evidence of student's science learning. When the students studied ecosystems in the community, the students were assessed on their actions and how they thought or wrote about using insecticides in the rice fields. The students also drew diagrams to represent their understandings and learned about the effect of oil pollution in their communities. The students came up with ideas for science projects to sustain the environments surrounding the community. For example, the students experimented to find out the best plants for absorbing the oil. The students learned about being responsible in their own communities.

Administrators were introduced to the value and relationship of community resources to classroom learning and were encouraged to be creative in the use of these, especially when government-provided finance and resources which were lacking or inadequate. Place-based education in effect, encouraged both teachers and administrators to be more responsible for school success and more creative and determined in developing ways to achieve this.

At the beginning of the teacher professional development training, the attitude of the teachers was poor. They were not confident, and they viewed science as a difficult subject to teach that they were not interested in. After the training process, the teachers learned teaching strategies that supported the Buddhist way in which they supported and networked with each other. As the teachers participated in the place-based education training, the attitude of the teachers began to change. The interviews and symposium provided evidence that place-based education helped the teachers make connections between science learning and everyday life. Although most of the teachers had no or very little background in science, they began to understand why it was important to teach science. After the training, the researcher followed up to learn how teachers were doing in teaching science through the place-based approach.

Overall, the place-based science lessons were successful because of: (1) team support from peers; (2) student behavior change that came about as the students were more responsive to the activities that connected to their families and local communities; (3) parental support from the communities that became strong and clearly evident, and (4) strong feedback and/or support of the researcher, and school principals that emerged. Because of their lack of experience teaching science, the teachers initially lacked confidence and they had trouble teaching science in depth. In comparing the first and second observations, however, the teachers gained confidence and were successful in engaging the students in science activities that connected to the local communities. Part of this success was due to the coaching and support for teaching place-based science lessons that the researcher provided the participants. The teachers were first engaged in model lessons taught by the researcher; later, the researcher and peer observers provided feedback and suggestions as the teachers taught the lessons. The teachers learned to apply an active way of teaching and learning in class. They tried many place-based education approaches to their teaching. By supporting each other through the peer observations and discussions, as well as

through feedback and resources from the researcher, the teachers continued to work hard as they tried to improve themselves.

Students' behavior changed significantly over time as a result of place-based education. At first, the students were quiet and did not talk in class. Later, the students became actively involved in talking about the results of their experiments and investigations in the local communities. They learned to talk with and ask questions of guest speakers and adults from the local communities, some of whom were strangers to them. From the researcher's observations and interviews with teachers and parents, it became obvious that students became more curious, outgoing, and confident over time. The students also developed reasoning skills. They could explain what was going on in class and they were able to analyze problems, problem indicators, causes of problems, and potential solutions. According to the Buddhist way, students learned not to judge a problem from what you see. Instead they analyzed what different indicators there were of the problem, what caused the problem and then tried to apply solutions to eliminate or diminish the problem. This was exemplified by students investigating the life cycle of the mosquito to find the best time to destroy the insect to keep it from reproducing or when students tested the water quality to identify the cause of the yellow color in the water. The students also applied their knowledge to related problems in the community. As result of place-based science teaching, most of the students performed well. Some students continued to struggle however, because of reading and writing problems although they were able to express their understanding of difficult information by orally answering questions. The students also did well as they gained more confidence in their teachers. Third grade students' improving science test scores over a six-month period (67.84 average score in grade 3; 83.94 average score in grade 4,  $p$  value < 0.05,  $n =$

50) were further evidence of students' achievement, mastery of the subject matter and empowerment.

The parents involved in the project did not originally believe that they were part of the schools, and certainly did not think they had a role in the science curriculum. However, they were very happy to collaborate with the teachers on the lesson planning and share their knowledge and experiences with the students. The parents were amazed with how the students were actively engaged in reasoning, problem solving, and discussing science. According to Buddhist tradition, the students were very respectful and appreciative of the elders that were involved in the project. Because it was important to connect science taught in the Thai National Curriculum with local funds of knowledge, the support of the community was critical to the success of the place-based education lessons.

The school principals wanted to see what would happen with the place-based science education approach. They could see that students were enthusiastic, engaged, and their performance was improving. The principals also observed what happened to the teachers as a result of the place-based science professional development program – seeing that the teachers had developed a more positive attitude about science teaching. The teachers changed from thinking that their role was being a scientist (with which they did not feel comfortable) to understanding that their role was to be a guide to science learning by bringing in natural and human resources from the local community. Place-based science education helped to change their attitude toward making personal changes. Most importantly, the teachers developed a new found respect for science and their important and even critical role in enabling students to discover the wonders of science for themselves.

As evidenced by the success of the symposium, teacher professionalism, understandings of science, and outreach to the community were enhanced. Students also demonstrated increased confidence and competence in science.

## Abstract

### Background

As we welcome the era where more and more individuals are attending universities (college universality), along with the need for redesigning to classes and improve the quality of education, the need for the cultivation of basic societal skills such as independence and pro-active mindsets, problem-solving and leadership has also come into question.

On the topic of college universality, Kawashima (2008) points out that the lack of students' 'study abilities' as well as a 'desire to learn' results in their difficulty transitioning and adapting from high school to university, stating that in first-year students' education, 'the support for the students' transition from high school to university, as well as 'the extent to which students themselves understand the meaning of pro-active learning' are correlated, and that the objective of first-year education is to have freshmen learn basic skills, as well as the formation and maintenance of 'a desire to learn' and 'good study habits'. Hamana (2009) also argues, more specifically, that through group work with friends, mentors and upperclassmen, the usage of non-passive learning methods and self-reflection are shown as important factors in first-year education.

In accordance with the 2008 reports of the Ministry of Education, Culture Sports, Science and Technology Central Council for Education, 3) Improvements in

---

<sup>1</sup>学部生 TA: primarily undergraduate students in or above their 2<sup>nd</sup> year chosen to help facilitate student discussions and provide additional assistance where necessary. Each peer supporter is in charge of a group of 5-6 students.

Educational Methods, (3) Specific Plans for Improvement (pp. 23-24), ‘the proposal for TAs (Teaching Assistants), which garnered high expectations from universities, has been actively implemented in APU for mutual learning and for supervising small numbers of students. The role of TAs has further expanded, including active participation in class planning(e.g. discussion, debate etc.)and additional support outside of class. Outstanding students are also considered as candidates for other peer support roles such as SAs (Student Assistants).’

At APU, faculty in charge of first-year education subjects attempt to create classes from the students’ perspective, actively assign undergraduate TAs to classes, and give the first-year students opportunities to learn from and lead each other.

### **Research objectives**

The main focus of the paper is to analyze how the first year students’ relationships with their upperclassmen in their role of peer supporters affected the first years’ development. This research aims to clearly show how passive students who have limited ability to translate thought into action experience growth after taking part in the Introduction to APU class. It also hopes to clarify how the development of each student brought about change in the cooperative learning process of his/her respective group.

### **Summary of the “Introduction to APU” Class**

Starting in the spring semester of 2009, “Introduction to APU” has been launched as a 2-credit freshman seminar class. This subject, which outlines the understanding of APU’s ideals and history, adaptability to all aspects of the university lifestyle and a growing sense of community belonging, the improvement of study attitudes and goal orientation, and the conversion to responsible and active learning as its objectives, is designed towards the acquisition of knowledge, skills, mindset and actions that contribute to a successful university life.This class is based on the University of South Carolina’s “University 101” freshman class, but includes APU’s ideals and characteristics for the creation of a unique class course.

Introduction to APU is composed of one Japanese-basis class and one English-basis class, with a small class size of 30 students per class, and its four distinct characteristics are as follows.

1) The usage of case study materials: The study materials are based on reports written by approximately 30 upperclassmen regarding their experiences during their university life, with 50 case studies selected and compiled for usage in accordance with the class

topics.

2) The allocation of upperclassmen as peer leaders: Each upperclassman peer leader is in charge of 1 group (6 members) of first-year students. Peer leaders help facilitate group discussions and activities, and are also tasked with writing constructive comments for each week's assignments. Peer leaders also do consultations with the freshmen as necessary.

3) Cooperative learning: Case study materials are used as the basis of thorough group discussions. Afterwards, groups present the results of their discussions with the entire class. The class also provides opportunities for domestic and international students to engage in multicultural cooperative learning, encouraging intercultural understanding and measuring the growth of the students' ability to work with people of diverse backgrounds.

4) Reflection: After each class, "Reflection" reports are assigned to the first-year students (1000 characters in Japanese, 800 words in English), promoting self-analysis and reflection. Outstanding reports are shared with the entire class.

## **Methodology**

The sample of this study is taken from the Introduction to APU (First-Year Education subject) students and the upperclassmen who provided peer support. The data is taken from self-evaluation questionnaires distributed during the first and last classes of the semester, with the average of the students' evaluation scores taken and the difference between the first and second self-evaluation used as the basis for quantitative analysis on possible changes in the students' way of thinking. Additionally, reflective essays written by both the first year students and their upperclassmen will be used as material for qualitative analysis. The qualitative analysis, based on the grounded theory, will attempt to outline the growth of the first year students from their own perspectives as well as that observed by the upperclassmen peer supporters. This paper will also analyze the upperclassmen's final reflective essays, in particular their experiences as first-year students' peer supporters.

## **Result and Discussion**

From the questionnaire results, it was found that there were significant differences in answers, particularly for the items 'I was motivated', 'I was proud to be an APU student', 'Relationships with people are important' and 'the importance of reflection'. It can be said there were changes in the students' way of thinking before and after taking the Introduction to APU class. There were also many written reports by the

students discussing the importance of taking action, becoming a more active student and other such ideas, supporting the results of the questionnaire.

The written material from the undergraduate TAs outline the first-year students' changes in detail, with the meetings and consultations with individual students outside of class and the subsequent changes in the students' attitudes towards class activities suggesting a strong correlation between the two.

It should also be noted from the instructor's observations that after meeting individually with the TAs, the students' atmosphere as a group improved, and their attitudes shifted to one of mutual dependency. The TAs, who were able to empathize with the students' feelings and learn the freshmen's future goals, can thus be said to have built good rapport with them. By respecting the uniqueness of each group member even while continuing to lend a helping hand where necessary, the upperclassman peer supporters have arguably contributed to the students' proactive stance of broadening their own possibilities.

For the first-year students, who have taken the class directly after enrolling as a student in the university, the changes in the students' individual ways of thinking, as well as the change in the results of group-based learning indicate that they were affected, to an extent, by their interactions with their upperclassman peer supporters. While observing how the first-year students mature as they interact with the peer supporters, instructors also receive an invaluable opportunity as educators to grow alongside them.

# **Experience “Math with Robots” Using Inquiry and Design Processes: A STEM Learning Module**

## **Abstract**

This paper will present an example of effective educational training and support services provided by the National Center for the Advancement of STEM Education (nCASE) that will address our nation’s critical need to produce more scientists and engineers (S&Es) from our pre-K-12 student population. These services utilize a variety of effective instructional methods with select teachers across the United States to positively prepare targeted K-12 students (including those from underrepresented groups) with the skills required to be successful in STEM subjects with the ultimate goal of encouraging them to join the STEM workforce. In a world where advanced knowledge is widespread and low-cost labor is readily available, U.S. advantages in the marketplace and in science and technology have begun to erode. A comprehensive and coordinated federal effort is urgently needed to bolster U.S. competitiveness and pre-eminence in these areas (National Academy of Sciences [NAS], 2007).

## **Introduction**

The public may not realize that the DOD is the largest employer of those working in STEM. Both the DOD and private industry have found that our nation’s education system is not graduating enough students qualified to fulfill the current/future needs of our STEM workforce.

In an attempt to reverse the STEM deficit, President Obama increased federal support for STEM education under the authority of the America COMPETES Reauthorization Act of 2010 (<http://www.whitehouse.gov/administration/eop/ostp/nstc/committees/>). He also authorized several key governmental agencies and committees to work together on this initiative.

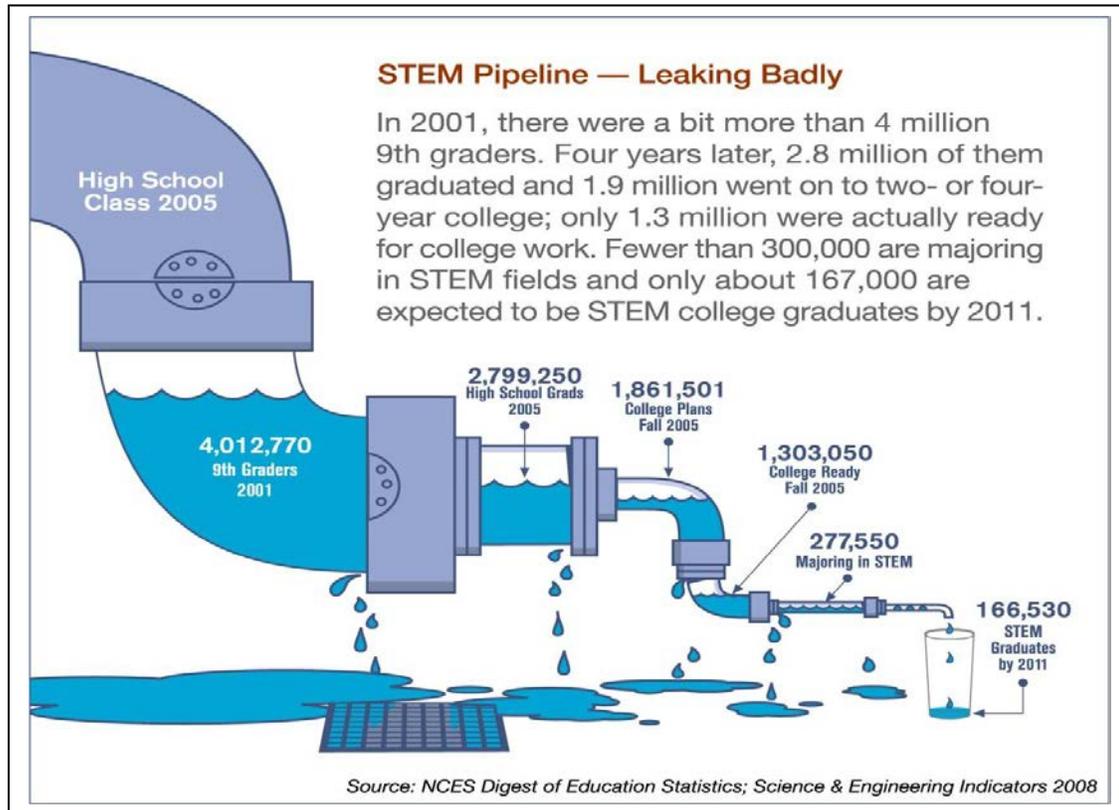

The National Science and Technology Council (NSTC), established by Executive Order on November 23, 1993, is chaired by the President and remains the principle means within the executive branch to coordinate science and technology policy across the federal research and development enterprise (NSTC, 2011). As part of its renewed commitment to STEM education, the NSTC established its Committee on STEM Education (Co-STEM) to focus on Federal STEM education activities and programs. In turn, Co-STEM established the Fast-Track Action Committee on Federal Investments in STEM (FI-STEM) to develop a STEM inventory. It also chartered the Federal Coordination in STEM Education Task Force (FC-STEM) to prepare the Federal STEM Education 5-Year Strategic Plan (2010-15) under its oversight (NSTC, 2011).

A major cause of the S&E shortfall is the anemic academic performance of U.S. students as measured on national and international tests of STEM learning. The achievement gap in turn contributes to students’ reluctance to pursue STEM careers (NSB, 2006). Another contributing factor is inadequate teacher preparation. Better prepared teachers and greatly improved teacher in-service programs are two essential ingredients for obtaining stronger academic outcomes for this nation’s K-12 students (Education Week, 2013).

## The Problem

The leaky STEM pipeline problem identified in **Diagram 1** below was presented by Robert Seltzer, DOD National Defense Education Program Point of Contact in Orlando, Florida, at a 2011 Navy briefing. The data was taken from the National Center for Education Statistics, Science and Engineering Indicators 2008.

**Diagram 1**

A review of **Diagram 1** gives evidence that in 2001 there were a little more than four million ninth grade students in U.S. schools. By 2005, approximately 2.8 million of these graduated from high school, but only 1.3 million were college ready. Only 277,000 of those ready for college majored in STEM. It was projected that only a little more than 50 percent of those initially enrolled would graduate in a STEM field. This is a serious problem for our nation—one all of us must address collectively. nCASE utilizes an effective intervention as a solution to this serious dilemma. During its professional development training programs, it delivers a major portion of the STEM content in a student-centered classroom using inquiry and design as the instructional process and adds real-world relevancy by including DOD S&Es as coaches/mentors. The workshop that follows has been developed using this effective delivery model.

## Effective STEM Professional Development

nCASE provides teachers and S&Es with effective strategies that strengthen the skills and content knowledge of their K-12 students (including those from underrepresented groups) to allow them to succeed in STEM subjects and eventually join the nation's STEM workforce.

A unique component of the training is that classroom teachers will be trained together with U.S. DOD laboratory S&Es in a method of instruction modeling a student-centered approach emphasizing inquiry (science, technology, mathematics) and design (engineering) elements (Action Research, 2007, 2008, 2009). This collaborative approach includes teachers, students, school administrators, S&Es, and STEM education partners, which enriches the learning process. The **five areas of foci for nCASE training** are: content knowledge, inquiry- and design-based teaching skill sets, research processes, STEM communication, and classroom integration of digital technology.

During this condensed Math with Robots I (MWRI) training program, participants will learn that STEM is comprehensive and integrated for students in the activity-based, inquiry and design (I&D), student-centered classroom. As a culminating activity, participants will be challenged to reflect and share ideas that will be used to modify the design and program challenge activity applying the knowledge and skills acquired during the module activities and instruction.

The first unit was developed to provide Algebra I/STEM teachers innovative materials to be used with all students (even those identified as "at risk") to successfully complete Algebra I without some type of intervention. Since then, additional units have been created to address the standards in the Achieve Model Pathways Integrated Math I course ([www.achieve.org/files/CCSSI\\_Mathematics\\_Appendix\\_A\\_101110.pdf](http://www.achieve.org/files/CCSSI_Mathematics_Appendix_A_101110.pdf)).

Motivation for the development of MWR materials came from the K-12 classroom teachers who were searching for supplemental materials to use with Algebra 1 students. Materials needed to be different than those already being used. nCASE decided to assist in the development of instructional materials using Lego Robotics kits that would include scientific inquiry as well as periodic design challenges all viewed through the lens of mathematics. Lego kits were chosen due to their low cost and non-metal parts. Plastic parts reduce the possibility of cuts with the younger audience. In addition, many science teachers have sets of the Lego robotics platforms which can promote the sharing of resources when math and science teachers are trained together in teams.

These materials have been used in several workshops throughout the U.S. (Alabama, Hawaii, Illinois, Maryland, Massachusetts, New Jersey, and West Virginia) during professional development for teachers as well as in pre-service teacher education classrooms.

## **Workshop Focus: Math with Robots I (MWRI)**

(For more information, visit [www.nacase.org](http://www.nacase.org).)

### **Introduction to the Inquiry and Design Process Models**

Through several activities, participants learn about the attributes and advantages of the Math with Robots I STEM learning module. Each activity prepares teachers/S&Es for the culminating design challenge project, which brings together everything they learned during the module. In today's workshop, we will share one activity with you, "Introduction to Wheels." Participants also learn about the attributes and advantages of other STEM Learning Modules (SLMs) related to specific core content. In addition to the adapted Ball Model (Ball, 2003) used to create the MWR materials, we will share the inquiry process model (Carin, Bass, & Contant, 2005) and the design process model (Northwestern University, 1999). Because the design process is interactive, participants get to apply what they learn during the inquiry activities in real and satisfying ways.

**Overview:** Participants will learn mathematics definitions/concepts needed in Algebra 1 and emphasized in the new common core state standards during hands-on inquiry and design activities. The final design challenge requires they modify the robot and write a program to allow the robots to complete a challenge activity utilizing the knowledge and skills acquired during the workshop.

### **Workshop Purpose**

This workshop is intended to motivate participants to learn the mathematics associated with the study of Lego Robots. Learning Objectives include: comparing and contrasting attributes of different wheels and sharing ideas that will be used to modify the design in a challenge activity.

### **Procedure, Data and Observations for the MWRI Learning Module**

**Participants will:** deepen their understanding of I&D-based methodologies utilized throughout the modules; review the requirements, responsibilities and expectations for scientists, engineers, and teachers; use the constructivist approach to explore the module; interact and network with experienced nCASE/NDEP module educators, including DOD S&Es; explore the integration of appropriate technology within the nCASE/NDEP modules; and participate in discussions throughout the training to differentiate the module and explore support resources.

### **Conclusion**

This paper describes one of the many nCASE STEM learning modules developed to lead students toward a rigorous, in-depth understanding of mathematics as related to the application of the study of wheels associated with robots. The ultimate goal is to increase the number of pre-K-12 students seeking STEM careers and to improve student achievement in STEM courses. We hope to provide a 21<sup>st</sup>-century vision within a student-centered setting as well as provide administrative oversight and support services to select teachers using the expertise and experience of practicing DOD STEM professionals.

## **HICE 2014 Conference Proceedings**

- 1. Title:** “Learning Through Shared Online Reflections”
- 2. Name:** Sidonie Pors
- 3. Affiliation:** University of Melbourne
- 4. Address:** 17 Kurrawa Cr., Patterson Lakes, VIC 3197, Australia
- 5. Email:** sidoniepors@gmail.com
- 6. Abstract**

The purpose of this study was to explore the implications of continual, shared, online reflections among students in a web-enhanced course. Participants of the study were twenty-two graduate students who registered in the Second Language Acquisition (SLA) course at the Institute of Foreign Languages (IFL), Royal University of Phnom Penh (RUPP). The SLA course was a web-enhanced course which employed EDU2.0 as a virtual learning space in addition to the regular 3-hour weekly face-to-face class. After each weekly class, students were required by their lecturer to post a reflection of the class online using the class’s discussion forum. The forum served as an open space for students to share their reflections with their peers and comment on each other’s reflections. Data of this study were collected from an interview with the lecturer, four focus group interviews with students, and over 150 written reflections from the class discussion forum, which were later coded and analyzed to identify common patterns and themes. The results of the study showed that shared online reflections were perceived to be beneficial for peer-to-peer learning and support. However, lecturer also needed to consider the issue of authentic participation when employing online reflection as a component of the course assessment.

## **Mixed-Age Settings: The Importance of the Role of Relationships Between Children in Early Childhood Programs**

In 2012, approximately 10.9 million children under the age of 5 years old attended some form of child care (Child Care Aware of America 2013). With increasing numbers of young children spending the majority of their days cared for outside their homes, children are progressively spending larger amounts of time in groups of children of the same age. Outside of childcare settings, it is uncommon for young children to spend considerable lengths of time in groups of children of the same age. In fact for most of human history, mixed-age learning was common: it is only in modern day that schools began to group children by age into grades. This is in stark contrast to the family-type setting where you typically find children that are heterogeneous in age, as well as the real world such as in the work force, gym, or park, where people interact with others of all ages.

This same age grouping practice in early childhood education is likely based on the assumption that chronological age is the single most reliable developmental index. However, this article argues that developmental factors other than chronological age (i.e., social, emotional, and cognitive level of maturity) are more valuable aspects of a child's development. Research has found that social and communicative interactions play a key role in learning (Wells and Claxton, 2002; Daniels 2001). Subsequently, this article proposes to examine the structural components that help cultivate the development of healthy, secure relationships between and amongst children in early childcare centers and family home programs. This article argues that through child-to-child relationships, mixed-age classrooms support the development of the young child in a unique way. For the purposes of this article, mixed-age classrooms are defined as classrooms in which children of different ages are grouped together. This article will also discuss the research

findings that delineate the benefits of mixed-age groupings and explain how being in a mixed-age classroom may have positive effects on children's social, emotional, and cognitive development.

### **Mixed-Age Learning: A Review of Research**

Researcher Peter Gray reviewed articles, published between 2000-2010, in the two foremost early childhood journals *Child Development* and *Developmental Psychology* and found the preponderance of studies focused on child-child interactions amongst single-age groups (Gray 2011). He determined that during the first decade of the 21<sup>st</sup> century only 213 articles centered on mixed-age groups. The limited research available has stated that a child's social development in a mixed-age environment is significantly different from those in single-age groupings. Research suggests mixed-age groupings support increased self-concept and improved attitudes towards school as compared to single-age groups (Veenman 1995). These benefits are further manifested the longer children are involved in mixed-age groupings (McClellan and Kinsey 1999). Additionally, mixed-age groups benefit from the differences in age and ability: social isolation is less common than in same-age classrooms, and increased social skillfulness is apparent as children gain practice with younger children (McClellan and Kinsey 1999). The researchers also found that these benefits carry on beyond the mixed age classroom. This may be particularly beneficial to at-risk populations, as their early experiences may serve as a protective factor for any future challenges. Overall, mixed-age interactions promote greater long-term pro-social behaviors, including helping, cooperation, turn-taking, and caring for others.

The scant research that exists on the role of relationships in early childhood education denotes that the child-to-child relationship plays a critical role in fostering a young child's development. Based on these findings, it may be extrapolated that mixed-age programs will

further support development as children learn from both their age peers and older children.

Accordingly, Veenman (1995) finds “students have a chance to form relationships with a wider variety of children than is possible in the traditional same-age classroom. This leads to a greater sense of belonging, support, security, and confidence” (p. 322). Furthermore, given that spontaneously formed peer groups are typically heterogeneous in composition, the separation of children into same-age groups in early childhood education settings is something that requires further examination.

The principles behind mixed-age grouping are supported by the work of Lev Vygotsky, a well-renowned developmental theorist. Vygotsky believed that children learn by observing others, then imitating their actions while adapting to fit their own needs (Vygotsky and Rieber 1988). He also emphasized the importance of social interaction and community in learning and stated “learning presupposes a specific social nature and a process by which children grow into the intellectual life around them” (Vygotsky, 1978, p.88). Age integration allows for children to have the opportunity to observe, emulate and initiate a wide range of competencies. In a study by Howes and Farver (1987) pretend play between two year olds, five year olds and two year olds with five year olds was examined. They observed that the five year olds played at the same level with their same age peers as they did with the two year olds. The five years also brought up the two year olds level of play through instruction and guidance. In a mixed-age classroom, younger children are exposed to older children, who model more sophisticated approaches to problem solving. This creates a "win-win" environment, where younger children accomplish tasks they could not do without the assistance of older children, while the older children increase their feelings of independence and competence.

Further mixed-age classrooms develop cooperation skills where children nurture each other as individuals, rather than see each other competitors (McClellan and Kinsey 1999). Moreover, research has found that children in mixed-age settings are more likely to offer instruction to younger peers than to age-mates (Ludeke and Hartup 1983). This reduced competitive pressure has shown to help foster children's development along several lines. Brownell (1990) concluded that 18 month olds in mixed age interactions are more socially active, socially involved, and affectively enthusiastic. Toddlers in mixed-age groups have higher Battelle Developmental Inventory scores in language, general cognitive and motor development (Bailey, Burchinal, and William 1993). Research has also found that children in mixed-age classrooms exhibit increased maturity and cognitively complex play (McClellan and Kinsey 1999).

### **Discussion**

Research supporting mixed-age groupings finds a number of benefits to both children and teachers; additionally, mixed-age environments demonstrate a number of advantages in practice. A mixture of ages within a class can be particularly beneficial for children who may have fewer peers that match their development in a more homogenous setting. These children may find it less stressful to interact with younger peers than with same-age peers. Such interactions can enhance younger children's motivation and self-confidence. In addition, these older children benefit from an enhanced self-concept as they help teach younger children in the classroom (Veenman 1995). By allowing children to learn at differing rates and levels, mixed-age classrooms greatly reduce the performance stress on young children as well as diminish stereotyping (Aina 2001). The availability of younger and therefore less threatening peers in

mixed-age groups offers the possibility of remedial effects for children whose social development is at risk.

Mixed-age classrooms also create an environment of community (Aina 2001) as children and teachers often spend longer periods of time together than in single age classrooms. Close teacher-child, teacher-parent, and child-child relationships allow for the development of mutual trust and understanding (Kinsey 2001). The resulting long term relationships between the teachers, children, and parents are regarded as the major determinants in the resulting deeper social and cognitive development in the children (Nye, Cain, Zaharias, Tollet and Fulton 1995). These continued relationships and the consistency “is viewed as one of the most significant strengths of the mixed-age approach because it encourages greater depth in children’s social, academic, and intellectual development” (McClellan & Kinsey, 1999, p. 2).

### **Practical Challenges**

Research supports mixed age group settings in terms of the significant benefits for not only the children but their caregivers as well. The creation of these settings does not only help optimize children’s development but also greatly helps teachers in the caregiving process, particularly alleviating the stress infant caregivers often report feeling in infant-only classrooms (NICHD Early Child Care Research Network 1996). As children of different ages likely have different developmental needs, not all children will have the same caregiving demands at the same time, allowing teachers to provide individualized care. Structural aspects of a caregiving program can also play a role: the environment can also help support and facilitate mixed-age groupings. For example, having a shared outdoor space may promote interactions between children across a wider age spectrum. In addition, Miller (1996) found mixed age classrooms

have some commonalities, including supportive families and administration, committed educators, and greater teamwork among staff members (as cited by Walser, 1998).

Extensive planning further supports the success of a mixed age environment. Teachers must consider the flow of the day and keep a balance of activities to provide for differing developmental needs. Additionally, routines and the classroom itself must be organized to help children recognize what is expected of them and take on responsibility in the classroom. For example, children can help during clean up time as well as in preparation for upcoming activities. Structural supports in the program must allow teachers to observe and reflect on the children's capabilities to effectively plan for and provide for their learning needs. Lastly, teachers must have an in-depth understanding of the developmental levels of children in their care, with a strong understanding of child development.

Adapting care to different aged children in one group can be a challenge. Researchers note "teaching a diverse group of students demands individualized instruction" (Veenman, 1995, 322). Caregivers need to use specific strategies in mixed age settings in order to meet the needs of this unique cohort including how to approach implementing curriculum in mixed-age groups. Mixed age classrooms "focus on individuals rather than on grade-level expectations. [Teachers] also have more time to address individual needs because children spend more than one year in their class" (Walser, 1998, 2). In true mixed-age classrooms, children are taught together across the curriculum and are not separated into smaller groups by age to work on activities or projects, but are grouped using other attributes such as temperament and interest on the topic at hand. Research supports the idea of cooperative learning as a way to "manage academic heterogeneity in classrooms with a wide range of basic achievement skills" (Veenman, 1995, 374). Children work together in small groups to complete a task, each taking on their own responsibilities within

the group. This type of learning has been thought to increase cognitive gains, encourage pro-social interactions, and prompt higher-order thinking (Veenman 1995). Teachers need to provide opportunities that are challenging enough for the older children while scaffolding the older children to teach the younger children. This can come in the form of developmentally-appropriate materials (e.g., writing implements, paintbrushes) provided for children of different levels, or other structural modifications to cater to each child's abilities. Brown and Reeve (1985) maintain that instruction aimed at a wide range of abilities allows the novice children to learn at their own rate and to manage various cognitive challenges in the presence of "experts". That is to say that there is a limit to what a child can do on their own or with a peer of their same age and developmental ability, but when a child is with an older peer with a different level of skill sets, the younger child is brought to a higher level. Vygotsky described this collaborative learning that takes place between a younger child and an older child as the zone of proximal development (Vygotsky 1978).

Vygotsky also recognized that mixed age learning was not only an advantage for the younger children, but also for the older peers. The older peers, while acting as the teacher, share in the learning experience by "reflecting" their knowledge off the younger children. As the older peers present the information to the younger children, they have to work towards comprehension for the younger child by explaining their abstract knowledge in a concrete way, and during the process they may question their own previous understanding. Vygotsky described this process as reflective learning (Vygotsky and Rieber 1988). Though Vygotsky's theories are usually applied to the interactions between adults and children, there is another advantage when utilized between children. Children share similar activity levels and interests; therefore, interacting within the younger child's zone of proximal development comes more instinctively to them (Gray 2008).

These experiences with the younger child are believed to provide the older children opportunities to practice self-regulation and acquire pro-social and leadership skills (Messer, Joiner, Loveridge, Light and Littleton 1993; Winsler and Diaz 1995). Beatrice Whiting (1983) examined cross-cultural studies and determined that children from all cultures demonstrate more nurturing behaviors toward younger children than same-age peers.

### **Conclusion**

Mixed age groupings are beneficial to all parties involved if they are executed with appropriate planning and training. Children benefit from the increased heterogeneity of skills in the classroom, which prompts them to engage in prosocial helping behaviors with younger or less-skilled classmates rather than promoting competition. Additionally, teachers benefit from the diverse abilities as children help each other rather than seeking adult support at each turn. It is also obligatory for teachers to view learning on an individual level rather than maintaining a group-wide scope of teaching, which allows them to have a realistic view of each child's capabilities. While converting all single-age classrooms to mixed age experiences may not be feasible, portions of a child's day may include mixed age interactions to promote their learning in a new way. As children gain experience in mixed age groupings, they are gaining an understanding of how to negotiate social interactions with people of differing abilities—a key aspect of real life, as both families and society as a whole include multi-age interactions (Walser 1998).

The value of the relationships formed in mixed age settings increases as the children spend more time (i.e., multiple years rather than a single year) with the same peer group as well as the same teachers. This allows these relationships to deepen with time and familiarity, allowing the children to recognize the capabilities of others and provide support where required.

Additionally, as teachers come to know the children better, they can better equip them with the skills needed for successful social interaction and other learning across developmental domains. The benefits to this continuity all stem from the valuable relationships formed in the mixed age caregiving environment.

1. **Title of the submission**: Strategies for Calming Fearful Patients (#1124)

2. **Name of the author**: Belinda Stillwell

3. **Affiliation of the author**: California State University, Northridge

4. **Address of the author**: California State University, Northridge, Department of Kinesiology, 18111 Nordhoff Street, Northridge, Ca 91330-8287

5. **E-mail address of the author**: belinda.stillwell@csun.edu

6. **Abstract**:

It was the purpose of this study to investigate the strategies used by therapeutic aquatic professionals when working with patients who are fearful in water. Twenty-seven (27) professionals responded to an on-line survey that examined clinician demographics, barriers patients encountered during the therapeutic process, and techniques and methods successfully used to help patients reach their aquatic goals. Demographic data was reported descriptively. Open coding was used to break down, examine, compare, conceptualize and categorize data on barriers encountered and techniques and methods used by practitioners. Results indicated that these professionals were highly educated with many years of experience working with patients in the water. With regard to barriers encountered by their patients, over half (51%) of practitioners cited psychological barriers such as past traumatic water experiences and lack of control in the water as obstacles to achieving the prescribed aquatic goals. Approximately 23% stated that physical barriers like getting water in their eyes, nose, and ears created a high level of discomfort for their patients. About 12% referred to cognitive barriers that included negative self-talk and lack of knowledge about the principles and properties of the water. Categories that collectively described successful techniques and methods used by practitioners were: (1) guided, self-paced progressions, (2) providing explanations, information, and demonstrations, (3) creating distractions, (4) using relaxation exercises, and (5) building trust. Finally, when asked if practitioners would like more training in the area of working with fearful patients, 13 responded yes, 9 responded no, and 4 said maybe (1 respondent skipped this question).

# White Teachers Perceptions of a Multicultural Curriculum and Self-Efficacy in Addressing Diverse Student Population: Gender Differences

## Abstract

The purpose of this study was to evaluate teachers' gender differences in two variables: multicultural curriculum and teachers' self-efficacy. The sample used was 136 White teachers in a suburban school district in Long Island New York, with a highly diverse student population. Thirty females were selected from a random sample of 106 females to contrast with thirty males. An Independent sample t-test was conducted to evaluate gender differences. An item analysis of all the items was further conducted. The gender difference means for teachers' efficacy showed no significance. However, for multicultural curriculum, female teachers tend to agree more than their male counterparts that multicultural curriculum occurs in schools.

Keywords: gender, multicultural curriculum, multicultural education, self-efficacy

## Purpose

As the population of the United States becomes increasingly diverse, including Long Island, New York, one of the most segregated areas in the United States (Erase Racism, 2005), a multicultural curriculum can bolster teachers' instructional practices by presenting multiple perspectives to explain phenomenon. Although the teaching force remains predominantly monocultural, White, middle class, female in both rural and suburban areas (Banks, 2001; Ladson-Billings, 1995, Sleeter & Grant, 2009), emphasizing a multicultural curriculum increases students' engagement (Fereshieh, 1995; Smith, 1999) while enhancing their self-efficacy. Benefits to self-efficacy are the influence on one's effort, perseverance, and resilience regardless of thought patterns that are self-hindering or self-aiding (Bong & Skaalvik, 2003; Bandura,

1977). The absence of a multicultural curriculum perpetuates the marginalization of traditionally disenfranchised groups. This paper examined teachers' gender differences in two variables: multicultural curriculum and teachers' self-efficacy.

### Theoretical Framework

Banks (2001) noted a major goal of multicultural education is to help students develop the knowledge, attitudes, and skills needed to participate effectively in their cultural communities and within the civic culture of the nation-state. Teachers' level of multicultural awareness improves their instructional practices when they include the experiences of students from diverse racial, ethnic, and linguistic backgrounds; this inclusion assist students in engaging in the learning process more (Shade & New, 1993).

Morote and Tatum (2010), while testing for multicultural awareness, evaluated the school's curriculum and instruction, which they explained pertains to materials and other educational resources used in the classroom to instruct students. It also includes the assessment procedures used by teachers and other educators to determine students' performance. While some teachers may be ideologically resistant to multiculturalism (Banks, 2006), Irvine (2003) noted that teachers have a responsibility to be culturally responsive, which includes incorporating elements of students' culture into their teaching. Culturally competent teachers ensure that their pedagogy is multicultural in that they use differentiated instructional techniques and provide instructional materials that include multiple perspectives (Irvine, 2003). Leaders' responsibility entails, but is not limited to, providing instructional supervision that endorses teacher's multicultural pedagogy.

Gorsky, Davis, and Reiter (2012) examined self-efficacy and multicultural teacher education in the United States; they found no significant difference across gender or other

demographic variables. Similarly, there was no correlation between participation in professional conferences and other professional development opportunities, or participation in professional associations and level of self-efficacy. However, Dee (2006) surveyed nearly 25,000 eighth graders on the influence of teachers' gender on students' performance. He used test scores and self-reported perceptions by teachers and students and found learning from a teacher of the opposite gender has a detrimental effect on students' academic progress and their engagement in school; having a female teacher instead of a male teacher raised the achievement of girls and lowered that of boys in science, social studies and English.

Although Bong and Skaalvik (2003) found teachers' self-efficacy contributes to their professional growth and development, Nadelson et al. (2012) noted there is no significant difference between teachers who received multicultural training and their attitude toward multicultural efficacy. Conversely, Siegel-Hawley and Frankenberg (2012) found teachers from various racial compositions found differences among the groups as it pertains to multicultural education in their school environment; inferring multicultural education can positively inform teachers' practices and self-efficacy while promoting students' academic needs.

### Method

The Multicultural Awareness to School Environment (MASE) survey was developed by Morote and Tatum (2010) to provide a valid assessment of respondent's level of multicultural education awareness. It was a 30 – item questionnaire. From the survey, 14 items were selected for the purpose of this study to develop two variables: multicultural curriculum and teacher efficacy. One hundred thirty-six White teachers participated in this study. Thirty females were selected from a random sample of 106 females to contrast them with thirty males in order to avoid type II error. An independent sample t- test was conducted to evaluate whether the mean

was significantly different from the two variables multicultural curriculum and teacher efficacy. An item analysis of all the variables was further conducted.

The teacher efficacy variable encompassed 5 items: Q2, Q5, Q9, Q10 and Q11. The reliability of these variables was 0.73 (Crombach’s Alpha) = 73.2%. Please note question 2 was reversed. The variable of multicultural curriculum encompassed 9 items from Q12 to 19 and Q21 of the original survey. The reliability of this variable was 0.85 (Crombach alpha) = 85.8%.

### Results

An independent t- test was conducted to evaluate whether the mean was significantly different between males and females and the two variables multicultural curriculum and teacher efficacy. In the case of teacher efficacy, the test was not significant  $t(47) = 0.87, p = 0.38$ , male teachers ( $M = 18.96, SD = 4$ ) and female teachers ( $M = 18, SD = 4$ ). The test on multicultural curriculum was approaching significance  $t(43) = 1.81, p = 0.07$ , male teachers ( $M = 25.86, SD = 7$ ) and female teachers ( $M = 29.73, SD = 7$ ). Females tend to have higher disposition on multicultural curriculum (See Table 1).

*Table 1*

*Gender Differences on Multicultural Curriculum and Instruction ( $N_F=30, N_M=30$ )*

	<i>Gender</i>	<i>N</i>	<i>M</i>	<i>SD</i>	<i>M/I</i>	<i>SEM</i>	<i>t</i>	<i>df</i>	<i>p</i>
<i>Teacher Efficacy</i>	<i>Female</i>	28	<b>19</b>	<b>3.8</b>	<b>4</b>	.69	.874	47	.387
	<i>Male</i>	21	<b>18</b>	<b>3.6</b>	<b>4</b>	.88			
<i>MC</i>	<i>Female</i>	23	<b>30</b>	<b>3.3</b>	<b>7</b>	1.51	1.812	43	.077
	<i>Male</i>	22	<b>26</b>	<b>2.8</b>	<b>7</b>	1.52			

Table 1 shows that In the case of teacher efficacy both groups are between slightly agree and agree level (3.8 and 3.6). In contrast in MC females are in the slightly agree and agree level (3.3) and males are between disagree and slightly agree (2.8).

Item analysis was conducted on the items hypothesized to assess the independent items of teacher efficacy and curriculum instruction. In teacher efficacy there are two items that show major discrepancies. Females disagree twice as much as males in the set of data “too much emphasis is place on multicultural awareness and training.” (Q2r) In contrast, Q10, “Multicultural awareness is relevant for the subject that I teach”. Females agreed 25% more than males. No major difference can be seen in the other items of teacher efficacy (see Table 2).

*Table 2 Teacher Efficacy*

Efficacy	Female		Male		Agreement difference
	SD+D	A+SA	SD+D	A+SA	
Q2r-Too much emphasis is place on multicultural awareness and training	8.3	83.3	20.0	33.3	<b>50</b>
Q5- it is important to receive ongoing cultural diversity and sensitivity training	19.4	48.4	8.3	58.4	-10
Q9- Teachers have a responsibility to incorporate culturally relevant activities into their curriculum	3.3	73.3	16.7	66.7	6.6
Q10 - Multicultural awareness is relevant for the subject that I teach	6.9	79.3	22.7	54.6	<b>24.7</b>
Q11- . Multicultural awareness assists/would assist me in being more effective at my job.	23.3	53.4	17.4	47.8	5.6

Table 3 shows an item analysis of multicultural curriculum of the 9 items. Q12, 66% of females believed that the curriculum reflects the various learning styles of students within the school in comparison to 35% of males. In reference to Q13, 48% of females believed that the curriculum provides continuous opportunities for students to develop a better sense of their

ethnic and cultural background in comparison to 21% of males. In reference to Q14, 52% of females believe that the curriculum uses multiple perspectives to explain the experiences of various ethnic, cultural, gender and linguistic groups as compared to 25% of males. In reference to Q15, 10 % of females believed that opportunities are provided for students to participate in activities from diverse cultural groups as compared to 50% of males. In reference to Q18, 38% of females believed that instructional materials are examined for bias across gender, ethnic, and cultural lines as compared to 25% of males. In reference to Q19, 66% of females believe that school assemblies and holidays observed reflect the multiethnic and multicultural diversity in the United States as compared to 39% of males (See Table 3).

In conclusion, Table 3 shows that females agree at least 25% more than males in 4 of 9 items. Interestingly, males agree 40% more than females in one of 9 items. “Opportunities are provided for students to participate in activities from diverse cultural groups.”

Table 3 Multicultural Curriculum

Multicultural Curriculum	Female			Male			Dif Agreement (Female-Males)
	SD+D	SLA	A+SA	SD+D	SLA	A+SA	
Q12. The curriculum reflects the various learning styles of students in the school.	10.3	24.1	65.5	30.4	34.8	34.8	<b>30.7</b>
Q13. The curriculum provides continues opportunities for students to develop a better sense of their ethnic and cultural background.	37.0	14.8	48.1	41.7	37.5	20.8	<b>27.3</b>
Q14. The curriculum uses multiple perspectives to explain the experiences of various ethnic, cultural, gender, and linguistic groups.	33.3	14.8	51.8	50.0	25.0	25.0	<b>26.8</b>
Q15. Opportunities are provided for students to participate in activities from diverse cultural groups.	62.1	27.1	10.3	29.2	37.8	50.0	<b>-39.7</b>
Q16. The assessment procedures used with students reflect their cultural values.	42.9	28.6	28.6	43.5	34.8	21.7	6.8
Q17. There are evaluations of the goals, objectives and curricular used in teaching multicultural education.	55.6	11.1	33.3	62.5	25.0	12.5	<b>20.8</b>
Q18. Instructional material is examined for bias across gender, ethnic, and cultural lines.	29.2	33.3	37.5	25.0	50.0	25.0	12.5
Q19. School assemblies and holidays observed reflect the multiethnic and multicultural diversity in the United States.	24.1	10.3	65.5	34.8	26.1	39.1	<b>26.4</b>
Q21. The bulletin boards in my building reflect cultural diversity.	20.7	41.4	37.9	30.4	30.4	39.1	-1.2

## Discussion and Implications

In Table 2 females showed they disagreed with the item “Too much emphasis is placed on multicultural awareness and training.” Males in a 2 to 1 ratio think “too much emphasis is placed on multicultural awareness and training.” Table 3 indicated that females agreed at least 25% more than males in 4 of the 9 items. Interestingly, males agreed 40% more than females in one of the 9 items: “Opportunities are provided for students to participate in activities from diverse cultural groups.” A multicultural curriculum as explained by Shade and New (1993) indicated that when teachers include multiple perspectives to teach, they increase their cultural competency. In this study, female teachers are more prone to include multiple perspectives in their instruction; inferring more multicultural training should be offered to involve their male contemporaries. As it pertains to teachers’ efficacy, our study found there is no significant difference across gender, which echoes Gorsky, Davis, and Reiter (2012) findings on self-efficacy and multicultural education.

Diversity across various domains in our schools is a reality and addressing students’ academic needs is necessary, as students must be prepared for school and beyond. Evidence increasingly indicates that multicultural education makes schooling more relevant and effective for students when instructional practices guide students through engaging activities that promotes critical thinking academically and socially (Mc Carty, 2002; Gay, 2002; Moll, 1992; Ladson-Billings, 1995). Using one’s *funds of knowledge* advances toward social justice; yet, it requires having an educational system that provides opportunity for all students. Leadership practices that include supervision of instruction that challenges misconceptions about diverse

student population can inform teacher's multicultural awareness and knowledge. To address the academic needs of students from various cultural groups, leaders should conduct targeted professional development according to gender, as awareness and disposition may vary as illustrated in this study. This professional development may include elements that speak to multicultural curriculum and teacher efficacy, as they both play an important role in the process of incorporating strategies that address cultural diversity in our schools.

The findings from this study were limited to a single school district with predominantly White teachers. However, as noted by Hill-Jackson (2007) a major obstacle in teacher preparation programs arising from this mismatch of teacher and student cultures is the ability to facilitate a critical consciousness. This includes the ability to analyze the world and employ equity pedagogy in pre-service teachers who are resistant to diversity issues. Further studies with more diverse faculty are recommended.

The United States population is rapidly growing in a variety of diverse categories, signaling the need for continued research in these categories and educational attainment. Educational researchers addressed the issue of multicultural education in the classroom as it relates to teacher student relationship and bringing awareness to various cultural competencies. It is important that scholars continue to examine the implementation of multicultural education in every field of education that will prepare students for school and beyond. To prepare students to participate in the complete social structure as adults including social, political, and economic engagement, they must be prepared academically through the schooling process in their formative years. Leadership responses, then, require increasing teacher's multicultural competency through a multicultural curriculum regardless of race or ethnicity or gender of the teachers.

### **Abstract:**

Research has found that adults with cognitive impairments have inferior fitness levels than those without impairments (Lavay, Zody, Solko & Ezra, 1990; McCubbin & Jansma, 1987, Zhang, Piwowar, and Reilly, 2009). Many facets such as work, maintaining a household, cooking, self-care and recreation require the individual to possess a certain degree of physical stamina (Graham & Reid, 2000). Individuals with an intellectual disability need an adequate amount of fitness to contribute to work-related tasks as well as to enjoy the benefits from participation in recreation activities (Fernhall, Tymeson, Webster, 1988). Reid and Montgomery (1999) noted the following factors as attributing to low fitness levels for individuals with cognitive impairments: Sedentary lifestyle and few opportunities to participate in structured programs (Hoge & Dattilo, 1995); Physical characteristics (e.g. short stature) (Dobbins, Garronb & Rarick, 1981; Reid, et al., 1985); Lack of coordination and efficiency (Seidl, Montgomery, & Reid, 1989); Lack of motivation during testing and a tendency to stop when uncomfortable (Reid et al., 1985; Rimmer, 1994).

The purpose of this study was to examine the overall school day physical activity levels, as measured by pedometer data, of 31 High School Students enrolled in Multiple Disability classrooms during 16-weeks of the study. This project supplied each student with a Omron HJ-720-ITC pedometer to be used during the school day to track physical activity, with the goal of achieving 10,000 steps per day ([www.shapeup.org](http://www.shapeup.org), Hellmich, 1999; Quittner, 2000). Tracking the student's data (e.g.: steps, calories burned, aerobic

steps, and distance) through exercise, then charting their progress individually and as a whole will bring cross-referenced learning into the curriculum (Gao, Lee, Solomon, Kosma, Carson, Zhang, Domangue, and Moore, 2010). Physical activity has been found to increase academic achievement, academic behaviors, help individuals regulate and there are indicators it has a positive affect of cognitive skills and attitudes (Perry and Hambrick, 2008; Uhlrich and Swalm, 2007; CDC, 2010).

Thirty-one students enrolled in one of five Multiple Disability (MD) (WNHS, WCHSA, WCHSB, WSHSA, WSHSB) Classrooms which were housed in the three Midwest city high schools, were assigned a downloadable Omron HJ-720-ITC pedometer. In two instances, students were not independently mobile, and they were not included in this study. The APE teacher met with each student to measure each individual's stride length, weight and set the pedometer accordingly. The students wore the pedometers during the school day (maximum 7 hours) for 16 weeks. The pedometer data recorded individual steps, number of days the pedometer was worn, the aerobic steps taken (e.g. 10 consecutive minutes of movement), aerobic time in minutes, number of calories burned, distance walked and fat burned. The purpose of this study was to examine the overall school day physical activity levels, as measured by pedometer data, of High School Students enrolled in Multiple Disability classrooms. Students recording 10,000 steps on any given day, received a heart sticker to display in the classroom.

Intervention Specialists' fear of losing (or flushing) the pedometers impacted the length of time students were able to record data during the school day. The students' alternative schedules (e.g. community days, worksite days, late arrivals or half/day attendance) impacted the length of time students were able to record data. Except for rare instances, students were not motivated to achieve the 10,000 step daily goal and lack of student motivation resulted in a tendency to stop moving when uncomfortable. Students receiving Adapted Physical Education, those who had a pedometer step goal or treadmill goal, and those who participated in general physical education were able to accumulate a higher number of pedometer steps and aerobic steps.

This study revealed that in general students enrolled in the five multiple disability classrooms moved very little during the school day. This is especially concerning when taking into account the growing body of research focused on the association between school-based physical activity, and academic performance among school-aged youth ([http://www.cdc.gov/HealthyYouth/health\\_and\\_academics/index.htm](http://www.cdc.gov/HealthyYouth/health_and_academics/index.htm)). Based on these general findings, further study is warranted specifically focusing on obtaining full-day pedometer step data including community days, worksite days and after school hours to determine how much physical activity students receive.

## Hawaii International Conference on Education 2014 Proposal Proceedings

**Title of Submission:** The Induction Process for New PETE Faculty: What You Don't Learn in Graduate School!

**Names of Authors:** Ann-Catherine Sullivan, Ph.D., Julienne Maeda, Ph.D., Lynn Randall, Ph.D., Pamela Bechtel, Ph.D.

### **Abstract:**

Addressing a new environment, workload and requirements, and the culture of one's place of employment can be a very overwhelming situation. It is often the case when everything is new and unfamiliar. This session will provide an overview of duties and responsibilities that are often connected to research, teaching, and/or service requirements that were not necessarily learned or performed in total as part of one's graduate work. The idea of learning on the job is very true for new faculty and it is often the "new person" who is asked to do many tasks because being new also means it's more difficult to say "no". These tasks are often presented under the guise of meeting requirements for tenure and promotion.

Navigating through the processes of being a new faculty member, personalities of colleagues, staff, and students, and learning traditions within a department can be challenging enough, let alone simply overwhelming if left to face it alone. This poster seeks to facilitate discussion amongst interested PETE faculty of all ranks and years of experience to address those duties and responsibilities often assigned to new faculty. Whether it be the means of perpetuating a rite of passage practice "you need do this because I did when I was new" or instituting practices we often employ for new teachers, this is a discussion that needs to occur if we are to retain and nurture new faculty and their growth to continue being productive and involved tenured faculty. In many instances assignments like writing a report for accreditation, coordinating all assessments for accreditation and institutional purposes, or handling advising for all undergraduate majors, often do not completely align with requirements for tenure and promotion. Depending on the Carnegie status of the institution, it is often one's research and publication record that are valued rather than teaching excellence or service.

## Investigating the Relationship between Math and Science Achievement:

### Parallel Process Model

#### **Introduction**

Very little research on the relationship between mathematics and science achievement has been available to us. Instead, attention has focused on achievement in either math or science, independently of each other (Robitaille & Beaton, 2002). In most studies, the investigation was conducted to show the relationship between instructional practices and student achievement within a certain discipline itself (i.e., mathematics or science). For example, it was revealed that the use of reform-oriented instructional practices in math and science is associated with higher student achievement (RAND, 2006). Historically, however, mathematics development has closely been linked with the sciences and the methods of mathematics have dominated the theoretical divisions of the sciences (Browder, 1988). One extreme view saw that science ultimately resolves into mathematical modeling (Harpending, 1985). In addition, since parents are children's first teachers, it can be hypothesized that parents' education level would probably have an effect on their children's initial scores and/or the growth rates of math and science achievement. Furthermore, a 2005 study by the Institute of Social Research at the University of Michigan found that a parents' education directly affects their children's standardized achievement testing scores. This research will show the relationship between math and science achievement, the effect of parents' education level, and what kind of relationship the growth model will be.

My hypothesis was math initial score and mothers' educational level will have more effect than fathers' education level on the growth rate of science and the initial scores respectively because mothers, in general, tend to have more time than fathers with their children and therefore mothers are more concerned with their children's education. Another hypothesis was the growth model will show a non-linear relationship because the contents

they learn tend to be more complicated and difficult as they move up to higher grade.

## **Methods**

### **Participants**

The data set used for this study was from Cohort Two of the Longitudinal Study on American Youth (LSAY), a national sample of approximately  $N=3,000$  7<sup>th</sup> grade students in public schools that served as feeder schools to the same high schools in which Cohort One was enrolled. The LSAY is a two-cohort longitudinal study of a national sample of approximately 5,000 young adults, now 38 to 41 years of age. The LSAY was launched in the fall of 1987 with national probability samples of 7<sup>th</sup> and 10<sup>th</sup> grade students in public schools throughout the United States. The data set contains six years (i.e., from grade 7 through 12) of math and science achievement data and mothers' and fathers' self-reported highest degrees earned.

### **Variables and Data Screening**

LSAY students were given math and science achievement standardized tests each fall administered by Northern Illinois University and one parent of each LSAY student was interviewed each spring by telephone. The math and science scores were continuous variables measured on a 100-point scale. Parents' education level was measured on a 5-point ordinal scale from 1 = *Lower Than HS diploma* to 5 = *Advanced degree*.

Univariate normality was checked by examining skewness values and histograms. To identify univariate outliers, box-and-whisker plot was utilized. Traditionally, multivariate normality is assumed when the assumption of univariate normality is satisfied. To further identify multivariate outliers, Mahalanobis distances (Mahalanobis, 1936) were calculated. Multicollinearity amongst variables was assessed by examining the Pearson correlation coefficient for each pair of variables, the variance inflation factor (VIF) and tolerance. A correlation coefficient which is greater than .80 ( $r > .80$ ), a VIF value ( $\frac{1}{1-R^2}$ ) that is greater

than 10 ( $VIF > 10$ ), and a tolerance value ( $1-R^2$ ) smaller than .10 (tolerance  $< .10$ ) may indicate a multicollinearity problem. Bivariate scatterplots were examined to check the assumption of linearity and residual plots were also assessed to check the assumption of homoscedasticity.

## **Procedure**

The growth rates of math and physical science scores from grade 7 through 12 (from 1987 through 1992) were examined and the effect of mothers' and fathers' education level on the initial scores and annual change over time was investigated. A parallel process model with two centered covariates (i.e., mothers' education level and fathers' education level) and with equal intervals was estimated using Mplus 7.0 (Muthén & Muthén, 1998-2013). Math and physical science scores were regressed on mothers' and fathers' education level. The unstandardized loadings on the intercept were all fixed to 1 and the slope loadings were fixed to constants beginning with 0 (7<sup>th</sup> grade) and ending with 5 (12<sup>th</sup> grade). This model was compared to another parallel process model with freely estimated time scores to get a better model using Maximum likelihood estimator with robust standard errors as the estimator to include all available information. The guidelines to interpret the model fit indices were as follows: (1) a non-significant  $\chi^2$  (Fabrigar, Wegener, MacCallum, & Strahan, 1999); (2) a Comparative Fit Index (CFI) and a Tucker-Lewis index (TLI) greater than 0.90, or preferably above 0.95 (Bentler, 1980); (3) a Root Mean Square Error of Approximation (RMSEA) less than 0.08, or preferably less than .05 (Steiger & Lind, 1980); and (4) a Standardized Root Mean Square Residual (SRMR) of .08 or preferably less than .05 (Brown, 2006).

The physical science and math slopes were regressed on the math and physical science intercepts respectively. The covariance of the math and physical science slopes was also examined (see Figure 1).

## Results

Univariate normality tests showed that there were no severely skewed distributions by examining skewness values and histograms. Multivariate normality was also assumed since univariate normality was satisfied (Abu-Bader, 2010). A total of 26 univariate outliers were found by examining box-and-whisker plots. *Mahalanobis distances* showed there were 33 multivariate outliers,  $D^2 = 36.12$ ,  $p < .001$ . These outliers were not excluded because they took a very small proportion, considering the large number of cases ( $N=3,038$ ), and did not much influence the normality.

The final model showed adequate fit except RMSEA and SRMR: CFI = .92; TLI = .93; RMSEA = .11 (90% CI = .11-.12); SRMR = .19;  $\chi^2(75) = 2737.55$ ,  $p < .001$  (see Table 3). The SRMR and RMSEA values indicate there is still unexplained error in the model and this would probably be the biggest weakness of this model. The significant chi-square value may be due to sample size.

The growth model showed curvilinear relationship in the slopes of math and physical science scores (i.e., as they get older, the growth rates of math and physical science tend to be decreasing). When the slopes of math and physical science were regressed on the intercepts of physical science and math, the slope of physical science was more significantly predicted by the intercept of math (7<sup>th</sup> grade),  $b=.13$ ,  $p<.001$ . When father and mother had average education level (i.e., 2.5), the intercepts of math and physical science were 50.56 and 50.71 respectively in 7<sup>th</sup> grade. These results were almost the same as the means of math and physical science (i.e., 50.59 and 50.72).

When the intercepts of math and physical science were regressed on fathers' and mothers' education level, there will be a 1.65 and 1.20 expected unit change in 7<sup>th</sup> grade math and physical science score, for every 1 unit change in fathers' education level and there will be a 2.07 and 2.07 expected unit change in 7<sup>th</sup> grade math and physical science score, for

every 1 unit change in mothers' education level. Mothers' education level was more associated than fathers' education level with 7<sup>th</sup> grade math and physical science score. The association of mothers' and fathers' education level with the slope of math was not significant,  $p=.57$  and  $.81$  respectively.

As expected, math growth and physical science growth significantly co-varied,  $r= .46$ ,  $p<.001$ , indicating math and physical science growth are likely to have a positively moderate to strong effect on each other.

### **Discussion**

In this study, how closely the initial scores and the growth rates of math and science were related with each other was investigated. In addition, since parents are considered as children's first teachers (Pfannenstiel & Zigler, 2007), it was hypothesized that parents' education level would probably have an effect on their children's initial scores and/or the growth rates of math and/or science achievement. Therefore, mothers' and fathers' education level were added to the growth model for analysis. Finally, what kind of relationship the growth model shows, whether it is linear, quadratic, or exponential was examined. Overall, there was a positive increase in math and physical science scores over time due to learning, natural maturity (Gakhar, 2003), or both. However, the growth rate has been decreasing (i.e., curvilinear relationship), indicating the contents tend to be getting more and more complicated and difficult as they move up to higher grade. Math initial score was significantly associated with the growth of physical science score, so an effective math instructional strategy in addition to an effective science instructional strategy would probably be desirable to improve science achievement. Mothers' education level is more associated than fathers' education level with math and physical science initial scores, which makes sense because mothers, in general, tend to have more time than fathers with their children and therefore mothers are more concerned than fathers with their children's education (Walker,

1993-2006).

Fathers' education level was negatively associated with physical science growth, which did not make sense. It might be due to the problem of data collection. Since one parent of each LSAY student was interviewed each spring by telephone, mothers had more probability than fathers to receive a call and therefore fathers' education level was probably collected in more indirect way through mothers' response. Furthermore, students' 1987 report of fathers' and mothers' education was used if no information was collected directly from fathers and mothers. In this regard, fathers' data were more likely to be incorrect than mothers' data. However, further study would be recommended.

This study was meaningful in that it tried to reveal the relationship between mathematics and science achievement using one of the advanced statistical methodologies (i.e., parallel process modeling) with real data, which has been very rarely pursued. Findings showed that both the initial score and the growth rate of math were significantly associated with science achievement. Therefore, it would be really important for schools to try harder to establish the foundation of mathematics from the elementary level or at least no later than the beginning of secondary level not to fall behind in math and science afterwards even though most schools are trying to do now. Another important thing was that this study revealed the statistically significant positive association of mothers' education level with their children's math and science achievement. In this regard, family services, that is, providing families with the knowledge and skills in the areas of effective parenting, especially for mothers, would be essential to improve students' math and science achievement. Finally, the growth model of math and physical science scores did not show linear or quadratic relationship. The result revealed that the slope of the math and physical science scores was in the middle of linear and quadratic relationship. In other words, the growth in students' math and science achievement has been decreasing as they advance toward higher grade. Although this

phenomenon makes sense, more careful and profound strategies would be recommended such that students at the end of secondary level could not be too much frustrated with their slow pace of improvement.

Title:

Combining innovative technologies and the high-fidelity simulation mannequin Harvey®, The Cardiopulmonary Patient Simulator, to prepare pre-licensure nursing students for the National Council of State Boards of Nursing Licensure Examination

Topic: Health Education

Presentation format: Poster Session

Description:

The use of simulation mannequins within nursing labs is quickly becoming the standard. Providing students opportunities to learn novice and advance nursing assessment skills can be accomplished by using high-fidelity simulation mannequins such as Harvey®, the Cardiopulmonary Patient Simulator. This poster presentation will discuss the use of the high-fidelity simulation mannequin Harvey® along with the provided curriculum used in the lab setting to prepare BSN prepared candidates for the NCLEX-RN® exam.

School of Nursing  
Lipscomb University  
Tamara.baird@lipscomb.edu

**Abstract**  
**Background**

Simulations are quickly becoming the standard of learning and assessment within nursing curricula on a global scale. Trends emerging within Bachelor prepared nursing programs include use of high-fidelity patient simulation mannequins. Fishman (2009) explains how “the rapidly evolving changes in simulation equipment, audio visual technology, simulation synthesis software and trends in curriculum make the proper planning and design of flexible, sustainable labs ever more complex and important” (p. 6). Providing students opportunities to learn novice and advance nursing assessment skills can be accomplished by using high-fidelity simulation mannequins such as Harvey®, the Cardiopulmonary Patient Simulator created by the Michael S. Gordon Center for Research in Medical Education, GCRME, at the University of Miami. The curriculum included with this simulation technology includes 30 different cardio-pulmonary disease states ranging from hypertension, mitral valve prolapse, and pulmonary stenosis (GCRME, 2013). Harvey® is a robust educational tool for nurse educators to use while preparing pre-licensure nursing students for the National Council State Boards of Nursing Licensure Examination, NCLEX-RN®. With the recent release of the updated NCLEX-RN® exam, a number of alternate format questions including audio questions were asked. Candidates were asked to listen to the audio file and then answer the question (NCSBN, 2013, p. 56). The use of high-fidelity simulation mannequins play a significant role in preparing candidates to master alternate question types.

**Outcomes**

This poster presentation will discuss the use of the high-fidelity simulation mannequin Harvey® along with the provided curriculum used in the lab setting to prepare BSN prepared candidates for the NCLEX-RN® exam. The nature of the research being presented is a discussion of current literature in progress and initial development of a theoretical framework for testing and ongoing research. Methodologies used will be Colaizzi’s phenomenological and analytical interpretative data approach. Upon completion of this poster presentation, the attendee will have a better understanding of the role of innovative, educational technology using high-fidelity simulation mannequins for teaching of cardio-pulmonary disease states in nursing curricula.

**Abstract:** Learning in the 21st century is focused on information management and students are expected to be developed as inquiry learners instead of just knowledge gatherers. As inquiry learners, they have to be observant, for example when conducting experiments in the laboratory, and to make use of information to solve or complete science-related problems or tasks. Traditionally, science practical skills are assessed through single-session laboratory-based examinations and students are prepared through drill-and-practice strategies. However, school systems around the world today have chosen to adopt course-based science practical assessment which assesses students on their abilities to identify and select appropriate hands-on skills when conducting laboratory experiments. Thus, there is a need to help students prepare for this change in practical assessment format and one established way is the use of scaffolding strategies. Although scaffolding is a tried and tested method to help students master new knowledge and skills in many school subjects, its effectiveness in school science practical work has not been thoroughly investigated. This paper reports some of the current work done in Singapore schools where the use of scaffolding strategies in preparing students for school-based practical assessment is being studied. The findings from these studies are significantly positive and do indicate the potential of scaffolding strategies in helping students become more motivated and skillful in science practical work.

**Keywords:** science, practical, skills, assessment, scaffolding, strategies

## **1 Introduction**

In recent years, assessment of students' science practical work in Singapore has been reforming to focus on the course-based development of science practical skills (over two years) instead of assessing the end-product of learning in the form of a submitted laboratory report over one assessment sitting in the usual end-of-course science practical examinations. Teachers usually prepare their students to sit for the practical examinations through a series of drill-and-practice science practical sessions. In 2006, the practical examination was replaced by the School-based Practical Assessment (or SPA) for students offering sciences as subjects in the Singapore-Cambridge General Certificate of Examination (or GCE). Students' proficiencies in science practical skills are now assessed through performing a series of experimental tasks over a two-year period for the 16-year olds (equivalent to the middle school students) sitting for the GCE Ordinary Level examination, and the 18 year-olds (equivalent to high school or college pre-university students) sitting for the GCE Advanced Level examination. Unlike practical examinations, in which students were drilled to perfect specific practical skills like those in qualitative analysis (identification of ions in unknown chemical samples) or volumetric analysis (using titration techniques to find out concentrations, in moles per litre, of unknown aqueous solutions of acids or alkalis), SPA requires students to be proficient in an array of science practical skills.

Given the broader range of skills in SPA (compared to those assessed in practical examination) it is no longer effective to train students to be competent in practical skills through drill-and-practice methods. To help students prepare for the assessment of practical skills, one established way is the use of scaffolding strategies. Although scaffolding is a tried and tested method to help students master new knowledge and skills in many school subjects, its effectiveness in school science practical work has not been thoroughly investigated. This paper is a report of a few current Singapore studies on the use of scaffolding strategies in preparing students for school-based practical assessment.

## **2 What is Scaffolding**

The idea of scaffolding to support learning was introduced more than three decades ago by Wood, Bruner and Ross (1976). The original notion of scaffolding was applied to interactions between an expert and a learner, the former was usually a teacher or a parent who provided the help needed to move the learner forward (Wood et al., 1976). In essence, it was a one-on-one interaction where the expert, being the knowledgeable and skillful one, provided just enough support the learner needed to complete an activity or task successfully. The interaction between them allowed the expert to monitor the learner's progress and provide the appropriate support. The support was then removed once the learner was in control of her/his learning. In an education context, instructional scaffolding is known to enable a child or a novice to solve a problem, carry out a task, or achieve a goal that s/he cannot accomplish on her/his own (Wood et al., 1976). The support can progressively "fade" away when there is no longer a need for it. This fading of the support, one of the key theoretical features of scaffolding, enables the learner to be responsible for her/his learning.

Over the past 35 years, the concept of scaffolding has been widely used as a metaphor to support teaching and learning. This metaphor was used to describe the support provided by parents, teachers and mentors to assist the learners to learn new concepts, master skills or raise levels of understanding. This term describes the nature of an essential support that provides temporary assistance to enable the learner to advance to the next level in knowledge and understanding (Maybin, Mercer & Stierer, 1992).

Another notion of scaffolding is “distributed scaffolding”, a term coined by Puntambekar and Kolodner (1998; in press), and it refers to instructional designs that sequence and integrate a variety of social and material supports (cited in Tabak, 2004). In this context, scaffolding refers to the titrated supports that enable learners to engage in learning through activity, such as “doing and talking science”. It helps learners perform tasks that are outside their independent reach and consequently develop the skills necessary for completing such tasks independently (Rogoff, 1990; Wertsch, 1979; Wood, Bruner, & Ross, 1976; cited in Tabak, 2004). In short, it is a collection of materials and social supports that enable learners to learn discipline such as science by “doing science”.

Tabak (2004) described distributed scaffolding (Puntambekar & Kolodner, 1998) as an emerging approach in the design of supports for rich learning environments that are intended to help students develop disciplinary ways of knowing, doing, and communicating. In this scaffolded environment, multiple forms of support are provided through different means to address the complex and diverse learning needs of the learners. It is the metaphor that made the multiple supports explicit, in contrast to the original conception of scaffolding in relation to parent-child interactions, where there is just a single means of support. Her framework formalised distributed scaffolding and delineated the different forms or patterns that the scaffolding can take and the functions that these different patterns perform. Distributed scaffolding is envisaged in different ways and differentiated scaffolds, redundant scaffolds and synergistic scaffolds are the three complementary patterns associated to it.

Redundant scaffolds have been explicitly identified as a design strategy for distributed scaffolding. It involves different means of support that target the same need but are enacted at different points in time in the curriculum to provide titrated levels of support (Puntambekar & Kolodner, 2005). As a result of the difference in student competencies, there is a need for different types and levels of support to meet the particular learning needs.

When scaffolding is provided in multiple formats, there are more chances for students to notice and take advantages of the environment’s affordances (cited in Puntambekar & Kolodner, 2005). Providing good and effective scaffolding may mean that a learner is provided with support that can enable him or her to function independently. The best scaffoldings are the ones that can be faded because the learner will eventually (through the scaffolds) internalise the processes s/he is being helped to accomplish (Rogoff, 1990; cited in Puntambekar & Hubscher, 2005). Tabak (2004) argues that the tasks in these contexts are more complex and extend over longer periods of time than the tasks depicted in the classical examples of scaffolding. As such, scaffolding needs to

change accordingly over time in response to the changing needs of students and the curriculum.

Studies have also shown that question prompts, a type of instructional supports, can effectively promote students' knowledge integration (Davis & Linn, 2000). Different question prompts may serve different needs and purposes for students. Davis and Linn (2000) also studied the effects of guided questions on metacognition skills, knowledge integration, and problem-solving. Also, reflective prompts were used to support knowledge integration and encourage reflection at a level that students did not generally consider. This paper documents an initial effort to apply scaffolding in the learning of school science, especially how it can be used in the laboratory to help students learn chemistry practical skills.

### **3 Scaffolding in the Recent Years**

In terms of learning, teachers are responsible for providing the scaffolding for classroom instruction. Scaffolding used in the classroom is only a temporary support which has to be removed when learners are able to independently demonstrate their competence and articulate knowledge without the support. To distinguish scaffolding from just mere help given by a teacher to accomplish a task, there should be some evidences that the teacher has intention for the learner to develop a specific skill, learn a specific concept or achieve a particular level of understanding. There should also be evidences indicating how the teacher could monitor a learner's success in a task or on how the teacher intends to measure the learner's increased competence or improved level of understanding of a specific learning activity (Maybin, Mercer, & Stierer, 1992).

Many of these evidences are reported by researchers and educators in their studies using various forms of scaffolding or scaffolding experiences or environments. As a result of the frequent use of this metaphor in the teaching and learning, it has been re-defined and re-interpreted in relation to the learners' needs in these studies. However, the main idea of it being a form of support for learners' attempts to achieve specific learning goals under a wide range of learning environments remains unchanged. Also, its popularity in classroom instruction suggests that teachers do believe it contributes to effective classroom instruction and the beneficial effects on school curriculum. Few teachers and educators would have any dispute over the importance of scaffolding in their own learning environments. Despite the many changes and adaptations, most forms of scaffolding, if not all, still align with Wood's idea of providing a just-in-time learning opportunity to help the learner complete the task and reach the goal per se (Wood et al., 1976).

This paper aims to (i) present the various forms of scaffolds and scaffolding strategies that have been used in classrooms to help students learn curriculum-assessed practical skills, and (ii) share recent experiences on the use of scaffolds in science education in some studies conducted in Singapore schools, including some of the outcomes from these recent studies in which scaffolding were used to support learners as they learn laboratory experimental skills in the chemistry laboratory.

#### 4 Recent Studies on Scaffolding in Singapore Schools

Unlike the wide ranging literature on scaffolding that generally helps students learn in school, there are fewer studies involving the use of scaffolding to help students learn science practical skills in the school laboratory. Two recent studies in Singapore schools on the effectiveness of using scaffolding in school science laboratory (Au, 2009; Au & Tan, 2010) had shown that this is a potential area for more extensive and intensive research to be done. The two studies investigated the effectiveness of scaffolds in laboratory as a means for teachers to help students learn and master curriculum-assessed chemistry practical skills. The focus of both studies was on the types of scaffolds provided during chemistry laboratory practical lessons. Both adopted the concept of distributed scaffolding, an emerging practice among researchers interested in supporting science learning (Raes et al., 2011; Puntambekar & Kolodner, 2005) and others such as in history (Li & Lim, 2008). This concept involves developing ways of knowing, doing, and communicating and entails a large assortment of learning or support needs (Tabak, 2004). The different types of scaffolds used in her study are teacher support, procedural facilitation (a pedagogical technique used in the study of Scardamalia and Bereiter, 1985, cited in Pea, 2004), prompts and questions, and reflection prompts (Davis, 2003). Some of these scaffolds are used as redundant scaffolds. Redundant scaffold is one of the three patterns of distributed scaffolding. As a result of the difference in student competencies, there is a need for different types of support in the chemistry laboratory to meet the particular learning needs. Redundant scaffolds provide the multiple scaffolds for the same needs to the students who may have missed opportunities to benefit from a particular scaffold (for example, missing out parts of the teacher's verbal instructions in the laboratory) and to some others who may need more support to perform the tasks (Tabak, 2004).

Similarly, all students performing science practical tasks in the laboratory can also benefit from both redundant and multiple scaffolds. The different types of scaffolds supporting the same learning needs were incorporated at different points in the curricular materials used in the studies. Thus the multiple supports used allowed students to receive more assistance to complete a task. Initial findings of an earlier study on two classes of grade 9 chemistry students (Au, 2009) indicated that students who had been through scaffolded lessons performed better than those who did not. These findings suggest that scaffolds may enhance student performance in chemistry laboratory and the students can function independently when the support is removed (faded).

A survey was conducted with the two classes of 63 students performing a set of experiments with scaffolds (S1-S6) provided to learn six common skills (Au & Tan, 2010). The findings of the survey conducted indicate that a large number of students in both classes viewed scaffolds that were provided in the scaffold environments of chemistry laboratory were helpful in supporting the learning of practical skills and useful for reflection on skills performed. This is observed in the comparable number of "Strongly Agree, SA" and "Agree, A" responses from both classes. Table 1 shows the percentage range of responses for both classes.

Table1: Percentage of responses to Scaffolds S1 – S6

Class	% Responded (SA & A)	SA (%)	A (%)
I (33)	85 – 97	42 – 49	33 – 51
II (30)	87 – 93	60 – 73	20 – 33

The percentage response to SA in Table 1 indicates that class II students have a higher percentage response than class I. This finding may indicate that a greater number of class II students find scaffolding helpful in chemistry laboratory. A larger number of SA responses from class II may be attributed to students' experiences in both no scaffold and scaffold environments for chemistry laboratory. Class II students were not provided with scaffolds in the first round of the study but after the second round with scaffolds, more students of the class could make a distinct comparison between scaffold and no scaffold laboratory environments.

An extension of the research on distributed scaffolding followed after the earlier studies. The project was conducted with two classes of Secondary 3-4 (Grade 9-10) students (n=73) over a 2-year chemistry curriculum. This project probed the effectiveness of distributed scaffolding in the curricular materials for the Grades 9 -10 chemistry laboratory. In this extended study, multiple supports were provided to scaffold the learning of practical skills with the end goal being the completion of the chemistry experiments safely using the appropriate laboratory techniques. The multiple supports provided involved guiding questions and reflective prompts (Davis & Linn, 2000) and instructions which are procedural and direct in nature.

The extension project involved the “non-scaffolded” class and the “scaffolded” class. Each class carried out 11 chemistry experiments over a 12-month period. Each experiment was a one-hour long and was designed to be aligned to the formal chemistry curricular schedule. Only the intervention class was given chemistry laboratory materials supported by distributed scaffolding instructions or notes. After carrying out a series of five to six experiments (non-scaffolded or scaffolded) the classes sat for a one-hour chemistry laboratory (non-scaffolded) test. For the scaffolded classes, the scaffolds were deliberately and gradually removed over the series of five to six experiments until they sat for the final chemistry laboratory (non-scaffolded) test. This tapering off of scaffolds aligns with the fading feature of scaffolding

A t-test analysis was done on the total of the two test scores of the two classes. The t-test results and the related descriptive statistics are summarised in Table 2.

Table 2: Summary of t-test results for the scores of no-scaffold class and scaffold class

Class	No. of students	Mean	SD	t	p	E S
No-scaffold	34	13.18	2.33	-3.94	.000	0.93
Scaffold	39	15.03	1.55			

The mean score of the scaffold class (M = 15.03, SD = 1.55) is significantly higher (t = -3.94, df = 56, two-tailed p = .000) than that of the no-scaffold class (M = 13.18, SD = 2.33). The effect size, estimated with Cohen's d was .93. The findings show that a scaffold

folding environment can enhance the learning of practical skills in chemistry laboratory and that scaffolding has a large effect ( $E S = 0.93$ ) on the performance of practical work in the laboratory.

## **5 Implications and Conclusion**

The findings of the Singapore studies on the use of scaffolds in practical work have important implications on student learning of chemistry laboratory skills in school. For example, the different types of support did help students improve in their performance in chemistry laboratory tasks. These supports would be especially helpful in large classes where the teacher may not be able to effectively provide individual attention to the students. Scaffolds, like those in the worksheets used in the studies or presented visually next to instruments in the laboratory, may be effective supports to assist students in the learning and mastery of practical skills. Also, by providing different multiple scaffolds in chemistry laboratory students' learning of practical skills can be better enhanced because students have indicated that the scaffolds were helpful in their learning process. The Singapore studies have also provided new insights into how scaffolded learning environments can help improve student learning of laboratory skills. The scaffolded chemistry laboratory environment has enabled us to explore the use of different and multiple scaffolds as another teaching and learning approach to learn science practical skills in school chemistry. Nevertheless, more investigation on scaffolding the laboratory for learning science practical skills have to be done in chemistry classes before the essential features of scaffolding in the laboratory setting may be more convincingly identified.

**Title of research: Empowering individual mind for peace education: Examining a Buddhist contribution to the development of mind for peaceful and harmonious world**

**Topic area of the submission: Educational Psychology**

**Presentation Format: Paper Session**

**Description of presentation: This research examines how a Buddhist philosophy of mind contributes to the qualitative enrichment of individual mind for peace education. Based on the three proposed concepts of mind – the conditioned mind, the unconditioned mind, and holistic mind –, it explores the empowerment of the individual mind to develop multiple ways of thinking and knowing such as critical thinking, mindfulness, contemplation, intuition, imagination, empathy and so on in collective settings to make a positive change.**

## Abstract:

There has been a recent push to integrate mathematics into other content areas, particularly in STEM related fields. With this in mind, we taught a lesson to middle school students that integrated mathematics and archeology. The students had to develop a method to determine the height of a prehistoric person based on his/her stride. The research presented here focuses on the students' approaches to the problem with an emphasis on their generalizations. Three different methods were generated by students: 1) an additive model 2) a proportional model and 3) an advanced proportional model accounting for gender. The results indicate that students are at different levels of development but can be guided to advance their thinking. Those who struggled with the task (and used the additive model) were able to discover the problems with their model once they were asked to test the model. Students were able to problem-solve and create new models as their original models failed to work. Qualitative data are provided. This study indicates the need for students to discover on their own the limitations of models. As well, teachers should provide students with opportunities (along with time) to revise and reinvestigate.

Modeling involves identifying and selecting relevant features of a real-world situation, representing those features symbolically, analyzing and reasoning about the model and the characteristics of the situation, and considering the accuracy and limitations of the model” (NCTM, 2000, p. 303). Mathematical models are fruitful tools for many professions including scientists, mathematicians, engineers, economists, statisticians and many others.

With the importance of modeling as a center for this investigation, middle school students in Turkey were asked to solve a dilemma involving archeology and mathematics. The purpose of this STEM investigation is to have fifth grade students explore a modeling experience through an activity called “How Tall were People in Ancient Times?” which was adapted from an activity called “Lengthy Relationships” Johnson (1999). Specifically, the aim of the activity is to find the relationship between the stride length of a person and his/her height. A scenario was posed to the students: An archeologist discovered preserved ancient footsteps during a dig. The stride was 72 centimeters in length. How can we use this information to estimate the height of a person using stride length? Create a model to help the archeologists

The students followed the common phases of a modeling activity: 1) introduction, 2) exploration, 3) building of a mathematical model and 4) testing the built model (Sekerak, 2010). Qualitative data that documented students’ thinking are presented to support the results related to student thinking in this investigation.

### The Models

Students created 3 different models to address the connection between stride length and height: 1) an additive model 2) a proportional model and 3) an advanced proportional model accounting for gender.

### *The Additive Model*

The additive model was an inaccurate model that applied an additive relation between stride length and height. Using algebraic notation, students translated height length as the side length plus 100 ( $h = s + 100$ );  $h$  = height while  $s$  = stride length. Students incorrectly assumed that 100 needed to be added to each stride length to find height. Initially, students thought that their model was effective. But once they were asked to test their model, they realized that there were flaws.

Teacher Can you show me that your model is working?  
John My stride length is 59 centimeters and I am 159 centimeters tall.  
Teacher Can you show me that your model is working for other students in the classroom?  
John : His stride length is 67 centimeters and he is 152 centimeters. It is not working exactly.

### *The Proportional Model*

The proportional model presented a multiplicative relationship between stride length and height. Students averaged the ratio between stride length and height after gathering data from their classmates. Student created a model that used the following formula:  $h = 2.4s$ . They saw that a constant (2.4) was needed in the formula.

Teacher How did you find your mathematical model?  
Abby We first measured the heights and stride lengths of 21 students in the classroom. And then we found average heights and average stride lengths. Finally, we divided average heights by average stride lengths. We found approximately 2.4. If you multiply 2.4 with any stride length you would find the height of that person. It is close but not exact.

### *The Advanced Proportion Model (Using Gender)*

The final model was a proportional model that considered gender in the multiplicative relationship. These students realized that males and females have different stride lengths based on their height. The formulas were:  $h = 2.5s$  (for girls) and  $h = 2.3s$  (for boys). The data from this class can be found in the appendix.

Teacher How did you find your mathematical model?  
Maya We found in our group an average ratio for girls and boys separately. There are 21

students all together. 14 of them are girls and 7 of them are boys. The average height/stride length ratio for girls is 2.5 and for boys 2.3. So if a person is a girl then you multiply her stride length with 2.5 to find her height. If not, you multiply it with 2.3.

To further this exploration, the students were asked to interpret how the formula could be related to stride length. If a boy and girl had the same stride, who would be taller the boy or girl? Who takes shorter steps, boys or girls? Explain how that relates to the formula.

### Conclusion

While some models were more effective at predicting heights than others, the importance of this investigation was for students to recognize the limitations of their own model and make adjustments as necessary. Our recommendations are that teachers help students discover the limitations of their models through scaffolding, allowing the students to observe possible contradictions. The students also need class time to adjust and rethink their models, as this was critical for students to analytically evaluate what the model means and what the model predicts and whether or not the predictions are accurate.

**Title: Knowledge intensity in the workplace and occupations. How well does vocational education prepare for occupational requirements in working with information and knowledge?**

Michael Tiemann

Federal Institute for Vocational Education and Training (BIBB)

Robert-Schuman-Platz 3

53175 Bonn

[tiemann@bibb.de](mailto:tiemann@bibb.de)

**Title: Knowledge intensity in the workplace and occupations. How well does vocational education prepare for occupational requirements in working with information and knowledge?**

**1. Research objectives**

The importance of dealing with information and knowledge at work is undisputed. Yet, when it comes to assess what exactly knowledge in work, knowledge intensive tasks or occupations or even the shares of workers in an economy working as “knowledge workers” is, approaches and answers differ significantly. The proposed paper sets out to find a sensible definition of knowledge in the workplace and knowledge intensive work that can be operationalized with existing data. Once this first important step has been made, further questions are raised: Are there differences in educational backgrounds of workers in high to those in less knowledge intensive occupations? In how far does personal background matter? What other differences than knowledge intensity exist between more or less knowledge intensive occupations?

**2. Body of knowledge**

There are different conceptions of types of knowledge work (and knowledge workers) and knowledge intensity in the workplace. Hermann (2004: 10) synthesizes that “knowledge work is present, if a person has to accomplish complex or new tasks for which their present knowledge and skills are not sufficient to find an adequate solution. Thus they have to utilize other peoples’ knowledge or invent new knowledge themselves” (own translation). Volkholz and Köchling (2001) take up such considerations in operationalizing types of knowledge workers as a combination of learning and creativity requirements. Tiemann (2010) utilizes this operationalization to define knowledge intensity in the workplace and hence in occupations.

Knowledge here is seen as empowering employees to accomplish the tasks set for them in their work. It is related to the concepts of Polanyi (1966) as well as Nonaka and Takeuchi (1997), where different types of knowledge (being either codified, codifiable or ‘tacit’) can be distinguished (and also transformed into one of the other types). It is also related to autonomy at work: the more autonomy on his or her work one has, the more relevant become knowledge work requirements like learning and creativity requirements. There is a discussion about which kind of secondary education will better set students up for dealing with knowledge requirements in the workplace. Baethge and Baethge-Kinski (2006) as well as Baethge et al. (2007) propose that academic knowledge would be superior to vocational, practical knowledge. Still, economic innovation is not exclusively generated by academically trained personell. The paper seeks to overcome this contradiction by utilizing a more fitting operationalization and definition of knowledge – encompassing not only specific economic sectors like research and development but the whole economy.

### **3. Proposed methodology**

Large data-sets exist, with which occupations' knowledge-intensity can be successfully assessed. For Germany, the most prominent one is the BIBB/BAuA Employment Survey of 2012 (Hall et al. 2012). They contain data from 20,000 employed persons with at least 10 hours paid work per week (core-employment). The data will be used to assess knowledge intensity in occupations classified after the International Standard Classification of Occupations (ISCO) 2008. Other aspects like qualificalional careers, formal job requirements, tasks fulfilled and contempt with the work situation are surveyed and will be analyzed accordingly.

### **4. Discussion of expected outcomes**

Using the ISCO 08 classification, cross-country comparisons are made possible. Furthermore, the data allow addressing the following questions:

- Which occupations are knowledge intensive?
- Who is working in such occupations? Are there differences in occupational positions, salaries or working conditions other employees?
- Who comes to work in such occupations? Are there differences in qualifications, educational careers, family background (social status)?
- Are there more differences between knowledge intensive occupations and others (differences in formal qualificalional requirements, the overall matching of qualifications and competences, the tasks performed etc.)?
- How well do different institutional paths of vocational education prepare for working in knowledge intensive occupations? (In Germany, the 'dual system' of vocational education is very prominent, but other forms like full-time vocational schools are also present, as is, of course, academic education.)

Leszczensky et al. (2011) and Tiemann (2011) showed that over the last decades there has been an increase in knowledge intensive work in Germany. Yet, it is still questionable to what extent and on which level knowledge intensive work really persists in the economy. Drawing on the possibilities of ISCO 08, a comparison with other countries could be made to answer this question.

“What Does That Mean?: Keys to Success or Failure for Beginning World Language Teachers in the Digital Age.”

Dr. Tonia Tinsley, Missouri State University

“What does that mean?” is a question posed every day to teachers of all levels and content areas. It may be the simple question of a young child pointing to an unfamiliar word; it may be a more complex question of a high school student attempting to make sense of an unfamiliar concept; or, it may be a pedagogical question from a university student preparing to become a teacher. The question becomes more serious when a soon-to-be teacher lacks a fundamental understanding of the most basic common language of education – whether pedagogical or from his/her selected content area. The question becomes disconcerting for university teacher education faculty when it stems either from a student’s perceived inattention to following instructions (such as not reading the syllabus or the directions), or from a sincere deficiency in preparatory courses. The question may well indicate a disconnect between teacher preparation programs and the digital natives who are now part of these programs. With the ever-rising stakes for P-12 teachers, the ramifications of the question beg examination.

In a relatively recent issue of *Educational Leadership*, Linda Darling-Hammond commented, “the core value of every profession is that everyone in the profession has a common body of knowledge and skills needed to be responsible and effective.”<sup>1</sup> However, in this rapidly-changing digital world, the set of common knowledge has become more difficult to establish because of the piecemeal pathways individuals take through higher education, including their teacher education preparation. If certain student teachers say their teacher education programs failed to adequately prepare them in areas vital to their performance, then this presents a problem for teacher education across the country. To establish the “core value” cited earlier by Linda Darling-Hammond, the question ‘What does that mean?’ must be answered in the minds of student teachers and cooperating teachers alike. The question must also be asked at multiple stages in the educational process, because, as in a world language

---

<sup>1</sup> Scherer, Marge. “The Challenges of Supporting New Teachers.” *Educational Leadership* 69.8 (May 2012): 21.

class, words take on depth and a certain degree of flexibility as they take on nuance, or as the context changes. If one considers that each of the different paths to teacher certification represents a different context, then the meanings of the words can shift.

So, what is the core value of teaching? What is that common goal or guiding principle that all teachers share, regardless of content area? It is, in fact, multi-layered—educators share the goal of facilitating the acquisition of knowledge, but also play a vital role in guiding their students to become critical thinkers. Students must define their own paths in life, and assess the strengths and weaknesses of their own performance. In order to ultimately improve and succeed: “We want students to learn how to develop a critical stance with their work: inquiring, thinking flexibly, and learning from another person’s perspective. The critical attribute of intelligent human beings is not only having information, but also knowing how to act on it.”<sup>2</sup> When one considers applying this principle to student teachers, the core value integrates both autonomy and critical thinking, while also providing a way for the learner and the professional to co-exist. Both of these are sometimes a struggle for digital natives, given the environment of instantaneous confirmation, reinforcement, or negation in which they function on a daily basis. However, the demands of the teaching profession require educators to constantly inquire, constantly evaluate perspective, and constantly assess and re-assess, so the disconnect experienced by some student teachers might seem odd.

However, if we establish the metaphor of the core value as a common language, then from the vantage point of world language instruction, the difficulty for student teachers is clear. Learning the word does not guarantee understanding its definition. The language process typically involves several steps: a) learning a word; b) mimicking the word in a context; c) paraphrasing the definition of the word; and, d) successfully using the word in original utterances to clearly illustrate comprehension of its meaning. Student teachers must be given the chance to reflect on the direct question of meaning because the process provides vital insights into their profession and how to be successful at it. This paper will examine and explore the following key

---

<sup>2</sup> Costa, Arthur L and Bena Kallick, “It Takes Some Getting Used To: Rethinking Curriculum for the 21<sup>st</sup> Century.” Heidi Hayes Jacobs, ed. Curriculum 21: Essential Education for a Changing World. ASCD: Alexandria, Va: 223.

areas related to successful teaching: a) dispositions, b) professional development, c) classroom management, d) content area, and e) pedagogy, and will provide examples and guidance for the beginning foreign language teacher, as well as the wider P-12 community. Although the discussions of issues in teacher education preparation programs focus on the core content areas, foreign language teacher education provides a meaningful jumping-off point to explore and illustrate the difficulties encountered by newly qualified teachers in all subject areas and the real possibility of their success.

In world language study and proficiency development, the learner must be brought to two key realizations: a) there is more than one way to express an idea, and 2) to create with language, one must recognize the process, as well as the parts of that language. Certain habits of mind must be defined and rooted. Habits of mind directly related to success are “a curriculum of processes that serve as leverage for learning any content. It is a curriculum that gives students practice engaging with complex problems, dilemmas, and conflicts whose resolutions are not immediately apparent.”<sup>3</sup> Included in the curriculum are elements that apply directly to communicating in a new language: “persisting, listening with understanding and empathy, thinking flexibly, striving for accuracy and precision, creating, imagining, and innovating (Jacobs 212-213).” The metaphor of the core value as a common language continues to hold because these habits dually address the question of dispositions, especially those related to meeting the needs of diverse learners in the classroom. The information presented has to be accurate, but malleable, to allow learners to approach it from different angles, or through different steps. Examples must abound; paraphrases and circumlocution present value as formative assessments. Learners cannot explain what they have not understood.

‘What does that mean?’ To be sure, just as with all teachers, this question constantly confronts the world language classroom teacher, with the added complication of deciphering what exactly the student is asking. In this case, the experience level of the teacher to whom the question is asked is relevant in its assessment. Teachers are tasked with making meaning of

---

<sup>3</sup> Jacobs, Heidi Hayes, ed. *Curriculum 21: Essential Education for a Changing World*. 1<sup>st</sup> ed. Alexandria, VA: ASCD: 2010: 212.

ideas and information through exposure to both in an organized sequence, and then leading students to create meaning for themselves.<sup>4</sup> A seasoned teacher knows a) many strategies useful in explaining the nuances of the language being taught, and b) how to navigate the myriad of dynamics at play in the classroom beyond course content. Experience brings with it understanding.

For the beginning world language teacher, the question of meaning can originate from students regarding the target language; but, it can just as easily originate in the teacher himself/herself, because navigating the depths of the profession of an educator represents more of a challenge than ever imagined. The distance between the ideal profession in theory and in practice is great, akin to the chasm between formal written language found in dictionaries, and the extremely flexible, busy oral counterpart found in everyday transactions. Although nationally-normed definitions for most professional education/teacher preparation terminology exist, they are articulated in a language in which student teachers must receive a greater initiation. In order for those standards and definitions to take on relevance, student teachers' reflection needs to deepen and evolve. This is especially true in the case of digital natives. Literacy and critical thinking development in digital natives has been the subject of much analysis since the generalized presence of Web 2.0 in P-12 education. For the purposes of this current study, I present simply the idea of "beginnings" (a common formatting convention used in Web pages), and assessment of relevance based on a hyperlink or partial text.<sup>5</sup> If, indeed, students attempt to formulate an accurate impression of a whole text from a key word search, that may yield a partial reproduction of a much denser and more complex argumentation. They would benefit

---

<sup>4</sup> The original framework of this idea is in relation to English-language literacy development, and is defined as the "fundamental purpose and structure of learning English: 1) making meaning of ideas and information through exposure and critical response to literature and non-fiction text; and 2) creating meaning for themselves and others." (Jacobs, ed 47-48)

<sup>5</sup> For a more in-depth analysis of 'beginnings', literacy development and relevance of words in middle school world language teaching, see Tinsley, Tonia. "The Fourth R: The Relevance of Language[s] for Digital Learners" *Transescent* May 2010. [www.mmsa-mo.org](http://www.mmsa-mo.org). Also see Ohler, Jason. "Orchestrating the Media Collage." *Educational Leadership* 66.6 (March 2009): 8-13.

from a focused examination of the definitions inherent to understanding their profession, to bridge the gap between the formal and the informal, the partial and the whole.

## Dispositions

The national NCATE standards define dispositions as the “professional attitudes, values, and beliefs demonstrated through both verbal and non-verbal behaviors as educators interact with students, families, colleagues and communities.”<sup>6</sup> Within the documents put forward by NCATE, firstly, within this definition, we come across another moment where teacher education programs can vary in the preparation provided, since “the two professional dispositions that NCATE expects institutions to assess are *fairness* and the belief that all students can learn. Based on their mission and conceptual framework, professional education units can identify, define, and operationalize additional professional dispositions.”<sup>7</sup> In the teaching profession, the sheer variety of pathways to certification dilutes the initiation process, starting at the very beginning with the cognizance of the job itself—very wrapped up in language, as it turns out. Teaching is a performance profession: it involves public speaking every day, sometimes to crowds that love you, sometimes to crowds that do not; most often to crowds that float somewhere in between. Therefore, it is a profession that requires excellence in communication and language, as well as an in-depth knowledge of the content area to be taught. When that content area is world languages, an instantly international element is thrown into the mix, but that element leads to the development of many of the primary dispositions required for successful teaching, including acceptance of diversity, non-judgmental attitude, and professional oral and written language.<sup>8</sup>

<sup>6</sup> National Council for Accreditation of Teacher Education (2008). The NCATE Unit Standards. Washington, DC. <http://www.ncate.org/Standards/UnitStandards/Glossary/>

<sup>7</sup> National Council for Accreditation of Teacher Education (2008). The NCATE Unit Standards. Washington, DC. <http://www.ncate.org/Standards/UnitStandards/Glossary/>

<sup>8</sup> Vivien Stewart mentions the Peace Corps as one of the places where aspiring teachers can develop the “dispositions that are essential to effective teaching” (Jacobs, ed. 104). The *Peace Corps Cross-Cultural Workbook* stresses 13 beliefs, attitudes, and concepts that differ across cultures: Age, Concept of Fate and Destiny, View of Human Nature, attitudes toward Taking Risks, Concept of Suffering and Misfortune, Concept of Face, Source of

World Languages act as a filter through which one comes to understand, respect, and value differences between individuals, communities and countries, and can better equip student teachers to communicate with, and design instruction for, the diverse learners in their classes. Departments of Higher Education recognize success in world language study as one of the greatest indicators of college readiness. Business leaders and educators realize that “America’s continued role as a global leader will depend on our students’ abilities to interact with the world communities both inside and outside our borders.”<sup>9</sup>

The experienced world language teachers in a school or district might just prove to be the best hidden resource for both student teachers and beginning teachers, because of the cultural awareness and other-language immersion adaptations inextricably connected to their content area. World Language educators possess a double awareness that all learning takes place through the filter of some sort of language—“At the root of all performance is a student’s capacity in four language modalities: reading, writing, speaking, and listening [...] When individuals have acquired a level of competence in those capacities, they become functionally literate.”<sup>10</sup> Students cannot learn what they have not understood. Members of one linguistic community agree generally on the conventions of its language—the language is the common value. Novice learners in the community are initiated to it, then develop literacy in it. In order to gain experience, one must be placed in a position of having to communicate with someone who does not share the same native language, because “there is arguably no more direct route for understanding another country or understanding someone else’s perspective than working

---

Self-Esteem, Concept of Equality, attitude towards Formality, Degree of Realism, attitude toward Doing, and View of the Natural World, PLUS Politeness.

Economic and National Security* (2006) endorsed by the Committee for Economic Development.

<sup>10</sup> Jacobs, Heidi Hayes, ed. *Curriculum 21: Essential Education for a Changing World*. 1<sup>st</sup> ed. Alexandria, VA: ASCD: 2010: 47.

at using their language.”<sup>11</sup> In such a situation, dependency on shared conventions or a perceived prior knowledge surface. Students learn to recognize that assumptions based only on the dominant culture hold little validity in the diverse populations in schools, just as a ‘one-size fits all’ approach to a lesson plan or classroom management cannot sufficiently meet the needs of all the learners in the room. A balance then must be struck between explanation, examples, repetition, practice, group work, individual creativity and autonomy.

### Classroom Management

The NCATE glossary does not contain an entry directly related to classroom management, even though related terms such as ‘avoidance of bias in assessment’, ‘diversity’, and, most notably “professional knowledge” each contain part of that skill set, either as values or practices. Professional knowledge is defined as the “historical, economic, sociological, philosophical, and psychological understandings of schooling and education. It also includes knowledge about learning, diversity, technology, professional ethics, legal and policy issues, pedagogy, and the roles and responsibilities of the profession of teaching.”<sup>12</sup> Student teachers consistently cite classroom management as one area in which they feel inadequately prepared. A more fruitful articulation of this aspect of teaching presents itself in the idea of classroom management as “a stated and systematic course of action based on a thoughtful analysis of existing conditions,”<sup>13</sup> while also reinforcing respect and value of differences, hierarchies and codes of conduct, and identifying/recognizing bias and bullying. World Language study again provides a useful filter, for all but the final issue of bullying. Within the very act of learning another language lays the practice of respect and value of differences, because students are led to consider in a non-judgmental way cultural gestures, products, and conventions that differ

<sup>13</sup> Moles, Oliver C. *Student Discipline Strategies: Research and Practice*. Albany, NY: State University of New York P: 1990: 6.

greatly from their own. Teachers must consider this global view as they develop and apply their policies, so that these policies honor with the same neutrality and equality the different backgrounds and home cultures of the students in their classrooms. Reactions of students to others' opinions and practices might also be more easily understood and addressed through the filter of the Continuum of Cultural Competence that outlines the stages of that process (from destructiveness to proficiency).<sup>14</sup>

As for the hierarchies and codes of conduct, within a foreign language that contains both a formal and an informal set of subject pronouns, the nature of respect and relationships naturally becomes part of the discussion and the learning process. Every single time a student engages someone in a conversation, courtesy, respect, and hierarchy must be considered. These pronouns serve as a tangible sign of the expression of all of those qualities. This can often be difficult to identify in English, since it does not carry those same subject pronouns.

Identifying bias is part of identifying and analyzing a source. Geography in world languages provides a crucial point of reflection on this point, since maps are often examined from the perspective of a particular nation. Looking at a map from a different perspective involves a moment of recalibration on the part of the students, since often their country of reference is no longer located in its 'usual place.'

In this age of instant social media, it is crucial for teachers to model and expect their students to model respect for and value of differences among their peers. In order to present a systemic picture of how failing to instill this respect and value can lead to bullying, I have instituted three events in my Methods of Teaching Foreign Language. Firstly, the students watch a performance by the Giving Voice troupe sponsored by our Department of Theater and Dance. The genesis of the Giving Voice project is to 'meet the needs of a continuing and growing presence of oppressed or marginalized groups in higher education.'<sup>15</sup> This initial performance allows the

<sup>15</sup> <http://www.missouristate.edu/assets/fctl/GivingVoiceBrochure.pdf>. Web. Last retrieved on Oct. 13, 2013.

students to see how comments and actions can be interpreted, no matter the intention. At several intervals in the performance, the performers pass into what is an 'aside' mode to explain either their behavior, or their reaction. Secondly, the students then watch the documentary 'Bully', and respond to a series of reflection questions on the reactions, strategies, and outcomes they observe. They must then propose different courses of action from those in the film. Lastly, during the semester of student teaching, the students participate in a diversity discussion with local P-12 educators and other members of the community. This discussion includes strategies on how to meet the needs of diverse learners as well as first-hand accounts of cultural or educational bias in an international setting.

### Professional Development

This term represents "opportunities for professional education faculty to develop new knowledge and skills through activities such as inservice [sic] education, conference attendance, sabbatical leave, summer leave, intra- and inter-institutional visitations, fellowships, and work in P-12 schools."<sup>16</sup> It is worth noting here that within the confines of the NCATE definition of the term, 'professional education faculty' does not include P-12 educators, who are considered clinical faculty. For these clinical faculty, professional development is often a state requirement, and for newly certified teachers, one of the tenets involves mentoring. In actuality, if student teachers are to gain a realistic picture of their profession, and if they are to grow and thrive in their career, their initiation to professional development must begin early in their teacher preparation program, with mandatory participation in content-area specific conferences and professional learning days. Just as novice learners of a world language are taught the linguistic supports of French, German, Spanish, or Chinese in stages, student teachers must be guided through their developmental steps as teachers. Arguably, aspects of clinical practice, such as observational practica, methods courses, and student teaching, address and facilitate some of this development, but these elements appear later in their

---

<sup>16</sup> National Council for Accreditation of Teacher Education (2008). The NCATE Unit Standards. Washington, DC. <http://www.ncate.org/Standards/UnitStandards/Glossary/>

education and do not provide proper initiation into the context of the activity as most P-12 teachers experience it during their career.

It behooves teacher education programs to emphasize and mentor the presence and active participation of student teachers in their state content area or educational associational conferences. Also the student teachers need guidance on the process of seeking funding to attend future conferences. Learning how a district's professional development funding process works is important since budgetary constraints and an overwhelming focus on numbers, have compromised such funds in many districts.

Just as world language students and teachers seek out immersion in the culture and language of study, so too should all student teachers be immersed in professional development, but not in a sink-or-swim sort of way. The goal is to create autonomous learners, speakers, and teachers so professional education faculty must model and guide pre-service teachers in critical assessment of teaching proficiency and identification of areas where professional development is needed. Many national associations have counterparts at the state and regional levels. These would allow student teachers the much-needed initiation into the P-12 context of professional development and provide them an equally-important opportunity to create connections to regional schools and in-service teachers prior to their clinical experience. Experienced teachers have many resources that support them in their performance; before they begin their careers, student teachers need to see this in action.

The student teaching experience itself represents the most important and impactful mentoring environment, so it should be undertaken with great care. However, as mentioned earlier, the splintering of the teacher preparation process into the various certification pathways can affect the mentoring and support. University student teacher supervisors may come from different areas of service or content areas, or there may be no local cooperating teacher in a content field. This is especially true in the case of 'lateral-entry teachers', those who instantly become the teacher of record of a course, because they have been hired by a school district and given 3

years in which to complete the requirements for educator certification.<sup>17</sup> Cooperation and closer ties between the P-12 educational community, its teaching corps, and teacher education programs bring the issues related to teacher training and preparation to light. They also lead to very useful exchanges which better serve the needs of all of the students concerned. This includes the beginning teacher, who needs and deserves the instructional coaching and support as much as the student teacher, and who can be most effectively mentored through those connections with area colleagues that were formed during the teacher education program: “to best support new teachers, keep them in the profession, and improve their instructional effectiveness, schools need to make sure that the mentoring they provide is a good fit for each novice teacher’s individual backgrounds, needs, and school context.”<sup>18</sup>

In the P-12 classroom, we stress differentiated instruction and mastery in the content area, and yet, without certain concrete efforts, we deny the same necessary supports to newly qualified teachers. Oftentimes, the mentor does not teach in the same content area; smaller schools or FTE constraints mean that the new teacher is the only teacher of that subject, most notably in electives or highly-specialized advanced classes. Sponsored participation in the regional or state content-area associations’ gatherings become even more crucial.

To continue the parallel between world languages and teacher preparation, proficiency increases with meaningful interaction between the native speakers and those at the novice level: “although non-matched mentors can provide emotional support and coaching on classroom management, it’s hard for someone who has never taught history to guide a new teacher in using primary source documents, or for an English teacher to help a novice science teacher learn to address common student misconceptions around photosynthesis.”<sup>19</sup>

---

<sup>17</sup> The most common routes to teacher certification are a) the traditional undergraduate teacher education program, b) post-baccalaureate certification, and c) Masters of Arts in Teaching, all of which have structures that vary, but lateral-entry teachers usually pursue completion of a certification begun in another state, or one that was interrupted with a gap of several years, and which contains deficiencies relative to full initial teacher certification.

<sup>18</sup> Grossman, Pam and Emily Davis. “Mentoring That Fits.” *Educational Leadership* 69.8 (May 2012): 54.

<sup>19</sup> Grossman, Pam and Emily Davis. “Mentoring That Fits.” *Educational Leadership* 69.8 (May 2012): 55-56.

Depending on the level of instruction and years of teaching, World Language teachers potentially have experience in both tasks. Because the content area of a modern language is interdisciplinary, these professionals delve into and grapple with historical figures and cultural issues related to exploration and colonization, or scientific discoveries and functions. They also must be skilled in designing units of enquiry that help their students to acquire ‘mainstream’ everyday vocabulary and discursive skills to match those of their counterparts in the target language, because oral and written proficiency use the benchmark of ‘educated native speakers.’ World Language educators provide a breadth of language and concepts related to the target language and culture to ensure age-appropriate register and general thematic knowledge. Therefore, many of them could serve as mentors across different areas of the curriculum, because they will undoubtedly have taught a related topic or skill in their courses.

One of the most promising (yet somewhat controversial) teaching models that can integrate sustained mentoring for student teachers is co-teaching, which places equal but different responsibilities on the team of educators. The mentoring possibilities seem endless, because the collaboration built into this type of learning environment is so strong. Within the context of a world language class, the presence of two teachers facilitates many different levels of modeling, especially in the development of speaking skills. The controversy of co-teaching appears to revolve around whether or not the student teacher in such an environment gains enough autonomy to be responsible for a course based on the traditional model where there is only one teacher for a defined class of students. Realistically, in smaller districts, the world language teacher is often ‘a department of one;’ therefore, the opportunity to co-teach would most certainly prove to be beneficial, since the exchange of ideas and information provides time for reflection and analysis of teaching effectiveness. This new mode of instructional delivery might also correspond to the participatory nature of the digital generation of “new teachers who may have a different disposition towards collaboration [...] not only to take, but also to give—ideas, resources, observations, encouragement.”<sup>20</sup>

## Content Area

The NCATE glossary of terms defines Content as “the subject matter or discipline that teachers are being prepared to teach at the elementary, middle, and/or secondary levels. Content also refers to the professional field of study (e.g., special education, early childhood education, school psychology, reading, or school administration),”<sup>21</sup> and presents an accurate two-pronged reference to a) the subject area, and b) the professional field of study. During a recent advising appointment, one of my advisees restated it this way: “so, if I want to become a French teacher, basically I double-major in Teacher Education and French.” In many universities, looking at the degree program in his way provides a comprehensible representation of the interactions between the Professional Education faculty and the Content Area faculty. Rather than solving issues for a student with a desire to teach a foreign language, often bridging teacher education and content area faculty becomes a nightmare for the student. This is unfortunate, because many of the students who develop a passion for a content area begin learning it in the P-12 years, thanks to a teacher. Instead of being considered as separate entities, an alternative interpretation would be to consider those students as cross-disciplinary.

Despite its far-too-frequent status as an elective set of courses, world languages represent the most cross-disciplinary of all content areas. Within the scope of each course, students explore and learn history, geography, science, literature, cinema, linguistics, numerical skills and oratory skills. They learn to recognize patterns, improve their L1 (first language) proficiency, deduce meanings, and take risks. Their teachers and their textbooks show them the appropriate structures and conventions of the language use for different contexts. Students engage with authentic materials online and in print; they engage with native speakers through Skype or Wikis<sup>22</sup>. The World Language teacher guides them through all of those processes during the

---

<sup>21</sup> National Council for Accreditation of Teacher Education (2008). The NCATE Unit Standards. Washington, DC. <http://www.ncate.org/Standards/UnitStandards/Glossary/>

<sup>22</sup> “Thoughtful engagement with content knowledge should include a redoubled emphasis on textbooks as well as sources of current information, like newspapers and magazines” (Schmoker 32). Textbooks have their place, because they often use a ‘dense, complex prose’ (Schmoker 35) that student teachers will confront again and again in their professional lives.

lessons, because the goal of advanced proficiency requires it, as does the passion for the content.

In teachers, the latter does not often arrive unaccompanied by the former. International immersion experiences in a target language and culture remain crucial for the successful world language teacher, although the process can be of use to improve student teacher understanding as well. When the content area focuses on written and spoken expression, the field of possible queries represented by “what does that mean?” or “how do you say X?” is really endless. For a beginning teacher, the scope of those questions can seem intimidating, because the superficial focus seems to emphasize the importance of instantly knowing the right answer. Actually, the focus should turn more towards the mapping of the thought and its message, which then allows for a more efficient determination of the parts to be used.

When university students ask, “What does that mean?”, I often counter their questions with a firm request for them to provide me with the whole sentence or thought, or I provide them with a possible partial fit, and follow up with this question of my own: “if I say to you that ‘X’ means this, but that X is a verb, how are you going to use it to express your idea?” This brings them to think about what they actually mean to say. Both for the student and the teacher, three opportunities for metacognitive growth and development occur every single time that these questions appear, since “metacognition [...] is our ability to know what we know and what we don’t know [...] It is our ability to plan a strategy for producing whatever information is needed, to be conscious of our own steps and strategies during the act of problem solving, and to reflect on and evaluate the effectiveness of our own thinking.”<sup>23</sup> In the process of working through the filter of a world language, students gain a deeper understanding of the importance of context in determining meaning and a greater appreciation of the variety of structures that languages possess to express ideas and nuance. They grasp the important role played by the

---

<sup>23</sup> Costa, Arthur L and Bena Kallick, “It Takes Some Getting Used To: Rethinking Curriculum for the 21<sup>st</sup> Century” Heidi Hayes Jacobs, ed. *Curriculum 21: Essential Education for a Changing World*. ASCD: Alexandria, Va: 214.

perspective and intent of the speaker in creating the thought, and integrate that into their sentence. Because they have to think about it, they have to plan it. Once they have used words enough times repeatedly in their thought planning, they appreciate the meaning and flexibility of the words, as well as their place in the grammatical structure. The parallel of lesson planning and instruction cannot be neglected here. For a student teacher, planning is key—they simultaneously must include the language and the tasks, and must reflect on both, which brings us to pedagogy.

## Pedagogy

If pedagogical knowledge is defined as the “general concepts, theories, and research about effective teaching, regardless of content areas”<sup>24</sup> and pedagogical content knowledge is defined as the “interaction of the subject matter and effective teaching strategies to help students learn the subject matter. It requires a thorough understanding of the content to teach it in multiple ways, drawing on the cultural backgrounds and prior knowledge and experiences of students.”<sup>25</sup> In the World Language class, a third element must be added: exposure to ideas, themes, and knowledge generally available to, or learned by, an educated native speaker of the target language. To achieve this, we must turn to primary source texts and resources, and carefully structure lessons around them. Sound knowledge of that same concept in the language common to the local environment is also required, because language educators become very practiced in cognate identification and usage. Experience also permits the ready identification of vocabulary groupings and grammatical features necessary for any task. To provide two examples from a French III course, I taught units on inventors and inventions, including an illustrated schematic of how a microwave works, where the grammatical functions and requirements of impersonal expressions and the subjunctive were very useful; I also taught

---

<sup>24</sup> National Council for Accreditation of Teacher Education (2008). The NCATE Unit Standards. Washington, DC. <http://www.ncate.org/Standards/UnitStandards/Glossary/>

<sup>25</sup> National Council for Accreditation of Teacher Education (2008). The NCATE Unit Standards. Washington, DC. <http://www.ncate.org/Standards/UnitStandards/Glossary/>

a unit on the prevention and causes of avalanches, which allowed the students to also study meteorological terms and safety procedures, as well as geography and topography.

Grammatically, structures used to express hypotheses were the focus.

Student teachers struggle frequently with task definition and design. One of the maxims of every level of world language instruction focuses on exactly this skill: because the teacher sets the goal to initiate students to using authentic materials from the target language and culture from day one, the charge becomes “edit the task, not the text.” The sequencing of language and literacy development plays an essential role in the ability to modify questions, role-plays, prompts, analytical questions, and synthesis to correspond to the desired competency level.

The other issue involved in strategic planning is “matching time frames to tasks.”<sup>26</sup> Once again, languages play a role in illustrating the process; in a world language course, particular attention must be paid to this technique, since students process information in a second (or third) language more slowly. Recalling the sequencing and the necessary linguistic functions required for a specific task is useful in any content area, however, because many of the learners in the class will be filtering the information through a native language which is not the one of instruction.

The most tangible indicators of progress needed or achieved are the questions students ask. Therefore, it is essential to teach them how to identify the types of questions required to fill the knowledge gaps, and to provide them opportunities to practice both formulating the questions and developing the supported answers. World Language study contains questions of all types, at every level of proficiency, and requires students to pay closer attention to the type of question asked, as well as the type of text being analyzed. Integrated Performance Assessments which gauge interpretive, interpersonal, and presentational modes of communication contain an overarching question or situation that must be addressed, and then present targeted questions within a given situational exchange (interpersonal) with an

---

<sup>26</sup> Jacobs, Heidi Hayes *Curriculum 21: Essential Education for a Changing World*. 1st. Alexandria, VA: ASCD, 2010: 66.

information gap, as well as analytical questions where students must hypothesize meaning, and support their conclusions by citing elements from the text.

## Conclusion

All learning is transmitted or inhibited by language. All teachers must be expert communicators who can explain, rephrase, prompt, guide, model, and assess. World Language teachers hone these skills every day in the service of a very complex, cross-disciplinary area of expertise, one that is often undervalued, because of its elective status. These teachers must inspire, amuse, and instruct in a second language; and they do. For the student teacher, observing lessons in a World Language classroom could bring them to focus more heavily on identifying the mechanics of a given technique. The experience could also bring home to the student teacher the importance of non-verbal cues, advance organizers, and prompting questions, as well as illustrating the perspective of a student who, for whatever reason, struggles with the content. Not only would “the teaching of the English language or the dominant language in one’s own country [...] be improved by emulating the best tactics used by world language teachers,”<sup>27</sup> since those tactics help meet the needs of students who are very often at different levels of proficiency and literacy. The teaching of all content areas combined could be enriched by the experience, and, as educators, we all know what that means for student teachers and students alike.

1. *Differentiation for the Inclusive Classroom: Integrate & Elevate*
2. Toby J. Karten
3. School of Special Education  
Monmouth University, College of New Jersey, Drew University, Gratz College

Toby Karten has taught populations of students ranging from kindergarten to graduate level. Her ongoing professional goal is to help administrators and teachers effectively deliver the curriculum standards to students within their least restrictive environments, looking at inclusive placements as viable first options. University affiliations include being an adjunct professor at Monmouth and Drew University, Gratz College, and College of New Jersey, delivering instruction, coaching sessions, and staff development. She offers pragmatic interventions to design collaborative inclusion lesson plans that offer students with disabilities high quality instruction.

4. 6 Quebec Road Marlboro, NJ 07746

[tkarten@monmouth.edu](mailto:tkarten@monmouth.edu)  
<http://www.inclusionworkshops.com>

6. *Differentiation for the Inclusive Classroom: Integrate & Elevate*

Instead of fixing the student, fix the instruction to differentiate the planning and lessons with research-based goals, methods, materials, classroom designs, and assessments. Set up structured inclusive classrooms that honor students' academic and social skills, levels, and diversity. Connect the differentiation principles to students and staff with classroom integration that elevates the knowledge, skills, and levels for all of the inclusive partners.

Learn how to develop solid lesson plans that proactively expect, accept, and embrace the differences of students with social, emotional, behavioral, and learning differences in inclusive classrooms. Experience how to effectively map out daily, weekly, monthly, and long-range lesson plans that honor the content and performance standards. Optimize differentiated instructional approaches; provide online resources and forums for staff and colleagues with effective collaborative partnerships. Organized classrooms that value differentiated lessons have high expectations for all learners. Embrace students' strengths and potentials by fostering and facilitating disABILITY awareness and inclusive mindsets. Transform

awareness into inclusion initiatives that yield successful outcomes for students, staff, colleagues, and families. Achieve academic successes and social acceptances with positive attitudes, administrative and teacher preparation, appropriate scaffolding, content-rich differentiated lessons, appropriate strategies and interventions, technology applications, positive peer interactions, standards-based assessments, data documentation, reflections, and collaborative school and home supports. Embrace and honor not only the principles of inclusion, but most important the abilities of all learners!

This session addresses diversity within special education since students with cultural differences often incorrectly enter the special education system for multiple reasons. These include inaccurate assessments, faulty communications due to language barriers, and at times a set of differing values and beliefs between school and home cultures. This session connects to diverse student cultures and affirms how appropriate inclusive lesson designs honor student exceptionalities and cultural differences. The interactive workshop highlights how to differentiate lessons across the curriculum for learners of all abilities. This includes valuing student and staff strengths within structured and collaborative inclusive schools. Achieve high outcomes for staff and students by honoring and embracing how to translate the research into pragmatic classroom applications.

Learners will gain knowledge and skills to:

1. Apply appropriate lesson accommodations and instructional supports that align with students' strengths and levels, while honoring the rigor of the literacy and mathematics standards.
2. Connect specific standards in grade-level inclusion lesson designs to promote critical thinking skills for learners with exceptionalities
3. Explore evidence-based strategies and resources that offer challenging assignments for students in K-12 inclusive classrooms. This includes student motivation, instructional practices, and standards-based lessons and assessments that honor students' individualized education programs.
4. Apply administrative and instructional inclusion evidence-based approaches that honor the strengths and potentials of learners who are taught in inclusive classrooms
5. Explore real-life applications that prepare students to achieve successful post secondary outcomes
6. Collaborate and communicate with staff, students, colleagues, and families

This session unites the standards to research-based instructional practices that respect students' differing academic and functional levels. In comparison to typical students, students with exceptionalities have both similarities and differences (Hallahan, Kauffman & Pullen, 2012). To ensure that students master the standards, educators have to change the way that they teach (Sawchuk, 2012). Ongoing training and professional development assists educators to improve their practices (The National Mentoring Partnership's Elements of Effective Practice, 2013). Strong evidence suggests that teachers can increase student engagement and on-task behavior by differentiating the classroom environment, routines, or learning activities (Epstein, Atkins, Cullinan, Kutash, & Weaver, 2008). Standard is identified and described in terms of rigor, prerequisite skills, how and when it is taught, ways mastery will be determined, and opportunities for extension (Buffum, Mattos, & Weber, 2012). Instructional materials affect teacher effectiveness (Chingos & Whitehurst, 2012, Karten, 2012). Educational shifts need to be made (Alberti, 2012) while dangers, opportunities, and challenges are scrutinized (Brooks & Dietz, 2012; Constable, 2013) Evidence-based practices in special education are essential (Cook & Odom, 2013; Kretlow, & Blatz, 2011, Karten, 2012). Students' IEPs need to be aligned to the CCSS (Courtade, & Browder, 2011) with assignments that matter (Dougherty, 2012) and culturally responsive practices (Dray & Wisneski, 2011; Gamm, Elliott, & Halbert, 2012). This includes effective strategies for literacy and mathematics (Kist, 2013; NCTM, NCTE, NCEO, 2013, Karten, 2013).

Case Study on the Mail-Order Sales in Anime-Related Businesses

[masao.toyama@it-chiba.ac.jp](mailto:masao.toyama@it-chiba.ac.jp)

## Abstract

The anime related market is currently in the middle of an expansion following the growing recognition of anime as one aspect of Japanese culture. In the background of this growing recognition and expanding market is the consolidation of infrastructures like the internet. With this, it is easy to approach anime from anywhere. This study focuses on anime related businesses such as using the internet for mail-order sales in order to examine the current state and issues regarding mail-order sales in anime related businesses. One form of business related to anime is the cosplay business. Cosplay refers to the impersonation of anime and manga characters, and businesses that sell the costumes and goods necessary for such impersonations are expanding following the growing recognition of Anime.

Youth Development Aligned with School Success: A Collective Impact Approach

*Education Policy and Leadership*

*Paper Session*

**Description:** This paper examines outcomes for a school community partnership in Spokane Washington that incorporates a collective impact framework. Workshops and surveys from forty-five programs supplied feedback in the first year of the project. For our findings, we see requests for: 1) more data sharing amongst other CBOs as well as SPS, 2) more access to working in schools, 3) a streamlined partnership process, and 4) knowing who is doing what for whom.

### Abstract

As presented by Kania and Kramer in the *Stanford Social Innovation Review* (2011), collective impact works to bring all elements of community together to enhance deliberate efforts in community improvement. By creating intentional collaborations between community-based organizations (CBOs), government, private enterprise, and community members, community capacity building projects are substantially enhanced and are streamlined in being more efficient. For collective impact to work, the various sectors of community need to be: (*vision*) working toward common community-derived goals, (*data*) measuring and sharing impact results based on shared metrics, (*action*) implementing change based on data while maintaining communication, and (*sustainability*) continuing collective impact efforts for the future. The Cincinnati Strive Cradle to Career project provides a model for implementing collective action for the well being of children and youth.

The Spokane School Community Partnership project uses a collective impact model to address the Priority Spokane goal of improving on-time graduation rates by focusing on the academic success of middle school youth. The current study examines community youth-serving partnerships where the common purpose is “youth development that is aligned with school success.” During the 2012-2013 school year, three Spokane Community Partnership workshops were held to discuss potential improvements in engaging CBOs and Spokane Public Schools (SPS) in collaboration. The survey, which was designed to ascertain more detailed suggestions, emerged from these workshops. Thirty-three community organizations comprising 45 programs dedicated to serving school-aged youth and partnering with SPS responded to this survey. The survey asked these program directors/administrators about their current partnership with SPS and more specifically, what suggestions they had for partnership improvements. Based on feedback

from the survey and from workshop proceedings, we see requests for: 1) more data sharing amongst other community based organizations as well as SPS, 2) more access to working in schools, 3) a streamlined partnership process, and 4) knowing who is providing what to whom and where.

**Scaffolding innovative practice for teachers of English Language Learners with instructional cases**

Trish Stoddart

**Abstract**

This paper focuses on preparing teachers to use an innovative instructional approach for teaching English Language Learners through the integration of academic language and literacy development into science teaching. It is proposed that to learn this complex new pedagogy teachers need to engage in observation, analysis and experience with explicit models of the new instructional approaches. The paper presents lessons learned and instructional cases from the ESTELL and SSTELLA projects.

## **Introduction**

Teaching is becoming increasingly complex for both novice and experienced teachers across the United States, as the K-12 student population becomes increasingly culturally and linguistically diverse. The fastest growing student group is English Language Learners (ELL) (National Center for Education Statistics [NCES], 2006a; US Census, 2010; The National Education Association (NEA) projects that by 2025 one in four students in the U.S. will be from homes where a language other than English is spoken. Though ELLs are the fastest growing sector of the school-age population, they also have the least access to the core academic curriculum (National Center for Education Statistics [NCES], 2006a; US Census, 2010; Wong-Fillmore & Snow, 2000). For at least thirty years, the achievement of ELLs has lagged behind that of native English speakers in science and literacy (Lee & Luyck, 2006; NCES, 2006b, 2011; Rodriguez, 2004, 2010). The 2009 National Assessment of Educational Progress (NAEP) showed a 30-point difference in average science scores between students from ELLs and students who are native speakers of English. Gaps in achievement actually increase from elementary school to secondary school (NCES, 2011). ELLs are also less likely to pursue advanced degrees in science (Commission on Professionals in Science and Technology [CPST], 2007; NAS, 2010) or to perceive science subjects as relevant to their lives (Aikenhead, 2006; Buxton, 2006; Calabrese Barton, 2003; Lynch 2001; Rodriguez, 1998). Despite the severity and persistence of these gaps, few teachers receive education in how to teach science to ELLs (Ballantyne et al., 2008; Darling-Hammond, 2006; Gándara et al., 2005; NCES, 2001; Villegas & Lucas, 2002) and ELLs are the group least likely to have a qualified or experienced science teacher (Business-Higher Education Forum [BHEF], 2006; California Council on Science and Technology [CCST], 2007; Oakes et al., 2004).

This paper focuses on preparing teachers to use an innovative instructional approach to teaching ELL through the integration of academic language and literacy development into subject matter teaching. It is argued that in order to learn this complex new pedagogy teachers need to engage in observation, analysis and experience with explicit models of the instructional approaches they are being prepared to teach (Abell & Cennamo, 2004; Goldman, Pea, Barron & Derry 2007; Hewson & Hewson, 1988; Roth, Garnier, Chen, Lemmens, Schwille, & Wickler 2011; Schwartz & Hartman 2007; Sherin, 2004). The paper draws on lessons learned and presents instructional exemplars from three research and development projects: ESTELL (Effective Science Teaching for English Language Learners) and SSTEMA (Secondary Science Teaching with English Language and Literacy Acquisition).

## **Teaching Science to English Language Learners**

The education of English language learners is complex because it involves teaching academic subjects, such as science, to students while they are developing a second language (Rosebery, Warren & Conant, 1992; Stoddart, Pinal, Latzke and Canaday, 2002). The traditional approach to teaching of school subjects – such as science – to ELL typically separates the teaching of language and literacy from the teaching of subject matter because it is assumed that ELL need to be proficient in English before being introduced to more rigorous instruction in the content areas. (Buxton, 2006; Collier, 1989; Cummins, 1981; Lee & Luyck, 2006; Met, 1994; Stoddart, Pinal, Latzke, & Canaday, 2001). As a consequence most ELL are relegated to remedial instructional focusing on the acquisition of basic skills that supposedly match their English-proficiency level

(Garcia, 1988, 1993; Lee & Luyck, 2006; Moll, 1992; Valdez, 2001). This is problematic because it may take as long as seven years to acquire a level of language proficiency comparable to native speakers (Collier, 1989; Cummins, 1981). English Language Learners fall behind academically if they do not learn the content of the curriculum as they acquire English. However, the amount of time it takes to acquire grade-level English proficiency can be accelerated with the integration of content and language teaching for language minority students (Thomas & Collier, 2003). Research on second language immersion programs finds that contextualized, content-based instruction in students' second language can enhance the language proficiency of English Language Learners with no detriment to their academic learning (Cummins, 1981; Genesee, 1987; Lambert & Tucker, 1972; McKeon, 1994; Met, 1994; Swain & Lapkin, 1985). The subject matter content provides a meaningful context for the learning of language structure and functions, and the language processes provide the medium for analysis and communication of subject matter knowledge.

The relationship between science learning and language and literacy learning, therefore, is reciprocal and synergistic. Through the contextualized use of language in science inquiry students develop and practice complex language forms and functions. Through the use of language functions such as description, explanation and discussion in inquiry science, students enhance their conceptual understanding (Stoddart, Pinal, Latzke & Canaday, 2002). This is a synergistic approach to teaching and learning where language and literacy development is contextualized in scientific inquiry projects that promote understanding through collaborative work and discourse between teachers and students.

The recognition that the development of academic language is fundamental to the learning of academic subjects by all students has recently been influential in the development of new teaching standards that will be implemented nationally over the next few years. The Next Generation Science Standards (NGSS) based upon the National Research Council (2012) report: *A Framework for K-12 Science Education: Practices, Crosscutting Concepts, and Core Ideas* identifies core science ideas and cross cutting themes that students would learn in cognitively more complex ways as they progress through their K-12 science education. NGSS views science activities (reflected in scientific and engineering practices) as language intensive practices that require specific forms of language scaffolding for English language learners (ELLs). As stated by Lee, Quinn, & Valdés (2013), “Engagement in any of the science and engineering practices involves both scientific sense-making and language use. The practices intertwine with one another in the sense-making process” (p. 2). Furthermore, “the opportunity for language development through use in context can be a language learning experience at the same time as it can be a science learning experience” (p. 6). This recognition of the role of academic language and literacy in content learning is echoed the Common Core for English language arts and literacy in social studies, science, and technical subjects (Common Core State Standards [CCSS], 2010).

## **Inadequate Teacher Preparation**

The challenge is to prepare both pre-service and experienced teachers to prepare teachers to teach ELLs by integrating rigorous science instruction with the development of English language and literacy to prepare students for advanced coursework and degree programs in STEM fields. However, most teacher education programs currently do not provide such preparation. Prior research on professional development with elementary school experienced teachers has demonstrated that experienced teachers can be trained to use an integrated pedagogy and that teachers use of this approach improves the achievement of ELLs in science, language and literacy (Bravo & Garcia, 2004; Cervetti et al, 2007; Ku, et al., 2004;, 2005; Lee et al., 2008; Stoddart, 2005).

Teacher preparation programs (both in-service and pre-service) rarely contain coursework or practicum with ELLs as part of their requirements. According to an American Association of Colleges for Teacher Education survey of 417 institutes of higher education conducted in 2000, less than one-fifth required any preparation for mainstream teachers at the elementary or secondary levels (Menken & Antunez, 2010). In the majority of teacher preparation and professional development Courses on subject matter teaching typically give little attention to the importance of valuing and incorporating the linguistic needs and cultural experiences of the students being served (Cochran-Smith, Feiman-Nemser, McIntyre & Demers, 2008; Fradd & Lee, 1995; Godley, Sweetland, Miininci & Carpenter , 2005; Lee & Luykx, 2006; Rosebery & Warren, 2008; Stoddart, Bravo, Solis & Mosqueda, 2011; Zeichner, 2003). Issues relating to cultural and linguistic diversity, when taught, are presented in separate courses that often focus on social conditions and not pedagogy (Ball & Tyson, 2011; Trent, Kea, & Oh, 2008; Zeichner, 2003). . It is not surprising that few novice or experienced teachers feel prepared to teach ELL (Ballantyne, Sanderman, & Levy, 2008; California Legislative Analyst's Office [LAO], 2007-2008); Gándara, Maxwell-Jolly, & Driscoll, 2005; NCES, 2001). In a survey of 1000 teachers in four states, Freeman, Garcia, Herrera, Murray, Valdés, & Walqui (2004) found that the number-one gap that a majority of teachers identified in their preparation programs was a lack of training in appropriate instructional and assessment strategies for working with ELL. The consequence of this inadequate teacher training is that ELL are the group least likely to have a qualified or experienced science teacher (Business-Higher Education Forum [BHEF], 2006; California Council on Science and Technology [CCST], 2007; Oakes et al., 2004). In 2010, a combined report of the National Academy of the Sciences, National Academy of Engineering, and the Institute of Medicine, identified as a top priority improving the preparation of science teachers in high need schools with large numbers of underserved minority students to increase their successful participation in STEM careers and degree programs (NAS, 2010).

## **Preparing Teachers to Integrate the Teaching of Science, Language and Literacy**

The implementation of the Common core and NGSS standards across the US makes it critically important to develop programs that prepare teachers to integrate the teaching of academic language and literacy into the teaching of core academic subjects for all learners including ELL. Over the past decade a series research and development projects have demonstrated that both pre-service and in-service teachers can be successfully trained to integrate the teaching of science, language and literacy for ELL and that the use of these

practices improve the science achievement and language development of ELL students (Baquedano-López, Solís, & Kattan, 2005; Bravo & Garcia, 2004; Cervetti, Pearson, Barber, Hiebert & Bravo, 2007; Ku, Bravo, & Garcia, 2004; Ku, Garcia, & Corkins 2005; Lee, Maerten-Rivera, Penfield, LeRoy, & Secada, 2008; Ovando & Combs, 2012; Rivet & Kracjik, 2008; Rosebery & Warren, 2008; Rosebery, Warren, & Conant, 1992; Short, Vogt & Echevarria, 2011; Solís, 2005; Stoddart et al., 2002; Tharp & Gallimore, 1988; Warren & Rosebery, 1995, 1996). The efficacy of integrated pedagogy for ELL has been documented by two groups of researchers from: 1) the USDOE funded Center for Research on Education Diversity and Excellence (CREDE) project (Doherty & Pinal, 2004; Estrada & Imhoff, 2001; Hilberg, Tharp & DeGeest, 2000; Saunders & Goldenberg, 1999; Saunders, O'Brien, Lennon & McLean, 1998) and 2) a set of NSF funded science-language-literacy integration projects (Amaral, Garrison and Klentschy, 2002; Baquedano-López, Solís, & Kattan, 2005; Bravo & Garcia, 2004; Cervetti, Pearson, Barber, Hiebert & Bravo, 2007; Ku, Bravo, & Garcia, 2004; Ku, Garcia, & Corkins 2005; Lee, Maerten-Rivera, Penfield, LeRoy, & Secada, 2008; Stoddart, 1999; 2005; Stoddart, Pinal, Latzke & Canaday, 2002; Stoddart, Abrams, Canaday, & Gasper, 2000; Yore, Holliday & Alvermann, 1994). Both approaches have identified a common set of specific and observable teacher actions that a substantial body of empirical research has demonstrated raise the achievement of culturally and linguistically diverse students and improves their motivation to learn (Stoddart, Solis, Tolbert & Bravo, in press; Tharp & Dalton, 2007). This research has identified four areas of teaching practice that promote the achievement of ELL: (1) Language Development; Teacher use of science discourse patterns and science vocabulary (LI); Literacy Integration; Teacher use of authentic science literacy tasks to support science learning. (3) Contextualization (C): teacher elicitation of student expertise from home/community (culture) or local (environmental/natural surrounding) understandings of science-related phenomena in classroom science lessons: (4) Instructional Conversation (IC): teacher initiation of conversation that requires student scientific reasoning and dialogue.

A series of research studies based on CREDE, using both qualitative and quantitative methods, have demonstrated that students in classrooms using the CFSEP practices show significant gains in reading, mathematics and science achievement and teachers use of this pedagogy has been positively linked to factors critical to student performance in school such as motivation, perceptions, attitudes and inclusion (Doherty & Pinal, 2004; Estrada & Imhoff, 2001; Hilberg, Tharp & DeGeest, 2000; Saunders & Goldenberg, 1999; Saunders, O'Brien, Lennon & McLean, 1998; Stoddart, 1999; 2005). Of particular relevance to this project are the findings of several studies conducted at one of CREDE's Research and Demonstration Schools (serving low-income Latino ELLs) document the effects of teachers' use of the approach used in ESTELL and student achievement. In all studies, teachers' use of the practices was recorded with the Standards Performance Continuum (Doherty, et al., 2002), and student achievement gains were estimated from standardized test scores (SAT-9) from two consecutive years. Teachers' overall use of the practices reliably predicted achievement gains in comprehension, language, reading, spelling, and vocabulary (Doherty, Hilberg, Pinal & Tharp, 2002). Students whose teachers used the practices extensively in their classroom organization showed significantly greater achievement gains on all SAT-9 tests than students whose teachers had not similarly transformed their teaching. (Doherty, Hilberg, and Lee (2004) replicated these findings) Doherty et al (2002) in a quasi-experimental design that used a school in an adjacent catchment area as an untreated control group, showed the same

patterns of vocabulary gains, exceeding a half a standard deviation in normal curve equivalent scores. A second set of studies by Estrada over a four-year period has consistently shown a positive relation between use of the CREDE practices and positive outcomes in 1<sup>st</sup> and 4<sup>th</sup> grades. Stronger implementation of the pedagogy produced higher student scores on tests of reading and the language of instruction. The vast majority of students in strong implementers' classrooms reached grade level in reading, whereas less than half did so in weaker implementers' classrooms (Estrada & Imhoff, 2001).

A second body of empirical evidence of the impact of integrated pedagogy on ELL student achievement is presented in the research literature on science, language and literacy instruction for ELL. The LASERS, project promoted the development of elementary student scientific understanding through the integration of contextualized science inquiry and science. ELL achievement was tracked over three years in two participating schools districts. Students (n=1,300) who were in a LASERS trained teachers' classroom for one and two years scored significantly higher on the SAT-9 in reading, language, mathematics and science than students who were not in a LASERS teachers classroom (Stoddart, 2005). The Seeds of Science of Science, Roots of Reading project involved science educators and literacy educators in creating and testing an integrated literacy-science curriculum. Reading instruction (texts, routines for reading, word level skills, vocabulary, and comprehension instruction) was integrated into inquiry-based science (Cervetti, Pearson, Barber, Hiebert & Bravo, 2007). The integrated curriculum was tested in 20 second and third grade classrooms over the course of either four or eight weeks against 24 comparison classrooms (12 where science was taught alone and 12 where literacy was taught alone). ELL made positive gains science knowledge, literacy and vocabulary development when measured against the comparison groups. The Science Instruction For All (SIFA) project analyzed the impact of an instructional intervention. The SIFA study implemented a curricular intervention in six schools and with twenty-one teachers in third and fourth grade classrooms, in which each classroom received a year of literacy and science integrated instruction. The results indicate participating students, regardless of linguistic and cultural background, experienced significant growth in their science achievement and understandings of scientific writing (Baquedano-López, Solís, & Kattan, 2005; Bravo & Garcia, 2004; Ku, Bravo, & Garcia, 2004; Ku, Garcia, & Corkins 2005; Solís, 2005). The Imperial Valley Project in Science implemented an instructional approach that allowed 4<sup>th</sup>-6<sup>th</sup> grade students to conduct first-hand science investigations and keep a science journal to reflect on science activities and develop writing proficiency. The study led to significant gains among ELLs in both science knowledge and literacy abilities as measured by SAT 9 and California Standards assessments (Amaral, Garrison and Klentschy, 2002). Finally the P-SELL project examined the impact of an integrated science language and literacy curriculum on the achievement of 1,134 third-grade students at seven treatment schools when compared to 966 third-grade students at eight comparison schools. Students who received the integrated science and language curriculum showed a statistically significant increase in science achievement than students in the comparison group (Lee, Maerten-Rivera, Penfield, LeRoy, & Secada, 2008).

### **Language Development**

The teacher modifies and scaffolds instruction to help ELL students increase both their English language fluency and content understandings. Teachers' modify their talk decreasing

speed of speech, increasing wait time, rephrasing, etc. so that ELL students can better understand teacher instructions and new content. The teacher also gives instruction on English language development, such as figurative language, idioms, grammar and mechanics (i.e. cold/colder/coldest, “raining cats and dogs,” etc.), and provides students with feedback on their English language usage when appropriate. S/he consistently scaffolds content instruction through the use of scaffolds and SDAIE strategies such as gestures, manipulatives, audio, visuals, demonstrations, word walls, graphic organizers, technology, and other instructional tools (see Hogan & Pressley, 1997; Spycher, 2009; Wong-Fillmore, & Snow, 2000).

### **Literacy integration**

The teacher both promotes content-based vocabulary learning and engages students in reading and writing activities that are authentic to the content-area, i.e. reading non-fiction readers, news articles, writing up investigation/experiment procedures and results, using notebooks, etc.). The teacher gives clear instructions on how to use these materials within class activities and provides feedback to the students on how they are using the materials (i.e. feedback on written assignments, guidance on how to use research materials on the Internet, etc.). The teacher also introduces and uses key terms and ensures students have multiple opportunities to review and use those terms during the lesson. S/he also makes sure to check for student understanding of new terms throughout the lesson (see (Cervetti, Pearson, Bravo, & Barber, 2007; Short, & Fitzsimmons, 2007)

### **Instructional Conversation**

The teacher engages students in sustained discussions about subject-area topics and assists students’ develop oral expressions of their reasoning and argumentation through the use of open-ended questions and probing students to discuss their ideas further. The teacher elaborates, revoices, and connects student ideas, and invites students to follow-up on others’ talk (see Engle, & Conant, 2002; Hanauer, 2006; Nystrand, 1997; Saunders, & Goldenberg, 1999; Tharp, 2005).

**Contextualization.** Effective science instruction *for all* students must provide learning experiences that are simultaneously *rigorous as well as relevant*. In SIELL, contextualizing science instruction advances teaching beyond physical hands-on activities or isolated inquiry investigations and extends it to include the purposeful integration of students’ funds of knowledge from home, school, or community (Buxton & Provenzo, 2011; Gonzalez & Moll, 2002; Hammond, 2001, Ladson Billings, 1995; Moll, et al., 1992). Teachers actively seek knowledge and contributions from students’ experiences outside of school. Students’ intellectual and cultural resources from homes, schools, or communities are purposefully and meaningfully integrated into the science lesson. The increased focus on engineering and technology in school science instruction can help facilitate these connections: “By solving problems through engineering in local contexts (e.g., gardening, improving air quality, or cleaning water pollution in the community), students gain knowledge of science content, view science as relevant to their lives and future, and engage in science in socially relevant and transformative ways” (p. 5, NGSS, 2013).

## **The Use of Instructional Cases in Teacher Education**

An extensive body of literature has demonstrated that the development of teacher expertise in is facilitated by engaging both novice and experienced teachers in observation, analysis and experience with explicit models of the instructional approaches they are being prepared to teach (Abell & Cennamo, 2004; Goldman, Pea, Barron & Derry 2007; Hewson & Hewson, 1988; Roth, Garnier, Chen, Lemmens, Schwille, & Wickler 2011; Schwartz & Hartman 2007; Sherin, 2004) and then providing them with opportunities to practice instructional approaches with the student population they are being prepared to teach with intensive feedback, coaching and support (Joyce & Showers, 1995; Loucks-Horsley, Hewson, Love & Styles, 1998; Speck & Knipe, 2001). The use of cases, has been shown to be effective in developing novice and experienced teachers ability to identify, analyze and use new teaching strategies through focusing their attention on specific classroom events (Abell & Cennamo 2004; Goldman et al., 2007; Roth et al., 2011; Schwartz & Hartman 2007; Sherin, 2004). The cases are used to promote productive discourse for both individual and collaborative reflection (Pointer Mace, Hatch, & Iiyoshi, 2007, Sherin 2004; Zhang, Lundeberg, Koehler, & Eberhardt, 2011), as well as help novice teachers more closely approximate the beliefs and behaviors of more experienced teachers (Ash, 2007; Segal Demarest, & Prejean, 2006; Sherin, 2004).

In this section, we provide exemplars of two types of cases – instructional scenarios and integrated teaching units that were developed in the ESTELL and SSTELLA Projects for which the senior author serves as Principal Investigator. The ESTELL project restructured three elementary science teacher education programs by engaging student teachers. The ESTELL team developed integrated science content/science methods lessons life science, Earth science, physical science, which were taught by ESTELL science methods instructors across three different university sites (<http://j.mp/RBUq5O>). Teacher candidates used ESTELL lesson plan templates to design and implement science lesson activities during their student teaching field experiences in elementary classrooms with ELLs. ESTELL treatment group pre-service teachers showed a significant increase in their use of integrated science-ELL instructional practices when compared with a control group of teachers in a control ‘business as usual’ teacher education program (Stoddart et al, in press; Stoddart, Bravo, Solís, Stevens, & Vega de Jesús, 2009). The SSTELLA project extends the work of ESTELL into Secondary Science Teacher Education and is developing instructional exemplars and video cases in secondary biology, chemistry and physics teaching (Tolbert, Stoddart, Geaney-Lyon & Solis, under review).

### **Instructional Vignettes**

The cases contained in the instructional vignettes give rich examples of integrated instruction with explanatory text. The ESTELL instructional scenarios can be viewed at [http://education.ucsc.edu/estell/pdf/ESTELL\\_Teacher\\_Handbook\\_2010.pdf](http://education.ucsc.edu/estell/pdf/ESTELL_Teacher_Handbook_2010.pdf)

### **ESTELL: Elementary Science Integrating science language and literacy**

The development of English language and literacy for ELLs involves learning to speak, comprehend, read, and write in a second language. This includes the learning of

vocabulary, syntax and lexical grammar and the use of language and literacy for both social and academic functions. Research on second language development has emphasized the importance of the contextualized use of language (Cummins, 1981; Genesee, 1987; Lambert & Tucker, 1972; McKeon, 1994; Met, 1994; Swain & Lapkin, 1985). Contextualization of language use refers to the degree to which language provides learners with meaningful cues that help them interpret the content being communicated – visual cues, concrete objects, and hands-on activities. In primary language development, children begin to understand utterances by relating them to sensory motor activities and the physical context (Krashen, 1985). In the development of a second language, this relationship needs to be explicitly communicated in instruction. By integrating language and literacy with the exploration of scientific phenomena, language activities are explicitly linked to objects, processes, hands-on experimentation and naturally occurring events in the environment i.e., they are contextualized (Baker & Saul, 1994; Casteel & Isom, 1994; Lee and Fradd, 1998; Rodriguez & Bethel, 1983; Rosebery, Warren and Conant, 1992; Stoddart, 1999). The development of science literacy is a social process, part of recognizable cultural expectations for communicating about the natural world (Roth & Lee, 2003).

ESTELL instruction around language and literacy development works to provide students with opportunities for written or verbal language expression *and* development in a contextualized science activity. Students have opportunities to collaborate with peers and the teacher, and the teacher assists students' language development by questioning, listening, rephrasing, or modeling. There is a particular focus on promoting authentic science literacy use (graphing data, recording observations, reading and writing expository texts, illustrations, etc.) using science reading materials/references/illustrations for learning science, the use of science language including science discussion, and the systematic use of scientific vocabulary. Opportunities for literacy practices germane to science provide a context for authentic uses of literacy and increase the likelihood that students will build fluency in these literacy practices. Teachers of ELLs also use the integrated science, language and literacy lessons as an opportunity for native language development and primary language support

### **Integrating science and language development – Life science – 2<sup>nd</sup> grade**

The following example describes an elaborated implementation of the ESTELL approach. All the ESTELL elements for the integration of science and language development are covered including attention to: authentic science literacy, oral science discourse, science vocabulary use, and the primary language support.

This teacher has developed a thorough understanding of how to design and implement an integrated science and language lesson. The design and implementation of the lesson uses a substantial amount of science inquiry and a range of language activities designed to engage students and advance their learning in science and language. The language and literacy activities are contextualized by being related to observations of pictures and examination of flowers. The lesson covers in-depth science and language content and the implementation provides students with an opportunity to reflect on their learning. Students are provided with tools to participate in both science inquiry and writing about that inquiry. While there was an initial focus on writing a “message” that does not correspond to scientific forms of data observation and recording, the teacher does relate authentic science literacy tasks by having students write about their pollination observations.

## Secondary Science Chemistry Lesson from the SSTEMMA Project

In the vignette below, Ms. C helps students make sense of natural phenomenon through explicit communication and reflection of a “big idea,” driven by an ill-defined question: “*How could I turn this [ice] into steam?*” The collaborative generation of a partial model (first heating/cooling diagram), followed by testing and refining the model, presses student engagement in scientific practices using complex English language functions. Rather than evaluate student responses to her questions (Cazden, 1988), Ms. C facilitates productive student talk by eliciting student conceptions and hypotheses throughout the lesson (e.g., how to turn ice into steam) and activates collaborative talk among her ELL students, increasing student access to science discourse and concepts. Individually and through small groups, Ms. C presses students to explain and discuss/critique their models as well as produce an authentic scientific text. She scaffolds students’ discourse through meta-discursive awareness (sentence frames, science notebook) and targeted feedback (Hanauer, 2006; Lemke, 2000). Students’ English language and literacy are not only developed through the authentic literacy task of writing a scientific argument, but also through the development and use of science vocabulary “claim” and “evidence” recorded in their science notebook. Ms. C contextualizes the science activity by making connections to students’ observations of steam in their homes, which she used to extend the lesson by drawing on a specific experience (using steam to clean the carpet). Finally, she closes the lesson by once again inviting students to share ways in which they could apply what they have learned, leveraging experiences for learning complex science content (Moll, et al, 1992; Rosebery & Warren, 2008). In a follow up lesson, Ms. C might scaffold and contextualize another literacy (reading) activity, using reciprocal reading (Palinscar & Brown, 1984) to read about how scientists are finding “greener” ways to harness steam energy.

### SSTEMMA secondary science lesson vignette

Ms. C is teaching a thermochemistry lesson for 10<sup>th</sup>/11<sup>th</sup> grade students including some ELL and former-ELL students. The lesson builds on physical properties of matter to create a heating/cooling curve model for water that students will later use for energy calculations.

Ms. C begins by using a document camera to display the phrase, “Uses of steam in the home” and a photo of steam coming up from a teapot. She asks for student suggestions, and they offer “cooking vegetables” and “ironing.” One student says, “My mom once used steam to clean a stain on the carpet.” Ms. C records these suggestions, then shows students a container

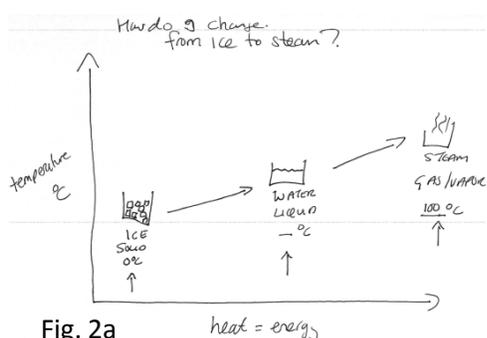

Fig. 2a

of ice cubes: “Let’s say I need some steam to clean my carpet, but all I have is this ice. *How could I turn this into steam?*” Students offer: “heat it” and “put it in a pot of boiling water.” Ms. C probes further: “How long would it take?” and “what factors might I need to consider?” She makes sure that Juan, an emerging bilingual, participates: “Juan, what could you add on?” and encourages students to build on each other using a sentence frame ([Name of peer], I agree/disagree that [restate peer’s comment]; therefore,...). Olivia states:

“Juan, I agree that steam is ‘hot.’ Therefore, it should have more energy.” The shared perspectives lead students to generate, collectively, a hypothesized visual model (Fig. 2a) of the phase changes of water when energy is applied.

Ms. C refines the problem: “We really want to know the *relationship* between energy and temperature in these phase changes. Is the relationship linear?” She writes the question with the doc-u-cam and invites another ELL student to write the question in Spanish - ¿Cuál es la relación entre la energía y la temperatura, es la relación lineal? Students record both versions in their science notebook. The lesson continues with students working with water, ice, a heating device, and thermometer in heterogeneous groups (by EL proficiency and class grade) to test the model. Some students observe their ice at a temperature lower than 0°C. While walking around the class, Ms. C encourages students in one group to think about what this means for the visual model they have created. The students recognize the need to relocate the position of the first beaker in the diagram. Additional observations lead students to notice that their thermometer stays at zero degrees while the ice melts.

At the end of the activity, Ms. C displays a sentence frame: “I claim that the diagram should really look like ... because ...” reminding students that scientists explain science by making claims that they support with evidence. She refers students to the class-generated science word wall and the “student-friendly” definitions of *claims* and *evidence* previously recorded in their science notebooks.

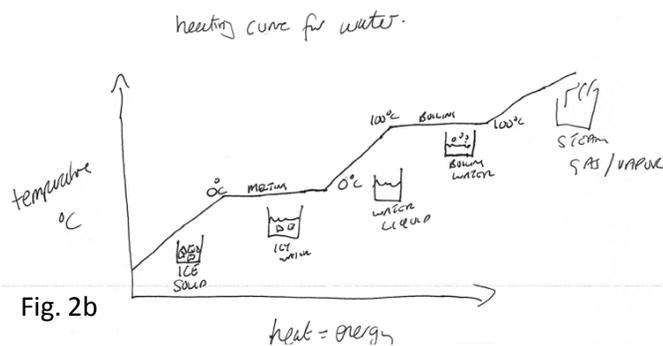

Fig. 2b

Moving around the classroom, she asks students to share what they have written and provides feedback on their writing. Finally, in a mini-poster session, Ms. C uses a cooperative structure, e.g. Numbered Heads Together, to ensure equitable participation as student groups share their explanations to the whole class, which leads to a discussion about how to amend the initial heating/cooling curve diagram. Ms. C draws the revised model to match the model the students have developed (Fig. 2b) and then returns to the question of the energy and temperature relationship during phase changes inviting students to share experiences outside the classroom where they can apply their model.

### Integrated Instructional Units

The integrated instructional units are designed to train teachers to develop science units that build on both the state Science Teaching Standards and the state English Language Development standards to scaffold both student science understanding and language and literacy development. The teachers, both experienced and pre-service teachers, have a personal learning experience through the integrated unit. Sciences methods instructors and professional developers teach the unit to the student explicitly modeling the strategies. The instructor and teachers engage in analysis and discussion of the units and the learning experiences during the process. After the learning experience, teachers use the model to develop their own integrated lesson plans. An elaborated version of this unit and six

additional integrated elementary science instructional units can be found at [http://education.ucsc.edu/estell/pdf/estell\\_sci\\_methods\\_course\\_materials.pdf](http://education.ucsc.edu/estell/pdf/estell_sci_methods_course_materials.pdf).

### **ESTELL Integrated Lesson Plan: Moon Phases and Seasons (3<sup>rd</sup> grade)**

This series of activities provide students opportunities to experience and understand the nature of science and levels of inquiry through the context of Sun-Earth-Moon (SEM) systems. Students are introduced to day and night through a whole class reading of a non-fiction reader. A kinesthetic modeling of day and night allows students to experience the spinning Earth and the day/night cycle. Selected manipulatives, models, visuals, video clips and teacher demonstrations will be provided to support students' conceptual understanding. The guided inquiries are designed using the 5E Learning Cycle Model to provide a student-centered and planned sequence of instruction (Engagement, Exploration, Explanation, Extension/Elaboration, and Evaluation).

**Day 1** - Access students' prior knowledge about the Sun-Earth-Moon systems

Activity 1: Concept Mapping: Why do you think we have day and night?

What do you want to know more about day and night?

Activity 2: KWL: Phases of the Moon

Activity 3: S-E-M Model

Activity 3A: Moon Phase Demo (whole class) - Optional

**Day 2** – Causes of Seasons (Guided Inquiry)

Activity 4: Sun-Earth Survey (Pre-Assessment)

Activity 5: What Causes the Earth's Seasons? OR

Activity 5A: How Angle Spreads a Flashlight Beam

**Big Ideas/Unifying Themes:** Models & Scale and Systems & Interactions

The objects in our solar system move in regular and predictable patterns that can be observed, recorded, and analyzed. The position of the Earth during its rotation causes the cycle of day and

night. The observed phase of the moon is determined by its position relative to the Earth and Sun. Earth's seasons are caused by the tilt of its axis.

**Process Skills:** Observing, Making Inferences, Hypothesizing, Communicating, Constructing Models, Theory Development

**Intended Learning Outcomes:** At the end of these lessons, students will be able to:

1. (Day 1) Describe & demonstrate the Earth's rotation on its axis in a cyclical fashion.
2. Demonstrate & illustrate why there are phases of the moon, using given manipulatives & models.
3. Read and retell at least one story about how people from different cultures have various beliefs about the Sun, Earth and Moon.
4. (Day 2) Assess personal models about what causes the Earth's seasons after viewing *The Private Universe* video clip, reading informational texts, and in-class demonstrations.
5. Formulate effective scientific questions and use evidence from data (i.e, observations and measurements) to refine their explanations.

**Vocabulary: English Spanish English Spanish**

Astronomy Astronomia Revolution Revolucion  
Moon Luna Earth Tierra  
Waning Moon Luna Menguante Solar Eclipse Eclipse Solar  
Waxing Moon Luna Creciente Spin Giro  
Northern Hemisphere Hemisferio Norte Equator Ecuador  
Rotation Rotacion Lunar Eclipse Eclipse Lunar  
Sun Sol Model Modelo  
Seasons Estaciones Tilt Inclinacion  
Axis Eje Moon Phases Faces de la Luna  
Southern Hemisphere Hemisferio Sur Sunrise El amanecer  
Day Dia Night Noche

**CA Frameworks/Standards: Earth Sciences, Grade 3**

Objects in the sky move in regular and predictable patterns. As a basis for understanding this concept: a) *Students know* the patterns of stars stay the same, although they appear to move across the sky nightly, and different stars can be seen in different seasons; b) *Students know* the way in which the Moon's appearance changes during the four-week lunar cycle; d) *Students know* that Earth is one of several planets that orbit the Sun and that the Moon orbits Earth; e) *Students know* the position of the Sun in the sky changes during the course of the day and from season to season.

**CA English Language Development Standards Grade 3 Intermediate ELD level focus:***Listening and Speaking*

Strategies and Applications: Listen attentively to stories and information and identify important details and concepts• Participate in social conversations with peers and adults on familiar topics by asking and answering questions and soliciting information.

**Conclusion**

The research and instructional practices discussed above demonstrates that the integration of ESTELL pedagogy into science teaching is a powerful model for improving ELL achievement. The challenge is to prepare novice teachers to effectively use this instructional approach in their classrooms. Most teachers, however, are not prepared to teach academic content to diverse learners (Bryan and Atwater, 2002; Lee & Luykx, 2004; Rodriguez & Kitchen, 2005). The majority of teacher education programs do not model an integrated approach to instruction and in the course work there is little connection between learning to teach science and the use of use of culturally responsive pedagogy. Subject matter teaching methods are taught with little emphasis on integrating the language and culture of the student population being served (Dalton, 1998; Fradd & Lee, 1995; Stoddart, 1993a). Issues relating to cultural and linguistic diversity, when taught, are presented separate courses and often focus on social conditions not pedagogy (Met, 1994; Zeichner, 2003). If novice teachers are to learn to effectively teach science to diverse learners there must be coherence between their own learning experiences of science content, the pedagogy taught and modeled in science teacher education methods courses and they need to engage with explicit models of practice.

**Abstract**

Preservice teachers lack mathematics skills and positive attitudes toward mathematics. We cannot change students' mathematics scores or solve the STEM pipeline problem until we address these challenges. We developed a videogame and training materials to address these challenges and have tested them with 100 preservice teachers. Preliminary results indicate teachers need additional mathematics training, and that *PlatinuMath* can help. Attitudes toward mathematics and games are more positive than the literature leads us to believe.

## Introduction

Preparing teachers to teach mathematics effectively is one of the most urgent educational problems facing us today. Research shows that students learn more from teachers with strong academic skills than they do from teachers with weak academic skills (Ballou, 1996); similarly, when the teacher does not have the skill in the subject matter being taught, student achievement is negatively impacted (Darling-Hammond, 2000). The U.S. Department of Education through its Race to the Top initiative has made raising teacher quality, improving teacher training programs, and the development of better evaluation ratings including examination of formative assessment a national priority (Walsh and Jacobs, 2009).

Many U.S. elementary teachers lack sound mathematical understanding, though there is great variance in teachers' grasp of mathematics required to teach this subject. Studies comparing the mathematical knowledge of teachers in China and the U.S., for example, show dramatic differences between the two groups. Elementary teacher weaknesses in the procedural and conceptual understanding of fundamental mathematics results in inability to present material clearly and to provide error free content—as a result classroom instruction suffers and student achievement is affected (Ball et al., 2005; Wu, 2009; Hill, 2010; Morris et al., 2009). On the other hand, mathematically stronger teachers have the ability to go beyond problem solving to interpreting and responding to student mathematical thinking (Hill, 2010; Jacobs et al., 2010; Wilson et al., 2011).

The content deficiencies appear not only in in-service teachers, but also in preservice teachers. Studies of preservice elementary teachers show alarming deficiencies in their procedural knowledge of the subject matter at the levels they are teaching. For example, one study (Silver, 1986) found that many preservice teachers thought that  $\frac{1}{4} + \frac{1}{6} = \frac{2}{10}$ , adding numerators and denominators separately. This and other procedural errors are linked to faulty representations, such as counting the two shaded and the ten total parts in rectangle drawings of the two fractions, as well as other conceptual difficulties (Ball, 1990; Hiebert & Lefevre, 1986; Ma, 1999; Newton, 2008; Rittle-Johnson et al., 2001; Silver, 1986).

Conceptual understanding, which is necessary for teachers to explain mathematics well to students, is also low, and research shows that teachers' conceptual knowledge affects elementary students' mathematical success (Hill et al., 2005). "It is a fact of human nature that teachers who are uncomfortable with the mathematics they teach are not the ones to push hard for excellence in the mathematical performance of their students" (Wu, 1999).

Preservice teachers also need to develop an understanding of student mathematical thinking, a complex skill critical to effective teaching. Prospective teachers need to be able to recognize the patterns and processes a student uses to solve mathematical problems, regardless of whether the student arrives at the correct or incorrect solution (Jacobs et al. 2010; Morris et al., 2009).

The specialized knowledge required to teach mathematics will require teacher training programs to provide preservice students an opportunity to develop these

competencies over time (Morris et al., 2009). Scalable tools that can objectively and reliably measure student progress and competence in the math skills required for teaching are desperately needed because teacher self-reporting and current assessments are inadequate measures (Hill, 2010; NCTQ, 2008; Walsh and Jacobs, 2009). A recent study of first-year teachers in New York City showed specialized mathematics knowledge to be a better predictor of student mathematics outcomes than a series of other indicators, including general cognitive ability (Rockoff et al., 2008).

The U.S. Department of Labor projects 15-16% growth in the number of K-5 classroom teachers needed between 2008 and 2018—a growing demand that will result in the hiring of 271,200 additional elementary teachers. These new teachers, along with the 1,729,000 already employed as of 2008, will have a tremendous impact on the quality of education for millions of elementary school children.

We hypothesize that our formative assessment tool in the form of an online game, PlatinuMath, will measure the preservice teacher's mathematical understanding for teaching, will provide learning while playing, is conducive to repeated practice over time, can differentiate instruction, and therefore can improve the competency of prospective teachers. As preservice teachers become more competent with the mathematical knowledge for teaching (MKT) (Ball et al., 2008; Hill, 2010; Morris et al., 2009) their attitudes and beliefs about teaching math will also improve. As a result of improved content competence and changed attitudes, teachers will do a better job with instruction, students will learn more, and student performance on standardized assessments will improve.

### **Inadequate Teacher Preparation**

Reviews show that colleges erroneously assume that future teachers enter with sufficient conceptual understanding of elementary school mathematics, and therefore do not teach that content (Conference Board of the Mathematical Sciences, 2001). Elementary teachers are entering training with poor previous experiences and performance and become practicing teachers who have not learned the content they are required to teach (Adler et al., 2005). In addition, U.S. elementary teacher preparation programs do not compare favorably with the international elementary teacher preparation programs (U.S. National Committee on Mathematics Instruction, 2009). Findings suggest that generally the mathematics preparation of elementary school teachers falls short of recommended guidelines with regard to the number, sequence, and type of college courses taken (Dossey et al., 2008).

A comprehensive study on elementary mathematics commissioned by the National Council on Teacher Quality (NCTQ, 2008) found poor mathematics preparation of elementary teachers to be the rule rather than the exception, with only 13% of the 77 schools in the sample passing the overall evaluation quality of preparation criteria set forth by the commission. This lack of preparation was the number one determining factor in the poor performance of U.S. elementary students on national and international assessments. Because math understanding relies on cumulative knowledge, solid elementary grade mathematics teaching is critical.

When a solid foundation is not acquired in the early years, remedial work is the norm thereafter.

### **Assessment of Preservice Teachers Needed**

National organizations and centers including, but not limited to the U.S. National Committee on Mathematics Instruction, the National Council on Teacher Quality (NCTQ), the National Council of Teachers of Mathematics (NCTM), the U.S. Department of Education, and prominent researchers in the area of education reform are calling for scalable and effective assessment of preservice teacher competencies (NCTQ, 2008; Race To The Top, 2009; Hill, 2010; Rennert-Ariev, 2005; Dossey et al., 2008). Currently the only large-scale assessment for prospective elementary teachers in most states is the Praxis II (ETS, 2010), which contains mathematics items; however the results are not public. The NCTQ specifically noted that the Praxis test, the most widely required exit/licensure test, failed to measure the proficiencies required for good teaching of math in the classroom. The council developed a sample test as a starting point for a new generation of tests to measure the preparation of teachers entering the classroom (NCTQ, 2008). We will consider the recommendations and items developed for the NCTQ sample test when designing items for our formative assessment game.

### **The Intervention**

Our formative assessment game, PlatinuMath, provides a unique solution to these problems. In order to address shortcomings in teacher preparation programs college instructors must have accurate assessments of their students' mathematical understanding. Likewise preservice teachers need to have an accurate assessment of their own mathematical understanding before they can be prepared to improve their content knowledge. PlatinuMath can provide that assessment data. However, we know that the majority of preservice teachers have negative beliefs and attitudes about their ability to do math and so they are reluctant to be tested in the subject. With PlatinuMath, students will become engaged by the narrative and game play and will be less focused on the intervention as a didactic instrument. PlatinuMath is deliberately designed to measure *and* improve content understanding simultaneously, which will help alleviate the preservice teachers' math anxiety and low math confidence—factors which become reflected in classroom teaching strategies and passed on to students. Our commercialization plan in section 8 of this proposal fully describes TDM's strategy to bring PlatinuMath to market.

PlatinuMath is a narrative-based video game of the action-adventure genre. The formative assessment is organized into three games, each covering eight basic mathematics ideas. Mini-games within the game narrative address 24 NCTM standards. PlatinuMath is designed to address the mathematics knowledge for teaching that preservice elementary teachers need to master. Ma refers to this as 'a profound understanding of fundamental mathematics' an understanding which includes (1) Connectedness-seeing how math concepts relate to one another; (2) Multiple perspectives-the ability to approach mathematics in a variety of ways; (3) Basic ideas-the foundation of elementary mathematics that recur throughout math

learning; and (4) Longitudinal coherence-the acknowledgement that what is taught today is the base for future knowledge (Ma, 1999).

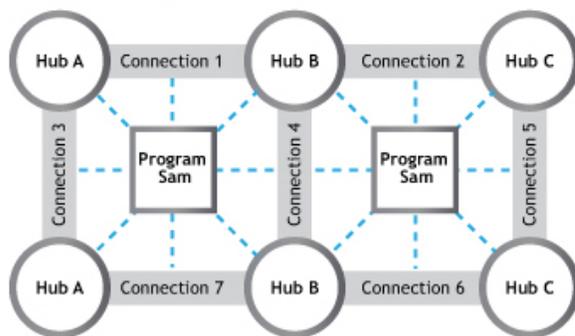

PlatinuMath is designed to seamlessly incorporate the content knowledge and pedagogical content knowledge components into a unified experience of assessment and skill building. Mini-games will be developed for procedural content knowledge, conceptual concept knowledge, and simulated student logic. Below are a précis of the storyline and a graphic representation of how the game world will be organized.

### **PlatinuMath Game Narrative: New York, 1893**

The day before her college graduation, young Regina Cavendish receives a note from her brilliant and reclusive uncle, Dr. Paddington. Following the note's instructions, Regina travels to her uncle's estate, only to find the house has been ransacked and her uncle, kidnapped. Among the wreckage, Regina finds a message written with blood; "Surrender the Platinum weapon and your uncle will live."

Regina races to the secret lab beneath the house, where she discovers Sam, a mechanical man built from bolts, gears, and platinum. The astonishing humanoid reveals that Dr. Paddington was hired by a secret society to construct an unstoppable weapon made of Platinum. The doctor built Sam, a robot with free-will. When Paddington refused to surrender his creation, he was taken hostage and Regina was summoned to do what her uncle would not. Now, Regina must join with Sam to rescue Dr. Paddington while protecting the identity of her uncle's most powerful, and dangerous invention. However, to achieve her goal, Regina must solve a series of mathematical problems that will give her clues for rescuing Dr. Paddington.

### **PLATINUMATH GAME WORLD**

#### **PlatinuMath Game World Mathematics Legend**

Connections: Procedural--Skill Building

Hubs: Conceptual--Multiple Perspectives

Program Sam: Simulated Student Logic

## **Mini-games**

The 24 content knowledge targets are delineated into implicit conceptual understandings and more explicit procedural skills. The game world of PlatinuMath (above) is a network of locations; each point on the plane is a multi-leveled mini-game with content carefully scaffolded into the leveling structure. Mini-games are designed with 6 difficulty levels. Mini-games that develop the requisite procedural skills and content knowledge precede mini-games that build the central implicit mathematical understandings. Conceptually based mini-games act as "hubs," with skill based games connecting one mathematically implicit hub to another. The construct facilitates a deeper understanding of basic mathematics by allowing the player to experience the connections between simple and complex ideas, while demonstrating the multi-faceted nature of problem solving and the variety of approaches to finding a solution.

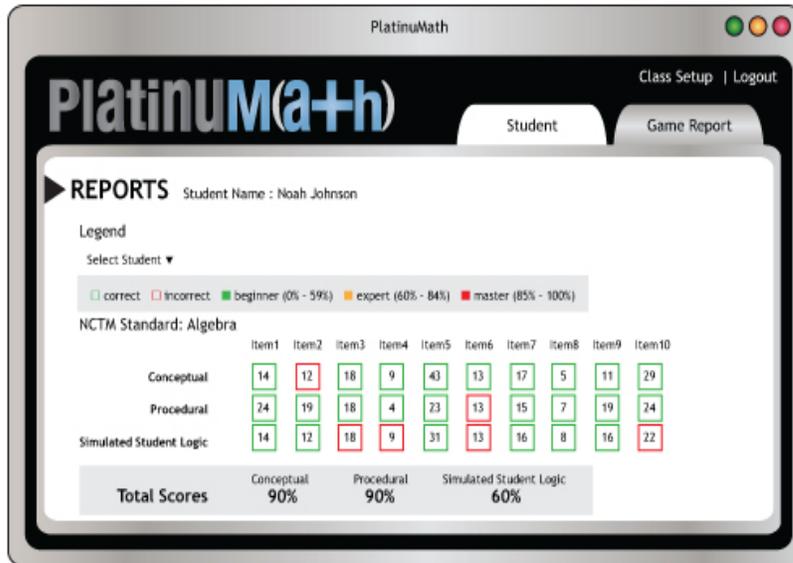

Procedural skill mini-games are fast moving models where a problem appears on the screen and the player clicks on the correct answer. Such formats are a necessary part of any mathematics curriculum as they allow the learner the repetition requisite for procedural fluency. The design of PlatinuMath incorporates problem-solving or conceptual mini-games unlike anything currently on the market. These more in-depth mini-games are designed to model specific conceptual ideas or logical intersections of the more procedural games. In conceptual mini-games, the player can interact in a variety of ways to solve the problem and will often be challenged to use more than a single strategy.

PlatinuMath gaming requires the preservice teacher to exhibit competence in decoding and understanding children's mathematical thinking and error analysis. Common errors reveal that something may have been overlooked in instruction, and these perceptions get repeatedly transferred from one concept to another until the gap in student understanding has grown quite large. Although actual teaching experience is often the best way to become familiar with the common pitfalls, PlatinuMath introduces the preservice teacher to most of the commonly seen issues.

Simulated student logic is introduced through the mechanical character, Sam, who accompanies the protagonist throughout the narrative. Sam has the ability to hack into the minds of his mechanical counterparts in order to find solutions to the math questions thrown at him. The player is able to see the questions Sam encounters and Sam's answers to them. Sam is logical, knows his basic facts, but like a student is imperfect and will perform mathematical procedures incorrectly. The player needs to be able to analyze Sam's responses and figure out where Sam's calculation has gone wrong. The errors will seldom be careless errors; more often Sam will have to be "taught" something which happens by the player reprogramming Sam through a user friendly interface. To program Sam, the player has to become familiar with writing general rules using variables that allow the player to consistently gain experience connecting the practical to the abstract.

## **PlatinuMath Database and Dashboard**

The easy-to-use dashboard (see Figure 1) is a reporting tool that will provide logging and tracking that is rarely if ever found in formative assessment products. The dashboard will allow sorting of performance data by student, mini-game, item analysis, and mastery level. The student and/or faculty member can customize the game to meet the student and program learning needs. These features differentiate PlatinuMath from all other assessment products on the market, including Praxis and other multiple choice tests. Aggregate data will be collected which could be used to inform instruction and program curriculum decisions.

**Figure 1. PlatinuMath Dashboard.**

### **Product Implementation and Intended Outcomes**

Preservice teachers use PlatinuMath as an ongoing supplement to their teacher training program of coursework, math methods and mathematics course requirements, as well as practical classroom experiences. Because it is web-based, they will be able to access it at any time from any place. Because it is self-paced and personalized, the product implementation is scalable and cost effective; it may be used by as few as one student or by an entire program. Although the initial assessment portion can be completed in several hours, the tool is designed to be used throughout the training program for improved mathematical understanding and content review, with or without the game narrative. An easily accessed backend database collects the student's performance and time on task for each content area over time and by instance. The data collected reflect holistic math knowledge for teaching scores as well as individual scores of procedural and conceptual competence by content domain. PlatinuMath is computer adapted to adjust the difficulty level of questions according to the success of the player. Since it is a formative rather than summative assessment, PlatinuMath data should inform university instruction with regard to the success of both individual student and programmatic competencies and result in adjustments to teaching, if required.

## Theoretical and Empirical Support for PlatinuMath

Our theoretical assumptions are based on studies of teacher qualities that influence student success. In the following section, we describe assumptions and their sources; explain how particular steps within the project flow from the assumptions; and indicate how the theory of change informs evaluation of each step's success. Since dimensions of change in preservice teachers' mathematical knowledge for teaching depend on one another, we strongly believe in addressing all of them holistically, and paying close attention to dependencies and connections.

### Theory of Change

The theory of change as defined by Connell et al. (1995) has been integrated prominently into the theoretical framework of PlatinuMath. Our theoretical assumptions are based on studies of teacher qualities that influence student success. In the next section, we describe assumptions and their sources; explain how particular steps within the project follow from the assumptions; and indicate how the theory of change informs evaluation of each step's success.

Studies show deficiencies in elementary teachers' math procedural knowledge (Ma, 1999). This weakness comes from and exacerbates poor conceptual understanding of fundamental mathematics (Ball et al., 2005), lack of understanding for the mathematical thinking of children (Jacobs et al., 2010), and lack of mathematical sophistication in attitudes and beliefs about mathematics (Seaman & Szydlik, 2007). These components of content knowledge—together with teaching and learning knowledge, attitudes and beliefs included in pedagogy, and pedagogical content knowledge (Shulman, 1986)—comprise what Ball et al. (2008) call mathematical knowledge for teaching (MKT). In addition, we believe that mathematical pedagogy needs to be situated within modern computational and social media technologies, supported by 21st century skills and attitudes.

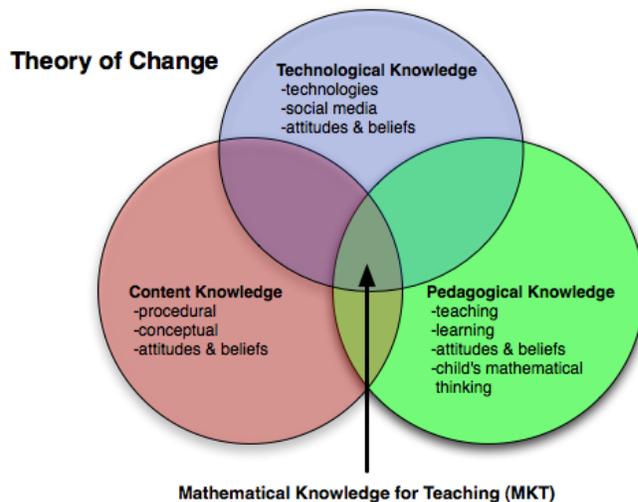

### Empirical Support: Knowledge Framework

For this project, we are building a conceptual framework that incorporates multiple research perspectives. Having diagrammed the major framework parts, we will now explain the ways in which our study builds on past works.

*Specialized Content Knowledge* is the knowledge of mathematics unique to and essential to good teaching (Ball, Thames, and Phelps, 2008). Procedural knowledge and

conceptual understanding described below are parts of specialized content knowledge.

*Procedural Knowledge* is defined as the ability to use math notation and to apply step-by-step algorithms to solve exercises (Hiebert & Lefevre, 1986). As noted in our problem statement, both pre-service and in-service teachers lack procedural knowledge of mathematics at the level they are

teaching (Silver, 1986; Ball, 1990; Hiebert & Lefevre, 1986; Ma, 1999; Newton, 2008).

*Conceptual Understanding* is defined as ‘knowledge that is rich in relationships. It can be thought of as a connected web of knowledge, a network in which the linking relationships are as prominent as the discrete pieces of information. Relationships pervade the individual facts and propositions so that all pieces of information are linked to some network’ (Hiebert and Lefevre, 1986). Ma (1999) found that the vast majority (80-90%) of U.S. teachers are unable to provide meaningful, correct mathematical explanations because they lack conceptual understanding.

*Noticing of Children’s Mathematical Thinking* is paying attention to children’s logic, interpreting their understandings, and effectively responding based on that information (Jacobs et al., 2010).

### **Beliefs and Attitudes**

Within the study’s framework, we focus on three components of the belief and attitude structure: content, pedagogical knowledge, and technological knowledge. The content component includes both cognitive and affective elements; the affective part deals with intrinsic motivation ( Ryan & Deci, 2000) and math anxiety (Tobias, 1993). Preservice elementary teachers have the highest math anxiety levels of all college students; studies have shown that interventions addressing the affective domain alone lead to improved math success (Hembree, 1990). Our game and the online community are specifically intended to increase intrinsic motivation for mathematics and to reduce math anxiety.

Pedagogical knowledge, the second component, includes teaching and learning parts. Our project is intended to effect belief and attitude changes connected to know-how about particular elementary mathematical topics. The result will be changes affecting preservice teacher preparation, thus leading to better student achievement once the teacher enters the classroom.

### **Professional Communities and Networks**

Today’s college students are fully integrated into the social networks of facebook and Twitter. For the online community part of this project, we adapt the principles put together by Herrington & Oliver (2000) on the basis of multiple studies, including: authentic contexts true to real-life mathematical teaching; authentic activities allowing higher order thinking; access to expert performances and modeling; collaborative construction of knowledge; opportunities for reflection and articulation; and authentic assessment of learning. We will collect data about these processes using the learning theory of connectivism (Siemens, 2005) Table One, below, summarizes how our research and development framework addresses the dimensions within our game and the online community supporting the game.

### **PlatinuMath: Pathway to Change**

We have discussed the theoretical and empirical frameworks that serve as the basis for the design of PlatinuMath. The Figure 2, below, is a visual representation of the causal relationship between actions and outcomes associated with the intervention (Anderson, 2005). This map should be read from bottom to top, because the earliest preconditions and outcomes at the bottom are needed to get to the next level. We predict that if teacher training programs implement the PlatinuMath intervention as a supplement to math/math methods courses preservice teachers' will see increased procedural and conceptual mathematic

understanding, this growth will lead to positive changes in attitudes and beliefs about math and with continued interaction with PlatinuMath over time a statistically significant improvement in preservice teachers' MKT will result.

**Figure 2. Conceptual Framework for PlatinuMath**

### Rationale for Game as Formative Assessment

Today, serious digital games are used by the U.S. Army, FEMA, the FAA, the Office of Homeland Security, multinational corporations, universities, and non-profits to teach and test everything from economics and cultural sensitivity to counterterrorism and jet piloting. In this study, the purpose of the game is formative assessment, specifically, the measurement of mathematical knowledge for teaching (MKT). Serious games with learning purposes are now being developed for all areas of the curriculum (Gibson et al., 2007). NCTM itself promotes gaming as a means of teaching mathematics on its Web site. Recent cutting edge research explores the use of serious games as a vehicle for embedded formative assessment (Shute, et al., in press).

Computer assessment games allow what paper and pencil tests do not: saving multiple states and returning to the previous ones; automatically replicating objects and actions as the program adapts to student decisions; bolstering the strengths and identifying the weaknesses of the student; and keeping the assessment history over time.

A game design environment was chosen for PlatinuMath for the following reasons:

- *Prevalence.* If anything characterizes today's generation of students—whom Marc Prensky (2001) calls “digital natives”—it is that they are gamers, and today's preservice teachers have grown up playing games, the female students as well as the males. According to *Gamer Segmentation 2009*, female gamers make up 40% of all players of video and computer games (<http://www.csmonitor.com>).
- *Motivation and Immersion.* Games have the potential to induce and sustain flow, which
- Csikszentmihalyi (1990) defined as total immersion in a task or activity.
- *Encouragement, Formative Feedback, and Rewards.* Effective adaptive formative feedback provides the student with two types of information as it tracks the student's progress: verification and elaboration. Verification simply confirms whether the answer is correct or incorrect; elaboration can provide the student with relevant cues. Both are important for effective feedback within the game structure and PlatinuMath can exploit the potential of multimedia to further improve the value of the feedback (Shute, 2008).
- *Adjustment of cognitive load.* Serious game computer-based assessment systems know how a student is progressing and where they are having problems, and they can use that information to make real-time adjustments by altering the difficulty level of tasks (Shute et al., in press). The combination of feedback and adaptive task sequencing while concurrently assessing knowledge and skills can result in a powerful assessment tool (Shute and Hansen, 2007).
- *Rich Interactive Environment.* Paper and pencil standardized tests restrict the presentation of content to static text and images. PlatinuMath will appeal to multiple learning styles because it is multimedia, multi-sensory, and multifaceted. Also, because games are graphical and auditory rather than textual, math concepts can be presented in a variety of ways that require the student to interact with and manipulate the content as opposed to react to it.
- *Recurring Practice.* Preservice teachers develop the mathematical understanding for teaching over time. Because gaming holds their attention in the way traditional instruction often does not, students frequently practice games on their own time (Garris et al., 2002). PlatinuMath can be programmed so that students are presented with new numbers and varied game-play assessment each time they play and increase time on task, which improves students' understanding.
- *Improved Performance.* Evidence indicates that formative assessment gaming can be highly effective for improving student performance by helping students to facilitate and direct their own learning (Shute et al., in press). Examples include web-based formative assessment, PsyCAL, which is used to teach university psychology; TRIADS software used to devise a formative assessment for students

in engineering; web-based formative assessment for medical students; and GAM-WATA, a web-based formative assessment quiz game for 5<sup>th</sup> graders (Wang, 2008). Although the assessments cited above are different from the formative assessment game we are proposing, the basic elements are similar.

### Evaluation Plan and Model

#### Strategies.

Preservice teachers (PST) and teacher-educators (TE) math competency, attitudes toward teaching math, attitude toward PlatinuMath (PM), and attitude toward games as teaching tools were assessed using qualitative and quantitative methodologies. Attitudes and math competency were collected as pretests prior to implementation of PM, and again as posttests after using PM. PSTs completed surveys, and some were selected for focus group interviews based on a range of demographic characteristics to ensure representativeness. TEs completed attitude toward the intervention/games surveys pre and post PM, provided a written analysis of the product, and were interviewed afterwards.

Table 1. Evaluation Questions, Data Collection, and Analysis.

Goal	Research Questions/Short-Term Outcomes	Measurement & Instruments	Data Analysis
Improve mathematics competency for preservice elementary/early childhood teachers	Preservice teachers will demonstrate better mathematics ability after playing the game	NC Mathematics Scales (Please list the NC tests sections/titles/subjects here)	ANOVA of control and intervention groups; Analysis of change scores
Improve preservice elementary/early childhood teachers' attitude toward math	Preservice teachers will demonstrate better attitude toward mathematics after playing the game (confidence, anxiety, etc.)	The Kalder and Lesik Adapted Fennema Sherman Math Scale for pre-service teachers.	ANOVA of control and intervention groups; Analysis of change scores
Improve preservice elementary/early childhood teachers' attitude toward games in the classroom	Preservice teachers will demonstrate better attitude toward games in the classroom after playing the game	Interview (individual or focus group), observation. Games Survey (based on Millstone, J. (May 2, 2012). <i>National survey and video case studies: Teacher attitudes about digital games in the classroom.</i>	Thematic Analysis of Qualitative Data; ANOVA
Improve teacher educators attitude toward PlatinuMath as an instructional tool	Teacher educators attitude toward PM as an instructional tool will be neutral or more positive than before evaluating the materials	Interview (individual or focus group), observation.	Thematic Analysis ANOVA Descriptives
Improve teacher educators attitude toward games as instructional tools	Teacher-educators will demonstrate neutral or positive attitude toward games in the classroom after evaluating the materials	Interview (individual or focus group), observation. Survey--based on Millstone, J. (May 2, 2012). <i>National survey and video case studies: Teacher attitudes about digital games in the classroom.</i>	Thematic Analysis ANOVA Descriptives

## Method

### *Research Design and Participants.*

We used a pretest-posttest control group design:

$R0_1 \quad X \quad 0_2$

$R0_1 \quad 0_2$

Two hundred pre-service elementary education majors at an Upper Midwest university were invited to participate out of a pool of 400 total preservice teachers. These students included elementary education majors and those with double majors in elementary education and either early childhood or middle school. Data collection took place in the latter half of the Spring semester, 2013. Students were recruited in classes, by email (through the college student distribution list), and via flyers in the building. Four educators were recruited to conduct an analysis of the games and lessons for possible use in courses. These educators include the chair of the Teaching and Learning department at and expert in elementary math education, an Associate Professor in the Mathematics department. The other two educators were drawn from the Resident Teacher master's program which comprises in-service teachers seeking advanced degrees. These teachers attend classes full-time in this intensive education program, and are thus highly motivated and have significant professional and academic experience and knowledge. This program is also highly selective, so they are in the upper percentiles for academic and professional knowledge.

Reviewers were offered \$250 incentives for participation in the evaluation of the games and lessons in the form of a written report and participation in an interview. PSTs were paid \$10 for completion of all games and surveys, and those who completed all phases of the study (comparison group or intervention group) were entered into a drawing to win one of five iPad Minis. The pretest, intervention, and posttest took between 10 and 15 hours. Participants were asked to play one hour per day for 10 out of 15 days and/or until all lessons and games have been completed). We also conducted an exit survey for all intervention participants to ask how they used the games, how long they played, when they played, what they thought, etc. A variety of demographic data were collected, including gaming experience whether they had taken methods courses yet, what their major was (early childhood plus elementary education; elementary education; elementary education plus middle), what their academic experience was (when they declared major, how many courses taken, whether they have switched majors, credits toward degree, current class schedule, etc.) and number of math classes taken.

### *Instruments*

*Math Test.* Items were drawn from the North Carolina End-of-Year test for mathematics across grades 3–8, based on the mathematics coverage of the PlatinuMath game. A mathematics education expert was consulted on paring down the number of items to just those covered and practical for the time allotted. These test items are validated and reliable, having been used in North Carolina after extensive design and

testing, until 2009. There were 64 questions on this test, and it takes approximately 40 minutes to complete.

*Game Attitude Survey.* This survey was developed based on Fullan & Stiegelbauer's (1991) first order and second order barriers to change. Existing game attitude and use surveys or articles that reported findings based on scales were identified and the questions, constructs, and/or outcomes were categorized and first or second order barriers, and then items from those scales were either used, if available, or developed based on reported outcomes. Scales used for this included Beggs, (2000); Bingimlas (2009); Bunch and Broughton (2002); Brown, Davis, Onarheim, and Quitadamo (2002); Butler and Sellbom (2002); Christiansen (2002); Graham, Culatta, Pratt, and West (2004); Kennedy-Clark (2011); Kenny, and McDaniel (2011); Maddux and Johnson, (2010); O'Hanlon (2009); Mueller, Wood, Willoughby, Ross, and Specht (2008); Ray, and Coulter, G. A. (20??); Russell, O'Dwyer, Bebell, and Tao (2007); Schoepp (2005); Teo, Chai, Hung, and Lee, (2008). Equal numbers of items per construct were generated, and items were worded in the negative and positive to prevent skewing of the data due to spurious responses. Several iterations were examined for face validity, and principal components analysis will be conducted once sufficient data are available. There are 83 items on this test which use a 5-point Likert-type scale, and the instrument takes approximately 10 minutes to complete.

*Math Beliefs.* This was tested using the Kalder and Lesik Preservice Teacher Math Scale, which was based on the Fennema Sherman Math Scale. The Fennema Sherman scale has been shown to have three factors (Wikoff and Buchalter, 1986), the first anchored by confidence on one end and anxiety on the other, with 24 items loading on this factor between .53 and .84, with 18 above .70 and a reliability of .97. The other two factors are positive attitude toward math (loading between .56 and .74, with reliability of .89) and negative attitude toward math (with loadings between .43 and .80 and a reliability of .90). These sub-scales were used as described above, in addition to additional scales proposed by Kalder and Lesik, including Math Enjoyment, Math Motivation, and Attitude Toward Mathematics Teacher. There were 72 total items on this 5-item Likert-type scale, and the instrument takes approximately 15 minutes to complete.

## **Results**

### ***Phase I: April, 2013***

A total of 90 participants completed at least one phase of the research, for a response rate of 45%. However, only 58 of these completed all phases of the protocol (pretest-posttest for comparison group; pretest-intervention-posttest for the experimental group), for a final response rate of 29%. The sample were predominantly white (95.6%, n=86) females (92.2%, n=83) between the ages of 20 and 22 (68%, n=72) with a range of 18 and 43 years of age. There were 6 males, 2 African Americans, and 1 Native American.

While participants were randomly assigned to comparison or experimental groups, there was a disproportionate rate of mortality in the experimental group. Of the 45 comparison group participants, 60% (n=27) and 69% of the experimental group participants completed the pretest and posttest. However, the majority of those in the experimental group did NOT meet the protocol requirements for participation, which

were to play the game 10 hours per week, on average, during a two-week period, and to attempt to complete all parts of the game. Of the 45 experimental group participants, 8 never played, 5 played the game one time, 3 played the game twice, 6 played it 3 times, and 2 played it four times. Overall, 61% played the game four times or less, and 14% played it 7 times or more. This results in unequal groups when controlling for having met the protocol (played approximately 7 times) and violates the assumptions for most of the analyses needed.

There are several other limitations of this first phase of the study. The students were recruited to play toward the end of the term, which is a stressful time for them. It was not possible to test sooner because the game was still under development. Additionally, at least 50 of the participants were in their final coursework and preparing to go into the schools for their field work. These students are under particularly high stress, as this experience is directly tied to their success in their careers and job search, and they have many lesson plans to develop for the first time. As it was, at the time of testing (which was as late as we could possibly go), one whole chapter of the game was missing from the game and there were some bugs in the game that prevented completion of some of the games. All of these factors combined to reduce our *n*, and to increase our attrition and non-compliance rates. While participants were loathe to give up their chance at winning an iPad Mini, many could not make the time to spend on the game that they had anticipated and promised.

Finally, the overall sample size is too small to detect the anticipated effect size. Our power analysis indicated the need for 88 participants per condition to detect a medium effect size, and even without attrition and non-compliance we only have 45. Therefore, the analyses presented in this report are preliminary and descriptive, and no definitive assertions of causality or correlation are made. Further analyses will be run this fall, as described later.

Pearson Product Moment bivariate correlations were run on days of gameplay and posttest scores. As expected, mathematics posttest scores were positively correlated with positive attitude toward mathematics on six of the subscales, including mathematics value (.39,  $p = .001$ ), enjoyment (.45,  $p < .001$ ), motivation (.45,  $p < .001$ ) negative attitude toward mathematics (-.39,  $p = .001$ ), positive attitude toward mathematics (.41,  $p = .001$ ), and combined anxiety and confidence scales (.42,  $p < .011$ ) as suggested by Wikoff and Buchalter (1986). Additionally, day of gameplay was positively correlated with posttest scores (.23,  $p < .05$ ).

Univariate ANOVAs to compare group differences did not reveal any statistically significant differences between the groups because of sample size (and reduced power therefrom) and low protocol compliance rates among experimental group participants. Comparison of group means were conducted for possible trends however.

When comparing all experimental to all comparison groups on posttest measures, the experimental group showed higher scores on seven measures (lower anxiety, higher math value, better perception of mathematics teachers, attitude toward games as instructional tools, lower overall negative views of mathematics, higher positive views of mathematics, and overall mathematics confidence). They were lower on mathematics posttest scores, and the same on confidence, enjoyment, and motivation. None of these

differences were statistically significant. Table 3 presents means by group on these measures.

*Table 3. Mean Posttest Scores by Group.*

Measure	Condition	Mean	Std. Error
Math Posttest	Control	47.18	2.01
	Exp	45.00	2.25
Posttest Math Confidence Scale Score	Control	54.40	2.70
	Exp	54.96	2.81
Posttest Math Anxiety Scale Score	Control	58.51	2.90
	Exp	59.12	2.97
Posttest Math Value Scale Score	Control	75.81	2.16
	Exp	77.61	2.14
Posttest Math Enjoyment	Control	55.03	2.68
	Exp	55.83	2.52
Posttest Math Beliefs Motivation Scale	Control	52.14	2.55
	Exp	52.93	2.37
Posttest Math Teacher	Control	62.11	1.73
	Exp	65.03	1.90
Overall Game Attitude Score (no constructs)	Control	287.33	4.79
	Exp	288.61	7.26
Overall Negative Attitude Toward Mathematics	Control	46.81	1.51
	Exp	47.25	1.53
Overall Positive Attitude Toward Mathematics	Control	81.18	3.09
	Exp	83.32	3.11
Overall Confidence	Control	99.66	4.85
	Exp	101.06	5.00

Because so few of the experimental group complied fully with the protocol, it was possible that any effect of the intervention would be “diluted” by these participants who, for all intents and purposes, experienced little different than those in the comparison group. Therefore, the same analyses were run with only those members of the intervention group who played at least 4 days (approximately have the hours required by the protocol. Table 4 presents these means.

This resulted in only 13 participants in the experimental group vs. 27 in the comparison group. This difference in group sizes violates the assumptions of ANOVA which, although robust to such violations, is highly unreliable with differences are two-to-one, as they are here. ANOVAs were NOT run, and these results must be interpreted with caution. What becomes apparent is that treatment group members who played more were different from those who played less. Experimental group members had better attitudes toward mathematics and were better at mathematics than comparison group members on 10 out of 11 measures. They were the same as their counterparts overall negative attitude toward mathematics. No causality can be inferred here because we have selected a subset of perhaps more motivated learners within the experimental group and compared it to all members of the comparison group, but the trends are all in the predicted direction.

Table 4. Mean Posttest Scores by Group With Those Who Played More than Four Days.

Measure	Condition	Mean	Std. Error
Math Posttest	Control	47.18	2.01
	Exp	55.30	2.33
Posttest Math Confidence Scale Score	Control	54.40	2.70
	Exp	57.45	4.43
Posttest Math Anxiety Scale Score	Control	58.51	2.90
	Exp	61.90	4.08
Posttest Math Value Scale Score	Control	75.81	2.16
	Exp	77.09	3.70
Posttest Math Enjoyment	Control	55.03	2.68

Overall Negative Attitude Toward Mathematics	Control	46.81	1.51
	Exp	46.63	2.62
Overall Positive Attitude Toward Mathematics	Control	81.18	3.09
	Exp	85.81	4.76
Overall Confidence	Control	99.66	4.85
	Exp	105.81	7.26

Because these trends appear to be significant in some cases, and despite the violation of assumptions for univariate analyses are not met, between and within subject ANOVAs were run for the sake of further exploration. Again, no results should be interpreted beyond potential trends and differences for future analysis.

A one-way between groups ANOVA indicates that there could be a statistically significant difference between those who played the game more than four times ( $m = 55.3$ ) and those in the comparison group ( $m = 47.1$ ) on mathematics posttest scores ( $F_{1,35} = 5.539, p = .024$ ). Although random assignment should result in equal distribution of participants with varying posttest scores on mathematics and attitude, selection of a subset of the intervention group introduces potential variance that cannot be controlled for in the comparison group. Therefore, further within-subject analyses were run for intervention and comparison groups to determine how participants may have changed on these measures over time. While a linear mixed model GLM repeated measures would be the ideal procedure for our purposes, the violations of assumptions and the complexity of the analysis are not warranted at this stage, and individual repeated measures for each group have as much explanatory value for our purposes. The same cautions apply to the interpretation of these results as with previously reported results.

Within-subject ANOVA was conducted on all measures, and this procedure should be assumed to apply to all results reported here unless otherwise noted. Comparison group participants became MORE negative about mathematics overall from the pretest ( $m = 30.26, SD = 9.05$ ) to the posttest ( $m = 46.81, SD = 7.86$ ) assessments;  $t(26) = -5.31, p < .001$ , and approached significant differences on mathematics scores ( $p = .052$ ). Likewise,

experimental group participants also were more negative about mathematics overall from pretest ( $m = 28.9$ ,  $SD = 1.17$ ) to the posttest ( $m = 47.26$ ,  $SD = 8.55$ ) assessments;  $t(30) = -7.10$ ,  $p < .001$ . Participants in the experimental group were also lower on mathematics confidence ( $m = 57.32$  and  $54.97$ ,  $SD = 13.35$  and  $15.70$ ),  $t(30) = 2.18$ ,  $p = .037$ ; on mathematics enjoyment ( $m = 58.74$  and  $55.84$ ,  $SD = 11.86$  and  $14.03$ ),  $t(30) = 2.18$ ,  $p < .001$ ; and mathematics scores ( $m = 50.19$  and  $45.00$ ,  $SD = 6.86$  and  $12.58$ ),  $t(30) = 2.18$ ,  $p = .037$ .

Lower scores for comparison group members might be explained by participants not being able to correctly assess their own mathematics skills prior to taking a mathematics course. There are only two required mathematics courses for teacher candidates, and taking the measures toward the end of class (when final tests begin to reveal possible gaps in their knowledge and thus create lower confidence) could explain this. But this does not explain differences for the intervention groups. However, because so few of the intervention group actually fully complied with the protocol, their experiences were relatively similar to those of the comparison group. Therefore, the analyses were run again with a subset of intervention group members who played the game at least 5 times. Data were also further examined for outliers and one case was removed for the posttest analysis and one case for the game attitude scale.

Paired-sample t-tests for the subset of the intervention group (those played more than 4 times) revealed that posttest scores were unchanged over time, lending support to the idea that gameplay may have remediated what would otherwise have been reduction on posttest mathematics score experienced by all others in the study ( $m = 55.40$  and  $55.30$ ,  $SD = 4.08$  and  $4.55$ ),  $t(9) = .114$ ,  $p = .912$ . Similar analyses for those who played 4 times or less indicated a significant drop in posttest scores ( $m = 47.75$  and  $40.40$ ,  $SD = 6.73$  and  $12.48$ ),  $t(20) = 3.33$ ,  $p = .004$ . The ratio of standard deviations is 2-1, indicating unequal variance in the pre- and posttest scores, but no outliers were found and these analyses are only for the purposes of discussion.

Comparison group participants also were lower from pre- to posttest on measures of motivation ( $m = 58.73$  and  $54.73$ ,  $SD = 9.33$  and  $12.13$ ),  $t(10) = 2.29$ ,  $p < .05$ , and higher on overall negative attitude toward mathematics ( $m = 28.55$  and  $46.64$ ,  $SD = 6.17$  and  $8.72$ ),  $t(10) = -4.36$ ,  $p = .001$ . Intervention group members were similarly lower on motivation ( $m = 58.73$  and  $54.73$ ,  $SD = 9.33$  and  $12.13$ ),  $t(10) = 2.29$ ,  $p < .05$  and higher on overall negative attitude toward mathematics ( $m = 28.55$  and  $46.64$ ,  $SD = 6.17$  and  $8.72$ ),  $t(10) = -4.36$ ,  $p = .001$ , when controlling for those who played more. Again, such results cannot be fully interpreted and future analyses will be able to detect any differences more reliably.

### ***Conclusion***

While no results can be interpreted with confidence, the trends are for the most part in the anticipated direction, providing preliminary support for the efficacy of the game. Those who played the game more appear to have done better overall by the end of the study. And despite the problems and glitches with the game and the stress of being at the end of the semester, game players still felt overall that games were an effective instruction tool for mathematics. Phase II of the study will help to answer the research questions more

definitively, as we will analyze those data separately and, where warranted, in combination with phase I participants.

## **Phase II: Fall, 2013**

### **Participants**

We are working with two, intact mathematics education courses; one with 50 students and another with approximately 20. Because we recruited from across all courses in the Spring, some of these students will be ineligible for participation this time, so the final number is expected to be between 35 and 50. Because PM is designed to be integrated into preservice teacher education courses, this phase will have more ecological validity (all participants will be using it as intended as part of a class for grade, rather than for payment).

### **Method**

All instrumentation will remain the same, except that PM is now a complete product with the addition of a teacher portal for scaffolding how to play PM and integrate it for teaching purposes. The game is also fully functional, with bugs and suggested features and modifications from phase I now implemented.

Participants will be required to generate a lesson plan around the use of either PM or another set of technology resources as specified by the teacher. They will be required to interact with the product fully (e.g., for PM, play all the games to the end) and then choose one of them to write a lesson plan around. This is expected to take 10 hours for the game/resource, and 10 hours for the lesson plan. They will get class credit for their lesson plan.

This is expected to result in higher participation and protocol compliance, and to emphasize the pedagogical nature of the product as a learning and teaching tool. Participants will be screened for prior participation, and those who have already participated will be assigned to the comparison group but will NOT be included in final analyses. Those who have not participated will be randomly assigned to comparison and experimental treatments.

They will first complete pretests as described earlier, then the treatment or comparison group activity, and then complete posttest. This will happen during October and the first part of November.

We will analyze results and write them up for a final report in December, and use them also to present at an international conference, to which we have submitted a proposal and expect to be accepted shortly.

**Proceedings Submission**

**Title of the Submission:** Indigenous Knowledge System: Osage-Pawnee-Lakota Oral Tradition and Intercultural Education

**Author:** Victoria M. Graves

**Affiliation:** University of Arizona

**Address:** 9901 N. Oracle Rd, Oro Valley, AZ 85704

**Email:** [vgraves@email.arizona.edu](mailto:vgraves@email.arizona.edu)

**Presentation Format:** Workshop Session

**Abstract:**

This workshop will be an interactive intercultural immersion session based on my work as an Osage (American Indian) spiritual practitioner of fifteen years. My intent is to introduce a methodology of Indigenous Education that will provide participants with an indoor creative space so they can experience an Indigenous Knowledge System of oral tradition through story, song, and collective interaction. My approach is based on a natural world ritual called a “willow walking stick creative methodology.” The objective of the workshop is to engage the participants in a group activity that forms a praxis for spiritualizing pedagogy. My Indigenous Education work is grounded in the appreciation of the natural world by utilizing collective voice, dialogue, and creativity. This process elevates our collective sensorial perception toward gaining respect for and dialogue between differing cultures relative to a positive Intercultural Education group exercise. The participants will experience an Indigenous language of oral traditional story, song, and practice that will help mirror the storytelling genre of the “willow walking stick creative methodology.” Overall, the workshop will provide the audience with an opportunity to appreciate the flow of respectful dialogue, creativity and well-being that is supportive of Indigenous Knowledge System within an Intercultural Education learning environment.

## Abstract

Title: Teasing and Bullying Prevention for the Young Child

Abstract: The purpose of this workshop is to help educators gain an understanding of why some kids tease and bully and how an adult might intervene. Participants will learn specific strategies how to teach children to create social groups that aren't defined by excluding others. We will look at and discuss the social lives of children and help teachers and parents who are trying to understand how to prevent exclusion and how to support children.

**“The more kids are aware of what bullying is the better. Simple teasing can really take a toll on a kid. We just want kids to know bullying when they see it, so they can at least try and stop it. - Carl Sousa**

Bullying happens when: a student is exposed, repeatedly and over time, to negative actions on the part of one or more students. (D. Olweus, 1993). Many students are identified as *at-risk* with social/emotional, behavioral and learning issues who are struggling with success. Several of these students are being recommended to special education, but are falling short of eligibility requirements, thus lacking the support they need to succeed. “With appropriate early services, referral to special education may be prevented for children showing early indicators of behavioral maladjustment”. (Baker, J.A., Kamphaus, R.W., Horne, A.M., & Winsor, A.P., 2006). Researchers have found evidence that prevention services must include helping children develop the prosocial competencies needed to mediate the school environment, in addition to remediation of academic and/or behavioral deficits. (Baker, J.A., Kamphaus, R.W., Horne, A.M., & Winsor, A.P., 2006).

There are many types of bullying behaviors, which have been seen in children as young as preschoolers. The most successful way to end bullying behaviors is through preventative education. Markers of Bullying include: Imbalance in power or strength, intent to harm., threat of further aggression (B. Coloroso, 2003). Some types of bullying are: Teasing with the intent to hurt/harm, Name calling, Threats, and Saying things to hurt feelings. (Bailey, T.L., 2002).

## 6. Abstract

Seminars are one of the learning styles in university classes in Japan, and they play significant roles for students' learning. First, various activities in seminars are effective for students in generating motivation and acquiring satisfaction. Writing theses, reading books and articles, making presentations, asking questions, discussing, conducting fieldwork or a survey, and planning some sort of events or workshops are typical of seminars. Second, seminars promote a variety of abilities which include collecting information, analyzing information, solving problems, and communicating with others. Some researchers have reported that seminars develop cognitive skills, critical thinking, and generic social and cooperative skills. Finally, teachers are able to provide more individual, careful and polite instructions for students in seminars. In other words, seminars represent a community which is comprised of a teacher and students.

As previously mentioned, most teachers and researchers have focused on positive effects of seminars. However, little research discusses the relationship between methods of seminars and learning outcomes such as generic skills through seminars based on empirical studies. Additionally, assessments by students have not yet become a subject of research about seminars. Therefore, it should be significant that researchers conduct an empirical survey for teachers and students who study in seminars.

The purpose of this study is to investigate motivations for learning, senses of communities, acquiring expertise, growth in generic skills, and satisfaction in undergraduate seminars for second, third, and fourth year students, and then to consider the relationships among these factors. In this study, we conducted a survey using two questionnaire forms. One is for teachers who run seminars on the basis of five features to understand lesson structures of seminars: understanding learners' characteristics, setting educational goals, setting learning goals, performing learning activities, and teachers' instruction. The other is for students who attend seminars on the basis of five features: motivations for learning, senses of communities, acquiring expertise, growth in generic skills, and satisfaction.

We surveyed 600 seminars, of that 114 completed these questionnaires. First, we analyzed the data using exploratory factor analysis. The results suggest that students are aware about seminars serve as a community for interaction among a teacher and students as well as a means of professional education, and they appreciate the seminars' value that exceeds at improving their expertise. Next, we divided the 1293 students' data into "Within model" and "Between model" categories, because the multilevel data collected in this study includes individual and seminar levels, and calculated the correlation coefficients using multilevel correlation analysis. The results indicate that the following three variables correlate positively with growth in the skills of problem solving and personal relationship development, and satisfaction in seminar levels: (1) students' motivations for learning in cooperation with others; (2) students' senses of communities such as cohesion and reciprocity; and finally, (3) students' acquisitions of expertise.

From Preservice To Inservice: Transferring Linguistic, Cultural, and Technological Awareness  
into Teaching Practice

Teacher Education

Paper Session

The continuing linguistic, cultural and technological diversity among K-12 students and the increasing influence of Internet technologies on learning bring challenges in teaching to today's teachers, this research presentation includes a literature review, research questions, methodology, and a model of effective teacher linguistic, cultural and technological awareness transfer.

Congcong Wang

Languages and International Studies

Brigham Young University - Idaho

wangc@byui.edu

**Abstract**

In a pilot study on native-English-speaking preservice teachers' perceptions of learning a foreign language online, Wang (2012) suggested that pre-service teachers perceived that their experience as new language online learners increased their linguistic, cultural and technological awareness, which would further benefit them when working with diverse students. However, the pilot study was unclear about whether teachers perceived they transfer their awareness into teaching practice in a shift from preservice to inservice teachers. Therefore, extending the pilot study, the follow-up study conducted in 2012 explored inservice teachers' perceptions of linguistic, cultural and technological awareness transfer. This follow-up study suggested a model for teacher linguistic, cultural and technological awareness development and transfer, as well as a discussion of issues related to teacher awareness transfer.

Abstract:

This paper describes a collaborative research project between a Hispanic-serving community college and a large urban university to address how to recruit, retain and inspire underrepresented community college students through a summer research internship program. This project is funded by the NASA Curriculum Improvements Partnership Award for the Integration of Research (CIPAIR) program through a three-year grant, the ten-week summer research internship program which provides opportunities for freshmen and sophomore community college students to participate in engineering research under the supervision of a university professor and a graduate student mentor at the four-year university research facility.

## **Introduction**

Over the past few decades there has been a consistent rise in participation in high school athletics. According to the National Federation of High School Sports there is now an estimated 7.6 million athletes in the United States that compete in high school interscholastic athletic competition. With a constant increase in athletic participation, safety has become a national concern. The National Athletic Trainers Association (NATA) along with numerous other allied health and medical professions agree that certified athletic trainers (ATCs) should be involved in the everyday operation of interscholastic sports in order to deliver medical care to athletes (Lyznicki 1999). Numerous states have taken the steps to implement legislation designed to protect athletes such as requiring schools to employ healthcare professionals, having written emergency action plans, and passing concussion legislation. Rural areas experience disproportionate health disparities and often have fewer healthcare resources (Pleis & Lethbridge-Cejku, 2007). There is little research examining the management of secondary school sports programs and the health care provided to athletes in rural areas. The purpose of this study is to determine the level of medical care and coverage that is provided to secondary school athletes in a rural state in Appalachia.

## **Methods**

A cross-sectional survey was administered online in the spring of 2013. Through collaboration with the state Department of Education the SurveyMonkey survey link was sent to all public high school principals throughout a rural Appalachian state.

The Self-appraisal Checklist for Health Supervision in Scholastic Athletic Programs was used to assess health care coverage for high school athletes (American Academy of Pediatrics, 1993). Questions were combined to measure four main categories: 1. Organization,

Meeteer, W. R., Schneider K. R., Nolan, J. A., & Campbell, H. D.

administration, and staffing; 2. Facilities and equipment; 3. Event coverage; & 4. Education.

Open-ended qualitative questions assessed barriers and facilitators to successful sports medicine programs.

### **Data Analysis**

Analysis included descriptive statistics and group comparison conducted through One-way ANOVA with Tukey's post hoc test to assess mean differences in the four categories by school size.

### **Results**

Sixty-two schools were represented in the study. The majority (80%) reported that their school was in a rural setting. School size included 1A (43.5%), 2A (19.4%), and 3A (35%). No significant difference was found between size of school (1A-3A) and Athletic training education, Event coverage, or Facilities and equipment. There was a significant difference however in the Organization, administration, and staffing ( $F(2,46)=5.206$ ;  $p=.009$ ). Tukey Post hoc test showed that 3A schools had significantly greater organization, administration, and staffing when compared to 1A ( $p=.042$ ) and when compared to 2A schools ( $p=.014$ ). The majority (90%) provided medical training personnel at football practices and games. This coverage was much less for all other sports. Only 43% reported that an emergency action plan is in place always, 11% reported sometimes, 5% seldom, 16% never, and 25% did not know. Concerning CPR certification, 33% reported that coaches were CPR certified always, 25% reported sometimes, 11% seldom, 7% never, and 24% did not know. The majority of participants reported limited funding and inability to fill open positions as barriers to a successful sports medicine program.

## **Discussion**

Important issues can and should be discussed based on the results including significant differences between 1A and 3A high schools in the area of organization, administration, and staffing; the level of health care provided during games and practices; and knowledge of the health care provided. Money will always play a major role in the quality of services provided. Larger 3 A schools with more students and tax dollars have the ability to provide more services than 1A schools. Almost 90% of schools always provided trained medical personnel for football practices and games. This statistic shows quality compliance with state regulations requiring school to provide medical services for all football practices and games. Under the current state regulations secondary schools are only required to provide medical services for football. The survey data shows no other sport received medical services even 40% of the time. Another big concern from the survey is the principals lack of knowledge. Almost 25% reported not knowing if there was an emergency action plan in place or if coaches maintained current CPR or First Aid training.

Currently there are no known state plans in place to fix any of the issues emerging from this data. In the future school and sport governing bodies need to look into educating school administration on current regulations and requiring higher levels of medical services be provided to all interscholastic sports (i.e., requiring coaches to keep current CPR and First Aid certifications, requiring all schools to develop an emergency action plan, and providing more medical care to all sports not just football). Future research and interventions should examine best practices for increasing compliance and protecting high school athletes in rural areas with existing health care disparities.

## **Case Studies in Peace Education through Peace Museums :**

### **A Trip to Hiroshima and Nagasaki**

Kazuyo Yamane

Ritsumeikan University

#### **Abstract**

The research objective is to find roles of peace museums in peace education in a trip to Kyoto, Hiroshima and Nagasaki by students from the United States, Japan, China, Korea, etc. This trip started in 1995 when the atomic bomber was exhibited at the Smithsonian Institution without showing the result of the atomic bombing such as photos of suffering atomic bomb survivors. Students visited Kyoto Museum for World Peace, Hiroshima Peace Memorial Museum, Nagasaki Atomic Bomb Museum and Oka Masaharu Memorial Nagasaki Peace Museum in August. The methodology is participatory: the author visited these peace museums with such international students. One of the expected outcomes is that peace museums can play important roles in promoting better understanding of history, and education for peace and reconciliation. Students have different history concepts and their visit of peace museums tends to make them think of the other side's historical viewpoints. This happened between American students and Japanese students as well as between Chinese/Korean students and Japanese students. Better understanding of history tends to lead to promoting

reconciliation and peace, and peace museums should be used for peace education more.

## **I. Introduction**

In 1995 the Enola Gay, the atomic bomber, was exhibited at the Smithsonian Institution commemorating the 50<sup>th</sup> anniversary of the atomic bombings, but artifacts and photos of atomic bomb survivors were not exhibited. However, they were exhibited at American University in Washington D.C. Then a peace trip to Hiroshima stated in 1995 by Professor Atsushi Fujioka of Ritsumeikan University and Professor Peter Kuznick of American University. They started to take their students to Hiroshima in 1995 and then they added a trip to Nagasaki in 1996. In 2011 students of the author's class called "Peace Studies Seminar" started to join them: there are international students from various countries such as China, the Republic of Korea, England, Thailand, and so forth. The class was named "the most creative and innovative" summer program in North America by the North American Association of Summer sessions according to the following website.

( <http://peacephilosophy.blogspot.jp/p/hiroshimanagasaki-summer-tour-2012.html> )

Students in various countries tend to have different historical concepts. American students tend to learn that the atomic bombing was necessary without learning the result of the atomic bombing such as atomic bomb survivors' suffering from effects of the atomic bombing. On the other hand, Japanese students tend to learn simple facts of the atomic bombing, but modern history tends to be skipped at school because it is often excluded in entrance examinations to universities. However, children in Hiroshima and Nagasaki usually study historical facts of the atomic bombing and the suffering of atomic bomb survivors though they do not learn the result of Japan's aggression such as people's suffering in China and Korea much.

Chinese and Korean students tend to learn that the World War II was ended because the atomic bombs were dropped on Hiroshima and Nagasaki. They also do not learn the result of the atomic bombing and the atomic bombed victims' suffering. They tend to learn Japan's aggression of other Asian countries and how much people suffered from Japan's aggression. On the other hand, Japanese students do not study Japan's aggression at school and public peace museums. There tend to be big gaps of historical concepts between Chinese/Korean students and Japanese students.

How did they study different histories in the trip? What happened to their historical concepts after the trip? This article examines the history education for peace and some roles of peace museums.

## **II. Different Concepts of History of Students among Japan, the USA and China/Korea**

### **1. Different Concepts of Atomic Bombing**

The trip to Hiroshima and Nagasaki in 2013 was different from an annual event because Oliver Stone participated in a seminar in Nagasaki. He is a well-known American film director who received three Academy Awards for his work on the films such as *Platoon*, and *Born on the Fourth of July* about the Vietnam War, in which he had participated. He also produced films that criticize corruption and conflicts of American government. A book of *The Untold History of the United States* was written by Oliver Stone and Peter Kuznick, a professor of history and director of the award-winning Nuclear Studies Institute at American University. It was published in 2012 and a 10 part documentary film series was broadcast on Showtime in the United States in November 2012. It was also broadcast on NHK TV in Japan in 2013.

It is shocking to know that “Erroneously convicted that the bombs had ended the

war, 85 percent of the American public approved of their use.” (Kuznick & Stone, 2012, p. 176) The authors wrote that it is unknown to most of the public that “many U.S. top military leaders considered the bombings either militarily unnecessary or morally reprehensible.” (Kuznick & Stone, 2012, p. 176) For example, Truman’s chief of staff, Admiral William Leahy, who chaired the meetings of the Joint Chiefs, proclaimed as follows: “the Japanese were already defeated and ready to surrender....The use of this barbarous weapon at Hiroshima and Nagasaki was of no material assistance in our war against Japan. In being the first to use it we adopted an ethical standard common to the barbarians of the dark ages.”(p. 176) It must be surprising for Americans to know that it was not necessary to drop the atomic bombs on Hiroshima and Nagasaki reading such American leaders’ testimonies.

The authors also clarified that what made Japan decide to surrender was not the atomic bombing but the Soviet’s entry into the war as follows: “Though the atomic bombs certainly contributed to the Japanese decision to surrender, they were ancillary to U.S. island hopping, bombing, and blockade and to the dramatic impact of the Soviet invasion, which convinced the Japanese leaders that even holding on for the last decisive battle on the Japanese mainland was no longer a viable option.” (p. 178)

Gar Alperovitz, an American historian, also criticizes the atomic bombing saying that “Quite simply, it is not true that the atomic bomb was used because it was the only way to save the “hundreds of thousands” or “millions” of lives as was subsequently claimed.” (Alperovitz, 1995, p. 629) He also insisted that it was not necessary to use the atomic bombs as follows:

It is clear that alternatives to the bomb existed and that Truman and his advisers know it ... Why then were the atomic bombs used? ... Some

writers also suggest that because huge sums were spent developing the new weapon, the US political leadership found it impossible not to use it. Most relevant to the Smithsonian flap is substantial scholarly acceptance of the once controversial idea that diplomatic issues – especially the hope of strengthening the West’s hand against the Soviet Union – played a significant role in the decision. (Alperovitz, 1994)

What he meant by “alternatives to the bomb” was to guarantee the continuation of the emperor system in the Potsdam Declaration. Alperovitz insisted, “We must also note that all along – as Truman subsequently acknowledged on many occasions – it appears to have been clear to those concerned that in the end the Emperor would in any event almost certainly have to be retained to command a cessation of the fighting and to maintain internal order. (And, of course, five days after the bombing of Hiroshima, his position was in fact assured by the president.) (Alperovitz, 1995, 632)

However, such a condition was deleted by President Truman from a draft of the Potsdam Declaration in order to drop the atomic bombs as experiments. (Kimura & Kuznick, 2010, p. 19) An atomic bomb made from uranium-235 was dropped on Hiroshima on August 6 while an atomic bomb made from plutonium-239 was dropped on Nagasaki on August 9 1945. Why were the two different types of the atomic bomb used though Japan was seeking to end the war through the Soviet Union as a mediating power (Yamane, 1995, p. 11) It is clear that the atomic bombs were used as a human experiment because “a test of plutonium type atomic bomb was successful, but it had not been used at an actual fighting.” (Kimura & Kuznick, 2010, 190) The ABCC (Atomic Bomb Casualty Commission) was founded in Hiroshima in 1947, but only health examinations of atomic bomb survivors were done without any treatment. This means that atomic bomb survivors were treated as guinea pigs.

In Nagasaki students were very lucky to have Oliver Stone as a guest at a seminar.

A student asked Oliver Stone how the two authors of the book started to write it. Professor Peter Kuznick said that he showed Stone's films at American University and his students suggested they meet Oliver Stone. Professor Atsushi Fujioka mentioned in his book review that it was an interesting combination of an artist and a historian. (Fujioka, 2013) Students were very impressed to watch the film of "The Untold History of the United States" when it was shown to them. Since only a part of the film on the atomic bombing was shown, they said that they also wanted to watch other parts of the film. It seems that their historical concepts were greatly changed by the film.

## **2. Atomic Bomb Survivors' Testimonies**

Though there are differences of historical concepts on the atomic bombing among students in the United States, Japan, China and Korea, students seem to learn much about the horror of nuclear weapons listening testimonies of atomic bomb survivors in Hiroshima and Nagasaki. The students were said to be the last generation who can listen to atomic bomb survivors directly because the survivors are getting very old and they tend to pass away. They also started to think that they needed to disseminate the atomic bomb survivors' memory to other people, especially to children and young people so that nuclear weapons would never be used again. The following is some students' responses to atomic bomb survivors' testimonies.

A student wrote an essay that she was most impressed by Koko Kondo's story. She was atomic bombed in Hiroshima when she was only eight-month old. Her father is the Reverend Mr. Kiyoshi Tanimoto whose experiences in Hiroshima are vividly described in John Hersey's book called *Hiroshima*. (Hersey, 1972, p. 2-7) It was published by *The New Yorker*, a leading American weekly magazine in its August 31, 1946 issue, almost a year after the atomic bombing. It describes what life was like for atomic bomb victims who survived a near attack. Since Koko Kondo was only 8

month-old when the atomic bomb was dropped on Hiroshima, she has no memory at that time. However, she said that she learned the horror of an atomic bomb watching burn scars that seemed to pull tight in faces and bodies of neighbors. She often thought of taking her revenge on a pilot of the bomber called Enola Gay for dropping the atomic bomb and killing and injuring many people in Hiroshima. When she was ten, she went to the United States to attend a TV program where her father met Robert Lewis, a copilot of the bomber. Her father took twenty-five women who were going to have an operation for burns in the United States at that time. Koko was very shocked to meet Robert Lewis because tears formed in his eyes when he was asked a question about his thought after the atomic bombing by a TV caster. He wrote, "What have I done?" in his diary, but it is said that such an attitude was criticized by the government and he had to stay in mental hospital. Koko Kondo realized that he had also suffered from the atomic bombing and her hatred toward him decreased, she said. She said to the students, "War hurts both sides leaving only sadness" with tears in her eyes. A student wrote that she learned that tremendous courage was necessary to forgive enemies who you had hated.

The students also listened to Mrs. Keiko Ogura who was about 2.4 km away from the epicenter of the atomic bomb. She founded Hiroshima Association of Translators for Peace in 1984 and has been active to inform foreign visitors of the result of the atomic bombing using English. She said to the students, "Foreigners come to Hiroshima to see what happened in Hiroshima and also to learn how people in Hiroshima recovered their energy overcoming hatred." A student said that she learned it was important to make the tragedy a good chance to make the better future. A student from Turkey said, "It would be normal to think of revenge after an atomic bomb was dropped because people suffered so much. But it is wonderful that atomic bomb

survivors have been working hard to abolish nuclear weapons.” It is important to learn from such atomic bomb survivors though they have been suffering physically and mentally. There has been no apology and compensation by the US government, which makes the situation worse.

In Nagasaki Mr. Sumiteru Taniguchi aged 84 talked about his horrible experiences showing his photograph of his back which had been seriously burnt. He said, “I almost died after the atomic bombing. However, I decided to live after going through many operations because I need to convey the horror of atomic bombs to future generations.” Listening to him, a student wrote, “I’d like to convey atomic bomb survivors’ strong messages for peace to the next generation.”

Students attended a peace ceremony at Shiroyama elementary school in Nagasaki before they attended an official Nagasaki peace ceremony on August 9. The school was only 500 meters away from the hypocenter of the atomic bomb and many children and teachers died. A part of the school building is used as a peace museum so that children and citizens can learn what happened there on August 9 1945. All the pupils of the school attended the peace ceremony and a representative of each class made a pledge for peace. They sang peace songs, which made the college students feel “we want to protect such lovely children.” A student said that she noticed why atomic bomb survivors had been working so hard for the better future.

Such atomic bomb survivors are getting very old and they tend to pass away. How is it possible to convey the horror of nuclear weapons and the preciousness of peace to the next generation? Peace museums have been playing important roles to promote peace education and history education for peace. Before they went to Hiroshima and Nagasaki, they visited Kyoto Museum for World Peace at Ritsumeikan University. In the trip to Hiroshima and Nagasaki, students visited Hiroshima

Memorial Peace Museum, Nagasaki Atomic Bomb Museum, Nagasaki National Peace Memorial Hall for the Atomic Bomb Victims and Oka Masaharu Memorial Nagasaki Peace Museum. What were their responses to these peace museums?

### **III. The Roles of Peace Museums**

Before students visited Hiroshima, they visited Kyoto Museum for World Peace at Ritsumeikan University in Kyoto. First, some peace museums will be briefly explained and students' responses will follow.

#### **1. Peace Museums that Students Visited**

In 1992 Ritsumeikan became the first university in the world to open a peace museum. It shows not only the history of war and peace movements but it also helps each of visitors think about what they as individuals can do to promote the cause of peace. While it is important for human beings to be able to live without fear, just being alive is not enough. "Having a goal and devoting our energies to achieving it makes life worth living. However, there are many things in the world today that prevent us from leading such a life. While it is important for governments and the United Nations to work to eliminate these problems, there is much that ordinary people, working as individuals and through non-governmental organizations, can do to help. It is our hope that the exhibits will serve as a place where together, we can think about what we can do for peace" according to Professor Ikuro Anzai, honorary director, on its website: <http://www.ritsumei.ac.jp/mng/er/wp-museum/> It is possible to say that Kyoto Museum for World Peace is a comprehensive private peace museum in Japan.

Hiroshima Peace Memorial Museum was founded in 1955 in Hiroshima. The aim is to ensure that the reality of the nuclear bombing is passed down to future

generations and to spread “the spirit of Hiroshima” which entreats the realization of total abolition of nuclear weapons and an eternal world peace. (Yamane, 2008, p. 41)

In the East Building the story of Hiroshima before and after the atomic bombing is displayed. In the main building the story of August 6 is explained using photographs, the belongings of A-bomb victims, and other artifacts. An emphasis is put on the atomic bombing and atomic bomb survivors’ suffering while Japan’s aggression is not exhibited much. The details on the museum and the Peace Memorial Park are available on the website in English: <http://www.pcf.city.hiroshima.jp/>

Nagasaki Atomic Bomb Museum was founded in 1955 in Nagasaki City. The purpose of the Nagasaki Atomic Bomb Museum is “to disseminate the reality of the atomic bombing and citizens’ wishes for peace in Japan and the world and to contribute to the abolition of nuclear weapons and the realization of peace” according to the returned questionnaire which the author sent. As for the exhibition, the section as a prelude to the main exhibits introduces the scenery and customs of Nagasaki just before the atomic bombing. A clock that stopped at 11:02 a.m., the moment of the explosion, is displayed to show how the people were destroyed in an instant. By exhibiting the devastating scene of Nagasaki just after the atomic bombing, this section provides visitors with an understanding of the fearsome destructive power and horrors of the atomic bombing. The section of “Toward a World free from Nuclear Weapons” provides visitors with an opportunity to think about issues related to war, nuclear weapons and peace in order to realize a world without nuclear weapons. Documentary films related to the atomic bombing are shown in the Video Room. The facilities include a Q&A corner regarding the atomic bombing and peace, and a reference system to find documents such as Nagasaki's Peace Declaration according to its website as follows:

[http://www1.city.nagasaki.nagasaki.jp/abm/abm\\_e/index.html](http://www1.city.nagasaki.nagasaki.jp/abm/abm_e/index.html)

There is also Nagasaki National Peace Memorial Hall for the Atomic Bomb Victims which was founded in 2003 in Nagasaki City. It was founded by the Japanese government “to convey the hardship of the atomic bomb victims to the future generations and pray for peace” according to *Muse* 9 published in September, 2003. (*Muse* newsletter of the Japanese Citizens Network of Museums for Peace has been edited by Masahiko Yamabe, Ikuro Anzai and the author twice a year both in Japanese and English. It is available on the website of the Center of the Tokyo Raids and War Damage: <http://www.tokyo-sensai.net/>.) The main functions of the Memorial Hall are to provide places to pray for those who died after exposure to the atomic bombings, and to encourage people to contemplate peace. It also maintains archives of materials on the atomic bombings and radiation illnesses, and serves as a center of international cooperation and exchange according to its website. The website is written in English, Chinese, Korean and Japanese as follows: <http://www.peace-nagasaki.go.jp/eng/ftop.html>

Oka Masaharu Memorial Nagasaki Peace Museum was founded in 1995 in Nagasaki City. It was founded by citizens “to shed light on Japan’s aggression through the presentation of historical facts and to keep alive the legacy of the late Rev. Oka Masaharu, who devoted his life to calling Japan to account for damages and suffering by Japan’s aggression” according to the museum guide. The museum plays an important role in peace education with an emphasis on Japan’s aggression in spite of some nationalists’ criticism of the museum. It is impressive that German conscientious objectors used to work there, and the members of the peace museum have been working hard for reconciliation with Chinese victims of Japan’s aggression. The details are available on the website in English and Japanese as follows: <http://www.d3.dion.ne.jp/~okakinen/>

## **2. Students Responses to the Peace Museums**

The students visited such five peace museums and learned what happened in Hiroshima and Nagasaki as well in China and Korea during World War II. Public peace museums such as Hiroshima Memorial Peace Museum, Nagasaki Atomic Bomb Museum and Nagasaki National Peace Memorial Hall for the Atomic Bomb Victims tend to put an emphasis on the atomic bombing which is the victim side of Japan during the war. The same thing can be said in other public peace museums according to the author's questionnaire conducted in 2001. (Yamane, 2006, p. 47) Oka Masaharu Memorial Nagasaki Peace Museum is a private peace museum where there is relatively freedom of speech whereas directors of public peace museums tend to make exhibitions on Japan's victims side of the war only without showing Japan's aggression. This is because nationalists tend to criticize exhibitions on Japan's aggression since the 1990s. Kyoto Museum for World Peace is also private and it has freedom of speech because it exists on campus: exhibitions are based on peace research and well balanced, which means that not only Japan's victims side of the war but also Japan's aggression is honestly exhibited. This is a good start of the students' visit to prepare for their trip to Hiroshima and Nagasaki.

What were their responses to these peace museums? It seems that American students tend to be shocked to see exhibitions at the Hiroshima Memorial Peace Museum and Nagasaki Atomic Bomb Museum. This is because they learned that the atomic bombing ended World War II and many American soldiers did not have to die fighting against Japan. An American student mentioned that he had not learned the result of the atomic bombing: how much Japanese people suffered from the atomic bombing. Chinese and Korean students also learned in their history class that the

atomic bombs ended World War II and many lives in China and Korea were saved. However, they were also shocked to know how horrible the atomic bombs were.

On the other hand, Japanese students tend to be shocked to know Japan's aggression exhibited at Oka Masaharu Memorial Peace Museum in Nagasaki. This is because they did not study Japan's aggression such as Nanjing Massacre and women who were forced to work as sexual slaves by Japanese military during the war. A Japanese student said that it was important to understand Chinese and Korean suffering by Japan's aggression because this would be the first step to understand history and create the peaceful world.

It seems that students from Japan, China, the Republic of Korea and the United States learned the history of World War II from different viewpoints and understand one another more than before.

#### **IV. Conclusion**

The trip to Hiroshima and Nagasaki promoted the students' better understanding of history for peace and reconciliation. Atomic bombed survivors are getting older and older and it is hard to have a chance to listen to their testimonies directly. Under such circumstances, peace museums can continue to play important roles to promote peace education. It is encouraging to know a student who changed her attitude toward her grandmother. She was not interested in listening to her experiences during World War II, but she said that she began to think of listening to her story after visiting Hiroshima and Nagasaki. She even said that she would need to convey what she learned from atomic bomb survivors to the next generation. Professor Peter Kuznick said that the trip tends to become a life-changing experience for American students. The same thing can be said among students from Japan, China and Korea also.

Last but not least it is regrettable that Japanese students did not have a chance to learn what happened to American soldiers in Pearl Harbor. It would be worth considering an inclusion of studying the result of Japan's attack of Pearl Harbor in the future peace trip.

## **Introduction**

When the word “test” is mentioned, people tend to think that tests are typically used to evaluate students on various learning outcomes. However, there is an emerging trend now in education (e.g., value-added-evaluation) where the testing of students is used to evaluate quality of teacher practices as well as the effects of programs or interventions in the entire educational system. When poor test results are present at the individual student level, we would conclude that the students did poorly on the test and that by inference they failed to learn what they were supposed to learn. If poor test results are looked into at the school level, researchers tend to conclude that the schools have failed to help their students to learn and that by inference teachers ought to be blamed for their responsibility of poor instructions. As a result, proposals and plans are usually made for immediate action of improvement. The United States of America is a country often called a "nation of immigrants", there are so many factors affecting schooling and the school outcomes and student outcomes given the diversity of students in today’s schools. When test scores are used to make inferences about school outcomes and education policy, shall we ask what exactly test scores can tell us and what unobservable factors influence students’ scores?

Many studies have examined students’ achievement with respects to the predictors of social economic status (SES), race, and/or gender differences. For example, researchers claim that poor academic performance and underachievement among ethnic minority youth, compared with Caucasian youth, is a well-documented and pervasive problem in contemporary American public schools (e.g., Becker & Luthar, 2002; Jencks & Phillips,

1998; Vanneman, Hamilton, Anderson, & Rahman, 2009). Achievement disparities are especially baffling for ethnic minority boys who increasingly lag behind not only their Caucasian male counterparts, but also girls within their own ethnic group (Coley, 2001). Among African Americans, for example, girls achieve more academic success than boys from middle school (Jordan & Cooper, 2003). Similar academic patterns favoring girls over boys have been documented among Latino youth (e.g., Portes & Rumbaut, 2001; Suárez-Orozco & Qin-Hilliard, 2004). However, the importance of parents' expectation and peer support on adolescents' academic achievement has been underscored by many theorists and researchers. Therefore, this study aims to explore how unobservable factors, for example, family and peer support, influence adolescents' achievement and how does one quantitatively describe these unobservable factors/constructs. One exploratory factor analysis (EFA) and two separate confirmatory factor analysis (CFA) were applied to the dataset of the Longitudinal Study of American Youth (LSAY), by using Mplus 6.0 (Muthén & Muthén, 1998-2010).

According to Fabrigar et al. (1999), EFA is based on the common factor model. The goal of this model is to understand the structure of correlations among measured variables by estimating the pattern of relations between the common factors and each of the measured variables (Fabrigar et al., 1999). By performing EFA, items with the highest loadings on each factor would be selected to conduct CFA. Unlike EFA, in which the researcher can only specify the number of factors, in CFA researchers can test much more parsimonious solution by indicting the number of factors, the pattern of factor loadings, and an appropriate error

theory (Brown, 2006). In contrast to EFA, every aspect of the CFA model is specified in advance. The acceptability of the specified model is evaluated by goodness of fit. Further, CFA offers a very strong analytic framework for evaluating the equivalence of measurement models across distinct groups (e.g., two achievement groups in this study). Based on the dataset, the grouping variables in this study is *BYS23C* which was coded as 0 = Not recognized for good grades and 1 = Recognized for good grades. By measuring the same factors in the same way in the two different achievement groups, we can answer the question “*are there mean differences on the factor across groups*”. In other words, the CFA results can illustrate if the two factors have the same influence for students who performed well in study and students who got poor grades in high school. This result might be very helpful for making policy with respect to family and peer support on adolescents’ achievement. Hence, CFA framework is superior in terms of its modeling flexibility (e.g., specify partial invariance models) and its ability to examine potential source of invariance in the factor solution, including latent means and indicator intercepts (Byrne, B. M., Shavelson, R. J., & Muthén, B., 1989). These capabilities permit a variety of important analysis in applied study.

## **Method**

### **Data and Samples**

The Longitudinal Study of American Youth (LSAY) is the longest and most comprehensive longitudinal study of a national sample of public school students ever conducted in the United States. It aims to provide a more intensive longitudinal examination of the development of student achievement in middle school and high school, and the

relationship of those patterns to career choices (Miller, J., Kimmel, L., Hoffer, T., & Nelson, C., 1999). For present study, the particular sample was selected from 10<sup>th</sup>-grade cohort which was started in 2001-2002. The sample included  $N = 2,315$  respondents, 50% male ( $n = 1158$ ) and 50% female ( $n = 1157$ ). After discarding the influence of the missing values, the total number of 2052 respondents were measured in EFA. In CFA, the subsample of people who were “*Not recognized for good grades*” included 879 observations and the subsample of people who were “*Recognized for good grades*” included 953 observations.

## **Variables**

According to Little, Lindenberger and Nesselroade (1999) the issue of variable selection is directly related to the quality of the research design and the value of the results. For the present study, the dataset LSAY used to guide variable selection, all variables related to parents and peer support were selected to measure the influence. This is a limitation of this study because the data was not collected based on the purpose of this study, in other words, it was not an experimental design. EFA was performed first to select variables with the highest loadings on each factor. A subset of the variables in LSAY were chosen for EFA because they measured family and peer support on adolescents’ academic achievement. In CFA, the grouping variables is *BYS23C* which was coded as 0 = Not recognized for good grades and 1 = Recognized for good grades. The latent factor family support included four selected variables based on EFA results. They are listed as follows: *BYS86A* - How often discussed school courses with parents, *BYS86B* - How often discussed school activities with parents, *BYS86C* - How often discuss things studied in class with parents, *BYS86G* - How often

discussed going to college with parents. Another five variables were included in the factor of peer support: *BYS90A* - Important to friends to attend classes regularly, *BYS90B* - Important to friends to study, *BYS90D* - Important to friends to get good grades, *BYS90F* - Important to friends to finish high school, *BYS90H* - Important to friends to continue education past high school (see Table 1 for covariance matrix, means, and standard deviations).

### **Data Screening**

Before conducting EFA and CFA, normality assumption and outliers were examined based on descriptive statistics and Q-Q plots (see Figure 1). Based on cutoff values of  $|2.0|$  for skewness and  $|7.0|$  kurtosis (Chou & Bentler, 1995), no variable showed severe violations of normality. However, outliers (e.g., observations 4, 16, 20, 28 in the variable *BYS86A* - How often discussed school courses with parents) existed in data and they were not deleted from the sample because we are interested in the influence of these special cases on study, the influence of outliers will be shown in CFA results. Case study can be designed to analyze the effect of outliers in future.

### **Analysis Plan**

An EFA was performed to confirm two factors structure based on Kaiser's eigenvalues (Kaiser, 1960) and Cattell's scree plot (Cattell, 1966) and determine the optimal number of variables for each factor. Factor loadings were used to select variable and each variable has a high loading on one factor only. Factor determinants close to 1.0 are considered to indicate how well a factor was measured by the variables (Grice, 2001). Stevens (1992) suggests

using a cut-off of 0.4, irrespective of sample size, for interpretative purposes. When the items have different frequency distributions Tabachnick and Fidell (2007) follow Comrey and Lee (1992) in suggesting using more stringent cut-offs going from 0.32 (*poor*), 0.45 (*fair*), 0.55 (*good*), 0.63 (*very good*) or 0.71 (*excellent*). In my study, at least 4 variables would be selected for each factor because too few indicators for factors could cause Heywood problem (cited from Dr. Karen, Nylund-Gibson, EDUC 216B, Winter 2013, UCSB). Two groups CFAs were conducted separately based on the results of EFA. Variables specified for each factor were allowed to freely correlate, except for the reference variable for each factor, which had a loading 1.0. To examine the model fit, I used the following criteria: chi-square test of model fit, Comparative Fit Index (CFI), root-mean-square error of approximation (RMSEA) fit index, and standardized root-mean-square residual (SRMR) fit index. Fabrigar et. al. (1999) suggested that chi-square is highly influenced by large sample; therefore it is appropriate for checking model fit in this analysis, it was expected to be acceptable with  $p < .05$ . According to Brown (2006), CFI is used to assess relative improvement in fit of the model when compared to a baseline mode.  $CFI > .90$  indicates acceptable fit and  $CFI > .95$  indicates good fit. In addition, Brown (2006) also reported that  $RMSEA < .05$  illustrate close fit,  $.05-.08$  constitutes an acceptable fit, and values  $> .10$  are a poor fit of the model data.  $SRMR < .08$  are considered a good fit, and values close to zero are considered a perfect fit.

## **Results**

Firstly, according to Kaiser's method of interpreting eigenvalues greater than 1.0 as

the possible number of factor solutions and Cattell's scree plot examining for the last "substantial" drop in reduced eigenvalues (Dowdy et al., 2001), both confirmed a two-factor solution. Additionally, four variables with highest factor loadings were selected for factor family support and five variables for peer support (see Table 2 for EFA results).

Next, CFA with two-factor were conducted separately based on grouping variables. Fit indices for subsample of people who were "*Not recognized for good grades*" ( $n = 879$ ) were recorded as follows:  $\chi^2(26) = 97.479$ ,  $p < .01$ , CFI = .971, RMSEA = .056, SRMR = 0.031. According to the fit statistics criteria mentioned above, this model fits the data pretty well. According to Brown (2006), modification indices offer suggested remedies to discrepancies between the proposed and estimated model. In a CFA, there is not much we can do by adding regression lines to fix model fit, because all regression lines between latent and observed variables are already in place. Therefore, in a CFA, we look to the modification indices for the covariances. We cannot covary error terms with observed or latent variables. Thus, the only modification available to us is to covary error terms that are part of the same factor. In the present study, one pair of items with highest EPC (BYS90H with BYS90F) was identified and this re-specified model was reanalyzed with the sample sample. The fit indices were recoded as follows:  $\chi^2(25) = 47.204$ ,  $p < .01$ , CFI = .991, RMSEA = .032, SRMR = 0.025. All standardized factor loadings were greater than .57. The figure below illustrates this rule. The model was improved after modification and it fit the data very closely (see Figure 2 for path diagram).

Similarly, the modified model was applied to the subsample of people who were

*“Recognized for good grades”* ( $N= 953$ ). The results demonstrated a pretty good fit as well,  $\chi^2(25) = 83.084$ ,  $p = .00$ , CFI = .977, RMSEA = .049, SRMR = 0.025. All standardized factor loadings were greater than .56. Figure 3 illustrates the standardized parameter estimates and statistical significance for the *“Recognized for good grades”* group sample (see Figure 3 for path diagram) .

### **Discussion**

Using data from the Longitudinal Study of American Youth (LSAY), an EFA and two group CFAs were used to model student achievement in two dimensions (family and peer support) during high school. A major finding of this study was that family and peer support were associated significantly with the students’ grades during high school. Specifically, in CFA with *“Not recognized for good grades”* group, it demonstrates variable BYS90B (*Important to friends to study*,  $\lambda = .809$ ) has a bigger effect on adolescents’ grades. Further, the sample data was collected from the 50 states in the U.S., thus the analysis results can be generalized. The study, however, had various limitations. For example, data was used to guide the selection of predictors, thus only supports from family and friends were examined. Parenting styles, family structures, or the structure of friendship networks may also influence the achievement of adolescents. Future research needs to examine the form and content of family relationships and friend-ships, and the school climate that may also affect students achievement. In addition, the missing data was coded as 999 in this analysis and their influence was not considered. We assume the data missed randomly, however, we are unsure whether the missingness is unrelated to other variables under study. Missing data

analysis should be conducted in future for study accuracy. Last but not the least, future research is needed for measurement invariance testing because the issue of measurement invariance is crucial for studies that investigate group differences and cross-cultural studies. Especially in the United States which is often called a "nation of immigrants", there are so many factors affecting school outcomes and students' achievement. Sub-groups within populations are often heterogeneous with regard to the parameter values of a model. Thus, group comparisons within a multi-culture also require measurement invariance to insure that potential differences (e.g., in means or regression coefficients) can be interpreted reliably (Brown, 2006).

## Title Page for the Submission/Proposal of a Research Paper

1. Title: Examining In-Service Teacher Training for English Language Activities in Japanese Elementary Schools: Discrepancies amongst Local Districts
2. Name: Ai Ohmori
3. Affiliation: Rikkyo University, Japan
4. Address: 3-34-1 Nishi-ikebukuro Toshimaku Tokyo 171-8501
5. E-mail address: aiohmori.jp@yahoo.co.jp
6. Abstract of a research paper ( I would like to submit a full paper to the proceedings at the final submission deadline):

The aim of the present paper is to 1) investigate conditions of in-service teacher training for English language activities in Japanese public elementary schools and 2) indicate what is necessary in order to improve the situation of the present training system. Statistics will be used.

Since April 2011, the introduction of English language activities became mandatory for Grade 5 and 6. Before the introduction of the policy, English language activities were introduced and implemented based on the decisions of individual schools and the local boards of education. Since this created wide discrepancies in the way English activities were conducted, the policy was introduced in order to provide more equal English language activities in Japanese elementary schools throughout the nation.

Perhaps the number of class hours to conduct English language activities, or quantity, became more equal. The author argues, however, because measures that assure quality of the activities such as methodology, curriculum development and teacher training have been left untouched, the discrepancies on the implementation of English language education on quality still strongly remain amongst schools and local districts. In this

presentation, in-service teacher training will be focused.

The author utilizes two sorts of data sets: 1) an original survey that was conducted, and 2) an existing public data set. For the original data set, a survey was sent out to every local Board of Education in Japan by surface mail in the fall of 2011, and received 30 percent of return. It asked about the implementation of English language activities in each local district in detail. The already existing public data set includes data about local municipalities such as the district's population, the number of foreign residents, economic condition, etc. Based on quantitative analyses using SPSS, the following is elucidated: 1) the actual implementation and content of in-service teacher training conducted at the local district level, and 2) its relations with an economic factor of each district.

An expected outcome is that though the introduction of English language activities became mandatory, conditions and content of teacher training remain far from being equal. Furthermore, its implementation is affected by economic factors of local districts. Thus, the author argues that qualities of teachers conducting English language activities are not assured and far from satisfied.

For the presentation, I will first provide a brief history of the current movement towards the introduction of English language education in Japanese elementary schools. Teacher education and license for elementary school teachers in Japan will also be explained. Then, basic information about the survey and data collected will be explained. Finally, the results of data analyses will be reported, and implications for a future policy will be stated.

Learning attitude and motivation of high school EFL learners:  
Examination based on the hierarchical model of intrinsic motivation  
in foreign language learning

Tanaka, Kumiko (Hiro High School)

Tanaka, Hiroaki (Hiroshima International University)

The previous studies (Tanaka, 2009a, 2009b, 2013) proposed *the hierarchical model of motivation in language learning*. It includes trait level, classroom level, and learning activity level. Motivation in trait level is expected to be the most stable. On the contrary, motivation in learning activity level is situational and the most unstable. Motivation in classroom level is moderately stable, but can be influenced by environmental factors. In this study, intrinsic motivation in trait level is called *intrinsic trait motivation*, intrinsic motivation in classroom level is called *intrinsic classroom motivation*, and intrinsic motivation in learning activity level is called *intrinsic motivation to classroom activities*.

The present study aimed to examine the relationship between learners' intrinsic motivation in three levels and their learning attitudes on the basis of the hierarchical model of intrinsic motivation in foreign language learning. The questionnaire survey was conducted for this study to collect data from 84 high school students. Descriptive statistics and correlation coefficients were calculated to see the relationships between these variables. The results showed higher intrinsic motivation relates to more positive learning attitudes.

Learning attitude and motivation of high school EFL learners:  
Examination based on the hierarchical model of intrinsic motivation  
in foreign language learning

Tanaka, Kumiko (Hiro High School)

Tanaka, Hiroaki (Hiroshima International University)

The previous studies (Tanaka, 2009a, 2009b, 2013) proposed *the hierarchical model of motivation in language learning*. It includes trait level, classroom level, and learning activity level. Motivation in trait level is expected to be the most stable. On the contrary, motivation in learning activity level is situational and the most unstable. Motivation in classroom level is moderately stable, but can be influenced by environmental factors. In this study, intrinsic motivation in trait level is called *intrinsic trait motivation*, intrinsic motivation in classroom level is called *intrinsic classroom motivation*, and intrinsic motivation in learning activity level is called *intrinsic motivation to classroom activities*.

The present study aimed to examine the relationship between learners' intrinsic motivation in three levels and their learning attitudes on the basis of the hierarchical model of intrinsic motivation in foreign language learning. The questionnaire survey was conducted for this study to collect data from 84 high school students. Descriptive statistics and correlation coefficients were calculated to see the relationships between these variables. The results showed higher intrinsic motivation relates to more positive learning attitudes.

# The examination of the hierarchical model of intrinsic motivation in foreign language learning

Tanaka, Hiroaki (Hiroshima International University)

Referring to motivation as a unitary concept is insufficient to explain and fully understand its dynamics in the classroom, because individual motivation exists at different levels of generality. The previous study (Tanaka, 2013) addressed *the hierarchical model of intrinsic motivation in foreign language learning*. In this model, intrinsic motivation was represented within the individual at three hierarchical levels of generality: intrinsic trait motivation, intrinsic classroom motivation, and intrinsic motivation to classroom activities. The present study aimed to examine *the hierarchical model of intrinsic motivation in foreign language learning*. 311 Japanese EFL (English as foreign language) university students who were enrolled in a first-year English language course participated in this study. Descriptive statistics and correlation coefficients were calculated to examine *the hierarchical model of intrinsic motivation in foreign language learning*. The results supported the validity of the model.

# Motivational change and the hierarchical model of intrinsic motivation in foreign language learning

Tanaka, Hiroaki

*Hiroshima International University*

## **The multiplicity of ways to represent motivation**

Self-determination theory (Deci & Ryan, 1985, 2002) is quite an effective framework for describing and predicting learners' intrinsic motivation. Most of the previous motivational studies targeting Japanese EFL learners addressed intrinsic motivation as a trait. However, as Vallerand and Ratelle (2002) pointed out, referring to motivation as a unitary concept is insufficient to explain and fully understand its dynamics in the classroom, because individual motivation exists at different levels of generality. *The hierarchical model of motivation* (Vallerand, 1997; Vallerand and Ratelle, 2002) focuses on a collection of motivations differing in levels of generality; that is, the global level, the contextual level, and the situational level.

Based on the hierarchical model, Tanaka (2009) reconstructed the model for EFL learners' motivation. The model was named as *the hierarchical model of intrinsic motivation in foreign language learning*. In this model, intrinsic motivation was represented within the individual at three hierarchical levels of generality: intrinsic trait motivation, intrinsic classroom motivation, and intrinsic motivation to classroom activities.

The model includes the trait level, the classroom level, and the learning activity level. Motivation in the trait level is expected to be the most stable. On the contrary, motivation in the learning activity level is situational and the most unstable. Motivation in the classroom level is moderately stable, but can be influenced by environmental factors. In this study, intrinsic motivation in the trait level is called *intrinsic trait*

*motivation*, intrinsic motivation in the classroom level is called *intrinsic classroom motivation*, and intrinsic motivation in the learning activity level is called *intrinsic motivation to classroom activities*.

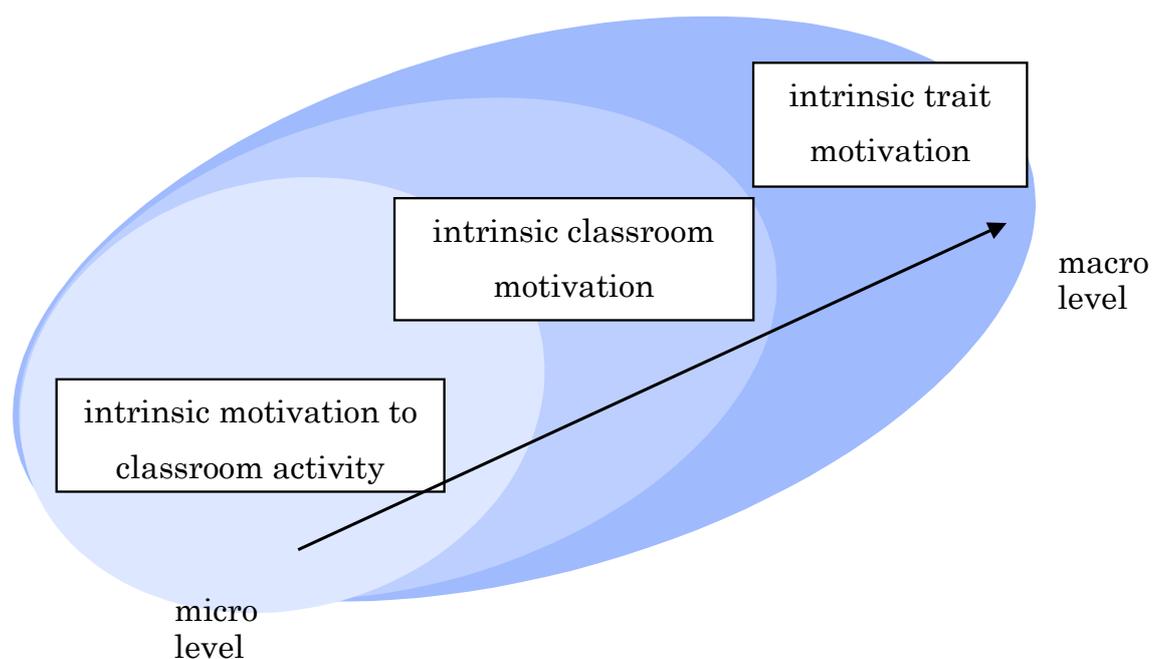

Figure 1. The hierarchical model of intrinsic motivation in language learning

### **Purposes**

Though this model has already been used in some academic research, the statistical examination of the validity of the model is still not enough. This model postulated a bottom-up relationship between motivation at one level and motivation at the next higher level in the hierarchy. If the hypothesis is valid, a higher correlational relationship was identified between intrinsic trait motivation and intrinsic motivation to classroom activity than between intrinsic trait motivation and intrinsic classroom motivation. Thus, the present study aimed to examine *the hierarchical model of intrinsic motivation in foreign language learning* by longitudinal data analysis.

## Procedure

The participants were 311 Japanese EFL (English as a foreign language) university students. The questionnaires were administered to the participants at two different times to see their motivational changes. Descriptive statistics and correlation coefficients were calculated to examine *the hierarchical model of intrinsic motivation in foreign language learning*.

Items from Tanaka (2009) were used for this study. Intrinsic trait motivation was measured by 5 items ( $\alpha = .83, .88$ ), intrinsic classroom motivation by 4 items ( $\alpha = .93, .95$ ), intrinsic motivation to classroom listening activities by 5 items ( $\alpha = .83, .86$ ), and intrinsic motivation to classroom speaking activities by 4 items ( $\alpha = .89, .92$ ). Data were analyzed by SPSS 15.0J for this study. Descriptive statistics and correlational coefficients were calculated.

## Results

The descriptive statistics of motivational subconstructs are shown in table 1 and figure 2.

Table 1.

Descriptive Statistics of Motivational Subconstructs

		<i>M</i>	<i>SD</i>
intrinsic trait motivation	Time 1	5.41	0.88
	Time 2	5.70	0.92
intrinsic classroom motivation	Time 1	5.12	1.28
	Time 2	5.47	1.07
intrinsic motivation to classroom activities	listening Time 1	5.88	0.82
	Time 2	5.96	0.84
speaking	Time 1	5.05	1.14
	Time 2	5.50	1.00

Intrinsic trait motivation, intrinsic classroom motivation, intrinsic motivation to classroom listening activities, and intrinsic motivation to classroom speaking activities slightly increased from Time 1 to Time 2.

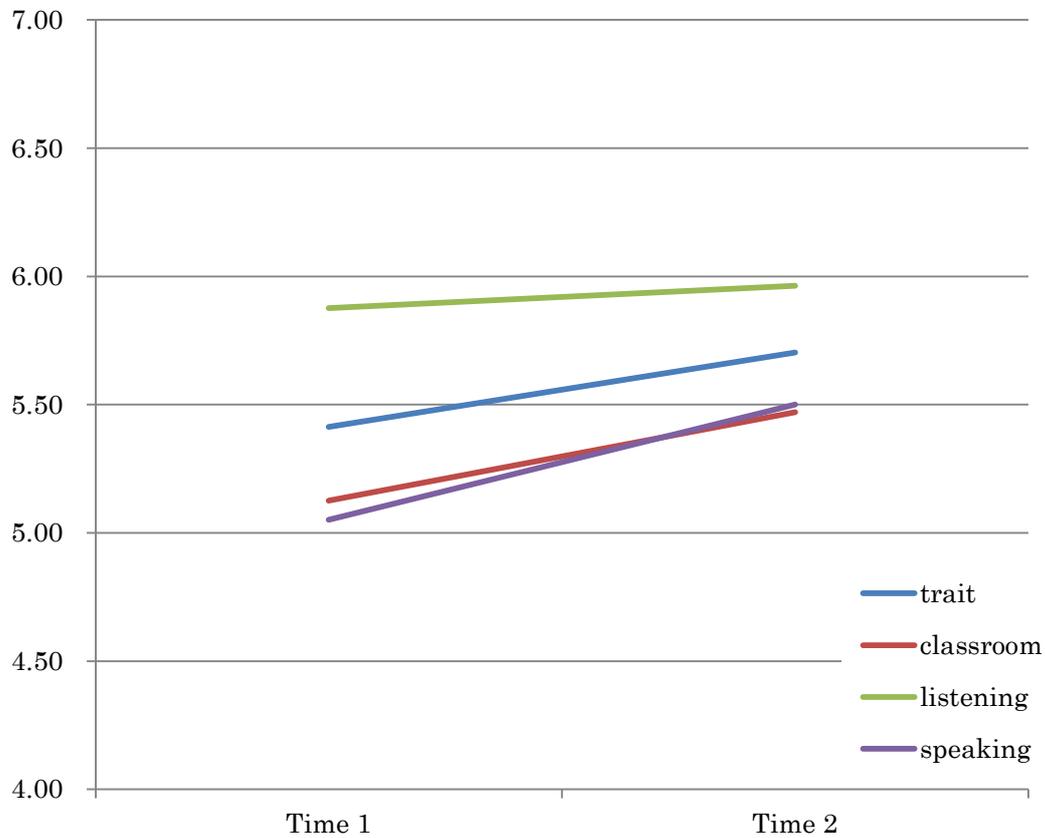

Figure 2.  
Mean Scores of Intrinsic Motivation in Three Levels

Table 3.  
The Correlational Coefficients of Motivational Subconstructs

	trait	classroom	listening	speaking
trait	-			
classroom	.46**	-		
listening	.40**	.42**	-	
speaking	.33**	.37**	.41**	-

Note. \*\* indicates 0.1% significance

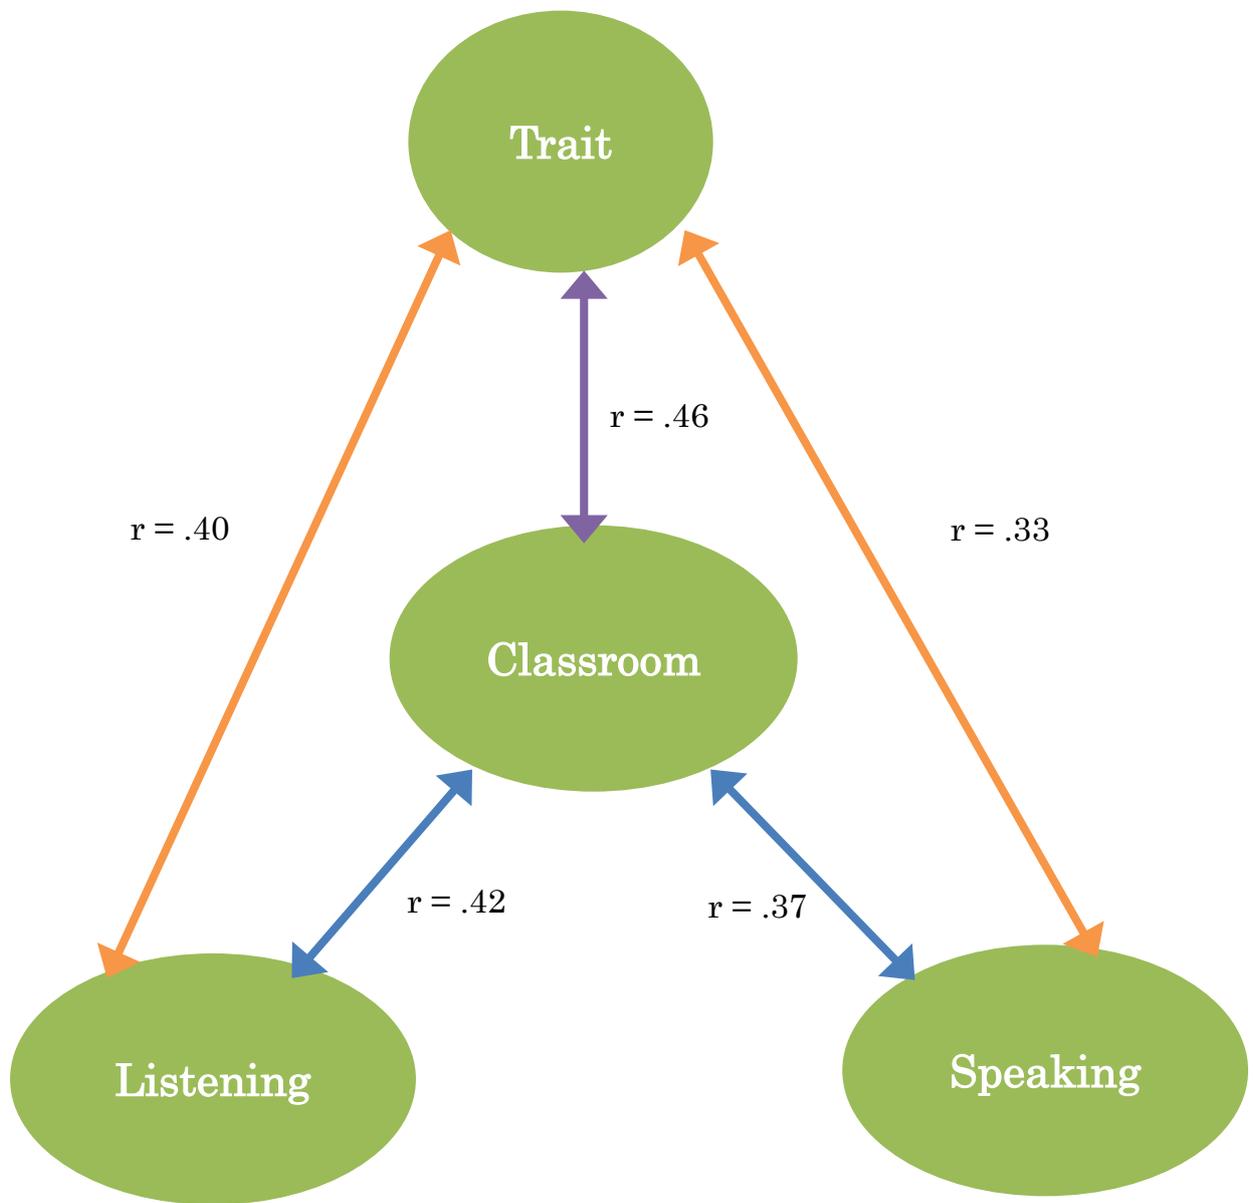

Figure 3.

Hierarchical Model and Correlational Coefficients

The correlational coefficients were calculated (see Table 3 and Figure 3). The results showed that intrinsic motivation to classroom listening activities correlated highly with intrinsic classroom motivation ( $r = .42$ ) and correlated less with trait motivation ( $r = .40$ ). Intrinsic motivation to classroom speaking activities correlated highly with intrinsic classroom motivation ( $r = .37$ ) and correlated less with trait motivation ( $r = .33$ ).

The results supported the validity of the model. That is, a closer relationship between motivation at one level and motivation at the next higher level in the hierarchy.

## **Discussion**

In this study, the validity of *the hierarchical model of intrinsic motivation in foreign language learning* was examined by longitudinal data from Japanese EFL learners. The model postulated the bottom-up relationships between subcomponents of intrinsic motivation. Motivational changes in classroom activity level showed a higher relationship with intrinsic classroom motivation. Intrinsic classroom motivation is in the next higher level in the hierarchy and is anticipated to have a higher correlational relationship with motivation in classroom activities than with intrinsic trait motivation. The results of the study supported the hypothesis.

In this study, correlational analysis was used, not causal analysis, because Vallerand and Rattele (2002) proposed two hypotheses. One is bottom-up relationship and the other is top-down relationship. These two hypotheses were inextricably associated with each other, and it is difficult to analyze these two relationships individually.

6. Abstract

In the late 19th century, Japan underwent considerable political and social changes. As a corollary, the Ainu, who enjoyed a certain level of freedom as indigenous people of Northern Japan, could not be spared from the impact of Japan's new nation building. Following the Meiji Restoration of 1868, the northern island *Ezochi* where the Ainu originally inhabited was renamed *Hokkaido*. The Ainu were systematically assimilated into the nation of Japan. Given the growing number of impoverished Ainu, *the Former Natives Protection Act*, which shares some similarities with the Dawes Act of 1887 (Tomita, 1989&1990), was promulgated by the Imperial Diet in 1899. Following this Act, some twenty-three elementary schools were established between 1901 and 1907 in Hokkaido (Ogawa, 1992, p. 199). Then, the school enrolment ratio of Ainu children increased rapidly, from 17.9 % in 1895 to 84.2 % in 1907 (Ogawa, 1992, p.201). However, the education that Ainu children received was principally assimilation-oriented and use of the Ainu language was strictly prohibited in schools.

Under these circumstances, the Abuta Industrial School (*Abuta Gakuen*) was founded in Abuta (Hokkaido) on February 10, 1904 by the Association of Saving and Educating Hokkaido Former Aborigines (ASEHFA). The purpose of this school was to promote

self-support for the indigenous Ainu youth by providing practical knowledge and skills. Having modeled Hampton Normal and Agricultural Institute in Virginia, the Abuta school was the first private boarding school in Japan specifically designed for indigenous Ainu students who completed elementary school. Jenichiro Oyabe, who studied at Hampton in the late 1880s, played a key role to establish the school. He served as pastor of the Japanese church in Hawaii for a few years, after being awarded a Bachelor of Divinity degree from Yale University. He was keen about the indigenous issues in Japan and broadened his knowledge on boarding schools for Native Americans and Hawaiians while his stay in the United States. It would not have been realised without Oyabe's unique experiences in several American universities and Hawaii.

The purpose of this study is to examine the process of educational transfer in early twentieth-century Japan, specifically focusing on the role of Oyabe and the curriculum of Abuta Industrial school. Drawing upon the theoretical framework of four stages of educational borrowing (Phillips & Ochs, 2003), the study illuminates the ASEHFA's political agenda underpinning the transfer of the Hampton model. The study also critically analyses why the boarding school system for the Ainu was not widely supported in Japan. The significance of this research lies in shedding light on how policy on indigenous education had structured in the globally interdependent political system.

## *Abstract:*

This project aims at promoting the learning of Computer Science by applying computer technology into the medical field. Several undergraduate students from our Computer Science department are actively involved in a medical project that is designed to solve a real world problem. In this medical project, an *in silico* model will be built and delivered by combining human Magnetic Resonance Imaging (MRI) data and biological mechanics data that is suitable for input into a Dassault Systemes Abaqus Unified Finite Element Analysis (FEA) product. *In silico* modeling will be married to physical *in vitro* modeling using human medical images, animation equations, flow simulations, and biological data to produce kinetic and static FEA models and a polymer mimic of the human lower gastrointestinal region.

*Keyword:* in silico model, finite element analysis, human lower GI region

## **1. Introduction:**

A finite element model [1, 2] is an abstraction of a more complicated physical system. Such methods can be employed in anthropology and biology to study morphological variation in the skeleton related to function [3-9]. However, it is extremely challenging to abstract complex biological structures using finite element models, due to the highly irregular, complex geometric shapes of organic systems [10]. With the help of advanced biomedical imaging techniques, it is now possible to capture virtually any structure in 3D space. Image processing can then be applied to the image sequences to reconstruct detailed water-tight 3D surfaces to be used as a finite element template. The image processing includes organ segmentation, surface reconstruction, surface smoothing, and model simplification.

This project comprises two steps: (1) to build and deliver an *in silico* model by combining human MRI data and biological data that is suitable for input into a Dassault Systemes Abaqus Unified FEA product, and (2) to produce an *in vitro* physical model made of transparent polymer material that mimics human rectal and anal compliance. Data extracted from Human MRI slices will be reconstructed into 3D images using appropriate software by tracing/drawing appropriate tissue outlines in the digital data set. Biological elements included will be the colon below the sigmoido-rectal junction, the rectal vault, the valves of Houston, and the anal canal including the interior anal sphincter. The images will also contain an invasive fecal incontinence catheter within the rectal vault. Peristaltic and haustral wave forms will be integrated into MRI slice data to obtain and display the kinematic gastrointestinal tract below the sigmoido-rectal junction as an

active organ and kinetic FEA model. Both static and kinetic FEA model parameters must be able to be imported? into Dassault Systemes Abaqus Unified FEA product.

In the remainder of this paper, Section 2 introduces the methodology of this project, detailing step by step procedures for image segmentation, volume reconstruction, and surface meshing. Section 3 shows some of the results and comparisons based on MRI slices of the human lower GI tract. Section 4 concludes this project and discusses its relevance and significance for improving the teaching of Computer Science in higher education.

## 2. Methodology

In this section, we propose standard operating procedure guidelines on how to create a segmentation of human anatomical structures, specifically the lower gastrointestinal region, for the purpose of creating a 3D model. Software used to accomplish segmentation and file conversions are also introduced. Step-by-step instructions on how to segment the sigmoid colon, rectum, anal canal and internal anal sphincter will also be covered in detail. Also included in this section are strategies and techniques on how to create a representative volume from these segmentations. The segmented volumes can be loaded into other software such as SCIRun, Paraview and MeshLab. Detailed steps to successfully convert segmented data into a tetrahedral volume, then to a VTK file and finally to a STL file are also included.

### 2.1 Medical Image Segmentation

In the first step, students work with Magnetic Resonance Imaging (MRI) series data of the human lower GI region provided by our collaborating hospital. Several software tools are evaluated for segmenting the Regions of Interest(ROI) from the MRI images. The list of evaluated tools is shown in Table 1. Students evaluate the tools based on the following categories: the supporting input image formats; the project organization and navigation; the user interaction capability; the visualization of the image data in 3D space; and the supporting output formats.

Table 1. Software Tools for Medical Image Segmentation

Software Tool	Link	Free / Commercial
Seg3D [11]	<a href="http://www.sci.utah.edu/cibc-software/seg3d.html">http://www.sci.utah.edu/cibc-software/seg3d.html</a>	Free
3D Slicer [12]	<a href="http://www.slicer.org/">http://www.slicer.org/</a>	Free
ParaView [13]	<a href="http://www.paraview.org/">http://www.paraview.org/</a>	Free
ITK-SNAP [14]	<a href="http://www.itksnap.org/pmwiki/pmwiki.php">http://www.itksnap.org/pmwiki/pmwiki.php</a>	Free
Mimics 3-Matic	<a href="http://biomedical.materialise.com/3-matic">http://biomedical.materialise.com/3-matic</a>	Commercial

Based on our evaluation, the Mimics 3-Matic tool provides the best overall user interaction, visualization, and input/output support. However, since it is a commercial tool and requires a fee to use the full functionality, we decided to use Seg3D for this project, as it also provides good user interaction and functionality sufficient for our project needs.

### 2.1.1 Introduction to Seg3D

Seg3D organizes the image processing work as projects. Users can create a new project or open an existing project from the welcome page. Once the project is established, the main user interface (called workspace) is displayed, as shown in Figure 1. There are four sections to Seg3D's interface. There is a toolbar located on the top of the window. The left pane will contain the tools or filters that have been selected from the toolbar. Located in the middle of the workspace are the different view windows. The views Seg3D offers are Volume, Axial, Coronal and Sagittal. Finally, the right pane is the Layer Manager which contains the layer or mask layer sections.

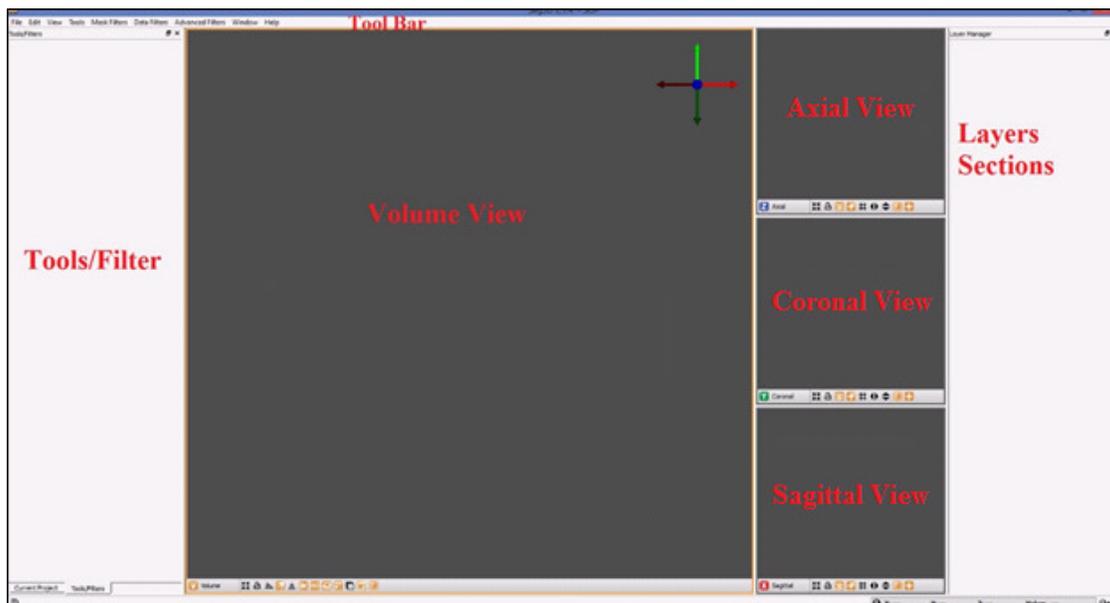

Figure 1. Seg3D Workspace

It is likely that a user will be working with a series of images within an MRI data set. Seg3D provides the option to load multiple images instead of a single image. Seg3D offers a set of “Keyboard Shortcuts” used together with mouse navigations. The list of shortcuts can easily be found from the toolbar under the Help menu.

Occasionally, the user will need to change views throughout the segmentation process as well as the size of the viewing window. The default workspace windows are known as the “One and Three” view. The benefits to this type of view are to see the 3D Volume and three different 2D views all at once in your workspace. Depending on the user's viewing preference, the user may change the number of viewing windows on the workspace to better accommodate their needs. The biggest advantage of having all four views on the workspace, is that the user can quickly identify their location when referring to a Cartesian coordinate system. This would be extremely helpful for first time users that are segmenting a stack of images. Also note, it is possible to see where a specific pixel or voxel is located on each of the views by their "picking" lines. Each

view has a corresponding color line. For example, the sagittal view's picking line is red, coronal is green, and axial is blue. As an example, refer to Figure 2.

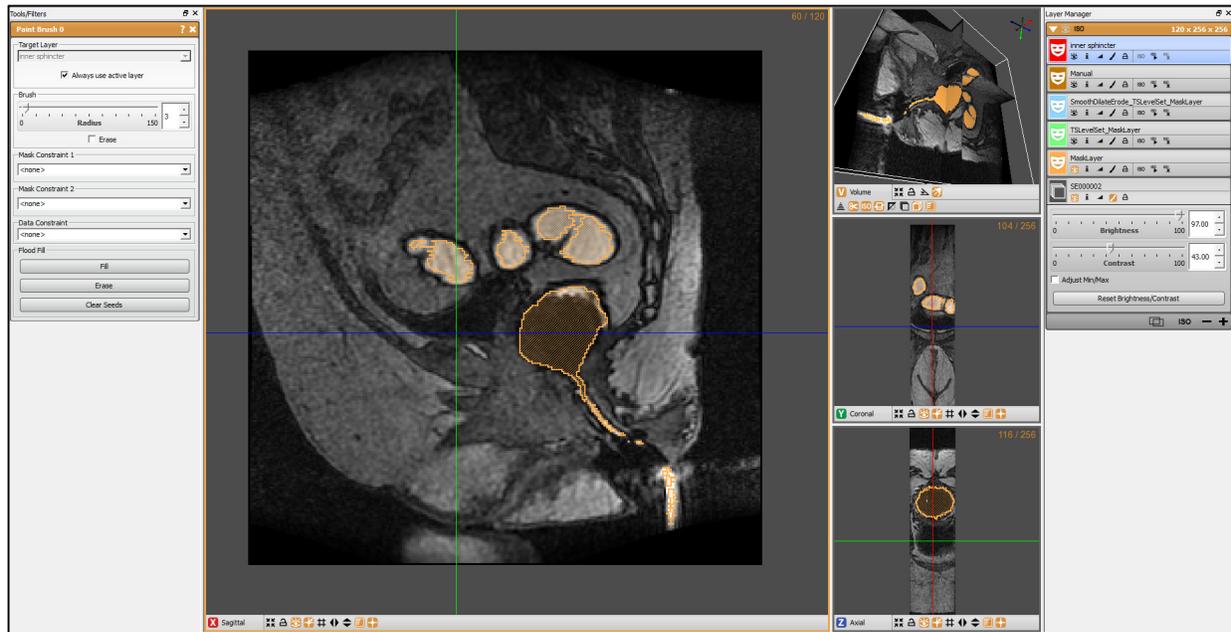

Figure 2. An example of picking lines

### 2.1.2 Segmenting the rectum

Figure 3 (Left) shows an anatomy overview of the sagittal view of an MRI slice. Parts of the colon have been saturated with a contrasting agent. The spine and tailbone are visible on the right side of the image. The rectum is also labeled and located near the middle of the image. In this specific picture, a catheter has been inserted into the rectum and a balloon has deformed the shape of the structure. A thin, white line that is passing through the anal canal is also labeled towards the bottom of the image. This is where the contrasting reagent is moving through the catheter's lumen within the anal canal.

Segmentation Level Set [15, 16] is the preferred method for segmenting MRI data sets of the lower GI tract. In order for the Segmentation Level Set tool to work, "seeds" will need to be added to the stack of images. In this case, we are referring to "seeds" as small, circular segmented pixels shown as colored regions in Figure 3 (Right). For best results, it's recommended to work in the sagittal view. Simply by selecting the Paint Brush tool and adjusting the circumference of the brush, a user can add seeds by "painting" them directly onto the image. For better results, additional seeds towards the first and last MRI slices have also been added. For the Level Set method to work properly, it is critical to select the right parameters. For the image shown in Figure 3, the Iterations parameter has been changed from 20 to 2000. The Curvature Weight and Propagation Weight parameters have been maximized to ten. The Threshold Range parameter is set to 3.50. The parameters for the Threshold Range and Iterations may need to be adjusted to avoid over-segmentation or under-segmentation.

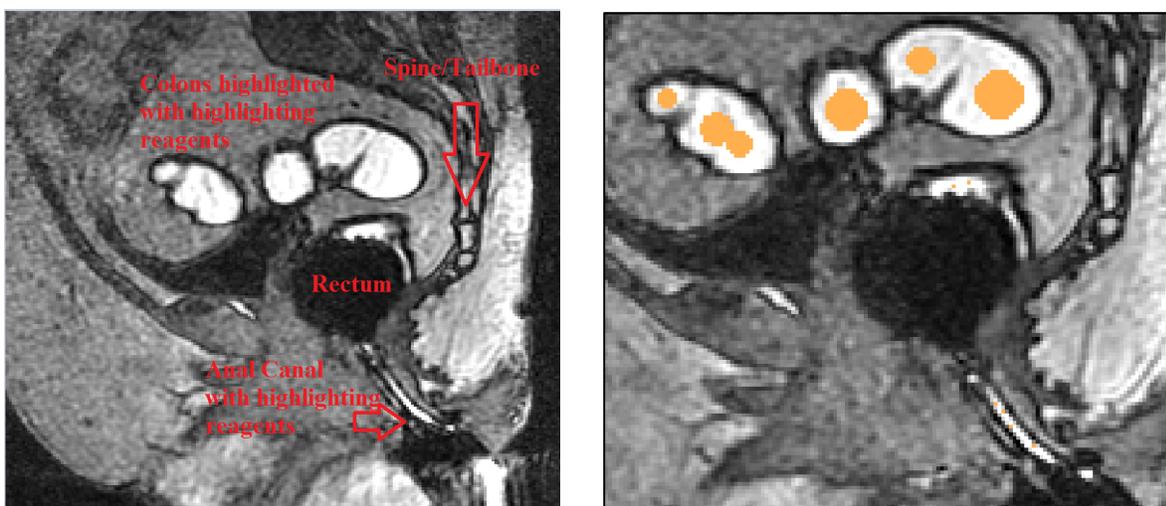

Figure 3. (Left) Anatomy overview in MRI slice; (Right) Adding seeds to Areas of Interest

After the MRI slices are segmented using Level Set, the user will need to traverse each slice to evaluate the segmented areas. After evaluating the segmented areas, the user can decide if additional segmentation is needed. One reason why additional segmentation may be needed is due to significant amounts of under-segmentation. In the case of small areas of over-segmentation, these segmented pixels can be easily removed using the Paint Brush tool. Some example segmentation results are shown in Figure 4.

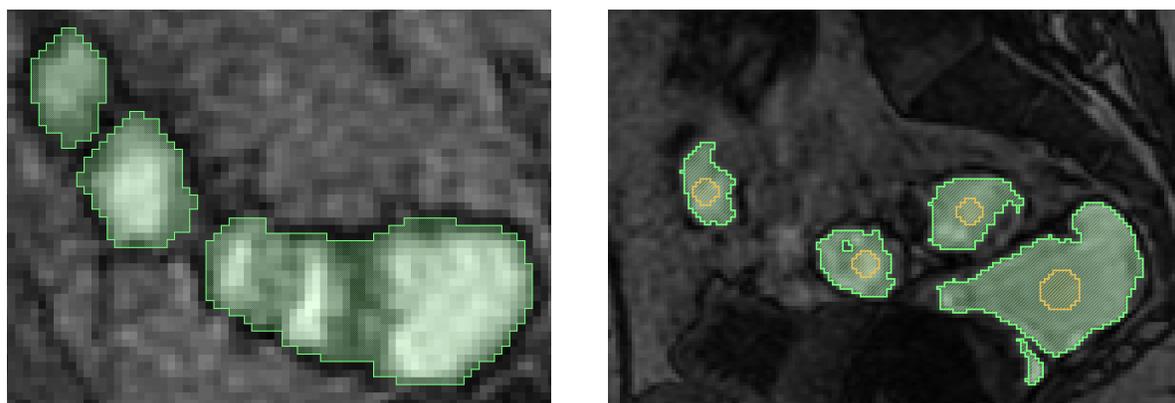

Figure 4. Examples of Segmentation using Level Set

Segmenting the rectum can be especially tricky. (Note: Segmentations are only as good as the MRI data that a user is given.) Figure 5 shows two examples from two different data sets. The outlined areas represent sagittal views of rectums on an MRI image. The first image is a little more complicated to segment because it has a contrasting, triangular shape located near the lower right side within the red outline. The triangular shape discrepancy in the rectum image is an air bubble where the catheter balloon did not fully fill the rectum wall. A technique to

segment data such as this would be to use the Segmentation Level Set tool for the rectum area to place seeds only in the very darkest areas. Do not place seeds on the triangular air bubble. The purpose of this method is to get an idea of the shape of the rectum. At this point, the user will have to manually segment the rectum either by using Paint Brush or the Polyline tool to cover the under-segmented areas.

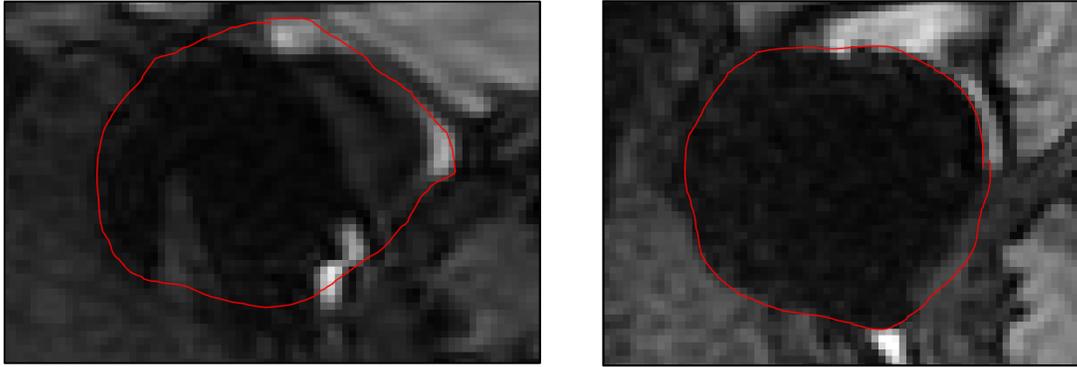

Figure 5. Examples of rectum Images

Isosurfaces can be created at any time during the segmentation process. An isosurface is a three-dimensional analog of an isoline. It is a surface that represents points of a constant value within a volume of space. If multiple layers were created, an isosurface can be created for each layer. It is recommended to rebuild the isosurface after making changes to the segmented data. The isosurface will appear in the Volume view. Further touch-ups can be done to make efforts of quantifying the data with the Dilate and Erode tool. The idea is to grow the segmentations by a certain radius and then decay it by a radius. The volume should even out after running both tools. A setting of 1 for both dilate and erode is the default. The user may need to adjust this setting to meet their needs. Due to the nature of the incomplete isosurface, a setting of 3 has been used. If the Smooth Binary Dilate and Erode tool does not provide data to the user's satisfaction, the user will have to smooth the segmented areas manually through the Sagittal, Coronal and Axial views. It's a good idea to keep in mind the anatomical shape of the areas that are being segmented. In this situation, the colon and rectum areas have a round shape. The user will need to traverse every slice of the Sagittal, Axial, and Coronal views to ensure the segmented areas are not over or under-segmented by adding or removing pixels from the ROI.

### 2.1.3 Segmenting the sphincter

The next step is to segment the internal sphincter. The internal sphincter is basically a ring-shaped muscle that surrounds the anal canal close to the rectum. In order to segment the sphincter, it is best to switch to the axial view. It is suggested to use the Paint Brush or the Polyline tool to segment this area. Figure 6 shows the segmentation results with and without the internal sphincter.

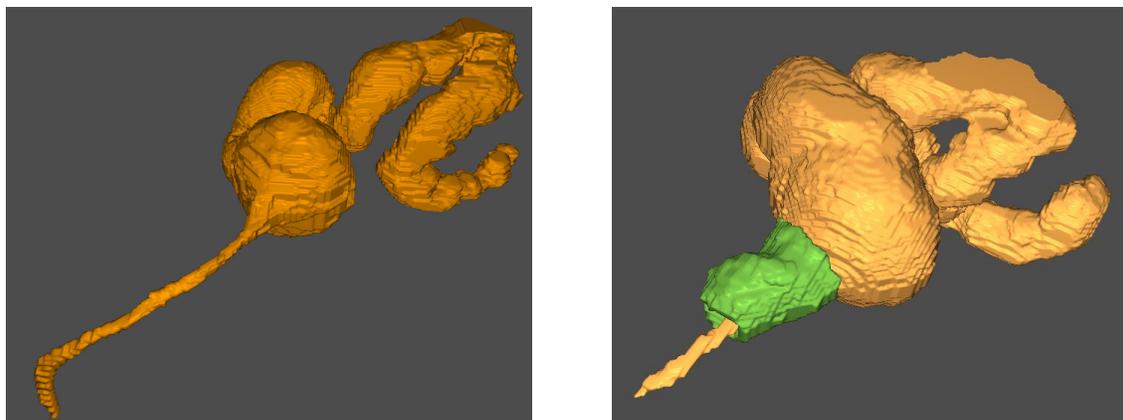

Figure 6. Isosurfaces of the segmentations (Left) without sphincter; (Right) with sphincter.

#### 2.1.4 *Exporting the segmentations*

Once the segmentation is completed, the resulting data may be exported as a NRRD file. NRRD ("nearly raw raster data") is a library and file format designed to support scientific visualization and image processing involving N-dimensional raster data. To save the segmentation as a NRRD file, the standard way is to click "File" in the toolbar and select "Export Segmentation". A Segmentation Export wizard pop-up box will appear. Only one layer should be exported. Deselect all boxes except for the desired layer. Click "Next" and name your NRRD file.

## 2.2 Model Surface Reconstruction and Meshing

In the second step, students use proper software tools to produce an in vitro physical model made of transparent polymer material that mimics human rectal and anal compliance. This step involves several operations, including building geometry, converting file format, surface smoothing and simplification, and model optimization.

### 2.2.1 *Building geometry*

SCIRun (v4.6) is used to convert a NRRD file into a tetrahedral volume. Eventually, the tetrahedral volume will be saved into a Visual Toolkit file. Python (v2.7.4) is used as the run time environment to create a tetrahedral volume from a NRRD file with SCIRun. The students generate python scripts with certain parameters to create the volume. An example python script is shown in Figure 7. There are two fields which will need to be filled out manually. These are the `model_input_file` and the `model_output_path`. For these two parameters, specify the file name of the segmentation and the name of the output folder where the user will want to save the results.

```

model_input_file=".nrrd"
# this directory must exist...
model_output_path=""
# -1 means all the rest of the materials combined
mats = (0, 1)
mat_names = ('air', 'mat1')
mat_radii = 1.0

#Number of refinement levels when generating the medial axis
points.
#More levels are needed to capture smaller details.
refinement_levels=4
max_procs=3
max_sizing_field = 3.0

num_particle_iters=500
# tetgen flags to use when making a volume from a single
# material
tetgen_joined_vol_flags = "zpAAqa10"

```

Figure 7. An example python script to build the geometry

Once the tetrahedral volume is created, the geometry mesh can be generated using the python scripts. As a warning, this process will take up CPU power and the computer may slow considerable if performing other tasks. The duration of this process may vary between one to four hours depending on the speed of the computer and the complexity of the geometry.

### 2.2.2 *Converting file formats*

After the meshing process has successfully completed, the output mesh files should be converted to STL format using SCIRun and ParaView. STL ( Standard Tessellation Language) is a file format native to the stereolithography CAD software, and used for rapid prototyping and computer-aided manufacturing [17]. In order to complete this task, two modules need to be loaded and linked in SCIRun. They are the "ReadField" and "WriteField" modules. Using these two modules, the mesh file can be converted to VTK format. VTK ( Visualization Toolkit) provides a number of source and writer objects to read and write popular data file formats. It also provides some of its own file formats. The main reason for using this format is to offer a consistent data representation scheme for a variety of dataset types, and to provide a simple method to communicate data between software. When dealing with medical images, it is always a good idea to use the most widely used format.

Once the VTK file is created, ParaView can be used to convert it to STL format. The conversion is straightforward using this tool. Alternatively, 3D Slicer can be used to convert VTK to STL. However, we find it is relatively more difficult to use 3D slicer to do the format conversion.

### 2.2.3 *Surface smoothing and simplification*

The last stage is to smooth the mesh. The software tool we used in this project is called MeshLab. MeshLab offers a few options to allow for mesh smoothing. In order to do this, navigate to the "Filters" option located on the toolbar and click the "Smoothing, Fairing and

Deformation" option. Within this sub-menu there are two options that work the best to smooth STL files: HC Laplacian Smooth and Taubin Smooth. Figure 8 shows the raw mesh and the smoothed mesh.

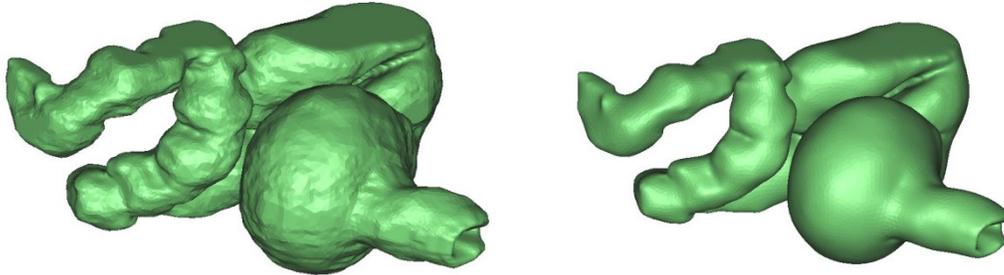

Figure 8. Comparison between raw mesh (Left) with the smoothed mesh (Right)

#### 2.2.4 Model Optimization

As an optional stage, we also utilize the commercial software tool, Mimics 3-Matic, to optimize the model such that it is more suitable to export to a Finite Element Analysis (FEA) product for use in software such as the Dassault Systemes Abaqus. The optimization includes scaling and registration of the anatomical data, reconstructing anatomy outside of original scan field of view (FOV), and remeshing. Some of the results are shown in Section 3 Experimental Results.

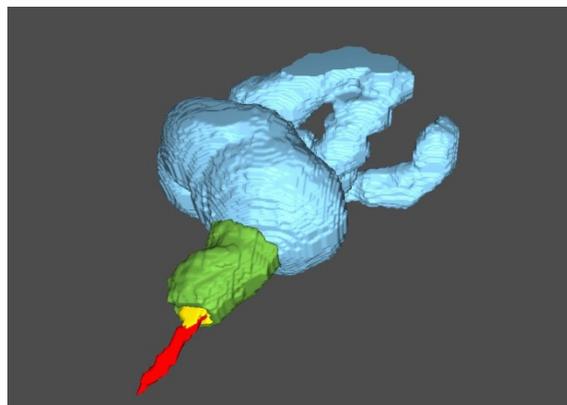

Figure 9. A completed color coded segmentation result

### 3. Experimental results

We include in this section some segmentation and meshing results based on sample MRI slices of the human lower GI tract. Figure 9 shows the completed color coded segmentation results with blue colon regions, green sphincter, and red lumen. This type of volume rendering has its limitations. Note due to the lack of information from the MRI images, parts of the anatomy have been truncated and thus we are given an incomplete and unnatural view of the

anatomical structure. Also, this type of model is purely for diagnostic purposes and cannot be used for any type of engineering analysis. For this reason, we need to convert or “mesh” this model into a calculated surface model also known as a tetrahedral surface mesh.

Figure 10 compares two meshed surface models, before and after smoothing. In each view, the upper left image shows the segmentation result; the upper right one shows the enlarged partial result; the lower left one shows the triangular surface mesh; the lower right one shows the enlarged partial mesh. Note the surface looks uneven and rough without smoothing. In the enlarged view, notice how the geometry contains sharp triangular edges. Our objective is to generate a smooth uniform surface of equilateral triangles as shown in the right set of images. Smoothing can be done in either MeshLab or in Mimics.

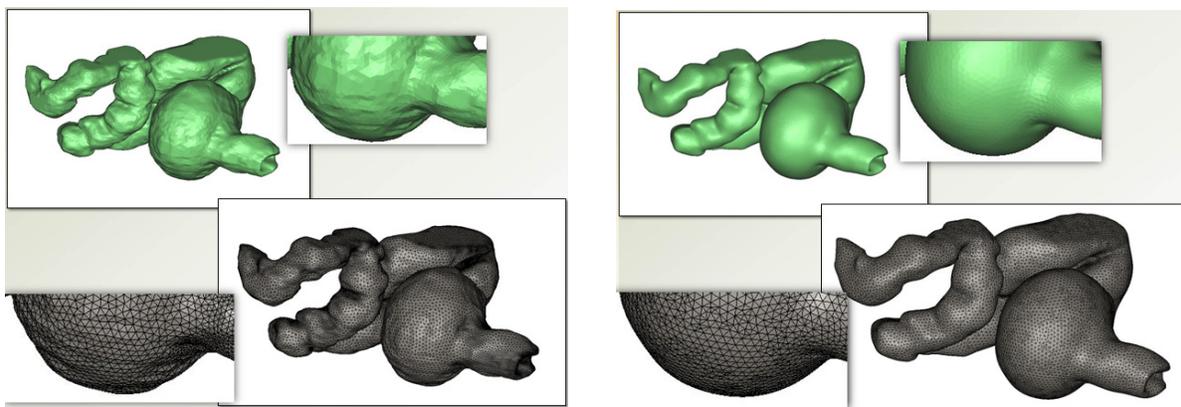

Figure 10. Comparison of meshed surface models (Left)without smoothing, and (Right)with smoothing

Figure 11 shows the results of reconstructing sections of the 3D volume to compensate the truncated surface areas due to the lack of data from the original MRI scan.

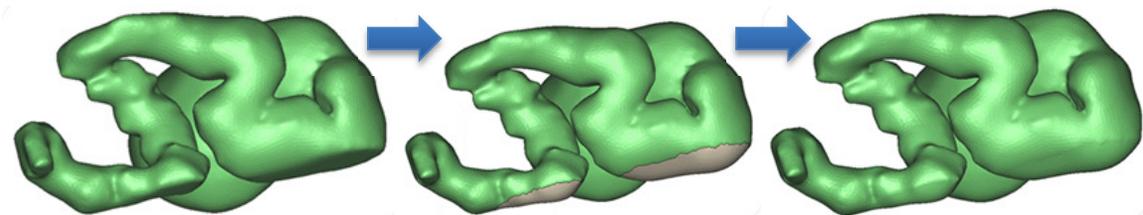

Figure 11. Result of reconstructing the truncated surface areas. (Left) mesh with truncated surface areas; (Middle) calculated missing data taken from the surrounding curvature; (Right) mesh after adding the calculated surface to the original structure.

After we have added the missing surface areas, we may need to remesh the volume so that the entire surface is uniform and smooth. Figure 12 (Right) shows the results of remeshing and exporting, compared with the one without remeshing. As you can see from Figure 12 (Left), the connections between the original and added areas have been somewhat roughly merged together.

In these images, after some additional smoothing and remeshing, the surface of our model has been smoothed and the triangular surface is clean and uniform and ready to be exported to either an engineering or manufacturing software environment. The next step with these models would be to export the digital 3D models into Computer-aided Design or CAD software which can execute computer simulated analysis to improve medical device design. With FEA software tools such as Abaqus, engineers are able to select areas of interest and load conditions such as stress to the lining of the rectum.

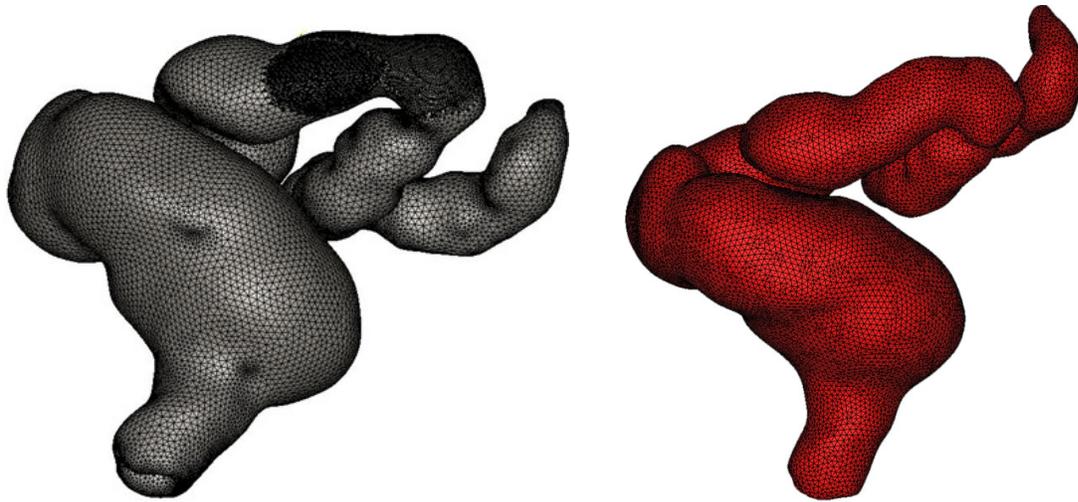

Figure 12. Comparison of mesh and remesh. (Left) mesh after surface reconstruction; (Right) remesh

#### 4. Conclusion

In this project, several students from our Department of Computer Science are actively involved to build and to deliver an *in silico* model of the human lower GI region by combining human MRI data and biological data. We propose the standard operating procedure guidelines on how to create a segmentation of human anatomical structures. Software used to accomplish segmentation and file conversions are also introduced. Step-by-step instructions on how to segment the sigmoid colon, rectum, anal canal, and internal sphincter are covered in detail. Also included in this paper are strategies and techniques on how to create a surface model from these segmentations that can be exported to manufacturing software for 3D printing or engineering software for finite element analysis.

This project not only helps faculty members stay at the forefront of their areas in order to teach successfully in the field of Computer Science, but also significantly improves student learning experiences by investigating how computer techniques can be applied to solve useful medical problems. In addition, we believe that the Computer Science curriculum extends beyond the subjects covered in a textbook, and this project introduces new topics into mainstream coursework, such as image and video processing, visualization and graphical design, and software development in medical imaging. Student participation in a project of this kind greatly enhances the impact of the Computer Science curriculum.

# Analysis of Online Community for a Project in the Foreign Country

YOSHIDA, Masami

Professor of Graduate School of Humanities and Science, Chiba University, Japan

## Abstract

A new music project JKT48 was started in Indonesia by using a business format of a famous music project AKB48 in Japan. Continuously, an online fans' community in Japan was emerged, and this community had possibility to be influenced from both an original project community in Japan and a music scene community in Indonesia. In this study, the social graph and behaviorgraphics were used to analyze communication characteristics of a new community in Japan. Gathered data were introduced to NodeXL software for analysis and visualization.

As results, the author could confirm that no bridge influencer became a hub in the online community. However, bridge influencers provided important information that most members did not know, and estimated to compose weak-ties to other communities.

## 1. Introduction

The globalization and internationalization are broadly deployed. At this moment, we can feel that the world is going to be flat (Freidman, 2005) in economical transactions, information communication and cultural exchanges.

In particular, the influence of Web2.0 reaches a stage in post-industrial societies where ICT is sufficiently powerful and low cost to be used by people. The integration of pervasive technologies with changes processed the ways how we communicate and interact with information. Also, the ability of people to organize online communities was developed. And, the social relationships have been altered by online communication in terms of scale and size.

The study in this article tried to investigate the effects of exportation of socio-cultural project, especially the study focused on effects in an original country, and how and what public opinions are formed through international information exchanges. Also, it needs to clarify that a new mode of collective intelligence has occurred in the prevalence of new forms of communication and the ways how people use to develop and distribute knowledge.

So far, we have limited cases to export our cultural or educational system to foreign countries. Moreover, we have no successful case to export our educational system before. From a limited number of our experiences of a project in overseas, the author selected a project of music business that could get great success.

## 2. Internationalization and an Emerged Community

The JKT48 (see Figure 1), an idol group that is active in Indonesian music business, debuted in November 2011 by applying a business format of AKB48 in Japan.

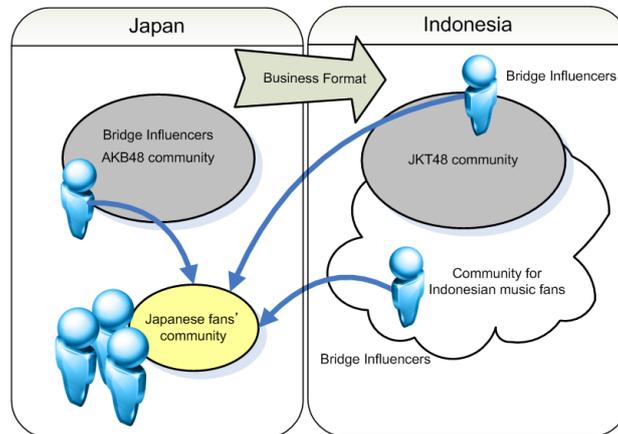

Figure 1: Idol Group, JKT48

Immediately after the announcement of launching the JKT48 project on 11th September, 2011, some Japanese fans began to search information of JKT48 and started to exchange messages collaboratively via a Japanese BBS; 2-channel, the largest BBS in the world. This 2-channel offers various thread floating bulletin boards, about 230 million page views per day, about 2 million of message posts per day, and frequently became the source to develop public opinions in Japan. In reality, more active message exchanges are seen in 2-channel than message exchanges in Twitter or Facebook, because it has a titled thread that is adaptable for deep discussion.

### 3. Communication

Rise of online fans' community of JKT48 was emerged as a thread of 2-channel in September of 2011. Besides, various online communities were formed around the project in addition to the Japanese fans' community in Japanese BBS. Therefore, this community had possibility to be affected by an original AKB48 community in Japan, a JKT48 community in Indonesia and/or an Indonesian music fans' community (see details in Figure 2).

**Figure 2: Situation of an Emerged Online Community**

Then, this investigational study challenged to know communication characteristics in which people formed collaborative opinions. In fact, target community was a newly developed online community, but it was not cold-start at all. It was possible to make ties with existing communities.

On the other hand, this study tried to know influences to a domestic community where exportation of cultural or educational system was viewed not only negatively, but also we have a tendency to be denounced.

As a method of investigation, the social graph and behaviorgraphics were used to analyze characteristics of the community.

### 4. Method

The author adapted a method of social network analysis as a way to investigate the online community by tracing messages. In particular, author selected earliest record of September, 2011, genesis of the online community, just before selection of JKT48 members by audition. Communication in BBS was processed under the lack of information. As usual cases of social graph study, ties are used for analysis. However, in this study, we processed the social research by searching bridge influencers as well. In this case, potentially three types of bridge influencers are able to effect on the community. That is,

- 1) A fan of preceding AKB48 who knows various system and experiences of this business format
  - 2) A fan of JKT48 in Indonesia who has more chances to access original information of JKT48
  - 3) A fans of Indonesian music community who knows music scene of Indonesia and can value JKT48 by comparison.
- (See conceptual view on Figure 2)

In this study, the author tried to know the quality of communication, and used social technographs method.

To identify the quality of communication, the author classified messages by using 14 types of behaviorgraphics developed by Brian Solis below (Solis, 2010).

1. Problem Solvers – One of the most common sources of conversations and updates in social media are questions...people seeking information in the hopes that commenters will respond with resolution or direction.
2. Commenters – Providing thoughts, opinions, observations, experiences, and sometimes, unfiltered reactions to the information shared online. They are less likely to produce original content, but are compelled to share their views based on the introduction of content by others in and around their social graph.
3. Researchers – Peer to peer influence is prominent in social networks and researchers rely on their social graphs for information and direction to make qualified decisions. They are also active in championing polls and surveys to truly learn about the thoughts and opinions of those connected to them.

4. Conversationalists – Participation in conversations through proactive updates seeking responses or direct responses to other content, conversationalists fuel threads within and across networks.
5. Curators – In the context of behaviorgraphics, curators carry a different role. This group works diligently to find and only share what captivates them as filtered by what they believe will interest their followers.
6. Producers – Among the more elite group of online participants, their stature is earned by the amount of content they generate within multiple networks.
7. Broadcasters – Social media is proving to be both an effective broadcast and conversational platform. Broadcasters are mostly one-way communicators who either intentionally or unintentionally push information to followers without injecting conversational aspects into the mix.
8. Marketers – Profiles dedicated to marketing ideas, products, or services and may or may not include content outside of their portfolio, unless the account is focused on funneling beneficial and value-added solutions to specific audiences regardless of origin.
9. Socialites – Individuals who have earned varying levels of weblebrity, these new internet famous personae earn recognition and attention in online networks which is increasingly spilling over in real world fame.
10. Self-promoters – Unlike broadcasters and marketers, self-promoters are unconcealed in their intentions through constant updating of activities, events, and accomplishments.
11. Egocasters – Contribute to the “ego” in the egosystem and represent the evolution of self-promoters. Through constant promotion and the activities and responses that ensue, promoters graduate to a position of perceived prominence and collective unawareness. What they think and say is what they believe to be the reality for one and for all. They lose touch with perspective as listening gives way to telling...
12. Social Climbers – Social capital is not only something that is earned in social networking, it is something that is proactively pursued by those whose sole mission is to rise to the top. These individuals intentionally climb ladders on the avatars, profiles, and social capital of others most often misrepresenting their purpose and stature to earn an audience based on disingenuous intentions.
13. TMI – The things some share in social media continue to blur the line between what’s relegated to inner monologue versus that for sharing with others in public. The state of sharing “Too much information” is dictated by those on the receiving end of the update, not those who publish it.
14. Complainers – When we love something, we tell a few people; when something bothers us, we tell everyone. Complainers are often sharing their discontent as a primary ingredient in their social stream. And, as customer service takes to the social web, these complainers are only encouraged to share their experiences to achieve satisfaction and earn recognition for their role as the new social customer.

Originally, Solis proposed 17 categories, but author excluded three incompatible categories in 2-channel online environment and selected 14 categories. For visualization of the social graph, the author introduced data into NodeXL, an extendible toolkit for community exploration implements an add-in to the Microsoft Excel 2010.

Note: The author did not post any message to the target thread of 2-channel.

## 5. Results

From the record, totally 513 posted messages were selected and the author could extracted 197 communications that have links to other messages. The following data are Graph Metric and Value (Table 1).

**Table 1: Network Data Statistics**

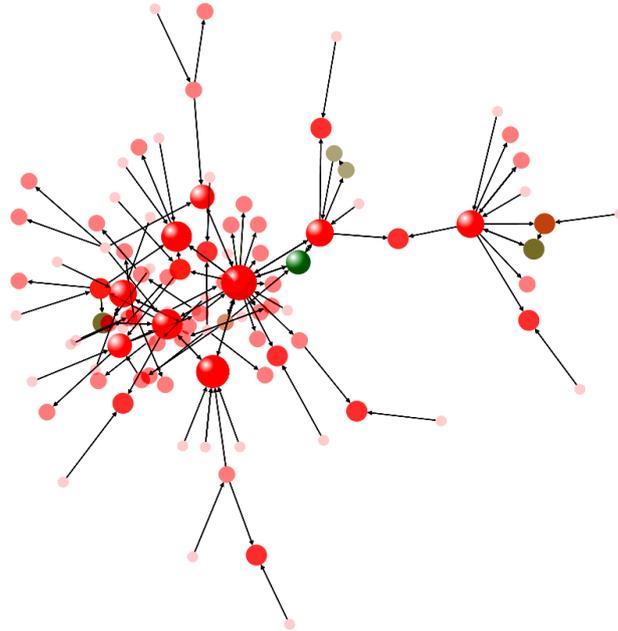

<b>Graph Metric</b>	<b>Value</b>
Vertices	102
Unique Edges	101
Graph Density	0.011
Diameter	9

From the graph (see Figure 3), it was evident that the larger core nodes with high degree, had relatively lower clustering coefficients because online users connected with many people who were not themselves connected to one another. Thus, nodes with high clustering coefficients would typically connect to fewer people since small groups are more able to connect every user to one another.

As a whole, the number of high clustering coefficient of green circles in Figure 3 is very small. However, two hubs are seen.

In Figure 4, nodes are sorted by decreasing clustering coefficient. These sub-graph images illustrate how the similar

clustering coefficient can refer to different local communication sizes.

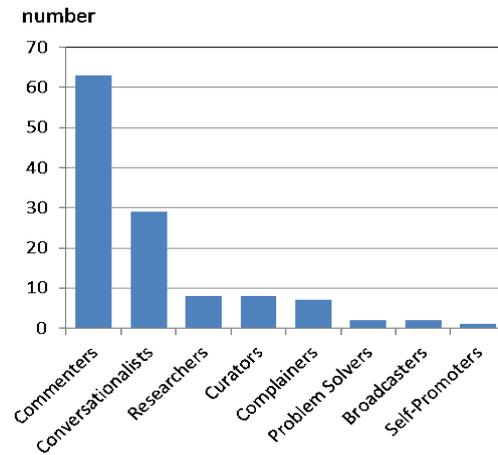

**Figure 3: NodeXL graph with node size proportional to node in-degree statistics and node color mapped to the value of the clustering coefficient: low values are indicated in red, high value indicated by shades of green (Harel-Koren Fast Multiplex Algorithm).**

Many of the clusters are visually grouped together by the Harel-Koren fast multiplex layout (Harel & Koren, 2001, 2002).

Betweenness Centrality	Closeness Centrality	Eigenvector Centrality	Clustering Coefficient	Subgraph
36.000	0.005	0.039	0.667	
0.000	0.004	0.014	0.500	
0.000	0.004	0.010	0.500	
0.000	0.004	0.010	0.500	
0.000	0.003	0.001	0.500	
89.500	0.005	0.034	0.333	
132.000	0.003	0.001	0.333	
291.333	0.004	0.023	0.100	
233.500	0.005	0.039	0.083	
928.167	0.005	0.050	0.071	
1836.000	0.005	0.040	0.071	
518.333	0.005	0.041	0.033	
870.000	0.005	0.040	0.033	
3333.833	0.007	0.120	0.016	
1222.000	0.004	0.003	0.014	

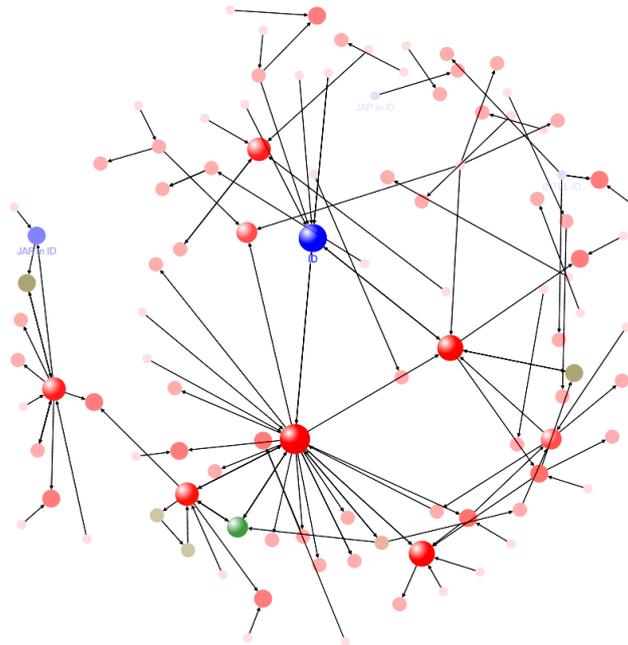

**Figure 4: NodeXL Vertex worksheet showing the list of nodes (online users), with sub-graph images indicating the node networks (personal communication networks) and selected related metrics.**

Through analysis of the genesis of the online community, totally 8 types of behaviorgraphics were observed (see details in Figure 5). Observed type numbers from links looked to fall into the scale-free networks. Types have power-law degree distributions, but data size is rather small and it should have further continuous monitoring and analysis to conclude it.

**Figure 5: Emerged Types of Behaviorgraphics**

Figure 6 shows a graph with bridge influencer of blue circles, and it can be find that ID: a local Indonesian connected with a hub. Other blue circles of Japanese (in Indonesia or Intel of Indonesia) were rather isolated.

**Figure 6: NodeXL graph with node color of bridge influencers mapped to blue (Fruchterman-Reingold Algorithm: Fruchterman & Reingold, 1991).**

This Fruchterman-Reingold layout is a force-directed layout algorithm, which treats edges like springs that move vertices closer or further from each other in an attempt to find an equilibrium that minimizes the “energy” of the system (Hansen, Shneiderman, & Smith, 2010; Harel & Koren, 2002).

## 6. Discussion

The sparse links were observed during genesis of the online community.

There were two hubs in the community, but these clustering coefficients were rather low.

### 6.1. Bridge Influencers

#### 1) An Indonesian local fan

Type of behaviorgraphics	number
Commenters	2
Complainers	2
Conversationalist	5

This member was not a hub, but had communication with a hub. On the other side, this member was disrespected two times. This shows that there is certain mental resistance at genesis. Also, an Indonesian local fan frequently provided important information from Indonesia to members and recognized as to make weak ties to Indonesian communities.

#### 2) Japanese in Indonesia & Japanese Intel of Indonesia

Type of behaviorgraphics	number
Commenters	3
Conversationalist	1
Curators	2
Researchers	1
Self-promoters	1

They are some Japanese, and they know Indonesia or live in Indonesia. Their activities are mainly offer information that Japanese should know, however limited action was seen to communicate with a hub. Nevertheless, offered information was indispensable for most members and recognized to compose weak ties to other communities.

#### 3) Fans of AKB48

It was difficult to identify the bridge influencers from AKB48 community, because many of community members had experience to be fans of AKB48, and frequently implied information of AKB48 project to recognize JKT48 or compared with AKB48 to value quality of performance. Their messages composed strong ties to AKB48 community.

### 6.2. Cold-Start Problem

The genesis of online community frequently encounters the cold-start problem. At the beginning of JKT48 project, there were frequent announcements of this project plan in broadcasting media and Internet. Then, an emerged online community involve people who had interested in Japanese sub-culture activities in a foreign country. However, the JKT48 project used existing business format in Japan, and so this community had many members from AKB48 fans as well.

In fact, some of AKB48 fans complained about the project of JKT48 in terms of quality and cultural differences.

On the other side, it looked easy to happen cyber cascade under limited information environment (Sunstein, 2001), but members were frequently asked and confirmed original resource of information and share opinions by using type of 'commenters' and 'conversationalist.'

### 6.3. As Fundamental Data of Internationalization

So far school education in Japan has been developed more than 1,300 years but it is still domestic diffusion. However, the recent Ministerial project intends to enlarge an externality of international education by provision of our education in overseas. It is deemed effective for the Ministry and Universities to focus resource investment in those with high potential to serve as hubs for internationalization (Ministry of Education Culture Sports Science and Technology, 2013).

So far most Japanese Universities have limited experience to deploy domestic education in foreign counties, but we has some cases to deploy Japanese culture or sub-cultural in foreign countries. Then, this study implies effects of domestic understandings to internationalization by analyzing a preceding cultural example as a model. Especially of communication, the author intended to find the effects of existing communities to the emerging online community.

In fact, Japanese sub-cultural community is becoming pervasive faster than educational community, and it would suggest more by processing continuous analysis that enable us to lead more understanding of communication about

the collective intelligence for internationalization.

#### 6.4. Future Study

At this moment (September, 2013), this community has variegated and produced eight active thread floating bulletin boards of sub-community. JKT48 became No.1 idol group in Indonesia, their song was ranked number one in the Indonesian song chart on 2nd September, 2013(Rajawali Citra Televisi Indonesia, 2013) and also Japanese fans increased. In our subjective recognition, positive messages of JKT48 project increased than messages with disrespect. Unfortunately, 2-channel does not offer available API for social graph analysis and users frequently omit hyperlinks when they answer, but it is possible to analyze by tracing messages.

In our attempting analysis of recent online communication data, the author could observe active bridge influencers and also important weak ties. Then, time series analysis and effects of change on formulate public opinions should be conducted.

**Abstract**

The purpose of the present study is to review literatures on the relationship between theory of mind and executive function of Korean children. For the literature reviews, ten articles on this topic were selected and used. Results showed inconsistent relationship between theory of mind and executive function. Implications for future research of theory of mind and executive function were suggested.

Children's theory of mind (ToM) has become an important research topic in the field of child development. ToM is the ability to understand the mental states (e.g., desires, beliefs, feelings, and intentions) of oneself and other people (Perner & Lang, 1999). Many previous studies have reported the significant relationship between ToM and executive function in children, but their findings were not consistent especially in research using Korean population. The purpose of the present study is to review literatures on the relationship between ToM and executive function of Korean children.

For the literature reviews, ten articles on this topic were selected and used. All of the 10 articles included Korean children and adolescents, and the journal of these articles were indexed in the Korean Citation Index(KCI) between 2004 and 2013. Results showed that seven out of the ten articles reported a significant correlation between ToM and executive function, while the remaining three reported no significant correlation. About scales to measure ToM, seven articles used a false belief task. Three out of the ten articles used the appearance-reality task (e.g., "Smarties box"). In addition, inhibitory control tasks (e.g., "Day/Night", "Sheep/Lion (Bear/Dragon)", "Card Sort") and delay of gratification tasks

("Gift Delay") were used to evaluate the executive function of Korean children.

Implications for future research of theory of mind and executive function were suggested.

# The Exploration of Strategy to Develop Serious Game for Science Learning

Joonhyeong Park, Youngseok Jhun\*, Donghun Shin, Kapsu Kim

Seoul National University of Education

## Introduction

Even elementary school students have many difficulties in science learning. Lots of students in elementary school are in trouble with understanding abstract science concepts as they are in concrete operational stage, according to Piaget's cognitive develop theory (Johnstone, 1994). So they are not prepared to think formally (Piaget, 1964). They do not familiar with science inquiry either (Shin, 2010). To make it worse, they are not interested in science learning. Higher grade they grow up into, less interests they have got (Kwak et al., 2006).

There have been many suggestions to help students learn science easily and properly through previous studies. Some emphasize the motivation, while others focus on learning strategy to make it easy understanding the difficult science conception. Serious game is one of the suggestions to help students have motivation as well as understand the science conceptions. The effectiveness of serious game for science learning has been proven.

The strongest attraction of serious game is lifting up the motivation. It is because that serious game originates from game which has lots of interests. Besides, as for the acquiring concepts, game can support the students who have various learning types - audible, visual, haptic. Students can understand the causal relationship between variables of natural phenomena with computer games' simulation function. They can observe huge events over geological era by fastening the passage of time.

In terms of motivation, game has strong attraction to induce students. Youths' addiction to game is a dangerous social problem in many countries. Well-designed serious games can make students absorbed in learning. However, it is very hard to design effective serious game. If we're not cautious in developing serious game, the result may be a boring learning program or ineffective playing tool.

So we need to explore the strategy to develop effective serious game for science learning. For the first step, we have explored the status quo of game addiction/flow through the interview. Interview as qualitative research method is a powerful way to explore someone's' life. The process of game addiction/flow will provide the solution of difficulties in science learning.

## Literature review

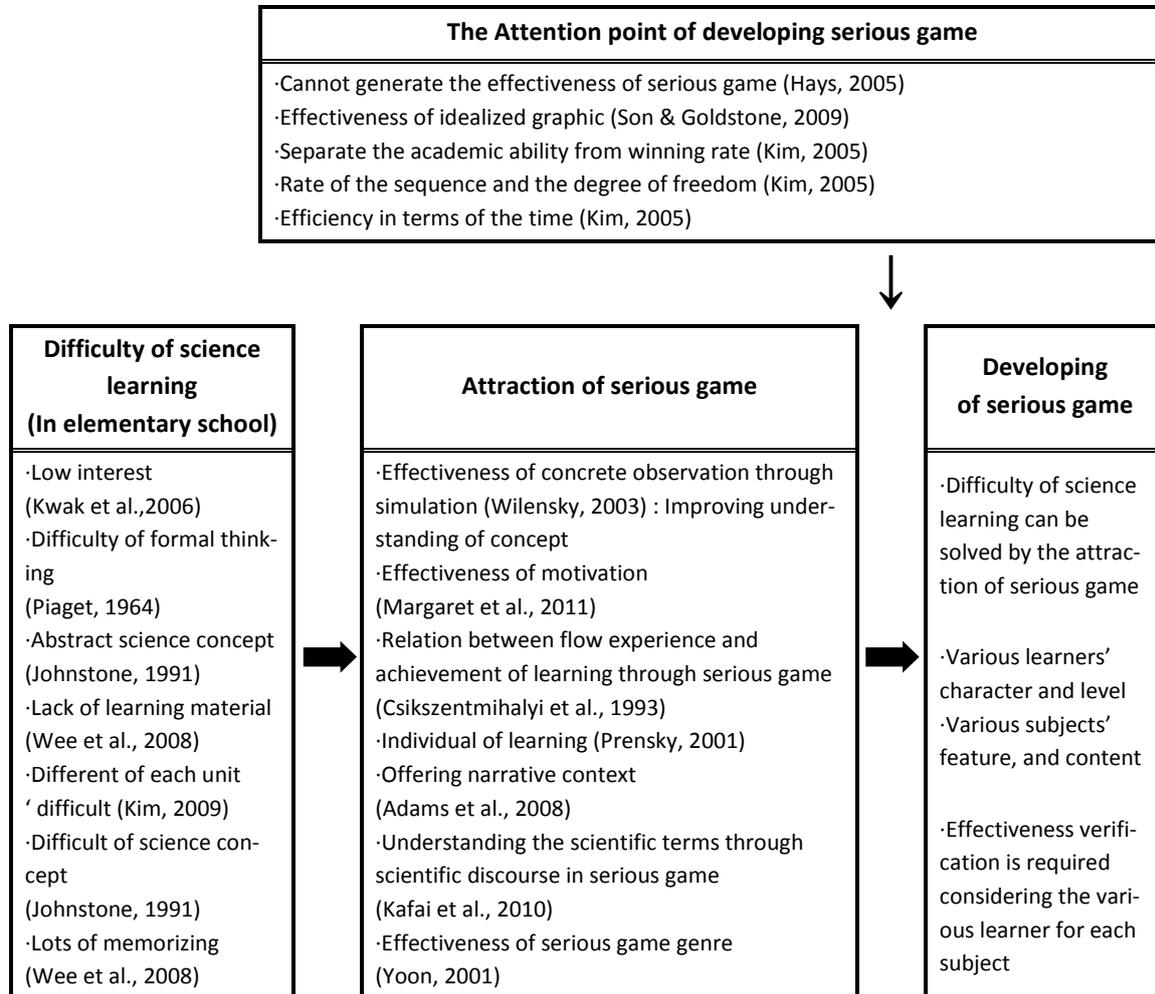

Figure 1. The Relation between the difficulty of science learning and the attraction of serious game

### 2.1. The Difficulties of Science Learning

#### 2.1.1. Student aspect

Student's attitude towards learning is the significant factor. But students' interest in science is less than the other subjects, and the higher grade, less interest in science (Kwak et al., 2006). They also think that their understanding ability is deficiency (Jeong, 2003). So it can be considered that they do not have sufficient confidence. In addition, they have a difficulty in thinking formally because they are in concrete development stage (Piaget, 1976). They also do not consider so many aspects at the same time (Johnstone, 1991).

### 2.1.2. Subjective aspect

The science concepts are not concrete but abstract (Kim, 2009; Johnstone, 1991). So the student who is in the concrete operational stage cannot help facing difficulty in learning science. To make it worse, scientific terms are difficult because these are not familiar with common life. (Johnstone, 1991; Kempa, 1991). There are many scientific terms which have a double meaning in common life and learning context. And there are not enough reality materials to learn either.

### 2.1.3. Curriculum Aspect

They have to memorize too many things to learn the science (Wee et al., 2008). Each science unit has each difficulty. In addition, students meet different difficulties according to the contents they are learning. For example, constellations are difficult for the students to learn as students have to memorize by rote. On the other hand, geological features give other difficulties in thinking long term era. Students cannot imagine the variation in huge scale for thousands of million years (Wee et al., 2008).

## 2.2. Attraction of Serious Game

The strongest attraction of serious game is motivation. So many researches show that serious game has the effectiveness of motivation (Beak, 2005; Clark et al., 2009; Margaret & Margaret, 2011; Kim, 2005; Seo & Park, 2010). Huizinga (1955) said that play is the origin of culture, human is homo ludens, playful instinct. So human find play element in learning (Kim, 2005).

Meanwhile, the effectiveness of observation in simulation has been proven by many previous studies (de Jong, 2009; Quellmalz et al., 2009; Wilensky, 2003). Through simulation, learners can see the concrete material instead of abstract concept. Serious game can provide the visual, audible, and haptic materials related to learning contents. This is possible due to the development of information technology. So learning can be approached by characteristic learning (Kim, 2005).

According to the constructivism, individualization of learning is one of the most important things. Serious game can provide the individualization learning situation (Margaret & Margaret, 2011; Prensky, 2001). So serious game can provide the various learning environments matching to the individual context, i.e. differentiated learning is possible by serious game (Plass et al., 2009).

Serious game has a narrative element (Adams et al., 2008). Narrative makes fun and interest in learning. Narrative can provide the flow experience. So it affects the motivation of learning. The flow experience in serious game is related to the achievement of learning (Csikszentmihalyi, M. & Larson, R., 1984, Csikszentmihalyi,

M. & Rathunde, K. Whalen, S., 1993). Besides, learner can understand the scientific terms easily through the discourse in serious game (Steinkuehler & Duncan, 2008; Kafai et al., 2010).

## Method

### 3.1. Proceeding of Research

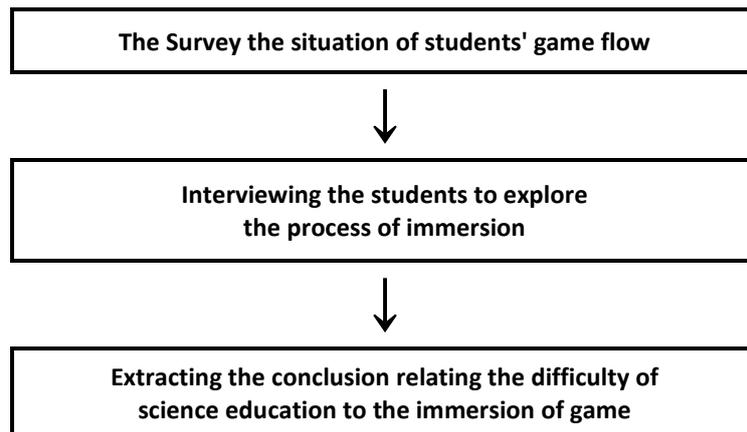

Figure 2. The Proceeding of the research

This study is designed in three steps. As a first step, we survey the situation of immersion in the game of elementary school student through questionnaire on the immersion in the game. Students are 6<sup>th</sup> grade in elementary school, in Seoul, Korea. As a second step, we interview some distinguished the students who are immersed in the computer game. Through interviews, we find out the process of immersion and the attractive important factors in the game. As a Last step, we extract the conclusion which concerns the relation of difficulties in learning science to the immersion factor in the game.

### 3.2. The Method of Exploring

#### 3.2.1 The questionnaire of measurement of game flow

The questionnaire developed by Chou & Ting (2003) was selected to measure the immersion in the game. We use the tool after translating the questionnaire in Korean. Chou & Ting (2003) has a point of view which the students who have experienced the flow are more likely to addict. The addiction constructs are Addiction (6 items) and Saliency (4 items). The flow constructs are Concentration (4 items), Playfulness (8 items), Distortion in time perception (3 items), Telepresence (5 items), and Exploratory behavior (8 items). The alpha value of sub-construct of Chou & Ting (2003) ' study is showed that ranged from 0.79 to 0.93, assuring the construct reliability. The alpha value of this study is Cronbach  $\alpha=0.91$ .

### 3.2.2. The method of selecting the interviewees and constructing the interview.

#### 3.2.2.1. Selecting the interviewees

The homeroom teacher can observe students in many dimensions; learning attitude, character, common life, level of learning achievement, etc. Especially, homeroom teacher can approach the student' diaries and class homepage. For this reason, we selected the students as the interviewees from the class where one of the researchers is in charge. The interviewees are selected from the questionnaire of the addiction/flow of the game, the diary, class homepage, and observation. Of course, the interviewer and the interviewees have a sensitive teacher - student relation. So the interviews were carried very carefully to reduce the effect of the relation problem.

Table 1. The basic information of Interviewees

Student	Grade	Age	The Addiction/Flow Score (five-point scale)	About Parents	note
Student A	6th	12	1.45	Only father	Feel lonely
Student B	6th	12	2.95	Father lives in other place because of working	Minecraft game
Student C	6th	12	2.68	Both parents show little concern.	Goes to PC room every day.

Student A writes postings in class homepage every day, accessed internet many times a day. His diary showed that he goes to PC room<sup>1</sup> many times a week. He also enjoys a talking to friends about the game. So we can presume him to be addicted to the game. For this reason, student A was selected as an interviewee.

Student B is not a student who is exposed about the game addiction. It is difficult to find a clue related with game through his diary and observation. However, through the survey about the game addiction, student B is exposed as a heavy gamer; he got the high score in the survey. Some description written in the survey showed that he plays the game about 2hours a day. It is not common that an elementary school student play the game 2hours a day. So student B was selected as an interviewee.

Student C is recognized by other students that he plays the game many hours a day. There are many reasons supporting the students' words. He writes it many times on his diary that he went to PC room with his friends. We can often hear him talking to the friends to go PC room after school. In addition, student C got a counsel

<sup>1</sup> PC room is the facility which place can play the game and/or work with computer. Many of Korean students go to PC room to play the game. It is the culture of Korean.

about his experience related PC room at last semester. He also got high score in the survey of game addiction. So student C was selected as an interviewee.

### 3.2.2.2 Construction of the interview

Seidman (1998) suggest a structure of deep interview as a qualitative research. So we constructed the interview structure suggested by him. The interview was composed of three steps. First interview was focused on the life history; how have you been addicted to the game? Second interview was focused on the reconstitution of detail experience; which factor do you consider attracts you in the game? Third interview was focused on the meaning of the game oneself; what is the meaning about playing game on your own viewpoint? Fourth interview was focused on the exploring the relation between the attractions of the game and learning science; what is your difficulty in learning science?

When we construct the interview structure, we consider that the interviewees are the elementary school student. So we limited the length of each interview not to exceed the 30 minutes. As elementary school students do not have enough concentration so long. We emphasized that they would not have any disadvantage due to the interview, it was because the students many concerned that interviewer was a homeroom teacher of these three students. The interviewer always checked the circumstance of the interview and especially attempts the students comfortable. The interviews were recorded and transcribed.

## Result

### 4.1. The Result of game addiction survey

Table 2 shows that the result of the survey of game addiction. The scores are based on 5 point Likert scale. Higher score means to be addicted more. The class students got the highest score in Distortion in time perception construct and the lowest score in Telepresence construct. Student A got the higher score than class average in only one construct. He is ranked 18<sup>th</sup> in the class while he spend more time playing the computer game than other student. Student B got the higher score than class average in all constructs. He is ranked 4<sup>th</sup> in the class. Student C got the higher score than class average in except two construct. He is ranked 6<sup>th</sup> in the class.

Table 2. The result of game addiction survey with five-scale

student code	gender	Addiction (10 items)				Flow (28 items)			In Five-scale	Rank In class (n=26)
		Addiction (6)	Salience (4)	Concentration (4)	Playfulness (8)	Distortion in time perception (3)	Telepresence (5)	Exploratory behavior (8)		
A	Boy	2.17	1.75	1.50	1.00	2.67	1.00	1.00	1.45	18
B	Boy	2.83	3.00	3.00	3.00	3.00	2.40	3.25	2.95	4
C	Boy	2.67	2.00	2.00	2.50	3.67	3.00	3.00	2.68	6
Class Average		2.07	2.01	2.69	2.00	2.95	1.34	1.86	2.04	

#### 4.2. The Result of interviewing the students who are immersed in the game

##### 4.2.1. The Process of Game flow

###### Student A

Student A plays the game just to kill the time. He does not have anything to do except going private educational institute 3 times a week. He spends 2~3 hours there at a time. He usually plays the game after school until eating dinner. But dinner time is not fixed because he always eats alone. His family members are four, which are grandfather, grandmother, father, and him. His mother died when he was 2~3 years old. His grandfather does not have any presence. His grandmother usually raise the grandson, him. However, she does not concern so much about his grandson. His father is yet young, spending the dinner time with his friends every day. So student A usually eats dinner alone. On the other words, he cannot derive comfort from his family. So he has no choice but to go to PC room with his friends. He says that he does not feel lonely because of his family, but he misses the comfort family in his inside. This situation makes him go PC room with his friends. And he kills much time rather than spend time playing the game.

###### Student B

Student B plays only one kind of game addictively. He is often immersed in the game. He believes that the game is very useful to develop creativity and helpful to learning English because the game require informal structure and made in English. His family has a permissive attitude toward playing the game. This atmosphere reinforces him play the game. His father lives other place because of the job. So he lives with his mother, his grandmother, and his brother. His mother works after dinner time, and his grandmother works evening to dawn. It is thought that parents' busyness has him play the game. So he plays the game enough everyday under lack of control from his parents or grandparents. In addition, his brother makes him be immersed in the

game. Playing the game alone is fun, while playing the game with his brother makes him more pleased. So he mostly plays the game with his brother every day. On the other hand, he does not have many friends. In the elementary school, he plays usually with only one friend. His friend plays the same game. If they want to play the game together, they have to go to the same Wi-Fi Zone. So he plays the game even after-school with the friend who plays with him in the school. It makes student B immersed in the game, too.

#### Student C

Student C enjoys playing the game. His parents have permissive education of children. So they allow him play the game, quit the private educational institute. Such parents' attitude to child education make the situation that student C can go to PC room. Student C doesn't participate in after-school lesson nor goes to the private teaching institute. He goes to PC room everyday to play many kinds of games with friend in the PC room every day. He wants to do well in many games. Actually, other friends of his said that he plays the game very well. Game is a tonic in his life. Finally, he wants to be a pro-gamer in the future.

Table 3. The comparison of game flow process of students

Students	Aim of playing the game	Background
Student A	Killing time	having too much time alone
Student B	Develop the creativity	Parents' permissive attitude
Student C	Just enjoying the game	Parents' permissive attitude

## 4.2. The strategy for serious game

### 4.2.1. Collective

Collective factor is an important element in the game. The three of student are playing the game with others. Student A and C said that they would not go to PC room alone. Student B also plays the game with his brother or friends. They have more fun when playing the game with others than playing the game alone. Besides in everyday life, many people also have more fun when playing together than playing alone. So collective factor should be considered when develop serious games. It is related with serious game can provide the interaction with others (Richards et al., 1992; Prensky, 2001).

### 4.2.2. Various

There are various learners in school. Each learner has difference interest and character in learning area. The three of student like different genre of games. Student A likes First-Person shooter game. Student B likes only Minecraft which makes structures. Student C likes many kinds of game. Each contents of learning have a suitable genre of game (Kang & Yoon, 2009; Kim, 2005; Yoon, 2001). And each genre of game has an appropriate type of thinking (Kang & Yoon, 2009; Yoon, 2001). For these reasons, serious game should be developed to satisfy individual learners' tastes.

#### 4.2.3. Online

Serious game which can be accessed on the internet is attractive to the students, who feel much free time. The student can play the game on the internet with others who don't know each other directly and play any-time. They would interact each other in online circumstance. The three of student A, B, and C play the game in online all the time. In addition, online factor is related with collective factor. It is necessary in play the game together having access the internet. So online factor should be considered when develop serious games.

#### 4.2.4. Narrative

In terms of constructivism, narrative situation is very important to learners. Learners can construct the knowledge with easy in narrative learning situation. The learner who has much free time like the student A, play the game in order to kill time. Such student can learn the knowledge with playing serious game which provides the repetitive and narrative learning situation.

## Conclusion

The students who are addicted the game have common characters. They have enough time to play the game. In other words, they have a little to do after-school until go to bed. Their parents or fosters have a permissive attitude to the students. Thus, a home environment effects to the student's process of game addiction. They play the game with their friends or brother, not alone. For this, we can extract the strategy of develop serious game. If serious game has collective, various, online, and narrative factors, the students can play the serious game easily. Such a process can make their learning naturally. Especially, serious game has strong attraction; they can help visual, audible, and haptic learners in studying science which is especially made up of many abstract and difficult concepts.

**6. Abstract and/or full paper :**

The purpose of this study was to develop a HAM(Heuristic Attention Model) by analyzing the difference between eye movements according to science achievement of elementary school students on discrimination task. Science achievement was graded by the results of Korea national achievement test conducted in 2012, a random sampling of classes.

As an assessment tool to check discrimination task, two discrimination measure problems from TSPS (Test of Science Process Skill; developed in 1994) which were suitable for eye tracking system are adopted. The subjects of this study were 20 students from 6th grade who agreed to participate in the research. SMI was used to collect EMD(eye movement data). Experiment 3.2 and BeGaze 3.2 programs were used to plan experiment and analyze EMD.

As a result, eye movements of participants in discrimination task varied greatly in counts and duration of fixation, first fixation duration and dwell time according to students' science achievement and difficulty of the problems. By the analysis of EMD, strategies of the students' problem-solving could be found. During problem solving, subjects' eye movements were affected by visual attention; bottom-up attention, top-down attention and aflunter attention.

In conclusion, HAM was developed and it is believed to help development of science learning program for underachievers.

**Key words :** heuristic, attention, bottom-up, top-down, aflunter, underachievers

## **Korean kindergarten teachers' emotional labor and its relations to job satisfaction and social support**

This study examined the overall aspects of kindergarten teachers' emotional labor, the differences in it according to their personal and institutional variables, and the correlations of their emotional labor with job satisfaction and social support. Subjects consisted of 334 kindergarten teachers, working at public or private kindergartens in Seoul, Korea, and the data were collected through a questionnaire including Emotional Labor of Teaching Scale (Brown, 2011), Job Satisfaction Measurement Scale for Childcare Teachers (Lee, 2007), and Indirectly Perceived Social Support Scale (Park, 1985). The results of this study were as follows. First, the kindergarten teachers' perceived emotional labor level was slightly over the average in general, and among the sub-categories of emotional labor, deep acting was the highest and surface acting was the lowest. Second, according to the variables, significant differences were found only in their kindergarten types and working hours. Third, as a result of examining the correlations between sub-categories of emotional labor and job satisfaction, deep acting was positively correlated with job satisfaction, while surface acting was negatively correlated with job satisfaction. In terms of the correlations between sub-categories of emotional labor and social support, natural emotions and deep acting were positively correlated with social support, while surface acting was negatively correlated with social support.

## **Lost in professionalism:**

### **Infant caregivers' confusion about professionalism and overcoming power**

This qualitative study explored infant caregivers' confusion about professionalism in the process of implementing infant education and care (educare) in practice and their inner power of overcoming the confusion and difficulties and growing as a professional. For this purpose, 24 infant caregivers in Korea were invited to participate in this study, and data were collected through in-depth interviews and observations.

As the key factors that lead to confusion about professionalism, the infant caregivers highlighted (1) physically hard work, (2) inelegant teaching, (3) low expectation and pervasive undervaluation on infant caregivers, and (4) consequential self-perception of their job as non-professional. Nevertheless, the infant caregivers had the inner power of overcoming the confusion actively and constructively. To be concrete, first of all, they aroused a sense of responsibility as infant caregiver by themselves, who could make differences in infants' lives. Second, they made an utmost effort to regard their job as professional, realizing that caring and daily routines are very essential and professional parts of their work and doing their best to get professional knowledge. Third, through sharing emotions with infants and new discoveries about infants, they got great consolation and got to gain confidence as infant caregivers, expanding their understanding about infants and improving relationships with infants. Fourth, they came to form proper beliefs on infant educare and curriculum from their day-to-day field experiences, building a clear and desirable image of infant professionals. When all of these four resilient powers were working together, the infant caregivers could overcome the difficulties and grow as real professionals. The results of this study shed light on the necessity of systematic caregiver education to attract, educate, and retain capable infant caregivers in the field and the necessity of improving regulations to support infants and caregivers in everyday practice.

**Title of the submission:** A Review of Research Papers on the Relationship between Metacognition and Emotion in Korea

**Topic area of the submission:** Educational Psychology

**Presentation format:** Poster Session

**Author:**

## **Abstract**

This study aims to examine research published in Korea on the relationship between metacognition and emotion in childhood and adolescence to investigate whether metacognition correlated with emotion in childhood and adolescence in research published in Korean journals and how metacognition affected the relation between emotion and behavior. The studies reviewed reported that metacognition was positively related to emotion and acted as a significant moderator variable.

Metacognition refers to the capability using the strategy to regulate one's own cognitive ability and knowledge (Flavell, 1979). Studies regarding the relationship between children's metacognition and emotion have reported that metacognition has been associated with various emotional outcomes including emotional disorders and problems. However, relatively little studies have been conducted in the Korean family contexts. The present study aims to review literatures including empirical evidence on the relationship between meta-cognitive ability and emotional outcomes in Korean children and adolescents.

For the literature review, five articles were selected from four academic journals of Korea published between 2004 and 2013. All the articles were shown in the KCI(Korea Citation Index) database. All of the five articles showed that negative emotion such as worry and anxiety was positively related to metacognition. However, none of the articles reported a significant relationship between children's meta-cognition and positive emotional outcomes. Discussion included the influence of meta-cognitive ability on the expectation and regulation

of negative emotional experiences, and suggestions for future research were also proposed.

## **A Critical Discourse Analysis of the Nuri Curriculum for 3-5 year olds in Korea**

### **I . Introduction**

The importance of early years to children's lives has been increasingly recognized across the world. UNESCO has developed the International Standard Classification of Education(ISCED) in 2011 to respond to the changes taking place in education systems and social policies around the world. In their report, of particular note is their new categorization of the early childhood period, which had been previously recognized as 'the stage zero', to two sub-stages: the 'early childhood development' for those aged birth to two and the 'pre-primary education' for those aged three to five. This change has reflected the worldwide belief that childhood development should not be seen as a mere step prior to primary school years but a stage of its own, arguing for better systematic education during early childhood(Park & Shin, 2012). In response to this movement, most developed countries in the OECD including the United States and the United Kingdom have established a free public education system for children aged three to five(Ministry of education, 2013).

In Korea, owing to those global trends, the significance of early childhood education also has been emphasized. As a result, Korea set out a national, common curriculum, called the Nuri Curriculum in 2012, for five-year-old children. In 2013, the Nuri Curriculum has been expanded into age three and four(Korea institute of child care and education, 2012). Despite this recent educational policy reform movement for early childhood education in Korea, little adequate political analysis has been conducted. Particularly, discourses embedded in policy have not been critically reviewed.

According to Foucault (1971), a discourse is a collection of signs with an agenda, and all cultural and linguistic activities of men are subject to analysis. From Foucault's point of view, discourse is historically operated by both rule of exclusion and control, and for this reason only those with a specific educational background and qualification can participate in a discourse and have the right to be granted expertise and credibility regarding the subject. In this regard, policies have been reviewed in relation with discourse. That is, those who participate in a discourse on a certain topic are those considered to have expertise in the field, and their discourse eventually gets reflected onto policies. These policies, in turn, affect the views of the so-called laymen, and then form the basis of social discourse on a certain topic. For that reason, a discourse analysis on policies has been used as a useful research method to reveal not only political hypotheses that would be considered as natural but also power relations inside the policies.

This study aims to reveal how social discourses have rationalized the Nuri Curriculum and constructed the meanings of early childhood education and care in Korea. For this purpose, we analyzed *the Manual of the Nuri Curriculum* for children aged three to five, co-published by the Ministry of Education, Science and Technology and the Ministry of Health and Welfare in 2012 for five year olds, and 2013 for three and four year olds.

The Manual consists of three parts; part 1 includes the introduction of the Nuri Curriculum and its background. Part 2 describes its goals and structure. Part 3 explains five core contents in the curriculum. We analyzed the texts of part 1 and 2, and looked into the discourses used to rationalize the goals and needs of the educational reform and construct the ideal images of early childhood education and care in Korea.

## **II. Background -Early childhood education and care in Korea**

Historically, Korea has had its divide system for early childhood education and care. That is, early childhood education is provided through kindergartens under the supervision of the Ministry of Education and Human Resources Development(MEHRD), while early childhood care is provided through childcare facilities under the management of the Ministry of Health Welfare(MHW). Under this dual system, kindergarten and childcare facilities had two separate national curriculums, the National Kindergarten Curriculum and the National Standards Education Curriculum with different focuses; the National Kindergarten Curriculum focused on early learning and preparation for school, and on the other, the National Standards Education Curriculum with their charitable and welfare focus. However, the need for integrated education and care services for young children has increased to provide quality and equity education with children.

As a response to this demand, the government announced the establishment of the national common curriculum for early childhood education curriculum in 2011. MEHRD and MHW had worked together, and established the Nuri Curriculum for age five, which has been implemented since 2012. The curriculum emphasizes children's well-being, safety and citizenship, and includes five development areas: motor skills and health, communication, social relationships, art and science. Starting from 2013, the Nuri Curriculum has been expanded to ages three and five. As a result of this educational reform, three to five-year-old children came to receive consistent quality of services regardless of the type of education and care institution.

In spite of a recent upsurge of interest in the Nuri Curriculum, however, few studies have been conducted in regard with this new national common curriculum. Among the existing research, some focused on the educational contents in the curriculum. These researchers analyzed the activities addressed in the teacher's guide book published by the government. For example, Ahn (2012)

examined musical activities and Kwon and Im (2013) investigated scientific activities in the teacher's guide book. Cho (2013) also analyzed the teacher's guide book in terms of its contents and structure. Other researchers pay attention to teachers, and investigate their perception about the Nuri Curriculum. For example, Chun and Seoh(2012). Lee(2012) and Park(2013) look at the teachers' perspectives of the new curriculum. Sohn(2013) investigates the teachers' implementation and effects of the curriculum. Chung(2013) examines the teachers' satisfaction with the Nuri Curriculum. In addition, some other studies have been conducted with the focus of the consistency of the Nuri Curriculum and the national Elementary Curriculum. Park(2013) examine the contents of the Nuri Curriculum and compare it with the national Elementary Curriculum. Other researchers also analyze both curriculums in terms of the educational philosophies(Hwang, 2012), and developmental domains(Lee, Chun & Park, 2012).

Although the existing research provides us with the description of the curriculum, its contents and its implementation, it fails to connect the past, present and future of our society within the discourses of early childhood education and care. If the past did not exist, the present and the future do not and will not. Therefore, a research on the past is necessary because the present can be recognized and the future is prospected based on a research on the past. Therefore, this study intends to approach to the Nuri Curriculum with the method of the discourse analysis so offers the critical insights of how the curriculum has been developed and worked in Korean society.

### **III. Critical Discourse Analysis Framework**

Discourse analysis was affected by the concept of discourse developed by Foucault. There are two different approaches to the discourse analysis(Philips & Jorgensen, 2002). First, which was originated from the study of Laclau and Mouffe(1985), there is a perspective viewing discourse as not only an absolute actor, but also society itself. In other words, according to this point of view, society does not exist independently of discourse but within conceptualization and discourse. The second type looks at discourse as a semiotic and linguistic component that includes texts, locution, and gestures. This type is referred to as the Critical Discourse Analysis(CDA), as represented by Fairclough(1999). According to this viewpoint, discourse is a certain snapshot of social execution or social reproduction or the moment at which such execution takes place. In other words, discourse can be seen as being combined with social execution and as having social influence and impact within that limit(Chouliaraki & Fairclough, 1999).

This study takes the second perspective, that is, Fairclough's CDA. We chose CDA as our methodological tool because CDA helps us to understand how practices have been socially

constructed in the official document of the curriculum, and as a result create and recreate the discourses of early childhood education and care in Korea.

Fairclough(1995; 2011) discussed discourse in three aspects: description, interpretation and explanation. The description means the activity analyzing on the formal aspects with much interest. In order to analyze the description, Fairclough suggested ten questions. Through these questions, we can recognize the features suggested in the texts and glance the formal features and the types of discourse. Interpretation shows some interest in the relevance between the texts and the interaction. Therefore, the texts are considered as the outcome of output process and the resource of interpretation process. Explanation shows some interests in the relevance between the interaction and the social contexts, that is, the social decision content on the outcome and interpretation processes and its effect on the society. The reason that Fairclough classified a discourse into these three aspects is because a discourse includes the social conditions related to different layers of social situation, social institution and social structure. And these social conditions shape and reshape the way people interpret and represent the texts. Therefore, it includes the analysis of the relevance among the texts, the processes to interpret and the social conditions to analyze a discourse. Thus, investing the discourse from the three levels of description, interpretation and explanation can make us understand the whole process forming the discourse.

This study used the official text from Korean government: *the Manual of the Nuri Curriculum* for children aged three to five(MEHRD & MHW, 2012), as its subject for analysis. Using Fairclough's CDA, we examined how the Nuri Curriculum works, or as Fairclough put it(2001, p.140), 'the inter-discursive work of the text materializes in its linguistic and other semiotic features.'

#### **IV. Findings**

The relationship between the texts, the process and social structure is 'mediated by the discourse which the texts is part of(Fairclough, 1989, p.140)'. From the in-depth CDA, we found that the Nuri Curriculum was the discursive space embedding the related discourses and the social structures in which it is situated.

Within the document for the Nuri Curriculum, the most evident genre was the information delivery and propaganda. The purpose of this genre was to sell the new policies to the concerned people such as teachers, principals, parents and other members, particularly tax payers in our society. Therefore, the texts strongly persuade the readers that the new educational reform of the Nuri Curriculum is necessary. Here, we discovered that the policy's background and vision contain the discourse of change. That is, historically in Korean society there has been the discourse of education that it is a parent's responsibility to educate their child. Accordingly, parents have

invested much of their energy and money on their child's education not only inside but also outside school. This discourse has resulted in the extreme expansion of private sector in education, and brought a big gap in the educational achievement of students depending on their parents' socioeconomic status. As a result, many parents have felt burden on raising their child, and the birthrate in Korea has come to dramatically decrease since the beginning of 21 Century. The birthrate decrease became a serious national issue as it was related to the workforce reduction and the aging population increase. The demand for change has been raised that the government should take the responsibility for educating children. The discourse to call for the change at the national level has embedded all over the texts in the *the Manual of the Nuri Curriculum*. In the background part of the Nuri curriculum, most agents were described as the 'nation'. That reflects the discourse of national change insisting that education for young children should be taken charge by the nation, as described in *the Manual of the Nuri Curriculum*.

*National awareness that the nation should take an active role has been expanded. In order to reduce significant educational gaps among social classes, we should give every preschooler the educational benefits (Manual of the Nuri Curriculum for 3-5 years old, 2013, p.6).*

*Many people agree that policies for education and child care should be reformed. There is a social consensus that we should provide an equal right with all infants to be receive quality education, particularly for six-year-olds (Manual of the Nuri Curriculum for 3-5 years old, 2013, p.6).*

In addition, we found that this discourse of change in early childhood education is interwoven with the discourse of globalism. Fairclough(2001) insisted that the discourse of the globalism is ideologically worked as the discourse of power. That is, it is the discourse of economics that is used in being connected with other resources in order that the people with power strength their own power. Within this discourse of globalism, the values of everything are judged economically; when a thing is judged as having economic profit, it is considered as valuable. With this perception, Korea made every judgment from the aspect of economic profit and appointed relative predominance. According to Fairclough's discourse of globalism, as the liberalism became globalized and the economic elements were changed into the power keeping the vested rights of people with power, and those economic elements were eventually judged its value in connecting with other resources.

*The importance of early childhood development has increasingly been recognized as Heckman(2006) reported that if the investment cost by life phase is calculated in the same cost, the return rate on early childhood investment would be the biggest one. Also American Perry Preschool Project(2003) reported that \$1 investment in early childhood education caused the benefit of \$16.14 in return.. English EPPE Project(2007) reported that supporting about 2,500 pound to enable 1 infant to attend on a preschool had the same effect directly supporting about 17,000 pound on his/her poor parents' income. (Manual of the Nuri Curriculum for 3-5 years old, 2013, p.7: 4-11).*

As shown above statements, under the global trend connecting the effects of early childhood education with economic value, current Korean education cannot but think in connecting the economic element. In the *Manual of the Nuri Curriculum*, it is often found that economic metaphors such as investment and human capital are used. Concerning the use of metaphors, Fairclough insisted that metaphors are instruments expressing an aspect of experience by reflecting it into another experience. Particularly, some interest could be found in the relevance with the analogies substituting the original aspect(Fairclough, 2001). Therefore, metaphorical expressions like investment and development of human capita reveal the fact that the economic concept contained the expressions are the major values in Korea currently. In view of this, no understanding of political discourse is complete without an adequate account of metaphor;

*National investment on 6-year-old children is an international trend. OECD members are recently expanding the free education and free child-caring in order to solidify the publicity of early childhood education and care. They expand the target ranges from the 6-year-old children to the 3-year-old children and strategically make enough investment on the children. For the OECD members, average burden rate of public on preschoolers' education cost was 79.7%: Finland 90.6%; France 94.0%; England 86.1%; the U.S.A 77.8%. Most EU members as well as the two nations in the North American region take the public burden of preschooler education cost over OECD's average burden rate of public. However, Korean public burden rate was 49.7% far less than OECD's average public burden rate of 62%, indicating that Korea should expand the public investment on the early childhood education and child-caring(Manual of the Nuri Curriculum for 3-5 years old , 2013, p.6).*

The above text indicates that the day-to-day language in daily life is used in metaphorical meanings. In particular, economic metaphors show the macroscopic social changes that the educational phenomena are encompassed in the globalism. That is, through the use of economic

metaphors, it shows the social changes insisting that the educational achievements should also be shown in economic effects.

Another discourse evident in the Nuri Curriculum is the discourse of developmentalism. Discourse of developmentalism is the concept emphasizing the human's natural development and insisting that the development should be led to the learning. This concept is created from the reconceptualists. Reconceptualists insisted the necessity of learner-centering education with opposing the concept of curriculum development insisted by the traditionalists represented by Tyler. Therefore the reconceptualists' learner-centering education concept is considered to be relevant to the connection between human's natural development and the education. Especially, the developmentalism is the concept emphasized in the early childhood education. That is, the developmentalism insists that each preschooler's development stage, individual developmental gaps and each preschooler's social & cultural experiences should be considered in teaching the preschoolers. Therefore this viewpoint is reflected in the guidebook of Nuri curriculum. That is, the guidebook emphasizes the necessity of education suitable for each preschooler's developmental stages and describes the preschooler's learning environment, the teaching & learning plan, and the operation and the evaluation and the environment composition connecting with the each preschooler's development stage. That means that early childhood education is delivered by the teacher, but the preschooler as a learner should be participated in the education, not being delivered only by the teacher. That is, in the manual of the Nuri curriculum, a preschooler is described as an active learner learning by himself, and the play is emphasized as a way of learning, as described below.

*With considering the preschooler's interest, developmental level and his/her experiences in daily life, the educational, caring activities around the play should be carried out(Manual of the Nuri Curriculum for 3-5 years old, 2013, p.22).*

*At organizing and operating the interest field, it is desirable to discuss with the preschoolers about an educational program from the plan phase and operate it in order to reflect the preschoolers' interests and requests(Manual of the Nuri Curriculum for 3-5 years old, 2013, p.25).*

*Teacher needs to plan and provide the plays which ar meet the intended educational goals and contents and the preschoolers can voluntarily and actively participate in(Manual of the Nuri Curriculum for 3-5 years old, 2013, p.27).*

*Based on careful observation, the teacher needs to recognize the preschooler's interests and to provide suitable activities(Manual of the Nuri Curriculum for 3-5 years old,. 2013, p.28).*

Another theme seen in the Nuri curriculum is the individualism. Individualism is the attitude that regulates things based on the individuals. In this perspective, a system design considering the individual's freedom and rights are deemed important. That is, the individualism puts the individual before existing social customs, and considers the activities pursuing for the development of individuality as good ones rather than the enlightened, universal, rational judgment.

This individualism is revealed in the texts of the Manual of the Nuri curriculum by age for 3-5-year-old children as themes like individual's uniqueness, originality, and creativity are stressed for the end of education for young children. In other words, individualism importantly considers that the individual grows up into a creative adult by developing his/her characteristics since his/her early childhood and planning and implementing suitable teaching & learning activities in suitable environment.

*Each preschooler needs to grow up into a creative adult to demonstrate his/her original, unique abilities(Manual of the Nuri Curriculum for 3-5 years old,. 2013, p.15).*

*Early childhood is the period when the creativity can be developed the most actively, so should focus on raising flexible, creative thinking ability based on the child's basic thinking ability(Manual of the Nuri Curriculum for 3-5 years old,. 2013,p.15).*

As shown above, the texts in the manual of the Nuri curriculum describe the individual's characteristics as one to be developed importantly in early childhood. Besides, the texts describes that each preschooler's uniqueness and individuality should be considered in planning and operating the teaching & learning methods.

*It is necessary to admit each preschooler's uniqueness and to support a suitable learning way for the individual preschooler(Manual of the Nuri Curriculum for 3-5 years old,. 2013,p.31)*

*Teacher needs to provide suitable activities and to use appropriate teaching strategies with considering each preschooler's characteristics, not to plan the educational activities only based on the preschooler's age(Manual of the Nuri Curriculum for 3-5 years old,. 2013, p.31).*

It can be interpreted in the same vein to consider the education as individuals' rival relationship and to compare the early childhood education to a 'starting line' from such a viewpoint. That is, individual's learning and development should consider his/her unique characteristics and it is like individuals' competition, so having similar-level educational opportunities in early childhood means that all preschoolers stand at a 'fair starting line'.

*By providing the 3-5-year-old Nuri curriculum integrating the preschooler's education & child-caring courses to all 4-6 preschoolers in Korea, the quality of education before entering the elementary school can be improved, and the fair starting line early in life can be guaranteed(Manual of the Nuri Curriculum for 3-5 years old,. 2013, p.8).*

Another theme is the collectivism, which seems to contradict against the individualism. Collectivism put more important on equity within the group rather than the individual's uniqueness. In the texts, the words such as national identity, society, nation, and government are repetitively appeared. For example, in the text, it is said that 'a child should live in the relations with other people in the community(p,15)' and 'create the culture of learning community(p.29),' 'in order to live as a healthy, happy member in the community of society(p.14).' This shows that texts describes the early childhood period as the starting point for the preschooler to learn the regulations and rules of community. This educational philosophy clearly suggests that Korean educational goal is to form the national community. Even though emphasizing on people's appreciation on the multi-cultures in global age, the fact setting the appreciation on Korean culture as the foundation of education shows Korea uses its education as an instrument integrating the society. While Korean society is gradually being changed into the multi-cultural society, but the premise hidden in the Nuri curriculum is that Korea is a single-race nation. This premise reveals in whole society in Korea including the relevant policies as well as the educational philosophy. So-called multi-cultural policies targeting the foreigners in Korean society cuts back the targets or don't admit the foreigners' characteristics in terms of contents. That is, Korean multi-cultural policies are the policies trying to assimilate the Korea-resident foreigners into Korean society(Cho, 2012). This reflects the sense of pure bloodline deeply rooted in Korean society, so Korean society admits the multi-cultures but tries to integrate the Korea-resident foreigners in one framework of Korean people, not seeing them as individuals. And it is the very education that is one of instruments used by Korean society for achieving this goal.

At critically analyzing the premises as being taken it granted in Korean society, it may be powerful to analyze what premise are absent or omitted in the texts, not only analyzing those

included in the texts(Fairclough, 2001). That is, by revealing the discourse hidden in the texts, the discourse which the author intended to hide or the discourse which is hidden but cunningly delivered to the readers can be analyzed. In this view, we can know that the discourse about the genders is excluded in the Nuri curriculum. One of main backgrounds of Nuri curriculum is the low fertility.

*As you see from the news that recent total birth rate reported into 1.22 baby (National Statistical Office, 2010), Korea suffers from the phenomenon that the world-lowest birth rate is being set in. As Korean population is reduced resulting from the low fertility and the population composition is also changed, more and more people worry serious social problems like workforce reduction, aging population increase and social cost increase resulting from the increase of old population. In such circumstance, the parents' burden of infant and preschooler's education & caring cost is pointed as a main factor exacerbating the low fertility(Manual of the Nuri Curriculum for 3-5 years old., 2013, p.6).*

The Nuri curriculum is proposed in order to solve this serious social phenomenon of low fertility resulting in the reduction of manpower to take the charge of national productivity, and lagging national competitiveness caused from the reduced national productivity. In order to prevent the low fertility from being expanded and to reduce the parents' child-raising burdens(economic burden and high-quality education provision burden), the Nuri curriculum is implemented. However the theme is not discussed in the discourse of low fertility is the social structure from the perspective of women. In Korean society, a woman's childbirth has been a hindrance preventing the woman from joining in the economic activities, so many women are reluctant to give birth. According to National Statistical Office(2011), Korean birth rate in 2012 is 1.30 lowering 0.22 than 1.52 of birth rate in 1997. If this trend is continued, it is expected Korean birth rate in 2015 will be about 1.28. However, the Nuri curriculum investigates the reason of low fertility from parents' child-raising burden, but doesn't consider the woman's place in the labor market.

In the texts of the manual of Nuri curriculum by 3-5 years old, there are not any words indicating the female, but are the participants revealing their roles like parents or teacher, not revealing the 'gender' like the female or the male. This implies author's intention not revealing various problems related to women seen in Korean society or not solve such problems through the education. In other words, in that the author regards the social problems related to women as the women's own problems, not seeing them from a macroscopic perspective, so it can be considered that the discourse about women absolutely exists but is hidden in the texts of the manual of the Nuri curriculum.

## **V. Discussion & Implication**

This study analyzed the texts of the manual of the Nuri curriculum for 3-5 years old in order to analyze the discourses of early childhood education and care in Korea. As the result of analysis, the discourses analyzed around the preschooler's appearance described in the Nuri curriculum is signified and conceptualized in the public document as follows.

First, there was the discourse of change. There created a discourse of change that pervious society recognized the education to be taken responsible for by the individual or the home and the awareness generated various social problems, so the education should be responsible by the nation, now. In its introduction background part, Guidebook of Nuri curriculum clearly reveals the nation as the main object supporting for the early childhood education.

Second, there was the discourse of globalism. As economic factors become important in whole society, and education also use the metaphors like national competitiveness, human capital, support, investment and so forth, the discourse judges the educational value as an economic factor, and describes the education as a valuable one when it generates some economic effects at the same time.

Third, there was the discourse of developmentalism. This discourse is originated from the reconceptualists opposing the concept of curriculum development, and it focuses on the learner's characteristics rather than an education model. Under this course, the Guidebook of Nuri curriculum insists that the curriculum should consider the learner, that is, the preschooler's development stage, each preschooler's developmental gap, and his/her social, cultural experiences.

Fourth, there was the discourse of individualism insisting that the individual's freedom and rights are more important than the society. The texts of Nuri curriculum use the terms like individual's uniqueness, originality, individuality and creativity, etc, and describe that the individual's characteristics should be respected importantly.

Fifth, there was the discourse of collectivism. As the concept contradicting the discourse of individualism, the discourse of collectivism regards the society more importantly than the individual. That is, the collectivism considers the individual as the creature learning his/her social rules and regulations in using the education as an instrument of social integration.

Sixth, the course about the women was a hidden discourse in the texts of Nuri curriculum. Low fertility is said as one of main problems in Korean society, but the texts mentioned about the discourse about women concerning this problem. It can be considered that the texts contain the author's intention not specifying and formalizing the discourse about women.

As reported above, there exist various discourses in the Nuri curriculum. Some discourses are clearly revealed and others are not. But a clear fact that the Nuri curriculum is composed of

compelling discourses containing the hybridized texts. That can be interpreted as that the participants in establishing the texts of the manual of the Nuri curriculum possessed such a discourse, and on the other hand, can be accepted as the participants' hope wanting to deliver these discourses to the readers. That is, it is meaningful in that it can draw the conclusion suggesting that Korean early childhood education takes such a role socially.

Based on our analysis, there are some suggestions for future studies. This study analyzed the texts in the manual of the Nuri curriculum with an analytic framework of Fairclough's CDA and analyzed discourses in Korean society embedded in the texts. For further study, it would provide more comprehensive account if we look at more various data from more macroscopic viewpoint.

# **Narrative inquiry of preschool teachers' experiences as agents of the implementation of the Nuri Curriculum**

## **Abstract**

### **I . Introduction**

Recently there have been such a rising variety of issues about the future over the world as low birth rate, population aging, environmental issues and economic polarization. Among them, education has its own importance not only for the current generation but also for the sustainability for future generations. Particularly, the value of the early childhood education stands out economically. Heckman(2006) reported that the investments in early education are the most cost-effective compared with later investments. OECD(2005) highlighted the importance of early childhood education as well, and particularly emphasized that high-quality early childhood education be provided for what heavy investments should be carried out by nations in that early childhood learning builds a stepping stone for the lifetime learning. UNESCO revised ISCED(International Standard Classification of Education) which had been compared and classified nation's educational policy that emphasized ISCED by including it in the basic education(UNESCO, 2011).

Alongside such global movements, Korea also has acknowledged the importance of early childhood education and recently carried out the education in early childhood education and care. The Korean government has strengthened the responsibility on early childhood education and care by adopting an ISCED amendment that UNESCO suggested in 2011. In this respect, Korea has started the Nuri Curriculum a national curriculum for five-year-olds, in 2012, and expanded its coverage to three-and four-years-olds in 2013.

The implementation of the Nuri Curriculum has its significance as it provides high-quality education for both education and child care, and guarantees the equality of the starting point at the early lifetime(Korea Institute of Child Care & Education, 2012). In fact, there used to be two different curriculum(the National Kindergarten Curriculum, the Standard Care Curriculum) for early childhood education and care. On this dualized systems, there is a problem in young children despite attending kindergarten or day-care-center that do not receive the common curriculum education in the quality of it. Therefore, the Nuri Curriculum would be implemented to work out this problem.

In order to increase the effectiveness of implementing this new standardized curriculum, the Korean government has provided the teacher training to the in-service teachers. Training is composed of process backgrounds, meaning, purpose, content and teaching methods of the Nuri Curriculum. Teachers shall receive education lecture-style four by six hours a day. It is not necessarily, however, that teachers implement the Nuri Curriculum uniformly in their classrooms. Since kindergarten teachers' autonomy of is reportedly guaranteed much more than that to the teachers in charge of different grades(Sung, Lee & Cho, 2010).

In reality, after the introduction of the Nuri Curriculum, professionalism of preschool teachers puts more emphasis on the operation of the Nuri Curriculum than before, because they should adjust education curriculum of institute level that used to be managed at the basis of the previous education curriculum of nation level to be appropriate to the Nuri Curriculum. Education curriculum can be considered achieved, when practiced beyond the original plan or the developed level. In this respect, the implementation of the education curriculum means the process that teachers can understand, adjust and practice it rather than act it just for making it real(Marsh & Willis, 2003). It can be understood in view of interaction that

teachers implement and adjust the planned education curriculum(Fullan & Pomfret, 1977). That is, it implies that the teachers' role and ability has an important role in the implementation of education, as their private lives make the difference of the implementation of education curriculum in institutes(Goodson, 1992).

The teachers' role as practice subject means that teachers implement education curriculum actively with thinking and knowledge. And their ability as 'developer of education curriculum' means that teachers are responsible for development, design and production of education curriculum(Darling-Hammond & Bransford, 2005). That is, it emphasizes the role of revising the curriculum that teachers have already understood and practicing it according to the development level of the learners and their interests. To do so, there need to be continuous chances when teachers can develop their viewpoints on education curriculum, teaching and knowledge and learning communities where they can consider the development and the practice of education curriculum(Ornstein & Hunkins, 2004).

In fact, The teachers' role as practice subject is required to implement the Nuri Curriculum. Teachers have been establishing their own identity, during adjusting themselves and performing their roles, under the changing conditions; the great change of the title of existing development category and specific educational contents, emphasis on teaching and caring required to political discourse. It is said that teachers' building professional identity defines the characteristics of their jobs and puts meaning to themselves and jobs(Sachs, 2001). Positive identity about teaching, relationship and roles enables teachers to sustain their passion by increasing self-esteem and self-effectiveness(Day, 2004), which plays a pivotal role to sustain teachers' dedication(Day, Elliot & Kingston, 2005). In other words, teachers taking over independent roles in the implementation of the Nuri Curriculum are likely to establish their identity of being a good teacher.

To understand teachers who implement education curriculum and in the meantime establish their own identity, it firstly needs to look into their lives(Connelly & Clandinin, 1996). Moreover, the observation of teacher's lives should be considered inside and outside classrooms in that the operation of the Nuri Curriculum is not limited to the particular situation or site. However, most of the preceding researches on teachers managing the Nuri Curriculum are now focused on how much they are interested in the developed education curriculum and how faithfully they perform it(Son, 2013). Considering that researches on education curriculum should be studied and developed in the light of specified space and time contexts rather than of general institutes or classrooms(Schwab, 1973), researches needs to be carried out to find out how identity is formed as well as what teachers consider the Nuri Curriculum. Accordingly, the purpose of this research is to figure out how kindergarten teachers comprehend the Nuri Curriculum and establish their own identity as practice subject in a new curriculum. Accordingly research questions are as follows.

1. How do preschool teachers understand the Nuri Curriculum?
2. How do preschool teachers construct their identities as agents as they implement the Nuri Curriculum?

## **II. Research Method**

### **1. Narrative Inquiry**

For this study, we employ a narrative research methodology to listen to the stories of four preschool teachers. Narrative inquiry is an analysis that human beings find meanings about the experience by telling their own lives to others and re-telling them(Clandinin & Connelly, 2000, p63). It is based on analyzing a person's life and re-organizing it, which helps us

understand the situation and the culture that the preschool teachers. Furthermore, it is the methodology that can represent how teachers construct their identities (Connelly & Clandinin, 1996). For these reasons, we chose narrative inquiry as a methodological tool to investigate what preschool teachers experience when implementing the Nuri Curriculum and how they form their identities in the process of implementing the curriculum.

## 2. Participants in the research

### i) The site of study

This study will be conducted in one preschool, named Bansok preschool<sup>1</sup>. Bansok preschool is a private preschool, located in Yang-choen Gu, Seoul. It provides its service to from two-years-olds to five-years-olds, and has implemented the Nuri Curriculum since 2012 (to five-years-olds in 2012, and to four-years-olds in 2013). It has five classes in total, one class for two-years-old, four-years-old and five-years-old each and two classes for three-years-old. Classes start at 9:30 in the morning and end at 2:30 in the afternoon. Teachers have frequent regular staff meetings. Overall, they have two different kinds of staff meetings: monthly meetings and informal preschool-center-based supervision meeting. Monthly meetings are held by the teachers in the beginning of the months. In these meetings, teachers discuss the general management of the Nuri Curriculum such as evaluation for the previous unit theme, class preparation for the next unit theme and education plans on a monthly basis. Teachers also have the informal preschool-center-based supervision meetings. The meetings are about difficulties in teaching and behavior guidance or positive teaching cases of the each class by sharing their experiences in classrooms. We will make an observation for those staff meeting for this study.

### ii) Participants

Participants in the study are three teachers working at Bansok preschool. The background of the teachers is as follows.

name	age	Years of experience	Education Level	The age of classroom
Cho	28	4years	Bachelor	5
Lee	33	9years	Bachelor	4
Kim	36	12years	Bachelor	3

Each Teacher teaches three-year-olds, four-years-olds and five-years-olds. Among them, Cho has implemented the Nuri Curriculum for two years since 2012. For Lee and Kim, it was their first year to implement it in 2013, the year when we conduct the study. Teachers are all female and the average years of their teaching are 8.3 years. Their level of education is high as all of them gained Bachelor's degree.

## 3. Data Collection and Plan of Analysis

<sup>1</sup> All names in this paper are pseudonym.

### **i) Individual Interview**

Each teacher will have five individual interviews. Individual interview will be held in the place where the participants prefer, for approximately one and a half hours, from September to November in 2013. Particularly the oral history interview method will be used for this study. The oral history interview is the most frequently used form for narrative inquiry (Clandinin & Connelly, 2000, p87). The aim of oral history is to gain first-hand knowledge from people who have lived through different social–historical–political periods and events. We will use semi-structured questionnaires, but also allow the participants to tell their stories in their own manner (Clandinin & Connelly, 2000, p.209).

### **ii) Participant Observation**

We will conduct an observation for this study. The observation will be mainly made during the staff meetings that the participant teachers attend. Therefore, two different kinds of staff meetings will be observed: monthly meetings and the informal kindergarten-center-based supervision meetings. Six observations will be made in total; two monthly meetings, four informal kindergarten-center-based supervision, from October to November 2013. We will attend all the meetings as an observer, and make field notes during observation.

### **iii) Collecting Documents**

In addition to the individual interviews and observation, related documents will be collected from the participants such as monthly, weekly, and daily lesson plans, the curriculum plans of the institutes and the guidelines of the Nuri curriculum sent from the government.

### **iv) Analyzing the Data**

Organizing field texts into research texts is a process that discovers meanings on experiences (Clandinin & Connelly, 2000: 239). It is designed to deal with field notes and recordings and read them repeatedly to find the meanings. The teachers are made to remind their own experience and keep telling them to the interviewer so that they can elicit educational meanings from the process. When the teachers read the story, they categorize the understanding and the role of the Nuri Curriculum and identity and thereby find out important subjects and sub-topics in the story. They are expected to review the elicited cases repeatedly and find the common messages.

In order to the reliability of the data, 'Triangulation', suggested by Guba and Lincoln (1994), helps the collected documents to be analyzed multilaterally. Two experts on the teacher training and a PhD student review if the analysis of the categories about the documents is valid or not.

## **III. Expected Results**

The purpose of this research is to elicit the understanding and practice of the Nuri Curriculum and educational meanings of forming identity by talking about events, joy and difficulties that the teachers experience.

Expected results are as follows; first, teachers' story can be understood in a process where teachers and researchers eagerly participate. Second, it is expected that the established identity of the teachers is reconstituted. Third, the story of their life plays an important role in figuring out the culture of the teachers, and then the understanding of experience should be treated as the knowledge as we can find the knowledge in the real.

Most of the researches on the teachers as practice subject of the Nuri Curriculum is mainly about artificial position or level. What we think about, however, should be the teachers' own history and story. That's because we can apprehend the real education environment condition, which can resolve the gap between theory and practice that many researchers have pointed out. In this respect, this research will help teachers reveal practical knowledge, which is integrated for teaching practice based on their values and beliefs. It will suggest that the attitude of the researchers is important, listening to the voice of the teachers who practice the education curriculum with an ability of variation.

We communicate with each other every day. We have what someone else wants to listen to in mind. We are more likely to involve in individual stories than in stories about groups. If someone wants to persuade someone else, he or she is advised to talk about his or her personal and specific story. That is 'Unpacking effect'. It is the study that researches human-based education environment. Thus, there should be efforts to listen to teachers and sympathize with their story in a communicative circumstance rather than look at them from my one-sided point of view. What should be remarkable existence are teachers, creating daily lives, whose experiences should be analyzed and made meaningful by the researchers of early childhood education.

6. Abstract

The purpose of this study was reconsidering the state of training program for in-service child care workers in Japan. This study explored the learning process of the adult learners who have participated “Personal-Research-Based Program(PRBP)”. PRBP is a training program that supports the each learners to conduct personal research based on their own experience on early childhood education and care(ECEC) field. Semi-structured interviews were conducted with ten program participants. The data was analyzed using the Modified Grounded Theory Approach. The results suggested that, 1) Participants have a desire of learning itself, 2) Participants were not only trying to solve their own problem relating their practice of ECEC but also have the concern on changing the of social system, 3) The process of participants` learning was closely related to reconstructing the learners` personal experience trace.

Sincerely yours,

Risa Kodama

# A Study on the Relationship Between Metacognitive Strategies and Self-learning Ability

Liu Yuhui

College of Foreign Languages Beijing University of Technology  
No.100 Ping Le Yuan, Chaoyang District, Beijing, China, 100124

[liuyuhui@bjut.edu.cn](mailto:liuyuhui@bjut.edu.cn); [liuyuhui5786@163.com](mailto:liuyuhui5786@163.com)

## Abstract:

Based on the researches of learning strategies by scholars both abroad and at home such as Rubin, Nunan, O'Malley & Chamot and Wen Qiufang, 93 students from thirteen different majors in Beijing University of Technology are surveyed about their use of metacognitive strategies and self-learning on line for one semester by using Wen's Questionnaire on English Learning Strategies and online self-learning and testing record.

The three research questions are (1) Is there any difference in the use of metacognitive strategies between the low mark group and the high mark group of test achievements of the subjects? (2) Is there any difference in the time and frequency of online self-learning and testing between groups different in using metacognitive strategies? (3) Is there any relationship between the time of online self-learning, the frequency of online self-testing and the final test achievements?

Mean value difference of Independent Samples T test of test achievements groups shows that there is a significant difference between high and low mark groups in cognitive management strategies (t value is 2.152). The high mark group uses more cognitive strategies.

Mean value difference of Independent Samples T test of cognitive strategies groups shows that there is significant difference between high and low mark groups in online self-learning (t value is 1.269) with the high mark group of cognitive strategies spending more time in average in self-learning than low mark group; there is extremely significant difference between high and low mark groups of cognitive strategies in online testing (t value is 3.558) with the high mark group students doing many more times of online testing.

Correlation analysis of online self-learning & testing and test achievements shows that online self-learning (hours) and test achievements are positively correlated (0.599); online testing (times) and test achievements are positively correlated (0.498); that is, the more online self-learning and the more times of online testing students have, the better their test achievements are.

The above analysis results suggest that students who are better aware of the use of cognitive strategies show initiative in learning, having better self-learning ability and test achievements. It agrees with Wen Qiufang's research result. Therefore, we can train metacognitive learning strategies accordingly by analyzing students' efforts first, hoping to improve test achievements of poor learners and train their self-learning ability.

## Key words:

metacognitive strategies; online self-learning and testing; test achievements; self-learning ability

Dear, Hawaii International Conference on Education

I like to submit a proposal as follows:

The title page

1. Title of the submission

The Acceptance and Development of Clay Activities in Early Childhood Education and Care in Japan

2. Name of the author

Yoshiko Nanyo

3. Affiliation of the author

None

4. Address of the author

1-6-6-414, Ohtsuka, Bunkyo-ku, Tokyo, 112-0012, Japan

5. E-mail address of the author

[yoshiko743@gmail.com](mailto:yoshiko743@gmail.com)

6. Abstract

The purpose of this study is to examine the history of the acceptance and development of clay activities in early childhood education and care (ECEC) in Japan influenced by Friedrich Froebel's "Gifts". The clay activity is one of the most popular activities in Japanese ECEC practice at the first public kindergarten in Japan attached to Tokyo Women's Teachers College (currently Ochanomizu University) and established in 1876. This showed the significance of clay activities in ECEC in Japan. This study analyzed the literature from the Meiji era to the present including the kindergarten guidelines published by the Japanese government. The results also showed that clay activities were treated as a task rather than a play, but also had a value of playing with and enjoying the process of making with. This study suggests that it is important to encourage children in expressing their human feelings prior to concrete forming.

Sincerely yours,

Yoshiko Nanyo

1. Title of the submission: Relationship between job-hunting activity self-efficacy and campus life experiences in university students

2. Name of the author: OTA, Satsuki

3. Affiliation of the author: Faculty of Business Administration, Tokyo Fuji University

4. Address of the author: 4-8-11-201 Minamiogikubo, Suginami-ku, Tokyo

5. E-mail address of the author: s\_ota@fuji.ac.jp

6. Abstract: Job-hunting activity self-efficacy (JAS) is known to predict the degree of efforts made by university students for job-hunting. However, it is possible that the Positive Illusion (PI; Taylor & Brown, 1988) also affects JAS: Students with high PI could be excessively optimistic and confident about getting jobs without making an effort. Based on the results of an empirical study, I found that the relationship between JAS and effort level was weaker for students with high PI than for students with low PI. In order to develop appropriate JAS, students might have to accumulate practical mastery experiences in which they achieve their goals by making an effort. Campus life experiences during university education might develop the self-efficacy of students. The purpose of this study was to explore the relationship between JAS and PI and how mastery and campus life experiences moderated these relationships. University students (N = 401) responded to a survey. A correlation analysis of the responses revealed that there was a significant relationship between JAS and PI. This relationship was weaker for students with much mastery experiences than for students with little mastery experiences and weaker for older than for younger students. The findings suggested that education, which facilitates students' mastery experiences, might develop realistic JAS with low PI and lead students to enthusiastically work hard on job-hunting activities. These findings are discussed in relation to career education in universities.

# HICE 2014 Abstract

**a. title of the submission**

Learning Strategy Use and Categorized Perceived Benefit

**b. topic area of the submission**

Educational Psychology

**c. presentation format**

Poster session

**d. a 2-3 sentence description of your presentation which should not exceed 75 words in total.**

The influence of the categorical combination of two terms (short, long) and two methods (anytime, circumstantially) perceived benefits on learning strategy use was investigated, and participants were Japanese undergraduate students. Long-anytime perceived benefit which mediated short-anytime perceived benefit had positive influence on strategy use, and long-circumstantially perceived benefit which mediated short-circumstantially perceived benefit had positive influence on strategy use. In addition, short-anytime perceived benefit was shown more effective than short-circumstantially perceived benefit on strategy use.

方略使用に対する有効性の認知は動機づけよりも方略使用に影響することが示されている。本研究の目的は2×2の有効性の認知が方略使用に与える影響を明確にすることであり、大学生を対象に調査を行った。分析の結果、長期的—継続的な有効性の認知は短期的—継続的な有効性の認知を媒介して方略使用に影響し、長期的—適宜的な有効性の認知は短期的—適宜的な有効性の認知を媒介して方略使用に影響していた。なお、継続的な有効性の認知の方がより方略使用に影響していた。

**ABSTRACT:** This session will present mathematics materials based in the culture and mathematics of Native American Peoples. These materials--both paper and electronic--are classroom-ready, and were developed and piloted in consultation with Native American Tribes in the Pacific Northwest, the Rocky Mountain Plains, the Pacific Northwest, and the Southwest. It will also discuss the philosophy behind the materials and the need for them. This is an NSF DUE TUES Type 2 funded project.

The session will include the following topics:

- 1. The background and need for the project.**
- 2. The relationship between culture and mathematics for Native American peoples.**
- 3. A discussion of the progress of this project during Year II.**
- 4. The mathematics of Native American people that may be of interest to teacher educators and teachers of grades 9 – 12.**
- 5. Examples of the classroom-ready materials selected from probability, number theory, transformational geometry, and pre-service elementary and secondary education-related content.**
- 6. Connections between these materials and other select groups of students.**

## ABSTRACT

This paper presents preliminary findings from an ongoing graduate study on “*Education and emerging democratic citizenship in Malawi*”. The present study, investigated the context of school citizenship teaching in secondary schools in Malawi and its impact on nurturing students deliberative values and skills. Data on knowledge of deliberative practices, perceptions and general school practices was collected through a survey, to understand how these relate to nurturing students’ deliberative values and skills for active citizenship. Questionnaires and interviews were used to collect data from teachers and students in four study schools in Malawi. Quantitative data was analyzed using descriptive statistics, and qualitative data was analyzing based on emerging themes. The study found that in general both teachers and students favor deliberation as a democratic practice and generally report elements of it in some school affairs. However from interview data it was apparent that school authorities seem not very enthusiastic about encouraging serious deliberative practices in the schools. Teachers expressed fears of encouraging discipline problems by allowing students more freedom and involvement in the affairs of the schools. The study consequently found limited evidence on deliberate measures taken by the schools to encourage deliberation between students and school authorities, favoring more control in the governance practices. The implications of these findings and future direction of the research are discussed.

## Enhancing Education for the Teacher/Athletic Coach

Drew Zwald  
Georgia Southern University  
Health and Kinesiology, GSU  
Statesboro, GA 30460-8076

### Abstract:

Georgia Southern University is noted as the largest “Teaching First University” and was the second university in the United States to have a nationally accredited Coaching Education Program. This program was established to provide teachers who wanted to coach sport teams the tools to meet the National Standards for Athletic Coaches established in 1995.

This presentation will highlight the pedagogy aspects of Georgia Southern University and the Coaching Education Program. This session will include: Student Assessments, Faculty Assessments, Curriculum Adjustments, Freshman Orientation, Undergraduate Coaching Minor, Online Master of Science Degree in Kinesiology in Coaching Behavior, Coaching Certifications, National Coaching Journal, International Experiences, Grants, Research, Field Experiences and Educational Research Leave. A power point and interactive approach will be utilized to present this paper.

Revisiting the Professional Identities of Transnational Foreign Language Teachers in the United  
States

**Abstract**

Most research on transnational foreign language teachers' professional identity formation focuses on how teachers from non-Western ethnicities negotiate professional identities in Anglophone countries other than the U.S. Motivated by our experiences in education, we examined professional identity formation in transnational foreign language teachers from both Western and non-Western cultural contexts in U.S. classroom settings through Third Space theory. In this study, we examined how transnational teachers negotiate the cultural and educational practices in U.S. foreign language classrooms, and how they create their own teaching third space at the core of their professional identities. Our findings showed that the transnational teachers' professional identity formation processes were complex and ongoing. Viewed from the third space framework, teaching in the new settings is a constant construction and reform process of professional identity. Transnational teachers mixed aspects of American and their home countries' teaching cultures while negotiating their classroom practices. There is a great deal of ambiguity in their everyday teaching practices and negotiation of meaning throughout the processes as they demonstrated their in-between personalities.

## Abstract

In order to promote students' conceptual understanding, this study is designed to explore the potential of integrating the question-based teaching and the open-ended approach in a reformed calculus classroom. The most important basis is that students should be involved in the teaching process. All samples are selected from two classes of freshmen in engineering college. Note that one class for experiment group and the other for control group, and each class has about fifty students. Both of quantitative and qualitative data are collected and analyzed.

Students are often encouraged to express their understanding in class based on their own knowledge. Moreover, prompting students to give more detailed explanations and discuss their reasoning, we hope, helps to fill in the gaps for a student who may have been struggling to understand the ideas being represented. Further, teacher often provides open-ended problems to stimulate their thinking and elicit a deeper discussion via small group work. In particular, two special strategies are used in this study: (1) Question-based teaching: Based on the reports of Mason(2000) and Resnick (1995), three models (focusing, inquiring and testing) and four kinds of questioning techniques(repetition, re-voicing, close questioning, and challenging) are included. In addition, (2) Open-ended approach : Including those steps of lesson plans, developed by Becker and Shimada(1997). In fact, these strategies may be viewed as attempts to promote students' understanding in a reformed calculus classroom. Results indicate that students in low achievements usually spend less time each week in doing homework, and they often dislike of teacher's classroom questioning. Both classes are significant difference in learning motivation.

**Key words:** Learning motivation, Question-based teaching, Open-ended approach.

## **Abstract**

The purpose of this presentation is to present to an audience of k-12 educators the impact of assessment development on teaching and learning. Assessment development is a rigorous process that is often times left to the experts found in large testing companies. Today, however, more school districts are beginning to develop their own assessments to measure student learning outcomes. This presentation describes the process of how a school district uses assessment development to create district-wide assessments and improve student learning.

In response to the demands of creating valid and reliable assessments across multiple subject areas and grade levels, a 50 hour Assessment Development course was created. Informational flyers and Interest Forms were sent out throughout the district to solicit teacher participation in the assessment development process. As a result, there were 38 teachers from a variety of subject areas and grade levels who submitted Interest Forms.

School district personnel from the Department of Research, Evaluation, Assessment and Accountability created four assessment development modules in order to facilitate teachers through process. An overview of these four modules---Creating a Test Blueprint, Item Writing, Test Formatting, and Revisions/Edits will be discussed during the presentation. The presenters will also discuss how the team of teachers will reconvene in the fall to review item statistics after the administration of pre-assessments to students. Once the item statics are reviewed, the assessments will undergo further revisions and edits prior to the administration of post-assessments during the spring.

The 50 hour assessment development course received rave reviews from teachers who participated. The majority of the feedback was for the course to be a requirement for all teachers within the district. As a result of this course, teachers not only created a valid and reliable assessment, but made the connection between teaching, learning, and assessment. The assessment development process can be a powerful tool used to improve teaching and learning throughout a school district.

The format of the presentation will include an overview of the process and a question and answer period. Individuals who attend this presentation will be able learn the steps in creating an assessment development course that can be reasonably implemented within their school district. Attendees will be able to ask specific questions to presenters on how to implement the assessment development process in their district, school, or classroom.

Voices From the Field: Secondary Teachers' Experiences With Discipline Specific Literacy

Instruction

Kellee Jenkins, Ph.D

Howard University

8853 Papillon Dr. Ellicott City, MD 21043

### **Abstract**

The development of advanced reading skills among adolescents is paramount in order for students to achieve success both in and out of school. If students are to develop an array of advanced literacy skills that are specific to each discipline, then teachers must understand the importance of promoting discipline specific literacy practices in order for students to gain a deep understanding of content specific information. This presentation will discuss the promise and challenge of implementing discipline specific literacy instruction in secondary schools.

**A Follow-Up: Indicators for Success in First Year Calculus**

**Abstract**

This is a continuation of a study implemented to determine why some students succeed in their first calculus course after completing an early enrollment program. Forty-nine high school students enrolled in a year-long sequence of two university mathematics courses were followed through their first-year, on-campus calculus course. Course grades and surveys were used to determine factors that influence student success. Preliminary results from surveys show students feel that having prior work in calculus is very important. In addition, due to placement changes, early entry students entering Calculus I via prerequisite courses seem to benefit by taking a year-long or extended version of the course.

**KEYWORDS:** calculus, early enrollment, first year courses, mathematics

### **A Follow-Up: Indicators for Success in First Year Calculus**

A successful, collaborative program offering college-level courses to high school students is offered at a large northeastern university. The program courses are offered in a blended learning environment where work is completed both on-line and face-to-face. Information about the development of the project can be found in earlier publications. (Pyzdrowski & Pyzdrowski, 2002, 2003; Pyzdrowski, Mays, Butler, Walker & Pyzdrowski 2009, and 2011). Since Fall 2000, approximately 4,000 high school students have completed College Algebra and since Spring 2003, approximately 2,000 high school students have completed College Trigonometry. A newly developed sequence of courses equivalent to a one-semester course of Calculus I has been offered to approximately 50 students in recent years. From the first offering of College Algebra in the program, course grades indicate that early enrollment high school students seemingly outperform their on-campus peers. Typically the DFW rate for an early entry course in the project is less than 10%. The DFW rate is the percentage of students withdrawing or earning grades of "D" or "F" in a course. A matched pair study performed in 2004 compared several factors of on- and off-campus students in College Algebra. Results indicate that both early enrollment and on-campus groups show a significant gain in score on the math ACT test when used as a pre- and posttest with no difference in gain found between groups (Pyzdrowski et al., 2011).

The goal of any dual credit course should be that students who successfully complete it are at least as well prepared for the next course as those who have taken it at the college from which the credit is given (Bressoud, 2007). In general, entry-level Calculus I courses at our institution have a high DFW rate. Until recently, flow-through data show that early enrollment

students perform as well as on-campus peers in subsequent mathematics courses. Early entry students now seem to be struggling in a 4-credit Calculus I course (Pyzdrowski et al., 2011; and Pyzdrowski, Sun, Curtis, Miller, Wynn, & Hensel 2013).

Table 1 shows DFW rates for students enrolled in Calculus I at our institution. Rates are given for two groups, former early entry students and all students enrolled in the fall offering of the 4-credit course. It is noteworthy that in 2008 the placement exam used for Calculus I was

Table 1

*DFW Rates for Students in Calculus I Courses*

---

Semester	DFW rate early entry students	DFW rate all students
F05	44.4% = (12/27)	47.7%
F06	62.9% = (17/27)	57%
F07	31.25% = (5/16)	55.3%
F08	40.9% = (9/22)	35.5%
F09	27% = (8/30)	35%
F10	46% = (18/39)	35%
F11	50% = (16/32)	37%
F12	55% = (27/49)	45%

---

changed and in 2010 the section of the placement exam used for entry into Calculus I was modified. There are typically about 700 - 800 students enrolled in on-campus Calculus I in any given fall semester. It should be cautioned that in this comparison, the number of early entry students followed through is low and that in most cases the difference in percentage for the early entry columns can be changed by adjusting the performance of only a few students. In addition, there are two different versions of Calculus I at our institution (Engineering and Non-Engineering), and differences in student success in each of these versions will be explored.

The motivation for this study is the recent trend of a higher percentage of DFW rates for early entry students when enrolled in their first semester, on-campus Calculus I course.

### **Review of Literature**

Recent evidence suggests that the prior exposure of calculus topics to first semester calculus students is a variable to be studied when exploring reasons for student success. Interviewed Calculus I students have said that having prior experience in calculus is very important for success in Calculus I (Pyzdrowski et al., 2013). Burton (1989) surveyed 741 first-semester calculus students and found that the group most at risk for not passing calculus had no previous calculus experience and could not pass a calculus pre-test on algebra and trigonometry. However in the study, even students who passed the algebra-trigonometry pretest with minimal or poor prior calculus experiences still had disappointing performance. And, given the trend that so many students are now taking calculus as a high school course, it is recommended for universities to rethink the structure of their Calculus I and Calculus II courses (Bressoud, Carlson, Mesa, & Rasmussen, 2013).

In addition to Prior Experience in Calculus, three other themes related to success in calculus were identified during the analysis of four student interviews (Pyzdrowski et al., 2013). Those themes were Prior Course Work, Getting Help/ Pace of the Course, and Instructors. All of the interviewed students felt that the success experienced in prior course work in early enrollment algebra and trigonometry courses was an indicator that they would have success in Calculus I. Students also felt that taking advantage of office hours, getting help when needed and keeping up with homework in a fast paced course was necessary for success. In addition, students felt that instructors played a key role in helping or hindering their success. They conveyed such things as teachers being very helpful in office hours and sometimes difficult to understand during lectures. When asked in a follow-up survey, four of seven students felt that the instructor had more impact than the student on the successful completion of calculus. It should be emphasized that the number of students responding to the survey in the study was small with only seven out of 37 responding.

It was also suggested in the 2013 study that on-campus placement changes may have created a "success gap" between the students placed via a test and those placed using prerequisite courses. It has been found that students who place into college-level mathematics courses based on scores are more likely to pass than those who completed a prerequisite course Morris (2006). It is therefore possible that the new year-long version of Calculus I could be a better course for all students being admitted to Calculus I based on prerequisite course work.

The research question explored in this document is: What are student indicators that lead to successful completion of calculus (grade of "A", "B", or "C") for students enrolled in an early enrollment sequence of algebra and trigonometry courses? The results will provide implications

for teaching, project redesign and suggestions for ways to improve student performance in calculus.

### **Method**

In order to better understand the challenges that face first-semester calculus students entering from an early enrollment program, we collected quantitative algebra, trigonometry and calculus course data. We then collected follow-up survey data from the students in order to capture a global perspective of the attitudes of the students in the study.

### **Participants**

Quantitative data were collected from 49 students (62% male) enrolled in Calculus I during the Fall 2012 semester at a northeastern university in the United States. The students all participated in an early enrollment project as high school seniors and upon entry into the project had at least a 3.0 high school grade point average (GPA) and had earned a C or better in Algebra I, II and Geometry. As high school seniors, they completed College Algebra and College Trigonometry with the grade of a C or better in the 2011 -2012 academic year. In the Spring 2013 semester, 49 of the students were asked to complete an anonymous, online, follow-up survey. Of the 49 students, 14 completed the survey giving a 29% completion rate.

### **Survey**

The project coordinator and researchers used interview analyses and a review of the literature to design a 9-item survey. The survey was given online and was anonymous. In addition to collecting some basic background information, questions explored students' feelings about their prerequisite content knowledge, self-confidence with respect to doing mathematics, enjoyment of doing mathematics, and feelings of relevance of mathematics. There was also an

opportunity for students to discuss the instruction and organization associated with the calculus course. One question asked students if the instructor or student has more impact on the successful completion of calculus.

### **Procedure**

All students in the study completed the four-credit Calculus I course in the Fall 2012 semester. In the Spring 2013 semester, students were asked to complete an anonymous, online, follow-up survey. The results from most survey questions were quantifiable, and in the case of open-ended questions, an analysis was performed. A coder independently analyzed student data, searching for key words and phrases to identify themes that emerged for the group.

## **Results**

### **Student Surveys**

Fourteen of 49 invited students completed the anonymous survey. Six of the students were enrolled in the Engineering Calculus sections. Seven of the students were enrolled in the Non-Engineering Calculus sections. One student did not identify the type of section. Five of the students were re-enrolled in Engineering-Calculus at the time of the survey.

Students were asked to respond to the following prompts if they withdrew or earned less than a C in Calculus I in the Fall 2012 semester. Of the nine students responding in this section, one did not answer the prompt regarding content (see Figure 1).

Seven of the students responding to the survey indicated that having calculus before enrolling into Calculus I would have helped them to do better; but, six of those students had no prior calculus experience. Of the three students who indicated that prior calculus experience was not necessary for success, two had taken AP Calculus in high school. Those two students

indicated that they had poor instruction of calculus while in high school. When asked if they were aware that there was a year-long option for Calculus I, only 7 of the 14 students responded with a yes. Three students mentioned getting help from tutors or their instructor in order to do better in the course. Comments regarding the fast pace of the course were scattered throughout the open responses on the survey and were made by several students.

When asked who has more impact on the successful completion of Calculus I, the teacher or the student, 11 chose the teacher and 3 chose the student. Most interesting was the justification for the choice. The student reflections were, for the most part, very mature. Following are a few of the comments. “With an instructor that knows how to break up the concepts in understandable ways, the students can better understand the material. It all starts with the instructor then it's the students' responsibility from there. Without the instructor's guidance, however it is too much for the student to try to teach themselves.” “I had the most amazing teacher in high school. I believe that is why I, as well as most of my class mates, excelled in her classes. The atmosphere was much different when I actually came to college and it took a while to adjust. It is much more fast paced, and many times, I felt like the teacher didn't truly care about the students.”

## Grade Distributions
