Abstract: Based on growth in online enrollment, many faculty members are required to develop and teach online courses they had previously taught in a traditional, face-to-face classroom. The purpose of this qualitative study was to explore the experiences of eight faculty members at one public university who journeyed through the transformative process by developing and teaching online courses previously taught face-to-face. The methodology for this study was a qualitative framework. Data were collected using a semi-structured interview guide that investigated the transformative process through three stages: planning, implementation, and reflection. Each participant was interviewed in-person for approximately one hour. Data were thematically analyzed using the transformative learning theory by categorizing the data into the 11 phases an adult learner goes through during the process. Each phase was inductively analyzed for patterns, and then the relationships that bound these patterns together were identified and labeled themes.

Introduction

According to Allen and Seaman (2013), the number of students taking at least one online course at institutions of higher education increased by over 570,000 to a new total of 6.7 million during the fall semester of 2011. Based on the growth in online enrollments, many faculty members are asked to develop and teach online courses they had previously taught in a traditional, face-to-face classroom. To successfully transition to an online environment, faculty
members must have technology skills, content knowledge, and sound pedagogy. During the transformative process, several challenges related to the planning and implementing of the online course have been cited in the literature. These challenges include, but are not limited to, having the time it takes to develop and teach an online course (Lewis & Abdul-Hamid, 2006), having the ability to use available technology tools and/or learning management systems to support student learning (De Gagne & Walters, 2009), implementing appropriate pedagogical strategies in the online course (Brinthaupt, Fisher, Raffo, & Woodward, 2011), and adapting to the role of facilitator rather than being the “sage on the stage” (Johnson, 2008). Planning, preparing, and teaching online represents more than a paradigmatic shift in the way faculty work; it is initiating new ways to think about learning. As faculty transform their face-to-face course to online, that process and experience transforms them, too. The purpose of this current study was to investigate faculty’s experiences with transforming courses from face-to-face to online delivery while situating the transformative process in the 11 phases of Jack Mezirow’s Transformative Learning Theory.

**Theoretical Framework**

Jack Mezirow defined learning as “the process of using a prior interpretation to construe a new or a revised interpretation of the meaning of one’s experience to guide future action” (Wiessner & Mezirow, 2000, p. 5). Mezirow labeled this process *transformation*. He began his work in 1978 when he qualitatively investigated women returning to postsecondary study or the workplace after an extended time out. Concluded from this seminal study was that these women went through a personal transformation, and Mezirow identified 10 phases they experienced (Kitchenham, 2008). Over time, Mezirow’s work on adult learning evolved into the Transformative Learning Theory with an additional phase incorporated in 1991. However, it was not until 2003 when he provided a clear definition of his theory:

Transformative learning is learning that transforms problematic frames of reference-sets of fixed assumptions and expectations (habits of mind, meaning perspectives, mindsets)-to make them more inclusive, discriminating, open, reflective, and emotionally able to change. Such frames of reference are better than others because they are more likely to generate beliefs and opinions that will prove more true to guide action. (Mezirow, 2003, pp. 58-59)

Transformative learning is the process of effecting change in a frame of reference. “Frames of reference are the structures of assumptions through which we understand our experiences. They selectively shape and delimit expectations, perceptions, cognition, and feelings (Mezirow, 1997, p. 5). As stated above, transformative learning is an 11 phase process with four main components (Mezirow, 2007): experience, critical reflection, reflective discourse, and action. To begin, the adult learner has an experience. The learner then critically reflects; examines their own beliefs, goals, assumptions etc. in relation to the experience. The learner proceeds to take part in dialogue further examining new thoughts and ideas that have come out of the critical reflection. This dialogue consists of gathering opinions of others, whether through one-on-one conversations or with a group setting. The final step is taking action based on this new level of learning and perspective.

The Transformative Learning Theory was the theoretical framework for this current...
Faculty’s experiences of transforming a course from face-to-face to online were investigated using this theory’s 11 phases. In Table 1 each phase is presented and operationalized for the context of this study.

Method
The purpose of this qualitative study was to examine the transformative process of faculty from one public university in the midwestern United States who developed and taught an online course they had previously taught in a traditional, face-to-face classroom. Eight participants, who met the criteria of having developed and taught an online course they had previously taught in a face-to-face course format within the last three years, were chosen to participate in the study. All eight participants were faculty who taught in a college of education and human development. For the majority of faculty, teaching an online course was a relatively new endeavor, taking place between one to six years previously. Of the eight faculty, three had developed and taught one online course, two had developed and taught two online courses, one had taught three online courses, and two had taught seven or more online courses. In reference to this study, all faculty interviewed developed and taught graduate level courses.

The research was conducted with the approval of the University’s institutional review board (#IRB-201404-426). Each interview transcript was assigned a code to maintain confidentiality. An interview guide (Kvale & Brinkmann, 2009) consisting of five closed-ended questions about demographics and 11 open-ended questions about planning, implementation, and reflection was developed and used by the researchers. Interviews were conducted in person by one of the two researchers and ranged in length from 45 to 75 minutes.

Prior to analysis of the interview data, a framework schema was constructed that identified the 11 phases of Mezirow’s Transformative Learning Theory with corresponding operational definitions that were derived from the literature and agreed upon by the researchers (see Table 1). An inductive process was used to examine the transcripts of the eight participant interviews. After each researcher independently coded the interview transcripts using the Transformative Learning Theory framework schema, the coded data were integrated into one document for inter-coding agreement by the two researchers. Any data that did not clearly fit within the specified Phase, were either moved to a more appropriate Phase or discarded. After agreement of data placement within the framework schema was conducted, the researchers independently analyzed the data within each phase for patterns. Together, the researchers compared the patterns and developed themes for each phase (see Table 2).

</tbody>
</table>
3. A critical assessment of epistemic, sociocultural, or psychic assumptions

Faculty assumed the same level of quality could not be achieved with online instruction. Pedagogical knowledge was critical with online teaching. Not all instructors nor courses are suited for online delivery.

4. Recognition that one’s discontent and the process of transformation are shared and that others have negotiated a similar change

To negotiate their presuppositions, faculty had philosophical, broad-based discussions with instructional designers and faculty who were already teaching online.

5. Exploration of options for new roles, relationships, and actions

Faculty’s dialogue with instructional designers and peers became more specific and skill-based. Pedagogy led the exploration for quality assurance, which was influential on the selection of technology.

6. Planning of a course of action

Faculty used their previously taught face-to-face course as their conceptual framework for the online transformation, as it was pedagogically sound.

7. Acquisition of knowledge and skills for implementing one’s plans

Faculty did not receive formal online course development training. Faculty sought pedagogical and emotional support from colleagues.

8. Provisional trying of new roles

Faculty’s role shifted from the “sage on the stage” to the “guide on the side.” Faculty included similar face-to-face instructional strategies in their online courses.

9. Renegotiating relationships and negotiating new relationships (critical-reflection)

Faculty who taught synchronously suggested online did not require a different type of instruction; whereas faculty who taught asynchronously felt differently. Some faculty noted feeling disconnected from students. Although most faculty liked teaching online, there were elements of face-to-face instruction that could not be replicated.

10. Building competence and self-confidence in new role and relationships

Faculty became more proficient at using technology.
As a result of online teaching, faculty increased their confidence and believed they became better instructors in their face-to-face courses.

Faculty were satisfied with their courses after the transformation, yet had goals for improvement.

Most faculty were surprised they liked teaching online and were willing to do it again.

Boundaries were less defined in an online class, making them essential to establish.

Results

Phase 1: A Disorientating Dilemma

Theme 1: Courses were transformed because it was a departmental expectation rather than a personal choice. For most faculty, their courses had to be transformed for online delivery because they were part of a graduate, distant degree program. One member of the faculty admitted he initially did not want to do it, yet no participant directly challenged this expectation. Notably, one faculty member came to the university for the opportunity to acquire online teaching experience.

Theme 2: Course transformation took a significant amount of time, but compensation for this extra time was inconsistent. Faculty were in agreement they spent ample time transforming their courses. Most faculty were simultaneously developing and teaching the course. One documented spending an average of 30 hours per week. However, none of the faculty were given release time for course development, but some received payment. For those who were fortunate to receive payment, the range of compensation was $500 to $3000.

Phase 2: A Self-Examination with Feelings of Guilt or Shame

Theme 1: Technology skills needed developing. None of the faculty reported specific feelings of shame nor guilt on the outset of the transformation process. What emerged as a barrier was their lack of technology skills. When faculty were asked to rate their skills prior to teaching online, they had a mean of 3.8 (based on a Likert scale of 1 to 10). For some faculty, they did not utilize Blackboard® (online course management system) for their face-to-face courses, even though it was a university expectation.

Phase 3: A Critical Assessment of Epistemic, Sociocultural, or Psychic Assumptions

Theme 1: Faculty assumed the same level of quality could not be achieved with online instruction. What was most concerning for faculty was how a sense of community could be built. “Isolating” was used to describe online learning. They assumed interaction among
students would be limited, as would their interactions with students. Ultimately, limited interaction would affect learning outcomes.

**Theme 2: Pedagogical knowledge was critical with online teaching.** Faculty in this study were from a college of education and were pedagogical experts. Their presupposition was that technology would guide the transformative process, rather than pedagogy. Consequently, if technology guided the content rather than pedagogy, the teaching and learning process would be compromised.

**Theme 3: Not all instructors nor courses are suited for online delivery.** Some faculty assumed that instructors who were not good teachers in the face-to-face environment, would be even worse teachers in the online environment. It was believed that online teaching needed to be intentional and explicit. Beyond this, some faculty noted graduate students are better suited for online learning than those who are undergraduates.

**Phase 4: Recognition that One’s Discontent and the Process of Transformation are Shared and that Others have Negotiated a Similar Change**

**Theme 1: To negotiate their presuppositions, faculty had philosophical, broad-based discussions with instructional designers and faculty who were already teaching online.** The university’s instructional technology center hired instructional designers to assist faculty with course conceptualization and technological skills. Faculty sought them out, along with their departmental peers, to investigate presuppositions and to explore ways of transforming their courses.

**Phase 5: Exploration of Options for New Roles, Relationships, and Actions**

**Theme 1: Faculty’s dialogue with instructional designers and peers became more specific and skill-based.** Through professional discourse with other faculty and instructional designers, faculty’s presuppositions became disconfirmed. Thus, dialogue shifted from negotiation of presuppositions to acquisition of skills.

**Theme 2: Pedagogy led the exploration for quality assurance, which was influential on the selection of technology.** Most faculty held individualized training sessions with instructional designers and departmental peers. At the forefront of these sessions was how technology would support pedagogical strategies, rather than how pedagogy would be adjusted to the technology. For example, one instructor chose to use Second Life® (3D virtual world) because of how it supported her pedagogical strategy of building a community.

**Phase 6: Planning a Course of Action**

**Theme 1: Faculty used their previously taught face-to-face course as their conceptual framework for the online transformation, as it was pedagogically sound.** Because faculty considered themselves pedagogical experts, they believed their original, face-to-face course was of quality, thus these courses were their frames of reference. This established pedagogy led the
decision-making throughout the transformative process, not the technology, mainly because learner outcomes remained constant across the two delivery methods.

Phase 7: Acquisition of Knowledge and Skills for Implementing One’s Plans

Theme 1: Faculty did not receive formal online course development training. While some attended workshops, all preferred working one-on-one with instructional designers to learn how to effectively use technology to support pedagogy and/or to troubleshoot technology problems.

Theme 2: Faculty sought pedagogical and emotional support from colleagues. While, technology questions were directed at instructional designers, faculty established an informal support system with colleagues to discuss instructional strategies and assessments and to share their emotional highs and lows throughout their journey of transformation.

Phase 8: Provisional Trying of New Roles

Theme 1: Faculty’s role shifted from the “sage on the stage” to the “guide on the side.” Almost all faculty noted a transformation in their role; they shifted from being the leader to the facilitator. While some felt comfortable in their new role because students took more responsibility for their learning, others felt “sidelined” and like the “silent partner.”

Theme 2: Faculty included similar face-to-face instructional strategies in their online courses. To support these instructional strategies, each faculty member used a variety of technological tools. However, adjustments needed to be made in order to fit the online environment. Examples of adjustments included: replaced DVDs with online videos, reduced number of “in class” activities.

Phase 9: Renegotiating Relationships and Negotiating New Relationships/Self-Reflection

Theme 1: Faculty who taught synchronously suggested online did not require a different type of instruction, whereas faculty who taught asynchronously felt differently. Student interaction and discussion were more easily maintained in synchronous courses; so for faculty whose courses were discussion-based, this type of instruction most replicated face-to-face. For faculty who taught asynchronously, they had to become much more detailed and explicit in their instruction, as well as intentional about interaction.

Theme 2: Some faculty noted feeling disconnected from students. Faculty described this feeling in the following ways: “Felt like the silent partner, not the competent other,” “Outside looking in,” “I feel disempowered and disconnected,” and “I need to communicate face-to-face.” These faculty expressed a commitment to both understand this disconnection and to find ways to connect with students.

Theme 3: Although most faculty liked teaching online, there were elements of face-to-face instruction that could not be replicated. For some, the face-to-face environment still felt more “natural” because discussion was generated more abundantly; students were not able to
“hide behind the technology.” Additionally, they could better “feel the pulse of the class” for understanding.

**Phase 10: Building Competence and Self-Confidence in New Roles and Relationships**

*Theme 1: Faculty became more proficient using technology.* On a scale of 1 to 10, faculty rated their technological skills prior to teaching online as 3.8 (M) and after teaching online as 6.3 (M).

*Theme 2: As a result of online teaching, faculty increased their confidence and believed they became better instructors in their face-to-face courses.* Faculty stated they became detailed, explicit, and organized. They also incorporated more technology, mainly Blackboard®

*Theme 3: Faculty were satisfied with their courses after the transformation, yet had goals for improvement.* Faculty identified a feeling of accomplishment (e.g., “I did it!”). One even suggested being a model for other faculty when they go through the transformative process. Although satisfied, faculty’s future aspirations were on the horizon. They had goals to increase interaction, incorporate more activities, increase the amount of detail, and become more connected to students.

**Phase 11: A Reintegration into One’s Life on the Basis of Conditions Dictated by One’s Perspective**

*Theme 1: Most faculty were surprised they liked teaching online and were willing to do it again.* Some faculty liked how they learned to “let go” due to having less control and “go with the flow” when an idea or technology did not work. One faculty illustrated how she learned so much about herself because she was “pushed” to find different ways to teach. For another, “class time” became more application-based rather than a review of the required reading.

*Theme 2: Boundaries were less defined in an online class, making them essential to establish.* The main boundary that needed to be established was when faculty would be (and not be) available to students. This was specifically targeted toward managing email, because “24/7” was neither realistic nor healthy.

**Discussion**

When planning, faculty spent ample time with an instructional designer learning the technologies to support their self-identified pedagogy, thus compensation for course development was perceived as necessary. While all faculty agreed that developing a course was more time intensive, none of them were given release time in any form to plan and design their course, only monetary compensation. Compensation for development was perceived as necessary, yet there was an inequitable monetary compensation structure within the college, as well as no evidence of additional compensatory mechanisms, such as a course release or reduction in service expectations.
The majority of time faculty spent planning was with an instructional designer selecting and learning technologies to support pedagogy. Only one faculty member worked in a department that invested in a full-time director of distant education position. The others were solely reliant on the university’s center for instructional and learning technologies. This center was the only formal support structure for faculty with a focus on teaching them to independently navigate technology, consequently faculty were expected to become both content and technology experts. Beyond this, faculty had to invest time creating all frameworks to situate their content for presentation (e.g., wikis, Powerpoints). None of the faculty even suggested clerical support. Moreover, faculty had to informally solicit pedagogical consultations from peers due to their departments, college, nor university providing a more formalized service.

Faculty acceptance of online education is consistently cited as a significant barrier (Allen & Seaman, 2007), with many being hesitant due to lack of support, assistance, and training (Allen & Seaman, 2008). In this study, all but one faculty member transformed their course because it was a required course in a distant degree program, consequently making the transformation a requirement. Comparatively, Mill, Yanes, and Casebeer (2009) also conducted a qualitative study of faculty perceptions in a college of education. One of the findings was that administrative support was lacking both with infrastructure and compensation.

De Gagne and Walters (2009) did a qualitative metasynthesis of the online teaching experience across nine studies involving 203 participants. All of the studies documented work intensity with planning, designing, delivering, and evaluating online instruction, thus increasing faculty workload. “The process of designing and planning online courses is usually more time-consuming because instructors must create a more explicit and transparent course in an electronic format, which requires more deliberation in designing the process, structure, and evaluation, along with the interaction components of the course” (Anderson, Rourke, Garrison, & Archer, 2001; De Gagne & Walters, 2009). Results from their study suggested faculty need to be provided with continuous support that includes appropriate technology, ongoing training, and technical assistance, while administrators must evaluate faculty workloads.

While implementing their online course, faculty’s conceptual framework was their prior face-to-face course; interestingly, for those who delivered it synchronously, online did not require different instructional tools like it did asynchronously. Intriguingly, the professional literature suggested online not only needs different instructional and technical tools (Ray, 2009), but also a different type of pedagogy (Bates & Watson, 2008). The opposing viewpoint is that the pedagogical strategies remain intact during the transformative process, it is the medium and instructional tools that change. To illustrate, modeling is a well-accepted pedagogical strategy that went from a live demonstration in a face-to-face class to a recorded demonstration in the online class. In the current study, faculty reported how course objectives and accreditation accountability were not altered per learning format; pedagogy remained for quality assurance. This was confirmed with the findings in Johnson’s 2008 study in that “the conceptual framework, program outcomes, and student learning objectives do not change in web-based education. Students can acquire and synthesize new knowledge in this environment much as they do in a face-to-face classroom.”

For those who taught synchronously, their instructional styles were comparable to face-to-face in how students both participated in and lead class discussions/presentations. Faculty denoted minor alterations, such as a reduction in lecture time. For faculty who delivered their courses asynchronously, they also retained their conceptual, pedagogical framework from face-to-face but had to use different mediums/instructional tools for presentation of content and for
student interaction. For these reasons, a face-to-face classroom experience is difficult to replicate in the online environment without adjustments (Ray, 2009).

Keengwe and Kidd (2010) wrote, “…it is critical for faculty to not only strive to learn the technologies associated with online learning, but also understand the need to fundamentally change and transform their pedagogical approach” (p. 6). Faculty in current study were considered pedagogical experts for which their pedagogical foundation remained stable during the transformative process. Arguably, should the rudimentary principles of what constitutes quality teaching and learning be changed in the online environment? Online, web-based instruction changes the delivery not the art of teaching; undoubtedly, educators have a responsibility to uphold these traditional, educational principles (Johnson, 2008).

Upon reflection, faculty postulated that online teaching made them more efficient and effective teachers, even with their role shifting to facilitator. Because this study was situated in a college of education, most faculty were already pedagogical experts, yet online teaching further advanced their skills. They used more explicit instruction for clarity, enhanced content with new instructional tools/aids, and became more intentional about social interaction. Faculty in Johnson’s 2008 study illustrated how they were able to transfer newly learned web-based teaching strategies to the face-to-face classroom.

When teaching online, faculty find themselves in the role of learning facilitator rather than lecturer/teacher, and this change is one many faculty find themselves unprepared (Vaill & Testori, 2012). In the current study, the shift to facilitator was embraced by most, but uncomfortable for a few. Students taking responsibility for their learning is an expectation of most faculty, yet how that responsibility is operationalized varies from taking leadership roles in content presentation to taking responsibility for studying content presented by the instructor. Based on De Gagne and Walters’ 2009 qualitative metasynthesis, one of the most significant transformations was from lecturer to guide from knowledge dispenser to resource provider, and from authority to facilitator. Reflected by the recipient of the 2003 Sloan-C award for Excellence in Online Teaching, Bill Pelz, “…my ever-emerging philosophy of education increasingly diminishes the role of ‘the teacher’ in the teaching/learning equation. It took over 30 years of college teaching experience for me to realize that the learner is, for the most part, in charge of what gets learned.”

There was also growth in the affective domain of learning. Some faculty were able to “let go” (or at least “push the boundaries of control”) of the variables in online learning they could not control. Others noted a reduction in anxiety after conquering the mysterious world of online teaching. De Gagne and Walters (2009) reported that many faculty perceived online teaching to be stimulating and satisfying. This perception was shared by some participants in the current study.

Abstract

In this work, LM in three categories of students – motivated, unmotivated and overmotivated – was explored. Fifty graduate students, which were current and prospective school teachers and took the author’s online psychology courses in 2012-2013, participated in the study. The research methodology included developing the rules of coding students’ course work, designing the 100-scale of LM for representing their individual as well as collective data, and collecting info about students’ academic achievement in this course. According to the results, students’ LM has two co-existing components – pragmatic (grade-oriented) and cognitive (knowledge-oriented). Three mentioned categories of students differ in quantity as well as quality of their LM. Further analysis showed that a) motivated students constituted a majority 74% of the population; they were rather pragmatically than cognitively oriented learners, b) unmotivated (problem) students, whose even pragmatic motivation was very low, represented 18.5% of the population, and c) overmotivated (enthusiastic) individuals that is, curious, and eager to get knowledge without being encouraged or rewarded, constituted the smallest part 7.5% of the total population. Considering these results in a wider socio-cultural context, the author suggests that prevalence of pragmatically motivated students among current and prospective school teachers, the shortage of enthusiastic learners and growth of problem learners can be possible significant causes affecting quality of the modern US primary school education.

Keywords: learning motivation, pragmatic (grade-oriented) vs. cognitive (knowledge-oriented) motivation, problem students, enthusiastic learners, current/prospective school teachers

Introduction

Beginning in the early 1990’s in the American educational periodicals and on educational forums in the electronic networks, specialists have been actively discussing failures of national primary school education. Conducting the cross-cultural research, scholars have repeatedly stated the American school students’ poor preparation in natural disciplines, especially, math (Stigler & Hiebert, 1999). In the recent years, there appeared articles about school students’ underachievement in other subjects as well (Hood, 1993; Albada, 2010; Report: Half of U.S. Schools Fail Federal Standards, 2011; Crotty, 2012; Khazan, 2012). The administration is taking various measures to address the present situation; one of them involves dismissing of “the bad school teachers”, namely those that are incompetent and lack motivation (Meador, 2014; Most Americans Want Easier Way to Fire Bad Teachers; 2010).

Indifferent and careless school teachers cause much harm to the society. Remarkably, a lack of motivation may display itself long before individuals come to school settings to teach – in their students’ years. They learn to become educators the same way they eventually will work as
educators. That’s why we made an attempt to study learning motivation (LM) in students who are current and prospective school teachers.

**Theoretical Frame: the Concept of Learning Motivation and its Study**

The phenomenon of LM has been explored in modern psychology and educational practice since the beginning of the last century. However, there is no agreement in how it should be termed. Often the concept of *interest* is used to describe a stimulating role of motivation in learning (Krapp, 1999). LM is also defined as a factor arousing, persisting, sustaining, and directing behavior in school (Skinner, 1947). Authors use *desire* and *drive* as synonyms for LM. Motivation is posited as a synthesizing factor for human cognition and affect known as fundamental aspects of any functioning including learning. In the last few decades, the term *academic motivation* became very popular (Vallerand et al., 1992, 1992; Frontier et al., 1995; Green et al. 2006). Despite of the variety of terminology, the actual subject being studied is LM.

“Motivation is a desire for and movement toward special goal. It is more than a wish or a day dream: true motivation awakens and sustains actions that propel a person closer to a goal. At its base, motivation is also a search for personal meaning and a reflection of a person’s deepest values” (Mwenda, 2012). This definition emphasizes that motivation determines not only what people do, but also how they reason what they do. Such a multifaceted understanding of motivation is important because it exposes its specifics in learning. And LM can be defined not only as the student’s desire to reach some educational goals, but also as his/her acceptance and perception of the educational goals, tasks, and requirements as his/her own personal and meaningful values.

Scholars distinguish between intrinsic and extrinsic motivation, “based on the different reasons and goals that give rise to an action” (Thoonen et al., 2011). When describing students’ motivation to learn, they define intrinsically motivated students as undertaking an activity “for its own sake, for the enjoyment it provides, the learning it permits, or the feelings of accomplishment it evokes” (Lepper, 1988). Extrinsically motivated students perform in order “to obtain some reward or avoid some punishment external to the activity itself” (Lepper, 1988); they “do something only because it leads to a separable desired outcome” (Thoonen et al., 2011). Intrinsic behavior does not require a reward, and it results in high-quality learning (Ryan & Deci, 2000).

Along with the concept of motivation, the concept of amotivation was introduced, although later. In the last decades the new phenomenon has been actively researched (Vallerand & Bissonnette, 1992).

To study LM, specialists tend to use interviews and surveys measuring students’ perceptions and opinions (Fortier et al., 1995; Pakulina & Ket’ko, 2010; Thoonen et al., 2011). Another method is based on the analysis of products of human labor and creativity which reflect in-depth personal characteristics. Being more direct, the latter is at least as, or even more objective and efficient than the prior. This method (sometimes in a combination with a survey) is fruitfully used by educators nowadays (Hartnett, 2010; Hartnett et al., 2011; Dadach, 2013). We also use this method for our study of LM. One’s activity is the best projection of one’s personality and motivation, and among many human activities learning is probably especially significant.
Research Tasks and Methodology

In this work, three major tasks were set: to study how LM differs in its quantity and quality in three categories of students: motivated, unmotivated (problem), and overmotivated (enthusiastic) students. It was also explored how participants’ LM influenced their academic achievement within a new and based on informational technologies learning environment.

The investigated population consisted of fifty students, current and prospective school teachers, who took the author’s online psychology course Child Development and Learning in the Cultural Context. The study was conducted within two semesters: in fall of 2012 with twenty participants and in fall of 2013 with thirty ones. We will name them the A-, and B- groups.

The research methodology included the analysis of the students’ coursework submitted to the course site and mathematical analysis of the collected data. To analyze students’ coursework, we used the criteria for recognizing unmotivated, motivated, and overmotivated students, rules of coding students’ data, and the 100-scale of LM for representing students’ individual as well as collective data that were developed and designed by the author in her previous similar research (Toom, A., 2013; 2013). Also, at the end of the semesters, students’ final course grades were collected and compared with their LM. The Pearson’s Correlation coefficient was calculated.

The hypothesis consisted in the following. There were certain requirements determining the way in which the coursework should be done to be accepted and graded. If a student met those requirements, we concluded that s/he had LM; a failure to meet these requirements was interpreted as lack of LM.

Quantification of Learning Motivation

The Online Course Content and Requirements

Homework assignments (HM). Each assignment consisted of two parts: reading the textbooks or Internet articles provided by the instructor and use this information to answer questions also provided. There were eleven homework assignments; each of them typically included three questions. The activity was mandatory. Requirements for this activity included:

1. Timely submission: each assignments should be submitted by a due date scheduled
2. Sufficient quantity: all questions should be answered completely
3. Sufficient quality: all answers should be brief (no longer than 60-80 words), clear, to the point; key words/phrases in every answer should be formatted as bold face.

Group discussions on the Discussion Board (DB). There were five discussions; each of them was devoted to one psychological or educational issue related to the course topic. Students were expected to respond to a question posted by the professor, share their experience, and exchange opinions with classmates. The activity was mandatory. Requirements for this activity included:

1. Timely submission: responses should be posted by a due date
2. Sufficient quantity: at least two responses ought to be posted for each discussion – one response to the professor and the other to any classmate; at least two references should be provided for each discussion forum
3. Sufficient quality: responses were expected to be substantial, supported by the student’s personal educational experiences and the references found in e-libraries or e-data bases.

The Final Research Paper (RP). One research paper had to be written on the topic “Comparative Analysis of Different Theoretical Approaches to Child Development and Learning”. The activity was mandatory. Requirements for this activity included:

1. Timely submission: research papers must be submitted by a due date
2. Sufficient quantity: bibliography and the paper outline should be submitted preliminary
3. Sufficient quality: the paper content should correspond to its topic, and the topic should be developed in full

The Educational Forum (EF). A special forum on the DB was open, and current educational, scientific, and administrative news in articles and on videos about children without and with special needs were presented there. There students could place their own findings. Participating in this activity was optional. No requirements were given.

The Principles of Coding Data

All students’ learning activities and actions that comprise them were recorded in the course site, analyzed and coded accordingly to their correspondence to the course requirements. Three characteristics of students’ coursework were measured: temporal, quantitative, and qualitative; each allowed values 0, 1, or 2.

Coding homework assignment:

1. Temporal characteristic: a missing homework received 0; a timely submission received 1; a submission done in advance (more than a week before a due date) received 2.
2. Quantitative characteristic: homework with two missing answers received 0; homework with one missing answer received 1; homework with all answers received 2.
3. Qualitative characteristic: homework with at least one incomplete or incorrect answer received 0; homework with all complete and correct answers received 1; homework with at least 2 answers out of 3 expressed “briefly, clearly, and to the point” received 2.

Coding DB post:

1. Temporal characteristic: missing responses received 0; timely responses received 1; responses posted in advance (more than a week before a due date) received 2.
2. Quantitative characteristic: one or less responses received 0; two responses received 1; more than two responses received 2; one or less reference received 0; two references received 1; more than two new references (not found by classmates) received 2.
3. Qualitative characteristic: a response missing or not including a personal experience received 0; a response presenting a personal experience received 1; if a student expressed a new idea stimulated by references or the discussion, his/her response received a “2”.

Coding the Final Research Paper:

1. Temporal characteristic: missing paper or a late submission received 0; timely submission received 1; advanced submission (at least a week before a due date) received 2.
2. Quantitative characteristic: missing preliminary bibliography and paper outline received 0; bibliography and outline that needed revising received 1; complete bibliography and correct paper outline received 2.

3. Qualitative characteristic: missing paper received 0; paper needed revising received 1; complete and rich in content paper received 2.

**Coding participation in the Educational Forum:**

1. Quantitative characteristic: no attendance received 0; one attendance received 1; two and more attendances received 2

2. Qualitative characteristic: no participation received 0; participation in discussions without sharing personal experiences received 1; active participation with sharing personal experiences and contributions in a form of new Internet resources received 2.

**The Scale Design and Data Representation**

The 100-point scale of LM was designed for the author’s specific course with its unique content and certain requirements. To develop it, four hypothetical students were invented. Two of them were called *perfectly motivated* and *perfectly unmotivated* students; they determined the left-most and right-most points of the scale. These individuals do not exist in reality; they with their highest and lowest scores were needed for mathematical transformations of the real students’ data. Two other imaginary individuals were the *lower boundary* and the *upper boundary* students. They were supposed to separate results of motivated, unmotivated, and overmotivated students from each other.

The data of four hypothetical students was coded according to principles described above. The row data were calculated and scaled. First, all the four values representing four types of the coursework were normalized: in each category the score was divided by the maximum possible score, and then a weight of 25% was attributed to all of them.

The course work of each participant of the study was coded identically. So, after these necessary mathematical transformations, every student hypothetical as well as real could be characterized by a tuple of four values, and their sum represented his/her LM manifested in the course.

**The perfectly motivated student** does everything in the best way. He is not just always on time, he is consistently ahead of the course work’ due dates. He not only meets requirements regularly, he always exceeds them. He has the best scores for each type of the coursework. LM of this student is 100% and determines the right-most points of the scale.

**The perfectly unmotivated student** systematically violates all aspects of the course policy, does not study, and fails. He has a 0 for each type of the coursework. LM of this student is 0% and determines the left-most point of the scale.

**The lower boundary student** is modeled according to the college’s policy determining which academically underachieving students should still be given a chance to eventually complete the coursework and receive a passing grade. Such a student should submit the maximum of assignments required (except the final paper) and complete at least 50% of the coursework by the end of the semester. This students’ row and scaled tuples of four values are shown in the Table 1. The sum 23% should be considered the boundary on the scale separating results of unmotivated students from motivated ones.
The upper boundary student is designed according to the author’s pedagogical experience: if something not quiet ordinary occurs in a student’s activity once, it might be random. However, if it happens twice, it points, rather, to a possible consistency. Such a student over exceeds every requirement for every type of coursework at least twice. Also, such a student prepares bibliography, the paper outline and the final paper that are accepted from the first attempt. This student’s LM and all corresponding data are shown in the Table 1. The sum 69% is the boundary separating results of motivated students from overmotivated ones.

Table 1

Note: HW = homework; DB = discussions; RP = research paper; EF = educational forum

On the Figure 1, the results of the A-group of students are distributed on the scale. Points 26 and 69 show the lower and the upper boundaries for results of motivated students. Twenty participants are displayed as stick-figures next to the corresponding locations on the axis with their individual LM scores on the “faces.” Most students of the A-group are motivated and located in the middle part of the scale. Three student (with their scores 70, 74 and 88) located to the right of the middle area’s upper boundary are overmotivated, and two students (with their scores 16 and 20) located to the left of the lower boundary are unmotivated.

On the Figure 2, the results of the B-group of students are distributed on the scale. Most students of the B-group are motivated and located in the middle part of the scale. No students are located to the right of the middle area’s upper boundary, that is, there are no enthusiasts in the B-group. Seven students (with their scores 14, 22, 24, and 25) located to the left of the lower boundary are unmotivated.
The Results

Analysis of the Investigated Population

Motivated but not outright enthusiastic students constituted a majority in both investigated groups: 75% in the A-group and 73% in the B-group. Unmotivated students constituted 10% in the A-group and 27% in the B-group. Overmotivated students constituted 15% in the A-group and were not present in the B-group. It is shown on the Figure 3.

The Correlation between LM and Academic Performance

To find out how students’ academic performance depended on their LM manifested in the course, we studied the correlation of their motivation with final course grades. The Pearson’s Correlation Coefficient was calculated with the use of the formula:

\[ K = \frac{n(\Sigma xy)- (\Sigma x)(\Sigma y)}{\sqrt{n\Sigma x^2-(\Sigma x)^2} \sqrt{n\Sigma y^2-(\Sigma y)^2}} \]
where \( x = (x_1 \ldots x_n) \) and \( y = (y_1 \ldots y_n) \) are distributions of the two chosen variables; and \( n \) is the number of students in the group (How to Compute Pearson’s Correlation Coefficient).

The study revealed a high correlation coefficient \( K_{LM,FG} = 0.61 \) between students’ LM and their academic achievement for the A-group and \( K_{LM,FG} = 0.52 \) for the B-group.

**Reliability and Validity of the Results**

In each of two semesters, the category of motivated students constituted the highest percentage (see Figure 3); it proves reliability of the result. The result reflects the fact that students enroll into educational programs for certain reasons: some have already worked in school system, some others were preparing for that, – and obtaining the Master’s degree is an important step for their professional growth and career.

It was found that students’ academic achievement positively correlates with their LM. The correlation coefficients are high for two groups of students studied the same subject with the same professor in different semesters. Similarity of this result for two different semesters proves its reliability. Additionally, the result is supported by discoveries made in other studies of LM (Fortier et al., 1995; Singh et al., 2002; Broussard & Garrison, 2004; Green et al., 2006); this points to the validity of the obtained results.

**Discussion**

**Structure of Learning Motivation**

Two components of students’ LM – grade-oriented and knowledge-oriented – were described in our study under the names pragmatic and cognitive. In essence, they link back to the familiar intrinsic and extrinsic motivation. However, for our specific study terms cognitive and pragmatic seem to be more adequate. This usage of terms is consonant with some other authors’ ideas about the content of LM (Csikszentmihalyias, 1975; Whitney & Hirch, 2007).

The components are co-existing, interrelated, and both are necessary for fruitful learning. However, unlike the pragmatic motivation that everybody (even unmotivated students) had, in our study the cognitive motivation was noticed in a few. The ratio of the grade-oriented students to those who were both grade- and knowledge-oriented was approximately 12:1.

This is understandable: cognitive LM is an infrequent phenomenon. The explanation is analogous to A. Maslow’s interpretation of the hierarchy of motives. Physical needs (for food, shelter etc.) and the need for safety are located at the bottom of the hierarchy and are applicable to everyone. The more spiritual a motive is, the higher it is located, the less frequent it is. Thus, the motives for self-actualization or knowledge are a privilege of a few (Maslow, 1970). Similarly, the cognitive component of LM, as non-materialistic and spiritual by its nature, is at a higher position in the structure of LM and exhibited by a few.

Three categories of students – unmotivated, motivated, and overmotivated – differed in quantity as well as quality of their LM. The more complex LM was, the stronger it was. Students who combined pragmatic and cognitive types of LM had the higher scores on the scale.

The students’ final grades highly correlated with their LM. However, a further analysis of the data showed that the dependency was only unidirectional. That is, highly motivated students tended to have good grades, but a good grade did not always indicate a high LM. According to
our online course policy, for being successful it was enough to follow the instructions, meet requirements, and timely provide correct and informative mandatory assignments. That’s why students lacking cognitive LM also could have good grades.

The Learning Style of Unmotivated Students

Unmotivated students are worse than others in all indicators of their activity. They miss their homework. If they submit assignments, their assignments have missing answers. If answers are present, many of them are incomplete and incorrect. Such students often miss discussions with classmates on the Discussion Board. If they participate, their responses are unsupported by references and personal experience. They are late with their Final Research Paper or their Bibliography is insufficient. Finally, they never participate in optional activities because they do not even know about their existence. Their knowledge of the course site and their computer skills are poor. These students turn out to be poorly adjusted to a new learning environment and have no ability or desire for acquiring new learning skills; their enrollment into the online courses is probably a mistake.

As the results show, they lack LM because of their incompetence as computer users. Another factor preventing them from the successful study in the new learning environment is psychological: they lack such characteristics as cognitive curiosity and self-discipline that are responsible for academic performance and very closely interconnect with LM.

Unmotivated students constituted 10% of the A-group and 27% of the B-group. The percentage of unmotivated or problem students tends to increase as semesters are progressing.

The Learning Style of Motivated Students

Motivated students follow most instructions of the course exactly as they are given. Neither more, nor less. Very seldom one of the students belonging to this category does an additional work; some others miss one of the activities, but it is not quite typical.

Their course submissions are timely. Their homework assignments are usually complete and correct. To the discussions on Discussion Board, they bring two required postings and two required references needed to support their point of view. Their Final Research Paper usually needs some revision and bibliography is insufficient, but they correct all mistakes before the semester is over.

They perform only the coursework for which they are graded and ignore optional activities offered for their professional growth. They never come to the optional educational forum offered in the online course considering it a waste of time; they neglect it because the activity is not rewarded. Pragmatic interests prevail in them, and their main guiding principle is maximizing the grade and avoiding learning that does not contribute to the grade.

Actually, an attitude found in many of our motivated students corresponds to the values of modern society: «time is money», and people prefer not to spend their time and effort on anything that does not bring immediate profit (USA – Language, Culture, Customs and Etiquette). The question still arises if this philosophy is appropriate for educators.
Motivated students constituted a majority 75% in the A-group and 73% in the B-group. Actually, it is the majority of the whole investigated population. They were responsive, responsible, and successful individuals. However, they were pragmatic learners.

The Learning Style of Overmotivated Students

Overmotivated students are better than others in all indicators of their activity. They are not just on time – they are always ahead of the due dates for their course work. They not only meet requirements regularly – they always exceed them. Their homework is always complete, correct, and contains some new information that was not provided by the reading materials offered in the course; they find this relevant information on their own. Discussing the issues of the subject with their classmates on the Discussion Board, they also over perform. Instead of two required responses they tend to submit five. Instead of two Internet resources for supporting their opinions, they would find five or six. Additionally, their responses are very high in quality – describe personal experiences and have new ideas. Their Final Research Paper needs no revision. From the very first attempt it is complete and rich in content.

These students perform the optional assignments as well as required because they want to receive knowledge relevant to their professional interests even if it is not immediately rewarded. Like everybody, they appreciate grades, but curiosity has a higher priority for them.

Overmotivated or enthusiastic students constituted 15% of the A-group and 0% of the B-group. The percentage of enthusiastic students tends to decrease as semesters are progressing.

Conclusions

Two different, interrelated, and co-existing components of LM observed in the study link back to the familiar intrinsic and extrinsic motivation. Students’ LM within the context of online learning environment was found to have the nature similar to that which was described by the theorists and explorers of traditional class settings.

Motivated participants constituted a majority of the total investigated population. They were reasonable, responsive, and successful individuals who received good grades for the course. However, they were pragmatic or grade-oriented learners. The percentage of overmotivated or enthusiastic and knowledge-oriented students is relatively small and tends to decrease as semesters are progressing. At the same time the percentage of unmotivated or problem students tends to increase.

The study was conducted in one statistically average American college. However, the tendencies that were made out do not characterize just one educational institution. The author suggests that they represent general tendencies in contemporary education, specifically, online distance education.

Considering the results of this study in a wider socio-cultural context, the author suggests that the prevalence of pragmatically motivated students among current and prospective school teachers, the shortage of enthusiastic learners, and an abundance of problem students can be possible significant causes affecting quality of the modern US primary school education and school students’ academic performance. In either case, a further study of teachers’ motivation seems to be a promising scientific direction.

Servant-Leadership-Followership: A Case Study for Educators

Abstract

Servant leadership develops caring, respectful, inclusive communities. The purpose of this article is to investigate its presence from the perspective of two elite NHL hockey players and their leadership style on and off the ice. A face-to-face interview was conducted with Henrik and Daniel Sedin, of the Vancouver Canucks. This case study provides evidence to support the existence of the servant leadership philosophy in sport. In this time of societal violence, especially in hockey, perhaps the Sedins’ modeling of a servant-leader attitude, coupled with their elite status can be a beacon for children and youth today.

_Someone who is admired, as a leader in sport often is, can change the significance of what might otherwise go unnoticed_ (Shogan, 2007, p 16).

If we use the National Hockey League (NHL) as a general reference, the goal is to score against the opposing team, while not being scored upon, and to protect and support each other in the process. Within a hockey team the players are constantly leading and following back and forth as they move over the ice in front of the team goalie. Specific athletes illustrate a variety of functions/roles: e.g., there is the enforcer, who tends to intimidate and who uses body size to overpower members of the opposing team; there are centers, who set up plays and are often the strongest skaters on the ice; there are defensemen, who guard their own goalie from intrusion; and there is the captain who is
supposed to be the one who speaks to the officials. Each member contributes when
needed, but even so, certain elite athletes are acknowledged as the key leaders on their
teams, often identified as team captains and/or select players who score or defend well.
This is not an exhaustive list, of course. Obviously, a well-balanced and successful team
needs players that respond with their particular leadership skills for the good of the team
as a whole.

Since 1980, I have been a student and researcher of leadership, particularly
servant-leadership (Greenleaf, 1991), in the areas of education and community (Crippen,
Please let me explain. After relocating permanently to the province of British Columbia
in December 2009, I decided to become acquainted with the local NHL team, the
Vancouver Canucks. I started by watching their televised games, though I did not know
any names or players. However, leadership is usually easily recognized in team sports,
and something happened over the first couple of games that I watched. I noticed there
were two players with red hair and red beards that seemed different in their approach to
the game and the dynamics between them, the other players and officials. Their
leadership seemed different than usually witnessed in professional sport, namely they
seemed to exemplify a particular philosophy of leadership known as servant leadership. A
much closer and lengthier investigation was necessary to validate my initial impression
and to see if there was actual evidence to support my thoughts.

The two red headed players were twin brothers, Henrik and Daniel Sedin, who
became a catalyst for an in-depth case study (Creswell, 2009; Stake, 1995; Yin, 2009).
Initially, I started writing down my observations and listening carefully to the announcers
of the games. I began to collect newspaper articles about the Vancouver Canucks. I
recorded and/or watched every televised Canucks hockey game from December 2009
until February 2013, broadcast on Sportsnet Pacific, CBC Hockey Night in Canada, and
TSN (CTV) television networks. That was just the beginning of a three-year research
journey investigating the leadership of Daniel and Henrik Sedin.

Leadership though is a broad topic with many interpretations; hence a definition
presented by renowned leadership scholar, James McGregor Burns (1978) will provide
the foundation for our discussion. He defines leadership “as leaders inducing followers to
act for certain goals that represent the values and the motivations – the wants and needs,
the aspirations and the expectations of both leaders and followers” (p. 19). Additional, yet
similar, clarity is offered by sports psychologist Daniel Wann (1997), defining leadership
as “a behavioral process in which one group member influences the other members
regarding the attainment of the group’s goals” (p. 128). Most of the leadership literature
in sport relates to the role of the coach (Rieke, Hammermeister, & Chase, 2008; Shogan,
2007; Wann, 1997), but I believe a particular form of leadership, namely servant
leadership, exists among a small group of elite athletes.

An Introduction to Daniel and Henrik Sedin

Henrik (6 minutes older) and Daniel Sedin are identical twins born in the small
town of Ornskoldsvik, Sweden on September 26, 1980. Their father, Tommy, is a school
vice-principal, who also played hockey and coached them as youth and their mother,
Tora, is a nurse. They have two older brothers: Stefan and Peter. The family of boys was
involved in sports from a very young age, playing soccer and hockey. Daniel and Henrik
began organized hockey at the age of eight, and did not play on the same hockey line
until they were fourteen. They are both married to women from their home village. Henrik has two children and Daniel has three. They reside in Vancouver and return to Sweden each summer to spend time with their extended family.

They joined the Vancouver Canucks in 1999 and have remained ever since. Daniel and Henrik are known for their effectiveness in playing off of one another. Henrik is a skilled passer and playmaker, while Daniel is a natural goal scorer. In 2010, Henrik won the Art Ross Trophy for leading the NHL in scoring points during the regular season and the Hart Memorial Trophy for the player judged to be the most valuable player to the team by the Professional Hockey Writers Association. In 2011, Daniel won the Ted Lindsay Award as the most outstanding player in the league as voted by the NHL Players Association and the Art Ross Trophy for the point-scoring leader. Henrik is classified as an Ironman, having played over 600+ games in a row.

The following paper addresses two elite players, Henrik and Daniel Sedin and their leadership approach both on and off the ice. Four sections form the paper: (i) an introduction to a leadership philosophy, not often identified in sport, called servant leadership; (ii) a synthesis of qualitative research, a case study, used to investigate and analyze the particular leadership style of the Sedin twins; (iii) evidence of any servant leadership competencies (Sipe & Frick, 2009) identified from an interview with Daniel and Henrik Sedin; and (iv) a conclusion to the paper which addresses the possible value of the servant-leader philosophy to sport literature, plus direction for further research.

The Philosophy of Servant Leadership

Exactly, what does this term mean? The term servant leadership was coined by Robert K. Greenleaf (1904-1990) in a small 37-page essay titled The Servant as Leader,
written in 1970 just after he reached retirement at age 66. Greenleaf was in middle management at AT&T and was interested in building caring, inclusive, supportive communities. He lectured at M.I.T. and Dartmouth, and was a colleague of James McGregor Burns whose definition of leadership is sited above. Greenleaf believed that one had to first want to serve before leading, and it was through one’s service that a person was recognized as a leader. He defined a servant-leader as:

A servant-leader is servant first... It begins with the natural feeling that one wants to serve, to serve first. Then conscious choice brings one to aspire to lead. The difference manifests itself in the care taken by the servant first to make sure that other people’s highest priority needs are being served. The best test, and difficult to administer, is: do those served grow as persons; do they while being served, become healthier, wiser, freer, more autonomous, more likely themselves to become servants? And what of the least privileged in society: will they benefit, or at least, not be further deprived? (Greenleaf, 1991, p. 15)

It is important to explain the term servant in servant-leader. Greenleaf believed that when one serves, “one is not a service provider, a martyr or slave” (Sipe & Frick, 2009, p. 38). The servant is one who “consciously nurtures the mature growth of self, other people, institutions, and communities – the objective of which is to stimulate thought and action for building a better, more caring society” (p. 38). Much has now been written about Greenleaf’s servant leadership philosophy with Larry Spears (former Executive Director of the Greenleaf Center in Indianapolis, Indiana) as the driving force behind its analysis (Frick & Spears, 1996; Spears, 1998a, 1998b).
Spears (1998a) identified ten servant-leader characteristics that appeared consistently throughout all of Greenleaf’s writing: (a) listening, (b) empathy, (c) awareness, (d) healing, (e) persuasion, (f) conceptualization, (g) foresight, (h) stewardship, (i) commitment to the growth of others, and (j) building community. It should be noted that those who practice the philosophy of servant leadership and aspire to being servant-leaders have the same strengths and weaknesses of all human beings. Thus, a perfect servant-leader seldom exhibits all ten characteristics: it is something to strive for during life’s journey. A list of ideal servant-leaders could include Gandhi, Martin Luther King, Nelson Mandela, Elizabeth May, Eleanor Roosevelt, Stephen Lewis, and Parker Palmer.

More recently, Sipe & Frick (2009) have defined a servant-leader as “a person of character who puts people first. He or she is a skilled communicator, a compassionate collaborator who has foresight, is a systems thinker, and leads with moral authority” (p. 4). Listed below are seven pillars and 21 core competencies related to each of the seven, as identified by Sipe and Frick. Each pillar contains three competencies and the authors suggest, “these competencies can also represent a set of performance appraisal metrics-barometers of professional growth for the continuous evaluation of your leadership strengths and development needs” (p. 6). The seven pillars are:

**Pillar I – Person of character:** Makes insightful, ethical, and principle-centered decisions

- maintains integrity
- demonstrates humility
- serves a higher purpose (p. 15).

**Pillar II – Puts people first:** Helps others meet their highest priority
• displays a servant’s heart
• is mentor minded
• shows care & concern (p. 34).

Pillar III – Skilled communicator: Listens earnestly and speaks effectively
• demonstrates empathy
• invites feedback
• communicates persuasively (p. 45).

Pillar IV – Compassionate collaborator: Strengthens relationships, supports diversity, and creates a sense of belonging
• expresses appreciation
• builds teams & communities
• negotiates conflict (p. 77).

Pillar V – Foresight: Imagines possibilities, anticipates the future
• visionary
• displays creativity
• takes courageous, decisive action (p. 104).

Pillar VI – Systems Thinker: Thinks and acts strategically, leads change effectively and balances the whole with the sum of its parts
• comfortable with complexity
• demonstrates adaptability
• considers the “greater good” (p. 130).

Pillar VII – Moral Authority: Worthy of respect, inspires trust and confidence, and establishes quality standards for performance
• accepts & delegates responsibility
• shares power and control
• creates a culture of accountability (p. 155).

Because I was very familiar with Spears’ ten characteristics and cognizant of my bias in this regard, I wanted a more recent framework that was deeper and broader in scope. Careful scrutiny of the two lists offered by Spears (1998a) and Sipe & Frick (2009) reveals much overlap and consistency, though the pillars identified by Sipe and Frick (2009) are more profound than those identified by Spears (1998a) for two reasons. First, Frick (2004) was the author of Robert K. Greenleaf’s comprehensive biography, having access to all the Greenleaf papers and related documents when doing his research. Second, it seemed to me that Frick’s knowledge base of servant leadership would provide a rigorous contribution for analysis and Frick’s research was inclusive of the growing body of literature on servant leadership (Frick & Spears, 1996; Stone, Russell, & Patterson, 2004; Wong & Page, 2003). The 21 competencies (Sipe & Frick, 2009) easily slotted into the ten characteristics identified by Spears (1998a), yet expanded upon the understanding of each.

Without reviewing the entire 21 competencies, suffice to say that foresight is present in both lists, strengthened by the competencies of vision, creativity, and decisive action in the competencies. As well, listening incorporates feedback, expresses appreciation, and communicates persuasively. Commitment to the growth of others is consistent with Sipe and Frick’s (2009) serves a higher purpose, is mentor-minded, invites feedback, shares power and control, demonstrates adaptability, considers the greater good, and builds teams and communities. Hence, the seven pillars and the 21
competencies effectively provide a conceptual framework for the case study, enhancing upon Spears’ (1998a) ten characteristics.

The Case Study Synthesis

The following section will explain the choice of qualitative research and the strategy of a case study approach. Creswell (2009) explains, “qualitative research is a means for exploring and understanding the meaning of individuals to a social or human problem” (p. 4). Henrik and Daniel Sedin were the two individuals and their leadership style and interaction/behaviour as hockey players was the focus of the research. Creswell provides a clear description of the case study approach as a strategy of inquiry in qualitative research, in which the “researcher explores in depth a program, event, activity, process, of one or more individuals. Cases are bound by time and activity, and researchers collect detailed information using a variety of data collection procedures over a sustained period of time” (p. 13). Although I initially became aware of these players in December 2009, I did not formalize the data gathering process until late spring of 2010, which continued until February 2013.

A case study approach provided a research method for in-depth analysis of these two elite hockey players and their modus operandi. Two research questions framed the study:

1. How did the Sedins demonstrate their unique leadership style in hockey?
2. Specifically, was there evidence to support the philosophy of servant leadership?

Data Collection

Yin (2009) suggests six main sources of data for case studies, of which one is an interview. Questions were developed with my doctoral student, Bill Brown (pseudonym),
to be used in a personal interview with the Sedin twins. We sifted through the list of questions over two weeks, revisiting the wording and intent of each, and eventually selected 16 questions (Appendix 1). I attempted to achieve qualitative validity (Creswell, 2009, p. 190) over the research time period by frequently doing informal checks with two of my doctoral students who play hockey, several friends who attend the Canucks games in Vancouver on a regular basis, and other colleagues in my department for their observations and perceptions of the Canucks games and the Sedins as players.

The process.

Gaining access for an interview with the Sedins proved to be a lengthy process. I realized this particular research was not going to be completed quickly and would require patience on my part as a researcher. As a member of the Human Research Ethics Board (HREB) at the University of Victoria and as a researcher, I am providing these details so they may be helpful to others embarking on research that involves a major commercial organization.

I first asked colleagues within the Faculty of Education at University of Victoria, including Physical Health Education, who might have connections with anyone in the Canuck organization. No one could help. Next, I made several phone calls to Rogers Arena in Vancouver and finally reached a contact person in Canucks Communication. I explained who I was and asked what chain of command I should follow. After several phone calls, I moved to sending e-mail correspondence, though this was not fruitful.

After five months, I finally decided to write to the Canucks senior administration in a formal (university letterhead), two-page, single-spaced letter (August 2, 2011) detailing my research and why I wanted to interview the Sedin twins. Letters were sent to
Mike Gillis (General Manager), Alain Vigneault (Coach), Henrik and Daniel Sedin, and Jennifer Rollins (Communications Coordinator). When I returned after Labour Day weekend 2011, there was a voice message from T.C. Carling (TC) – Vice-President of Communications & Community Partnerships and the Executive Director of Canucks for Kids Fund – expressing an interest in my letter that had been vetted with the Canucks management.

TC was involved in the start-up of the new 2011-2012 season and we played phone tag for a few days. Once we connected, he explained that it was important that the players were protected, etc. I explained about the Human Research Ethics Board (HREB) process and that I would send him the completed 18-page ethics application form to review. The University of Victoria HREB upon submission approved this and a copy was sent to TC, which he shared with Daniel and Henrik. Although my formal letter of introduction was very detailed about my intentions and background, I wanted complete transparency in the procedure of safety checks along the way.

By September 15, 2011 it was decided to hold the interview on Monday, November 14, 2011, first thing in the morning. I was permitted to bring my doctoral student, Bill Brown, with me to do the tape recording of the session. We arrived at Rogers Arena security and signed in at 8:15AM, after which TC escorted us up to the second floor Conference Room. The interview lasted 75 minutes and the Sedins answered all questions carefully and fully.

I had sent the 16 interview questions previously to them (through TC). I felt this was important because Swedish is their first language and I wanted to give them time to reflect upon their responses. We also sent a brief biography about ourselves so that the
Sedins would have some basic familiarity with who we were. Information such as Bill playing hockey and my son having the same birthday as the twins were mentioned. We were just trying to make some connections before meeting them that morning by “breaking the ice”.

There were ground rules that we agreed upon in my early conversations with TC: Bill would transcribe the interview and the transcription tape would be sent to TC and he would deliver it to the Sedins. Once they reviewed the transcription and agreed with the content and accuracy, we could then begin to write an article. Once the article was completed, it was sent to TC for sharing with the Sedins, after which they all accepted the content and gave permission for the article to be forwarded to a journal for peer review. The first article was submitted in spring 2012 and accepted for fall 2013 publication in the International Journal of Servant Leadership. This present paper is the second academic article, which will go through the same approval process before submission.

**Data Analysis**

I am a qualitative, archival researcher and am used to the slow, tedious work needed to sift and cluster artifacts, photographs, newspaper clippings, and recorded narratives, and I was comfortable with that process. Creswell (2009) states:

> The data analysis involves making sense out of text and image data. It involves preparing the data for analysis, conducting different analyses, moving deeper and deeper into understanding the data (some qualitative researchers like to think of this as peeling back the layers of an onion), representing the data, and making an interpretation of the larger meaning of the data (p.183).
He further suggests, “case study research involves a detailed description of the setting or individuals, followed by analysis of the data for themes or issues” (p. 184). So, I returned to my big paper approach of clustering the comments from the complete transcript of the Sedin interview, in order to respond to the first research question: How did the Sedins demonstrate their unique style in hockey?

I reread the transcript completely several times over two days “to obtain a general sense of the information and to reflect on its overall meaning” (p. 185). I started to code the interview text, by means of thematic analysis, into clusters or similar chunks and then into categories. I used coloured highlighters/markers to indicate common ideas/topics as themes began to take shape. The next section outlines the five themes that emerged.

**Emergent Themes from the Transcript**

The following five themes emerged from the Sedin interview transcript: (a) family values/culture, (b) work ethic, (c) building community, (d) caring/respectful character, and (e) growth/learning.

**Family Values/Culture**

The Sedins were consistent and repetitive about the importance of their parents and especially their older brothers, Stefan and Peter, in their lives. They were always involved in discussions, outings or games in Sweden as a family. As youngsters the twins’ inclusion was transferred to the schoolyard and into sports. There was a mutual respect regardless of age or role in the family. The twins speak clearly about this pattern of behaviour in the interview:

Henrik Sedin (HS): We were taught from early on about helping, and helping out, that we were important in our family. When we were sitting around and talking, that our thoughts
and ideas were as important as anyone else’s. Even from when we were little. And also, we had two brothers… they always let us be involved with their friends and what they were doing and I think that taught us a lot of things when we grew up.

Daniel Sedin (DS): I think that’s true, our brothers always made us a big part of their friends and we could always play with them, and I think that’s been in our life since that happened. I mean we all try to help others, and make everyone feel like they’re involved.

The Sedins return to Sweden each summer with their children to reinforce the bond with grandparents, aunts, uncles, and cousins in order to maintain the connection with their Swedish culture. They explain about their approach to their children:

HS: You treat them as what they do and what they say as, it’s important to us, and that they’re not just kids, and we try to feel as they’re important and to treat everyone else like they want to be treated themselves. And that’s the way we’ve been brought up.

DS: Yeah, it’s tough, but I think, when we’re home we really have a lot of quality time with our kids. We take them to the park, and have them spend time with Henrik’s kids, and other friends too. I think to teach them these things; I think they need to spend time, a lot of time, with other kids, and grownups too. To make them understand the values that we try to teach them.

**Work Ethic**

Both brothers emphasize the importance of hard work and practice to improve.

They return to Sweden each summer, continually working out, focusing on speed and strength in particular:

HS: I don’t know, there’s always some things you can get better at. I mean, we’re still not the fastest skaters on the ice. I don’t know how much faster we can get, but there’s
always something you can work on. Our shots can be better, at least mine. So there’s always something you can get better at, and I think once you get to a point that you feel that you’ve reached your peak, that’s the time when you got to maybe take a look at retiring.

DS: Yeah, I think so too. When you start to think that, you can’t get any better; I think that’s when things start to go the other way. So you always have to look for things that can make you better and that’s the only way to stay out there.

Henrik and Daniel practice over and over to achieve the special dynamic they have on the ice. It does not come without a commitment to hard work and involves repetition and drill.

DS: We think hockey the same way always… we’ve practiced together for so long, I mean, I know what I should, what I would have done in a situation where he (HS) is right now. Like, on the ice, I think we know what the other’s going to do. 

HS: I think we’ve been through every possible situation on the ice, we’ve been through at least ten times, and if he has the puck behind the net, and he skates one way I know where he wants me to go, and the same thing goes if I have the puck, and if I’m crossing the blue-line and he is behind me, or whatever, we’ve been through those situations a lot of times. It makes it easier.

I asked about the moments before the game and their reflective, quiet approach with their heads down sitting silently on the bench in the locker room. This was Daniel’s reply:

DS: I think at that moment you’ve done everything you can to prepare and you just get ready for you game. I think, on our team at least, we try to prepare, it’s more the day
before the game. I mean, you talk to guys; you talk about what you’re going to do tomorrow. When that time comes, you want to go out there and show that you’ve been preparing the right way, and you’re ready to go.

**Building Community**

The Sedins commented on their involvement and commitment to many types of community: their community of Ornskoldsvik, Sweden; the Vancouver Canucks organization as community; the team as a community; and the local community of Vancouver in particular. They spoke about these various scenarios:

HS: I think for us, it’s really important that everyone feels involved. It doesn’t matter if you’re not playing, or if you’re playing four minutes. We try to have them involved, having them feeling maybe as a bigger part of the team, as big a part of the team as they can. That’s really important to us, that we have everyone feeling important.

DS: I think when we first got here, ten or eleven years ago, that was the first thing we got taught. We realized that it is a big part of being a Canuck, helping out in the community, and going to the hospital and seeing kids, and that’s probably the biggest part of being a Canuck… So, it’s an important part of our lives, and especially when we’ve got kids ourselves, you realize how important those places are.

During our conversation Henrik recalls a sense of building community that began from a young age:

HS: Well I think, coming back to that making everyone feel involved, I think in school and recess or gym class, I mean a lot of times there were a few guys that were maybe a bit better than everyone else, and they wanted to play whatever sport they could, and we always felt like we’re going to do this as a class; we had everyone involved, like girls and
maybe kids that weren’t as good as everyone else and we always made them feel like they could be a part of the group.

**Caring/Respectful Character**

Henrik and Daniel are polite, caring individuals. They referred to caring many times during the interview and the importance of respect for everyone, regardless of role. New players, especially the young ones, have to adjust to playing with the Sedins. The Sedins realize and appreciate how difficult this can be:

HS: It’s a tough thing for whoever plays there to be in that spot, because they know that they’re going to have to score, and they’re going to have to produce, and if they don’t, there’s going to be a different guy there… It’s not easy, so we know we try to make them as comfortable as possible and have them relax and I think it’s, I think we’re pretty easy players to play with. We try to keep it simple a lot of times, and try to talk to them as much as possible.

They realize that they are role models and the responsibility that comes with it. This is important to them and once again they refer to their brothers in Sweden, the way they grew up and the influence of their siblings upon their own values and behaviours.

DS: Well I think; we were always a role model. I mean, hockey is big in Canada, as you know. So I think we are obviously role models for a lot of kids, and people. For us, I think, when we grew up, our role models were our older brothers, and I think we realized what they meant to us, and that makes us realize how important we are maybe for kids and people in the community. So, for us growing up we were pretty much exactly how our brothers are. I mean, they taught us a lot, and their values and everything they did, they influenced us.
It was interesting to note their opinion of each other and how they want to be remembered:

HS: He (D. Sedin) cares about people; he listens to his teammates, and his friends. I mean he’s there and he’s fun to be around. I think that’s it.

DS: I would say the same things too, but he’s (H. Sedin) always a step ahead of everyone else I think in his thinking. When we come to the rink for example, he’s always thinks about what needs to be done, and what players that maybe he needs to talk to. He’s a step ahead of everyone else in that department, and that’s what makes him a great captain and a great teammate.

HS: Yeah, I think hockey, you have a talent, and you do your best to be the best player you can be, and without that talent growing up, it’s tough to get somewhere, so you get a lot of things for free in hockey, but as a person, I think that’s where you can make the biggest difference, in a community or with your friends, or teammates, I think you want to treat everyone else like you want to be treated yourself, and you want to be remembered as someone that cares, and makes a difference. If it’s a big difference, or a small difference, or it’s just showing that you care about people or whatever, I think that’s more important.

DS: Yeah, I think if teammates and people say that they enjoyed our company and that we made them better people, I think that’s good enough for us.

When asked about a crucible moment (a major turning point) in their lives; they were in complete agreement about the decision they made to stay in Canada and to be true to themselves. Their strong sense of character was clearly demonstrated in this situation:
HS: We didn’t have a big failure until maybe when we got over here, and we realized how tough it was over here, and we went through a tough couple of years hockey wise, and living here too without family for the first time… we had to make a choice, if we were to stay here and fight or go back to Sweden and take the easier route.

Their appreciation and respect for everyone was evident when speaking about people in general along with their positive attitude:

HS: It doesn’t matter if it’s someone that works in the building, or in the staff, or trainers, or coaches, or whatever it is. You have to feel important. It doesn’t matter what you do, and that’s something that I think you’ve got to take seriously, to say hi to people when you walk by, or whatever it is. And that’s always been the way we’ve tried to do things, and I think it’s important.

DS: Yeah, coming in with a positive attitude. There’s going to be ups and downs for everyone, but if you try to stay positive and be happy, I think it can influence people to do good.

Growth/Learning

The opportunity to personally keep growing and learning remains a high priority for the Sedins. As children they watched their brothers on the ice and used their example to become better hockey players. But, they also see encouraging growth/learning in the other players on the team as a duty too.

HS: You’ve got to bring out the best in each and every one, and have them feel that they’re a big part of the team, and it comes from talking to them, being in a relationship, or having them grow as persons, and feel that they’re the best they can be (on the ice and off the ice). That’s when you, I think, get better as a team.
DS: We have a group here where we have a lot of leaders, and there’s times when you need to make them a leader. Hank, he’s the captain, but he can’t be a leader all the time. I think he needs to make other players lead to. That’s a big part of a team that’s successful. I think having everyone realize that they can be a leader at a certain moment, and then… you’ve got to let them handle the situation and make them grow. I think when you have that, everyone’s taking a step and getting better, as a person, as a player. That’s when you can kind of take a step back and you don’t need to be a leader anymore.

Being a leader requires knowing when to step back, along with knowing when to fully engage, and having the accumulated wisdom to strike a balance in those actions:

DS: When we leave this rink we don’t think about the game. The first few years I think 24/7 we thought about hockey and that’s a problem. I think, when you get to the rink you focus for four hours, five hours when you’re here, and then when you leave, you try to stay away from it.

Thematically, I have identified five themes that appeared in the Sedin interview, which occurred several times indicating repetition and consistency of thought, and thus were not isolated comments. Using the themes developed and the original transcript, I now turned to my second research question.

Research question #2: Specifically, was there evidence to support the philosophy of servant leadership?

**Connecting the Themes to the Seven Pillars**

Within the five themes mentioned above, there is evidence linking the themes to the Seven Pillars of Servant Leadership (Sipe & Frick, 2009). Often the evidence is overlapping, i.e., much of the theme of family values/culture illustrates that regardless of
the person(s) and roles of the other people involved, the Sedins always demonstrated respect, and civility. They return each summer to Sweden to reinforce their cultural heritage for themselves and their families. They encourage participation in Canadian and Swedish activities and organizations for themselves and their children. They are guided by a strong, inclusive value system that promotes positive self-worth among everyone. Ultimately it is about being a better person and helping others to be that way too.

Relationships are important to them, on and off the ice. The twins spoke clearly about supporting other young members of the Canuck team and helped them grow and learn, especially when these young players joined them playing on the first line. The success of the team was paramount too. They are persons of character (Pillar 1) and compassionate collaborators (Pillar IV).

The theme of a strong work ethic was demonstrated with the realization that it is hard work and practice that builds an effective player, team and family structure. This includes the ability to listen to everyone and to consider carefully all decisions and repercussions. The Sedins are not perfect and recognize their mistakes and responsibilities to each other, their team, the Canucks organization and the local communities (in Vancouver and Sweden). This is indicative of moral authority (Pillar VII) that includes accountability, delegating and accepting responsibility. The twins also spoke about helping their colleagues succeed.

The themes of growth and learning, plus a caring and respectful character are well demonstrated through the Sedins acting as mentors while demonstrating empathy and sensitivity, especially for young players and those who are struggling. Daniel and Henrik listen carefully to these players and offer suggestions to help them improve their game.
This is indicative of putting people first (Pillar II) and also of communicating skillfully (Pillar III) with understanding.

The theme of building community includes having the big picture, a vision of the whole, seeing the team as a group directed toward a goal, with an ability to foresee plays and positions on ice and to creatively make plays to each other and members of the team. This success reinforces an outstanding part of their sportsmanship. They are system thinkers who act strategically on the ice (Pillar VI). They are courageous and dedicated to the team, as Henrik may have to leave a game for a few plays if injured, but usually returns to continue playing.

Servant leaders have foresight (Pillar V) as one of their major strengths (Greenleaf, 1991). Henrik and Daniel strengthen relationships, yet wisely appreciate the diversity of the team players and their various strengths. The concept of team is critical, along with the feeling of inclusivity and belonging, though Daniel is aware that it is up to the players to hold each other accountable. Their comments are candid, constructive and courageous. They decided to bravely stay in Canada and to adhere to their personal style of hockey and to contribute to the culture of the Canucks organization- this was a strong indicator of the moral authority (Pillar VII) being generated within the organization through their servant leadership.

Conclusion

Although initially a skeptic of the philosophy of servant leadership existing in hockey, the evidence provided is somewhat overwhelming that both Daniel and Henrik Sedin demonstrate the seven pillars of servant-leadership. They seem unique in this approach, although additional research into other players in the NHL needs to be pursued.
As well, separate interviews may have gleaned additional perspectives. The next step for this research is to triangulate the findings from the interview with print and televised media content, as well as potential interviews with those familiar with and close to Daniel and Henrik Sedin. In this time of societal violence, especially in hockey, perhaps the modeling of the Sedins, amidst their elite status and servant-leader attitude can be a beacon for youth today. The Sedins have told me that “they are not into mean as an approach”. Daniel and Henrik Sedin demonstrate skill, hard work, care, civil values, inclusivity, and continual growth of self and others, which certainly contribute to building better serving communities, both on and off the ice. We are grateful to Daniel and Henrik Sedin, TC Carling, and the Vancouver Canucks organization for this research opportunity.

NB. This paper forms the case study for the 90 minute workshop for the conference and the contents have been vetted in the PHEnex Journal Dec. 2013.
Appendix 1 - Sedin Interview Questions

1. What experiences can you recall from your childhood of helping others, or showing compassion for others?

2. Can you talk about some of the values that your parents and family instilled in you when you were growing up? How did they go about teaching you these values?

3. There are times in a person’s life when character and values are tested, and they have to make a difficult decision, or take a difficult course of action. This can be called a *crucible moment*. Can you tell me of such a defining moment from your life?

4. How do you work to build relationships with your teammates, and foster a positive team climate?

5. I have watched you just before you play a game. The camera goes into the dressing room. You both seem to be sitting quietly. Please tell me what is going through your mind.

6. Much has been made in the media of you both being professional athletes with strong moral character. Stories have been written about your donation to the Children’s Hospital. How do you view your responsibilities as a role model, and what are your thoughts on the importance of your actions?

7. The Vancouver Canucks are a community. Please talk about your thoughts on a leader’s responsibilities to his teammates and sports community?

8. I know you return to Sweden every summer, to your original community. Can you explain why this is important to you? What do you do when you are *back home*?

9. You are both devoted fathers. What qualities are you trying to instil in your children? How do you go about this?
10. How does a leader admit and overcome his mistakes, and help his teammates admit and overcome mistakes? How do you deal with losing a game? What action, if any, do you take?

11. What do you think is the greatest strength that a leader can have in sport? Are you ever a follower and if so, when?

12. Servant-leadership places value on the skills of listening, empathy, healing, awareness, persuasion, and foresight. How do you think they fit into your particular leadership style?

13. How does an athlete who is such an intense competitor, with such a strong drive to win, lead with such a strong sense of morality, and a caring ethic?

14. In 1970, Robert Greenleaf wrote an essay called *The Servant as Leader*. This is regarded as influential work on servant-leadership, and is viewed by scholars as every bit as important today as it was when he wrote it. The most famous quote from Greenleaf (1991, p.15) is as follows:

   The best test, and difficult to administer, is: Do those served grow as persons? Do they, while being served, become healthier, wiser, freer, more autonomous, more likely themselves to become servants? And, what is the effect on the least privileged in society? Will they benefit or at least not be further deprived?

   What message do you understand from this quote?

15. Henrik, how would you describe your brother? Daniel, how would you describe your brother?

16. How would you like to be remembered? Is there anything else either of you would like to say?

Title:
L2 reading fluency development: Successes and failures

Topic area:
ESL/TESL

Presentation format:
Poster session

Presentation description (54 words):
This presentation explains and examines a series of longitudinal studies focusing on using timed and extensive reading to help EFL students develop reading fluency. The studies use both quantitative and qualitative data to explore actual and perceived gains. Fluency development is also modeled and the implications for teaching and further research are also discussed.

Author details:
Andrew Atkins
Department of English Communication
Kinki University
andrew@kindai.ac.jp
Abstract (169 words)

This paper provides a discussion of the results of a series of 4 longitudinal studies that utilize linguistic and non-linguistic variables predicted to influence L2 reading fluency to examine the successes and failures of L2 learners to improve their English reading fluency. The studies used online Timed Reading and Extensive Reading with participants from a mid-to-high level public and a mid-level private university in western Japan (N=613). In addition to the reading variables, a range of other variables was measured that includes vocabulary size, word recognition reaction times, working memory and speed of thinking. The relationship between the measured variables is explained using correlation and regression, ANOVA and latent variable growth curve modeling, and provides insight for reading researchers and teachers. Results from a short open-ended survey are also examined to discover student impressions of the required activities. Recommendations are made for further research into the issue, and how the findings could be used for Extensive Reading level placement or to assist decision making about remediation for weaker students.
School Followership: What Difference Does it Make?

Presented by:

Carolyn Crippen, PhD
Associate Professor of Leadership Studies

Faculty of Education
University of Victoria
British Columbia
CANADA

ccrippen@uvic.ca
Burns (1978) wrote *Leadership*, and introduced the concept of transformational leadership as collaboration toward mutually held goals of leader and follower that benefit both. Kelly’s (1992) *The power of followership*, explains and analyzes the world of followers and their relationship to leaders. More recently, Kellerman (2008, 2012) has generally maintained similar categories of followership in organizations. Literature related to school leadership is abundant; however, the topic of followership and implications of such in schools remains untapped (Crippen, 2012a,b). Kelly’s framework provides a focus for this paper and the important leader-follower relationship that drives the life of a school. Research questions include: Why do people choose to follow? What are the repercussions of different types of followers in schools? How can the leadership-followership relationship be nurtured in a school? Greenleaf (1977) suggests that leadership and followership are on a continuum and we move back and forth along this continuum during our lives. The development of relationships that contribute to leadership-followership are examined in a school context. Feedback suggests that an effective school has established a balanced leadership-followership dynamic that provides opportunities for all members of the school community, regardless of role, to participate.

**Key Words:** relationships followership servant-leadership reflections
School Followership:

What Difference Does it Make.

.....between leaders and followers it was presumed until only recently that leaders should dominate and followers defer. Leaders were generally expected to tell followers what to do, and followers were generally expected to do as they were told. No longer. (Kellerman, 2012, xvi).

Introduction:

Although, initially Burns’ (1978) landmark book Leadership, focussed on politics and business and introduced the concept of transformational leadership (collaboration toward mutually held goals of leader and follower that benefit both), the relevance of the leader-follower relationship seems a good fit for schools too. Burns suggests that leader and follower raise one another to higher levels of motivation and morality and ethics. And, teaching is a moral endeavour. Since then, hundreds of books have been written about various leadership characteristics, styles, outcomes, and purposes. In particular, much literature exists related to leadership in schools: Begley (1999); Fullan (2010); Glickman et al., (2005); Hargreaves (1994); Leithwood et al. (1999); Sergiovanni (1992); Starratt (2011). Less has been written about followership. But, in order to have leaders, we must have followers, although there are usually many more followers than leaders in most organizations and schools. Noted leadership scholar, Joseph Rost (1993) suggests the following definition of leadership: “Leadership is an influence relationship among leaders and followers who intend real changes that reflect their mutual purposes” (p. 102). Followership can be defined as the willingness to cooperate in working towards the accomplishment of the group mission, to demonstrate
a high degree of teamwork and to build cohesion among the group.  
http://leadership.uoregon.edu/resources/exercises_tips/skills/followership.  (Retrieved Nov. 6, 2012). Followership is the act or condition of following a leader. As a former long time school and district administrator and as a member of the academy, it is the intent of the author to draw attention and raise awareness to the issue of followership in schools which has received little attention to date. So, what do we know about followership in schools and what difference does it make?

In 1992, Robert Kelly penned a significant text, *The power of followership: How to create leaders people want to follow and followers who lead themselves*, that explains and analyzes the world of followers and their relationship to leaders. Kelly’s thoughts provide a framework to introduce this brief discussion paper while helping to focus upon the important leader-follower relationship that drives the life of a school. Currently, Barbara Kellerman (2012) has recognized similar followership roles in organizations. In addition, Starratt (2011) carefully reinforces the human dynamic in schools, “In schools we live every day with other persons- teachers, administrators, support staff and children” (p. 74). Starratt speaks about these persons being “a gift” and “our responsibility” and the relationship is reciprocal in which we nurture each other’s potential. A healthy effective school environment can be nurtured through a balance between the leadership-followership interplay. I would suggest that once you assume the mantle of teacher you become a leader (and a follower) in your classroom, school, and learning community (Author, 2005). Regardless, Kellerman (2008) states, “Some of us are followers most of
the time and leaders some of the time. Others are the opposite: leaders most of the time
and followers some of the time” (p. xxi).

Additional clarity to the followership discourse has been sustained through recent works,
* i.e., Bjugstad, Thach, Thompson & Morris (2006) introduce the concepts of followership
motivation, values, trust, and effectiveness; Chaleff (2009) describes followers as
courageous; Goethals & Sorenson (2006) caution us about the role of power in possible
manipulation of followers; Hayes & Comer (2010) stress the importance of developing
trust and inspiration among followers; Hollander (2009) regards the leadership-
followership relationship as inclusive; Kellerman (2008) introduces followers as change
agents; Riggio, Chaleff & Lipman-Blumin (2008) recognize the role of followers as
creators of great leaders. Such ideas have enhanced the earlier works of Greenleaf (1970)
who coined the term servant-leadership and the importance of effective followers.
Greenleaf (1977) speaks about his reflective writings over a twenty year period on the
leadership-followership connection:

They express in different ways my wish that leaders will bend their efforts
to serve with skill, understanding, and spirit, and that followers will be
responsive only to able servants who would lead them—*but they will respond.* Discriminating and determined servants as followers are as
important as servant leaders, and everyone, from time to time, may be in
both roles. (p. 3-4)

Sergiovanni (1992) recognized moral leadership as bringing out the best in followers;
and, Spears (1998) identified the characteristics exemplified by servant-leaders and
followers. Attention toward the concept of followership has provided recognition to its
importance in relation to leadership. It reminds us that we must understand the
functions of both leadership and followership in our schools and that the role of followers and the motivation of followers will have an impact on the effectiveness of the group and the organizational leadership specifically.

Followership seems ripe for further investigation and this is substantiated by Hollander (2009), who encourages “investigation into the relationship between leaders and followers including their needs and expectations and how they may come to be leaders” (p.8). Possible investigative questions should include, but are not exhaustive in nature: Why do people choose to follow in schools? What is the motivation? Are there different types of followers? And, if so, what impact do these issues have on school life? When does one choose to be a leader and when to be a follower? How can the leadership-followership relationship be nurtured in a school? And to what end? Kelly (1992) opines about followers, “Followers at their best, I learned, participate with enthusiasm, intelligence, and self-reliance- but without star billing- in the pursuit of organizational goals” (p. 27) and “For most of us, followership represents 70 to 90 percent of our working day” (p. 29). The following paper will attempt first, to respond to Hollander’s (2009) recommendation for additional research into the understanding and value of followership. Second, in order to link related followership (and leadership) research to school practice, examples of both “in-school” teacher and student activities will be provided within the paper. Third, all questions posed will address the concept of followership in schools as part of the leadership-followership relationship.
School Followership: What Difference Does it Make?

Followership Styles in Schools

When focussing on schools, I am led by Starratt’s (2011) observations that we are dealing with “human beings; humanity; individuals with their own experiential biographies” (p. 1). Although schools are about learning, development, values and ethos, I would suggest schools are all about relationships. Relationships (authentic or genuine) require work to build and strengthen and maintain. It is an ongoing and constant issue that must be a priority if a sense of inclusivity, respect, collaboration, transparency, and caring is to be developed and valued in schools.

Schools are about service to students and usually have formal leaders, a principal, and depending on the size of the school, a vice-principal. In this relationship, the principal is the master-leader and often, a new first-time vice-principal is the follower or apprentice. It seems fair to say that the role of vice-principal is learning how to be a strong leader by following the formal leader’s (principal) example. Today, many vice-principals choose to remain in their role. They are comfortable in the “second” formal administrative position in a school. Principals and vice-principals usually divide the administrative responsibilities within the school. It may be worth mentioning that in very large schools, the principal may be somewhat removed from the rest of the personnel and the vice-principal may be more in direct contact with the school staff. With the move toward democratization in our schools and the use of school teams to develop policy, curriculum, school plans, and school celebrations, the role of team leader and that of team follower has become critical in achieving planned goals and outcomes. Each team member or follower may be sorted into one of seven particular follower paths described by Kelly.
School Followership: What Difference Does it Make?

(1992), “apprentice, disciple, mentee, comrade, loyalist, dreamer, and lifeway” (p. 51). If one relates these followership paths to the internal school personnel groupings, there are those who are comfortable with themselves and just want to contribute to the school goals. These disciples can carry the message of a particular school culture and represent the ideas of the formal leader (principal). There are certain “rules” that school staff follow related to issues of safety, i.e. fire drills, bomb threat, earthquake. I would suggest these could fall under the category of disciple. Others want to change themselves through personal growth (mentee). Each year school teachers develop a personal growth plan and study or develop a new skill to strengthen their teaching in the classroom. New teachers often are assigned a mentor to guide them and act as a resource, especially their first year in a classroom. There are also interpersonal and intrapersonal goals of staff. Some aspire to lead. Apprenticeship, as mentioned in the role of vice-principal, is directed toward mastery of specific administrative skills. Comrades enjoy bonding together where many talents are needed to accomplish a goal, such as in a curriculum development committee. “Some people follow out of personal loyalty to the leader,” (Kelly, 1992, p. 71). A particular school principal may have a broad following of staff within a school which may last over several years. These followers can contribute to the success of this particular principal or vice versa- they could contribute to the principal’s demise if the formal leader is not liked. Dreamers follow their own ideas, their guiding force, not necessarily those of the leader. Such staff are “outside the box” and may “do their own thing”. The last path is that of the lifeway; the person is convinced this path of service or helping others provides the best or most satisfying way of living.
Lifeways and Servant-Leadership

Kelly (1992) directly links the seventh path, lifeways, to Robert K. Greenleaf’s (1970) philosophy of servant-leadership, an ethical-moral, transformational form of leadership-followership:

The servant-leader is servant first. It begins with the natural feeling that one wants to serve. Then conscious choice brings one to aspire to lead. The best test is: do those served grow as persons; do they, while being served, become healthier, wiser, freer, more autonomous, more likely themselves to become servants? (p. 7)

Greenleaf (1977) suggests that we are actually on a continuum during our lifetime. At one end of the continuum is leadership and at the other end is followership. We move back and forth along this continuum during our lifetime and neither one nor the other is better. It is only when we stop moving along the continuum we stop growing and learning and remain in status quo. Thus, if a school is truly developing and growing and learning and is collaborative, then each person is leader and follower at various times.

Greenleaf (1998) states, “even the ablest leaders will do well to be aware that there are times and places in which they should follow” (p. 114). Let me share this example.

Many years ago while a principal in a K-5 school, the computers went down across the school on a Monday morning. The teacher on staff who was the technical support was absent. No-one else on staff was able to help. Out of complete desperation, I went to the Grade 5 classroom and asked who knew the most about computers and three boys stood up. I then asked which one of them knew the most. Two of the boys turned and looked at the same boy. I then explained the situation. This student then went room to room and by morning recess all the computers in the school were up and running. I was the follower and he was definitely the leader in that situation. Perhaps by understanding the
motivation of follower paths, administrators, team leaders, and general school personnel may develop greater sensitivity and smoother interpersonal connections within a positive school community. Relationships require an investment of time and energy (Wheatley, 2005) and time is often restrictive in schools for staff interaction. I believe that using a few minutes to make connections at staff meetings, in the hallway, on yard duty help staff to know each other better. Allocating specific uninterrupted time periods for additional relationship building is a worthy investment that could fit easily into planned professional development days.

Where are you now?

A simple dialogue between teacher colleagues (also with intermediate-senior students) can reveal personal preferences for circumstances that encourage either leadership or followership and an appreciation for one’s strengths and weaknesses individually and as a group. The question is, “Where are you now?” The development of these relationships may ease the transition into coalitions within a democratic school. Starratt (2011) outlines the workings of school coalitions;

> It is usually generated by bringing together of various individuals and groups who have different interests and desires (parents, teachers, custodians, coaches, counsellors, students, and administrators) around a compelling common effort, a purpose that touches upon their common humanity, their common needs, their common aspirations for achieving something out of the ordinary. (p. 83)

In response to school administrator and school superintendent requests and after reading Greenleaf (1977); Sergiovanni (1992); and Starratt (2011), the author initiated a journey of self-discovery within an individual school staff (35 members) and later with a school district of 410 teachers and principals with the following questions:
1. What is your greatest strength?
2. How have you used this strength in your daily life?
3. What is your greatest area of weakness?
4. How has the weakness caused you problems in the past?
5. Describe a situation where you were leader.
6. Describe a situation where you were follower.
7. Have you a preference? Leadership or followership? Explain your choice.
8. Describe a situation where you relied upon your moral and/or ethical leadership to deal with a difficult decision?
9. How do you prepare to make a decision?
10. How do you react if the decision turns out to be wrong?

Post activity discussion revealed the commonalities among them. Such a process provided early steps to learning about each other; to building stronger teams; to understanding the strengths within the group; and to understanding themselves and their values. For years the attention has been on school leadership and it now seems sensible that teachers understand the roles and the types of followers with whom they work each day. Working with school staff may provide occasion for the identification of the seven types of follower paths and related strengths (and areas that need attention). But, because not everyone is confident to speak within a group, hidden talents may remain undiscovered. Hence, opportunities for team members to share their background and demographics in short activities at staff meetings, professional development days, and retreats could channel the development of valuable relationships and a new understanding and appreciation for each other. At the outset, participants are reminded to say only what they are comfortable expressing and not to say what they do not want to share. It is useful for all school staff to become aware of the various ages and stages, strengths, challenges, and values of the members of their group. Such opportunities can strengthen the
connections that bind a school together (Author, 2010; Glickman, Gordon, & Ross Gordon, 2005).

Teachers, in particular, seldom have time for self-reflection. Questions that encourage respondents to “consider their individual sense of themselves, but also their sense of themselves as a community of educators, learners, and support staff” (Starratt, 2011, p. 67) promote reflective thought. According to Wheatley (2006), and I concur, it is important to tell our stories to each other which will reinforce personal connections in the school among each other. The opportunities for school members to participate in the ebb and flow of shared information and to develop greater understanding and appreciation for each other as leaders and followers will reinforce an atmosphere of transparency, trust, and authenticity within the school. A small sample of the feedback from the previous self-discovery questions included:

- A good leader must be a good follower and a good listener.
- Use your strengths to help rectify your weaknesses.
- Involve students in having leadership-followership roles in the classroom. Talk about them. How did they feel as a leader? How do they feel as a follower?
- Leaders and followers are both part of the whole puzzle that makes up our school.
- The importance of self-awareness, listening to others, sharing decision making, valuing dissonance.
- I can be myself and I have lots to offer my school community.
- The roles of leaders and followers constantly change.
To continually remind myself of students being on a continuum at the same time as I am.

Such responses seem to support the use of such activities and the investment of time in each other.

**Continuing to build relationships**

During a recent professional development day session, staff spent an hour, in pairs, working through questions to “get to know” each other. Wheatley (2005) believes that without “shared beliefs and desires, people are not motivated to seek out one another and develop relationships. Instead, they inhabit the same organizational and community space without weaving together mutually sustaining relationships” (p. 102). Some questions in a professional development session that focussed participants on understanding each other were suggested by Baron (2010):

> When you think of your life’s story and how it unfolded, what people, experiences, or events were critical to your development? (p. 28)

And,

> To recall these defining moments, take a walk through the stages of your life, from early childhood, to adolescence, to young adulthood, to the present moment. You could have experienced these defining moments as either strongly positive or difficult, even negative. What thought and memories come to mind? (p. 28)

When the entire staff reconvened, many commented on how much they enjoyed the experience and that they never have had time to engage in this type of deep conversation before. Most importantly, many found similarities in their life stories, a commonality and a comfort level. Within this sharing time, participants could identify when they were followers (and leaders) and why this was the case. Wheatley (2006) agrees, “In this
School Followership: What Difference Does it Make?

world, the *basic building blocks* of life are relationships, not individual. Nothing exists on its own or has a final, fixed identity. We are all *bundles of potential*. Relationships evoke these potentials. We change as we meet different people or are in different circumstances” (p. 170). Also, Kelly (1992) stresses “nurturing and leveraging a web of organizational interrelationships” (p. 165). Further to this, Hollander (2009) indicates that effective leaders are aware of the needs and interests of their followers and that the dynamic of school staff interaction are critical.

Issues of listening, persuasion, partner inputs, and inclusivity of all school stakeholders with an overall recognition and appreciation for individual voice can nurture the entire school environment (Hayes & Comer, 2010; Hollander, 2009; Sergiovanni, 1992; and Starratt, 2011) so that everyone will feel valuable, capable, and responsible (Crippen, 2005). Chaleff (2009) explains, “Two essential elements of relationships are developing trust and then using that trust to speak honestly when appropriate; one without the other is meaningless” (p. 23). School staff “respond positively to leaders who are fair, show concern and get results…..humble behaviours along with authenticity result in trust and inspired followers” (Hayes & Comer, 2010, p.135).

**Followership Questionnaires**

Kelly (1992) developed a *Followership Questionnaire* (p. 90-97) to help people determine the kind of follower they are and to identify the strengths of the follower and areas that needed improvement. Independent thinking and actively carrying out one’s role were identified as critical to followership in the questionnaire. The brevity of this
School Followership: What Difference Does it Make?

This paper does not allow for an in-depth explanation of each; nor, where they would fit on the leadership-followership continuum. This topic is fuel for another paper. But briefly, five categories of followership (Kelly, 1992, p. 97) were named:

<table>
<thead>
<tr>
<th>Followership category</th>
<th>Independent Thinking</th>
<th>Active Engagement Score</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Exemplary</td>
<td>High</td>
<td>High</td>
</tr>
<tr>
<td>2. Alienated</td>
<td>High</td>
<td>Low</td>
</tr>
<tr>
<td>3. Conformist</td>
<td>Low</td>
<td>High</td>
</tr>
<tr>
<td>4. Pragmatist</td>
<td>Middling</td>
<td>Middling</td>
</tr>
<tr>
<td>5. Passive</td>
<td>Low</td>
<td>Low</td>
</tr>
</tbody>
</table>

More recently, Barbara Kellerman (2008) of Harvard also identified five types of followers:

<table>
<thead>
<tr>
<th>Followership type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Isolates</td>
<td>Completely detached.</td>
</tr>
<tr>
<td>2. Bystanders</td>
<td>Observe, but do not participate.</td>
</tr>
<tr>
<td>3. Participants</td>
<td>Are in some way engaged.</td>
</tr>
<tr>
<td>4. Activist</td>
<td>Feels strongly about their leaders and acts accordingly.</td>
</tr>
<tr>
<td>5. Diehards</td>
<td>Prepared to die if necessary for their cause. (p. 85)</td>
</tr>
</tbody>
</table>

A comparison between Kelly and Kellerman’s lists reveals some overlap/replication/consistency of thought: (1) *Isolates* and *alienated* followers prefer not to be involved. (2) *Passives* and *bystanders* may simply watch from the periphery. (3) Also, *exemplary* followers align with both *activists* and *diehards* to some degree. (4) *Conformists* and *participants* get involved, but for each for different reasons. It seems to me that if the members of a school community have the chance to understand the
leadership-followership dynamic that exists in their school; it may promote inclusive, transparent, interaction for all members, an authenticity. Such clarity plays a part in the development of trust and loyalty, mentioned previously, to an organization or school (Hollander, 2009). The relationships within the school form a net of support for teacher, administrator, support staff, student and parent participants. If the relationships within the school are genuine, then the school community will also be so- there will be honesty and openness, a sense of trust and safety.

Conclusion:

Schools are all about relationships and relationships are developed, in part, through caring, listening, trust, honesty, and collaboration. They are about reaching out to each other; first, by trying to understand and being true to ourselves (authentic) and then by trying to understand and appreciate our colleagues. It’s about telling our stories and realizing how much we have in common and yet how rich we are in diversity. It’s about discussing our values and why we are where we are in our lives and in our schools. It’s about service to the common good. Relationships include leadership and followership and moving back and forth along the continuum. Over twenty-five years ago, Kelly (1988) described and made clear the importance of these two domains that resonate today:

People who are effective in the leader role have the vision to set corporate goals and strategies, the interpersonal skills to deliver consensus, the verbal capacity to communicate enthusiasm to large and diverse groups, the organizational talent to coordinate disparate efforts, and above all, the desire to lead. (p. 142)

And, those in a followership role,
Have the vision to see the forest and the trees, the social capacity to work well with others, the strength of character to flourish without heroic status, the moral and psychological balance to pursue personal and corporate goals, and above all, the desire to participate in team effort for the accomplishment of some greater common purpose. (p. 142)

Both are needed in our schools.

In summary, schools are places where leadership-followership succeeds and is mutually reinforced through webs of relationships. School staff interplay is strongly influenced by these types of followers and their support, resistance, or laissez-faire attitudes toward school goals/directions. Additional knowledge of the motivation and outcomes of each follower typology would provide valuable insights into the rationale for participant interaction and attainment of a democratic atmosphere. Opportunities for staff development exercises that enhance mutual understanding, identify strengths, and recognize areas for improvement, will help build teams and appreciation for diversity and commonalities.

The development of leaders and followers—formal and informal—in a school will create stability and harmony and make a difference where all voices are valued and supported by the web of relationships. It is time to give recognition and attention to followership and the role it plays in schools. This paper is a simple call for greater study into the area of followership.

Title: Cultural consultants in the classroom: Harnessing student mobility for intercultural learning

Summary: Study abroad programs are frequently seen as an ideal opportunity for students to improve their foreign language skills and gain cultural knowledge through immersion in another society. However, while abroad, students often find it surprisingly challenging to engage with local people and culture. This presentation discusses a pedagogical approach designed to harness student mobility for authentic learning that brings study abroad students and local students together for mutually beneficial intercultural learning.

Abstract:

In the global effort for universities to internationalize, study abroad programs are seen as an ideal opportunity for students to improve their foreign language skills and gain direct cultural knowledge through immersion in another society. However, while abroad, students often find it challenging to engage with local people and culture. Barriers can include ways in which study abroad programs are tailored, sometimes as “island programs” designed exclusively for foreign students, study terms that conflict with the local academic year, and isolated dormitory accommodations. Despite being immersed in the target language and culture, a lack of opportunity or initiative to participate in authentic activities limits the learning potential of many study abroad students.

To maximize study abroad as a transformative learning experience for students, it is important for educators to recognize that engagement with local people and culture is not automatic and does not occur spontaneously. This presentation discusses a
pedagogical approach within the regular university curriculum designed to harness student mobility for authentic learning that brings study abroad students and local students together for mutually beneficial intercultural learning. In a cultural anthropology course, study abroad students served as “cultural consultants” sharing their life experiences and cultural knowledge with students studying their global region. This authorized role offered study abroad students authentic opportunities to practice speaking in their target language and to form relationships with local peers. Meanwhile, local students experienced an enriched classroom environment that brought foreign culture to life. In this way, each group of students provided an immediate, live, human cultural lens to facilitate the process of becoming acculturated to each other’s cultures, views, and perspectives. Moreover, collaborative learning helped each group build confidence to actively participate in authentic and meaningful topics of discussion, and a more culturally responsive classroom emerged in which students came to see themselves as being a part of a community of learners. Following a description of this particular course, the presenter will share ways in which a student-centered pedagogy with teaching strategies and activities designed to encourage active learning and intercultural engagement can be adapted across the university curricula for the benefit of students both at home and abroad.
Title: From ‘Lone Wolf’ Scholars to ‘Social’ Scientists: A Case Study in Graduate Student Advising

Summary:

What is the best way to mentor novice scholars? In the humanities and social sciences, graduate students have traditionally been advised through individual consultations, but this is rapidly giving way to the collaborative laboratory framework typical of the physical sciences. This presentation shares a case study of a graduate student mentoring group in the social sciences at a Research I state university in the Midwestern United States, describing the evolution of its shared community practices and the surprising effects of one advisor’s transition to enculturating ‘social’ science scholars.

Abstract:

What is the best way to mentor novice scholars? Amid a changing landscape with increasingly diverse roads to graduate school and career paths afterwards, attention has turned to the issue of graduate advising – what needs to be learned and how best to accomplish it. On the one hand, new PhDs are increasingly finding careers outside academia, and since potential employers demand job-ready new hires, the means and extent to
which professional skills should be taught in doctoral programs is a topic of active discussion. On the other hand, efforts to make higher education more accessible has led to a more diverse graduate student population, with more first generation, minority and international students whose different cultures, languages and experiences lead to an opacity in the process of ‘doing graduate school’. How can graduate school requirements be communicated more concretely to ensure student success?

This presentation describes a case study of the graduate advising group of a mid-career social scientist at a Research I state university in the Midwestern United States. In her early career, this professor’s initial framework for mentoring graduate students was not group-based, nor was this approach common in her department. The presenter shares a case study that, through participant observation, document analysis and interviews with group members past and present as well as peripheral student participants who were not officially members of the group, examines the evolution of the community practices of the mentoring group, how members interpret and participate in this form of mentoring, and the cultural adjustments required of the advisor, her students, and her department of adopting this mentoring framework. Following a description of the case, the presenter concludes with the surprising effects and implications of this advisor’s decision to transition to enculturating ‘social’ science scholars.

ACKNOWLEDGEMENTS

This dissertation journey was one of the most challenging and rewarding experiences I’ve had to face. I would like to gratefully and sincerely thank the following people who have provided patience, guidance, and support throughout this journey:

- Dr. Paul Sparks, who was more than happy to act as my supervisor despite teaching a million other courses, flying to remote islands to study education practices, and other professional commitments. His wisdom, knowledge, sense of humor, and commitment to my success inspired and motivated me. Thank you for being super duper patient with me throughout the hiccups and speed bumps during journey!
- Dr. Vanessa Tolosa, who supports my goal of creating a better STEM world for our students. Her dedication to her practice, research, and drive is inspirational! She is a role model to children aspiring to become scientists. Thank you for being my friend and offering sound advice!
- Dr. Spring Cooke, who undertook the role as my committee member. Her support and guidance has enabled me to complete my journey. Thank you for taking your time out of your busy schedule to guide me to completion!
- Lupe, who provided me with a great group of teachers to study. She had faith in my work and provided enthusiasm throughout the journey. Thank you for being so positive and having such a great outlook in life!
- My friends and family, who provided the support, love, and laughter that I needed throughout this process.
- Odiesha, Tracy, Malika, and Damon, who were one of my top supporters and provided me with ventilation outlets for the ups and downs of this journey.
- Neighborhood Grinds, my second office and caffeine source that enabled me to keep my motor running!

Finally, and most importantly, I would like to thank my wonderful husband:

- Vladimir Uzoff, who is my number one fan! His support, love, encouragement, and patience have helped me stay afloat. His sound advice and tolerance for my swinging moods is testament in itself for his unyielding devotion and love. His brains, engineer mind, and systematic cognitive prowess motivate me to continue to pursue my higher education. Thank you for your love, being my rock, and supporting me through this journey. I don’t know how I would have survived without your unwavering love. You’re the best!

This dissertation is dedicated to Vladimir and to my “Phamily”.
VITA

RESEARCH EXPERIENCE

Pepperdine University, Los Angeles, CA

Doctoral Candidate  September 2012–July 2015

*Dissertation: Virtual School Teachers’ Science Efficacy Beliefs: The Effects of Community of Practice on Science-teaching efficacy Beliefs*
The purpose of this study was to examine how much K–12 science teachers working in a virtual school experience a community of practice and how that experience affects personal science-teaching efficacy and science-teaching outcome expectancy. The study was rooted in theoretical frameworks from Lave and Wenger’s (1991) community of practice and Bandura’s (1977) self-efficacy beliefs. The researcher used three surveys to examine schoolteachers’ experiences of a community of practice and science-teaching efficacy beliefs. The instrument combined Mangieri’s (2008) virtual teacher demographic survey, Riggs and Enochs (1990) Science-teaching efficacy Beliefs Instrument-A (STEBI-A), and Cadiz, Sawyer, and Griffith’s (2009) Experienced Community of Practice (eCoP) instrument.

The results showed a significant linear statistical relationship between the science teachers’ experiences of community of practice and personal science-teaching efficacy. In addition, the study found that there was also a significant linear statistical relationship between teachers’ community of practice experiences and science-teaching outcome expectancy. The results from this study were in line with numerous studies that have found teachers who are involved in a community of practice report higher science-teaching efficacy beliefs (Akerson, Cullen, & Hanson, 2009; Fazio, 2009; Lakshmanan, Heath, Perlmutter, & Elder, 2011; Liu, Lee, & Lin, 2010; Sinclair, Naizer, & Ledbetter, 2010). The researcher concluded that school leaders, policymakers, and researchers should increase professional learning opportunities that are grounded in social constructivist theoretical frameworks in order to increase teachers’ science efficacy.
Chapter One: Virtual School Teacher's Science Efficacy Beliefs

Effective execution of science education requires that teachers have a deep understanding of science content knowledge (National Research Council [NRC], 1996, 2000, 2007, 2011a, 2011b; Smith & Neale, 1989). However, studies have found that teachers are not fully prepared to implement the new content standards advocated in science education reform efforts (National Science Teachers Association, 2003). As a result, quality of instruction is poor because most teachers either avoid teaching science (Appleton, 2002, 2003; Hestenes, 2013; NRC, 2011b) or rely heavily on textbooks and worksheets (Appleton & Kindt, 2002; Davis, Petish & Smithey, 2006; NRC, 2011b). One promising approach to overcome teachers’ lack of content knowledge and therefore improve their teaching effectiveness is to involve them in a community of practice (Lave & Wenger, 1991). Studies have found that teachers who were participating in a community of practice reported better science content knowledge, higher teaching efficacy, and increased student achievement (Fulton & Britton, 2011; Lumpe, Czerniak, Haney, & Beltuykova, 2012; Sinclair, Naizer, & Ledbetter, 2010).

Problem Statement

Studies have found that teachers who participated in a community of practice in science-teaching reported having a better understanding of how to teach science-inquiry standards (Fazio, 2009; Goodnough, 2010). These studies indicate the need for school partnerships with science experts, collaborative learning, and learning continuity for teachers, but they do not examine how being a part of a community of practice affects self-efficacy of science teachers. Researchers have found that higher teaching efficacy leads to more effective science-teaching (Lumpe et al., 2012; Sinclair et al., 2010). However, there is limited research evaluating how
being a part of a community of practice affects science-teaching self-efficacy, and the little research that exists focuses on teachers in a traditional “brick and mortar” environment, so that there has been no evidence for the effectiveness of the community of practice within virtual learning environments. With the rapid growth of virtual schools, it is important to examine science-teaching efficacy beliefs as they pertain to teachers in virtual classrooms. Because teachers in these environments are held to the same teaching standards as traditional teachers, it would be beneficial to examine their experiences in their communities of practice and the effects these experiences have on their science-teaching efficacy beliefs. This study explores the relationship of community of practice on science-teaching efficacy and science-teaching outcome expectancy of K–12 teachers in virtual teaching environments, who can also be described as virtual teachers.

**Purpose Statement**

The purpose of this study is to examine the factors within a community of practice that affect science-teaching efficacy beliefs of virtual K–12 teachers. Cadiz, Sawyer, and Griffith’s (2009) Experienced Community Survey will be used to measure the extent to which a person experiences their community of practice. These factors are open communication, shared vocabulary, remembering previous lessons, and learning from each other (Cadiz et al., 2009). Riggs and Enochs’ (1990) Science Teaching Beliefs Instrument-A (STEBI-A) will be used to measure science-teaching efficacy beliefs. This study seeks to provide understanding of factors that can enhance the efficacy and expectancy of teachers in online classrooms within their science-teaching community of practice.
Background

For over 50 years, the United States has greatly benefited from innovations in science and engineering. These innovations have created jobs, powered the U.S. economy, raised the quality of living, and enabled the U.S. to become an international economic leader (Atkinson, 2012). However, Atkinson reports that the country’s global share in Science, Technology, Engineering, and Mathematics (STEM) industries is on the decline. Additionally, the global economy has increased its need for a STEM workforce (National Science Board [NSB], 2012). Although the U.S. has seen a steady growth in STEM professionals, it still lags behind Asian and European competitors (DeJarnette, 2012). In addition, the NSB (2010) reports that the number of students pursuing natural sciences and engineering degrees is decreasing. These fields are essential in today’s knowledge-intensive global economy; therefore, if the United States is to remain competitive within the global economy, education reformers need to focus on preparing future generations of students to become literate in science.

Science Reforms

With ever-increasing changes in the global economy and the need for science and engineering professionals, initiatives have been passed to mandate more attention to science education in American schools (DeJarnette, 2012). These initiatives include national and state education policies that focus on improving student learning in science. These policy goals aim to increase student achievement and raise the international ranking of U.S. students in science from the middle to the top in the next decade (NSB, 2012). In 2011, only one-third of eighth-grade students in the United States scored proficient or above in science (National Assessment of Educational Progress [NAEP], 2012). Although the United States leads the world in spending per pupil, that spending is not translating into high achievement in science (Peng & Guthrie, 2010).
According to Peng and Guthrie (2010), the average U.S. expenditures per student increased by 25% from 1995–2006. However, the increase in spending did not equate to a dramatic increase in NAEP scores, which only increased by 3 percent (NAEP, 2012). These less-than-desirable scores have been linked to a lack of quality in science instruction (NRC, 2007). While the United States is spending more money than ever on education, student achievement scores have not measured up; as a result, more scrutiny is being placed on educational spending and education reform (Peng & Guthrie, 2010). Reforms include the creation of Common Core Standards that will be implemented across states and efforts to strengthen the quality of science curricula, encourage students to take advanced courses, increase teacher quality, raise graduation requirements, and expand technology use in education (NSB, 2012). These reforms aim to improve student achievement, but teachers play a central role in whether they succeed because it is teachers who must implement any new national, state, or district standards (Garet, Porter, Desimone, Birman, & Yoon, 2001).

Virtual Schools

Teachers who offer their instruction virtually are equally responsible as teachers in brick-and-mortar schools to help implement reforms that can improve student achievement in science. In the 2012–2013 school year, there were 31 U.S. states with K–12 virtual schools (Watson, Murin, Vashaw, Gemin, & Rapp, 2011). The increase in virtual schools has given students learning opportunities that were not previously available to them. For example, virtual K–12 schools have given rural school districts access to NCLB-qualified teachers in courses districts had previously been unable to provide (Watson & Ryan, 2007). Although the learning environment may be different from that in traditional schools, virtual schools are still responsible to deliver the same Common Core standards to their students (Watson & Ryan, 2007). This
means that teachers in those schools are also held accountable to raise student science achievement just as teachers from traditional brick-and-mortar environments.

**Professional Development**

The federal policy commonly called No Child Left Behind (NCLB, 2001) was passed in an effort to improve the quality of education for students. Under NCLB (U.S. Department of Education, 2004), there has been an emphasis on school accountability, which heavily focuses on the role of teachers in student learning (Desimone, Porter, Garet, Yoon, & Birman, 2002; Lumpe et al., 2012; Sinclair et al., 2010). According to many researchers, the success of educational reform depends on teacher qualifications and effectiveness (Garet et al., 2001). As a result, teacher professional development has become a primary focus in educational reform efforts.

While most teachers support education reform, many are not fully prepared to implement teaching practices that require students to critically analyze and develop higher-order thinking skills (Borko, 2004; Cohen, 1990). Cohen suggests that teachers are trained to teach through the classic model of learning and memorizing, which does not require students to build a deeper understanding of the subject. If students are expected to become more analytical and better critical thinkers, teachers must be prepared to teach these high standards through professional development (National Board for Professional Teaching Standards, 1989, 2003).

**Science Efficacy Beliefs**

Studies show that traditional types of professional development for teachers are usually short-term and do not adequately prepare them for science inquiry learning and practice (Barber & Mourshed, 2007; Borko, 2004; Lumpe, 2007). However, professional development that was long-term and included hands-on experience, scientific experts, and master teachers was positively correlated with teacher content knowledge, teacher science efficacy, and the amount of
time teachers taught science (Lumpe et al., 2012; NRC, 1996). Furthermore, some researchers found that professional development that focused on changing teacher efficacy beliefs and attitudes was correlated with improved student learning (Czerniak, Lumpe, & Haney, 1999; Knapp, 2003; Lumpe et al., 2012; Sinclair et al., 2010).

Numerous studies have indicated that teachers’ feelings of self-efficacy can have a positive impact on their students’ achievement (Akerson & McDuffie, 2006; Brown, Brown, Reardon, & Merrill, 2011; Duschl, 2008; Sinclair et al., 2010). Science teachers with higher feelings of science-teaching efficacy are more likely to teach science, to incorporate science-teaching reform standards, and to help their students build a deeper understanding of science (Appleton, 2003). Furthermore, studies have found a strong correlation between the hours, over 100 hours, teachers spend participating in intense professional development and their teaching self-efficacy (Desimone, 2011; Garet et al., 2001; Lumpe et al., 2012). Consequently, there is a critical need to examine how professional development affects teachers’ beliefs, teaching practices, and student learning (Guskey & Passaro, 1994; Lumpe et al., 2012; NRC, 1996; Riggs & Enochs, 1990; Sinclair et al., 2010; Swafford, Jones, Thornton, Stump, & Miller, 1999).

Growing amounts of research stress the need to embed social constructivist-learning theories within professional development for teachers (Koch, 2005). Professional development techniques that are long-term, collaborative, and involve experts and peers are found to be highly effective for teacher learning and teacher self-efficacy (Fulton & Britton, 2011; Garet et al., 2001). These types of continual professional developments are best exemplified by Lave and Wenger’s (1991) concept of community of practice.
Research Questions

This proposed research study seeks to examine the extent of how participation in a community of practice in science education will affect the science-teaching efficacy of K–12 teachers who teach in a virtual environment. Experience of community of practice (eCoP) will be measured using the Cadiz et al. (2009) instrument. The eCoP instrument was developed to measure the “extent to which a person is engaged in his/her community of practice” (Cadiz et al., 2009). Following the American Psychological Association and National Council on Measure in Education, Cadiz and colleagues developed field-appropriate measures of experience in a community of practice. It has origins in Lave and Wenger’s (1991) concept of community of practice, which consists of people who share a common interest or profession with the goals of exchanging knowledge through open communication (Lave & Wenger, 1991).

Science-teaching efficacy will be measured by using Riggs and Enochs’ (1990) Science-teaching efficacy Beliefs Instrument-A (STEBI-A) instrument. The STEBI-A is a survey designed by Riggs and Enochs (1990) to measure the level of science-teaching efficacy of in-service science teachers. The instrument measures science-teaching efficacy beliefs through two subscales: Personal Science-Teaching Efficacy (PSTE) and Science-Teaching Outcome Expectancy (STOE). It has its theoretical framework in Bandura’s Self-Efficacy Social Cognitive (SESC) theory (Bandura, 1977) and Gibson and Dembo’s (1984) teacher efficacy scale.

The following research questions will be explored in the study:

R1: What is the relationship between experience of community of practice and personal science-teaching efficacy (PSTE)? Which dimensions of experience in community of practice have the greatest effect on PSTE?
R2: What is the relationship between experience of community of practice and science-teaching outcome expectancy (STOE)? Which dimensions of experience in community of practice have the greatest effect on STOE?

**Theoretical Framework**

The theoretical framework supporting teachers’ feelings of self-efficacy resulting in science-teaching efficacy improvement through community of practice is based in the theories of social learning.

According to Bandura’s (1997) psychological social cognitive theory, self-efficacy is “the belief in one’s capabilities to organize and execute the course of action required to manage prospective situations” (p. 2). Research supports the idea that self-efficacy plays a strong role in human behavior. Bandura (2000) writes:

Perceived efficacy plays a key role in human functioning because it affects behavior not only directly, but by its impact on other determinants such as goals and aspirations, outcome expectations, affective proclivities, and perception of impediments and opportunities in the social environment. (p. 73)

Furthermore, research has shown that students’ self-efficacy beliefs play a significant role in influencing their motivation and achievement (Bandura, 1997); in addition, researchers have discovered that teachers’ self-efficacy beliefs also play an important role in influencing outcomes for teachers and students (Ross, 1992).

The notion of knowing and learning through situated activities forms the basis for a community of practice in which a learner participates (Lave & Wenger, 1991). A community of practice consists of individuals who interact with one another in order to achieve the same goal. For this research, the community of practice consists of science teachers. Researchers have found
communities of practice that focus on teacher collaboration and continuity have a positive effect on teaching efficacy and student achievement (Akerson, Cullen, & Hanson, 2009; Fazio, 2009; Liu, Lee & Lin, 2010; Vescio, Ross, & Adams, 2008). Chase, Germundsen, Brownstein, and Distad (2001) found that teachers’ efficacy increased when they are involved in an active community of practice, which consists of new teachers, experienced teachers, administrators, mentors, and faculty teacher educators who meet to reflect on their practices on a regular basis. Ramey-Gassert, Shroyer, and Staver (1998) found that teachers’ personal science-teaching efficacy is influenced by their positive experiences with high-quality science courses, professional development, access to resources, and a supportive community of practice from peers and administrators. Consequently, developing science-teaching self-efficacy is an important goal for science education reform.

**Implications for Research**

Teachers who were involved in science community of practices report higher teaching efficacy (Knapp, 2003; Sinclair et al., 2010). In addition, research has found that higher teaching efficacy leads to more effective science-teaching and higher student achievement (Lumpe et al., 2012; Sinclair et al., 2010). The researcher is assuming that teachers in virtual settings share similar characteristics of a community of practice with teachers in traditional “brick and mortar” settings. Therefore, the study will provide insights about the community of practice and provide a springboard for further research on the community of practice for virtual schools. In addition, the study will seek to increase understanding of factors within a community of practice that affects science efficacy of virtual school teachers. The data will provide school districts, administrators, and stakeholders with instructional strategies to help them develop and maintain ongoing communities of practice to support K–12 teachers in virtual environments. Furthermore,
results from this study will offer potential benefits including improvements in science-teaching efficacy, student achievement, professional development and community of practice for in-service teachers, and ideas about development of better science-inquiry curricula.

**Summary of Methodology**

This study is a descriptive, correlational, quantitative, nonexperimental survey study. The purpose of this study is to determine if relationships exist between personal science-teaching efficacy and science-teaching outcome expectancy and the independent variables of experienced community of practice: (a) open communication, (b) shared vocabulary, (c) remembering from previous lessons, and (d) learning from each other (Cadiz et al., 2009). These variables are treated as ordinal variables and measured quantitatively with a Likert scale. Two dependent variables were measured by the STEBI-A: science-teaching efficacy beliefs and science-teaching outcome expectancy.

**Significance of Study**

This study is significant because it will provide insight into ways teacher science efficacy beliefs can be improved in order to improve STEM education reform measures. Furthermore, understanding how a science teacher experiences a community of practice can provide professional development opportunities to enhance science-teaching efficacy beliefs. “Enhancing the quality and quantity of K–12 STEM education is inextricably linked to the continued professional development of K–12 teachers,” according to Nadelson, Seifert, Moll, and Coats (2012, p. 69). While it is important to focus on students’ science content knowledge, it is just as vital to focus on teachers’ knowledge and pedagogy in science-teaching.

According to Nadelson et al. (2012), schools often lack teachers with the knowledge and expertise to teach science effectively. Furthermore, teachers lack the professional support,
systems, and tools to fully implement science-focused lessons. Without the proper professional
development and knowledge building, how will teachers inspire students to become competitive
in the STEM global workforce? In addition, as virtual schools continue to proliferate in the
United States, it is imperative that more research should be done on what policies and practices
support teaching effectiveness for these schools. Therefore, focusing on improving teachers’
professional development opportunities may be beneficial in improving U. S. global
competitiveness and improving national prosperity (Nadelson et al., 2012). According to
Nadelson, et al,

The importance of STEM education to societal developments provides justification for
assuring K–12 teachers are prepared to teach the related content. Inservice teacher
professional development is critical to achieving the goal of enhanced student knowledge
of STEM. (Nadelson et al., 2012, p. 69)

The success of science education reforms depends on teacher qualification, effectiveness,
and teaching efficacy (Garet et al., 2001) for both traditional and virtual school teachers.

Limitations

The present study has several limitations. First, the participant population was gained
through a sample of convenience. Because the sample consists of schoolteachers in virtual
settings, the study’s findings cannot be generalized to the entire population of science teachers.
Other science teachers in both virtual and traditional settings may have different responses.
Second, the present research is only examining correlations between variables; therefore data
will not identify causation. Third, self-reporting can be problematic as there may be social
desirability bias. However, surveys are efficient and cost-effective in data collection for a large
population (Babbie, 1998); furthermore, the instruments have demonstrated reliability and
validity. Finally, the measures for experience of community of practice are relatively new; therefore, repeated studies utilizing the measures are recommended.

**Definitions of Terms**

The following terms and definitions are relevant to the topic being studied here.

*Personal science-teaching efficacy beliefs:* the confidence a science teacher has in his/her ability to successfully teach science.

*Science-teaching outcome expectancy:* the belief a science teacher has that effective science-teaching will influence his/her students.

*Self-efficacy:* the measure of one’s own confidence in completing a task and reaching a specific goal.

*Virtual schools:* A form of distance education that delivers online courses or classes that cater to K–12 grade levels.

*Virtual teachers:* Teachers who teach at virtual schools.

**Summary**

In this chapter, I have shown the lack of research exploring the relationship between community of practice for science teachers in virtual schools and their science-teaching efficacy and science outcome expectations. I have presented background regarding the national need for science education reform and the relationship between professional development and the effectiveness of science teachers. Furthermore, I have provided the purpose of the study, which is to examine the extent of how virtual K–12 teachers’ experience with a community of practice in science education can affect science-teaching efficacy. In addition, I have included the research questions:
R1: What is the relationship between experience of community of practice and personal science-teaching efficacy (PSTE)? Which dimensions of experience in community of practice have the greatest effect on PSTE?

R2: What is the relationship between experience of community of practice and science-teaching outcome expectancy (STOE)? Which dimensions of experience in community of practice have the greatest effect on STOE?

Finally, three limitations have been addressed: sample of convenience, the correlational data, and self-reporting of participants.

The following chapter will be a review of literature that addresses the science education reform movement in the United States and theoretical framework for this study: community of practice, self-efficacy, and science-teaching efficacy beliefs. Chapter 3 will examine this project’s methodology. Chapter 4 will provide the results, and Chapter 5 will provide a summary of the project.
Chapter Two: Literature Review

This study will examine the relationship between community of practice and science-teaching efficacy beliefs of teachers in K–12 online schools. This chapter will address the science education reform movement in the United States, which includes science inquiry instruction and science literacy. The theoretical framework for this study will focus on teachers’ community of practice, self-efficacy, and science-teaching efficacy beliefs. The review of literature will examine options for improved professional learning opportunities and development that could affect science-teaching efficacy beliefs. Lastly, this chapter will provide a brief background of virtual K–12 online schools and the need to examine the science-teaching efficacy beliefs of teachers in those schools.

Background

Many national, state, and local policymakers and educators have introduced education reform policies (Garet et al., 2001) in response to recent measurements showing low student achievement in the United States (NAEP, 2006). These education reforms include implementing higher educational standards, developing common core curriculum standards and frameworks, and using standardized testing to develop and measure advanced thinking and problem-solving skills among students (National Commission on Teaching and America’s Future, 1996). While these reforms aim to improve student achievement, teachers play a central role in the success of executing education reform because they must carry out the demands of state and district standards (Cuban, 1990). Federal policy such as the legislation commonly called No Child Left Behind or NCLB (2001) was passed in an effort to improve the quality of education for students (U.S. Department of Education, 2004). Under NCLB, there has been an emphasis on school accountability, which emphasizes the role of teachers in student learning (Desimone et al., 2002;
Sinclair et al., 2010). The success of educational reform depends on teacher qualifications and effectiveness (Garet et al., 2001). As a result, teacher professional development has become a primary focus in the educational reform efforts.

While most teachers support education reform, many are not fully prepared to implement teaching practices that require students to critically analyze and develop higher-order thinking skills (Borko, 2004; Cohen, 1990; Hestenes, 2013). Cohen suggests this is because teachers have been trained to teach through the classic model of learning and memorizing, which does not require students to build a deeper understanding of the subject. If students are expected to become more analytical and critical thinkers, teachers must receive professional development to prepare them to help their students attain these higher standards (National Board for Professional Teaching Standards, 1989, 2003).

**Science Education Reform**

Due to our global economy’s heavy reliance on technology, there is a higher demand for people who can solve complex problems and understand science and technology (Brown et al., 2011). In order to meet these demands, reform in science education is necessary (Brown et al., 2011). Research shows that students are not gaining science literacy at school (Cohen, 1990). In order for students to become more science literate, reforms must be made that will incorporate science inquiry teaching into the curriculum. Science inquiry teaching involves active learning strategies that engage students in the scientific process (NRC, 1996). Researchers have found that science inquiry teaching has been effective in building science literacy in students (Brown et al., 2011; Dani & Koenig, 2008; NRC, 1996).

The science reform movement for standards-based education began in the 1990s. Rutherford and Algren (1989) provided a foundation for high quality science education. The
reform movement focuses not only on science but on education as a whole, advocating for high standards to develop students as critical thinkers who are capable of solving complex problems and applying abstract knowledge to real-world problems (NRC, 1996).

In order for students to gain scientific knowledge and critical-thinking abilities, teachers must actively implement science inquiry instruction. Science inquiry-based instruction shifts from the traditional use of textbooks and lectures to a more student-centered approach where students engage in “doing science” (Von Secker & Lissitz, 1999). The ultimate goal for science reform is to encourage students to become more proficient in utilizing scientific strategies to logically solve problems and to verbalize and discuss their findings. In order for this goal to be achieved, teachers need to feel confident that their teaching practices can enable the scientific method to naturally transpire in the classroom.

Science inquiry. The NRC (1996) states that scientific inquiry involves studying the natural world in a diverse way and proposing hypotheses based on the evidence derived from observations. The science inquiry process requires student to develop knowledge and understanding of the natural world, as well as an understanding of how scientists examine the natural world (NRC, 1996). When practicing the scientific inquiry process, teachers and students are expected to:

• Think critically, plan, and conduct scientific investigations in context.
• Gather and interpret data based on observations.
• Discuss their hypotheses, ideas, observations, and conclusions.
• Use diverse tools of science, mathematics, and technology to support their scientific investigations. (NRC, 1996)
Science inquiry-oriented instruction engages students in some manner such as asking questions, hypothesizing, generating, interpreting, and evaluating data (NRC, 1996). During science inquiry instruction, teachers help their students learn through the scientific method rather than transmitting information through lectures or from reading books (Marshall, Horton, Igo, & Switzer, 2009). In this way, students are “doing science” and developing science literacy, which is the foundation of K–12 science education reform (Duschl, Schweingruber, & Shouse, 2007). Evidence has indicated that science inquiry instruction has significantly increased student science literacy (Judson & Sawada, 2000), although teachers find the new processes challenging to implement.

**Science literacy.** Science education reforms use Rutherford and Algren’s (1989) outline in *Science for All Americans* as a foundation to build scientific teaching strategies (Liang & Gabel, 2005). Scientific teaching breaks away from the traditional form of teacher-centered teaching to a more student-centered approach; it encourages students to use the scientific method as they actively engage building their science literacy (Dani & Koenig, 2008). Due to the national goal that all students must become science literate, The National Research Council established National Science Education Standards (NSES) in 1996. These standards were formed to guarantee that American students who have all the necessary resources and instructional tools achieve the national goal of scientific literacy.

According to NRC (1996) scientific literacy requires students to understand and process scientific concepts so that they can make personal decisions in civic and culture affairs and use their knowledge to aid the economy. Scientific literacy involves students having the ability to identify scientific issues as they pertain to local and national level political issues. Furthermore, students who are literate in science are able to ask questions and establish hypotheses based on
their curiosity. The NRC (1996) stresses the need for teachers to utilize as many science-inquiry standards as possible in order to develop the understanding of science literacy in order to meet the demands of a complex global society.

**Professional Development**

The education reform movement acquired national attention, which led to the push to implement more standards-based instruction in public schools. The NCLB legislation set ambitious goals to raise student achievement (Borko, 2004). Borko adds that although there are numerous factors that contribute to education reform goals, the ultimate changes in the classroom rely heavily on teachers.

As a result, school districts and administrators are placing more focus on teacher professional development and teacher learning (Desimone et al., 2002; Lakshmanan, Heath, Perlmutter, & Elder, 2011; Lumpe et al., 2012; Smith & Desimone, 2003). Professional development is a crucial component in the reform effort (Garet, et al., 2001; Moore & Esselman, 1992). As mentioned in the previous chapter, STEM reform goals are to enable our students to become competitive in the future global economy. Unfortunately, studies have found that teachers are not adequately trained in teaching science-inquiry standards (Akerson & McDuffie, 2006; Brown et al., 2011; Duschl, 2008; Sinclair et al., 2010). Studies have found a strong correlation between the hours, over 100 hours, teachers spend participating in intense professional development and teaching self-efficacy (Desimone, 2011; Garet et al., 2001; Lumpe et al., 2012). Consequently, there is a critical need to examine how professional development methods affect teachers’ beliefs, their teaching practices, and student learning (Guskey & Passaro, 1994; Lumpe et al., 2012; NRC, 1996; Riggs & Enochs, 1990; Sinclair et al., 2010; Swafford et al., 1999). The primary goal of this study is to examine the effects of participation in
a community of practice (Lave & Wenger, 1991) on teachers’ efficacy and teachers’ science efficacy.

**Science professional development.** In recent years, the definition of science education has been modified (Hodson, 1998; NRC, 1996). Science education has shifted from focusing on student acquisition and memorization of technical concepts and science terminology to emphasize critical thinking skills, inquiry processes, reasoning processes, and application of scientific concepts and skills (Hand & Prain, 2006). While these science inquiry standards must apply to all K–12 students, most teachers in K–6 are not fully prepared to teach the science inquiry methods or curriculum (NRC, 1996). Most elementary teachers are usually “generalists” (Darling-Hammond, 1999); they do not have a teaching specialty, nor were they trained to teach science content or pedagogy. Akerson and McDuffie (2006) add that since the primary subject taught to younger students is literacy, K–6 teachers usually are not science specialists but literacy specialists. Elementary school teachers often avoid teaching science because they lack confidence in their ability to teach science well (Brown et al., 2011; Epstein & Miller, 2011; Moreno, 1999).

Although the National Commission on Science and Mathematics Teaching for the 21\textsuperscript{st} Century (2000) provided recommendations to support elementary teachers through professional development in science-teaching, the recommendations do not fully prepare teachers for science instruction (Akerson & McDuffie, 2006). Moreno (1999) adds that while science professional development is offered to teachers, what is offered rarely fully prepares teachers to implement science inquiry-based curriculum. Teachers usually receive materials or textbooks for the use of science instruction but receive no guidance for effectively executing science lessons. Because
they often lack science background knowledge and science-teaching preparation, many K–6 teachers are not prepared to teach science effectively. Sinclair et al. (2010) assert:

This inadequate content knowledge causes lack of confidence in their ability to teach science. This lack of confidence, coupled with the need for students to perform well on high stakes testing in science, has led to an increase in requests for science professional development programs for elementary teachers. (p. 580)

Akerson and McDuffie (2006) add that professional development generally focuses on helping teachers to use certain materials. While the development can help teachers learn how to use the teaching materials effectively, not all materials, curricula, and strategies are equally effective for all students (Abell & Roth, 1992; Akerson & McDuffie, 2006; Sinclair et al., 2010).

Traditional professional developments are short-term workshops, which are often found to be inadequate in teacher learning and practice (Barber & Mourshed, 2007; Borko, 2004; Lumpe, 2007). Studies have found that long-term professional development that includes hands-on experience, scientific experts, master teachers, and experiential application has been positively correlated with teacher content knowledge, teacher science efficacy, and time spent teaching science (Lumpe et al., 2012; NRC, 1996). Furthermore, while studies found a connection between teacher professional development and student learning (Yoon, Duncan, Lee, Scarloss, & Shapely, 2007), some researchers have found that effective professional development includes an effort to change teacher beliefs and attitudes in order to improve student achievement (Czerniak et al., 1999; Knapp, 2003; Lumpe et al., 2012; Sinclair et al., 2010). Pajares (1992) found that there is a positive relationship between teachers’ beliefs and their instructional practices. In addition, the focus on teachers’ beliefs and attitudes is pertinent to
the success of science education reforms (Lakshmanan et al., 2011; Lumpe et al., 2012; Sinclair et al., 2010).

While it is important to provide instruction for teaching content and inquiry processes to teachers (Akerson & McDuffie, 2006), it is just as vital to change teacher beliefs and attitudes in order to improve student achievement. Studies have found that there is a positive correlation between teaching self-efficacy beliefs, teacher effectiveness, and student achievement (Bruce, Esmonde, Ross, Dookie, & Beatty, 2010; Ramey-Gassert, Shroyer, & Stayer, 1998). More recent studies have consistently supported teacher efficacy and student growth (Goddard, Hoy, & Hoy, 2004; Lumpe et al., 2012). Furthermore, Berman, McLaughlin, Bass, Pauly, and Zellman (1977) found that reported higher teaching self-efficacy beliefs were positively related to student achievement and teachers’ willingness to continue to effectively implement federally funded projects.

**Self-Efficacy**

Self-efficacy plays an essential role in the thought processes and emotions that empower goal-oriented actions (Tschannen-Moran & McMaster, 2009). Self-efficacy is the level of confidence a person has in achieving future goals (Bandura, 1977). The concept of self-efficacy evolved from Bandura’s (1977) social cognitive theory. According to Bandura’s (1997) social learning theory, self-efficacy is a psychological construct that refers to one’s own ability to successfully complete a specific task. Bandura (1977) further adds that self-efficacy is one’s own perceived competence to form and complete the actions required to produce a given goal. Within Bandura’s social cognitive theory, a triadic relationship between a person’s behavior, environmental events, and personal factors work together to explain human functioning (Lumpe et al., 2012). Pajares (1992) suggests that a person can change their behavior
by targeting one or all three of these factors. Consequently, self-efficacy can be manipulated and changed in suitable circumstances (Bandura, 1997).

In order to influence self-efficacy, it is important to understand that self-efficacy involves two subscales, personal expectancy beliefs and outcome expectancy beliefs, that serve as a predictor for behaviors. Personal expectancy beliefs measure one’s belief in his or her capabilities to achieve an anticipated outcome, while outcome expectancy is one’s beliefs that a certain behavior will result in a specified outcome (Bandura, 1997). Bandura (1997) states that an individual with high personal expectancy beliefs and outcome expectancy is likely to be more resilient during challenging efforts in order to reach the desired goal, while individuals who were low on both scales are more likely to give up if they do not easily reach their desired outcome. Therefore, behavior can be predicted utilizing the two subscales of self-efficacy, and the appropriate factors could be utilized to influence self-efficacy (Bandura, 1977).

Because self-efficacy affects human behavior, it is important to understand how self-efficacy beliefs are developed (Tschannen-Moran & McMaster, 2009). Bandura (1977) defined four strategies for developing self-efficacy: mastery experience, vicarious experience, social and verbal persuasion, and physical and emotional states. Because mastery experience is more direct, it is the most influential strategy for developing self-efficacy. For example, when a person masters a task, that individual gains self-efficacy; on the contrary, when a person fails a task, self-efficacy is lowered (Bandura, 1977). Vicarious experiences are less direct because they occur when a person observes someone modeling a certain task. If the model is successful, self-efficacy may increase; however, if the model is unsuccessful, self-efficacy may decrease (Tschannen-Moran, Hoy, & Hoy, 1998). Social and verbal persuasion occurs when an individual receives encouragement, affirmation, or praise. In effect, the social and verbal persuasion can
encourage the person to continue to spend more energy and effort to achieve a goal. The final factor affecting self-efficacy is found in the physical or emotional states that occur synchronously when a person is performing a task. For example, if the individual is excited and positive about the task, self-efficacy increases. However, if an individual experiences anxiety and is uncomfortable, self-efficacy may be lowered (Goddard, Hoy, & Hoy, 2004).

If the two subscales of self-efficacy are determined, an individual’s behavior can be predicted and appropriate strategies can be applied to improve self-efficacy, thus increasing the chance an individual will continue efforts to reach the desired outcome. In connecting the two subscales for influencing teachers’ self-efficacy, Tschannen-Moran and McMaster (2009) found professional development that focuses on master experiences with follow-up coaching had a positive effect on teacher self-efficacy. When teachers reported higher self-efficacy, they were more likely to implement new teaching strategies (Tschannen-Moran & McMaster. 2009).

Ross and Bruce (2007) found that teachers who participated in vicarious experiences had an increase in teacher efficacy beliefs. Furthermore, Lakshmanan et al. (2011) report that teachers who attended monthly professional developments that incorporated best practices for executing standards-based instruction, trainings in reflective cognitive coaching, and discussions on implementation of standards of strategies reported having a significant increase in self-efficacy. Additional studies demonstrate the importance of teacher collaboration and community of practice on teacher self-efficacy (Bruce et al., 2010; Sinclair et al., 2010).

In connecting these four strategies to science teacher efficacy, professional development should be focused on both science curricula content and building science-teaching self-efficacy. As mentioned earlier, teachers generally are not confident in teaching science-inquiry curriculum and, as a result, are avoiding teaching science (Brown et al., 2011; Epstein & Miller, 2011). If
the United States is to become competitive in the STEM global workforce, stakeholders and school leaders must shift traditional professional development from focusing primarily on curricula and handing out materials to enhancing teacher’s science knowledge and self-efficacy.

**Teacher Self-Efficacy**

In recent years, education reform has called attention to teaching self-efficacy (Lumpe et al., 2012). Bandura (1997) indicated that teacher self-efficacy beliefs influence student achievement and motivation. Researchers found that teachers’ self-efficacy beliefs positively affect teachers’ attitudes and beliefs about teaching and instructional behaviors (Gibson & Dembo, 1984; Skaalvik & Skaalvik, 2007; Tschannen-Moran & Hoy, 2001). On the other hand, teachers with low self-efficacy beliefs struggle more in teaching, are more stressed, and have lower job satisfaction (Betoret, 2006).

With the recent call for educational reform, there has been increasing interest in current conditions in schools, specifically on the school climate, student achievement, school leadership, teacher learning, teacher beliefs and attitudes, teacher development, and teacher efficacy (Fulton & Britton, 2011; Lumpe et al., 2012; Soodak & Podell, 1997). Two Rand Corporation evaluation studies first conceptualized teacher efficacy based on Bandura’s (1977) work. The Rand evaluation of 100 Title III Elementary and Secondary Education Act (ESEA) found that teacher efficacy was positively related to student achievement (Berman et al., 1977). Ashton and Webb (1986) found a significant relationship between teacher efficacy and student achievement on standardized testing in math and reading. Teacher efficacy is the belief of teachers in their ability to affect student outcome (Lakshmanan et al., 2011). Teacher efficacy has been identified as a factor that most consistently relates to teaching and learning and has been associated with student achievement, engagement, motivation, and students’ self-efficacy beliefs (Anderson, Greene, &
Loewen, 1988; Ross, 1992; Soodak & Podell, 1997; Tschannen-Moran & McMaster, 2009).
Furthermore, there is a growing body of empirical evidence that supports Bandura’s (1977) theory that teachers’ self-efficacy beliefs are related to teaching efforts, goal setting, persistence when lessons do not go as planned, and resiliency during challenging situations (Ashton & Webb, 1986; Guskey, 1986; Haney, Wang, Keil, & Zoffel, 2007; Tschannen-Moran & McMaster, 2009).

Researchers have found that there are positive effects of high teacher efficacy on instructional practices (Ross, 1998). Teachers with high self-efficacy were more likely to implement new strategies than were teachers with low self-efficacy (Ross & Bruce, 2007; Tschannen-Moran & McMaster, 2009), more willing to adopt new instructional tools in the classroom (Guskey, 1988; Ross, 1994), more willing to try new teaching ideas (Ross, 1998), and more willing to set higher goals and expectations in the classroom (Angle & Moseley, 2009).

Teachers with higher self-efficacy were more willing to change their behavior in order to adapt to new instructional programs intended to increase classroom effectiveness (Smylie, 1988). In addition, teachers with high teaching self-efficacy are more open to taking risks in the execution of difficult practices and are more comfortable with facilitating student learning (Ross, 1998). Gibson and Dembo (1984) found that teachers who had higher self-efficacy were more enthusiastic, reported lower stress levels, and were more satisfied with their teaching job. Finson, Riggs, and Jesunathadas (2000) found that teachers with higher self-efficacy spent more time teaching science, used more innovative and challenging teaching methods, and were more effective in teaching science.
Science-Teaching Self-Efficacy

The NRC (2007) reports that elementary education teacher certification and credentialing requires teacher candidates to complete only two college-level science courses, which many believe is not an adequate preparation for teaching science curriculum (Bradbury, 2010; Fulp, 2002). A recent report on teacher quality conducted over the last 20 years reveals a positive relationship between teachers who majored in science and student achievement (Kuenzi, 2008). However, only 2% of elementary teachers, 27% of middle school teachers, and 52% of high school teachers possess a degree in science or science education (Aud et al., 2012). Which means that many U. S. science teachers are not truly qualified to teach the subject (Kuenzi, 2008). In addition, there is a dramatic difference in teacher confidence to teach science compared to other school subjects. According to Fulp (2002):

It is clear that elementary school teachers do not feel equally qualified to teach all academic subjects, with preparedness to teach science paling in comparison to mathematics, language arts, and social studies. Where fewer than 3 in 10 elementary teachers reported feeling well prepared to teach the sciences, 77 percent indicated that they were very well qualified to teach reading/language arts. (p. 14)

As mentioned in the previous section, teachers who do not feel qualified to teach science are less likely to spend much time teaching science in the classroom (Fulton & Britton, 2011). In order to build science-teaching qualifications and confidence, professional development methods have been created to boost teacher learning through innovative, inquiry-based instruction (Lakshmanan et al., 2011). Insufficient science content knowledge also may lower teacher self-efficacy (Swarz & Dooley, 2010), thus highlighting the important of professional development techniques that focus on building content, pedagogical, and social cognitive components.
Riggs and Enochs (1990) contend that although science is required for all students in elementary schools, elementary teachers do not place high priority on teaching science; as a result, students are not receiving the high-quality science education they deserve. They suggested that many teachers are ineffectively teaching science because they have low levels of science-teaching efficacy. Therefore, it is imperative to determine science-teaching efficacy in order to contribute to reform movements in science achievement.

Yoon et al. (2006) found that science teachers’ self-efficacy had a strong influence on their ability to successfully implement new science curriculum and choose the best instructional practice for effective teaching. In addition, teachers with low self-efficacy stemming from lack of science subject-matter knowledge were more likely to teach as little science as possible and to rely heavily on textbooks, science kits, and experts (Harlen & Holroyd, 1997). Appleton (2003) found that as many elementary school teachers have difficulties teaching science they tend to avoid the subject. Some teachers use “token” science content in reading and social studies, and some teach based on their limited science knowledge. Furthermore, teachers with low self-efficacy in science were more likely to give up on students who have difficulties, criticize students who do not understand the material, ignore subject misconceptions, or move on without reteaching the lesson using a more comprehensible approach for their students (Bandura, 1993).

By contrast, teachers with high self-efficacy were more comfortable using instructional strategies that enhanced student learning (Woolfolk & Hoy, 1990) and to ask more open-ended questions that allowed their students to utilize higher-order problem-solving skills (Mulholland & Wallace, 2001). Teachers with high self-efficacy were more supportive in providing learning experiences for their students, open to reflect on their teaching practices, willing to reteach lessons that did not run smoothly, and more accessible to student inquiries (Schunk, 1991).
Studies have found that low teaching efficacy can affect how teachers view their capability to teach students (Bandura, 1993; Schunk, 1991; Woolfolk & Hoy, 1990). It is, therefore imperative that teachers continue training and learning through science professional development (NRC, 2007). In order to bridge the gap associated with underprepared teachers, professional development in science and STEM is critical for teachers to become more effective in meeting the needs of their students. Science professional development should focus on building teacher efficacy and practices, which will have a positive impact on student achievement (Gibson & Dembo, 1984; Goddard & Goddard, 2001; Moore & Esselman, 1992; Ross, 1992).

Ramey-Gassert et al. (1998) found that there is a positive correlation between a teacher’s science self-efficacy and attitude toward science choosing to teach science and self-rated effectiveness in science-teaching. Teachers with higher science self-efficacy were more likely to teach the mandated hours of science to their students, while teachers with lower self-efficacy were more likely to avoid teaching science (NRC, 2007). If teachers are not teaching science, how will students learn and achieve? Professional development needs to be able to accommodate those teachers who lack science knowledge as well as teachers who are proficient in teaching science. Researchers suggest that professional development that focuses on social constructivist learning can enhance teachers’ learning and build their self-efficacy (Guskey & Yoon, 2009; Liang & Gabel, 2005).

**Social Constructivist Theory**

There has been extensive research on the concept of learning–situated social interactions and practices (Bruner, 1990; Dewey, 1933; Lewin, 1946; Vygotsky, 1978). The traditional view of learning as an internal cognitive function has shifted to see knowing and learning as concepts
of context, culture, situated activities, and practice (Bruner, 1990; Lave, 1988; Lave & Wenger, 1991). Thus, popular frameworks of situated learning have been integrated into learning interventions (Tinker & Krajcik, 2001) and provided a foundation to implement improvements in teaching. More importantly, situated learning has been recommended as an effective method for teacher learning (Guskey & Yoon, 2009; Yoon et al., 2007).

Traditionally, professional development methods have focused on a top-down approach to delivering teacher learning (Bruce et al., 2010; Guskey & Yoon, 2009). These professional development techniques lack learning continuity, are disconnected from teachers’ daily practices, fail to promote collaboration, and do not take into account that teachers are adult learners (Darling-Hammond, 2005; Guskey & Yoon, 2009). This traditional method of executing professional development has been deemed ineffective (Bruce et al., 2010; Yoon et al., 2007). In a large-scale analysis conducted by Regional Education Laboratory-Southwest (RELS), 1,300 studies were examined on the effectiveness of teachers’ professional development on student outcomes (Yoon et al., 2007). The RELS study found that only 9 of the 1,343 schools studied met the 2001 NCLB Act’s criteria for rigorous standards and that these nine schools utilized experts who were able to align theory and practice, maintain teacher collaboration, support peer and expert coaching, and reinforce learning continuity. The RELS study therefore recommended that professional development should utilize strategies employed by these nine schools as a model for effective teacher learning (Yoon et al., 2007).

If teachers are expected to provide rigorous science inquiry standards to their students, professional development should be designed to support teachers as learners. In considering effective professional development, Bruce et al. (2010) stress that teachers should be a part of a sustained, collaborative, professional learning community. In analyzing two school districts in
Ontario, Bruce and colleagues found the school district that offered sustained professional learning communities reported higher teaching efficacy and higher student achievement compared to the second school district that utilized the traditional model for professional development. Professional development methods that considered teachers as adult learners were reported to be more effective and have a positive effect on student achievement (Bruce et al., 2010; Guskey & Yoon, 2009; Webster-Wright, 2009).

Current research stresses the need to embed social constructivist-learning theories within professional development methods (Koch, 2005). Professional development that encourages continual collaboration among experts and peers are found to be highly effective on teacher learning and teacher self-efficacy (Fulton & Britton, 2011; Garet et al., 2001). The social nature of learning is best exemplified by Lave and Wenger’s (1991) situated learning theory, which posits that learning is the process of participation through social interactions. Wenger (1998) further broadens the concept of situated learning as being a part of a community of practice (CoP). Lave and Wenger (1991) suggest that a learner enters a community from the periphery and comes closer to the center through social interactions with existing members, which enables full, legitimate participation. Through legitimate participation, the learner gains knowledge and customs from the CoP and identifies herself as being a member of the community. A person can be a member of many CoPs, whether at work, in professional learning communities, schools, or other social groups (Lave & Wenger, 1991).

**Community of Practice**

There has been much interest in supporting and overlapping the concept of CoP since Lave and Wenger’s (1991) publication, including the ideas of a professional learning community, a community of learners, a learning community, a community of inquiry, and
community knowledge, just to list a few (Hung & Yuen, 2010). These conceptual models stem from or extend the concept of CoP, and they all share the supposition that social interaction and participation are fundamental to how people learn and become members of a community (Lave & Wenger, 1991). A CoP embodies language, artifacts, tools, beliefs, norms, and behaviors. A newcomer becomes a participant within a community of practice through mutual engagement and social interactions. These social interactions involve the exchange of knowledge between members through mutual engagement such as talking or teaching one another (Lave & Wenger, 1991). For the purpose of this study, the term *communities of practice* will be used interchangeably with *professional learning communities*.

There have been few studies that investigate teacher learning and teacher self-efficacy as they relate to being a part of a science-teaching CoP (Fazio, 2009; Lakshmanan et al., 2011; Liu et al., 2010; Sinclair et al., 2010). Lakshmanan et al. (2011) found that there was a positive correlation between teacher self-efficacy and instructional practices for teachers who participated in a professional learning community. Webster-Wright (2009) reviewed over 200 studies in professional development and professional learning and found that professional development needs to provide learning in context and offer continuity. They further add that professionals learn from practice and that knowledge is gained through this practice.

In their research, Lave and Wenger (1991) challenged the traditional view that learning is the transmission of abstract and decontextualized knowledge from one person to another. Instead, they introduced a theory for learning as being part of social interactions and critical concepts such as situated learning, CoP, and legitimate peripheral participation.

**Situated learning.** Studies have found that professional development sessions most often focus on distribution of science material and resources without providing social interaction
connected to science inquiry practices and thus have been ineffective for teacher learning (Appleton & Kindt, 1999) and enhancing teaching self-efficacy (Akerson & McDuffie, 2006). Lave and Wenger (1991) argue that learning does not transpire in isolation and that a person learns from socially interacting with others—a CoP—who are attempting to obtain the same skills or knowledge. In addition to social interaction, Lave and Wenger contend that people learn best when they are given an appropriate context for learning. For example, a teacher wanting to learn how to implement a new science inquiry process may start by reading the teacher guide on science inquiry. This learning process is decontextualized and abstract. In order for her to become a more competent teacher in science, she attends professional development sessions in the science-teaching community. In this new CoP, the members share the same goal, which is to become a more competent science teacher.

Based on Lave and Wenger’s (1991) concept of situated learning, a teacher learns how to utilize and implement new science-teaching practices through experienced teachers. In this social dynamic, she is the newcomer; the old-timer is the expert. As she continues to attend more professional developments, she becomes more active in the community. She is no longer an outsider, but a member in the science-teaching community. This process where the newcomer moves from the periphery to the community’s center is known as legitimate peripheral participation. Through this progression, the newcomer becomes an old-timer.

Thus, learning occurs in social interactions within context, activity, and culture; this concept is known as “situated learning.” Within situated learning, knowledge is socially distributed. Lave and Wenger (1991) assert that learning is useless unless it applied within the context that is intended for. The success of the science teacher depends on her social interactions between other teachers within the community. Therefore, learning must take place within a
social setting. This setting is known as a CoP and offers teachers in situated learning activities a chance to collaborate with other members, which has been found to have a positive influence on teacher and student learning (Liu et al., 2010; Vescio et al., 2008).

**Legitimate peripheral participation.** According to Lave and Wenger (1991), the concept of legitimate peripheral participation provides a way to connect the relationships between newcomers and old-timers, the acquisition and dissemination of knowledge; and the transformation of identities. As a newcomer, learners participate in peripheral activities such as observing the experts, acquiring the culture’s language, using the culture’s tools, and organizing the cultures’ beliefs and values.

In a CoP, access to an expert is vital to a member’s learning experience (Lave & Wenger, 1991). Tschannen-Moran and McMaster (2009) found that professional development sessions that focus on mastery experience with follow-up meetings with expert coaches had a strong effect on teaching efficacy beliefs compared with teachers who did not participate in follow-up meeting with expert coaches. Teachers who interacted with the experts were more likely to report an increase in their teaching efficacy beliefs. In connecting Lave and Wenger’s concept of CoP, when a teacher masters a new instructional practice with the assistance of an expert, the instructional practice becomes reified. Through situated activities and legitimate participation, the teacher will be able to internalize the science knowledge and transmit the knowledge to new teacher members. The success of membership in a CoP relies on the learner’s motivation to engage in the community and the community’s willingness to offer access to knowledge.

CoP can be connected to Vygotsky’s (1978) social constructivism theoretical framework for learning, as his concept of Zone of Proximal Development (ZPD) provides a foundation for how people master skills through tool usage and social interactions. According to Vygotsky,
ZPD is a shared space between a learner’s actual development and what she can achieve (potential development) when provided with mediating tools (tools, signs, language, or more experienced human beings). Vygotsky (1978) explains that the ZPD is “the distance between the actual developmental level as determined by independent problem solving and the level of potential development” (p. 86). This learning is achieved with the help of adult guidance, a tool, or in collaboration with more knowledgeable members.

Mastery of knowledge is gained through the use of mediating tools and social interactions. Within this context, these social interactions are extended through professional development. Professional development techniques that focus on building a CoP meet two requirements for Vygotsky’s (1978) learning theoretical framework: they provide a repository for knowledge and skills and can be used to extend social interactions. Professional development that connects science teachers with experts can serve as a way for new learners to gain accessibility to the learning community (Fosnot & Perry, 2005; Tschannen-Moran & McMaster, 2009).

According to Vygotsky (1978), the process of mediated memory and learning start externally (tools, signs, or language), and with practice learning becomes internalized as mastery occurs. People use external tools (tools, signs, or language) in order to mediate learning. Once the mediated tool is no longer necessary, the learning becomes memory, a process called internalization. Ultimately, through continual interactions within a science-teaching and learning community, teachers will build content knowledge, increase their science self-efficacy (Desimone, 2011; Garet et al., 2001; Sinclair et al., 2010), and internalize good teaching practices that transpire within a CoP. Figure 1 illustrates this relationship.
To summarize the theoretical framework of Lave and Wenger’s (1991) model for learning, there are three key interlinking concepts: situated learning, CoP, and legitimate peripheral participation. According to Lave and Wenger, learning does not occur in a vacuum but is situated in a CoP. Through the acquisition of knowledge, learners move from the community’s periphery to the center in a process known as legitimate peripheral participation, which suggests that the growth of membership in a CoP is mediated by the accessibility that a newcomer has physically and socially.

**Experienced Community of Practice (eCoP)**

The success of a CoP relies on the experience of the members. Cadiz et al. (2009) propose that there are four dimensions in which a person experiences their CoP, and they created a survey to measure experienced community of practice (eCoP). The four dimensions of eCoP according to Cadiz et al. (2009) are:
• Open communication. Cadiz et al. (2009) suggest that without open communication, situated activities would not occur between CoP members, and as a result the community will dissolve. Open communication can be synchronous (face-to-face) or asynchronous (online, message boards, emails, and other virtual modes of interactions).

• Shared vocabulary. In a CoP, each member utilizes a common language or jargon to interact with other members in order to facilitate the transfer of information. With a shared vocabulary, the group establishes a sense of exclusivity, which Cadiz et al. (2009) say adds more value and motivation for an expert to attend and interact within a CoP. As long as the members grasp the shared vocabulary, the situated activities between members can continue. Wenger, McDermott, and Snyder (2002) assert that CoP becomes more effective if there is a shared vocabulary among members.

• Remembering previous lessons. Within a CoP, the main goal is to transfer best practices and lessons from member to member. For example, science teachers may discover that starting an inquiry lesson with a research question is vital for students to think critically and fulfills the science standards. The CoP becomes a great place to share the best science-teaching practices with other science teachers and archive them for CoP repository.

• Learning from each other. Through situated activities and legitimate participation, knowledge can be propagated between members within a CoP (Lave & Wenger, 1991). The purpose of a CoP is to exchange information between community members through group interactions. If the knowledge exchange is not valuable, the CoP becomes more of a social group or disappears (Lave & Wenger, 1991). A CoP
provides members a chance to learn from previous experiences and a place for new information to be applied to a common practice.

Cadiz et al. (2009) suggest that the more participants feel that their CoP has open communication, shares vocabulary, remembers previous lessons, and learns from each other, the better the eCoP for those participants. Figure 2 demonstrates the stages of development and the extent to which a member feels connected to their CoP. When participants are active, they are most engaged in their CoP. For the purpose of this study, it is important to measure the extent to which teachers feel connected to their science-teaching CoP.

![Figure 2. Stages of development for community of practice. From “Communities of Practice and Social Learning Systems” by E. Wenger, 2000, Organization, 7(2), pp. 225-246. Copyright 2000 by Sage Publishing. Reprinted with permission.](image)

**Education**

The need for a CoP in science-teaching has been demonstrated by data collected from the Eisenhower Professional Development Program (Garet et al., 2001). The study was based on a national sample of 1,027 math and science teachers. Based on the sample, the researchers found
empirical evidence that the best practices for professional development and teacher learning included:

- Learning opportunities that were sustained and intensive.
- Learning opportunities that focus on academic content.
- Learning opportunities that are more active and “hands-on.”
- Learning opportunities that are integrated in the daily school practices.

Results from other studies also support these best practice outcomes for effective professional development (Cohen & Hill, 1998; Supovitz & Turner, 2000). CoP can potentially serve as a foundation for providing professional development that follows the best practices indicated by the research findings.

Communities of practice connect science teachers who have the same goal of learning, knowledge sharing, and collaboration in science-teaching and science education reform. Teachers who participated in a CoP in science-teaching reported they have a better understanding of teaching science standards and were more comfortable teaching science-inquiry lessons (Fazio, 2009; Goodnough, 2010). While this research indicates the need for school partnerships with science experts, teacher collaboration learning, and learning continuity, these studies do not examine how being a part of a CoP affects teaching self-efficacy. There is limited research evaluating how being a part of a CoP affects teaching self-efficacy, although research has found that higher teaching efficacy leads to more effective science-teaching (Lumpe et al., 2012; Sinclair et al., 2010). Therefore, it is vital to examine how being part of a CoP can provide a ZPD through situated learning and how legitimate participation can affect science-teaching efficacy beliefs.
Virtual Teacher Self-Efficacy Beliefs

In recent years, virtual schools have become more prevalent in the United States (Mangieri, 2008) and are now considered a legitimate method to deliver key instruction and a part of the everyday landscape for education (Strother, 2002). Virtual schools are a form of distance education that delivers online courses or classes that cater to K–12 grade levels. As more school districts provide students with virtual learning opportunities, there is a growing demand for highly qualified teachers for that environment. While there are similar components to teaching within traditional school settings and virtual environments, little is known about the experience of virtual teachers in their CoP and their effects on science-teaching efficacy beliefs. Currently, there is only one study that examines the effects of professional development, peer coaching, and support on teaching efficacy beliefs for virtual teachers.

Mangieri (2008) examined the efficacy beliefs of 39 virtual high school teachers at a Mississippi virtual school and evaluated how various professional development activities affected perceived teaching efficacy. The study found that continual professional development had a positive effect on teaching efficacy. Furthermore, two-thirds of the participants reported that peer coaching had a positive influence on their teaching efficacy beliefs and online teaching practice.

Mangieri’s (2008) research on teaching efficacy demonstrates a need for more research on how virtual teachers can utilize their CoP to enhance their teaching efficacy beliefs. As mentioned in the previous section, teaching efficacy beliefs have been found to have a positive influence on teaching pedagogy and student achievement (Tschannen-Moran et al., 1998); therefore, understanding and enhancing teaching efficacy beliefs can potentially improve professional development, support, and training for virtual teachers.
Virtual Schools

This section provides a brief history on virtual schools and the need to study virtual teacher science efficacy beliefs. The National Center for Education Statistics (1999) defines distance education as classes offered in remote locations via audio, video, or computer technologies. These trainings and classes can be synchronous, asynchronous, or both. Web-based or Internet-based education is a form of distance education that utilizes the Internet for delivery of classes. Virtual schools are a form of distance education that delivers online courses or classes that cater to K–12 grade levels. Virtual schools can be run by public school districts, local education agencies, charter schools, colleges, regional agencies, and as nonprofit or for-profit (Simonson, Smaldino, Albright, & Zvacek, 2006). Virtual schools can operate as supplemental programs, full-time programs, blended online programs (courses that blend online and face-to-face instruction), or web-facilitated where between 1% and 20% of the content is delivered online (Watson & Ryan, 2007).

Since the launching of Utah’s Electronic High School in 1994, virtual schools have grown in the United States at a significant pace (Hawkins, Graham, & Barbour, 2012). Setzer and Lewis reported in 2005 that 72% of schools districts were planning to expand distance education in the near future. According to a “Keeping Pace 2012 Report” for the school year of 2012–2013, two new fully online schools opened in Iowa and New Mexico, which brings the number of states with online schools to 31 (Watson, Murin, Vashaw, Gemin, & Rapp, 2011). A major factor in the rise of virtual schools is due to education reforms that call for educational choice and individualized instruction, which online distance learning can easily provide (Mangieri, 2008). In addition, Mangieri reports that educational entrepreneurs are capitalizing on the call for educational choice and providing online alternatives to traditional K–12 public
schools. As more virtual schools are opening, there is also an increase in K–12 online student and teacher population (Archambault & Crippen, 2009).

With the rapid growth of K–12 online student and teacher population, the teacher’s role in an online environment will also expand (Archambault & Crippen, 2009; Hawkins et al., 2012). Davis and Roblyer (2005) add that the characteristics and behaviors of effective face-to-face teachers are similar to virtual teachers; however, online teachers have new roles, responsibilities, and instructional pedagogy that must be initiated to become an effective online teacher. As a result, guidelines and standards for instructional practices for online environments have been adapted from face-to-face settings that emphasize content knowledge, communication skills, and instructional design (American Distance Education Council, 2003; Higher Education Program & Policy Council, 2000; South Regional Education Board [SREB], 2008). DiPietro, Ferdig, Black, and Preston (2008) add that while these guidelines provide a foundation for understanding online instructional practices and course design in online environments, they do not address the teaching skills needed for virtual school environments. With new guidelines and standards for teaching online, professional development sessions have been created to train virtual teachers (SREB, 2008). According to a report by SREB (2008), most virtual schools provide professional training and development for newly hired virtual teachers regardless of their years of experience in traditional schools. However, Watson and Ryan (2007) report that while state-led virtual schools continue to expand, few states have set policies and requirements for online teacher professional development.

In 2009, the SREB created the first Standards for Quality Online teaching, which define the qualifications of an online teacher and standards necessary for “academic preparation, content knowledge, online skills and delivery" (SREB, 2009). The guidelines provide state
virtual schools with benchmarks for hiring, training, and evaluating online teachers (SREB, 2009). In their report, the board stressed the need for ongoing and continual professional development. Furthermore, SREB adds that teachers in traditional settings do not require technology as a primary means of communication in order to transfer content knowledge to their students, whereas with online teaching, technology skills are vital to transmit content knowledge to students. SREB recommends that ongoing professional development be offered to continue to strengthen virtual teachers’ technology skills.

The SREB report (2009) recommends that professional development for virtual teachers should include both formal and informal training, with activities that range from online courses, workshops, Webinars, online communities, and forums. SREB highlights the need for CoP online as these communities will provide opportunities for virtual teachers to share ideas, discuss, illustrate, and collaborate with each other. These types of professional development activities should be designed to be flexible because most virtual teachers have different schedules than do traditional teachers. Unfortunately, the growth of K–12 virtual schools is such a recent phenomenon that few studies are available that investigate best practices for teaching in online environments and professional development of virtual teachers (Cavanaugh, Gillian, Kromrey, Hess, & Blomeyer, 2004).

Since the virtual teaching position is relatively new compared to the traditional brick-and-mortar school environment, there is a dire need to provide professional support and training for virtual teachers. Davis and Roblyer (2005) reported that virtual teachers felt disconnected from their faculty members and their students. Hawkins, Graham, and Barbour (2012) examined teachers at a virtual high school in Utah, where teachers reported feeling isolated from other virtual teachers. According to the study, virtual teachers reported that even though the high
school teachers met monthly via synchronous professional development sessions, many teachers reported that they still felt isolated and alone because their colleagues were less accessible. According to Hawkins et al. (2012), “Teachers experience isolation as they struggled to learn from one another and to understand their performance compared in relation to others” (p. 137). Their study calls for a more collaborative online CoP where teachers can continue to share best practices and experience being part of a virtual online educator community.

In summary, with the expansion of virtual schools in the United States, there is a need to add to the growing body of literature on science-teaching efficacy beliefs as it pertains to virtual teachers. As more students are enrolling in virtual schools, more teachers are needed to deliver key educational standards (SREB, 2009). Since the growth of virtual schools is a recent phenomenon, more research needs to be conducted to gain a better understanding of how to train and retain teachers so they can provide high-quality instruction for students (SREB, 2009). As mentioned in the previous sections, teachers who participated in a professional CoP reported having higher teaching self-efficacy (Fazio 2009; Lakshmanan et al., 2011; Liu et al., 2010; Sinclair et al., 2010); therefore, it would be potentially beneficial to gain knowledge about the experience of virtual teachers in their CoP, and how their experience affects their science-teaching efficacy beliefs.

Summary

This review of literature supports the purpose of this study. The review highlighted the history of science education reform in the United States and revealed the need for teaching science inquiry instruction in order to build students’ science literacy. In addition, the review of literature provided a basis for understanding how to improve professional development by emphasizing research that details successful and unsuccessful professional development methods
and learning communities in order to build science-teaching efficacy. Detailed within this review was the theoretical framework for the study, which included social constructivism, community of practice, and self-efficacy. Furthermore, the review provided research relevant to teaching efficacy, particularly science-teaching efficacy, and the importance of a collaborative environment for teacher learning in the form of CoP. Finally, the last section provided the history of virtual online schools and the need for research on science-teaching efficacy of virtual teachers.

Further research employing quantitative methods is needed to add to the literature on science-teaching efficacy beliefs and the experience of CoP. While there has been some research that examined the relationship between the efficacy beliefs of teachers and their professional development, there has been little research that explores the relationship between science-teaching efficacy beliefs and CoP (Lumpe et al., 2012; Sinclair et al., 2010). Furthermore, only one study has found a positive relationship between virtual teachers’ teaching efficacy and continual professional development (Mangieri, 2008). It is reasonable to assume that teachers who participate in a CoP and possess science-teaching efficacy are related. Therefore, it is useful to examine if there is a significant correlation between the experience of community of practice and science-teaching efficacy beliefs.
Chapter Three: Methodology

This chapter will present the methodology used for this study. The first section will provide an overview of the research design. The next section will outline the data collection procedures, including sample selection and instrumentation. Next, the methods of analysis are presented for evaluating each of the research questions. The last section will be a summary of the chapter.

Research has indicated that teachers who were involved in science communities of practice reported experiencing higher teaching efficacy (Knapp, 2003; Sinclair et al., 2010). In addition, researchers have found that higher teaching efficacy leads to more effective science-teaching and better student achievement (Lumpe et al., 2012; Sinclair et al., 2010). The purpose of this study is to examine the extent of whether K–12 teachers teaching in a virtual school experience a community of practice in science education and how that experience affects personal science-teaching efficacy and science-teaching outcome expectancy as measured by Riggs and Enochs’ (1990) STEBI-A instrument. The study is rooted in theoretical frameworks from Lave and Wenger’s (1991) community of practice and Bandura’s (1977) self-efficacy beliefs.

Research Design

The researcher uses a descriptive, correlational, quantitative, nonexperimental survey design (Bryman, 2008; Creswell, 2009) for this study. “Quantitative research questions inquire about the relationships among variables that the investigator seeks to know. They are used frequently in social science research and especially in survey studies,” according to Creswell (2009, p. 132). Furthermore, the purpose of survey designs is to make descriptive assertions about a certain population (Babbie, 1998). In addition, correlational research used to assess two
variables of interest that may be related ultimately enables a researcher to draw conclusions that “allow the researcher to speak to some issue in the real world” (Hancock & Mueller, 2010, p. 55). For the present study, the relationship between teachers’ reported experiences in a community of practice and their science-teaching efficacy beliefs are examined through validated and reliable survey instruments.

While it is important to utilize theoretical concepts in research, Kumar (1999) states that concepts should be operationalized in measurable terms in order to reduce and eliminate variability in respondents’ understanding of the concepts. These measurable terms are called variables (Kumar, 1999). For the present study, the variables will be ordinal and will be measured quantitatively with a Likert scale. “The goal of Likert-scale is to measure intensity of feelings about the area in question” (Bryman, 2008, p. 146). For the purpose of this study, the areas are teachers’ reported experiences in a community of practice and their science-teaching efficacy beliefs. The independent variable is experienced community of practice measured by the Experienced Community of Practice Scale (eCoP) (Cadiz et al., 2009). The independent variables as measured by the eCoP scale are open communication, shared vocabulary, remembering previous lessons, and learning from each other. The dependent variables are science-teaching efficacy beliefs and science-teaching outcome expectancy measured by STEBI-A (Riggs & Enochs, 1990). Following are operationalized definitions:

- Experienced community of practice (eCoP): the measure of participants’ “subjective experience of membership in a community of practice” (Cadiz et al., 2009);
- Personal science-teaching efficacy beliefs: a science teacher’s confidence in her or his ability to successfully teach science;
• Science-teaching outcome expectancy: a science teacher’s expectations that effective science-teaching will influence his or her students.

**Measures**

As described in Chapter 1, this research study seeks to examine the extent of how virtual K–12 teachers’ experience in a community of practice in science education can affect their science-teaching efficacy. Experience of community of practice will be measured using Cadiz et al. (2009) eCoP instrument. The instrument has origins in Lave and Wenger’s (1991) concept of community of practice, which consists of people who share a common interest or profession coming together with the goal of exchanging knowledge through open communication (Lave & Wenger, 1991).

Science-teaching efficacy will be measured by using Riggs and Enochs’ (1990) STEBI-A instrument. The Science-Teaching Efficacy Beliefs Instrument-A (STEBI-A) is a survey designed by Riggs and Enochs (1990) to measure the level of science-teaching efficacy of in-service science teachers. The instrument measures science-teaching efficacy beliefs through two subscales: Personal Science-Teaching Efficacy (PSTE) and science-teaching outcome expectancy (STOE). It has its theoretical framework in Bandura’s self-efficacy social cognitive theory (Bandura, 1977) and Gibson and Dembo’s (1984) Teacher Efficacy Scale.

**Research Questions**

The purpose of this descriptive, correlational, quantitative, nonexperimental study is to determine if relationships exist between personal science-teaching efficacy, science-teaching outcome expectancy, and the identifying variables of experienced community of practice: (a) open communication, (b) shared vocabulary, (c) remembering from previous lessons, and (d) learning from each other. The following are research questions that will be explored in the study.
R1: What is the relationship between experience of community of practice and personal science-teaching efficacy (PSTE)? Which dimensions of experience in community of practice have the greatest effect on PSTE?

R2: What is the relationship between experience of community of practice and science-teaching outcome expectancy (STOE)? Which dimensions of experience in community of practice have the greatest effect on STOE?

Instrumentation

Three surveys were used for this research. The three surveys were combined into one on a web-hosting site on SurveyMonkey.com. SurveyMonkey is an online survey tool that researchers use to create surveys, then post them on the encrypted website or email them to participants (Creswell, 2009). In addition, SurveyMonkey can generate results and reports in the form of descriptive statistics and graphs. These results can be downloaded into a spreadsheet for further data analysis. The following section will describe the instrumentation that will be used in this research.

Demographic data sheet. The researcher uses Mangieri’s (2008) demographic survey that examined the teaching efficacy of virtual teachers. Her demographic survey will provide basic foundational information about virtual teachers. Permission to use and modify Mangieri’s demographic survey was gained through email communication (Appendix A); the demographic survey was modified to fit the purpose of this research. The modifications included omitting the first three questions from Mangieri’s demographic survey. For the purpose of this research, virtual teachers and virtual teaching settings are the primary concern. Mangieri’s first three questions pertain to teaching in face-to-face teaching environments. The data that will be collected in the present study will include community setting for online teaching position, years
of face-to-face teaching experience, years of online teaching experience, primary content area for online teaching position, types of professional development for online teaching, and gender. A copy of the demographic data survey can be found in Appendix B. This demographic survey will be added to SurveyMonkey.

**Experienced Community of Practice (eCoP).** Cadiz et al. (2009) developed two surveys that measured absorptive capacity (an individual’s ability to transform new knowledge into useable knowledge) and experienced community of practice (the degree to which a person is involved in a community of practice). While Cadiz and colleagues developed both an absorptive capacity (aCaP) scale and experienced community of practice (eCoP) scale in their research, only the eCoP scale will be measured in this study. As stated in Chapter 1, the purpose of this study is to determine if there is a relationship between the experiences of virtual teachers in their communities of practice and science-teaching efficacy beliefs; therefore, it is not necessary to use the aCaP scale. While individual knowledge is vital to developing science efficacy, numerous studies have found that teachers who are isolated from their professional community of practice are less likely to report high teaching efficacy and are less likely to teach science (Czerniak et al., 1999; Knapp, 2003; Sinclair et al., 2010). Therefore, eCoP was chosen to be the best instrument to measure an individual’s engagement in a community of practice.

The experienced community of practice scale (eCop) was developed to measure the “extent to which a person is engaged in his/her community of practice” (Cadiz et al., 2009). Cadiz et al. (2009) developed field-appropriate measures of experience in a community of practice. It has origins in Lave and Wenger’s (1991) concept of community of practice (CoP), which consists of people who share a common interest or profession with the goals of exchanging knowledge through open communication (Lave & Wenger, 1991).
The eCoP survey consists of a 7-point Likert-type scale for each of the items, anchored from 1 = *strongly disagree* to 7 = *strongly agree*. Each researcher independently created a pool of three to five items aligned with the strong theoretical framework. The four dimensions of eCoP are open communication, shared vocabulary, remembering previous lessons, and learning from each other. Cadiz et al. (2009) assert that people will experience the greatest sense of their community of practice if open communication provides opportunities to use the shared vocabulary and people are able to learn from each other and their previous lessons. The eCoP scale can be found in Appendix C.

**Science-Teaching Efficacy Belief Instrument-A (STEBI-A).** The STEBI-A is a survey designed by Riggs and Enochs (1990) to measure the level of science-teaching efficacy of inservice science teachers. The instrument measures science-teaching efficacy beliefs through two subscales: personal science-teaching efficacy (PSTE) and science-teaching outcome expectancy (STOE). It has its theoretical framework from Bandura’s self-efficacy social cognitive theory (Bandura, 1977) and Gibson and Dembo’s (1984) Teacher Efficacy Scale.

The survey is composed of 25 Likert-scale items, each of which has five response ratings, ranging from 5 to 1 accordingly: *strongly agree, agree, uncertain, disagree, and strongly disagree*. Thirteen of the items: 2, 3, 5, 6, 8, 12, 17, 18, 19, 21, 22, 23, and 24 measure PSTE, while the remaining 12 items: 1, 4, 7, 9, 10, 11, 13, 14, 15, 16, 20, and 25 measure STOE. The following questions were reverse scored to ensure consistent values between positively and negatively worded questions: 3, 6, 8, 10, 13, 17, 19, 20, 21, 22, 24, and 25. The STEBI-A can be found in Appendix D.
Reliability and Validity

To ensure the quality of the instruments, reliability and validity were considered. Bryman (2008) writes:

Both reliability and measurement validity are essentially concerned with the adequacy of measures, which are most obviously a concern in quantitative research. Internal validity is concerned with the soundness of findings that specify a causal connection, an issue that is most commonly concern to quantitative researchers. (p. 33)

The following provides reliability and validity results from the eCoP Scale and STEBI-A Instrument.

**eCoP scale reliability and validity.** Internal consistency and construct reliability were evaluated by interpreting the squared standardized factoring loading for eCoP constructs. Using a two-way random effect in SPSS and construct reliability resulted in a coefficient score of .769 for communication, .806 for vocabulary, .804 for remembering past lessons, and .852 for learning from each other. Each estimated construct reliability was measured against a .80 guideline. Although communication construct was below .80 construct reliability, the researchers argue that the shared variance between the constructs and their measures outweigh the shared variances between error variance (Cadiz et al., 2009).

Validity ensures the “integrity of the conclusions generated from a piece of research” (Bryman, 2008, p. 33). Results from path analysis to test criterion-related validity demonstrated that the measures are internally consistent, are related to the variables, and provide explanatory power (Cadiz et al., 2009).

**STEBI-A reliability and validity.** Criterion and content validity of the STEBI-A were pilot tested, and expert judges “contributed to the instrument’s content validity” (Riggs &
Enochs, 1990). The panel clarified dimensions for each item and anchored scale. Reliability was tested through a pilot and major study. Riggs and Enochs tested internal reliability by conducting Cronbach’s alpha in their pilot study. Cronbach’s alpha is typically used to test internal reliability, and the figure .80 is used to indicate an “acceptable level of internal reliability” (Bryman, 2008, p. 151). The PSTE subscale Cronbach’s alpha was .92, and the STOE subscale was .74 (Riggs & Enochs, 1990).

The major study included a sample of 331 in-service elementary teachers. The final data analysis resulted in Cronbach’s alpha of .92 PSTE subscale, and Cronbach’s alpha of .77 for STOE subscale. Riggs and Enochs (1990) suggest that possible explanations for the lower STOE subscale alpha score was that science-teaching outcome expectancy has been historically a difficult construct to define and measure, and teachers may lack science content knowledge. “Construct validity is based on the way a measure relates to other variables within a system of theoretical relationships” (Babbie, 1998, p. 134). To establish construct validity, Riggs and Enochs ran a Pearson $r$ correlation test. They found that all criteria were significantly correlated in a positive direction. The researchers concluded that the STEBI is a “valid and reliable tool” (Riggs & Enochs, 1990, p. 633) to examine science-teaching efficacy beliefs and teacher learning.

**Participants**

Participants will be drawn from a sample of convenience within an education management organization, which serves 85 counties within the 50 states. The population in this study will be teachers who taught science during the 2013–2014 academic school year for virtual schools managed by the education management organization. The participants are part of a subset of online teachers who teach science online in K–12 virtual schools. The secured list from
the education management organization will be accessible after Pepperdine Institutional Review Board (IRB). Approval for research has been given by the education management organization (Appendix E).

**Procedure**

Initial correspondence between the education management organization and the researcher regarding this project took place on February 21, 2014, when a proposal was sent to the director of academic services. The director granted approval for the research on March 10, 2014. Upon IRB approval, data collection occurred. An IRB exempt application was submitted to Pepperdine Institutional Review Board, where it was determined to meet exempt status as outlined in 45 CFR-46.1010 (b) (2) and CFR 46.117(c) since the research involves a survey with an adult population that is not protected (see Appendix F).

The teacher consent email (Appendix G) was sent to the director of academic services who sent the email to potential participants. The copy of the email includes the description of the study, indicates this study is strictly voluntary, and informs participants they can discontinue their participation at any point in the study. In addition, the email provides a list of participants’ rights and explains potential risks and benefits of the study. The only identifiable risk was the time participants must spend to complete the survey. Participants were informed that the survey would take approximately 30 minutes to complete. Furthermore, the survey indicated that participants should complete it after working hours as to not interfere with district time. Potential participants were also informed that the survey is completely anonymous. To protect the identity of participants, no information that could be linked to the participants’ identity was collected. The web link to the survey was embedded in the email; by clicking on the link, the participants tacitly gave approval to consent to participate in the present research.
The Demographic Survey, eCoP Scale, and STEBI-A instrument were combined as one survey on SurveyMonkey. The survey was self-administered through SurveyMonkey, which is a secure web-hosting survey site. Users accessed the secured link, and Secure Socket Layers (SSL) technology protected users’ responses, which were encrypted to ensure that all user data will be safe, secure, and available only to the researcher. Participants accessed the embedded web link to SurveyMonkey and indicated their answers by clicking on the appropriate radio buttons. A reminder email to complete the survey was sent to participants two weeks after the initial email. A subsequent reminder email was sent to participants one month after the initial email. The survey remained open for two months. The data was securely stored on SurveyMonkey, and the only person who has the password is the researcher. The researcher will also keep the data in a password-protected file on an external hard drive for in a locked file cabinet to which only the researcher has access. The data will be destroyed after five years.

Data Analysis

The SPSS statistical program was used for analyzing data. After the survey web link closed, the researcher entered the data and ran descriptive statistics for each variable, and determined the mean, standard deviation, and mode. Each statistical test will be one-tailed. In order to avoid a Type I error, the researcher will set an alpha at .05. Listed below are the hypotheses and the statistical test conducted.

Hypotheses 1 and 2

R1: What is the relationship between experience of community of practice and personal science-teaching efficacy (PSTE)? Which dimensions of experience in community of practice have the greatest effect on PSTE?
H1: There is a significant relationship between experience of community of practice and PSTE. The dimension of “learning from each other” measured by eCoP instrument will have the greatest effect on PSTE.

R2: What is the relationship between experience of community of practice and science-teaching outcome expectancy (STOE)? Which dimensions of experience in community of practice have the greatest effect on STOE?

H2: There is a significant relationship between experience of community of practice and STOE. The dimension of “learning from each other” measured by experienced community of practice (eCoP) instrument will have the greatest effect on STOE.

“Pearson $r$ is a method for examining relationships between interval/ratio variables” (Bryman, 2008, p. 327). Since Hypotheses 1 and 2 examine the relationship between the independent variable and dependent variable, a Pearson’s $r$ analysis was run to determine if a relationship exists between the variables for the first part of the hypotheses.

Because Hypotheses 1 and 2 have one dependent variable and multiple independent variables that may affect the dependent variables, a regression model was performed for the second part of the hypotheses. Babbie (1998) writes, “Survey researchers very often find that a given dependent variable is affected simultaneously by several independent variables. Multiple regression analysis provides a means for analysis such situations” (p. 308). In addition, a bivariate analysis was used to identify relationships between gender, geographic area, and teaching experience and PSTE and STOE.

The researcher hypothesizes that the dimension of “learning from each other” will have the greatest effect on PSTE and STOE. According to researchers (Akerson et al., 2009; Lave & Wenger, 1991; Wenger et al., 2002), learning from one another is a key factor in the success of a
community of practice. It is therefore worth examining if the dimension of “learning from each other” within the eCoP scale has the greatest effect on science-teaching efficacy beliefs.

For each hypothesis, the researcher performed tests to ensure that there were no violations of normality, linearity, and homoscedasticity.

**Ethical Issues**

In designing a research study that involves human participants, researchers must take ethical issues into account. The present research has been designed to ensure the rights, safety, and welfare of potential participants. The Institutional Review Board at Pepperdine University reviewed the research proposal to ensure that all necessary precautions were taken (Appendix F). Once Pepperdine approves it, the study will be reviewed the education management organization. Once approved by both boards, informed consent will be sent to participants. Participants were told that their participation was completely voluntary; in addition, participants were allowed to discontinue their participation at any point in the study. Anonymity of potential participants was addressed; as noted earlier, no identifying data will be linked to the identity of participants, and the survey was anonymous. Lastly, the only harm that is present in this study is participation time. Participants will be informed that the survey should be taken during nonworking hours.

**Limitations**

As with most research, there are some limitations to the present study. First, the participant population was gained through a sample of convenience. Therefore, the results cannot be generalized to the entire population of science teachers. Although, Bryman says a “convenience sample probably plays a more prominent role than is sometimes supposed” (2008, p. 183), Bryman also cautions that the data will not provide definitive findings. However, the
data can provide a “springboard for further research or allow links to be forged with existing findings in an area” (Bryman, p. 183). Second, the present research only examined correlations between variables; therefore, data does not identify causation. Third, self-reporting can be problematic as responses may reflect social desirability bias, which is “the distortion of data that is caused by a respondent’s attempts to construct an account that conforms to a socially acceptable belief or behavior” (Bryman, 2008, p. 699). However, surveys are efficient and cost-effective in data collection for a large population (Babbie, 1998); furthermore, the instruments have demonstrated reliability and validity.

Summary

This chapter details the methodology employed to conduct the present study. The researcher has provided a detailed description of this study, including: (a) the theoretical basis for conducting research, (b) the research design, (c) the instrumentation, (d) the reliability and validity of the instrumentation, (e) the research questions and hypotheses, (f) the participants, (g) the procedure, (h) the data analysis, (i) the ethical issues, and (j) the limitations of the study. It is the researcher’s hope that the data collected will provide a better understanding of how science-teaching efficacy beliefs can be affected within a community of practice in a virtual teaching community. The data may provide information that can help facilitate the development of professional communities of practice to assist virtual teachers in order to improve their science-teaching efficacy beliefs.
Chapter Four: Results

Results of the study are presented in this chapter. The first section provides participants’ demographics, and the next section records the findings related to the research questions, hypotheses, and analyses. The last section will be a summary of the chapter.

The purpose of this study is to examine to what extent teachers for a K–12 virtual school experience a community of practice in science education and how that experience affects personal science-teaching efficacy and science-teaching outcome expectancy as measured by Riggs and Enochs’ (1990) STEBI-A instrument. The study is rooted in theoretical frameworks from Lave and Wenger’s (1991) community of practice and Bandura’s (1977) self-efficacy beliefs. Three reliable and validated instruments were used to collect data: Mangieri’s (2008) Demographic Survey; Cadiz et al.’s (2009) Experience Community of Practice Instrument; and Riggs and Enochs’ (1990) Science-teaching efficacy Beliefs Instrument-A (STEBI-A). The researcher used a descriptive, correlational, quantitative, nonexperimental survey design (Bryman, 2008; Creswell, 2009) for this study. SPSS was used to analyze data.

Demographics

Participants were drawn from a convenience sample of teachers for online classes within an education management organization that serves 85 U.S. counties. The participants are part of a subset of teachers who taught science online in K–12 virtual schools during the 2013–2014 academic school year. An email with a web link to the survey was sent potential participants; the email was also embedded in the education management’s newsletter and community page. A reminder email was sent two weeks after the initial message. A subsequent reminder email was sent to participants one month after the initial email. The survey was hosted on SurveyMonkey and remained opened for two months. Of the 118 invited to participate via email, 58 completed
the first eight questions, but only 44 participants completed the entire instrument. Incomplete survey responses were omitted from the data analysis to avoid skewing the results.

A modified version of Mangieri’s (2008) demographic survey was used to collect information on participants’ teaching community setting, face-to-face teaching experience, online teaching experience, and professional development activities. The results for participants’ demographics are shown in Table 1. The majority of participants teach in suburban community settings (74%). Twenty-four participants (43%) have five to ten years of teaching in face-to-face settings; nineteen participants have more than 10 years of face-to-face teaching experience (34%); and two participants have less than one year of face-to-face teaching experience. The majority of participants have one to four years of experience teaching online (54%). Thirty-five participants (64%) indicated that they taught science as their primary content area, while five (9%) taught English, and seven taught math as their primary content area. The majority of participants (65%) taught high school. Participants were also asked to provide their gender, although this was an optional question. Most respondents (80%) were female.

The demographic survey also asked questions about the different types of teacher professional development activities. Results are shown in Table 2. The professional development consisted of initial training in online pedagogy, initial training in technology training, supported
mentorship, mandatory professional development workshops, optional professional development workshops, and informal professional development activities (Mangieri, 2008). Forty-seven respondents (85%) indicated that they received initial online technology training professional development, which prepared them technologically to teach online. However, only 39 teachers (71%) reported attending initial pedagogy training to prepare them to teach an online course.

Ongoing professional development results are as follows: 46 (84%) reported attending mandatory professional development; 39 teachers (71%) participated in optional professional development; 31 teachers (56%) reported participating in supported mentorship; and 31 teachers participated in informal professional development. Although the research questions did not specifically examine professional development activities, it would be beneficial in future studies to understand the different types of community of practice activities and training.

Results

The purpose of this descriptive, correlational, quantitative, nonexperimental study is to determine if relationships exist between personal science-teaching efficacy, science-teaching outcome expectancy, and the variables of experienced community of practice, which have been identified as: (a) open communication, (b) shared vocabulary, (c) remembering from previous lessons, and (d) learning from each other. As outlined in Chapter 3, STEBI-A (Riggs & Enochs,
1990) was used to measure personal science efficacy beliefs and science-teaching outcome expectancy, and the eCoP Instrument (Cadiz et al., 2009) was used to measure an individual’s engagement in a community of practice.

**Research Question 1 and Hypothesis 1.** The first part of Research Question 1 asked if there was any relationship between the experience of community of practice and personal science-teaching efficacy (PSTE). The PSTE mean scores were relatively high ($M = 56.77$ with a standard deviation [$SD$] of 7.66) and ranged from 30 to 65 with a maximum possible score of 65 (see Table 3). The eCoP means scores were also relatively high ($M = 71.47$) and ranged from 44 to 84, with the maximum possible score of 84. A Pearson correlation test was performed to determine if there was a relationship between community of practice experiences and PSTE. It was hypothesized that there would be a significant relationship between experience of community of practice and PSTE. The Pearson correlation test findings generated ($r = .364$; $p = .0245$). The $p$ value of the test was lower than 0.05; the null hypothesis is rejected at an alpha of 0.05. Therefore, the results show there is a significant linear statistical relationship between the teachers’ experiences in community of practice and PSTE. (See Table 3.)

The second part of Research Question 1 asked which dimensions of community of practice had the greatest effect on PSTE. It was hypothesized that the dimension of “learning from each other” measured by eCoP would have the greatest effect on PSTE. After running the Pearson correlation test, the findings were as follows: ($r = .100$; $p = .550$). The $p$ value was greater than 0.05, therefore the null hypothesis is accepted. Therefore, the results show the dimension, “learning from each other” did not have a significant statistical relationship with the teachers’ PSTE. (See Table 3.)

A regression model was employed to adjust for the effect of potential confounders: gender, community setting, face-to-face teaching experience, and online teaching experience. We tested for normality, linearity, and homoscedasticity. The initial regression analysis showed a violation of the normality assumption (Shapiro-Wilk $W = 0.836; p = 0.000$). Some outliers were also detected. To test for homoscedasticity a Breusch-Pagan / Cook-Weisberg test was used. No heteroscedasticity was detected ($F = 2.06; 0.160$), and VIF values did not indicate presence of collinearity. Due to the violation of normality, a robust regression model for PSTE and eCoP was estimated. Results showed a positive linear relationship between PSTE and eCoP after adjusting for potential confounders ($B = .333; p = 0.005$). Female also showed a positive significant relationship with PSTE ($B = 5.142; p = 0.028$).
**Research Question 2 and Hypothesis 2.** The first part of Research Question 2 asked if there is a relationship between the experience of community of practice and science outcome teaching expectancy (STOE). The STOE mean score reported was 38.13 with a standard deviation of 6.82 with a possible overall score of 60 (see Table 4). As mentioned earlier, the eCoP scale maximum possible score is 84; the mean score for the responses was relatively high ($M = 71.47; SD = 8.81$). It was hypothesized that there would be a significant relationship between community of practice experiences and STOE. A Pearson correlation test resulted in findings showing ($r = .438; p = .0008$). With an alpha level of .05, we reject the null hypothesis, and report that the results show there is a significant statistical linear relationship between the teachers’ experiences in community of practice and science-teaching outcome expectancy. (See Table 4.)

The second part of Research Question 2 asked which dimensions of community of practice had the greatest effect on STOE. It was hypothesized that the dimension of “learning from each other” measured by eCoP would have the greatest effect on STOE. After running a Pearson correlation test, the findings were: ($r = .351; p = .031$). With an alpha of .05, the null hypothesis is rejected. Therefore, the results show the dimension “learning from each other” did have a significant statistical relationship between the teachers’ experiences and their science-teaching outcomes (see Table 5).

Note: p value corresponding to the test with null hypothesis (r = 0)

A regression model was employed to adjust for the effect of potential confounders: gender, community setting, face-to-face teaching experience, and online teaching experience. We tested for normality, linearity, and homoscedasticity. The Shapiro-Wilk test for normality was accepted. (W = .980; p = .772). To test for homoscedasticity a Breusch-Pagan / Cook-Weisberg test was used, and no heteroscedasticity detected (F = 1.92; p = 0.1654). The regression model
showed a significant effect between STOE and eCoP ($B = .482; \theta = 0.007$). The other regressors were not significant.

**Demographic Analysis**

Bivariate analysis was used to identify relationships between gender, geographic area, and teaching experience and PSTE and STOE. Since there was a small sample, Mann-Whitney Wilcoxon was used. The Mann-Whitney Wilcoxon rank-sum test is a nonparametric test equivalent to the student $t$-test. According to the $t$-test, there were no statistically significant differences between male and female, at $z = 1.831; p = 0.0671$ for the variable PSTE. There were no gender differences in STOE scores, $z = -0.113; p = 0.9098$. A student $t$-test was used to compare rural and nonrural teaching communities, and no significant differences were found for PSTE ($t = -0.8476$). There was a low statistically significant difference between rural and nonrural teaching communities for STOE ($t = 0.0541$). The $t$-test shows significant differences in the mean of eCop scores between teachers with fewer than five years of online teaching experience and teachers with five or more years of online teaching experience ($t = 2.4902; p = .00173$). Furthermore, teachers with fewer than five years experience in online teaching scored higher in the “remembering previous lessons” dimension ($t = .0033$). The Mann-Whitney Wilcoxon score was consistent with the findings ($z = .0073$). Teachers with fewer than five years of online experience scored higher in “learning from each other” dimension ($t = .0081$). The Mann-Whitney Wilcoxon score was consistent with the findings ($z = 0.0322$).

**Summary**

This chapter presented the results from the study that examined the relationship between the experiences for teachers in online classrooms in a community of practice and their science-teaching efficacy beliefs. The hypothesis tested found that there was a significant relationship
between experiences within a community of practice and personal science efficacy beliefs. Furthermore, there was a significant relationship between experiences within a community of practice and science-teaching outcome expectancy. In addition, the dimension of “learning from each other” in a community of practice had a significant relationship between science-teaching outcome expectancy. The implication for these findings and recommendations for future research will be discussed in Chapter 5.
Chapter Five: Summary

Initiatives to improve student learning in science have been the focus of education reform (Bybee, 2014; NSB, 2012). These policy goals aim to increase student achievement and raise the international ranking of U.S. students in science from the middle to the top in the next decade (NSB, 2012). These reforms emphasize teacher’s professional development as one the main factors in influencing students’ achievement.

To improve teacher quality, professional development activities have focused on teachers’ communities of practice (Feiman-Nemser, 2001; NSB, 2012). Researchers have found communities of practice that focus on teacher collaboration and continuity have a positive effect on teaching efficacy and student achievement (Akerson et al., 2009; Liu et al., 2010; Vescio et al., 2008). Chase et al. (2001) found that teacher efficacy increased when they are involved in an active community of practice, which consists of new teachers, experienced teachers, administrators, mentors, and faculty teacher educators who met to reflect on their practices on a regular basis.

In recent years, virtual schools have become more prevalent in the United States (Mangieri, 2008) and are now considered a legitimate method to deliver key instruction and a part of the everyday landscape for education (Strother, 2002). With the rapid growth of virtual schools, it is important to examine science-teaching efficacy beliefs as they pertain to teachers. Because teachers in these virtual schools are held to the same teaching standards as teachers in traditional schools, it was beneficial to examine their community of practice experiences and how these experiences affect their science-teaching efficacy and student outcomes. This study explored the relationship of community of practice for science teachers in virtual K–12 schools.
with their teaching efficacy and student outcome expectations. The following section summarizes the results.

**Summary of Findings**

The purpose of this study was to examine whether K–12 teachers teaching in a virtual school experience a community of practice in science education and how that experience affects personal science-teaching efficacy (PSTE) and science-teaching outcome expectancy (STOE). The study is rooted in theoretical frameworks from Lave and Wenger’s (1991) community of practice and Bandura’s (1977) self-efficacy beliefs.

The present study used the SPSS statistical program for analyzing data. Listed below are the research questions and hypotheses for each.

R1: What is the relationship between experiences of community of practice and personal science-teaching efficacy (PSTE)? Which dimensions of experience in community of practice have the greatest effect on PSTE?

H1: There will be a significant relationship between experiences of community of practice and PSTE. The dimension of “learning from each other” measured by the Experienced Community of Practice Scale (eCoP) instrument will have the greatest effect on PSTE.

R2: What is the relationship between experiences of community of practice and science-teaching outcome expectancy (STOE)? Which dimensions of community of practice experiences have the greatest effect on STOE?

H2: There will be a significant relationship between community of practice experiences and STOE. The dimension of “learning from each other,” measured by Experienced Community Of Practice (eCoP) instrument (Cadiz et al., 2009), will have the greatest effect on STOE.
The independent variable is community of practice experiences, which will be measured by the eCoP (Cadiz et al., 2009). The independent variables as measured by the eCoP scale are open communication, shared vocabulary, remembering previous lessons, and learning from each other. The dependent variables are PSTE and STOE, measured by the Science-Teaching Efficacy Beliefs Instrument-A (STEBI-A) (Riggs & Enochs, 1990).

Experienced Community of Practice and Personal Science Efficacy Beliefs. The research findings found a positive correlation between a teacher’s experiences in a community of practice and PSTE, which supports Hypothesis 1. As presented in Chapter 4, surveyed teachers with higher scores on the eCoP reported to having a higher sense of PSTE ($M = 56.77; SD = 7.66$). In addition, the reported eCoP scores were relatively high ($M = 71.47; SD = 8.81$). The results show that there is a significant statistical relationship between the teachers’ experiences in community of practice and their personal science-teaching efficacy. However, the second half of Hypothesis 1 was not supported as there was no significant correlation between PTSE and the dimension “learning from each other” in the eCoP scale. However, the dimension “shared vocabulary” ($p = .007 < .05$) was positively correlated with personal science efficacy beliefs.

Personal science-teaching efficacy belief is the level of confidence a science teacher has in his/her ability to successfully teach science. The PSTE scores recorded in this study were fairly high, which may be because science was the primary subject taught by the majority of respondents ($M = 64\%$). Furthermore, a high percentage of teachers who took part in the study (43\%) have 5 to 10 years of experience teaching in face-to-face settings, and 19 participants have more than 10 years of face-to-face teaching experience (34\%). It can be asserted that the PSTE scores of the teachers who took part in this study were high because of their content knowledge and teaching experience. High PSTE scores were consistent with other research (Lakshmanan et
The teachers’ overall high PSTE scores in this study may explain why there was no strong correlation between those scores and the dimension “learning from each other.” The teachers who participated in this study may already have high levels of content knowledge and confidence in their ability to teach science and so may feel less inclined to need to “learn from each other” in a community of practice.

The eCoP scores for the teachers who participated in the study were also relatively high, so it can be asserted that they do experience a strong connection to a community of practice. According to Lave and Wenger (1991), a community of practice functions by sharing tools, routines, symbols, and vocabulary to accumulate knowledge. The strong relationship between “shared vocabulary” and PSTE (p = .007 < .05) is aligned with Lave and Wenger’s community of practice theoretical framework. A community of practice creates a “common lingo” (Cadiz et al., 2009) to interact with each other and facilitate transfer of knowledge. Cadiz et al. add that a “shared vocabulary may be a way for a group to establish sense of exclusivity” (p. 1041). They further suggest that having this exclusivity adds value and motivation for interaction within a community of practice. While teachers in virtual schools have common science vocabulary with teachers in traditional brick-and-mortar schools, they also rely heavily on technology, which has created a new vocabulary concerning the transfer of knowledge and communication. Teachers in virtual schools rely on technology as a primary means of communication with their students, so that in online teaching, technology skills are vital in order to transmit content knowledge to students (SREB, 2009). The use of different communication tools and curriculum may lead science teachers in virtual schools to experience a strong need to utilize their “lingo” to effectively exchange knowledge. Thus, the strong correlation in this study between PSTE and the
eCOP dimension “shared language” may demonstrate a unique exclusivity and connection to a community of practice for teachers in virtual schools.

**Experienced Community of Practice and Personal Science Efficacy Beliefs.** The research noted a positive correlation between a teacher’s’ experiences in a community of practice and STOE. Surveyed teachers reported overall lower STOE scores compared to their PSTE scores ($M = 38.13; SD = 6.82$). However, the average score was slightly above the midpoint of the STOE scale (which ranges from 12 to 60). Lower STOE scores compared to PSTE scores were consistent with numerous research findings (Lakshmanan et al., 2011; Posnanski, 2002; Ramey-Gassert et al., 1998).

Science-teaching outcome expectancy is the belief a science teacher has that effective science-teaching will influence his/her students. The lower STOE scores noted in this study might suggest that the virtual learning environment affects a teachers’ confidence about influencing students. Hawkins, Graham, and Barbour (2012) found that teachers in virtual schools felt isolated and disconnected from their traditional role as teachers. Since these teachers are not able to physically work with students in a traditional setting, they may feel less effective in directly influencing students. Ramsey-Gassert et al. (1998) found that external factors influencing teachers’ STOE scores were variables related to student motivation, school, and workplace, and parents and community. These variables were considered “barriers” to science-teaching. Teachers with lower ranges of STOE scores expected these “barriers” to affect their effectiveness as a science teacher (Ramey-Gassert et al., 1998). They further add that students’ motivation and family variables were related to STOE but did not influence effective science-teaching (PSTE).
The present study found that student motivation is a strong variable that influenced participants’ STOE scores. Students who attend school virtually must learn to self-regulate their learning autonomously. However, research found that students in virtual schools often lack the ability to master their own learning through self-regulation and self-discipline (Cavanaugh, Barbour, & Clark, 2009; Murphy & Rodriguez-Manzanares, 2009; Rice, 2006). Education research suggests that teachers in traditional classrooms play a vital role in motivating students who are less likely to have intrinsic motivation, but teachers in virtual schools may not be able to supply that motivation for their students, which may suggest why teachers in virtual schools reported having a lower STOE.

Teachers in virtual schools may also feel more isolated and less in control of their external factors, and therefore, may report a lower STOE. However, as mentioned in the previous section, the eCoP scores for teachers participating in this study were relatively high ($M = 71.47; SD = 8.81$). The results show a significant statistical relationship between the teachers’ reported eCoP scores and their expected outcomes in science-teaching. There was a significant correlation between the reported STOE scores and the dimension “learning from each other” in the eCoP scale ($p = .031 < .05$). The dimension “learning from each other” has a positive influence on teachers’ STOE because teachers may leverage their chances to learn from each other to mediate learning within a virtual learning environment. Teachers in virtual settings may feel isolated from their traditional role (Hawkins et al., 2012) and can benefit from a community of practice (White, 2010). White suggests that isolated practitioners can still create communities to share knowledge, connect, communicate, learn, and support each other. The high eCoP scores and positive relationship between “learning from each other” suggests that teachers who participated
in this study may be leveraging their learning experiences in the virtual teaching environment in order to overcome the external “barriers.”

**Summary.** The main hypotheses tested in this study were supported as significant relationships were found between experiences within a community of practice and personal science efficacy beliefs and science-teaching outcome expectancy. In addition, as predicted in Hypothesis 2, the eCoP dimension “learning from each other” had a significant relationship to science-teaching outcome expectancy. However, that dimension did not have a significant relationship to the participants’ beliefs in their personal science-teaching efficacy, unlike what was predicted in Hypothesis 2.

The results showed a significant linear statistical relationship between the science teachers’ experiences of community of practice and personal science-teaching efficacy. In addition, the study found that there was also a significant linear statistical relationship between teachers’ community of practice experiences and science-teaching outcome expectancy. The results from this study were aligned with numerous studies that found that higher teaching efficacy leads to more effective science-teaching and higher student achievement (Lumpe et al., 2012; Sinclair et al., 2010). Past research has shown that long-term professional development that includes hands-on experience, scientific experts, master teachers, and experiential applications are positively correlated with teacher content knowledge, teacher science efficacy, and time spent teaching science (Lumpe et al., 2012; NRC, 1996).

**Research Implications**

The present study found a positive correlation between experiences in a community of practice for teachers in virtual classroom settings and their science efficacy beliefs. The majority of the teachers who participated in this study attended initial professional development
mandated professional development ($M = 83\%$), informal professional development ($M = 56\%$), and participated in supported mentorship relationships ($M = 56\%$). While overall eCoP scores were high ($M = 71\%$), ongoing collaboration among members was reported as low ($M = 5\%$). The results indicate a need for continuing professional development, which should focus on online science-teaching pedagogy, practice, and content.

The virtual teaching environment creates a “barrier” that may affect teachers’ confidence in their students’ outcomes. Yoon et al. (2006) found that science teachers’ self-efficacy beliefs had a strong influence on their ability to successfully implement new science curriculum and choose the best instructional practice for effective teaching. Because teachers in this study reported lower levels of confidence in their students’ outcomes (STOE scores: $M = 38\%$), the data suggest that it would be beneficial for school leaders to create a formalized, structured training program, which includes mentorships, formal and informal learning opportunities, and professional time for teacher reflections to increase their science-teaching outcome expectancy. Furthermore, these learning opportunities will increase the community of practice experiences, which may help teachers feel less isolated and reduce external “barriers” to high student outcomes.

The release of the Next Generation Science Standards (NGSS) in April 2013 calls attention to education reforms needed at the national, state, and local levels (Bybee, 2014). The NGSS calls for dramatically reformed science curriculum (NGSS Lead States, 2013). As a result, there are education shifts that teachers must learn in order to successfully implement the NGSS. Such a change in science curriculum may affect their science-teaching efficacy beliefs.

Findings from the present study suggest that school leaders need to provide more opportunities for ongoing science content knowledge training and to maintain an active
community of practice in for teachers who teach science in a virtual environment. Palmer (2011) found that teachers who participated in science professional development reported increased PSTE. In order to become successful in implementing the reformed science curriculum, Palmer recommends that professional development include out-of-school experiences, workshops, mentorships, and apprenticeships with science experts. Because the main science reform shift is in engineering, administrators for virtual schools can invite engineers to participate in the professional development or pair teachers with engineers. In essence, school leaders can provide more opportunities for science teachers in virtual settings to participate in their communities of practice.

Researchers have found communities of practice that focus on teacher collaboration and continuity have a positive effect on teaching efficacy and student achievement (Akerson, Cullen, & Hanson, 2009; Fazio, 2009; Liu, Lee, & Lin, 2010; Vescio et al., 2008). Chase et al. (2001) found that efficacy increased when teachers are involved in an active community of practice, which consists of new teachers, experienced teachers, administrators, mentors, and faculty teacher educators who meet regularly to reflect on their practices. As mentioned in the previous section, results from this study indicated that experiences in a community of practice were correlated to the science-teaching efficacy beliefs of teachers for virtual schools. School leaders, administrators, and policymakers should create a holistic professional development program for such teachers. The program should include training and development of new teachers, continual ongoing professional development for in-service teachers, peer coaching, apprenticeship with experts, and encouragement for teachers in virtual settings to maintain an active community of practice.
Limitations and Considerations

The present study has several limitations. First, the responses were gained through a sample of convenience, and because the sample consists of teachers teaching science in a virtual setting, the study’s findings cannot be generalized to the entire population of science teachers. In addition, the response rate was relatively low \(N = 58\). Bryman (2008) writes:

The key point is to recognize and acknowledge the implications of the possible limitation of a low response rate. On the other hand, if your research is based on a convenience sample, ironically it could be argued that a low response rate is less significant. (p. 220)

Since the present study was gained through a sample of convenience, the response rate is not as important as it would be if the population were nonrandom. Several reasons may be responsible for the survey’s low response rate, including the fact that the survey was lengthy (37 questions with multiple-choice answers). The survey takes about 30 minutes to complete, and unfortunately, teachers received this survey at the end of the school year, a time when they are focused on state proficiency testing, report cards, and preparing to end the school year.

In addition, there were no incentives given to teachers to participate in the study. Researchers have found that the use of incentives significantly increases participation and the tendency for respondents to complete surveys (Bosnjak & Tuten, 2003; Deutskens, Ruyter, Wetzels, & Oosterveld, 2004; Sánchez-Fernández, Muñoz-Leiva, & Montoro-Ríos, 2012). Fan and Yan (2010) also reported that measures that take thirteen minutes or less to complete are ideal for influencing good response rates. Unfortunately, the combination of three instruments in this study created a long survey. The STEBI-A and eCoP remain valid survey instruments; however, for future research, incentives should be given to participants in order to increase response rates and likelihood of survey completion.
Second, the demographic study revealed that participants who completed the surveys are a homogenous sample consisting mostly of females (80%) teaching in a suburban (78%) setting. Therefore, the findings of this study cannot be generalized to the full population of science teachers as factors such as gender, age, and years of teaching science have been demonstrated to affect science efficacy beliefs (Angle & Moseley, 2009; Ramsey-Gassert et al., 1998). It would be beneficial for future research to examine a larger, more diverse sample in order to yield responses that may be used to generalize how experience of community of practice affects teachers’ science efficacy beliefs and outcomes.

Third, the present research is only examining correlations between variables; therefore the data cannot identify causation. While the present research found a positive linear relationship between teachers’ experiences within a community of practice and their beliefs about science-teaching efficacy and student outcomes, we cannot conclude that a community of practice was directly responsible for their scores. A qualitative approach may be useful in better understanding the dynamics between community of practice and efficacy beliefs.

Fourth, the present study utilized surveys to collect data. For this dissertation study, the surveys were the most efficient and cost-effective way to collect data, and the instruments used have demonstrated reliability and validity. But self-reporting can be problematic as there may be social desirability bias. In addition, another limitation is self-selection, there is a reasonable likelihood that teachers who participated in the study were more involved in the community of practice and may have higher personal science efficacy beliefs, which may skew the findings. Also, the measures used to gauge experiences of community of practice are relatively new; therefore, repeated studies utilizing the measures are recommended.
Future Research

Possible future research could examine the virtual teaching environment through a mixed-method approach. While quantitative research provides useful data to understand the relationship between community of practice experiences and science efficacy beliefs, qualitative research can provide a deeper understanding of why teachers for virtual classrooms hold their efficacy beliefs and what experiences they have in communities of practice. Since the researcher did not ask open-ended questions, there are future opportunities to explore the relationship between communities of practice and science-teaching efficacy beliefs through both surveys and interviews.

In addition, longitudinal research would be useful in providing a more comprehensive understanding of the beliefs and experiences of science teachers for virtual schools. Since the present research collected data for one snapshot of those teachers’ beliefs and experiences, it may not be an accurate representation of their average science-teaching practices. While the instrument asked participants for their “typical” and “average” beliefs and experience, teachers may respond differently in the beginning of the year compared to the end of the year. A longitudinal research study could provide a pre- and post-school-year comparison of eCoP and STEBI-A scores. This data may provide school leaders and stakeholders with information to help them implement, improve, and modify professional development activities in order to enhance the confidence and outcomes for science teachers in virtual settings.

With the rapid growth of virtual schools, it might be beneficial for other virtual learning communities to replicate the study. Because the present study examined only one education management organization, data cannot be generalized to the entire population of teachers in virtual settings. It would be beneficial for future research studies to examine a larger sample size
to see if the results are similar to those in this study. Furthermore, since teachers in virtual settings reported to having a lower STOE for this present study, it may be beneficial to examine a hybrid online program and traditional online program. The comparative study may provide useful data that could be used to design training programs and ongoing professional developments for those types of schools. In addition, future research can examine teachers with less experience in the science-teaching community; there may be implications that teachers with less experience may be more likely to rely on their community of practice to learn from each other.

**Conclusion**

The goal of this study was to examine the relationships between the experiences within a community of practice for teachers in virtual schools and their science-teaching efficacy beliefs. With the rapid growth of virtual schools, the roles and responsibilities of teachers in those schools are quickly evolving. In this study, it has been shown that community of practice experiences for science teachers in virtual settings are positively correlated with higher ratings of science-teaching efficacy skills. These results provided insights about those teachers’ experiences with communities of practice, which may lead to improvements in student science achievement for their students. In addition, the study added to the understanding of how factors within a community of practice could affect the science-teaching efficacy of teachers in virtual settings. It is imperative that school districts, administrators, and stakeholders in the success of instructional strategies examine and develop professional learning opportunities to support teachers in virtual K–12 settings.

In conclusion, results of this study indicate a need for school leaders and stakeholders to create professional development programs that are grounded in social constructivist theoretical
frameworks. The results from this study are in line with numerous research studies that have found that teachers who are involved in a community of practice report higher science-teaching efficacy beliefs (Fazio, 2009; Lakshmanan et al., 2011; Liu et al., 2010; Sinclair et al., 2010). School leaders should create programs that: (a) are long-term; (b) are offered continually; (c) are collaborative and involve activities between teachers, peer coaches, and school leaders; (d) create partnerships with science expert practitioners; (e) utilize professional development activities that are rooted in developing science self-efficacy beliefs; (e) promote the use of social networking sites to support the community of practice; (f) include opportunities for teacher self-reflection. In addition, leaders need to collect and obtain STEBI-A and eCoP reflections on a quarterly basis to analyze the effectiveness of professional development programs, which can help school leaders assess and analyze the effectiveness of the ongoing programs.

Future research will add to a growing body of knowledge related to teachers’ science-teaching efficacy beliefs and of virtual teaching settings. That research can lead to improvements in science-teaching efficacy beliefs, student achievement, professional development, and community of practice experiences for teachers, and to ideas about the development of better science-inquiry curricula.

Subject: Re: Demographic Survey

Yes, Phuong, you have my permission to use and modify my demographic survey from my dissertation.

Thank you,

[Redacted]
Appendix B

Demographic Questions

1. Indicate the community setting for your online teaching position:
   a. Suburban
   b. Urban
   c. Rural

2. Indicate your years of face-to-face teaching experience:
   a. Less than one year
   b. One to four
   c. Five to nine
   d. More than ten

3. Indicate your years of online teaching experience:
   a. Less than one year
   b. One to four
   c. Five to nine
   d. More than ten

4. Indicate the primary content area for your online teaching position with the education management company:
   a. English
   b. Math
   c. Science
   d. Social science
   e. Foreign language
   f. Elective

5. Identify the types of professional development for online teaching you have received (select all that apply):
   a. Initial training for online pedagogy
   b. Initial training for technology such as course management system (CMS)
   c. Supported mentorship
   d. Mandatory formal online professional development workshops
   e. Optional formal professional development workshops
   f. Informal professional development (such as reading relevant books and journal articles, participating in chat groups or discussion forums aimed at online teachers)

6. Enter the grade level/levels in which you are teaching science: _____

7. Please provide the following personal information (optional):
   Gender:
   a. Male
   b. Female
Appendix C

Experienced Community of Practice (eCoP) Scale

Items

Open Communication

cop.1: I feel comfortable communicating freely with others in my technical specialty.
cop.2: In my technical specialty there is an open environment for free communication.
cop.3: It is easy to communicate with others in my technical specialty.

Shared Vocabulary

cop.4: My technical specialty has a unique vocabulary.
cop.5: There is a common understanding within my technical specialty of the words and meanings that are used within the technical specialty.
cop.6: People outside my technical specialty might have difficulty understanding the vocabulary members of my technical specialty use to talk about the technology.

Remembering Previous Lessons

cop.7: Collaborating with other members of my technical specialty helps me remember things that we have learned.
cop.8: Participating in meetings with members of my technical specialty helps me to remember things that we have learned.
cop.9: Lessons learned from past experiences shared within my technical specialty are easily remembered.

Learning From Each Other

cop.10: I interact with others in my technical specialty with the intention of learning from them.
cop.11: I learn new skills and knowledge from collaborating with others in my technical specialty.
cop.12: Learning is shared among members of my technical specialty.

1. When a student does better than usual in science, it is often because the teacher exerted a little extra effort.  

2. I am continually finding better ways to teach science.  

3. Even when I try very hard, I don't teach science as well as I do most subjects.  

4. When the science grades of students improve, it is most often due to their teacher having found a more effective teaching approach.  

5. I know the steps necessary to teach science concepts effectively.  

6. I am not very effective in monitoring science experiments.  

7. If students are underachieving in science, it is most likely due to ineffective science teaching.  

8. I generally teach science ineffectively.  

9. The inadequacy of a student's science background can be overcome by good teaching.  

10. The low science achievement of some students cannot generally be blamed on their teachers.  

11. When a low achieving child progresses in science, it is usually due to extra attention given by the teacher.  

12. I understand science concepts well enough to be effective in teaching elementary science.  

13. Increased effort in science teaching produces little change in some students' science achievement.  

14. The teacher is generally responsible for the achievement of students in science.  

15. Students' achievement in science is directly related to their teacher's effectiveness in science teaching.  

16. If parents comment that their child is showing more interest in science at school, it is probably due to the performance of the child's teacher.  

17. I find it difficult to explain to students why science experiments work.  

18. I am typically able to answer students' science questions.  

19. I wonder if I have the necessary skills to teach science.  

20. Effectiveness in science teaching has little influence on the achievement of students with low motivation.  

21. Given a choice, I would not invite the principal to evaluate my science teaching.  

22. When a student has difficulty understanding a science concept, I am usually at a loss as to how to help the student understand it better.  

23. When teaching science, I usually welcome student questions.  

24. I don't know what to do to turn students on to science.  

25. Even teachers with good science teaching abilities cannot help some kids learn science.

IRB Approval

PEPPERDINE UNIVERSITY

Graduate & Professional Schools Institutional Review Board

April 16, 2014

Protocol #: E1113D05
Project Title: Virtual School Teachers’ Science Efficacy Beliefs: The Effects of Community of Practice on Science Teaching Efficacy Beliefs

Dear Ms. [Redacted]:

Thank you for submitting your application, Virtual School Teachers’ Science Efficacy Beliefs: The Effects of Community of Practice on Science Teaching Efficacy Beliefs, for exempt review to Pepperdine University’s Graduate and Professional Schools Institutional Review Board (GPS IRB). The IRB appreciates the work you and your faculty advisor, Dr. Sparks, have done on the proposal. The IRB has reviewed your submitted IRB application and all ancillary materials. Upon review, the IRB has determined that the above entitled project meets the requirements for exemption under the federal regulations (45 CFR 46 - http://www��ntraining.com/ohsrsite/guidelines/45cftr46.html) that govern the protections of human subjects. Specifically, section 45 CFR 46.101(b)(2) states:

(b) Unless otherwise required by Department or Agency heads, research activities in which the only involvement of human subjects will be in one or more of the following categories are exempt from this policy:

Category (2) of 45 CFR 46.101, research involving the use of educational tests (cognitive, diagnostic, aptitude, achievement), survey procedures, interview procedures or observation of public behavior, unless: a) Information obtained is recorded in such a manner that human subjects can be identified, directly or through identifiers linked to the subjects; and b) any disclosure of the human subjects’ responses outside the research could reasonably place the subjects at risk of criminal or civil liability or be damaging to the subjects’ financial standing, employability, or reputation.

In addition, your application to waive documentation of consent, as indicated in your Application for Waiver or Alteration of Informed Consent Procedures form has been approved.

Your research must be conducted according to the proposal that was submitted to the IRB. If changes to the approved protocol occur, a revised protocol must be reviewed and approved by the IRB before implementation. For any proposed changes in your research protocol, please submit a Request for Modification Form to the GPS IRB. Because your study falls under exemption, there is no requirement for continuing IRB review of your project. Please be aware that changes to your protocol may prevent the research from qualifying for exemption from 45 CFR 46.101 and require submission of a new IRB application or other materials to the GPS IRB.

A goal of the IRB is to prevent negative occurrences during any research study. However, despite our best intent, unforeseen circumstances or events may arise during the research. If an unexpected situation or adverse event happens during your investigation, please notify the GPS IRB as soon as possible. We will ask for a complete explanation of the event and your response. Other actions also may be required depending on the nature of the event. Details regarding the timeframe in which adverse events must be reported to the GPS IRB and the appropriate form to be used to report this information can be found in the Pepperdine University Protection of Human Participants in Research, Policies and Procedures Manual (see link to “policy material” at http://www.pepperdine.edu/irb/graduate/).

6100 Center Drive, Los Angeles, California 90045  •  310-568-5600
Please refer to the protocol number denoted above in all further communication or correspondence related to this approval. Should you have additional questions, please contact Kevin Collins, Manager of the Institutional Review Board (IRB) at gpsirb@peppderdine.edu. On behalf of the GPS IRB, I wish you success in this scholarly pursuit.

Sincerely,

Title of Research: Virtual School Teachers’ Science Efficacy Beliefs: The Effects Of Community of Practice On Science-Teaching Efficacy Beliefs Link

Investigator: Phuong Pham Uzoff, Pepperdine University

My name is Phuong Pham Uzoff, and I am a doctoral student at Pepperdine University. I am conducting my dissertation study regarding community of practice, science-teaching efficacy, and science teaching beliefs of virtual science teachers. As a teacher, I am well aware of how precious your time is, and I greatly appreciate your participation.

Before agreeing to participate in this research study, it is important that you read the following explanation of this study. The research study is being conducted as a partial requirement of the doctoral program. This statement describes the purpose, procedures, benefits, risks, discomforts, and precautions of the program. Also described are the alternative procedures available to you, as well as your right to withdraw from the study at any time. No guarantees or assurances can be made as to the results of the study.

Explanation of Procedures
You will be asked to complete a web survey that will take you approximately 30 minutes to complete.

Risks and Discomforts
There is minimal risk: the only potential risk identified with participation in this study will be the personal time you will invest in taking the survey. No compensation or medical treatments are available if injury occurs.

Benefits
There are no direct benefits from participation in this study; however, the benefits to the education profession may include a better understanding of how being part of a community of practice affects science-teaching efficacy and science teaching beliefs. It is hoped the results of this study can be used for professional development, collaboration, and instructional purposes.

Anonymity
All information and data collected during this study will be completely anonymous. No identifiable information about your identity will be collected in this study. The researcher will have access to the reported data, which will be kept in a password-protected file on an external hard drive for in a locked file cabinet to which only the researcher has access. All research materials will be kept for a period of five years and then destroyed.

Withdrawal Without Prejudice
**Participation is voluntary and you may choose not to complete the study.** There will be no penalty or loss of benefits if you decline or discontinue participation at anytime during the study.

**Costs and/or Payments to Subject for Participation in Research**
There will be no costs for participating in the research. Also, participants will not be paid to participate in this research project.

**Questions**
If you have any questions concerning the research you can contact Phuong Pham Uzoff, phuong.pham@pepperdine.edu, 310–883–4356. You may also contact my dissertation chairperson, Dr. Paul Sparks, Pepperdine University Graduate School of Education and Psychology, 6100 Center Drive, Los Angeles, CA 90045, paul.sparks@pepperdine.edu. If you have any questions regarding your rights as a participant, please contact Chairperson of the Graduate and Professional Schools Institutional Review Board, Dr. Thema Bryant-Davis Pepperdine University, Graduate School of Professional Schools of Institutional Review Board, Pepperdine University, Graduate School of Education and Psychology, 6100 Center Drive, Los Angeles, CA 900045, thema.bryant-davis@pepperdine.edu.

**Agreement**
By clicking the survey web link below, you are acknowledging that you have read and understand what your study participation entails and are consenting to participate in the study.

**Virtual School Teachers’ Science Efficacy Beliefs: The Effects Of Community of Practice On Science-Teaching Efficacy Beliefs Link**

After 2 weeks, a reminder note will be sent to you to complete and return the survey. Since this email will go out to everyone, I apologize ahead of time for sending you these reminders if you have complied with the deadline.

Community Life Counseling Center:

The evolution of a counselor training facility

Marta Garrett with H. Ty Leonard and Jason Martin

University of Mary Hardin-Baylor

Author Note

Marta Garrett, is an Associate Professor and Director of the Graduate Counseling Program. H. Ty Leonard is an Associate Professor and served as the Community Life Counseling Center Director for 8 years. Jason Martin is an Assistant Professor and current Director of the Community Life Counseling Center, University of Mary Hardin-Baylor. Correspondence concerning this article should be addressed to Marta Garrett, Director of the Graduate Counseling Program, University of Mary Hardin-Baylor, 900 College Street, Box 8006A, Belton, TX 76513 (e-mail: mgarrett@umhb.edu).
Abstract

Master's level counselor education programs typically require hands-on practicum and internship courses to enhance the development of students' counseling skills. Many programs use on-campus training facilities to observe student-counselors with real clients because this allows faculty to provide close supervision while they monitor the skill development of their counseling students. Creating a facility to enable these kinds of training opportunities requires considerable business and management knowledge and skills beyond the expertise of most counselor educators. Additionally, this type of facility demands a substantial initial and on-going budget allocation for space, personnel, equipment and training. This case study describes the evolutionary process of the Community Life Counseling Center (CLC) – the counseling training facility of a small, private religiously-affiliated university in Central Texas. This case study discusses the conception of the CLC more than a decade ago to fully-operational status today. Over the last nine years this facility has evolved and developed and is now a well-known and well-respected counseling clinic in the local community having been used to provide more than 11,000 clients sessions.

Keywords: community clinic, counselor education, training center
Community Life Counseling Center:
The evolution of a counselor training facility

Introduction

This article discusses the need for on-campus counselor training facilities and the evolution of one such training facility, the Community Life Counseling Center (the CLC), which was designed to support the training needs of a master’s level counseling program at a small, private, Christian university in Central Texas. The CLC was specifically designed to meet the training needs of the Graduate Counseling Program at University of Mary Hardin-Baylor (UMHB) which currently offers two 60-credit master’s programs in counseling – one in Clinical Mental Health Counseling (accredited by the Council for Accreditation of Counseling and Related Educational Programs [CACREP] since 2004 [originally accredited as a Community Counseling Program]), and one in Marriage, Family, & Child Counseling (currently seeking CACREP accreditation). The Community Life Counseling Center (the CLC) first opened on the edge of the UMHB campus in Belton, Texas, in August, 2005. Over the last nine and a half years, the CLC has provided counselor training opportunities for more 200 graduate counseling students and has made more than 11,000 free or nearly free counseling sessions available to clients in the community who might not otherwise have been able to afford mental health services.

Much of the history and details of the early evolution of the CLC was gathered in a series of interviews and discussion during the Fall 2013 and Spring 2014, with Dr. Raylene Statz, now retired, who served as the former Graduate Counseling Department Program Chair for more than a decade, and Dr. H. Ty Leonard, Associate Professor, and initial Director of the Community Life Center (who served in this role for eight years). More recent information regarding changes
and future directions for the CLC was gathered from Dr. Jason Martin, Assistant Professor, who serves as the current Director of the CLC (since August, 2013).

**Background**

The master’s level degree is generally viewed as the practitioner’s degree in the mental health field providing the vast majority of independently licensed mental health practitioners in the country (for example, there are approximately 26,000 independently-licensed master's level practitioners in Texas alone, and roughly 375,000 in the United States [American Counseling Association, 2011]). Training these master's level practitioners requires more than classroom instruction. Within the counseling profession, there is an expectation that graduates are capable of working with a variety of clients at the time they graduate (Engels, Barrio Minton, Ray, & Associates, 2010; also see counseling position descriptions posted on various job search websites). This level of ability requires significant hands-on training and skill development while in graduate school, under the close supervision of faculty. Typically, this advanced training is addressed through a series of two to four semesters of practicum or internship at the end of graduate study where students are provided with the opportunity to work with increasingly demanding clinical presenting issues under the supervision of a licensed faculty member (e.g., Graduate Counseling Program Requirements, 2014; Texas State Board of Professional Counselors, 2014).

In addition to the stated expectations regarding competencies and performance for professional counseling students and graduates (e.g., Engels, Barrio Minton, Ray, & Associates, 2010), this need for hands-on experience and training in counselor education is further emphasized by the accepted standards of ethical practice in the counseling profession (ACA, 2014; National Board of Certified Counselors [NBCC], 2012). The primary accrediting body
for the counseling profession (CACREP) mandates professional training opportunities be made available to counseling students within accredited counselor education programs (CACREP, 2009). While this accrediting body does not specifically require training programs maintain or operate an on-campus clinic for training purposes, the accreditation standards clearly address the need for training under close faculty supervision (for example, the opportunity to view taped counseling sessions and/or provide live supervision for counseling students [CACREP, 2009]). When a counselor education program relies on an off-campus site for training opportunities, they can face issues with inconsistency or lack of adequate supervision. Thus as counselor education programs grow, they often prefer to manage their own training environments so that they can ensure students are getting the widest variety of clinical experiences under appropriate supervision.

Institutions generally follow one of two models of operating a counselor training facility on campus: a university counseling center that serves the counseling needs of the undergraduate student body; or an outreach-based counseling center that serves the counseling needs of members of the larger community and not the university student body (Henderson, 2010; Mobley & Myers, 2010). Historically, programs that train master’s level practitioners primarily have chosen to offer services to community residents to avoid potential conflicts of interest and dual relationships with undergraduate students on campus (Mobley & Myers, 2010).

As accreditation of counseling training programs has become increasingly necessary for competitive job placement of graduates (Department of Defense, 2014), more training programs are seeking accreditation than ever before (CACREP, 2013). Currently there are 29 master’s level counseling programs accredited by CACREP in Texas (CACREP, n.d.) and this number will likely to continue to grow in coming years. One of the larger obstacles for programs who
wish to pursue national accreditation is the need to design, staff, manage, and fund a facility to adequately train their counseling students. This is particularly an issue for smaller, private, or religious institutions who are generally not able to rely on grants or funding from the state or federal government.

**Community and cultural influences on the CLC**

A deep understanding of local and institutional culture is paramount to creating a thriving counselor training facility. The history and culture of the Belton community and UMHB as an institution had a significant influence on the development of the Graduate Counseling Program and the affiliated counselor training facility, the Community Life Counseling Center. Belton, Texas is approximately a one hour north of Austin and one hour south of Waco. Fort Hood, the nation's largest military installation, lies directly to the west of Belton and has significant influence on the local area both in culture and in job opportunities. Belton is a small but rapidly expanding bedroom community in Central Texas. Over the last decade Belton has grown from a few thousand residents to now just under 20,000 people. In the area surrounding Belton (30 minute drive each direction), there are approximately 250,000 people [City-data.com, 2014]).

UMHB originated as a "sister college" to Baylor University in 1845 and remained a women's institution until 1974 (*Our history*, n.d.). UMHB (like the larger, more well-known, Baylor University) is affiliated with the Baptist General Convention of Texas. While these two institutions share similar historical experiences and structures, UMHB is perhaps considered more conservative than Baylor (as Baylor University went co-educational much earlier in its history). Today, UMHB has approximately 3,700 students - predominantly undergraduate students.
UMHB's Graduate Counseling Program first started as an extension of the undergraduate psychology department. As graduate level training became the norm for community-based counselors, the graduate program separated from the undergraduate department and began to focus more on counselor education. When the Graduate Counseling & Psychology program was formed the faculty retained only graduate level teaching responsibilities - making it the first and only stand-alone graduate educational program on the UMHB campus. At that time, the Department primarily offered graduate level programs that led to the Licensed Professional Counselor (LPC) credential and to certification in School Counseling (additionally, the Department retained a non-licensure track that had started as a preparatory track for students who wished to pursue doctoral education). As the Licensed Professional Counselor (LPC) credential became the license of choice for master's level practitioners in Texas, the decision was made to emphasize counselor education programs rather than psychology programs. Today, the Clinical Mental Health Counseling track (preparing graduates to apply for the LPC) remains the strongest and largest of the programs offered in the Graduate Counseling Program (accounting for more than 75% of the Department’s enrolled students).

When the Department decided to pursue national accreditation with CACREP, the remaining tracks that led to psychology credentialing were dropped and the faculty began to pursue a training facility to address the specific skill-development needs of counselors. Over time, several additional changes were made in the focus of the degrees offered by the Department to meet the changing needs of the local economy and job market. The Department added a second clinical focus in marriage and family counseling (initially this was offered with a Christian emphasis to complement the over-arching mission of the institution). Later, the Graduate Counseling Program dropped the word psychology from its title in an effort to better
emphasize its connection to the counselor education field. Still later, a second marriage and family track (with additional coursework in counseling children) was added in order to pursue national accreditation in the marriage and family field. And, most recently, the Academic Specialization track (that does not lead to clinical licensure) was renamed to clarify its purpose as a non-clinical professional studies program (see Figure 1 below for additional detail).

Figure 1. Time line of curricular changes in the Graduate Counseling Program

![Timeline of curricular changes](image)

Laying the groundwork for the CLC

The decision to move forward with plans to open the Community Life Counseling Center required significant preparatory work and planning. The Graduate Counseling Department prepared a lengthy proposal to demonstrate the need for the training facility to administrators. This proposal required describing the rationale for the training facility in detail - describing the need for the facility from both the counselor education standpoint as well as the potential benefit of adding an additional source for mental health care needs in the community. Budgeting issues
were considered to include the added demand on faculty, space, and facilities. Legal advice was sought to determine how to best minimize any possible risks to the institution. Support was sought from faculty, administrators, and the institution's Board of Trustees. Additionally, support was solicited from local churches and mental health providers to ensure future referrals. This pre-planning phase of the development of the CLC occurred over approximately a two year period of time.

Once approvals had been granted, an appropriate site was selected on the edge of campus to best meet the needs of the potential clients (transportation, easy to access from off campus, etc.). An older residence on the edge of campus was selected because of its location, size, price, and the desire to have a “homey” environment for the CLC (as opposed to a more sterile classroom-like building). Renovations to the building were required to make the building more suitable for client sessions. During the renovations and before opening the facility, all the client-based paperwork and processes were prearranged to minimize any potential surprises and risk. An advertising campaign was launched to announce to the community the purpose of the CLC and to bring in new clients. Finally, an open house was held and the Community Life Center was officially open for business in August, 2005.

The Community Life Counseling Center has been in operation three to four week days each week since August, 2005. CLC operating hours have been adjusted to meet demands based on the number of students enrolled in practicum and/or internship each semester. Initially, the CLC was open even during the semester breaks and over the Christmas holiday and Spring break; however more recently with a better understanding of client needs and other available resources in the area the CLC now has regularly scheduled closures for holidays and between semesters.
Budgeting issues

Considerable effort was made to estimate the expenses of opening and operating a community-based mental health center to train counseling students. However, as might be anticipated, this is almost an impossible task. With constantly changing dynamics such as variable student enrollments, changes in accrediting standards, changes in licensing requirements, developing technology in the field, and fluctuations of clients, the unknown factors clearly outweigh the known factors in managing this type of a training clinic. Despite researching and querying similar clinics and training programs about the potential costs involved, much of the necessary information regarding budgeting and managing this type of clinic came only with experience.

At the time the Community Life Counseling Center was opened, monies were budgeted for procuring a space (about 1,800 square feet) and renovating the space to include moving walls, upgrading wiring, and adding interior doors for privacy and security (see Appendix for pictures and floor plans). An initial outlay for videotaping equipment was budgeted at approximately $5,000. No additional faculty or staff lines were initially pursued. The remainder of the needed monies and materials were acquired through donations (to include furniture and other equipment such as toys for the play room). In recent years, significant additional funding has been added to the CLC operating budget for upgrading safety features and technology (both described in greater detail below).

The CLC was designed as a training facility and was never intended to be profitable. The administration of the University considers the services provided by the CLC as one of the many ways the institution gives back to the larger community (which is closely tied to the institutional mission and philosophy). The CLC does not accept any form of insurance which simplifies
many of the paperwork and money processes involved). It operates as a cash-and-carry business utilizing a sliding scale for services (from free to $20 per session). Student counselors come to a fee agreement during the intake process based on the client's ability to pay. If a client is unable to pay for services, the fees may be waived entirely, but clients are encouraged to pay something for their counseling (even if it is a nominal fee) because negotiating fees in counseling and paying for these services helps encourage client commitment to the therapeutic process, helps clients value the counseling services they receive, and promotes professional boundaries (e.g., Gutheil & Gabbard, 1993). All monies that are generated from CLC services go back to the general operating fund of the institution.

**Staffing**

As described above, when the CLC first opened in 2005, there was no dedicated faculty line or course reduction provided for the director. This was a sacrifice that was needed to gain the support of the administration (R. Statz, personal communication, October, 10, 2013). The position of director was given to a tenure-track junior faculty member who retained all regular faculty duties (to include a full-time graduate teaching load, research, office hours, university committee duties, etc.). The Director was expected to be on-site at the CLC at any time that students were seeing clients. In the event that class or other commitments made this impossible, other faculty would "sub" for the Director to provide required on-site supervision coverage. Unfortunately, in the early years of the CLC's operation, there were no added clinical adjunct positions funded or office/support staff positions available for the CLC.

For the first several years of operation, the CLC was essentially manned by a single faculty member - requiring an average of 60 or more hours a week. As the graduate counseling program grew, so did the demands on the CLC director. This burden quickly became
unmanageable and the CLC director was able to successfully lobby for, and acquire, first one and then a second part-time clinical faculty. These two part-time clinical faculty were hired as adjuncts initially being paid the equivalent of teaching one graduate level counseling course for approximately 20 hours of supervision work at the CLC each week during the semester.

In the early years, with no administrative support staff available, counseling students enrolled in practicum or internship were required to be available for administrative duties at the CLC (e.g., answering client inquiries, booking appointments, etc.). After the CLC had been open a couple of years the Director was able to successfully lobby for and acquire student worker assistance (graduate level student employees paid minimum wage who worked as administrative help at the CLC). By the seventh year of operation, the CLC had two student workers (each working approximately 12 hours a week). This assistance allowed for a smoother client-referral process and provided someone to greet new clients so that the clinical staff were not interrupted from their primary role of providing live supervision for counseling sessions.

**Continuing Evolution of the CLC**

**Furnishings.** Furnishings for this type of facility can be a costly endeavor to balance client comfort needs as well as durability. Over time, most of the donated furnishings in the CLC have been replaced with new and more generically appealing items (see Appendix for more detail). In this process, the overall decor of the CLC was updated to appeal to a broader group of potential clients. Consistency in furnishing between rooms was desired for both client comfort (should clients not be seen in the same room each session), and also for flexibility. For example, the group room chairs were replaced with roller chairs to allow more flexibility in how and where they can be used (they can be added to other counseling rooms for couples or larger family sessions or to seat an additional counseling student if needed in co-therapy).
In an effort to be able to better serve the growing number of child clients that are seen at the CLC, the play therapy room is currently being redesigned and moved to a less-central portion of the CLC for noise abatement. Old, worn out, or infrequently used play items have been removed, upgraded, and re-stocked. A substantial financial investment has been budgeted for this endeavor over the next three fiscal years. The sandtray room is also in the process of being converted to a more child-friendly space (currently it is used only for adolescents and adults due to safety issues with the shelving and the sandtray stand).

Due to the age of the CLC facility and the shapes of some of the counseling rooms, sound issues (e.g., echoes from the nine-foot ceilings, difficulty picking up soft voices on the microphones, etc.) continue to be a challenge. This has required multiple installations and adjustments of the recording equipment which can be costly; the installation of shag area rugs and sound panels in most of the rooms to absorb sound - also an added unplanned expense and the addition of white noise machines.

**Staffing.** Within a few years of opening the CLC, it became apparent that it was an unfair burden to place all the responsibility for managing the clinic on one faculty member. Attempts were made to divvy up the responsibilities of the Director position, but these were unsuccessful as it was a challenge to partition and delegate these kinds of duties while maintaining stability of policies and practices. To ensure students received consistent and adequate supervision and that client safety was not compromised, the Director essentially performed two full-time positions until the administration came to understand the need for a separate and new faculty line for a clinic director. Once budgeting for a new clinic director was approved, it took nearly a year to advertise and hire this position.
Currently, the CLC Director’s position is a nine-month, tenure-track regular faculty position (it is not designated as clinical faculty). The CLC Director position requires a minimum of 30 hours a week at the CLC and comes with a significantly reduced teaching load (the CLC Director teaches only one practicum or internship course each fall and spring). Because the CLC is open year-round, the CLC Director is paid by a separate contract for duties during the summer months. The CLC Director also has the ability to adjunct coverage hours at the CLC with the two part-time clinical faculty as described above (however, these clinical adjuncts now work 12-15 hours a week [versus the earlier 20 hours] for the equivalent pay of teaching one graduate level course). Thus, during the busier semester when practicum is being taught (during practicum, students gain all of their experience hours at the CLC and practicum students typically require more supervision than more advanced internship students), the CLC is staffed by the CLC Director and both of the clinical faculty. In the remaining two semesters, when the CLC is being used by internship students (who are required to gain most of their supervised experience at off-campus, community-based sites), the CLC Director augments coverage at the CLC with one of the two part-time clinical faculty (these two clinicians alternate semesters so they each work 2 of the 3 semesters per calendar year). In terms of student support staff, the CLC now has 2 student workers (as described above) who each work 12 hours per week at the CLC for minimum wage; and one Graduate Assistant (GA), assigned to support the CLC with 15 hours a week (the GA position also comes with partial tuition remission).

**Technology.** The initial design for viewing and recording student counseling sessions included ceiling mounted cameras and microphones in each of the four counseling rooms which were attached to VHS recorders and television sets in the viewing room. Over the years, several updates were made to this recording and viewing system (as was required due to changes in
technology and failures in the recording processes). Within a few years, the VHS format became obsolete and the system was overhauled to rely on DVDs.

In 2013, when the new CLC Director was hired, the administration also supported a major modernization of the CLC facilities to include significant renovations and technology updates (see Appendix for details and photos). At this time, the overall space in the CLC was redesigned to allocate six counseling rooms in what had previously been used for four counseling rooms. Additionally, the back hallway space was also equipped for session viewing and recording to allow it to be used for group counseling sessions, if needed. Space was taken from the large waiting area to create a new, smaller receptionist area. The previous receptionist area (which had been larger than actually needed) was redesigned to be used as a student-counselor work space and outfitted with five new computer works stations so students could work on client notes and files on site.

Considerable effort has been made to continually upgrade the technology used at the CLC to ensure students are gaining technological competencies as is expected in the counselor education field and will be expected of them in the counseling field (Jencius, Poynton, & Patrick, 2007). During the renovations and enhancements made to the CLC in 2013, all of the session taping and recording equipment was upgraded to digital format. This included digital recording equipment for seven counseling spaces as well as six digital viewing stations in the supervision and viewing room (the seventh space, the group room, is only used when the back two counseling rooms are not in use, thus no more than 6 sessions can take place at one time). In addition to the purchase of all new recording and viewing equipment, upgrading digital required complete rewiring of the CLC facility. Finally, two large-screen televisions were added (one to the CLC Director's office, and one in the viewing room). These two additional viewing stations
allow faculty supervisors to view all seven session rooms at the same time (with our new NICE system [see NICE, n.d. for additional detail]), or to focus on one session and play this session to provide live supervision lessons with students in the viewing room (or in the Director's office).

In order to comply with advances in the profession and new recommendations regarding electronic health records (EHR), a new digital recordkeeping and client scheduling program was purchased for the CLC in 2013 (see Titanium, n.d.). This upgrade required a substantial budget allotment as well as on-going financial support for yearly maintenance fees; however, the faculty felt this has been balanced by the ability to adequately prepare students for similar technology they will face in off-campus internship sites and later in employment (Jencius, Poynton, & Patrick, 2007). As part of this technological upgrade, a client input-station was added next to the receptionist center - so new clients can enter their own intake data into the system. Student counselors can pull this data up on a tablet computer which they can take into the intake with them. This digitalization of the records and processes at the CLC has helped reduce the risk of accidental breeches by limiting paper records.

**Safety.** As times have changed, so has the need to upgrade safety features in the CLC. Due to the increased need for safety planning across all universities, the CLC now undergoes a yearly safety inspection to ensure the facility maintains readiness for the variety of potential crises and emergencies that could arise there at any time. CLC faculty and staff are now trained regarding safety issues specific to the CLC every fall. Over the last two years, several new CLC procedures were implemented to increase the safety of CLC operations: All new practicum students now undergo a mandatory safety training before beginning any clinical work at the CLC (in addition to clinic orientation and mandatory privacy/record management training); the back door of the clinic now remains locked at all times and all students and staff are required to enter
the facility from the main front door (where clients enter); and the viewing room door now remains locked during all times when clients are in the CLC.

Additionally, in the last two years, several safety features were added to the CLC to include: New and brighter lighting in the central hallways; an upgraded alarm for the building; two panic buttons for student and staff use; additional mobile panic buttons (that can be taken into session rooms with student counselors if desired); an internal phone system (with two-way phones in each counseling room connected each room to the viewing/supervision room); a camera in the waiting room so that faculty and campus security can view this area if needed; and an identification card lock has been added to the viewing room door, requiring students and staff must slide their identification cards to enter.

**Clients.** Initially when the CLC opened, the clients served were mostly referrals from the local churches, overflow for county mental health services, and local probation services (basically individuals, couples, and families who had no other options or resources for counseling and mental health services). Now, as the reputation of the CLC has grown, more clients are self-referrals and referrals from private practitioners in the area. Overall, clients seen at the CLC include a wide variety of presenting issues such as: systemic family dysfunction, couple issues, parenting issues, developmental and adjustment issues, biogenic mental health disorders, mental health disorder, mental health disorder with co-morbid substance abuse, spiritual issues, and mandated court referrals. This varied list of presenting issues has provided student counselors with a plethora of training and professional development opportunities.

**Future Directions**

By necessity, the CLC is a flexible and dynamic facility. It continues to evolve as the needs of the counseling program it supports have varied (e.g., changes in the focus of the
degrees), as the faculty has changed, and as client needs have changed. Currently, the CLC is undergoing a slight title revision and is in the process of pursuing institutional permission for a logo that will be separate and distinct from approved institutional logos. Whereas the CLC previously had been named the Community Life Center, the name has recently been changed to the Community Life Counseling Center (to emphasize that the facility provides counseling services). The acronym CLC will be retained as it has recognition in the community among referral agents. A tag line of "Outreach at UMHB" has also been proposed to emphasize that the CLC serves the community and not the UMHB student body.

Summary

As described, the Community Life Counseling Center is a dynamic and flourishing counselor training facility which is constantly evolving to meet the changing training needs of the clientele it serves and the Graduate Counseling Program. The two most constant themes in the successful establishment and management of the CLC could easily be described as strong administrative support and faculty dedication. Without complete support from the University administration, the CLC would never have made it past the planning phase. Administrative support is considerably more complex than mere budget support (although clearly, adequate budgeting is essential). Opening the CLC required long-term vision and considerable administrative commitment to fully understand the potential value that this type of training facility could bring to the counselor education program and how this benefit would outweigh the potential risks (e.g., legal liability and added operational costs). However, administrative support alone cannot guarantee the success of a training facility like the CLC. This type of training facility takes considerable faculty dedication, time, and effort to be successful. Faculty must have a strong interest not only in training students, but in clinical work as well. It takes a
consistent team effort to provide faculty coverage and supervision to operate a fully-functioning mental health clinic manned by student-counselors and to address the challenges that emerge (not only client situations but also questions about student competency). Finally, faculty must seek continuous improvement to ensure the facility and training being offered to students continues to mirror the growth and technological advances in the counseling profession.

THE EVOLUTION OF A COUNSELOR TRAINING FACILITY / COMMUNITY-BASED COUNSELING CENTER: LESSONS LEARNED

Dr. Marta Garrett, LPC-S, LMFT-S, RPT-S,
Graduate Counseling Program Director
University of Mary Hardin-Baylor,
Belton, TX

UNIVERSITY OF MARY HARDIN-BAYLOR, BELTON, TX

- Small, private, Christian institution affiliated with the Texas Baptist Convention (3,400 students)
- Historical girls school (1845; sister school to Baylor)
- Primarily undergraduate (3,000 undergraduate students)
- Small town (< 20,000)
- 1 hour from Waco; 1 hour from Austin
- 20 minutes from Ft. Hood
LAYING THE GROUNDWORK...

3

- Demonstrating the need (in the community & to support the counseling training program)
- Getting the support of the administration & Board of Trustees (more than just financial support)
- Preparing the paperwork & processes (minimizing risk to the institution)
- Advertising and getting clients (initially & on-going)

COMMUNITY LIFE COUNSELING CENTER
Grand Opening
August, 2005
THEN & NOW:

Early 1900s

COMMUNITY LIFE COUNSELING CENTER (TODAY)

- Open 9 ½ years
- 11,000+ client sessions
2005:
- No dedicated director
- No course reduction for faculty
- No office worker support
- VHS tapes
- Furnished by donations

2006:
- Addition of the director's office (wall separating the viewing room)
- Initial upgrade to cameras & viewing equipment (still VHS)
2006: Waiting area

2006: Receptionist area
2006:
Group room /
Large
counseling
room

2006:
Back hall area
2006:
Play therapy room

2006:
Viewing area
- Analog equipment
- 4 viewing stations
- VHS; then DVDs
- (4 counseling rooms)
**Changes in 2013:**

- Full-time director (took more than one year due to budget cycle)
- Digital upgrade of equipment and wiring
- Digitizing records: Titanium & NICE
- Additional counseling rooms (6 total + group room); and additional viewing stations
- All new furniture
- Multiple session viewing in director’s office
- 5 student computer work stations
- New/smaller receptionist area
- Better sound-proofing (on-going effort)
- Additional student workers (to assist with scheduling, answering phones, etc.)
- Once-a-year schedule (practicum in the spring; internship in fall-spring sequence)
- Recognition of CLC Student-of-the-month
2013: COUNSELING ROOM 2
(Other half of old play therapy room)

2013: COUNSELING ROOMS 3 & 4
(Mirror image rooms – each with 3 seats)
2013: COUNSELING ROOM 5
Sandtray counseling (teens & adults only)

2013: BACK HALL / GROUP ROOM
- DVD viewing area for psycho-educational work
- Camera and microphone equipped for group sessions
- Chairs can be moved to other areas as needed
**2013: VIEWING ROOM**

- 6 viewing stations (on computers)
- Desk for GA or supervisor (with phone and computer)

**2013: DIRECTOR’S OFFICE**

- Ability to see all sessions at once or listen to any one room:
- Room for supervision
2014: TECHNOLOGY

- Better AC (to counteract heat from all the electronic equipment);
- Phones for added supervision;
- A second large viewing TV.

THE FUTURE?

- Better play therapy space?
- Continuing adaptations for safety and technology
One of the many challenges that confront pre-service teacher educators is the resistance to change that many teaching candidates bring to their preparatory experiences in colleges of education. For as many as 16-21 years prior to commencing their formal preparation for the classroom, pre-service teachers watch what their teachers do in the classroom, a compendium of experience known as the apprenticeship of observation (Lortie, 1975). As a result of this apprenticeship, pre-service teachers develop very firm ideas and convictions about teachers and teaching, attitudes and beliefs that are very difficult to alter or amend, even when conflicting evidence is presented (Borg, 2004; Brouwer & Korthagen, 2005; Holt-Reynolds, 1992; Kagan, 1992a, 1992b; Nissani & Hoefler-Nissani, 1992; V. Richardson, 1990, 2003). Furthermore, there is a well-documented discrepancy between research-based practices and the instructional methods that comprise the varying experiences that pre-service teachers have as students (Borg, 2004; Holt-Reynolds, 1992; Kagan, 1992; Kennedy, 1998; Richardson, 1990, 2003).

In this presentation I review a qualitative study I conducted of six pre-service teachers who were each paired with a high school writing partner to see if a correspondence obtained between the pre-service teachers' stated attitudes and beliefs about writing, writing instruction, and responding to student writing and the response strategies they employed as part of a field experience component of an introductory course in secondary writing instruction. Additional targets of inquiry included the pre-service teachers' negotiations of their concurrent positions as students and teachers towards the development of their professional identities as well as the
perceptions of the high school students of the pre-service teachers’ methods of responding. Social Positioning Theory was utilized as an interpretive lens for discovering how pre-service teachers and their high school counterparts were negotiating rights and responsibilities during the revision process.

Three data sources were utilized in this study: (1) a 50-item Likert-style survey/questionnaire with seven open-ended questions, administered pre- and post- semester, (2) copies of essays or creative research pieces (two drafts per participant) written by the high school students and marked and commented upon by the pre-service teachers, and (3) audiotaped interviews of all pre-service teacher and high school student participants, conducted after the field experiences. Methods of analyses included coding the Likert-Style surveys for patterns in dispositions towards writing and instruction, using HyperResearch software to organize and code the interview transcripts, and classifying/interpreting the pre-service teachers’ written commentary utilizing two reflective models that represent “teacher/student responsibility for revision” and “degrees of control.”

Although there was a correspondence between the stated attitudes and beliefs and response styles in four of the six cases, it was discovered that the pre-service teachers’ backgrounds as student writers were more reliable as indicators of their initial response strategies, obtaining a correspondence in all six cases. In two cases, pre-service teachers working with reluctant writers altered their response strategies from their stated attitudes and beliefs between the first and second drafts (and first and second writing conferences). These changes in strategy and methods indicate that instructional circumstances can supersede attitudes and beliefs as markers for instructional practice where novice teachers interpret classroom contexts as being limiting or otherwise uncertain. In only two of the six cases does a correspondence obtain between the pre-service teachers’ written commentary on the high school students’ assignments and their willingness to position themselves as “teacher” during the writing conferences, indicating that written response is only one of several factors in determining how pre-service teachers’ are negotiating their developing identities in the classroom.

Implications for writing instruction and teacher education are discussed.

Biographical Information

JT Cox has taught English language arts in secondary schools in Arizona and Florida. He completed his Ph.D. in English Education at Florida State University. His research interests include issues in writing instruction, especially the attitudes and beliefs of writers and writing teachers, response theory and practice, and pre-service teacher development. He currently teaches courses in education in Valdosta, Georgia. Contact: jtcox@valdosta.edu

The Adventures of ADDIE—The Unsinkable Model of How We Get Things Done

Keith B. Hopper, PhD
Southern Polytechnic State University

Abstract
The pervasive ADDIE model of instructional design guides much of what professionals do in a remarkably wide venue. Working in often insular silos of work, we may be startled to find that fields as different as instructional design and nursing independently found their way to a core model of “getting things done.” This paper reviews the evolution of this core model across disciplines to present remarkable similarities. This comparison reinforces the eminently sensible way that intelligent humans accomplish worthy work, and reveals tools and techniques developed in some fields that may transfer to others far away.

Introduction
Trainers, teachers, information designers, and instructional designers are aware of the the eminent ADDIE model of instructional design, the source of most of the 100+ models of instructional design (Gustafson & Branch, 2002):

- **Analyze**—learner characteristics, task to be learned
- **Design**—develop learning objectives, choose instructional approach
- **Develop**—create instructional materials
- **Implement**—deliver instruction
- **Evaluate**—assess efficacy

Ships steaming parallel courses through the night, the venerable ADDIE model of instructional design reveals surprising similarity to disciplines and fields outside its presumed borders. These include the large fields of human performance technology (HPT), project management (PM), and even instructional design (ID). Side-by-side comparison of the major models of practice in these disparate fields shows overlap often congruence. Presumably developed independently, with little modification these foundational models can be substituted one for another.

Getting Stuff Done
Beyond a philosophical curiosity, this epiphany (for the author) suggests a new line of academic inquiry that may return surprising and undiscovered pearls and “lessoned learned.” This is because many competent people have spent a good bit of time and energy trying to tease out how to get stuff done.
And in many cases there is transferability that asks to be explored across disciplines. Nurses want to achieve optimal patient outcomes, project managers want to build things on time and according to specifications, instructional designers want to develop effective courses and tools—and although the goals, training, background, work environment and clothing varies—the several professional models and methods are strikingly similar. The intent is to establish a framework of commonality and seek tools, techniques, and hard won lessons learned that might transfer across disciplines.

The Usual Suspects

Project Management

Project Management (PM) is the application of knowledge, skills and techniques to execute projects effectively and efficiently. It’s a strategic competency for organizations, enabling them to tie project results to business goals — and thus, better compete in their markets. (Project Management Institute)

PM is a well-established discipline with a dynamic professional organization (PMI.org) and a rigorous and formidable body of knowledge. PM is also a professional practice focus in many professions such as the various engineering fields, construction, and computer software development. The Project Management Institute provides various levels of professional credentialing and publishes a widely acknowledged, authoritative repository of PM expertise, the Project Management Body of Knowledge (PMBOK). Of several models of PM, the PMBOK model is best known and defines the following PM processes (“IEEE Guide Adoption of PMI Standard a Guide to the Project Management Body of Knowledge,” 2004):

1. Initiating—The project’s scope is established and the project team assembled.
2. Planning—Project requirements are acquired, detailed plans are made, and a schedule is established.
3. Executing—Project requirements are further developed iteratively and the project is continuously monitored and managed.
4. Controlling—Resources and project team member assignments are adjusted to keep the project on schedule with optimal efficiency.
5. Closing—The project gets final quality assessment, the project team reviews the endeavor and records lessons learned, and the project is brought to closure administratively and by conveying project deliverables.

PM is a field that reveals a near mysterious aspect in successful human endeavors—that the tools and techniques of PM, and the invaluable lessons learned, are transferable to seemingly unrelated projects. Successful and unsuccessful projects from software design to skyscraper construction to producing the international Olympics show remarkable similarity. Project managers share a highly codified toolset of processes with their underlying challenges, solutions, and terms. A project must be completed by a deadline, within budget, and according to specifications (Wysocki, Jr, & Crane, 1995). PM is described as
a “cascading” process, where one phase or process must be complete or well along before the next may begin.

**Human Performance Technology**

**Human Performance Technology (HPT)**

Human Performance Technology (HPT) is a systematic approach to improving productivity and competence, uses a set of methods and procedures — and a strategy for solving problems — for realizing opportunities related to the performance of people. More specific, it is a process of selection, analysis, design, development, implementation, and evaluation of programs to most cost-effectively influence human behavior and accomplishment. It is a systematic combination of three fundamental processes: performance analysis, cause analysis, and intervention selection, and can be applied to individuals, small groups, and large organizations. (International Society for Performance Improvement)

HPT in adult world of adult learning—corporate, government and military— is considered the parent field of instructional technology and likely also instructional design. The HPT model of practice shows more than a passing resemblance to the others presented here (see comparison table below).

**Technical Communication**

**Technical Communication**

Technical Communication (TCOM) is the process of conveying usable information about a specific domain to an intended audience. (Society for Technical Communication)

Instructional Design and Technical Communication are remarkably similar, manifestly compatible sister fields, although they often seem to be curiously unaware of one another. Developing as independent disciplines, the similarities in theory, tools and techniques in ID and in TCOM projects are striking. Consider the seminal model of instructional design, ADDIE (Gagne, Wager, Golas, & Keller, 2004), the basis for most instructional design models, compared to the Hackos model (Hackos, 1994) for managing documentation projects:

Note that the ID and TCOM project models are made identical by reversing the positions of Hackos model steps three (implementation) and four (production). Perhaps best known of the ADDIE model derivatives is the ID model of Dick and Carey (Dick, Carey, & Carey, 2008) ADDIE ID models appear linear but are in fact iterative and recursive, not stepwise (Gagne et al., 2004, p. 3). TCOM projects are often similarly cyclical, as is the Nursing process in clinical practice.
Table 1—ADDIE and Process Models of Three Sister Fields

The Folk Who REALLY Get Things Done—The Nursing Process

The common thread uniting different types of nurses who work in varied areas is the nursing process—the essential core of practice for the registered nurse to deliver holistic, patient-focused care.

Assessment
An RN uses a systematic, dynamic way to collect and analyze data about a client, the first step in delivering nursing care. Assessment includes not only physiological data, but also psychological, sociocultural, spiritual, economic, and life-style factors as well. For example, a nurse’s assessment of a hospitalized patient in pain includes not only the physical causes and manifestations of pain, but the patient’s response—an inability to get out of bed, refusal to eat, withdrawal from family members, anger directed at hospital staff, fear, or request for more pain medication.
**Diagnosis**
The nursing diagnosis is the nurse’s clinical judgment about the client’s response to actual or potential health conditions or needs. The diagnosis reflects not only that the patient is in pain, but that the pain has caused other problems such as anxiety, poor nutrition, and conflict within the family, or has the potential to cause complications—for example, respiratory infection is a potential hazard to an immobilized patient. The diagnosis is the basis for the nurse’s care plan.

**Outcomes/Planning**
Based on the assessment and diagnosis, the nurse sets measurable and achievable short- and long-range goals for this patient that might include moving from bed to chair at least three times per day; maintaining adequate nutrition by eating smaller, more frequent meals; resolving conflict through counseling, or managing pain through adequate medication. Assessment data, diagnosis, and goals are written in the patient’s care plan so that nurses as well as other health professionals caring for the patient have access to it.

**Implementation**
Nursing care is implemented according to the care plan, so continuity of care for the patient during hospitalization and in preparation for discharge needs to be assured. Care is documented in the patient’s record.

### ADDIE model of instructional design vs The Nursing Process

The Adventures of ADDIE—The Unsinkable Model of How We Get Things Done

Keith B. Hopper, PhD
Southern Polytechnic State University

Abstract

The pervasive ADDIE model of instructional design guides much of what professionals do in a remarkably wide venue. Working in often insular silos of work, we may be startled to find that fields as different as instructional design and nursing independently found their way to a core model of “getting things done.” This paper reviews the evolution of this core model across disciplines to present remarkable similarities. This comparison reinforces the eminently sensible way that intelligent humans accomplish worthy work, and reveals tools and techniques developed in some fields that may transfer to others far away.

Introduction

Trainers, teachers, information designers, and instructional designers are aware of the the eminent ADDIE model of instructional design, the source of most of the 100+ models of instructional design (Gustafson & Branch, 2002):

- **Analyze**—learner characteristics, task to be learned
- **Design**—develop learning objectives, choose instructional approach
- **Develop**—create instructional materials
- **Implement**—deliver instruction
- **Evaluate**—assess efficacy

Ships steaming parallel courses through the night, the venerable ADDIE model of instructional design reveals surprising similarity to disciplines and fields outside its presumed borders. These include the large fields of human performance technology (HPT), project management (PM), and even instructional design (ID). Side-by-side comparison of the major models of practice in these disparate fields shows overlap often congruence. Presumably developed independently, with little modification these foundational models can be substituted one for another.

Getting Stuff Done

Beyond a philosophical curiosity, this epiphany (for the author) suggests a new line of academic inquiry that may return surprising and undiscovered pearls and “lessoned learned.” This is because many competent people have spent a good bit of time and energy trying to tease out how to *get stuff done*. 
And in many cases there is transferability that asks to be explored across disciplines. Nurses want to achieve optimal patient outcomes, project managers want to build things on time and according to specifications, instructional designers want to develop effective courses and tools—and although the goals, training, background, work environment and clothing varies—the several professional models and methods are strikingly similar. The intent is to establish a framework of commonality and seek tools, techniques, and hard won lessons learned that might transfer across disciplines.

**The Usual Suspects**

**Project Management**

*Project Management*

Project Management (PM) is the application of knowledge, skills and techniques to execute projects effectively and efficiently. It’s a strategic competency for organizations, enabling them to tie project results to business goals — and thus, better compete in their markets. (Project Management Institute)

PM is a well-established discipline with a dynamic professional organization (PMI.org) and a rigorous and formidable body of knowledge. PM is also a professional practice focus in many professions such as the various engineering fields, construction, and computer software development. The Project Management Institute provides various levels of professional credentialing and publishes a widely acknowledged, authoritative repository of PM expertise, the Project Management Body of Knowledge (PMBOK). Of several models of PM, the PMBOK model is best known and defines the following PM processes (“IEEE Guide Adoption of PMI Standard a Guide to the Project Management Body of Knowledge,” 2004):

1. **Initiating**—The project’s scope is established and the project team assembled.
2. **Planning**—Project requirements are acquired, detailed plans are made, and a schedule is established.
3. **Executing**—Project requirements are further developed iteratively and the project is continuously monitored and managed.
4. **Controlling**—Resources and project team member assignments are adjusted to keep the project on schedule with optimal efficiency.
5. **Closing**—The project gets final quality assessment, the project team reviews the endeavor and records lessons learned, and the project is brought to closure administratively and by conveying project deliverables.

PM is a field that reveals a near mysterious aspect in successful human endeavors—that the tools and techniques of PM, and the invaluable lessons learned, are transferable to seemingly unrelated projects. Successful and unsuccessful projects from software design to skyscraper construction to producing the international Olympics show remarkable similarity. Project managers share a highly codified toolset of processes with their underlying challenges, solutions, and terms. A project must be completed by a deadline, within budget, and according to specifications (Wysocki, Jr, & Crane, 1995). PM is described as
a “cascading” process, where one phase or process must be complete or well along before the next may begin.

**Human Performance Technology**

*Human Performance Technology (HPT)*

Human Performance Technology (HPT) is a systematic approach to improving productivity and competence, uses a set of methods and procedures — and a strategy for solving problems—for realizing opportunities related to the performance of people. More specific, it is a process of selection, analysis, design, development, implementation, and evaluation of programs to most cost-effectively influence human behavior and accomplishment. It is a systematic combination of three fundamental processes: performance analysis, cause analysis, and intervention selection, and can be applied to individuals, small groups, and large organizations. (International Society for Performance Improvement)

HPT in adult world of adult learning—corporate, government and military—is considered the parent field of instructional technology and likely also instructional design. The HPT model of practice shows more than a passing resemblance to the others presented here (see comparison table below).

**Technical Communication**

*Technical Communication*

Technical Communication (TCOM) is the process of conveying usable information about a specific domain to an intended audience. (Society for Technical Communication)

Instructional Design and Technical Communication are remarkably similar, manifestly compatible sister fields, although they often seem to be curiously unaware of one another. Developing as independent disciplines, the similarities in theory, tools and techniques in ID and in TCOM projects are striking. Consider the seminal model of instructional design, ADDIE (Gagne, Wager, Golas, & Keller, 2004), the basis for most instructional design models, compared to compared with the Hackos model (Hackos, 1994) for managing documentation projects:

Note that the ID and TCOM project models are made identical by reversing the positions of Hackos model steps three (implementation) and four (production). Perhaps best known of the ADDIE model derivatives is the ID model of Dick and Carey (Dick, Carey, & Carey, 2008) ADDIE ID models appear linear but are in fact iterative and recursive, not stepwise (Gagne et al., 2004, p. 3). TCOM projects are often similarly cyclical, as is the Nursing process in clinical practice.
### ADDIE model of instructional design

| Analyze—learner characteristics, task to be learned | Identify Gap | Initiating | Information Planning |
| Design—develop learning objectives, choose instructional approach | Cause Analysis | Planning | Content Specification |
| Develop—create instructional materials | Design Intervention | Executing | Implementation |
| Implement—deliver instruction | Implement Intervention(s) | Monitoring and Controlling | Production |
| Evaluate—assess efficacy | Evaluate | Closing | Evaluation |

The Impact of Digital Technology Use in High School Critical Incidents: Why schools need to update their current policies.

Mardi Frost
St Andrews Lutheran College
175 Tallebudgera Creek Rd
Tallebudgera QLD
Australia  4228

Mardif@salc.qld.edu.au

Submission ID: 62

ABSTRACT OF PAPER:

The way in which a high school student uses digital technology during a critical incident on campus is a growing area of research. A critical incident could include, sudden death of student or staff member, natural disaster, school shooting, threat of terrorism or outbreak of disease. In reviewing current literature, it is evident that many issues arise from the use of technology during a crisis.

Key themes that emerge within the current research include the rapid transmission of information and the inability of schools to restrict communication to media outlets during and after an incident. Invariably this may amplify the risk of inappropriate or inaccurate information being communicated to the school community and the wider public. Social media usage by members of the school community can also contribute to ambiguity in information and subsequent recovery if not managed effectively.

Additionally, the rapidity of information dissemination potentially restricts the schools ability to manage the high level emotion and reactive behaviours that can surround critical incidents. Specific
training, clear roles of staff and clarity in the function that digital technology plays in emergency management are essential aspects for schools to embrace in policy development.

In reviewing the current trends in research of this topic a list of recommendations is presented. It is clear that ongoing research and reflection into this issue is required to ensure critical incidents are managed effectively in our schools.
Title:
More than just Read Alouds: How to get the most out of mentor texts

Author:
Amy Griswold
Department of Teaching
University of Northern Iowa
UNI SEC 509 0613
Cedar Falls, IA 50614
amy.griswold@uni.edu

Abstract:

More than just read alouds: How to get the most out of mentor texts is a presentation that focuses on how to use mentor texts to teach essential literacy skills while addressing core standards. Quality mentor texts will be shared as well as lesson plans and activities for each text. Connections will be made to content areas, with the inclusion of both fiction and non-fiction texts. Multiple examples will be provided for implementation in a variety of grade levels. New and favorite book titles will be included in this presentation.

In addition to sharing tools and strategies in the use of mentor texts, participants will have the opportunity to discuss current research, trends, and challenges faced when using mentor texts. During this session, educators will also be asked to collaborate with others as they share ideas regarding the current use of texts in their teaching and classroom.
GirlPower & GoodGuys: The Language of Friendship for Tweens

Topic Area: Counselor Education, Elementary Education, Health Education
Presentation Format: Workshop

Designed for professionals working with students from grades 1 to 6, the fundamental principles of GirlPower & GoodGuys are explored along with the behind-the-scenes rationale for our approach. Through a dynamic, upbeat presentation, educators will learn a new “language” to share with students so they can co-identify Friendship Fires™ and learn to better communicate solutions. We will also highlight the fascinating similarities and differences between boys & girls and their experiences in friendship.

<td><strong>Name and bio</strong></td>
<td>Dana Kerford is a Teacher, Friendship Expert, Author, and the Founder of the internationally recognized friendship programs, GirlPower &amp; GoodGuys. With extensive research on relational aggression and conflict-resolution, Dana developed GirlPower’s skills-based curriculum. She has worked with close to thirty thousand tweens, parents, and educators across North America and Australia and has been featured in magazines, newspapers, and been a guest on numerous television programs. After piloting GoodGuys in 11 schools across 3 countries, GirlPower’s brother program launched in June 2014. Dana’s passion to empower tweens with the skills, language, and self-confidence to be better friends and develop healthier friendships is the heart and soul of GirlPower &amp; GoodGuys.</td>
</tr>
<tr>
<td><strong>Description of presentation:</strong></td>
<td>GirlPower has improved the social climate in hundreds of schools globally, teaching girls a common language for confidently managing conflict and creating a culture rooted in respect and kindness. After years of being asked, “What about the boys?” and extensive research on the dynamic of boys’ friendships, GoodGuys launched in June 2014. These unique programs empower children with the skills, language, and self-confidence to be better friends and develop healthier friendships. A key element of the curriculum is teaching students the difference between normal conflict and bullying. GirlPower &amp; GoodGuys’ focus on teaching the skills to develop healthy relationships, starting at a young age, is the preventative approach and, ultimately, the solution to the bullying epidemic. Designed for professionals working with students from grades 1 to 6, the fundamental principles of GirlPower &amp; GoodGuys are explored along with the behind-the-scenes rationale for our approach. Through a dynamic, upbeat presentation, educators will learn a new “language” to share with students so they can co-identify Friendship Fires™ and learn to better communicate solutions. We will also highlight the fascinating similarities and differences between boys &amp; girls and their experiences in friendship.</td>
</tr>
</tbody>
</table>
## Learning Objective(s):

Educators will learn strategies to use in the classroom, along with information to share with parents for supporting their child at home. Key elements of our curriculum that will be covered include:

- What’s normal in a friendship via the 4 Friendship Facts
- How to identify healthy versus unhealthy friendships via the Friend-o-meter
- The normal cycle of a healthy friendship via the Friend-o-cycle
- Strategies for putting out Friendship Fires™
- Identifying the difference between normal conflict and mean-on-purpose behavior (e.g. bullying)
- How to use a “Quick Comebacks” to combat mean-on-purpose behavior

## Summary of Program:

GirlPower™ & GoodGuys™ empower students with the skills, language, and self-confidence to be better friends and develop healthier friendships.

Our team of “Friendship Experts” offer a full suite of in-school workshops for girls, boys, parents, and educators. We also have an in-school curriculum for both GirlPower & GoodGuys, Friendology 101, that’s been adopted by over 80 schools around the world.

To learn more about our programs & resources available for tweens, parents, and educators please visit: [www.urstrong.com](http://www.urstrong.com)

Distance Education Teaching and Learning

Carol A. Hall

University of Phoenix School of Advanced Studies
Abstract

Institutions of higher education are adding online programs in which students and faculty are virtually present, and different forms of technology are the conduit used to transfer and acquire knowledge. This learning dimension is cause for thought as to how higher education institutions are going to maximize the online teaching and learning potential to satisfy faculty and students. More research needs to be undertaken to determine online teaching and learning “best practices.”
Distance Education Teaching and Learning

A new higher education classroom environment for many faculty and students has emerged. A student does not need to sit in a traditional classroom or theater with hundreds of other students, listen to an instructor’s lecture, answer questions, and leave only to return later in the week to do the same thing or, perhaps, return to take an exam. Learning at many higher education institutions no longer only takes place in traditional, brick-and-mortar classrooms or theaters containing a physically present teacher. Modes of delivery of higher education are blurring. Students can now attend multiple educational institutions using various delivery modes.

More and more institutions of higher education are adding online classes and degree programs in which students and faculty are virtually present, and different forms of technology are the conduit used to transfer and acquire knowledge. Various types of online learning for use include asynchronous communication tools such as newsgroups, e-mail, and threaded discussions that allow participants to contribute to class discussions at their convenience. Other models include synchronous means comprised of chat rooms, video and audio technologies, and webcasting. Some models incorporate both asynchronous and synchronous technology.

According to the National Center for Education Statistics 2006-07, 61% of two- and four-year colleges offer online, hybrid/blended online, or similar distance education courses (U.S. Department of Education, 2008, p. 6), and the number is increasing. From 2007 to 2008, 20% of undergraduate students took at least one course online, and 4% of undergraduate students took all courses online (U.S. Department of Education, 2011, p. 5). In fall 2012, 14.2% of undergraduate students took at least one course online, and 11.1% of undergraduate students took all classes online, and almost 5.5 million post secondary students enrolled in distance
education courses (NCES 2014, p. 4). As of 2012, some states have mandated high school
students take a minimum of one virtual class to earn their high school diploma. This learning
dimension is cause for thought as to how higher education institutions are going to maximize the
online teaching and learning potential to satisfy faculty and students.

The pedagogy of online learning versus face-to-face learning is and continues to be a
concern for many educators, particularly in view of student academic preparedness, maturity
level, and study skill acquisition. Online faculty members are challenged to redefine their roles
and assumptions of teaching and learning (Wiesenberg & Stacey, 2008). Kreber and Kanuka
(2006) stressed the need to facilitate online learning so students reach their potential as
imperative. Even though students are responsible for their own learning and success, instructors
must act as facilitators and guides (Berge, 2009, Salmon, 2004; Smith, 2005) in providing
students with the support, resources, and tools they need to be successful.

Instructor well-planned syllabi and well-explained class policies enumerating clear
expectations to fulfill course competencies are essential for distance education students, as well
as the need for instructors to provide students with timely, detailed feedback on assignments.
The online teacher must be cognizant of and follow the institution's policies, which policies may
not allow for such occurrences such as late assignments, make-up work, or personal
emergencies. The online student's responsibility is to read and follow syllabi and policies, to
fulfill assignment and class expectations, and to seek information by questioning when clarity is
sought. Students are encouraged to read instructions carefully, highlight relevant information
and due dates, examine assignment criteria and rubrics, and employ mechanics of writing and
formatting rules.
Successful institutions and systems that undertake instituting classes in virtual environments encourage and support teamwork (Berge, 2009). Instructors can foster a sense of community by having students work in a group or team to collaborate and complete a learning project during each course. Team projects allow students the opportunity to take turns leading and following. Instructors in virtual classrooms can promote, encourage, and enhance team learning and community building.

All students, whether attending traditional or online classes, deserve a quality education that allows them to reach their potential and prepares them to be productive citizens in their workplace and the world. The North American Council for Online Learning [NACOL] (2010) established national standards for online teaching for K-12 educators. Council standards include teacher knowledge of concepts and structures needed to be an effective online teacher who fosters success in students; teacher knowledge of and ability to use technologies to sustain and promote student learning and engagement in the online environment; teacher ability to incorporate activities for students to demonstrate learning by applying, participating, collaborating, and interacting substantively online; teacher competence in enhancing student success using clear expectations while giving prompt, detailed feedback; teacher modeling of ethical online behavior; teacher ability to meet the needs of all students, to assess student learning accurately, and to design assessments that meet course learning goals and objectives and fulfill course competencies; and teacher proficiency in using data driven assessments to adapt course content to foster student learning (NACOL, 2010). While these standards are in place for K-12 environments, they also appear applicable for colleges and universities.

The International Association for K-12 Online Learning [iNACOL] (2011) endorsed a first-rate education for all students along with opportunities to prepare students to be successful.
iNACOL (2011) established “guidelines for course content, instructional design, technology, student assessment, and course management” (“Introduction”). The association also supported new teaching and learning models to include “blended learning, personalized instruction, portable and mobile learning” (iNACOL, 2011, “Understanding online courses”).

According to the Council for Higher Education Accreditation [CHEA] (2002), 17 institutional accreditors recognized 1,979 institutions as providing distance education to students. Higher education accrediting agencies reviewed alternative instructional designs, alternative providers, and the expanded focus on training. The agencies gathered information on “institutional mission, organization, resources of the institution, curriculum and instruction, faculty support, student support, and student learning outcomes” (CHEA, 2002, p. 3). In the 2000–2001 academic year, an estimated 3,077,000 students enrolled in distance education courses.

Community, technical, and traditional colleges along with many universities use "Quality Matters Standards." These standards were established by MarylandOnline (Martin, 2012). Quality Matters Standards focus on course design while incorporating peer-to-peer feedback to establish best practices for the course overview and introduction, learning objectives, assessment and measurement, instructional materials, learner interaction and engagement, course technology, learner support, and accessibility (OIPQMP, 2011, slide 13).

"Best practices" teachers use to foster student learning in the online environment are evolving. Best practices include humanistic aspects of learning such as addressing students by first name and integrating current happenings into weekly discussions. Being present; responding promptly when asked a question; publishing and using rubrics for assignments; giving detailed, encouraging feedback on assignments and returning assignments promptly; and
interspersing humor into the virtual environment are necessary and appropriate. Additional important practices to include in the online environment are incorporating media into learning, making learning relevant by sharing experiences and connecting learning to student career goals, fostering critical thinking and inquiry, and gathering feedback from students and applying it to improve teaching and learning practices.

To be successful instructors in a distance education environment, instructors must adapt some of their ways of teaching to facilitate student learning. Instructors who wish to teach students online must familiarize themselves with best practices needed to maximize student success and work to acquire those skills. Lastly, more research and study needs to be conducted to obtain the knowledge needed to prepare distance education faculty to fulfill the needs of online students and to assist online students in reaching their potential (Baran, Correia, & Thompson, 2011).

Abstract

Title: Teasing and Bullying Prevention for the Young Child

Abstract: The purpose of this workshop is to help educators gain an understanding of why some kids tease and bully and how an adult might intervene. Participants will learn specific strategies how to teach children to create social groups that aren't defined by excluding others. We will look at and discuss the social lives of children and help teachers and parents who are trying to understand how to prevent exclusion and how to support children.

“The more kids are aware of what bullying is the better. Simple teasing can really take a toll on a kid. We just want kids to know bullying when they see it, so they can at least try and stop it.” - Carl Sousa

Bullying happens when: a student is exposed, repeatedly and over time, to negative actions on the part of one or more students. (D. Olweus, 1993). Many students are identified as at-risk with social/emotional, behavioral and learning issues who are struggling with success. Several of these students are being recommended to special education, but are falling short of eligibility requirements, thus lacking the support they need to succeed. “With appropriate early services, referral to special education may be prevented for children showing early indicators of behavioral maladjustment”. (Baker, J.A., Kamphaus, R.W., Horne, A.M., & Winsor, A.P., 2006). Researchers have found evidence that prevention services must include helping children develop the prosocial competencies needed to mediate the school environment, in addition to remediation of academic and/or behavioral deficits. (Baker, J.A., Kamphaus, R.W., Horne, A.M., & Winsor, A.P., 2006).

There are many types of bullying behaviors, which have been seen in children as young as preschoolers. The most successful way to end bullying behaviors is through preventative education. Markers of Bullying include: Imbalance in power or strength, intent to harm., threat of further aggression (B. Coloroso, 2003). Some types of bullying are: Teasing with the intent to hurt/harm, Name calling, Threats, and Saying things to hurt feelings. (Bailey, T.L., 2002).

Title: Regional Mathematics Centers: Equitable Support for Rural and Remote Schools

Topic Area: Mathematics Education

Presentation Format: Paper Session

Description: This session will focus on the work of the Idaho Regional Mathematics Centers to support teachers by providing free professional development, training, and support in creating effective instructional settings across the state. This qualitative study investigates teachers’ understandings of the Standards of Mathematical Practice and Findings indicate that teachers cite changing roles, the need for greater time, and the use of effective questioning as necessary in implementing the new standards.

Paper Authors:
Dr. Cory A. Bennett, Department of Teaching and Educational Studies, Idaho State University, benncor3@isu.edu

Dr. Julie Amador, Department of Curriculum and Instruction, University of Idaho, jamador@uidaho.edu
Abstract
The Common Core State Standards for Mathematics (CCSSM) has highlighted the need for professional development as teachers implement new content standards and Standards for Mathematical Practice. Supporting teachers in rural Idaho is restrained by a substantial geospatial landscape, lack of professionals in remote regions, and lack of technological infrastructure to support distance delivery. Idaho has developed the Idaho Regional Mathematics Centers to support teachers in implementing the CCSSM. This qualitative study investigates teachers’ understandings of the Standards for Mathematical Practice in order to provide more focused follow-up support for teachers in rural Idaho. Findings indicate that teachers cite changing roles, the need for greater time, and the use of effective questioning as necessary in implementing the new standards.

One of the more recent initiatives for improving student performance in mathematics came from the development and implementation of the Common Core State Standards for Mathematics (CCSSM) (Common Core State Standards Initiative, 2010). These standards, both content and practices, seek to increase students’ mathematical performance and understanding through the development of substantive conceptual understanding. For a few decades there has been considerable attention on high-stakes testing to raise test scores and measure student learning (Phelps, 2000; Wilson, 2007). In doing so, an over-emphasis has been placed on developing students’ computational skills and not on reasoning and thinking skills; skills applicable beyond just mathematics.

In addition, the CCSSM include the Standards of Mathematical Practices, the behaviors and habits of mind used by proficient and creative mathematical thinkers. These practices draw from decades of research and are grounded in the National Council of Teachers of Mathematics (NCTM) Process Standards (2000). The Standards of Mathematical Practices state that students should: “1. Make sense of problems and perseve in solving them, 2. Reason abstractly and quantitatively, 3. Construct viable arguments and critique the reasoning of others, 4. Model with mathematics, 5. Use appropriate tools strategically, 6. Attend to precision, 7. Look for and make use of structure, and 8. Look for and express regularity in repeated reasoning” (CCSS, 2010, p. 6-7). With the adoption of the CCSSM many teachers are unsure of how these new standards, both content and practices will “look” in their classroom and how they can support students’ in mathematics. In short, teachers need to be better equipped to implement the CCSSM and the Standards of Mathematical Practices.
Rural challenges

Supporting teachers to implement the CCSSM can be a daunting task, especially in rural states such as Idaho. The state of Idaho has an average population density of 19 people per square mile, yet 40 of the 131 school districts have less than one student enrolled per square mile (Idaho State Department of Education, 2012). Accessing additional resources to support student learning is not merely a matter of covering great distances in Idaho. The rugged terrain of Idaho imposes geographical barriers that are not easily overcome and when accompanied with the vast distances between districts a greater geo-spatial barrier becomes evident; barriers which become even more pronounced during the winter months. Distance technologies can assist in overcoming these barriers but not all resources can be easily supported through the use of distance technologies. For example, many of the rural schools do not have the bandwidth capabilities to support high speed internet, or other technological advances needed for distance communication. Idaho has an inadequate infrastructure to support distance learning; it is ranked 45th in the nation in average internet speeds (Communications Workers of America, 2010). This means that even with the best of conditions in Idaho, the infrastructure to support interactive distance learning is lacking. In addition, the high cost of maintenance and the continual cost of upgrading software and hardware are often restrained by small budgets in districts with one or two schools.

Thus, a three-faceted barrier exists in Idaho impeding the access to equitable resources and supports for schools as they work towards understanding and implementing the CCSSM. First, the substantial geo-spatial landscape inhibits quick and timely travel to and from remote and rural districts. Second, these remote and rural districts employ far fewer teaching professionals, thus their internal pool of intellectual capital and resources is greatly restricted. Lastly, the technology infrastructure and costs associated with maintaining and updating distance technologies often surpasses available funds. Again, Idaho’s rural schools are unintentionally restricted in accessing equitable human and instructional resources and supports for their teachers and students. This complicates the implementation of new initiatives, such as the CCSSM. As a result, this research answers the following questions: What supports do teachers in rural Idaho need as they work to implement the Common Core State Standards in Mathematics? What are the instructional implications for implementing the Standards for Mathematical Practice?

Methods

Context

To address this issue, the Idaho Mathematics Steering Committee—a group comprised of university faculty, educators, Idaho State Department of Education personnel, and industry partners—set out to determine how the implementation of a statewide, and regionally based, professional network advances teachers’ professional expertise in mathematics and thus student learning in mathematics. Currently, the IMSC is overseeing the implementation of the Idaho Regional Mathematics Centers (IRMC). The IRMCs are research-based and informed resource centers staffed by experts in mathematics education (i.e. master teachers, curriculum specialists, and university faculty) that are strategically housed within regional colleges of educations at the universities and four-year colleges across Idaho. Their primary objective is to provide direct and timely mathematics support to all teachers, schools, and districts across the state. The IRMC serve as regionally-based support centers that develop and deliver instructional support for all school districts within their region. This support includes such things as in-class feedback for teachers and modeling of lessons, single day or continuous and reoccurring school or district-
wide workshops, Professional Learning Community guidance, continuing education credit courses in mathematics and mathematics education for re-certification, or more in depth and multiday district and state-wide conferences. At present, the implementation of the IRMCs are aimed at understanding how these centers advance teacher knowledge, teachers’ professionalism, and how teachers can be supported as they implement rigorous new standards.

The purpose of this study was to better understand teachers’ perception of the instructional implications associated with the Standards of Mathematical Practices to advance their professional expertise in mathematics. For the larger project focused on IRMCs, an explanatory mixed methods multi-phase research design (Creswell & Plano Clark, 2007) was used, as this allowed the researchers to create a more complete and rich understanding of the research questions (McMillan & Schumacher, 2006). For the purpose of this research brief, only the preliminary findings from one phenomenological qualitative research endeavor within the larger project will be reported. Qualitative research is descriptive in nature and focuses on process, thus deeming it appropriate for analyzing how teachers perceive implementation of the CCSSM (Denzin & Lincoln, 2005).

Data

Data included come from work with rural K-12 teachers at IRMCs across the state. The intent is to use this initial data to refine professional development opportunities at all IRMCs to further understand how to support teachers as they implement the CCSSM. To gather data, each IRMC held an initial professional development conference focused on implementation of the CCSSM. At these sessions, teachers worked together to make meaning of the Standards of Mathematical Practices. In this process, they worked in teams of 3-4 to define the meaning of each Standards of Mathematical Practices and determine related implications for teaching and learning. Collectively, teachers in groups at each site completed a Mathematical Practices Analysis Form for each of the eight Standards of Mathematical Practices. The form asked participants to, 1) explain what the mathematical practice means, and 2) detail the implications for teaching and learning.

To analyze the Mathematical Practices Analysis Form, a phenomenological approach (Guest & MacQueen, 2012) was used. Initially, all data were read in entirety by grade level and open coded for instances describing teachers’ perceptions of implications for practice. Main categories from each grade level were then united into common themes in the data; memos about the specific themes were written to provide further explanation of the meaning of data. To conclude analysis, themes in the data were extrapolated to explain teachers’ perceived implications for teaching and learning the Standards of Mathematical Practices. Understanding how teachers perceive the Mathematical Practices provides insight for knowing how to support these teachers as they implement the standards.

Findings

Data analysis revealed teachers in rural Idaho perceive three main implications for teaching and learning related to implementation of the Standards of Mathematical Practices: Changing Roles, Need for Greater Time, and Using Effective Questioning. The following provides an overview of these perceived implications.

Changing Roles

As the teachers worked to make sense of the Standards of Mathematical Practices, they realized full implementation would result in a change in their role in the classroom and a change
in the role of students. Specifically, teachers came to realize that students would need to take increased ownership for their learning and assume leadership roles. For example, one group wrote, “Let kids be teacher.” In this way, the teachers viewed students as authorities of knowledge and realized that they needed to provide opportunities that permit students to take on these roles. In addition, the teachers also reflected on their own roles in the classroom and realized that they need to function as a facilitator of knowledge as opposed to an all-knowing authority figure. When discussing Standards of Mathematical Practices 4, *Model with Mathematics*, one group of teachers wrote “Relinquish Power!!” The teachers realized that their teaching and learning would be influenced by the need to shift roles and provide opportunities for students to take leadership roles with their learning. In essence, the intellectual authority of the classroom needed to reside with the students.

**Need for Greater Time**

As the teachers worked to understand the implications from the standards, they realized implementation of the CCSSM and Standards of Mathematical Practices would take time and student learning would take time. As they analyzed each standard, the need for time to implement the standards for learning became apparent. For example, one 7th grade group wrote, “One day to work on one problem” and another group wrote, “Being patient!!! Give them time” in reference to helping students learn to reason abstractly and quantitatively. At all three grade levels, teachers realized that implementing the Standards of Mathematical Practices would require changes in how they think about lessons because it would demand that they spend more time and go deeper in concepts that had previously been covered in a shorter amount of time.

**Using Effective Questioning**

Finally, the teachers perceived that they would need to focus on the types of questions they asked students and the types of questions students asked each other. One group commented, “Teachers need to develop effective questions…and teach students how to develop ‘good’ questions.” Likewise, another group commented, “Teachers need to help students learn how to ask good questions (Good questions are based on the mathematics).” As the teachers worked to make meaning from the Standards of Mathematical Practices and considered the implications, they realized that the questions asked within the class, be it from teacher or student, should be of a higher order by design and directly related to strengthening students conceptual understanding.

**Implications**

Understanding the implications teachers perceive for teaching and learning with respect to the implementation of the CCSSM is important for understanding how to support teachers as they implement the standards in rural locations. Clearly, the teachers realized that their way of thinking about mathematics instruction would have to change to support implementation of the standards. The challenge is supporting the teachers to: 1) Change roles, 2) Take more time, and 3) Ask intellectual questions, without district level expertise to support these changes. In districts with one or two schools, the role of the IRMCs is essential for ensuring these teachers have support because it provided a means for personnel to work directly with teachers, thereby increasing their access to additional intellectual capital. To date, the formation of the Idaho Regional Mathematics Network and the IRMCs have provided expertise in all six regions of Idaho and personalized professional development. Mathematics education personnel in these locations are still a distance from many of the schools (approximately 20-180 miles); however, the schools have found value in having regional personnel who support them with implementing the CCSSM. As mentioned previously, the full paper will provide additional details on how the
IRMCs continue to provide support to help teachers from rural school districts overcome the aforementioned challenges.

At present, Idaho has worked to implement the IRMCs and these preliminary findings highlight the need to provide continued professional development for teachers throughout the state of Idaho as they work to understand the pedagogical actions needed to appropriately address the standards. In times of increased testing pressure (Phelps, 2000; Wilson, 2007) and given the geo-spatial and infrastructure limitations in the state, the IRMCs are able to support teachers in specific areas of content and pedagogical knowledge regardless of location.

References
Introduction

As individuals age, many physical changes occur, including eye and retina changes that can affect vision. The macular region of the retina provides good central vision. If the macula begins to deteriorate, age-related macular degeneration (AMD) can result. Studies have shown that inadequate diet can be a risk factor for many chronic diseases, including AMD (World Cancer Research Fund, 1997). The leading cause of blindness (54.4% of cases) among white Americans is AMD (Congdon et al., 2004). Blindness and visual impairment are among the top 10 common causes of disability for Americans, and AMD causes both of these impairments. Legal blindness is expected to increase by 70% by 2020, with the growing proportion of older adults in the United States (Centers of Disease Control and Prevention, 2011).

A healthy diet including plenty of fruits and vegetables is thought to contribute to healthy eyes, especially the macula. Although there are over 600 carotenoids (Kruger, Murphy, DeFreitas, Pfannkuch & Heimbach, 2002), carotenoids lutein and zeaxanthin are uniquely found in high concentration in the macula of the eye. Lutein and zeaxanthin make up the macular pigment, a yellow region in the back of the eye (Nussbaum, Pruett, & Delori, 1981; Snodderly, Brown, Delori & Auran, 1984). Some carotenoids, including beta-carotene, lycopene, lutein, and zeaxanthin, exert antioxidant activity which slows or prevents the damaging effect of free radicals, especially within the eyes (Sies & Stahl, 2003; Seddon et al., 1994). The high antioxidant activity of carotenoids may explain why a higher intake of carotenoids has been associated with a lower risk or slowed
Nutrition education in the eye clinic

progression for AMD (Seddon et al., 1994; Snellen, Verbeek, van den Hoogen, Cruysberg & Hoyng, 2002). As the body ages, damage caused by free radicals increases the risk for AMD (Beatty, Koh, Phil, Henson, & Boulton, 2000). The role of dietary intake of lutein and zeaxanthin in the prevention of AMD has been explained elsewhere (Seddon et al., 1994).

Inadequate diet is common among older adults and especially among the elderly (Institute of Medicine, 2000). Studies of the elderly have suggested that individual characteristics, such as race or sex, and health-related factors, such as chronic disease, were associated with nutrient inadequacy and low nutrient intake perhaps because of difficulty in shopping, cooking, and the ability to eat a variety of nutritionally dense foods (Sharkey et al., 2002). In their study of homebound elders, Sharkey et al. (2002), reported inadequate intake of calcium, vitamin D, calories, vitamin E, folate, and magnesium. Although lutein and zeaxanthin were not part of the study, key sources of lutein and zeaxanthin such as spinach also are key sources of folate, vitamin E and magnesium. Primary sources of lutein, and its isomer, zeaxanthin, include green leafy vegetables, egg yolk, corn, and many other fruits and vegetables.

To diagnose AMD, individuals are usually referred to a retina specialist (i.e., ophthalmologists with advanced training). Ophthalmologists currently have no treatment that can halt AMD, and many have turned to prescribed diets as their only recommended treatment to slow the progression of the disease. After smoking, diet is the most modifiable risk factor associated with AMD. Specifically, lutein- and zeaxanthin-rich foods or supplements have been beneficial for prevention or slowed progression of AMD (Seddon et al., 1994; Snellen, Verbeek, van den Hoogen, Cruysberg & Hoyng, 2002;
Nutrition education in the eye clinic

Richer, 1999). Dry AMD involves large, soft drusen which cause blind spots in the field of vision (Pratt, 2001). About 15% of those diagnosed with AMD have wet AMD, which is more debilitating than dry AMD (Wang, Foran, Smith & Mitchell, 2003).

As part of an overall program to reach the public in prevention efforts for AMD, a group of dietitians worked with an ophthalmology office to reach individuals with AMD. Based on the health belief model, the goal was to teach nutrition information specific to AMD to encourage and to motivate individuals diagnosed with AMD in one eye to change their nutrition and lifestyle habits to slow progression in the diagnosed eye and prevent the disease in the accompanying eye. A variety of tests were conducted to track progression of AMD in the diagnosed eye, as well as tracking for detection of AMD in the healthy eye.

The goal of this study of four participants was to build on evidence presented in other studies which demonstrate that AMD is responsive to a nutrition intervention (Richer, 1999; Richer et al., 2004). Specifically, a primary objective was to measure effectiveness of an increased dietary intake of lutein and zeaxanthin foods and/or supplements on slowing or stopping the progression of diagnosed AMD in the healthy eye for those diagnosed with AMD in one eye. A second goal was to determine whether increased nutrition “expert” accessibility (i.e., licensed, registered dietitians), affected participant post-intervention food intake patterns (i.e., increased lutein and zeaxanthin intake). Finally, the study was designed to finalize a protocol for an ophthalmology-based nutrition intervention, including determination of which tests are most effective for evaluation of results and how much time should be allotted to complete each test.

Methods
Nutrition education in the eye clinic

All protocols followed the tenets of the Declaration of Helsinki and informed consent was obtained from all participants after explanation of the nature and possible consequences of the study. The Institutional Review Board (IRB) of BLINDED FOR REVIEW University approved all protocols.

Recruitment

A laminated pocket card was designed for the sponsoring ophthalmologist who recruited participants from his current practice of individuals diagnosed with AMD. The pocket card listed the following study criteria: wet AMD in only one eye, drusen present in at least one eye, date-of-birth between 1916 and 1941, central vision functioning present, no signs of dementia, and free of glaucoma, diabetes, pulmonary disease or other disease that affects the retina. Each participant completed a series of tests offered by an interdisciplinary team.

Since AMD is a complicated condition involving genetic, cardiovascular, nutritional, and environmental components, multiple methods of assessment were designed for the study. The study assessments or tests included components regarding family history, smoking history, history of other disease and medical procedures, and nutrition and environmental components as well. Participants were assessed by an interdisciplinary team, within an individualized time. All of the study elements are explained in the following five sections, as carried out by each discipline.

Ophthalmology measurements by nursing staff

A registered nurse measured blood pressure, heart rate, body temperature, medical, ocular and drug history. Since a dosage of 10,000 micrograms of lutein per day has been associated with slowed progression of AMD (Richer, 1999; Richer et al., 2004),
Nutrition education in the eye clinic

the study dose was established at two 5,000 microgram capsules per day. The registered nurse distributed the lutein supplement and was responsible for dosage education. Study lutein was pre-packaged in zip-top bags for distribution.

Specific exams completed by trained retina specialty nursing staff included the Humphrey visual field exam, the distance logMAR exam, and the Farnsworth D15 dichotomous color test. The Humphrey test which measures how wide and detailed the field of vision is for the participant, took about 30 minutes. Seated at a computer screen, participants with AMD will not be able to see areas in the field where they have blind spots or areas where they are unable to see (i.e. scotoma).

In the logMAR test, the participant is asked to identify letters projected on a screen across the room. The smaller the letters on the chart, and the further away they are, the smaller will be the angle opposite to the eye by the letters. If the patient is unable to read any of the letters, the chart is moved closer to the patient; and the logMAR score is adjusted accordingly. Similar to a Snellen eye chart, the logMAR is more reliable in predicting degree of visual impairment. This test is very subjective, so tests are repeated three times each. The logMAR testing required 35 minutes to over 1 hour to complete for each participant.

Finally, nursing staff completed the Farnsworth procedure to predict color vision. Most color deficiencies are characterized by a lack of certain photopigments in the retina. Participants were given fifteen colored chips and asked to arrange them in the correct order, left eye first time, then again with the right eye, in order of color hue. Most chips are in the blue/brown range and the test is difficult with any loss of color vision.
Nutrition education in the eye clinic

Individuals with certain color vision deficiencies will tend to make typical arrangement errors. This test took about 20 minutes.

*Ophthalmology measurements by physician*

Data collection included a review of systems (i.e., organ systems, reflex, breathing, general health, etc.), followed by a general physical, and finally a complete ophthalmic examination: brightness acuity testing, external and adnexa exam, ocular motility, slit-lamp exam, intra-ocular pressure in each eye, dilated fundus exam, fluorescein angiography, and a check for lens abnormalities (e.g., cataracts).

Most of the ophthalmologic procedures are typical to a complete eye exam used for diagnostic purposes and will not be described in detail. Procedures that were specific to the study were the fluorescein angiography and the brightness acuity testing. Fluorescein angiography was completed during a prior clinic appointment. The fluorescein angiography involved a blue-dye injection into a vein of each participant, and a subsequent series of digital black and white photographs of each retina. The photographs depict both the count and size of drusen present in each eye. As drusen grow in size, or in counts, scotomas increase, i.e. progression of AMD. Pigment of drusen is also a key indicator of progression of disease. Retinal photography was performed in full digital color, illustrating the current pigment hue of particularly the larger drusen.

Disparities exist between functional vision in brightly lit situations compared to that in standard lighting. The brightness acuity tester simulates high lighting conditions such as a white sand beach or white concrete sidewalk on a sunny day (i.e., 10,000 foot candles); medium which mimics indirect sunlight (i.e., 2,500 foot candles); or low such as fluorescent lighting (i.e., 300 foot candles). Upon completion of the tests, the physician
Nutrition education in the eye clinic discussed participant diagnosis changes (if any) with the patient. The ophthalmology diagnostic procedures, not including the fluorescein angiography, took 20 to 30 minutes. **Ophthalmology measurements by dietitian**

The National Eye Institute (NEI) Visual Functioning Questionnaire (VFQ-25) Version 2000 was designed to assess and determine individual perceived quality of life with vision impairment (National Eye Institute, 2000). The VFQ-25, available in English, Spanish, and other languages, obtained at no charge from the NEI, also can measure the dimensions of self-reported vision-targeted health status that are most important for those with eye diseases. The VFQ-25 is divided into nine subscales: global vision rating, difficulty with near vision activities, difficulty with distance activities, limitations in social functioning due to vision, role limitations due to vision, dependency on others due to vision, mental health symptoms due to vision, driving difficulties, limitations in peripheral vision, color vision, and ocular pain. The VFQ-25 also contains the single quality of life related question:

“In general, would you say your overall health is:.....”

The respondent can answer: Excellent, very good, good, fair or poor. This question has been shown to be a robust indicator of future health and mortality in large population-based studies (Ware, Kosinski & Keller, 1996). The near vision subscale, used particularly for this study, contained three questions with the addition of three questions from the VFQ-25 appendix. The additional questions increase the reliability and theoretically would improve the responsiveness of the tool based on dietary intervention. The composite score of all questions, the overall health question score, and the score of the perceived overall vision question also were studied to judge effectiveness of the
Nutrition education in the eye clinic
dietary interventions. The dietitian checked to see that all 28 questions were answered
and also served as the study coordinator.

*Anthropometric measures*

The dietitian measured the weight and height of each participant, shoes and heavy
outerwear removed, using a Seca 700 balance beam scale (Hanover, MD). Waist
measurements were completed using a parallel-to-the-floor tape measure just above the
hip bone with heavy outerwear and belts removed. The dietitian calculated the participant
BMI and explained all measurement results to study participants as the data was
collected. This component was completed within about five minutes.

*Nutrition measures and interventions*

The VFQ-25 and a food frequency questionnaire (FFQ) were mailed to each study
participant the week before their initial appointment. The dietitian checked for
completeness and accuracy especially looking for unanswered questions on both
questionnaires. The FFQ for the study was the Arizona Food Frequency Questionnaire
(AFFQ), a modification of the Health Habits Questionnaire (Block et al., 1986). It has
been tested for reliability as well as relative validity (Thomson et al., 2003). The semi-
quantitative, scannable 153-item FFQ asks respondents to report how often they usually
consume each particular food item over the prior month, expressed in number of times
per day, week, or month. Vitamin and mineral supplement information is collected and
are included in the analysis. The database includes 91 nutrients and lutein, zeaxanthin and
other phytochemicals.

A nutrition screening for undernutrition was completed using the Mini Nutrition
Assessment [MNA] (Guigoz, Vellas & Garry, 1994). Each participant also received a
Nutrition education in the eye clinic

complete nutrition assessment by a licensed, registered, dietitian, individualized diet
instruction, emphasizing food sources of lutein and zeaxanthin, and an analysis of their
anthropometric measurements. All participants received three study designed “BLINDED
FOR REVIEW for Your Eyes” brochures: (1) Spinach, a super food; (2) BLINDED FOR
REVIEW your eyes; and (3) BLINDED FOR REVIEW health. The brochures
summarized much of what was explained in the diet instruction and provided a “take
home” message to encourage diet compliance. Eating for your eyes has been offered to
residents of 36 BLINDED FOR REVIEW counties and 9 states including BLINDED
FOR REVIEW (Blinded for Review, 20XX).

Statistical analysis

The distributions of all variables in the study population were examined and
characterized using descriptive (e.g., frequency, relative standing, and classification) and
summary (e.g., proportions and means) statistics. The AFFQ was tabulated using the
University of Arizona Cancer Center (UACC) technical staff and software to summarize
results. Results are based on the UACC pre-programmed statistical calculations using
summarized and proportioned data collected from each participant. Frequencies were
based on the reported last month intake of small, medium, or large portions for lutein and
zeaxanthin foods and supplement intake combined.

The VFQ-25 was tabulated in Excel following published guidelines (Rand
Corporation, 2000). To calculate an overall composite score, each of the 25 question
responses were scored. Answers are weighted in increments of 20 to 25, and in a range of
0.0 to 100.0. If an individual indicates that they can no longer perform an activity, a zero
is scored; if an individual indicates no problems completing the activity, the score is 100.
Nutrition education in the eye clinic

A subscale score was calculated in each of the areas, then an average of those scores revealed the total composite. A high score, up to 100 points, indicated no vision problems. A lower score indicated impaired vision. The composite score was designed to predict overall vision and health related quality of life, including domains such as social and emotional well-being.

Results

Description of participants

Four participants were recruited for the study. Similarities for each participant included being white, retired, and diagnosed with AMD in one eye. None of the participants screened positively for undernutrition; all consumed balanced diets as evidenced by MNA results, and results of the FFQ (detailed below). That was where the homogeneity of the participant group ended. Table 1 describes differences. Measurements were taken and listed for baseline and after 90 days intervention for the 4 study participants.

Ages for participants ranged from 70 to 82 years, with a mean age of 76 years. Half the group were borderline underweight (BMI less than 24) and half were obese (BMI above 30). Two participants exhibited health risk factors associated with heart disease, having a waist larger than 40 inches for males and larger than 38 inches for females, in addition to the higher BMI range. Another risk factor for heart disease is smoking. Participant A was a self-reported daily smoker.

The visual field test revealed a very large blind spot in one participant. Participant C commented that she completed the color blindness testing using her “side vision.” Comparing baseline and 90 days intervention, visual field improved in half the group, and worsened in the other half. One participant complained that the procedure was “boring” and that she felt drowsy during the test. Of all the procedures carried out in the study, nursing staff reported that the Humphrey visual field test was the most difficult for participants to complete, increasing in difficulty with worsened vision.

The color arrangement test consisted of 15 colored chips. The chips are shuffled and then have to be arranged starting from a fixed reference color. The degree of color blindness was measured by colors missed. Although diagnostic standards were not found for this procedure, the registered nurse on the team noted that 10/15 missed by participant A and C was rarely seen. Participant A mentioned that he is color blind on the VFQ-25 so was aware of the impairment; Participant C did not self-report her measured color blindness. Participant D, who had the largest baseline consumption of lutein, had the best color vision, only missing two colors in the entire exam.
The confounding factors were challenging and were addressed in different ways. First, participant A was taking warfarin and warned by his internal medicine physician that he could consume no green, leafy vegetables because of the risk of excessive intake of vitamin K. After obtaining participant permission, the study dietitian contacted his internal medicine physician and registered nurse with a letter explaining that a moderate amount of foods that contain vitamin K may be used with warfarin. Up to 1.5 cups of spinach can be used per day, as long as it is in a “constant,” that is, consistent, amount each day. During the follow-up measurements at 90 days, this was discussed with participant A, who indeed got permission from his primary physician to eat green, leafy vegetables. Participant A was introduced to kiwi (a lutein-rich food) in the study and reportedly was consuming this food regularly.

Participant A also had experienced a recent surgery and subsequent infection along with weight loss. Micronutrient deficiencies are common following weight loss, especially in older adults. His reported deterioration in vision during the study may have been due to the lack of micronutrients or could be related to his continued smoking.

Participant B also was told by her primary physician to avoid most vegetables because of her diagnosis of diverticulosis. The study dietitian found recent educational materials on the disease, which allow almost all vegetables; in fact, the diverticulosis diet emphasizes high-fiber foods. Those materials were mailed to the participant’s physician, upon receiving participant permission. After receiving permission, the study dietitian emphasized use of vegetables daily to control the diverticulosis and also explained the differences between diverticulosis and diverticulitis, where the participant may have had
confusion (one diagnosis calls for a high-fiber diet, the other, a low-fiber diet, respectively).

Participant C had suffered a heart attack in the last five years, but was in a cardiac rehabilitation program that included dietitians on the team. She was very open to the AMD study-prescribed diet, and enthusiastically accepted spinach samples even though she said she never “normally” used that food.

Participant D had a significant weight gain between baseline and the 90-day follow-up assessment. Higher prevalence of AMD in obese individuals is theorized to be correlated with a competition between adipose tissue and macular pigment for lutein and zeaxanthin (Nolan et al., 2004). Obesity is a risk factor for AMD (Nolan et al., 2004). Participant D was obese at baseline and gained 20 pounds during the course of the study. She complained of seeing “pink” light and “double arrows” at stop lights while driving. Participant D also very enthusiastically reported her new found “love” of kale and how she used this vegetable often in her salads. Participant D had joined a swimming program and was willing to take the study dietitian’s advice to start a walking program, especially with anticipated “nicer” weather to prevent any further weight gain.

Specific test results are compared in Table 2. The study revealed that of the eight eyes tested, one was considered blind. However, when compared to the VFQ-25, even with low logMAR scores, participant C’s VFQ-25 showed close to moderate vision impairment in her worse eye.

Table 2. Participant logMAR and VFQ-25 baseline results compared to standard results for the logMAR and VFQ-25.

Visual acuity testing was measured in logMAR acuity with normally reported uncertainty (95% confidence interval) of 0.08 which was reported to be more reliable than others such as the Snellen eye chart (Smith, 2006). Blindness is diagnosed in that eye if the logMAR results are greater than 1.0, as seen in Table 2. The VFQ-25 ranges for mild, moderate and severe were based on reliability testing of the VFQ-25 compared to six other tests in a prior study (Altangeral, Spaeth, & Steinann, 2006). According to criteria in table 2 (driving cut-off and logMAR), participant C should not be driving. In the VFQ-25 all participants responded that they have “no difficulty at all” in driving.

Family history of AMD is risk factor for AMD (Klaver, Wolfs, Vingerling & Hofman, 1998). Half of the participants were not sure about AMD in their family, but B reported that her mother had AMD, and participant C reported that her mother “died young” and often “complained about her eyes” (Table 3).

Study treatment impact on dietary patterns
The differences in lutein and zeaxanthin intake for each participant at baseline and post intervention are compared to the Ciulla et al., study (Ciulla et al., 2001) in Figure 1. Of 280 healthy volunteers from the general population, average intake for lutein was reported using a 122-item FFQ from the Women’s Health Initiative Program (Ciulla et al., 2001).

Figure 1. Reported intake of lutein and zeaxanthin in foods based on averages of food consumed in the last month at baseline and 90 days (T1 and T2).

Participants A, B, and C consumed about the same amount as the reported intake of the participants in the Ciulla study: roughly 1,100 micrograms, at baseline. Participant D reported baseline consumption of about 5,000 micrograms lutein and zeaxanthin, or roughly 5 times more than the average Ciulla participant. All participants increased their self-reported dietary intake of lutein and zeaxanthin comparing baseline to 90 days after the study interventions. Participant D had a 22% increase in dietary intake of lutein and zeaxanthin comparing baseline to the 90 day measurement. While participant A had an almost 50% increase (about 2,500 micrograms per day), and participants B and C had a
Nutrition education in the eye clinic

slight increase in dietary lutein intake (about 1,500 micrograms each), comparing baseline to the end of the study, all fell short of the therapeutic “dose” for dietary lutein. Amounts or “dosage” in the 10,000 microgram range have been associated with stopped or slowed progression of AMD (Richer, 1999; Richer et al., 2004).

With the addition of the supplement, participant A and B would be consuming at least 11,000 micrograms lutein and zeaxanthin per day; participant C, 11,400 micrograms; and participant D, 16,100 micrograms lutein and zeaxanthin per day. Participants were asked to return any leftover supplements during their 90 day follow-up appointment. Only participant D had leftover study supplements, meaning she was not compliant with the supplement protocol (2 capsules, twice per day with food).

Total energy intake contributes to overweight, and being overweight has been associated with AMD. Fat intake can foster absorption of carotenoids, but should be balanced so it as not to result in excess calories. Figure 2 depicts individual results for calorie intake, on average, during the 90 days of the course of the study.

![Figure 2](image)

**Figure 2.** Mean total intake of kcalories from baseline and at 90 days post dietary intervention.
Participants B and C reported a low caloric intake compared to their needs. However, based on measured actual weights and calculated BMIs, participants B and C may have underreported their actual intake. In general, FFQ studies are limited in their reproducibility and validity because people tend to overestimate their servings of fruit and vegetables and to underreport servings of meat and dairy, which are more calorically dense (Feskanich et al., 1993).

**Impact on perceived vision**

VFQ-25 composite scores were reported in Table 2. Figure 3 illustrates comparisons of the near vision subscale within the VFQ-25. The near vision subscale is an important indicator for vision impairment especially for AMD. Participant A reported extreme difficulty in reading his favorite newspaper reports, which concur with his “moderate difficulty” rating on the VFQ-25 subscale score for near vision. All study participants reported at least a “mild impairment” according to the responses of the six-question subscale.

**Figure 3.** Participant-reported near vision from six VFQ-25 questions.
Perceived near vision did slightly improve after the study intervention for participants C and D. Although participant B reported her near vision as deteriorating in the VFQ-25 near vision scale, her comment at the 90 day visit was that her “dark spots” were “lightening.”

Impact on perceived quality of life

As shown in Figure 4, all participants perceived their overall vision or “vision quality of life” as being either fair or good at baseline. Self-reported ratings did not change after the 90 day intervention. Of the 4 participants, the females (B, C, and D) rated their overall health as good or very good both at baseline (shown in figure 4) and the same at the 90 day visit. Participant A increased his perception of overall health from good at baseline to very good 90 days later. This may have been because he was recovering from hip surgery, which occurred about a year before the 90-day check. How individuals may answer this question may be affected by many confounding factors such as how they are feeling the day they complete the questionnaire, weight loss, and recent surgery.
Discussion

Although the multiple vision-related testing procedures add up to about a two-hour clinic appointment, more time was added due to unexpected or unrelated questions, e.g. individual nutrition or eye health question unrelated to study. Also, if the participant exhibited symptoms and results of significant vision impairment, even in only one eye, extra time was needed to complete tests, and often tests needed to be repeated. Ideally, 2.5 hours need to be scheduled for the study type of interdisciplinary appointment.

The study participants consumed almost no green leafy vegetables at baseline, so it was time consuming to assess food preferences that include choices rich in lutein and zeaxanthin. Time was needed to explain how to purchase spinach, kale, Swiss chard, etc., how to prepare these vegetables, and suggestions for a variety of recipes. The study dietitian discussed the role of eggs as related to the macula for each participant. Handouts including recipes for egg preparation were helpful especially when photographs of the recipes were included. Both zeaxanthin- and lutein-rich fruits were also recommended to participants (e.g. kiwi, orange juice).

Richer (1999) suggested use of canned spinach for all study participants regardless of likes and dislikes. In the current study, participants could supplement their diets with lutein- and zeaxanthin-rich foods while still using foods they enjoyed because the dietitian assisted in meal planning. The participants seemed to appreciate the convenience of having dual dietitian/ophthalmologist access in one office. Each participant also seemed open to the follow-up telephone calls and mailings from the dietitian. However, disappointingly, overall dietary lutein intake did not increase to
Nutrition education in the eye clinic
recommended level with diet alone. Therefore, a concomitant supplement may be prudent, such as in the Age-Related Eye Disease Study 2 [AREDS2] (National Eye Institute (NEI), 2013).

Overall, for our 90 day short study, no participants exhibited increased or new AMD in the healthy eye. Whether or not this was due to the dietary intervention is unknown. Participant D improved on every measure, despite a 20-pound weight gain. Participant A reported recognition of less “blips” on the Humphrey visual field testing during the second testing period. Also, his perception of near vision deteriorated between baseline and the second visit according to results of the VFQ-25 near vision scale.

Closely-monitored regular face-to-face dietitian visits ended after the 90 day study. Even though phone contact continued, no data was collected. Future studies should track (1) dietary compliance and (2) disease progression. During a telephone conversation, participant A complained that is was becoming very difficult to read small print. Participant B had the least amount of vision impairment in the group and did not change perceived overall health and eye health from baseline to the 90-day post intervention measure. She did miss a few more “blips” on the visual field testing, and missed an additional color chip or two at the 90-day testing, but these minor changes could have been due to individual alertness the day of the testing. Participant C had the highest amount of visual impairment in the study, but had a positive outlook, rating her overall health as “good” at both baseline and 90 days later. Also, participant C rated her visual health as “fair” at both measures, although the logMAR and Humphrey visual field tests identified blindness in her worse eye.
Nutrition education in the eye clinic

All results reported here were helpful in understanding the current status of individual AMD, how the interventions may have affected that status, and also how AMD affects quality of life. The brightness acuity testing did not add anything new to the reported results, so this test could be eliminated from future research.

Limited compliance was exhibited in all four participants for the dietary plan. The study team had hoped for a total dietary intake of 4,000 micrograms of lutein and zeaxanthin in foods per day, minimum (e.g., amount in one-eighth cup cooked spinach), or up to 10,000 micrograms per day (e.g., one-third cup cooked spinach). Compared to other studies (Richer, 1999; Hammond, Johnson & Russell, 1997; Kopsell, Murphy, DeFreitas, Pfannkuch & Heimbach, 2006; Khackik et al., 2006) an intake of 10,000 micrograms of lutein and zeaxanthin in foods would have been favored, as one would not be reliant on a supplement. Foods contain a variety of nutrients such as other carotenoids, e.g. beta-carotene for night vision, so obtaining lutein and zeaxanthin from foods would be preferred over supplements for overall health.

Improved compliance may have been achieved by supplying foods containing the recommended amount of lutein (at least 4,000-12,000 micrograms per day), daily. Cost, however, was prohibitive. Others have trialed lutein and zeaxanthin dietary changes combined with a supplement (Hartmann et al., 2004). In the current study two 5,000-microgram capsules per day supplemented a deficit of lutein in the diet for all participants.

Having multiple methods to measure visual acuity, perceived visual field impairment, plus duplicated dietary assessments enhanced healthcare professional understanding and ability to treat individuals with AMD. For example, participant C,
Nutrition education in the eye clinic

logMAR testing revealed poor vision in one eye; the Humphrey visual field test repeated these results while the VFQ-25 indicated below moderate visual impairment. For all participants in the dietary assessment component, the AFFQ served as a baseline to start a dietary interview where we were able to confirm information revealed on the AFFQ, or to deepen our understanding of participant food preferences or aversions.

The interdisciplinary team approach eased individual access to a dietitian. As indicated by the ophthalmology office experience, the presence of a dietitian as part of an eye clinic health team did impact nutrition intake and possibly their AMD for at least two participants, and possibly three, as evidenced by slight improvements in test results reported for participants. Increased awareness of the role that nutrition plays in eyesight was evidenced by small dietary and lifestyle changes for some and larger changes by all of the participants in the study.

With an aging population that may be open to information particularly concerning their eyes, a starting point for nutrition information may be an eye health discussion. Other eye clinics may benefit from the educational study brochures available from (Blinded for Review, 2007).

Declaration of Conflict of Interests

The authors have no conflict of interests to disclose.

International Large-scale Student Assessments and National Policy-making in Education

Author
Dr. Eva Klemenčič
Center for Applied Epistemology
Educational Research Institute, Slovenia
eva.klemencic@pei.si

Abstract:
The presentation will discuss possible ways of using international large-scale student assessments datasets for national policy-making in education. It explores methodological issues- possibilities and limitations; theoretical assumptions of international large-scale student assessments (ILSA) conceptualizations- epistemological perspectives. It is work in progress of the report on the State of the Art in the area of “Theory and Practice of Using ILSA Datasets for National Evidence-based Policymaking”- international research network that was established in 2014 within World Education Research Association.

Type: work in progress

Introduction

A special type of research carried out within applied epistemology, are studies using measurement instruments and procedures of quantification. These studies measure the extent and depth of the 'pool of knowledge' held by society and social groups. Moreover, in the international sphere compare the volume and quality of the knowledge they acquire different parts of the population, such as school-age generation. In this regard, we can mention the international studies of educational outcomes, coordinated by the international centres: International Association for the Evaluation of Educational Achievement (IEA)- Trends in International Mathematics and Science Study (TIMSS), Progress in International Reading Literacy Study (PIRLS), Civic Education Study / International Civic and Citizenship
Evidence-based educational policy making has been adopted around the world, with Wiseman (2010, p. 2) stating that it is “the most frequently reported method used by politicians and policymakers”. This movement has provided support, among others, to an emphasis on the use of student assessment data in the policy process (Campbell & Levin, 2009; in Knight, Lietz, Nugroho & Tobin, 2012, p. 15)

International assessments have become a major focus of national education policies. National governments can use the results from international assessments to carry out reforms aimed at resolving issues highlighted by the results of the assessments (Rey, 2010, pp. 143-144). They bring a huge amount of indicators and information on educational systems, but these don’t necessary fit to on-going reforms or government goals. Moreover, governments sometimes only use the ranking and superficial features of the international achievement surveys, not the more detailed analyses. Despite the fashionable trends in evidence-based education, one cannot be convinced that policy has to be driven only by numbers, with the risk that policy-makers have too much say in the indicators used. The challenge, both for researchers and policy-makers, therefore, is to consider that the aim to improve the information on educational systems has to be pursued for their common interests. Comparative external evaluations may continue to be a key means of doing this, but there needs to be an acknowledgement that policy and research processes cannot always run on the same timescales. (Rey, 2010, p. 154)
Therefore to fulfil the gap between policy and research is essential for both of them. With the international research network\(^1\) we would like to minimize this gap and raise aware of possibilities and limitations of using international large-scale datasets for national policy making.

**International research network**

To achieve this general objective a synthesis report on the State of the Art is a first priority of the research network.

**Research problem**

Very often league tables are used as the main or only source in deriving political decisions without accounting for the local and global contexts. Therefore we would like to establish a proper methodological approach of using ILSA’s data in secondary analysis as the source of political decisions in policy making, an evidence-based approach.

**Research questions:**

1. What are the current practices in using ILSA data for policy making worldwide?
2. What are the best practices of using ILSA data for national policy-making with regard to the diversity of the educational systems?

The intended outcomes of WERA international research network are: 1. Establish common practices for reporting the results from ILSA nationally raising the awareness of methodological issues; 2. Advise national authorities in national policy-making.

*State of the Art report (presented as a work in progress)* will synthesise the core of knowledge from two approaches: methodological and theoretical. The research methodology will be composed of two main distinct aspects which complement each other- literature review and empirical data collection (questionnaire for IEA national research coordinators). The core of the methodology used in this paper will be literature review, accompanied with a case study from Slovenia (the research that grounded the base to establish international research network).

\(^1\) “Theory and Practice of Using ILSA Datasets for National Evidence-based Policymaking”- international research network that was established in 2014 within World Education Research Association (WERA).
Case study: Slovenia

Research that was conducted in 2010 tried to explore the ‘impacts’ of international comparative studies (and international large-scale student assessments in particular) on national education policy-making in Slovenia, in the sample three groups of respondents were included:

a) National research coordinators from Slovenia (NRC): TIMSS and TIMSS Advanced, PISA, CIVED/ICCS, PIRLS, SITES;
b) Expert and advisory board (EAB);
c) Policy-making (PM).

Instruments used:
- first phase (structured interviews)
- second phase (semi-structured face-to-face interviews)

All participants were given all questions, but the NRC’s answered, within the topic of concrete impacts (research question four), only about the study that they were coordinating.

The interviews were focused on five major research questions, relating to:
1. the impact of international education studies on national policy-making in Slovenia (respondents general feelings about impacts);
2. reasons for participating (focused on studies and particular cycles);
3. media and expert interests (which of the studies have (potentially) major media and experts interests);
4. concrete impact of all data collections (regarding particular cycles); impacts on curriculum and/or some syllabuses);
5. additional use of collected data.

In the semi-structured interviews, respondents were asked for additional information about the uses of international large-scale student assessment results as a tool for national progress as well as obstacles/limitations; and for ways in which the international data could be used in real-world policy-making situations and the possible implications of international large-scale student assessments for Slovenia were discussed.

Summarizing the results:

---

From the first phase (using structured interviews), it is clear that all three groups of respondents expose the great impact of international comparative studies on Slovenian national policy-making in education, especially for evidence-based policy. However, they are all in agreement that more secondary analysis is needed. This is actually the first conclusion, that in Slovenia more analyses that are socio-culturally oriented are need. In addition, socio-cultural orientation could be attained using national assessments or with some additional data analysis combining international and national assessments (actually parts of the mentioned assessments, because simple interpretations between national and international assessments are not possible). It seems that estimations about the impacts of international comparative studies (especially emphasizing the impacts) are still more declarative statements than everyday reality and that participating in these studies is seen of as important due to being placed in international league tables.

On the contrary, with second phase (using semi-structured interviews with NRCs) aim was to identify some of the concrete direct (e.g. from TIMSS study) and indirect impacts. Since indirect impacts are often not measurable at all, estimations about impacts could be misleading. From this phase, it is also clear that some of the results from e.g. TIMSS have leads to changing curriculum (e.g. Mathematics syllabus), while other results e.g. PIRLS and National Reading Strategy are more important as a declarative statement which in Slovenia is compulsory, but it has still not been realized in everyday school reality.

Abstract

Incremental predictive value of 5 robust and 13 specific personality traits for school grades over and beyond age, gender, parental education, and country was examined in Russian and Slovene students aged from 8 to 15 years. Final grades in two core school courses over the nine-year compulsory schooling, mathematics and language (Russian/Slovene) were considered as measures of academic success from Grade 3 through Grade 9. The Inventory of Child Individual Differences – Short was employed to assess student personality. To test the consistency of personality – achievement associations, personality data was collected from both mothers (Russia: $N = 994$, Slovenia: $N = 624$) and adolescents (Russia: $N = 481$, Slovenia: $N = 310$). The robust personality traits uniquely predicted the school grades, improving the criteria variance by 11% to 14% over the background variables. When the specific personality traits were considered in hierarchical regression analyses, the traits contributed additional 14% to 18% to the variance explained. Across the countries, informants and school courses, younger age, higher parental education, female gender, openness (especially subjectively perceived intelligence), and low extraversion (especially low sociability) predicted the course grades. Conscientiousness was also predictive of achievement, with low distractibility contributing to mathematics grades and organized behavior predicting success in language. No moderator effects of age and country were revealed. Identification of non-cognitive factors predicting academic achievement over compulsory schooling obtained in this study has important implications for education. It allows educators to predict who will perform better or worse academically and provides background to direct students towards educational programs in which they are likely to succeed. Teachers may be also advised how to adjust their work with students differing in personality in order to compensate for their weaknesses and to enhance their strengths related to academic performance.
1. Cognitive Effectiveness of a Four-Dimensional Revision of Textbook Fragments: A Quasi-Experimental Study

2. Other Areas of Education

3. Poster Session

4. Cognitive effectiveness of four original versus linguistically revised thematic fragments of geography textbooks was tested in a quasi-experimental study with 247 nine-graders of compulsory school. The original fragments were revised in cohesion, argumentation, considerateness, and coherence. Controlling for the students’ previous school grades in geography, a considerable positive effect of reading the revised fragments on comprehension was revealed. Low achievers who read the revised fragments caught-up in comprehension with high achievers who read the originals.

Abstract

In a quasi-experimental study, we examined the effect of a revision of four thematically different textual fragments taken from four textbooks of geography (Grade 9 of compulsory school) on students' comprehension. The original fragments were linguistically revised in four inter-related dimensions: Cohesion, argumentation, considerateness, and coherence. An initial sample of 247 students (50% girls) was divided into groups reading the original and the revised fragments of the four thematic units. The design was such as to permit each group of students to function both as a control and experimental group. The students’ comprehension was then measured using tests of knowledge. Controlling for the students’ previous school grades in geography, reading the revised fragments resulted in considerably higher test-scores across the thematic units. We further investigated the extent to which (i) the differences between test-scores of low- and high achievers in geography decrease when the former read the revised fragments and the latter read the original fragments, and (ii) the low- and high-achieving students differ in comprehension when reading the revised fragments as compared to the original ones. The results suggested that low achievers (graded sufficient or good at the end of the previous school year) who read the revised fragments scored at the level of high achievers (graded excellent) who read the original fragments. Nevertheless, an exposure to the revised texts showed a substantial advantage in comprehension for both the low- and the high-achieving group. The technique and procedure of text improvements employed in this study could, with some adjustments, be transformed into a tool for a large-scale evaluation and development of school textbooks.

Introduction

School textbooks are often the subject of criticism that is normally focused on various aspects of external events (system of confirmation and purchasing, pricing, etc.) or the external appearance of a textbook or its perceived attractiveness for young readers (e.g., the content and quality of photographs). Yet the essence of textbooks, i.e. the semantic and cognitive perceptions created by the contents of a textbook in the minds of students, as well as the structure and contents of textbook messages received by students while reading or studying from textbooks, is rarely criticized (Justin, 2010a). By merely changing the structure of a textbook (semantic structure, vocabulary, syntactic, semantic and textual characteristics), we can improve and at the same time facilitate students' successful retrieval of information read, their comprehension of the cognitive
contents of a text, and use of the information learned in new contexts (Justin, 2010b, 2012; Mikk, 2002). Through the premeditated creation of a textbook fragment in line with research findings on its cognitive effectiveness, it is therefore possible to create essentially more effective texts than those written solely on the basis of authors' expertise, their personal creative abilities and teaching experience (Justin, 2010b).

A Quasi-Experimental Approach to Studying the Cognitive Effectiveness of School Textbooks

The approach used to study the cognitive effectiveness of school textbooks is (quasi)experimental and mostly deals with the question how a certain (linguistic, visible) method of conveying information in textbooks influences students’ retrieval, comprehension and use of such information, as well as the achievement of educational goals (Justin, 2010a; Mikk, 2000; Selander, Thoey, & Lorentzen, 2002). The findings of (quasi)experimental studies of the effect of textbooks on users are significant both in the creation and development of cognitively effective and student-friendly textbooks, as well as in the expert evaluation of their quality.

In (quasi)experiments, authors generally select samples of textbook fragments, and revise (generally improve) one or more characteristics (e.g., semantic complexity of text, vocabulary difficulty, vocabulary abstractness, sentence length). Then, in supervised procedures, usually comprising an experimental and a control group (matched in characteristics which, alongside the presumed variations in the cognitive effectiveness of texts, could influence the learning result), they compare the effects of the original and revised versions of texts on the learning outcomes of participants (memory recall, comprehension of and conclusions on what they read). In this study, we selected for revision the following characteristics of a textbook fragment, which are interconnected: its cohesion, considerateness, argumentation structure, and coherence (Beck, McKeown, & Gromoll, 1989; Julkunen, 1991; Mikk, 2000; Wilkes, 1997).

Four Characteristics of the Text Affecting Its Cognitive Effectiveness

Cohesion is the internal connectedness of a text, how it 'sticks together', where the reader recognizes the central theme to which most of the sentences are connected, and where the links between integral parts of the text are solid (e.g., Klare, 1985). In reading such a text, the reader can more easily represent the meaning of what he/she has read as a whole, since each individual meaning is linked to other meanings. This naturally has a favorable effect on the reader's memory
retrieval of information, and above all on his comprehension of the text. Cohesion is further strengthened if, for example, some key words in the text are repeated, the text has a clear and orderly argumentation flow (supported by conjunctionally used expressions between parts of the text, e.g. 'since', 'because', 'although', 'as', 'however', 'further', etc.), phrases and sentences follow one another in a sequence reflecting a sequence of events, the causal and persuasive connections between phenomena are indicated in the text, a general statement is followed by specific statements, etc. (Justin, 2004).

The considerateness of a text refers to the communication of unambiguous and essential information, close and direct reference (e.g., the sequence of a sentence adequately reflects the cause – effect relation), which facilitates the reader's reception and comprehension of information (Beck et al., 1989). As an example, we are presenting three text fragments from a Slovene school textbook:

/1/ Napoleon's army rested for a few weeks. It was exhausted from the long marches and battles.

/2/ Long marches and battles exhausted Napoleon's army. It rested for a few weeks.

/3/ Long marches and battles exhausted Napoleon's army. Therefore, it rested for a few weeks.

Fragment /1/ does not facilitate comprehension of the causal connection it expresses. Namely, it first describes the consequence and only afterwards the cause. Fragment /2/ facilitates comprehension to the extent that the sequence of two sentences reflects the cause – effect relation. Fragment /3/ best facilitates comprehension of the causal connection, which it directly expresses using the conjunction 'therefore' (Justin, Zupančič, & Rožman, 2012).

Coherence refers to the consistency and orderliness of meanings in a text, and the orderliness of the relation between the structure of the text and the structure of referents (things, events and phenomena) referred to in the text. A coherent text is homogeneous in meaning, logically correct (using linguistic means it forms a representation of the world in which time, space and events are logically connected; Justin, 2004), consistent with the rules of text building (Wales, 1994), and maintains continuity of meaning (Beaugrande & de Dressler, 1992).
Presented below is an example of an illogical connection between the time and spatial dimensions of a representation in a text (Justin, 2004; Justin et al., 2012) taken from a Slovene school textbook that speaks of the origin of the city of Ljubljana:

/4/ The capital city of the Republic of Slovenia – Ljubljana – originated at the meeting point of the Ljubljana basin and the marshes.

The main referent of the sentence, the city, is spatially determined: the meeting point of the basin and the marshes. The sentence speaks of the origin of the city in the Middle Ages. The capital city of the Republic of Slovenia – Ljubljana – certainly did not originate at that time at the meeting point of the basin and the marshes.

The text can remain coherent if, at some point, a new time, place, new persons, a new theme, new events or a new situation are introduced. However, this must be done in an orderly and logical manner, and according to the rules of text building. One of these rules requires that any change of time should be specifically designated in the text. By designating a change of time, the author of sentence /4/ in the Slovene textbook could maintain a historical perspective:

/5/ At the meeting point of the Ljubljana basin and the marshes, a city began to develop which, much later, in the 20th century, would become the capital of the Republic of Slovenia – Ljubljana.

By improving the argumentation structure of texts, which we presumably achieved, at least partially, through the greater considerateness, cohesion and coherence of revised texts in school textbooks, we strove to eliminate as many gaps in the text as possible. Gaps are those places where the reader has to make conclusions that are not directly expressed (Sperber & Wilson, 1986). In a large majority of – didactic and other – texts, the reader will, by 'decoding' the meaning of words that comprise the text, repeat only part of the message; he/she will repeat the remainder by drawing inferences that bridge or fill the gaps in the text. Texts that have many such gaps (they are more implicit) are cognitively more complex than those with fewer gaps (they are more explicit) (Van Dijk & Kintch, 1983). In order to comprehend a text in a textbook as a meaningful whole, the student must, in some places, draw inferences that are not directly expressed in the text – he/she has to fill these gaps. As an example (Justin, 2010a), we are presenting a sentence from a Slovene geography textbook used in this study:
The textile industry was gradually losing its leading position, but through the enlargement of its plants and modernization, it continues to be an important exporter of its products.

In this sentence, the student needs to make two bridging inferences:

It is good for an industry to export products. An industry can export only if it has sufficiently large and modern production capacities.

The Present Study

The first aim of our study was to develop, on the basis of critical linguistic analysis, a procedure for improving original school textbook fragments by changing their argumentation structure (cohesion, considerateness, coherence, bridging of gaps), i.e. revising texts for the purpose of improving their cognitive effectiveness. In doing so, we focused on fragments of geography textbooks for the 9th (last) grade of compulsory education, because geography is a subject comprising components of the natural and social sciences, geography classes are compulsory for the entire basic elementary school population, and all 9th grade students had previously attended three years of geography classes. Using a quasi-experimental procedure, our second aim was to test: (i) whether the effect of textual revision (if it exists) on students’ comprehension is preserved with their background knowledge in the field, which also contributes to comprehension (e.g., Chiesi, Spilich, & Voss, 1979; Justin, 2010a; Justin et al., 2012), controlled for; (ii) the extent to which the differences in comprehension between low- and high course achievers in geography level off when the former read the revised textbook fragments and the latter read the original fragments, and (iii) how much low- and high-achieving students benefit in comprehension when reading the revised fragments as compared to the original ones.

Method

Participants

Total sample. We randomly sampled 8 public compulsory schools distributed over three main regions of the country. In each school, we further randomly selected one or two school classes of students attending grade 9 (age 14 to 15 years); in total, 14 school classes were included. Following this procedure, 247 students (approx. 50% girls) whose parents provided a written consent, were selected to participate. Because a few students were not present in school at one of
two experimental sessions (exceptions were absent at both), the Ns presented in the Results section deviate from the sample-size reported here.

Subsamples. In order to estimate the effect of reading the revised texts on comprehension with low- and high-achievers in geography, we created two subsamples based on school grades distribution of the total sample; 170 students of the total sample were included. Low achievers (73 students, i.e. 42.9%) were the participants who were graded sufficient or good by their geography teachers at the end of the previous school year, and high achievers (97 students, i.e. 57.1%) were those who were graded excellent.

Measures and Instruments

Textbook fragments. For the purpose of the revision, we selected text fragments from four Slovene geography textbooks for the 9th grade of elementary school, which were approved by the Council of Experts of the Republic of Slovenia for General Education. We selected the fragments from four thematically different textbook units that have not been taught in the sampled school classes yet (the assurance was provided by the students' geography teachers), i.e. the units of agriculture, settlement (of Slovenia), between hills and plains (hereinafter: hills), and industry. The fragments were further selected according to an additional criterion – each of them had to be conceptually thorough and comprise approximately 300 words without thematic interruption. The four original fragments were then revised.

Tests of comprehension. We assessed the students' level of comprehension of the thematic fragments read (original or revised) using four multiple-choice tests (a separate test for each thematic fragment). The tests were created for the purpose of this study and were preliminary tested for discriminative validity with a convenient sample of nine-graders (n = 132). According to the results, the tests were adjusted. Each of the four adjusted tests included 19 questions, except for the one referring to hills which consisted of 20 questions. The questions required comprehension of relations among phenomena (causal relations, influences, reasons for undertaking actions etc.) and not merely memory recall. There were four response options to each question with only one being correct. However, two questions of the test referring to settlement required from students to indicate whether each of four assertions (possible responses) is either correct or wrong; a correct answer was always scored one point and the sum of correct answers
represented a test-score (per thematic fragment). The students who read either the original or the revised version of the same thematic fragment responded to the same test.

*School grades.* The participants’ final grades in geography (1 = failed, 2 = sufficient, 3 = good, 4 = very good, 5 = excellent) assigned by their geography teacher at the end of the previous school year were taken as a proxy of their background knowledge in geography. Final grades represent an overall teacher assessment of a student’s academic achievement in a given course; they are based on the student’s written and oral examination performance over a school year. Although partly subjective, the final grades of Slovene nine-graders, at least in mathematics (Puklek Levpušček, Zupančič, & Sočan, 2013) and Slovene language (Puklek Levpušček & Zupančič, 2009), show strong correlations with their National Examination Test scores (an objective measure) in the respective school subject.

*Procedure*

*The revision of textual fragments.* First we performed a thorough, critical analysis of selected fragments, i.e. we critically examined the texts in those dimensions where we intended to make improvements. These are the dimensions that have already been mentioned: cohesion, considerateness, argumentation structure (particularly gap filling), and coherence. Below is an example of an analysis of a small part of one of the original fragments on the topic of hills (Justin et al., 2012).

/8/ In the past, the hilly region referred to by the locals as Gorički bregi was one of the most agricultural regions in Slovenia, although the farming conditions are not good. There is little flatland, the soils are leached and for this reason poorly fertile. The most developed activities are livestock farming and fruit-growing, there are very few vineyards. Because the land holdings are very fragmented, small farms were not able to modernize crop production; thus, so-called agricultural overpopulation occurred. This means that given the natural conditions in the region, too many people were making a living out of agriculture. Farmers attempted to improve their circumstances by doing seasonal work abroad, primarily in Austria, and by emigrating. For this reason agriculture is, to a considerable extent, still traditional, but this had a favorable effect on the region because it was left untouched. Although Goričko is the least developed and most remote Slovene region, precisely its preserved elementary state is its best legacy for the future.

The coherence of texts is influenced, among others, by the use of tenses (past tense, present tense) as well as the conjunctive and argumentative use of expressions such as 'since', 'because', 'as', etc. We shall first demonstrate how tenses are used in the original fragment.
… region … was past one of the most agricultural regions … although the farming conditions are not present good … The soils are present leached … The most developed activities are present livestock farming and fruit-growing, there are present very few vineyards. Because the land holdings are present very fragmented, small farms were not able past to modernize crop production … For this reason agriculture is present, to a considerable extent, still traditional, but this had a favorable effect past on the landscape because it was left past untouched … Goričko is present the least developed …

Due to the alternating use of verb tenses, the text is ambiguous. A student wonders: is the fragment speaking about the present or the past state? The text is not only ambiguous, but, for the student, at least incoherent. Let us examine the following sentence:

/10/ Because the land holdings are present fragmented, small farms were not able past to modernize crop production …

The student finds it hard to understand how the present fragmentation of land holdings could have prevented farmers from modernizing crop production. Even the adult reader wonders: Does this mean that the land holdings were fragmented in the past and are still fragmented today? Moreover, the phrase 'small farms' in this sentence functions as a definite description. For this reason, a parallel conclusion suggests itself:

/11/ If the land holdings were not fragmented, small farms would be able to modernize crop production.

Namely, the main characteristic of definite descriptions is that they refer to things or to the state of things as they are; they are referents which do not depend on the variables described in other parts of the sentence.

Presented next is an example of the use of the argumentative conjunction 'because', as well as the explanatory phrase ‘thus’ and 'this means that', in the first two sentences of the original text fragment.

/12/ Because the land holdings are very fragmented, small farms were not able to modernize crop production; thus, so-called agricultural overpopulation occurred. This means that given the natural conditions in the region, too many people were making a living out of agriculture.

The conjunction 'because' gives the impression that the fragmentation of land holdings is the reason for the inability to modernize crop production. The word 'thus’ leads to the conclusion that the inability to modernize is the reason for overpopulation. A major obstacle for interpretation
appears when we read the definition of overpopulation: *given the natural conditions*, too many people were making a living out of agriculture. What is the obstacle? In /12/ we first learn that overpopulation occurred *because* small farms were not able to modernize crop production. Immediately afterwards, the text informs us that overpopulation is linked to (unfavorable) natural conditions. The first or the second? Furthermore, it is not easy to draw inferences about what is meant by 'natural conditions'. It will be necessary to go back a few sentences in the text, to the place where it speaks of there being little flatland, leached soil and poor fertility. But how can the student relate this to the question about modernizing crop production? Among the possible, though by all means risky, inferences that are in no way supported by the text and could hardly be made by the students, is the following:

/13/ The poor natural conditions (unleveled surface, leached and poorly fertile soil) and fragmented land holdings can be compensated (?) by modern crop production, i.e. by the use of machines (?) and fertilizers.

This analysis illustrates the cluster of uncertain inferences that need to be drawn by the student attempting to construct a coherent interpretation of the text, and the obstacles he/she meets by a poorly constructed text. The parts of fragments presented are all the more problematic for the student, who, having little previous knowledge of the subject, finds it all the harder to guess which inferences will bring him closest to the author's communicative intention that he/she believes is incorporated in the written text.

The student not only has difficulty drawing adequate inferences because he lacks sufficient previous knowledge, but also because the disorderly text leads one to draw inferences that are at least partly contradictory. The text should make it easier, and not more difficult, to draw inferences that we use to relate the causes and consequences, factors and states which the factors influence. An example of how the drawing of inferences is further rendered difficult can be seen in the remainder of the original text:

/14/ Farmers attempted to improve their circumstances by doing seasonal work abroad, primarily in Austria, and by emigrating. For this reason agriculture is, to a considerable extent, still traditional, but this had a favorable effect on the region because it was left untouched.

Here the connecting phrase, 'for this reason', again causes confusion. Its use generally directs attention to the *previous* sentence. One would therefore infer that seasonal work and emigration are reasons why agriculture in the Goričko region is still traditional. The writer, however,
probably intended to say that the reason for this was in something that is mentioned further back in the text, namely, in the fragmentation of land holdings and/or the inability to modernize crop production in the past. Adult readers can speculate on that. But for students, all of this is entirely unclear.

In addition, something else happens in this part of the text. If, up to this point, the entire argumentation flow leads to negative consequences (poverty, underdevelopment, overpopulation), all of a sudden this flow takes a positive direction. We now learn that undeveloped agriculture had a favorable effect on the region. This favorable effect is apparently visible in the untouched elementary state of the region. However, the region can in no way be untouched. For the inhabitants have cut down forests, created orchards and pastures, are cultivating fields, etc. This is followed by an even more disputable part:

/15/ Although Goričko is the least developed and most remote Slovene region, precisely its preserved elementary state is its best legacy for the future.

The transition to the present, and even the future, finally occurs here. The landscape is no longer untouched, but has preserved its elementary state. Our attention, however, should be focused primarily on the assertion that Goričko is the most remote Slovene region. The question one needs to ask is: for whom is this region most remote? Probably for someone living (and writing textbooks) in Ljubljana or Koper. But Goričko is by all means not the most remote Slovene region for someone living in Murska Sobota, being only a few kilometers away. The judgment that Goričko is a remote region is therefore an egocentric judgment made from a specific point of view, probably from the perspective of central Slovenia. But – is not the decentralization of spatial perception one of the key conditions of geographical thinking?

This is followed by the judgment that underdeveloped agriculture is the best legacy for the future. Of course this judgment, expressed with a metaphor (legacy), is extremely puzzling to elementary school students. This was also shown in a comprehension test which we will report on. The students were not able to relate two metaphors – the metaphor of untouched elementary state, and the metaphor of legacy. Even an adult reader cannot be entirely convinced that the writer's intention in using the term 'legacy' was to point to the possibilities of future development of tourism.
The revised text of the original fragment present above was as follows:

/The hilly region referred to by the locals as Gorički bregi was an agricultural region in the past. However, the conditions for farming were poor. Namely, the ground is uneven and water has removed a great many substances from the soil that are necessary for the growth of plants. This is why farmers were more occupied with livestock farming and fruit-growing than agriculture and vine growing. Moreover, the land was divided into a multitude of small farms that gave only a small yield and income. So, land holders earned too little to be able to buy machines and fertilizers with which to improve the soil. For all these reasons, some farmers occasionally worked abroad (primarily in Austria) or moved elsewhere. If individual farm families in a specific agricultural region have little land, which on top of that is even poor, we say that the region is agriculturally overpopulated. The agriculture was thus outdated. Nevertheless, this had at least one good consequence. Namely, the region has remained such as it was a hundred years ago. Although it is still the least developed Slovene region, its preservation will prove highly interesting to tourists in future.

The revision strongly emphasizes argumentation. The expressions that are the carriers of the argumentation flow ('but', 'namely', 'because', etc.) help the student to more easily follow the communicative intention of the author of the text, and to more easily create a mental model of the situation being discussed in the text.

The quasi-experiment. First, consents from school principals, principal teachers, and students' parents were obtained. Then, we carried out the procedure in school classes. In each class, an experimenter presented the purpose of the study and asked students to participate. Next, she distributed the thematic fragments (four units, referring to agriculture, settlement, hills, and industry) to the participants according to a permutation principle. The students in each class were randomly assigned to one of four groups: Group 1 read original fragments A (settlement) and B (industry), and revised fragments C (hills) and D (agriculture); The students in group 2 read the original A, revised B, revised C, and original D fragments etc. (Table 1). Such a design permitted each group of students to function both as the control and experimental group.

Note: The rank-order was also rotated randomly within each group to control for possible effects of decreased motivation, concentration or newly acquired problem solving skills.

Each participant thus read four thematically different fragments (15 minutes each) over two sessions, which were held a few days apart so that a student read only two fragments per session. In each session, the students read the first fragment individually and then responded to the test-questions related to the theme of the first fragment. After that they read the second fragment and then responded to the respective test-questions. While responding to the questions, they were allowed to use the text they have just read. The students who shared the same school desk did not read the same text and consequently, they did not respond to the same test-questions concurrently.

The school grades in geography were taken from school records by the experimenter and matched with the codes assigned to an individual participant’s set of written material (a selected version of the text fragment and corresponding test sheets). The ‘matching list’ was destroyed immediately after the test material was collected and checked.

Results
The Effect of Reading the Revised Textual Fragments on Comprehension Controlled for Students' School Grades in Geography
Table 2 displays means (M) and standard deviations (SD) of the students' test-scores across the four thematic fragments (agriculture, settlement, hills, and industry) after reading the original and the revised text.

Note: 1 = Original fragment read, 2 = Revised fragment read. A maximum score concerning agriculture, settlement, hills and industry was 19, 25, 20 and 19, respectively.

The Leven's test indicated that the variance of the test-scores was homogeneous for groups reading the original and the revised fragments of the text (agriculture: $F_{(1, 230)} > 0.05, p = 0.47$; settlement: $F_{(1, 226)} = 2.44, p > 0.05$; hills: $F_{(1, 226)} = 0.75, p > 0.05$; industry $F_{(1, 222)} = 1.69, p > 0.05$). Next, the one-way analysis of variance for independent samples was used to test for differences in comprehension between the students who read the original and those who read the revised textual fragments. The results suggested that the latter scored significantly higher on the test across the four thematic units (agriculture: $F = 29.84, p < 0.001$; settlement: $F = 23.57, p < 0.001$; hills: $F = 40.65, p < 0.001$; industry: $F = 101.94, p < 0.001$). However, the students’ background knowledge in geography (as captured by their school grades in geography at the end of the previous school year) was also considered to contribute to their comprehension (test-scores). As presented in Table 3, the students who were assigned higher final grades in geography by their teachers indeed scored significantly higher on the test across the four thematic units, and the version of the fragment read (original or revised).

*Note:* **p < .01 (two-tailed).*

Due to the significant and moderate positive correlations (Table 3), we controlled for the school grades by means of analyses of covariance with the version of the textual fragment as an independent variable, the respective test-score as a dependent variable, and the grade in geography as a covariate.

The students' grade in geography and the version of the textual fragment read jointly explained from 29% to 41% of variance in their test-scores across the thematic units (agriculture: $R^2 = 0.30$; Adj. $R^2 = 0.29$; settlement: $R^2 = 0.34$; Adj. $R^2 = 0.33$; hills: $R^2 = 0.36$; Adj. $R^2 = 0.36$; industry: $R^2 = 0.42$; Adj. $R^2 = 0.41$). The students' grades significantly contributed to their test-scores (agriculture: $F = 60.33$, $p < 0.001$; settlement: $F = 82.33$, $p < 0.001$; hills: $F = 74.91$, $p < 0.001$; industry: $F = 38.90$, $p < 0.001$). The students with better background knowledge in geography (grades) scored higher than those who were assigned lower grades by their teachers at the end of the previous school year. Nevertheless, controlling for the grades, the students who read the revised fragments of the text still consistently scored higher on the test than their class-mates who read the original fragments (agriculture: $F = 32.47$, $p < 0.001$; settlement: $F = 30.09$, $p < 0.001$; hills: $F = 59.22$, $p < 0.001$; industry: $F = 124.63$, $p < 0.001$).

* Differences between Test-Scores of Low-Achievers Reading the Revised Text Fragments and High Achievers Reading the Original Fragments
Table 4 shows means and standard deviations of the test-scores for each of the four thematic units by grades in geography (low achievers and high achievers) and by the version of the fragment read before the test (original or revised).

Note: Low = grades 2 (sufficient) and 3 (good); High = grade 5 (excellent); Subscripts agr, set, hil and ind refer to the thematic units of agriculture, settlement, hills and industry, respectively.

Differences between low achievers' test-scores after reading the revised fragments and high achievers after reading the original fragments were calculated by means of the $t$-test for homogeneous and non-homogeneous (when necessary) samples. The Leven's test indicated that the variances of test-scores were homogeneous between the low achieving group reading the revised fragments and high achieving group reading the original fragments about agriculture ($F = 3.01, p > 0.05$), settlement ($F = 0.26, p > 0.05$), and industry ($F = 1.53, p > 0.05$), whereas the variances were non-homogeneous for the test-scores concerning the unit of hills ($F = 6.33, p < 0.05$). Except for the mean differences in test-scores (Table 4) referring to settlement, which suggested that the high achievers reading the original text scored significantly higher than their low-achieving class-mates reading the revised fragment ($t(73) = 2.18, p < 0.05, d = 0.53$, indicating a medium effect size), the differences between the high- and low achievers in geography were non-significant (agriculture: $t(72) = 1.76, p > 0.05, d = 0.42$; hills: $t(57) = 1.85, p > 0.05, d = 0.43$; industry: $t(78) = 1.88, p > 0.05, d = 0.43$).
Both low and high achievers in geography exhibited a significant advantage in their test-scores after reading the revised text fragments as compared to reading the original fragments.

For low achievers in geography, inequality of the variance between the groups reading the revised fragments and those reading the original fragments was revealed with respect to the thematic units of agriculture ($F = 6.14, p < 0.05$), and settlement ($F = 5.07, p < 0.05$), whereas the variances were homogeneous for the test-scores concerning industry ($F = 2.05, p > 0.05$), and hills ($F = 0.08, p > 0.05$). The results obtained by relevant versions of $t$-tests (for equal and unequal variances) showed a significant and consistent benefit in favor of students reading the revised fragments of the text (see also Table 4). The effect of reading the revised fragments ranged from moderate to substantial (indicated by the Cohen's $d$, representing differences in means of the two score-distributions displayed in standard deviations). With regard to the four thematic units, the advantage was moderate for agriculture ($t(50) = 2.91; p < 0.01, d = 0.75$) and large for the units of settlement ($t(52) = 3.08, p < 0.01, d = 0.82$), hills ($t(65) = 3.87, p < 0.001, d = 0.92$), and industry ($t(64) = 4.79, p < 0.001, d = 1.2$).

For the high achievers in geography, inequality of the variance between the groups reading the revised fragments and those reading the original fragments was suggested with respect to the thematic unit of settlement ($F = 5.92, p < 0.05$), whereas the variances were homogeneous for the test-scores concerning agriculture ($F = 0.02, p > 0.05$), hills ($F = 2.05, p > 0.05$), and industry ($F = 0.61, p > 0.05$). Significant favorable effects of reading the revised fragments of the text were also found in students who were assigned excellent grades in geography at the end of the previous school year (Table 4). For reading the fragments about agriculture and settlement, the effects were moderate in their magnitude ($t(88) = 3.69, p < 0.001, d = 0.78$) and ($t(79) = 3.72, p < 0.001; d = 0.79$), respectively, whereas the effects concerning hills ($t(87) = 3.85. p < 0.001, d = 0.82$) and industry ($t(84) = 7.72, p < 0.001, d = 1.68$) were large.

**Discussion**

In the present study, we aimed to linguistically improve four thematically different textual fragments selected from four geography textbooks (basic compulsory education, Grade 9) in order to increase their cognitive effectiveness; the textbooks under study were officially approved.
by the State Council of General Education as appropriate to be used by students in compulsory schools. The improvement (revision) of the textual fragments was focused on four interwoven dimensions, cohesion, argumentation, considerateness, and coherence. Effects of the assumed linguistic improvement were tested in a quasi-experiment with Slovene nine-graders. From the perspective of students’ comprehension of the text read, the results suggest a significant advantage of reading the revised fragments over reading the original ones even when controlling for the students’ background knowledge in geography (indicated by their final grade in geography at the end of the previous school year). The results further propose that our revision of the selected texts has a substantial effect on comprehension across different thematic fragments for both low- and high-achieving students in geography. Moreover, reading the revised fragments contributed to the students’ comprehension to such an extent that the low achievers attained levels of comprehension similar (or at least close) to levels of the high achievers (presumably possessing more background knowledge) reading the originals. The size of the effect of reading the revised textual fragments as compared to the originals was predominantly large though it varied somewhat by the thematic unit and the students' background knowledge in geography (final grades). Furthermore, the advantage of reading the revised fragments was the largest in case of reading the thematic fragment of industry in both the low- and high-achieving nine-graders. As shown by a semantic analysis of the original fragments, this fragment consisted of more gaps that are difficult to bridge by inference than the remaining three fragments (Justin, 2010a, b).

Based on careful analyses of original fragments in school textbooks and texts employed in international tests of literacy such as PISA (Justin, 2011) it seems that students' processes of inference, especially elaborative and bridging inferences (Garnham, 1994; Justin, 2010b, 2011) play a crucial role in their comprehension of written texts. In attempt to comprehend the text, a reader does not merely decode word meaning or sentence meaning but fills in the gaps in meaning by his/her representations retrieved from long-term memory and inferences. The reader completes the information given in the text explicitly by elaborative inferences (using knowledge about the topic to fill in additional details or to establish connections between what is being read and related items of knowledge). He/she also draws bridging inferences to bridge gaps in the text while constructing its meaning as all texts are semantically incomplete. Whenever the reader notices gaps in a text surface structure (observes that the text meaning is incomplete, i.e. not fully
expressed), this is a strong signal for him/her to make additional inferences. He/she tries to complete the meaning of sets of sentences, i.e. of the way they relate to each other, in a particular situation in which the sentences were used with a certain communicative intention of the writer. This reader’s completion by inferences contributes to coherent interpretation of the meaning which is necessary for the him/her to construct a model of the situation described in the text (Johnson-Laird, 1983; Van Dijk & Kintch, 1983), and has an important role in recognition of the writer’s communicative intention (Justin, 2011). Many of the bridging inferences appear self-evident and are thus not paid attention by writers (Garnham, 1994; Justin, 2011). But can students on a given level of cognitive development and by their knowledge recalled from long-term memory perform relevant bridging inferences and recognize the writer's communicative intention (an example of such inferences is given in the Introduction section of this paper)? If not (or at least not entirely), a student comprehends the text only partly (or even miscomprehends it). In revising the original textual fragments we thus, tried to make the students' processes of inference easier by: (i) filling in the gaps (identifying the gaps in the text that are difficult to bridge and conveying more explicit messages), (ii) conveying considerate information (eliminating ambiguous information, indirect referencing and abolishing concepts which students probably cannot relate to their background knowledge), (iii) increasing the cohesion of the text (by ordering the argumentation flow), and (iv) improving its coherence (by increasing unities of meaning, continuity, and logical accuracy of the text, accordant with syntactic rules).

The outcomes of our study showed that it is possible to create school textbook texts that are beyond the quality of those found in selected and officially valid Slovene school textbooks of geography. This can be achieved by performing linguistic procedures based on multi-disciplinary research findings and thoughtful revisions. We propose that considering the 'algorithms' used in our revision of the textual fragments would, in general, contribute to an increase in cognitive effectiveness (quality) of the extant (Slovene) school textbook texts. It is also important to note that a low level of cognitive effectiveness of school textbook texts not only hampers students' memory recall, comprehension and application of the information obtained but also puts a needless work-load on students, impedes their cognitive development and self-confidence, and decreases their motivation for reading and learning in a long run (Mikk, 2002).

Implications
An expert knowledge on interventions in the linguistic structure of a school textbook text, effects of these interventions on cognitive effectiveness of the text, and procedures which allow for concurrent empirical evaluation of preliminary developed parts of school textbooks with relatively small samples of students, has a special practical value for publishing companies creating school textbooks (Justin, 2012). In addition, the present study provides quality guidelines that could be used by evaluators of school textbooks and members of commissions who officially approve appropriateness of the textbooks for a given population of students in a given school course. Our findings and examples presented could be (in a somewhat 'naive reader-friendly' and simplified form) also helpful for school teachers when selecting among textbooks available on the market to be used by their students. Given that using cognitively effective (quality) school textbook texts with low-achieving students it is possible to attain a level of comprehension that is comparable to the level of high-achieving students reading lower quality texts, our findings are important for the development of quality of education (Justin, 2010b). Finally, the techniques and procedures employed in our study could be, with some adjustments, transformed into a tool for a large-scale evaluation and development of school textbooks (Justin et al., 2012).

Abstract

As China becomes a more international platform, studying abroad is becoming a common choice for Chinese students. Although business is the most popular major that Chinese students would choose abroad, a number of students are interested in psychology. For a good study experience, it is essential to understand the differences of curriculum and instruction between Chinese universities and American universities. In addition to language issues, Chinese students might encounter other problems when studying abroad. Chinese students are used to Chinese learning styles. When they study in a different academic environment, it is difficult for them to adapt their styles immediately. These situations add pressures to many Chinese students, which can result in learning difficulties. This article compares the two programs (one in America and one in China), to provide students information and suggestions so that they can make better choices and help them better prepare for future learning if they choose to study abroad.

*Key words*: curriculum, instruction, psychology, China, America
Comparing Chinese and American Curriculum
and Instruction in Psychology

General background

As China becomes a more international platform, studying abroad is becoming a common choice for Chinese students. America is China’s top pick to study abroad because of the high quality of education provided by American schools. “The US still takes the lead as the No. 1 country choice to study abroad for Chinese students. The percentage is 9.5 percent higher than that of the UK, the second most popular destination.” (Zhang, 2014, para. 7). Although psychology was born in Germany, it is a well-developed profession in America. America has excellent resources, mentors, and learning environments for individuals who want to learn psychology, which is why many Chinese students interested in psychology want to study there.

Differences in Chinese and American undergraduate psychology curriculum

This paper compares psychology-related curriculum at the Bachelor’s and Master’s level in Peking University in Beijing (PKU), which is widely considered the “Harvard of China” (US–CHINA, 2014), and the University of Mary Hardin-Baylor (UMHB), a small, private, Christian institution in Central Texas (Psychology Program Requirements, 2014).

Similarities

Both UMHB and PKU share many of the same core major courses in their undergraduate psychology programs: General Psychology, Statistics, Psychological Methods, Experimental Psychology, and Assessment and Evaluation (see Table 1, Undergraduate core course requirements in psychology). Table 2 (below) lists the courses that both universities require students to complete that are unrelated to their major. Both require English courses and physical education courses.
Differences

At PKU, students in different tracks are required to complete the same major core courses, whereas at UMHB there are some course differences for students in differing tracks. Additionally, PKU required more psychology courses overall and significantly more coursework in the biological area (see Table 1). UMHB offers both a Bachelor of Arts in Psychology and a Bachelor of Science in Psychology (Psychology Program Requirements, 2014), whereas PKU only provides Bachelor of Science in Psychology (Department of Psychology, 2014).

Because UMHB is a religious school, this institution requires courses like Bible study and Chapel (Table 2). In comparison, PKU requires several courses: the political theories and history of socialism and communism. Table 2 indicates that UMHB focuses more on cultivating students’ comprehensive abilities such as art, science, and public speaking, while PKU pays more attention to learning theories and math. Elective courses at PKU are all related to the student's major (psychology) such as education psychology, school psychology, psychology history, and child behavioral disorders.

Cultural expectations at the undergraduate level

Students in American undergraduate programs often are required to read textbooks and take quizzes over each chapter. They have many paper assignments, presentations, group discussions, and outside assignments such as interviews and observations. However, Chinese universities typically do not have rigorous requirements for undergraduate students and often do not require much homework. Chinese undergraduate educational programs rely more on final exams and a large thesis-type paper due before graduation.

Comparison of graduate level educational requirements

The larger psychological/helping professional field has split into several closely related professions in the United States: Counseling, Psychology, Social Work, and Marriage and Family Therapy - each with their own credentialing but all preparing graduates for related career positions (ACA, 2011; Lucas, 2009). State licensure varies by state in the U.S., but in all U.S. states, licensure requires a graduate-level training program with a supervised internship (ACA, 2011). In America, the master's level degree accounts for the majority of professionals practicing in the clinical helping fields today (ACA, 2011). Table 3 below demonstrates the variance in related graduate programs offered and the associated licensure (ACA, 2011).

¹This degree program is available at UMHB.
²This degree program is available at UMHB.
³This degree program is available at PKU.
⁴This includes majors such as: Cognition and Learning, Psychometrics, Developmental Psychology, etc.

In America, licensure for counselors is at the master's degree level while licensure for psychologists is at the doctoral level and generally allows psychologists to do more assessments (Lucas, 2009). The UMHB program focuses on training clinical practitioners requiring nearly three years to complete including a lengthy clinical training internship (Graduate Counseling Program Requirements, 2014). The Clinical Mental health Counseling graduate program at UMHB is a nationally accredited program in counseling which prepares graduates to sit for licensure for independent practice (Council for Accreditation of Counseling and Related Educational Programs [CACREP], 2009). All educational programs in Chinese universities are
accredited by Ministry of Education of the People’s Republic of China (The Ninth National People’s Congress, 1998). The PKU master’s level program focuses on training both practitioners and educators and requires 36 hours to complete including teaching practice. Additionally, PKU requires students to complete a dissertation before graduation. Then dissertation should be accepted for publication before defense (Department of Psychology, 2014). See Table 4 below for a comparison of the requirements for these two programs.

**Similarities**

At the graduate level, all compulsory courses are counseling/psychology related. Graduate level courses tend to be more skill-based than undergraduate program courses, and teach students how to use these skills in counseling or research (see Tables 1 and 4).
Differences

Similar to undergraduate level preparation, the PKU graduate psychology program required courses have more emphasis on science and research than the UMHB graduate program (see Tables 4 and 5). Tables 4 and 5 further illustrate that PKU has a larger number of elective courses whereas UMHB allows only one elective course at the graduate level (however several of the elective course areas of the PKU program are required at UMHB).

The UMHB coursework is less flexible due to strict standards set by the national accrediting body and Texas laws related to licensure (CACREP, 2009; Texas State Board of Professional Counselors, 2014).
Cultural expectations in graduate school

After graduating from a counseling program in America, most state laws require graduates to formally apply and pass a national licensure examination (American Counseling Association [ACA], 2011). Additionally, in most states, graduates are also required to complete 3,000 or more hours of counseling practice under the supervision of a fully-licensed professional (e.g., ACA, 2011). Most counseling programs in America do not require a thesis at the master's level, but American doctoral programs in counselor education and/or psychology generally do require a dissertation (Lucas, 2009). Historically, some American graduate programs required an oral exam; however in recent years most programs have moved to requiring a standardized licensure practice exam as a comprehensive exam to ensure graduates are adequately prepared to pass the compulsory licensure examinations (ACA, 2011).

The PKU master’s level program is in psychology (Department of Psychology, 2014). In China, most graduate level psychology programs have both oral and written exams, and students are required to complete a dissertation. Chinese graduate psychology programs generally focus on research and experimental assignments and dissertation requirements. Chinese master’s level psychology programs usually do not provide counseling training specifically. “China currently has a three-tier national licensing program that dates from 2002... [under] ...the auspices of the Central Department of Labor” (Lim, Lim, Michael, Cai, & Schock, 2010, p. 5). A licensed practitioner at level two or level three (level one is the highest) must complete a government-approve course and the pass the Department of Labor examination (Lim et al., 2010). However, “the highly coveted Level One License is reserved primarily for those who have Qualifying doctoral degrees in the fields of education, medicine, or counseling and have worked as a
therapist for at least 3 years” (Lim et al., p. 6). The PKU master’s level program is in psychology (Department of Psychology, 2014).

**Problems students might encounter when studying abroad and author’s suggestions**

**Language**

Language is most likely the biggest problem for most Chinese students. Psychology in American universities requires significant language skills for students, including English reading, writing, listening, and speaking. In graduate school, writing and speaking skills are more important because of many assignments relate to counseling skill acquisition, working in groups, or writing complex analysis papers. If Chinese students do not have adequate language skills, they will be required to take English language classes (ESOL—English for Speakers of other Language). Unfortunately, from my own experiences, these classes are not helpful to Chinese students. These classes are similar to English classes in Chinese schools.

It is better to work on spoken English before going to study in America. For extroverted students, they can make more connections with American students by hanging out with them and studying with them. This helps students integrate into American culture faster and allows them more opportunities to practice their verbal skills. For more introverted students, it can be far more challenging for them to interact with unfamiliar people. It can be quite painful for international students and lead to more isolation when they think American students are looking down on them when their English is not fluent or when they are not able to follow a conversation. This can be damaging to their self-esteem and potentially discourage further academic success. Sometimes international students will choose to spend more time being with other students from their home country rather than integrating with American students, which can further deter the improvement of their English communication skills. For those introverted
students, they may want to choose a more private way to practice their English skills, such as watching American TV series, movies, and record and transcribe class lectures. Compulsory assignments, like group discussions and presentations, force Chinese students to interact and may motivation them to practice more.

Psychology programs, especially at the graduate level, require that students finish multiple papers and essays, such as case studies, research reports, article critiques, and personal reflection papers. Sun (2013) asserted that writing in English can be difficult for Chinese students. “Among the many difficulties, errors from the influence of Chinese sentence patterns are the obscure ones that students cannot overcome easily” (Sun, 2013, p. 1298). To improve English writing skills, it is better for Chinese students to take writing classes and learn how to use school library databases to find resources for their papers.

**Learning styles**

Chinese and American education models and students’ learning styles differ significantly from each other. As described above in the comparison of curriculum, American education values more about students’ comprehensive abilities (including exposure to art and other cultural aspects), while besides Chinese and English, Chinese education tends to focus on scientifically-based academic learning (science, math, etc.). In Chinese high schools, major courses such as Chinese, Math, English, take up the majority of students’ study time. Chinese students’ high school life is very serious and stressful. Therefore, when Chinese students get to college, they spend more time doing what they think they missed in high school to compensate. Cutting classes, cheating in exams, and not listening to teachers in class are common behaviors in most Chinese colleges. Plus, Chinese students seldom ask questions. Most of them have already gotten used to following teachers’ instructions and Chinese teachers will tell them what to do. This
dominant learning model suppresses Chinese students' curiosities. For Chinese students to be successful in the American learning culture, they will need to learn to use their critical thinking abilities.

Chinese students should put more effort into reading textbooks because they usually have quizzes each week if they study in American universities. They also should actively participate in class activities, group studies, and presentations. These activities actually provide students with skills that enable them better adapt to the society when they graduate.

**Conclusion**

It is not easy to study in American universities, especially at the graduate level. Chinese students should better prepare themselves before going to study abroad. They also should consider whether study abroad or study in China would be more helpful to their individual career goals. This article does not intend to imply that Chinese education is poor, rather to point out the limitations of Chinese education when it is used as a foundation for further study in a different educational culture such as in America. Hopefully, as the number of Chinese students studying abroad continues to grow, the Chinese government will research these differences more and consider the need to make adjustments so that all Chinese students who want to study abroad will have adequate foundational experiences to ensure their academic and professional success.

TTA Study

Research Abstract

**Title**  Test Taking Anxiety (TTA) among Baccalaureate Nursing Students

**Keywords**  Test anxiety, nursing, BSN program, academic achievement.

**Problem/Purpose**  Nursing students at Simmons College anecdotally report a high level of test-taking anxiety which they feel limits their ability to showcase their mastery of content on examinations. In order to obtain resources to develop additional supports for test-anxious students, a more rigorous, objective assessment of the prevalence of test taking anxiety is warranted. Additionally, it is important to establish a correlation between test-taking anxiety and academic performance. By establishing these baseline prevalence measures and associations, we will be able to evaluate the effectiveness of any future programs developed to address this issue.

**Literature Review**  Test taking anxiety (TTA) is well recognized to have 2 parts; physical symptoms referred to as the emotional component, and worry, referred to as cognitive test anxiety (CTA) which is considered to have the stronger association with academic performance (Earnest, 1990; Cassady & Johnson, 2002; Cassady, 2004; Cassady & Gordano, 2005,). The cognitive interferences among test-anxious students include comparing themselves to others, ruminating on the consequences of the failure, and feeling loss of confidence, loss of self-worth, unpreparedness, and excessive worry. These interferences have been shown to influence academic performance (Cassady & Johnson, 2002). Worry, or CTA, and the self-defeating thoughts it creates can lead to a reduction in self-confidence and impede the ability to complete a test (Sansgiry, Bhosle & Sail, 2006). CTA may influence a student’s performance not only during exams but also while studying for exams (Cassady & Johnson, 2002). Cognitive test anxiety (CTA) has been studied among college students in general, and psychology students most commonly, but very little has been written about the influence of CTA on academic performance among baccalaureate nursing students (Cassady & Johnson, 2002; Bembenutty, 2008). For baccalaureate nursing programs, CTA and poor test performance can translate into low retention rates and threaten the ability of programs to graduate students.
TTA Study

Three BSN nursing studies used the worry subscale of the TAI scale against GPA and found significant inverse correlations ranging in magnitude from $r = -0.19$ (Waltman, 1997) to $r = -0.516$ (Hilbert & Allen, 1985). When using the TAS scale against GPA, a similar magnitude ($r = -0.49$) of correlation was observed (Howell & Swanson, 1989). The magnitude of the influence of the worry subscale on GPA, although statistically significant, is quite modest accounting for only 4% of the total variance in test anxiety (Howell & Swanson, 1989). Another nursing study explored differences in exam grades by level of test anxiety and found no statistically significant differences between graduate nursing students scores on the general test anxiety (GTA) scale (Barnes, 1987) and their academic performance ranking (high, medium or low). Finally only one study examined the influence of TTA on NCLEX performance (Hilbert & Allen, 1985) and found a significant inverse linear association ($r = -0.35$) between the worry subscale of TAI and mean NCLEX score. In summary, the nursing literature on the relationship between TTA and academic performance is sparse and in many cases decades old. The purpose of the present pilot study was to describe the distribution of cognitive test anxiety scores and determine whether higher levels of anxiety were associated with poorer academic performance.

Research Questions

1. What is the distribution of cognitive test-taking anxiety (CTA) scores among baccalaureate nursing students at a private college in the northeast U.S.A?

2. Are higher levels of CTA associated with poorer academic performance?

3. Is a self-reported anxiety score (1-10) correlated with scores from the CTA instrument and is the association with academic performance the same?

Framework  A stressor produces the fight or flight reaction which can be used by the individual to mount a response. If the reaction is ineffective or maladaptive, the stressor is intolerable and hinders the Individual’s chances of overcoming the stressor. This maladaptation creates an internal shift in equilibrium leading to more stress (Edelman & Ficorelli, 2005).
TTA Study

Methodology  Quantitative, descriptive, survey study design. IRB approval attained from Simmons College.

Population: Undergraduate baccalaureate nursing students or graduate nursing students in the pre-licensure portion of the curriculum. Recruitment: Public flyers, nursing newsletter announcements and in class announcements of the study were made. Group recruitment sessions were targeted with a convenience sampling methodology to capture times between the largest target classes. Inclusion: all UG and pre-licensure graduate students were eligible. Exclusionary criteria included age<18, inability to read English. The sample size goal was 100 students. Setting. Private, female-only undergraduate and co-ed graduate college in the heart of the Longwood Medical Area, Boston, MA. Data collection: Utilizing the Cognitive Test Anxiety (CTA) scale, a 25-item scale specifically designed for the one-dimensional assessment of the cognitive component of test-taking anxiety. It is considered a valid and reliable tool, which has good discriminant validity and strong internal consistency. It generally takes 8-15 minutes to complete (Cassady and Johnson, 2001). Additionally, a demographic form captured age, program track and specific nursing course registration. Academic performance indicators included GPA, SAT (verbal and math) and nursing course exam grades during the fall 2013 semester. Family Educational Rights and Privacy Act (FERPA) releases were obtained from willing students to access these data.

Data Analysis  The data were analysed using SPSS version 21. The outcome measures included exam T-scores. Main predictor variable was CTA score used categorically (low, average, high) as well as continuously in regression models. CTA scores were categorized by tertiles (1st tertile= low levels of anxiety, 2nd tertile = medium levels of anxiety, 3rd tertile= highly anxious). Descriptive statistics including mean and standard deviation for CTA scores, exam T-scores, GPA and SAT scores, self-reported anxiety, and relative frequency of categorical variables were conducted. Spearman’s correlation coefficients were computed for the association between CTA score total and academic performance measures. Between group comparisons used the ANOVA F-test to compare academic
TTA Study

performance measures between the 3 CTA groups. Repeated measures analysis of variance with post hoc analyses evaluated whether there were group differences in performance on the four nursing course examinations during the semester based on the CTA grouping. Hierarchical linear regression was conducted to determine if there is any additional ability of CTA score to predict final exam grade after accounting for baseline intellectual ability (GPA) and initial course exam grade.

Results Among the 373 students invited to participate, 183 (49.1%) participated, the majority were traditional undergraduates (48.1%), white (79.7%) female (99.5%) with average age 24.3 (SD 6.6) with range from 18-54 years. Scores on the CTA scale ranged from 26-95 with a mean (standard deviation [SD]) of 56.6 (17.4). Tertile categories were created with cut points for lowest CTA at <46, average CTA at 46 to <63 and highest CTA at 63 or higher. There were 60-61 students in each of the ‘low’ ‘medium’ and ‘high’ anxiety groups. No statistically significant differences in CTA scores were observed between any of the program tracks, age categories, race or academic year in the nursing curriculum. The relationship for all academic measures is linear with lower academic performance noted among those with higher levels of CTA compared to those with lower levels of CTA. These differences were all statistically significant below the alpha=0.05 level for all academic outcomes except SAT scores and exam three. The differences in nursing exam T-scores between CTA groups were quite modest (3-5 T-score points) and driven by the difference in academic performance between high and low CTA groups. Fewer statistically significant differences were observed between the low and medium or the medium and high groups. CTA scores are a significant although modest predictor of academic performance accounting for about four percent of the variance in final exam grade. Baseline intellect denoted by overall GPA was a stronger predictor of final exam grade accounting for about eleven percent of the variability in final exam grade. In self-reported levels of anxiety during nursing exams students’ scores ranged from 2-10 (not anxious to very anxious) with a mean (SD) of 7.4 (1.7). No statistically significant differences in self-reported anxiety scores were observed between any of the program tracks, age categories, race or academic year in the nursing curriculum. Finally there were no
TTA Study

statistically significant associations between a self-reported measure of anxiety and academic performance as there was with the CTA scores.

Limitations T-scores for exam grades included multiple nursing courses over the semester. Further study using a set of students in one course over time or over several semesters may produce stronger results.

Conclusions Cognitive test anxiety is quite common among baccalaureate nursing students at Simmons College. There is a linear relationship among the academic variables i.e. students with lower levels of performance had higher levels of CTA but CTA scores account for only 4% of the variance in final exam grade. GPA was a stronger predictor of academic performance on final exam grades. These data will help support a proposal to offer a Test Taking Anxiety Intervention in addition to a Test Taking Skills Workshop to all interested nursing students. To make this more accessible to nursing students who may commute and be juggling school, family, church and other interests, utilizing on-line resources such as webinars or Tegrity (screen capture/audio software) embedded within the learning management system used by the college would address this gap.

Abstract:

Ever increasing attention has been placed on the importance of having knowledgeable teachers who can influence reading achievement in meaningful ways. Yet many international reports suggest that large numbers of children are not learning to read. How can we better prepare teachers with the necessary knowledge to teach reading using the newly adopted English Language Arts Common Core State Standards? The current study examined the reading content and pedagogical knowledge of elementary education preservice teachers (N = 87) from two teacher education programs. Program A required 5 reading methods courses and Program B required 2 methods courses. Findings indicate that the preservice teachers presented fairly robust levels of knowledge in the areas of phonological awareness, phonics, comprehension, and vocabulary. We found that preservice teachers reported higher scores on pedagogical knowledge than content knowledge, and that there were statistically significant differences in knowledge based on the program attended and the number of reading methods courses completed. Suggestions for increasing reading teacher content and pedagogical knowledge are provided.

6. Abstract.

   An important learning objective for a final year University course called "Living with Climate Change" was to engender critical analysis skills in the students around the issues of media representation of the science of climate change. To facilitate this, students were required to curate an eportfolio where they accumulated bookmarks using Livebinder and importantly add short descriptions and analyses of their content. They have to think critically about each site and articulate how the site has represented the science. As they look for and accumulate bookmarks, they develop an appreciation of good and bad sites, sites that misrepresent the issues or mislead the reader, sites that are clear or confusing and sites that are biased or balanced. The activity encourages critical analysis within a self-directed, self-motivated learning experience and encourages students to apply their subject-specific knowledge. It also encourages them to curate and evaluate the flood of information that is available online. It is also part of the coursework assessment. The students send the lecturer a link to their individual eportfolio via Blackboard. The lecturer then uses a set of pre-agreed criteria to assess the eportfolio online via Blackboard and to provide feedback. In a survey 79% of students found the eportfolio Livebinder exercise 'useful' and 'engaging' and 83% considered it an appropriate mode of assessment.
Development of Mechanism Learning Kits Using 3D-Printer

Abstract
New mechanism learning kits comprising gears, links, etc. was developed. Using the kit, many kinds of mechanisms are assembled easily on a panel and students are able to make a mechanism which can move just as it was intended. Therefore, the kit improves the learning effect for mechanism, because each parts of the kit is designed using 3D-CAD that can be machined easily using 3D-printers. Furthermore, the parts can be molded in large quantities using resin. Therefore, the kit can be introduced to schools at a lower cost. In this paper, designs of the parts and assembling methods of the kit are explained in detail, and evaluations from the technical course teachers who oversee practice classes were carried out.

1. Introduction

The power transmission system and the mechanism to create various movement is one of the difficult field for teachers. The reason that instruction has difficult are the lack of experience for manufacturing with movement of the students, the lack of the school hour for industrial arts and the lack of the effective teaching materials. In recent studies for mechanism learning, mechanism of pendulum clock1), mechanical doll2) and pin gear3) are proposed. They are suitable for learning about the mechanism with a specific function, but are lacking in flexibility that assembles various mechanism that students considers. In addition, there are the commercial block teaching materials4)5) that assembling of various mechanism is possible, but they are not spread to schools very much.

Therefore in this study, an assembling mechanism learning kit, using which students touch various systems and can learn through training to produce a mechanical working mechanism, is developed.

2. Mechanism learning kit

2.1 Summary of mechanism learning kit

This kit is intended that a teacher assembles mechanism and exemplifies it and a student produces various mechanism by oneself. Thereby it is developed with considering about following points.

(1) Easy joining method of parts which is easy to understand a student intuitively.
(2) Size of the parts suitable for learning.
(3) Production method of parts possible at school.
(4) Use of cheap parts from market.
(5) Reduction of parts production cost.
(6) It being easy to combine it with the standard parts of the kit and the original parts which designed and produced at school.

Using this kit, occlusion of the spur gears, rack and pinion, link mechanism, cam mechanism, etc. are easily assembled. Furthermore, about the problems of backlash or the dead center can be learned through the experience.

2.2 Components of the kit

2.2.1 Panel

As a panel to install the parts, a standardized pegboard is used. Standard of the pegboard is 910x1830x4 mm, 8 mm
holes, 30 mm on center. It is cut this to appropriate size, for example 300x450 mm, for use.

About using the pegboard in this kit, there is the fault that flexibility of the assembling is limited by a hole position being fixed. However, it is easy that a user makes additional holes and raises flexibility as needed. On the other hand, there is the advantage that the learner attaches a gear without knowledge about the distance between the axle of the gear surely, and can operate it by setting up a gear suitable for the limited hole position. In addition, there is a problem of the durability that hole diameter of the pegboard gradually spreads by repeating assembly and disassembly of the parts, and the state of the fitting worsens a little. However, the pegboard is one of the materials suitable as the teaching materials because of enough accuracy of holes, easy to obtain, easy to cut into a free shape and reasonable price.

2.2.2 Spur gear

In this kit, power transmission with gears is mainly assembled. The power transmission mechanism using gears is precise and certain. A gear is a basic mechanism part used for various machines widely and is treated close so that the number of revolutions of gears becomes the numerical calculation for the student. In a class of industrial arts, there are many chances to use a gearbox for the shifting of the motor turn but the gears which are used in the gearbox are too small to learn the shape and the number of the teeth of the gear for students. Therefore in this kit, spur gears of module $m=3$ mm, teeth $z=10$ and 30, involute tooth are used as standard parts. Pitch diameter of these gears are 30 mm and 90 mm, therefore two kinds of these gears how can be engaged on the holes of the panel.

The gear of $z=10$ is shown in Fig.1. At the center of the gear there is a through hole of 4.2 mm diameter, and so the gear is assembled to a commercial Teflon spacer(outer diameter 8 mm, inner diameter 4.2 mm, length 10 mm) using M4 flat head screw and double nuts with a few gaps for smooth turn. A hole of 5.5 mm diameter and a pole of 5 mm diameter located at 7.5 mm from the center of the gear fit in each other when another part is stacked on the gear. Thickness of all parts are $t=6$ mm. Fig.2 shows the gear with the spacer or other parts.

2.2.3 Rack

Fig.3 shows a rack. Sliding pair is comprised by being attached to a panel through two Teflon spacers in a ditch of the part center, and it is possible for linear motion. A through hole at one end is provided in order to connected to other parts as a turning pair.
2.2.4 Link

Three types of link are shown in Fig. 4. 1 hole link and 3 holes link turn around alone by attaching a Teflon spacer to the φ 4.2 through hole in one end, and turning pair consists of them. Also, by putting a Teflon spacer through the hole of 8.5 mm diameter, plural links constitute a turning pair. On the other hand, a connecting rod is used to connect between links or is attached to the panel using the central hole of 4.2 mm diameter as a turning pair.

![Fig.4 Three types of link](image)

2.2.5 Slider

Fig. 5 shows a slider. A slider turn around by attaching a Teflon spacer to the φ 4.2 through hole in one end, or is used as a fixed part by letting the hole of a ditch and the panel penetrate in a Teflon spacer. The slider and the link are assembled as sliding pair through a Teflon spacer.

![Fig.5 Slider(t=6 mm)](image)

2.2.6 Cap for spacer

Fig. 6 shows a cap for spacer. The cap is put in the end face of the spacer. Turning pair or sliding pair are
constructed by assembling with links and sliders using the Teflon spacer. It prevents a part from falling on this occasion by putting an axis chief in the end face of the Teflon spacer, and being crowded.

![Cap for spacer](image1)

Fig.6 Cap for spacer

![Assembly structure](image2)

Fig. 7 Assembly structure

**2.2.7 Commercial parts**

Commercial parts which are used for assembling mechanisms on the kit are shown in Table 1. Spacers and Teflon washers are chosen and used depending on the situation appropriately.

Table.1 Commercial parts

**2.3 Production method of the parts**

**2.3.1 Design and production with 3D-CAD and 3D printer**
In this study, Creo Elements/Direct Modeling Express 4.0 which is a free 3D-CAD software is used for design of the parts. For cutting and processing the parts, a cutting type 3D printer MDX-540 made by Roland DG is used.

For work material, polyacetal or acrylic resin is chosen. Polyacetal is engineering plastic superior in low friction and strength therefore it is suitable when it is cut and is just used as the parts. On the other hand, acrylic resin has high transparency, and are beautiful, and the material cost is cheap with about 1/3 of polyacetal, but impact resistance is insufficient, therefore it is not suitable a little to use it as mechanism parts. In this study, acrylic resin is used as a male model for resin molding.

### 2.3.2 Production by resin molding

At the present when a 3D printer is hardly introduced into a school, resin molding is proposed as a method to easily produce the parts of the kit in the school. A process of the resin molding is shown below.

1. Production of the male model using 3D printers
2. Production of the female model by pouring silicon into the male model
3. Production of the parts by pouring epoxy resin into the female model

In these process, (1) is difficult under present school conditions therefore some offer of the male model from the school outside is necessary for some kind of methods Process (2) and (3) are easy to do at school because they are the work that only pouring resin into a male model. The process that a part is produced by resin molding in fig. 8.

![Fig.8 Process of production by resin molding](image)

### 3. Practice class using the kit

The practice class using the kit was carried out at a junior high school in Japan. A learning problem "to think about the mechanism of the toy which worked" was set by the class and it was intended to cultivate ability to devise mechanism to realize the movement that a student wanted to make, and to create. In the class, one among four kinds of production problems to show in fig. 9 was assembled by students.

Abstract

The presenters previously surveyed fully online students regarding their engagement in graduate online courses to find out what they said was the optimum learning environment as influenced by their instructors, classmates, and themselves.

Subsequently, the presenters have reviewed the categories of evaluative criteria on rubrics for the online discussion forums. Performance criteria, grouped into cognitive, mechanical, procedural/managerial, and interactive categories, have been analyzed to determine which ones are used in the rubrics for the program online discussion forums with the objective of mentoring the online students on performance criteria that the students need to know and be able to do in the online forum to achieve maximum success.

Each full-time faculty person has responsibility for each course that s/he develops. This includes the creation of rubrics for all assignments that are built into the particular course shell(s). Once a faculty member creates a rubric, it is reviewed by the members of the curriculum team for the SOE program that has oversight for the course. After the rubric has been approved, all full-time and adjunct faculty that teach the course are required to use that rubric for the specific assignment; rubrics are not supposed to be modified by anyone other than the course developer.

Rubrics are embedded in the online discussion forums for easy access by students. Instructions to the students specify that they are to use the rubrics as they craft their postings on the discussion forums. The reality is that the majority of the students do not use the rubrics until they have received their first week’s scored rubric for the forum that reflects a low assessment score. By that time, the negative experience creates a contentious relationship with the course instructor.

Specific challenges that we face in our distributed campus system are that, frequently, the course instructors do not use the rubrics when they grade the discussion forums. So, students who are taking the same course in a different section may have submitted comparable work but receive completely different rubric scores.

Abstract
Prior research in memory examined recollections of school. Aims: This study sought to extend earlier research concerning memories of school to preservice teachers. The participants were preservice teachers who were enrolled in an undergraduate Educational Psychology course. Based on prior research protocols, undergraduate teacher education majors were directed to recall memories about school subjects they planned to teach or those they did not plan to teach. Teacher-related recollections were more positive for the Plan To Teach subjects and more negative for the Plan Not To Teach subjects. This finding applied to both Elementary and Secondary preservice teachers who reported more pleasant memories for the subjects they Plan To Teach. More positive memories for Plan To Teach subjects were reported across the academic scoring categories of Teacher Behavior, Learning Experiences, and Recognition. Implications for the teaching of Educational Psychology were discussed.

*Keywords:* autobiographical memories, preservice teachers, teaching Educational Psychology, academic memories.
Preservice Teachers’ Academic Memories of School: A Tool for Learning

A major academic responsibility for Educational Psychology faculty on college and university campuses is to teach preservice teachers. This course typically occurs early in the preservice teachers’ program and is not always linked to a clinical experience. With limited experiences in school, it is likely that their own K-12 experiences would influence preservice teachers’ approaches to education in general and to instruction in particular. In fact, Hoy and Murphy (2001) addressed this as well “Given the timing of most educational psychology courses early in the prospective teachers’ college program, we [Hoy & Murphy] believe that the most valuable applications of knowledge from the course often are to the students’ current lives” (p. 167).

Introductory courses in Educational Psychology include concepts of learning and teaching. Common key themes include (1) Developmental Theories, (2) Student Differences and Diversity, (3) Learning and Motivation, (4) Classroom Strategies, and (5) Student Assessment. Do preservice teachers have positive and/or negative recollections related to these themes? Absolutely. For example, the memories of motivation and student learning are often vivid across the grades (K-12). Preservice teachers hope to be able to overcome the negative effects (e.g., punitive or hostile teacher behavior) and perpetuate the positive effects (e.g., nurturing and caring teacher behavior) that are resident in their memories of school. These memories are easily elicited in classroom discussions about motivation and learning, providing specific examples of the concepts.

School memories relate directly to one’s beliefs about education. It is highly likely that a preservice teacher would compare personal classroom experiences to the Educational Psychology content being taught. For example, if Jillian attended a parochial school, her
PRESERVICE TEACHERS’ MEMORIES  3

memories of that experience may lead her to believe that a traditional setting is more conducive to learning. So the idea of teaching in an open classroom environment may have little appeal. Is it possible for Educational Psychology courses to incorporate the collective memories of preservice teachers into the classroom; to use them to guide instruction? The memories exist, and they influence beliefs about the learning environment. Hoy and Murphy (2001) suggested that “teachers’ beliefs influence their planning, instruction, and interactions with their students” (p. 163). The literature on beliefs and attitudes (Fishbein & Ajzen, 2010) notes a sequence of belief development that results in attitude formation, which ultimately influences behavior. The link between beliefs – attitudes – behavior is reflected by the following statement “Basically, we assume that human social behavior follows reasonably and often spontaneously from the information or beliefs people possess about the behavior under consideration” (Fishbein & Ajzen, 2010, p. 20). Our position is that memories can have an influence that is similar to that of beliefs. Edwards, Higley, Zeruth, and Murphy (2007) believe that teachers’ efficacy maybe attributed to their own experiences as students in school. Memories of prior experiences operate in ways similar to beliefs, thus influencing attitudes and, subsequently, behavior. The question is how can these memories and beliefs be used to enhance instruction in Educational Psychology?

One way of examining preservice teachers’ motivations to teach would be to elicit their autobiographical memories of their own school experiences. Autobiographical memories, as reported by college students, tend to emphasize social situations (Pillemer, Goldsmith, Panter, & White, 1988; Walls, Sperling, & Weber, 2001). Conway and Pleydell-Pearce (2000) noted that autobiographical memory is significant for the development of identity and the sense of self. According to Conway (2001), autobiographical memory “…is the knowledge base of the self…Autobiographical knowledge then functions to ground the self in memories of actual
experiences or remembered reality…” (p. 1377). An examination of this “remembered reality” has the potential to uncover events that have influenced personal learning experiences that impact the beliefs about classroom instruction.

Selective memories may lead to beliefs that, in turn, lead to attitudes. Eagly and Chaiken (1993) examined the attitude construct. Attitudes are formed based on cognitive, affective, and behavioral processes. Attitudes, thus, are correlated with thinking, feeling, and doing. Encountering thoughts and behaviors counter to one’s attitude may be treated as cognitive dissonance and be combated by seeking additional support for the attitude or disregarding the dissonant information. Resistance to attitude change may be manifested in the process of selective memory. Preservice teachers’ attitudes about instructional strategies, in general, and teaching a given subject matter, in particular, are strongly related to their memories of school. Thus, the prior K-12 experiences of preservice teachers may lead to the development of beliefs and subsequently to the formation of attitudes about teaching (Eagly & Chaiken, 1993).

How might attitudes about teaching and K-12 school memories held by preservice teachers be used in an Educational Psychology course? Encouraging those students to use their own memories of K-12 learning could constitute an excellent experience for them. Then, actually trying out creative speculations based on those memories would potentially result in highly memorable learning experiences. Building stronger connections between (a) preservice teachers’ memories of their schooling experiences and (b) their beliefs and attitudes about teaching, strengthens the scaffold for exemplary instructional accomplishment.

Few studies have examined college student recollections or memories of school. These reported studies did not occur in an Educational Psychology setting. Graduates of a women's college wrote descriptions of their first, second, third, and fourth "memories to come to mind" of
The two most common topics of the memories were housing (34%) and recreation/leisure (33%), with lesser recollection of academics (24%). University undergraduates wrote descriptions of their autobiographical memories of school in research conducted by Walls et al. (2001). Even though these college students were instructed that they could write about their school memories related to academics or social situations at school, the vast majority of the memories were "social" in nature. There was evidence of stronger memories of the more recent school years. Unpleasant event memories were most frequent in the early grades and decreased in proportion across the grade levels. A similar finding was also reported by Mather and Carstensen (2005).

Walls, Haught, and Nardi (2011) conducted an investigation to extend knowledge of academic recollections about school subjects. In Data-Set 1, undergraduates (N=195) were directed to recall memories about Language Arts, Social Studies, Math, Science, Physical Education, and Music/Art. In Data-Set 2, undergraduates (N=179) were asked to recall academic memories but were allowed to choose the school subjects. In Data-Set 1, the scoring categories of Positive and Negative Learning Experience were reported more frequently than Positive and Negative Teacher Behavior, Positive and Negative Interpersonal Experience, or Positive and Negative Recognition categories. In both data-sets, Math was the only content area where the Negative Learning Experience category was most often reported. Extremely pleasant recollections were frequently reported for all school subjects in both data-sets (Walls et al., 2011).

Research more directly focused on teaching and teachers has documented that preservice teachers hold strong beliefs based on their earlier classroom experiences (e.g., Hoy & Murphy, 2001; Pajares, 1992; Richardson, 2003; Wideen, Mayer-Smith, & Moon, 1998; Wubbels &
PRESERVICE TEACHERS’ MEMORIES  6

Korthagen, 1990). Twelve preservice primary teachers were followed across the first year of an education program in northern England. They were (1) interviewed four times, (2) shown videos of contrasting teaching styles in math and a video of a lesson on creative writing, (3) asked to imagine teaching a lesson, and (4) required to develop a script for that lesson. Analyses of their “images” of teaching revealed that students held an image of good and negative teaching based upon one or two particular teachers from their past who stood out as role models. Their scripts of proposed lesson plans were frequently modeled after observed practice. “We know that student teachers do spend time imaging their classroom performance and that some students have quite powerful and influential images of teaching” (p. 8) that are derived from their own school experiences (Calderhead & Robson, 1991). If prior K-12 experiences influence their perceptions about teaching, how can Educational Psychology faculty use these experiences to improve learning? In the present investigation preservice teachers were asked to recall academic memories following the procedures employed by Walls et al. (2011). This was formulated to provide documentation of academic memories held by preservice teachers.

The current study is designed to answer the following research questions. Research Question 1: What content areas do education majors remember from their own K-12 academic experiences? Research Question 2: Do the participants write about more positive memories for the subjects that they Plan To Teach in contrast to the subjects they Plan Not To Teach? Research Question 3: Does intended Grade Level (elementary versus secondary) relate to Pleasantness when recalling memories for subjects that will be taught or subjects that will not be taught? Research Question 4: Do memories of subjects they Plan To Teach and subjects that they Plan Not To Teach differ across the four academic scoring categories of Teacher Behavior, Learning Experience, Interpersonal Experience, or Recognition? Research Question 5: Do
memories of intended Grade Level (elementary, middle, secondary, or art/music K-12) focus on the students or the subject/content area?

**Method**

**Participants**

The participants were 83 undergraduate education students at a mid-Atlantic public university. There were 16 men and 58 women (9 individuals did not report gender) enrolled in an introductory educational psychology course. They elected to participate in the study and received a small number of extra credit points. The first author was an instructor in one of the four sections of the course where these data were collected. Procedures were approved by the University’s Institutional Review Board for the Protection of Human Subjects. Participants were mostly Caucasian as is the current profile of this institution (86%) (Media Factual, http://www.collegefactual.com/colleges/.../student-life/diversity/, retrieved on 5/5/2014). Information about ethnicity and socioeconomic status (SES) was not reported by the participants and, thus, could not be examined through data analysis.

**Materials and Procedures**

Participants were asked to describe teaching episodes that were related to (a) two memories of subjects in grades 1 through 12 they Plan To Teach and (b) two memories of subjects in grades 1 through 12 they Plan Not To Teach. For each description of an academic event, they indicated (a) what school subject it was, (b) what grade level, (c) how well they remembered the event, and (d) how unpleasant or pleasant the event was. The positive-negative event component of the present study consisted of Academic Categories coded by the authors based on earlier protocols employed by Walls et al. (2011) that included (1) Positive Teacher Behavior, (2) Negative Teacher Behavior, (3) Positive Learning Experience, (4) Negative

The primary variables were school subject, grade level in school, memory intensity, and affect. School subject referred to Language Arts, Social Studies, Math, Science, Physical Education, and Music/Art. Grade level in school included grades 1 through 12. Memory intensity described how well the individual remembered the event (from 1 - Barely at All to 6 - Almost Perfectly). Affect referred to how negatively or positively the individual rated the event (from 1 - Extremely Unpleasant to 6 - Extremely Pleasant).

Participants responded to materials in a four-page packet. The information provided on the first page described the voluntary, anonymous nature of the study being conducted to “find out more about what people remember in relation to academic topics.” The second page asked for gender, major, and rank and provided the following instructions:

Describe four academic events that you remember that happened while at school. Academic events relate to a school subject matter such as Language Arts (Reading, English, Literature), Social Studies (History, Government, Geography), Math (Arithmetic, Algebra, Geometry), Science (General Science, Biology, Chemistry, Physics), Physical Education, and Music/Art. The event you describe for each subject matter should be the first one that occurs to you while filling out these pages. They can be from any grades (Grade 1 to Grade 12). Please tell the details of who was involved and what happened. After you write each description, circle the information asked for about that event. The first two memories will be based on a subject that you plan to teach. The last two memories will be based on a subject that you do NOT plan to teach.

Examples of events in Language Arts and Science were presented in rectangles (9 cm by 18 cm). These examples were handwritten to illustrate how a participant might respond to the prompts for the four academic event memories that followed. The Language Arts example was a scenario about doing a good job of reading in the first grade. The Science example was a scenario about an 11th grade physics teacher who demonstrated the concept of gravity by making
Pages three and four of the packet included a brief one-sentence direction for each of the four memories and a blank 9 cm by 18 cm rectangular response box (two per page) for the participant to write his/her academic memory. Two boxes were included on page three of the packet with the words “SUBJECT THAT YOU PLAN TO TEACH” included within each of the two boxes. Two boxes were included on page four of the packet with the words “SUBJECT THAT YOU DO NOT PLAN TO TEACH” included within each of the two boxes. Below each box, the participant was to indicate the school subject, the grade level (1 to 12), the memory intensity (1 to 6), and the affect (1 to 6) for the event described.

There were 316 memories written by the 83 participants. These memories were categorized by the authors using the Academic Categories developed in the study by Walls et al. (2011) to incorporate the primarily academic probes of their research. Thus, scoring procedures were based on the previously established coding rules. When the academic categorization of a particular recollection was unclear to a scorer, consultation between authors occurred (Walls et al., 2011).

We examined the academic memories of preservice teachers who were enrolled in an Educational Psychology course to see if their own K-12 classroom experiences (1) were related to the subject or content area in which they planned to teach, (2) yielded more positive memories for subjects they Plan To Teach, (3) were more pleasant depending on grade level for subjects they Plan To Teach or Plan Not To Teach, (4) were related to academic scoring categories, and (5) were focused on students or subject content.
Results and Discussion

The results are presented in terms of frequencies and content descriptions of the participants’ memories. The teaching episodes that they described were related to (a) two memories of subjects they Plan To Teach and (b) two memories of subjects they Plan Not To Teach. For each reported memory of an academic event, they indicated (a) what school subject it was, (b) what grade level, (c) how well they remembered the event, and (d) how unpleasant or pleasant the event was.

Research Question 1: What content areas do education majors remember from their own K-12 academic experiences? For the frequencies of subject matter memories written by the participants for Plan To Teach and Plan Not To Teach, the memories in subjects that they Plan To Teach were in Language Arts (n=43), Art/Music (n=38), Social Studies (n=31), Math (n=22), and Science (n=22). The memories in subjects they Plan Not To Teach were in Science (n=34), Language Arts (n=28), Social Studies (n=25), Math (n=24), Physical Education (n=20), and Art/Music (n=20). These totals exceed the number of participants because the participants were not restricted to just one subject. The findings related to Research Question 1 provide evidence of the breadth of memories that preservice teachers recall.

Research Question 2: Do the participants write about more positive memories for the subjects that they Plan To Teach in contrast to the subjects they Plan Not To Teach? Participants’ ratings of 5 and 6 on a 6-point scale were combined for Pleasant, and participants’ ratings of 1 and 2 were combined for Unpleasant. The percentages of Pleasant memories for the Plan To Teach category were higher (65%) than the Pleasant memories for the Plan Not To Teach category (47%). In contrast, the percentages of Unpleasant memories for the Plan Not To Teach category were higher (36%) than the Unpleasant memories for the Plan To Teach category.
A chi-square analysis for the cross tabulations for Pleasantness (High versus Low) and Teach Memories (Plan To Teach versus Plan Not To Teach) produced a statistically significant chi-square value ($\chi^2 = 16.17$, $df = 1$, $p < .01$) with more Pleasant memories for the Plan To Teach category.

Although most preservice teachers in the present investigation rated the memories of the Plan To Teach and the Plan Not To Teach subjects as being positive, the total number of reported Plan To Teach memories was substantially higher. This may be related to positivity bias. Mezulis, Abramson, Hyde, and Hankin (2004) reported that researchers have suggested the presence of a self-serving attributional bias, with people making more internal, stable, and global attributions for positive events than for negative events.

The present study examined preservice teachers’ memories about school subjects. These findings give rise to additional questions such as would their school memories become even more positive over time as reported by Walls et al. (2011) and noted by Mather and Carstensen (2005).

Examples of extremely pleasant classroom memories (with ratings of 6, Extremely Pleasant) are presented in the Appendix. These Plan To Teach memories include all school subjects except Physical Education. There were no participants indicating Physical Education as a subject that they planned to teach. Extremely Pleasant memories may be examined in an Educational Psychology class for common or reoccurring elements or themes (e.g., level of student engagement) to encourage preservice teachers as they contemplate their own lessons.

**Research Question 3**: Does intended Grade Level (elementary versus secondary) relate to Pleasantness when recalling memories for subjects that will be taught or subjects that will not
be taught? The grade levels were grouped in terms of Elementary (Grades K-4), Middle School (Grades 5-8), and High School (Grades 9-12). The majority of participants reported intending to teach at the Elementary level (n=35) or at the High School level (n=29). Fewer participants projected teaching at the Middle School level (n=7). There were 12 individuals whose grade levels for teaching were not included in this analysis (Special Education=2; information omitted=10). A chi-square analysis for the cross tabulations for Grade Level (Elementary versus Secondary) and Pleasantness (High versus Low) for the Plan To Teach Memories yielded a statistically significant chi-square value ($\chi^2 = 4.44, df = 1, p < .05$) with both Grade Levels having significantly higher positive recollections of the subjects that they Plan To Teach. In contrast a chi-square analysis for the cross tabulations for Grade Level (Elementary versus Secondary) and Pleasantness (High versus Low) for the Plan Not To Teach Memories was not significant ($\chi^2 = 0.004, df = 1, p > .05$). Since both elementary and secondary preservice teachers had more positive recollections for the subjects that they Plan To Teach, utilizing their recollections in subject-specific context would be helpful in Educational Psychology discussions.

**Research Question 4**: Do memories of subjects they Plan To Teach and subjects that they Plan Not To Teach differ across the four academic scoring categories of Teacher Behavior, Learning Experience, Interpersonal Experience, or Recognition? Four chi-square analyses were conducted to examine the Academic Categories that included (1) Positive and Negative Teacher Behavior, (2) Positive and Negative Learning Experience, (3) Positive and Negative Interpersonal Experience, and (4) Positive and Negative Recognition. A chi-square analysis for the cross tabulations for Teacher Behavior (Positive versus Negative) and Teach Memories (Plan To Teach versus Plan Not To Teach) yielded a statistically significant chi-square value ($\chi^2 = 3.88, df = 1, p < .05$) with more Positive Teacher Behavior memories reported for the Plan To
Teach subjects and more negative Teacher Behavior memories for the Plan Not To Teach subjects. The second chi-square analysis for the cross tabulations for Learning Experience (Positive versus Negative) and Teach Memories (Plan To Teach versus Plan Not To Teach) yielded a statistically significant chi-square value ($\chi^2 = 5.71, df = 1, p < .05$) with more Positive Learning Experience memories than Negative Learning Experience memories reported for the Plan To Teach subjects and for the Plan Not To Teach subjects. The third chi-square analysis for cross tabulations for Interpersonal Experience (Positive versus Negative) and Teach Memories (Plan To Teach versus Plan Not To Teach) did not produce a significant chi-square value ($\chi^2 = 2.40, df = 1, p > .05$). The fourth chi-square analysis for cross tabulations for Recognition (Positive versus Negative) and Teach Memories (Plan To Teach versus Plan Not To Teach) resulted in a statistically significant chi-square value ($\chi^2 = 6.46, df = 1, p < .01$) with more Positive than Negative Recognition memories recalled for the Plan To Teach subjects. Thus, these results indicated the Plan To Teach memories were more positive across the academic scoring categories of Teacher Behavior and Recognition. For the academic category of Learning Experience, more positive memories were reported for both the Plan To Teach and the Plan Not To Teach subjects. The differences observed for Interpersonal Experience were not statistically significant. All academic categories were used previously by Walls et al. (2011). These findings may provide direction for the types of memories to rely upon in Educational Psychology classrooms.

**Research Question 5:** Do memories of intended Grade Level (elementary, middle, secondary, or art/music K-12) focus on the students or the subject/content area? It is reasonable to expect clearer differences between the memories of the Plan To Teach and the Plan Not To Teach subjects because of the declared majors of the preservice teachers. An analysis to examine
whether Grade Level was related to Teach Memories (Plan To Teach versus Plan Not To Teach) in terms of content of shared memories (focus on student versus focus on subject matter) was conducted, but no clear patterns were found. The absence of clear differences in the content of the memories reported by secondary education majors is somewhat unexpected because they were preparing to teach one subject or content area (e.g., Science or Social Studies), and so they could easily note clear differences between those earlier experiences with the subject they Plan To Teach versus other subjects that they Plan Not To Teach.

It may be more difficult for elementary education majors to make these clear distinctions in memory content across Plan To Teach and Plan Not To Teach subjects since elementary teachers would ultimately teach four of the six listed subject areas including Language Arts, Social Studies, Math, and Science and may teach Physical Education (McKenzie et al., 2001) and Art/Music (Propst, 2003). Almost all memories were scored for a specific school subject. In a few instances, the participant noted that he or she engaged in a generic classroom activity such as “helped tutor a fellow student” but did not indicate the school subject. These findings, if replicated, might call into question traditional practice in Educational Psychology courses of grouping students by grade level of their teaching specializations.

Concluding Comments

To extend earlier studies where students predominantly reported memories of social situations and academic subjects (e.g., Pillemer, Picariello, Law, & Reichman, 1996; Walls et al., 2001), the current study explored the memories of preservice teachers about the subjects that they Plan To Teach or Plan Not To Teach. The pattern of findings in this study suggest that, overall, more Pleasant than Unpleasant memories were reported, even for Plan Not To Teach school subjects. Detailed memories were given for both Plan To Teach and Plan Not To Teach
events. Singer, Rexhaj, and Baddeley (2007) reported that college students “…show a strong tendency to tell memory narratives that provide detailed renderings of particular events” (p. 887). Participants in the present research described memories that were consistent with the reported school subjects. It is well documented that preservice teachers hold strong beliefs based on their earlier K-12 experiences (Buchmann, 1987; Calderhead & Robson, 1991; Florio-Ruane & Lensmire, 1990; Pajares, 1992; Wilson, 1990).

Recollections of various lessons that remain salient and positive with the passing of time might provide insights to teachers with varying levels of experience (e.g., preservice, first-year, established, veteran in the classroom). For example, what makes a science lesson dynamic, exciting, and memorable? Or, what kinds of lessons can be used to make math fun and positive? This information may be gleaned from the school memories of educators. The current study serves as an initial effort in learning about the impact of these early K-12 academic memories held by preservice teachers enrolled in an Educational Psychology course.

A survey of contemporary Educational Psychology textbooks (Snowman & McCown, 2012; Sternberg & Williams, 2010; Woolfolk, 2013) reveals that the topic of preservice teachers’ memories is rarely, if at all, addressed. However, beliefs are discussed in some of the texts in terms of how they relate to motivation to learn. Thus, in Educational Psychology courses, preservice teachers are taught that one's beliefs about personal learning can directly impact "if" and "how" learning occurs. Preservice teachers do consider their own school experiences through their own memories when they contemplate classroom performance and teaching (Calderhead & Robson, 1991). Memories provide the foundation on which preservice teachers base their perceptions of students and classroom learning. The current investigation examined preservice teachers' memories and found that preservice teachers hold positive memories about all subjects
including those that they plan not to teach. Those memories can serve as a tool used by Educational Psychology faculty for instruction about classroom practice, learning, and motivation through discussions, reflections, journal entries, and simulations. Having students in education foundation and methods courses recall their own school experiences and connect them to current course topics may be beneficial in helping students grasp and apply course content.
References

Appendix

Sampling of Extremely Pleasant (ratings of 6) Activities for Reported School Subjects

**Language Arts**

- In 1st grade the teacher played the piano before every reading lesson and we gathered around and read fun stories.

- In 9th grade we studied Romeo and Juliet. We read the play and watched a movie. Afterwards we completed a project (e.g., building a small scale model of the theater, designing costume, for the play, or writing a poem).

**Social Studies**

- In 4th grade we held a mock trial about a robbery at McDonalds to help us learn about the judicial system. I was the DA and won the case.

- In my social studies class in 8th grade, we were learning about George Washington. My teacher dressed up like him one day and acted like he was George. He taught our class from George’s point of view. He even used an accent. He stayed in character the entire time.

**Math**

- In 3rd grade I remember that we were learning our multiplication tables. My teacher had a big flower on the wall and a bunch of bees with our names on them. Each part of the flower represented a table (1s, 2s, 3s, etc.) and when we mastered one our bee would get put on that number. I was in a race with another girl to get my bee to the 10 first and I won. I learned my multiplication tables really well and really fast.
• In 9th grade geometry we learned about different shapes. We made scrapbook pages cutting our pictures into different shapes.

Science

• In sixth grade, my science teacher was doing a lesson on the parts of the cell. She started with a pan of Jell-O and put different fruits and candy in it to illustrate the different organelles. I think one thing that really makes it stand out was that she let us eat it later!

• In 5th grade, groups of four students constructed the solar system with materials of our choice. I worked with three of my best friends. We spent hours on this project, meeting several times at our various homes. We did our project with different types of candy and the entire class loved our idea.

Music/Art

• My General Music instructor in elementary school used creative games to teach the basic skills required to read music. He used tape to make a music staff on the floor. The students threw chalkboard erasers onto the staff, then named the notes where the erasers landed, each team was awarded points for correct answers. He also wrote music symbols such as rests, clefs, note shapes and time signatures on large cards. He turned them facedown and students tossed Koosh balls at them. Correctly naming the pictures earned points.

• In 1st grade art we made ceramic squares that would be part of a collage on the school wall. We fired them in a kiln and then painted them. Not everyone’s square ended up on the wall of the school so I was very proud that mine did.

ABSTRACT

This study investigated the participation of small business managers in continuing education activities. The population for this study was small business managers who were members of the Montana State Chamber of Commerce (MSCOC). The 2013 membership of MSCOC consisted of a wide range of diverse members. The small business managers selected for participation in this study resided in varied geographical locations in the state, possessed various income levels, had varied educational backgrounds, had differing amounts of business experience, represented both genders, and were a wide variety of age. From the population of approximately 1200 a random sample of 200 small business managers was obtained from the 2013 membership roster. Forty one usable surveys were returned for a response rate of 20.5%. The data were collected with the Adult Attitudes toward Continuing Education Scale (AACES), the Deterrents to Participation Scale-General (DPS-G), and a demographic sheet. The data were organized to facilitate statistical analysis. A t-test was utilized to assess whether a statistically significant difference existed between the participants and nonparticipants in continuing education.

The study respondents had an average age of 52.2 years. Their ages ranged from 24 years to 80 years. Of this group 45% were males and 55% were females. The educational level of respondents ranged from 9 to 20 years with an average of 15.4 years. Their gross income ranged from $20,000 to $300,000 with an average of $116,444. Respondent’s years in business ranged from four years to 47 years with an average of 22.7 years. This group had participated in adult educational activities; the participation status of respondents revealed that 61% had participated while 39% had not participated.

The group varied in its perceived barriers to participation and its attitude towards adult and continuing education. On the DPS-G, which had a possible range of 34 to 170, the group’s average score was 70.97 and their scores ranged from 34 to 130. On the AACES which had a possible range of 22 to 110, the group’s average was 88.13 and their scores ranged from 56 to 110.
An analysis of the group means for the various variables indicated that participants and nonparticipants did not differ greatly on most of the variables. On all the variables the participant group scored higher than the nonparticipant group. On the AACES adult education participants scored an average of 91.42 and nonparticipants scored 82.92. On the DPS-G, participants scored an average of 71.78 and nonparticipants 69.67. The average of participants was 53 years and nonparticipants were 50 years. Participants had an average educational level of 15.68 years and nonparticipants had 15.08 years. The average gross income of participants was $130,278 and nonparticipant’s gross income was $88,778. Finally, participants have an average of 23.6 years’ experience and nonparticipants had 21.42 years. Although the participants group was consistently higher on these variables, the AACES total score and gross income were the only variables with sizeable mean differences between the groups. This difference was statistically significant at the .05 level on both the AACES total score and the gross income levels of small business participants and nonparticipants in adult and continuing education in Montana.

In conclusion, the study suggests that small business managers who have participated in adult and continuing education have more favorable attitudes toward continuing education. In addition, they tend to be older, better educated, have more business experience, and earn significantly more income.
Evidence-based Practices: School District Considerations in the Design of Professional Development for General and Special Educators

Pamela M. Juniel, M. Ed.

Educational & Clinical Studies Department

University of Nevada Las Vegas

junielp@unlv.nevada.edu

Topic Area(s): Special Education; Curriculum, Research, and Development
**Description of Presentation**

Evidence-based practice standards have been present in the fields of medicine, psychology, and sociology for the past 20 years (Eddy, 2005). In education, there have been issues bridging the research-to-practice gap using evidence-based practices in special and general education settings (Cook & Odom, 2013; Gersten, Vaughn, Deschler, & Schiller, 1997). The dissemination, usage, adherence, sustainability, and fostering evidence-based practices via professional development at the district and state levels are a constant challenge (Cook, 2013; Klinger, Boardman, & McMaster, 2013).

The Council for Exceptional Children recently published the *Standards for Evidence-based Practices in Special Education* (Cook, Buysse, Klinger, Landrum, McWilliam, Tankersly, & Test, 2014). Currently, no data exists for researchers, practitioners, or teachers to determine which components of evidence-based practices are considered in how districts plan and design school-based professional development for general and special educators. This presentation describes a study conducted to provide empirical data on present school district considerations of the standards prescribed by CEC (2014).

**Abstract**

Using the *Standards for Evidence-based Practices in Special Education* prescribed by the Council for Exceptional Children, (Cook, et. al, 2014), a survey was created and distributed to 736 professional development coordinators in small, medium, and large school districts across the United States. This survey will determine which quality indicators and classifications of evidence-based practices were considered when planning school-based professional development.
for general and special educators. The results of this study will provide initial empirical data regarding which aspects of evidence-based practices are prevalent and important to school districts at the national level.
A Note on Modeling of Mathematical Competences

ABSTRACT

In this paper, the authors present causal model of mathematical competences. This paper is a continuation of research on causal models that authors presented at international conferences in Albania (Tepeš, Lešin and Hrkač 2013) and the United Arab Emirates (Tepeš, Šimović and Tepeš 2014). Mathematical competences were grouped in three areas: language/data, geometry and arithmetic. Statistical set in our research consisted of 77 children from kindergarten in Zagreb, Croatia. We have 8 measuring variables for language/data competences, 5 measuring variables for geometry competences and 6 measuring variables for arithmetic competences. Three different models from our previous papers, for language/data, geometry and arithmetic competences, are now combined into a unified causal model of mathematical competences in kindergarten.

INTRODUCTION

In Croatia, kindergartens are pre-school education institution. Kindergarten teachers use curriculum for kindergarten (MZOS 2013) and additional curriculum (Economopoulos and Murray 2004, Kilman 2006). Teachers have to learn children mathematical competences. Mathematical competences are mathematical knowledge, skills and abilities. Mathematical competences in kindergarten can be divided in three group: language/data, geometry and arithmetic (Tepeš, Šimović and Tepeš 2014). Language/data competences are divided in natural language and data. Geometry competences are divided in space relations and geometric objects. Arithmetic competences are divided in numbers, relations and operations. Statistical set for our research was 77 children from Kindergarten “Milan Sachs” in Zagreb, Croatia (Kindergarten M. Sachs 2011). The structure of children’s age can be seen in Table 1.

Table 1. Children’s ages

Testing of mathematical competences was performed as a part of an ordinary testing of development monitoring and children’s readiness for school. For testing language/data competences we used 8 different tests: telling the stories (DTEST), word analysis (DWOAN), word synthesis (DWOSI), hyphenation into syllables (DHYSY), color recognition (DRECO), distinguishing numbers and letters (DNULE), writing the name (DWRNA) and activity duration (ACTI). For testing geometry competences we used 5 different tests: relation in front of and behind (GIFBE), relation above and under (GABUN), relation left and right (GLERI), recognizing triangle (GTRIA) and recognizing rectangle (GRECT). For testing arithmetic competences we used 6 different tests: counting to 30 (ACO30), understanding the numbers to 10 (AUN10), knowing the number of fingers on both hands (ANFBH), adding + 1 (AAD+1), adding + 2 (AAD+2) and subtracting – 1 (ASU–1). Every test was evaluated with 1 if a child had a competence and 0 if a child had no competence. Those values are values of test or measurable variables. For example, in the telling the stories test (DTEST), a child was asked to retell what happened today. If a child knew how to retell the story he was evaluated with 1, and if a child did not know how to retell it he was

E-mail address: bozidar.tepes@ufzg.hr, vladimir.simovic@unin.hr, krunoslav.tepes@zagreb.hr.
evaluated with 0. Measurable variable DTEST has 77 values, obtained as a result of testing the children with 1 or 0.

In our last paper (Tepeš, Šimović and Tepeš 2014) we described three unrelated causal models for language/data, geometry and arithmetic of mathematical competences in kindergarten. We will now describe how they are connected into a single causal model of mathematical competences in kindergarten.

INITIAL CAUSAL MODEL OF MATHEMATICAL COMPETENCES

In causal model for language/data mathematical competences, three measuring variables are the cause of all other variables: hyphenation into syllables (DHYSI), telling the stories (DTEST) and distinguishing numbers and letters (DNULE). In causal model for geometry competences, one measuring variable is the cause of all other variables: relation above and under (GABUN). In causal model for arithmetic competences, three measuring variables are the cause of all other variables: counting to 30 (ACO30), knowing number of fingers on both hands (ANFBH) and understanding the numbers to 10 (AUN10). The main idea in our paper is to construct initial causal model that links three separate causal models of language/data, geometry and arithmetic. Initial causal model for competences is causal model with seven measuring variables that are the causes of other variables: hyphenation into syllables (DHYSI), telling the stories (DTEST), distinguishing numbers and letters (DNULE), relation above and under (GABUN), counting to 30 (ACO30), knowing number of fingers on both hands (ANFBH) and understanding the numbers to 10 (AUN10).

In the first step, we constructed Markov network or undirected graph (Whittaker 1989). The edges on undirected graph are defined by partial correlation coefficients. The edges connect two vertices or measuring variables. Connectedness is measured by the partial correlation coefficients \( \rho_{ij} \) of the vertices \( i \) and \( j \) knowing all other vertices \( \{i,j\} \). In our initial causal model, vertices are elements from the set \( V = \{ DHYSI, DTEST, DNULE, GABUN, ACO30, ANFBH, AUN10 \} \). Vertices \( i \) and \( j \) are elements in set of vertices or \( i, j \in V \). Partial correlation coefficients are shown in Table 2.

</tr>
</tbody>
</table>

We marked (bold) partial correlation \( \rho_{ij} > 0.190 \). Undirected Markov graph has vertices from set \( V \) with edges with bold partial coefficient from Table 2. (Graph 1.)
In the second step, causal structure of mathematical competences is calculated by using Inductive Causation algorithm (Pearl 2000, Pellet & Ellisseff 2007). Causal structure is acyclic directed graph. IC algorithm searches for V–structures that have a special meaning in the causal structure. V–structure is sub graph \( i \rightarrow k \leftarrow j \) in undirected graph with \( \rho_{ij,k} > 0.90 \). Sub graph \( i \rightarrow k \rightarrow j \) in directed graph of causal structure of mathematical competences in the case of V–structure is \( i \rightarrow k \leftarrow j \). Our acyclic directed graph is completed with non V–structures \( i \rightarrow k \rightarrow j, i \leftarrow k \leftarrow j \rightarrow i \rightarrow k \leftarrow j \) for \( \rho_{ij,k} < 0.90 \) (Graph 2.).

In the third step, we calculate the causal initial model for the mathematical competences. In causal model, every directed edge is a causal connection connecting cause and effect of the cause (Tepeš, Šimović and Tepeš 2014). For example if we have edge \( i \rightarrow j \) from vertex \( i \) into vertex \( j \) or \( i \rightarrow j \), vertex \( i \) is the cause and vertex \( j \) is the effect of the case. Intensity of the cause is determined with coefficients in multiple regression formula. If measuring variable \( i \) is a cause, and measuring variable \( j \) effect, than multiple regression formula connecting cause and effect is \( j = BG + CC_i \). Coefficient \( BG \) means background competences, and coefficient \( CC \) means causal competences of cause \( i \) to \( j \). If two measuring variables \( i \) and \( j \) are the cause or \( i \rightarrow k \leftarrow j \), and measuring variable \( k \) is the effect, than multiple regression formula is \( k = BG + CC_1i + CC_2j \) with same interpretation of coefficients. Initial causal model is represented in Graph 3.
Initial causal model (Graph 3), connected together with the causal models for language / data, geometry and arithmetic (Tepeš, Šimović and Tepeš 2014), describes one causal model of mathematical competence in kindergarten.

**DISCUSSION**

In our previous models for language / data, geometry and arithmetic, we found greater background mathematical competence or knowledge. The background knowledge was greater than 0.60, and it meant that we had great causal influence of some latent non measured variables. Only in arithmetic causal model for relations that describe orientation in space we had background knowledge around 0.30. To the contrary, in our initial causal model we have background knowledge less than 0.15. It means that we must have more measure variables in language/data, geometry and arithmetic causal models. From our initial causal model (Graph 3.), the most important variables in mathematical competences in kindergarten are $DTEST$, $GABUN$, $ANFBH$ and $AUN10$. The measurable variable or competence telling the stories ($DTEST$) is very important to mathematical competences from the language and date point of view. The measurable variable or competence relation above and under ($GABUN$) is important to mathematical competences from the geometry point of view. The measurable variables or competences knowing number of fingers on both hands ($ANFBH$) and understanding the numbers to 10 ($AUN10$) are important to mathematical competences from the arithmetic point of view. For the purpose of further research, it is necessary to increase the number of children included and the children from other kindergartens. Test materials must be standardized and must allow for higher graduation of results. The study should include more measuring variables in data competences such as collecting data, measuring and information technology, in geometry competences such as lines, planes and simple bodies and in arithmetic competences such as complex arithmetic operation and simple arithmetic problems.

ABSTRACT
There are many pupils with reading difficulty in Japanese schools. There is a method of objective assessments of the reading difficulty. We need to know the profiles of pupils for enabling the wide use of the objective assessment of reading difficulties. This paper discusses and proposes the profiles of reading difficulties of pupils in a Japanese elementary school. This paper describes the method of objective assessments of reading difficulty, and shows our experiments collecting the profiles of pupils. Then, we describe the profiles of pupils in the objective assessments of reading difficulties in a Japanese elementary school.

Keywords:: Profile, Reading behavior, Reading difficulty

1. INTRODUCTION
There are many pupils with reading difficulty in Japanese elementary schools. There are many difficulties. The big and first one is reading Japanese characters. Japanese characters are the construction of hiragana (phonetic character), katakana (another type of a phonetic character), kanji (Semantic character) and other characters.

There may be many causes of the difficulties on reading Japanese texts [1]. We do not discuss the causes. We only pay attentions to the methods for easing their difficulties. We call their difficulties “reading difficulty” in this paper.

The Japanese text presentation system was proposed and implemented to help the pupils with reading difficulties [2]. Figure 1 shows the display example of the Japanese text presentation system. In fig. 1, there are a normal presentation, a high-lighting part and masked parts. In this presentation,
a user can find the part reading. The system makes the precise record of the operations. With the operational record, we can assess the reading difficulties on objective base [3].

This paper proposes the objective assessment method of reading difficulties with the operational records of the Japanese text presentation system, and shows the profiles of pupils in a Japanese elementary school.

First, this paper proposes the assessment method using the system operational records. Then, we show some experimental assessments in a Japanese elementary school. And last, we conclude this work.

2. OBJECTIVE ASSESSMENT OF READING DIFFICULTY

With the Japanese text presentation system, the behavior of a user is recorded. From the recorded behavior, we can assess the reading difficulties about the user. This assessment is objective.

2.1 Operational record of the Japanese text presentation system

The Japanese text presentation system records all the operations of a user. The Japanese text presentation system moves the high-lighted part in a text with the key-input of the user.

Using the Japanese text presentation system, the user directs the move of the high-lighted part to the next word chunk with a key-input. The record includes the key operations with the precise time. With the record, we can measure the time for reading the high-lighted part. Table 1 shows the example of the operational record. The 1st and the 2nd columns have the date and time. The 3rd column is the operation. The 4th column includes the high-lighted part after the operation. They are Japanese. The 5th column does the elapsed time from starting the system in milli-seconds.

2.2 Assessment of reading difficulty

For assessing, we use the relation between the reading time and the length of the high-lighted word chunk. There is the number of characters and the number of phonemes for measuring the length of the text. In our pre-experiments, it shows clear relations between the reading time and the number of characters. We use the number of characters for measuring the length of a text. In Japanese texts, there are kanji, hiragana and etc. As a result, there is a change of phonemes in a character. However, the number of character shows better relation with the reading time.
Without reading difficulties, there is a linear relation between the reading time and the length of the high-lighted word chunk. However, in real reading, there are many miss-operations and reading difficulties. Figure 2 shows the relations between the lengths of the high-lighted parts and the reading times. Without outliers, there is a linear relation between the length and the time.

Figure 2: Relation between reading time and the length.

### 3. EXPERIMENTAL RESULTS

Our experiments include 182 pupils. Their ages are from 7 to 12 years old. They read the materials fitting for their ages. Before the experiments, we make the performance evaluation about reading ability by the teachers. The evaluation is rough classification into 3 categories. The 3 categories are A, B and C. The category A is good as the reading ability. The B stands for the category that shows
a little reading difficulty. The C does for the category that shows an apparent reading difficulty. Some pupils show more reading difficulty. However, the pupils are not included in this experiment.

3.1 Valid data set

There are many difficulties about the experiments over the whole pupil in an elementary school. Some experiments have interventions and distortions. The pupil may have difficulties about operations of the Japanese text presentation system itself. Teachers make some mistakes about controlling the system. As a result, we have 103 valid data sets.

<table>
<thead>
<tr>

</tr>
<tr>
<td>5</td>
<td>3</td>
<td>16</td>
</tr>
<tr>
<td>Total</td>
<td>24</td>
<td>55</td>
</tr>
</tbody>
</table>

Table 2 shows the precise distribution of the valid data sets. The normal pupils’ performances distribute in the grade ‘A’ and ‘B’. Of course, this distribution may differ among schools. However, at the elementary school, with the distribution, teachers grade normal pupils as ‘A’ or ‘B’.

3.2 Mean Reading speed of normal pupils

The most basic feature is the reading speed. We can define the reading speed with 2 methods. One is the number of phonemes per a second. The other is the number of characters per a second. At reading aloud, the number of phonemes may fit for utterances. The reading activity is the combination of looking a text, understanding letters, constructing words, understanding a sentence, and speak the sentence. The large parts of the process are understanding the text. In the parts, the understanding does not concern about the sounds of the letters. After understanding the sentence, the sounds of the letters are fixed. In the experiments, we observe more apparent linear relations between the number of letters and the reading time. We use the number of characters for measuring the reading speed in this work.

<table>

<td>2.9</td>
</tr>
<tr>
<td>5</td>
<td>2.0</td>
<td>2.4</td>
</tr>
<tr>
<td>Total</td>
<td>2.2</td>
<td>2.6</td>
</tr>
</tbody>
</table>
Table 3 shows the average of the reading speeds. The values are the average number of letters in a second. This included the time for operations and waiting. However, these reading speeds carry some information about reading behaviors of pupils.

First, the reading speeds do not change between years. The absolute reading abilities increase with the years. However, the texts for the year also increase their complexities and difficulties. The ratio of kanji characters increases. A kanji character has more phonemes than a hiragana character. As a result, the reading speeds in the number of letters do not change much.

Second, the reading speeds do not change among the pupils’ reading performances. In reading silently, the reading speed may increase with the increase of the reading performances. However, in reading aloud, good reading is not fast. Pupils with bad performance need much time for understanding the text. The pupils with reading difficulties cannot read fast. The good reading aloud for teachers is not too fast. It is proper speed. The normal pupil can read fast and does not read fast. The pupils with B of reading performance read faster than the pupils with A.

3.3 Standard distributions of reading speed of normal pupils

The next feature of the reading speed is the standard distribution. Table 4 shows the standard derivations of reading speeds. In the following, we describe the standard derivation as STD. In the year 5, the STD of reading speed of the pupils graded ‘A’ is smallest in all. The pupil with the grade ‘A’ read texts in steady pace. The pupils with other grades cannot keep the steady pace. In total, the difference is not large. However, the STD of one with the grade ‘A’ decreases with the increasing of the ages.

The pupils with the grade B do not show a clear decrease of the STD of the reading speed with the increase of the ages. They have a little difficulty in reading texts. As a result, they pause sometimes.

4. CONCLUSION

This paper shows the method of the objective assessments using the Japanese text presentation system. It discusses the profile of objective assessments of reading behaviors of the pupils in a Japanese elementary school. The profiles of pupils help to distinguish the pupils with reading difficulties from normal pupils. In the profiles, normal pupils read Japanese texts aloud smoothly.
We can measure the smoothness with the average and the standard derivation of reading speeds. The standard derivation is more important for measuring the reading difficulties.

We will make the system that enables to make day by day automatic assessments of reading difficulty. This helps many pupils with reading difficulty and the teachers that lead the pupils.

Abstract

The aims of the “Art Program Based on Esthetic Elements Found in Nature” (APEEN) are to explore nature in depth, appreciate its beauty, increase emotional sensitivity and esthetic attitudes towards it, and develop creative expressive abilities of young children.

The contents of the art program consist of five elements: line, color, shape, texture, and space. Each element includes three areas: exploration, expression, and appreciation. Communicating with nature as well as recognizing its characteristics and values are also involved. Teaching-learning processing of the APEEN had four steps: perception,
observation, expression and appreciation. Teaching strategies include questioning, explaining, modeling, cooperative learning, communicating, and feedback. For teaching-learning materials, exploring and appreciation materials and expressive materials are provided. Materials for exploration and appreciation include real objects from nature, as well as visual media of nature such as picture books, photos, and pictures. Materials for expression include collected natural objects and general art supplies and tools.

The purpose of the study was to investigate the effect on five-year-old children’s art appreciation ability, art representation ability, and nature-friendly attitude after participating in the APEEN for young children. The following questions were developed to guide the study:

1. How does APEEN affect developing children’s appreciation of art?
2. How does APEEN affect developing children’s representation of art?
3. How does APEEN affect developing children’s nature-friendly attitude?

A total of fifty five-year-old children participated in this study for twelve weeks. The APEEN was provided to the experimental group, while general art activities for kindergarteners were provided to the control group. To examine effectiveness of the program, a pretest and posttest on children’s appreciation and representation abilities of art, and nature-friendly attitude were conducted. Post-hoc test (SPSS) was used to analyze data.

The results were as follows. First, an average score of the sub-elements of young children’s ‘appreciation ability of art’ was significantly higher in the experimental group than in the control group. Observation and description (t =6.76, p < .001), materials and techniques (t =5.73, p < .001), artists’ intention (t =8.19, p < .001), atmosphere of a work (t =7.35, p < .001), artistic elements (t =8.13, p < .001), attitudes towards a work (t =2.67, p < .001). Therefore, APEEN showed a positive impact on increasing children’s ability for art appreciation.

Second, an average score of sub-elements of ‘representation ability of art’ was higher in the experimental group than the control group: there were significant differences in emergence of line and shape (t =6.18, p < .001), variety of colors (t =6.00, p < .001), detailed description (t =6.23, p < .001), balanced-symbol pace (t =7.71, p < .001), variety of shapes (t =5.42, p < .001), relevance to main theme (t =6.42, p < .001), originality of
symbol (t =6.07, p < .001), perfection of drawing (t =7.69, p < .001), and connectivity of symbol and language (t =7.70, p < .001). Thus, APEEN showed a positive effect to encourage children’s representation ability of art.

Third, an average score of the sub-elements of young children’s ‘nature-friendly attitude’ was higher in the experimental group than the control group: affection to animals and plants (t =4.76, p < .001), respect for life (t =3.47, p < .001), preference for nature to artificial environment (t =3.70, p < .001). Therefore, APEEN influenced positively to enhance children’s nature-friendly attitude.

The findings of this study clarify that the “Art Program Based on Esthetic Elements Found in Nature” for young children has a positive impact on children’s art appreciation ability, children’s art representation ability, and children’s nature-friendly attitude. The APEEN encourages young children to recognize the characteristics and values of nature, represent the beauty of nature creatively, and shape nature-friendly attitude by communicating with it. This reflects that the APEEN is feasible to apply in the educational fields for young children.

Abstract Earlier research investigated suitable extrinsic and intrinsic motivation by using a target setup function and an evaluation teaching function in a lesson assistance system and clearly showed that the action of participating students who do not use the system positively resulted in low improvement. In an experiment in this research, supplementary lessons were given to an absentee student who was not able to attend a lesson for an unavoidable reason, and a function aimed at raising the absentee's learning motivation was included. The absentee student performed supplementary lessons outside of school hours with a PC. Because the course content at the time of the absence was reflected in test results, the learning motivation for the lesson improved. Furthermore, the target setup function had a synergistic effect with the supplementary lesson learning function.

Keyword: lesson assistance system, intrinsic and extrinsic motivation, educational support, target setup, evaluation instruction, supplementary lesson

1. Introduction
1.1 Background
Nakayama and Matsuda (2004) developed a lesson assistance system that enables effective individual correspondence through a simultaneous lesson to students with different levels of understanding. It was shown clearly that the student who understands course content is provided with more study opportunities, and scores become higher because all the students understand the course content. Even if the system shows that a student received suitable advice, it also became clear that the student who does not use the system positively cannot fully utilize its functions. Abdusalam (2009) demonstrated that the volition of a student who does not use the system positively could still show improvement due to extrinsic and intrinsic motivation by setting up a target with an evaluation from the beginning of a lesson. Specifically, a teacher using the system could provide a scholastic evaluation through the target setup at the beginning of a lesson. The lesson assistance system motivates students by comparing one's desired target value and actual achievement value, as well as one's actual achievement value and another's actual achievement value. Such motivation makes it possible to shift to intrinsic motivation. In addition, it is thought that the learning assistance system is appropriate for the attention-relevance-confidence-satisfaction (ARCS) model (Keller, 1983, 1984, 1987) to increase motivation by checking the motivation at the beginning of a lecture and checking the achievement at each subsequent lecture. However, when a student is not able to attend a lecture for unavoidable reasons, it becomes necessary to perform supplementary lessons by distance education. It is also necessary to examine how the supplementary lesson is reflected in the achievement ratio for that time of absence, and how motivation is maintained. Here, the study case of supplementary lessons is described. Taniguchi (2009) reported a PowerPoint lesson on the Web as an example of supplementary lessons. Specifically, Web teaching materials are placed on the Web so that a student is able to see these materials after a lesson. Then, it is possible to check the record of studying and the amount of usage, and to analyze the effect on the final examination. As a result, it was reported that the rate at which a one-time absentee has supplementary lessons is higher than the rate of a student who was absent three or more times.
Moreover, it was reported that the quiz results may become better by participating in supplementary lessons. However, although the learning effect of seeing a lesson after a class and the learning effect of supplementary lesson materials were clarified in these previous studies, the technique of raising a student's learning motivation has not been clarified.

1.2 Purpose
This research proposes and evaluates a supplementary lesson learning function aimed at increasing the learning motivation of the student who cannot attend a lecture for unavoidable reasons. A target setup function is included in the system (Abdusalam, 2009).

Adding a supplementary lesson learning function contributes to the ARCS model (Keller, 1983, 1984, 1987). Fig. 1 is a diagram for improving the learning motivation of an absentee student.

![Diagram](image)

**Fig. 1: Conceptual diagram of increasing intrinsic motivation from extrinsic motivation**

2 System Outline
2.1 Features and Composition of System
The stage at which a student works with the learning assistance system is divided roughly into three functions: "target setup" (Abdusalam, 2009), "attendance check and quiz" at each lesson, and "supplementary lessons provided to absentee student". In the "target setup", attendance is taken during a lesson. The target setup is carried out for the comprehensive target, which includes the percentage of attendance, quiz achievement ratio, the results of a midterm and a final exam, and an evaluation of how many performance goals were achieved for every content of each lesson. The function that performs the target setup (called the target setup function) is prepared. "Attendance check and quiz" compares the comprehensive achievement ratio with the achievement ratio for each course content. The comprehensive achievement ratio includes the percentage of attendance and the quiz achievement ratio collected for every lesson, and the results of the midterm and the final test. The function that shows the achievement ratio of each lesson (called the evaluation instruction function) is prepared in the lesson assistance system. In "supplementary lessons provided to absentee student", the contents of each lecture are displayed. The contents of a lecture at the time of the student's absence are shown, and this part is reflected in the test and quiz results of every lecture. The function to show the course content at the time of an absence (called the supplementary lesson function) is prepared in the system. Specifically, it is thought that supplementary lessons maintain learning motivation and make it possible to understand the course content during the absence. The motivation of a lesson is maintained or improved by reflecting the student attendance at the time of the absence and the results of a quiz given to the attendees. The above three functions are the features of this system. In addition, an attendance registration function, a quiz function, an attendance registration and quiz check function, the top ten results of attendance and quizzes also constitute this system as a whole. This system carries out lesson support for a teacher on a PC, and the absentee student receives a lesson by a mobile phone or a smart phone.

2.2 Outline and Application of Each Function
Fig. 2: Outline and application of the system

The outline of this system and the procedure for its application are shown in Fig. 2. Explanations are given below according to the numbers shown ((1) to (12)) in the figure. The three functions are the information input function, lesson support function, and supplementary lesson learning function.

2.2.1 Information Input Function

(1) The teacher draws up a syllabus before a lesson and prepares the teaching materials.
(2) The information input required for the teacher is given in advance. This system performs a setup of the school registration number and the student’s individual password, which are used as the input ID of the student who is a participant.

2.2.2 Lesson Support Functions

(3) At the start of the first lesson, the teacher orally gives explanations and directions of the application method of the lesson assistance system. If a student accesses the system by a mobile phone, the main menu (Fig. 3) of this system is displayed. When a student is absent for an unavoidable reason, a supplementary lesson learning function explains that it can have supplementary lessons on the course content. An explanation about the attendance or the score of a quiz is also given.

(4) The student chooses a goal setting function (Fig. 4) from the main menu (Fig. 3) and sets up the desired target value of the lesson. This function has the following three set points (Fig. 4: Target setting function, Achievement target of score, Achievement target according to context of study).
(4) After setting up the above (Fig. 4), based on the total result of the desired target value, the teacher can learn the outline of the student's desired target value and a student's motivation.

(5) The student performs attendance registration by entering a “lesson password” and the “attendance registration function” (Fig. 3).

(5) The teacher checks the attendance after the registration of attendance.

(6) The teacher gives a quiz and presents the quiz problems with a document camera or printed matter.

(6) The quiz is multiple choice (four choices), and it is possible to answer two times. A correct answer at the first attempt is assigned 1 point, 0.7 point at the second attempt, and 0 point at the third or more attempt.

(7) The student transmits the results of the quiz. Then, the school registration number and the student's individual password are using the date, test, attendance, and supplementary lesson function (Fig. 5), and the results of the quiz are checked. At the same time, it is possible to check the attendance registration of each lesson or supplementary lesson.

(7) From the total result of the quizzes transmitted by the system, the teacher checks the student's achievement and makes the judgment regarding the lesson advance.

(8) The teacher gives the evaluation instruction by the evaluation instruction function (Fig. 6) to the student based on the total result of the quizzes of (7).
(8)' The student performs a self-evaluation by the evaluation instruction function. The evaluation instruction function is divided generally into two types of information: results achievement information and achievement information classified by the contents of study. Section 2.2.4 describes the calculation technique of these two information types in detail.

(9) The teacher performs the directions required for the student, and advice is presented orally based on the information of (7)'.

(9)' The student changes the desired target value through the advice about the contents and the teacher's evaluation instruction, if needed.

2.2.3 Supplementary Lesson Learning Function

(10) The teacher judges whether distance education is required for the student, and requests that the student carry out the supplementary lesson learning function based on the information in (5)' (Fig. 7 and Fig. 8).

(11) The student absent from the lesson uses the supplementary lesson learning function by distance education on a PC (Fig. 9). In the supplementary lesson learning function, the data and the course contents of each lecture can be displayed (Fig. 10). The point of student reflects the results after self-study with the supplementary lesson learning materials. In addition, the number of attempts to use the supplementary lesson learning function was restricted to three. The reasons for limiting the number of attempts to three are as follows: participation in the lesson is the objective, and supplementary lesson study is aimed at assistance in the case of unavoidable absence. Moreover, in the questionnaires from students, the number of attempts considered to be the most suitable was three.
(11) The student takes a quiz, as in (6), based on the information shown by the supplementary lesson learning function. However, the points assigned were 0.7 if the quiz using the supplementary lesson learning function was correctly answered on the first attempt, 0.5 point on the second attempt, and 0 point at the third or higher attempt. This difference was based on the result of an investigation on the attempt with the most motivation, as given in the questionnaires from students (Fig. 11).

(12) The student transmits the result after the quiz, as in (7). Then, the school registration number and then the student's individual password are entered using the date, test, attendance, and supplementary lesson function (Fig. 5), and this function checks the result of the quiz.

(12) From the total results of quizzes transmitted by the system, the teacher checks the achievement of the student's distance education and makes the judgment required for lesson advance.
2.2.4 Calculation Technique of Results Information

Motivation is determined by checking the following information for each lesson. First, the results of the achievement information consists of three of them (“a quiz target and a quiz achievement ratio”, “an attendance target and the percentage of attendance”, and also “the comprehensive target and comprehensive achievement ratio”). In addition, although these three target values are set by the students themselves, the three achievement ratios are calculated automatically by the computer. Moreover, information of the absentee student and other students is included for the above six target values (total of 12 kinds (Fig. 6)). The comprehensive achievement ratio (R) in this experimental lesson is calculated as the sum of five target values. The percentage of attendance (S) and the quiz achievement ratio (T) are 10% each, and a midterm exam (CK1) and a final test (CK2) are 40% each. Furthermore, when the supplementary lesson learning function, described by (11)' of 2.2.3 is followed, weight (H) are used.

The calculation is as follows (Fig. 11).

\[
R(\%) = S \times W_1 + T \times W_2 + CK_1 \times W_3 + CK_2 \times W_4 + H \times W_0
\]

“W” is used as weight attachment for each (W1: percentage for attendance, W2: Midterm exam, W3: Small Test, W4: Final exam, W0: Supplementary-lessons). Next, a target exists in the alignment with the item (six items in this experiment) for every course subject in the achievement information classified by contents of a scores (Fig. 6). Moreover, the student's desired target value and achievement ratio, the others' desired target values and achievement ratios are shown in the achievement information classified by contents of a scores. With reference to this information, the student can check and judge synthetically each content at each lesson and performs a self-evaluation. In addition, the achievement ratio \(X\), classified by the contents for every lesson, is shown below.

<table>
<thead>

</tbody>
</table>

\[
S(\text{Percentage of attendance} \%) = \frac{\sum S_i}{n-2} \times 100
\]

\[
T(\text{Midterm exam achievement quotient} \%) = \frac{\sum T_i}{n-2} \times 100
\]

\[
H(\text{Supplementary-lessons Achievement quotient} \%) = \frac{\sum H_i}{n-2} \times 100
\]

\[
R(\text{Comprehensive achievement quotient} \%) = S \times W_1 + T \times W_2 + CK_1 \times W_3 + CK_2 \times W_4 + H \times W_0
\]

\[
X(\text{Achievement quotient} \%) = (S_{\text{all classes}} + T_{\text{all classes}} + H_{\text{all classes}}) \times 50
\]

Fig. 11: Calculation method of the results information

The sum as a result of the percentage of attendance (S) and the quiz achievement ratio (T) might be 100%. In this
experiment, the target in one content of study was set up in one lesson and is expressed with the following formula

\[ X'\text{"Achievement quotient according to contents : \%."} = (S_{n-2} + T_{n-2} + H_{n-2}) \times 50. \]

3. Evaluation Experiment of System
3.1 Purpose
The purpose of this experiment was to perform distance education by the supplementary lesson learning function for the absentee who was not able to attend a lesson for an unavoidable reason, and to evaluate whether the learning motivation was increased.

3.2 Experimental Method
The subject "management information theory" was presented to 75 science and engineering university students. The experimental lessons for this lesson assistance system consisted of 12 lessons, and questionnaires were distributed about the learning motivation for the lessons using this system, and the lessons not using this system.

3.3 Results and Consideration
(1) The results of the study and volition of the participants with and without the supplementary lesson learning function (Table 1)

</tr>
</tbody>
</table>

* By the case where a significant difference is in an average by the T test, ** showed significance 1%.
** S.D.: Standard Deviation, Sig.Dif: Significant Difference
*** The question "When you are absent from the lesson for the unavoidable reason, what do you think about the learning motivation over a lesson using supplementary lessons as compared with a lesson which does not use ?" was asked for the reply by a five-affair method; “5: Motivation comes out very much.” ~ “1: Motivation does not come out at all.”

As shown in Table 1, the evaluation of the study and the volition of the participants for lessons with the supplementary lesson learning function was high. From these results, a supplementary lesson study is expected to improve learning motivation.

(2) Study and volition of participants with and without supplementary lessons and target setups

![Fig. 12 Comparison of study and volition of participants with lessons using the system and not using the system](image-url)
Fig. 13: Comparison of study and volition of participants with supplementary lessons and lessons using the target setup

*** In order to evaluate the lesson using a system, the question "Please answer about the learning motivation at the time by comparing the lesson with a supplementary lesson learning function and a target setup function with the lesson without them." was asked using a five-step scale, from “5: Motivation is much involved.” to “1: Motivation is unchanged”.

As a result (Fig. 12), the evaluation with lessons using the system were higher than with lessons not using the system. Furthermore, when a function of both was used, that is, the supplementary lesson study and the target setup functions, the effect was most shown by the improvement in learning motivation (Fig. 13). From these results, if both the target setup function and the supplementary lesson learning function are used, a synergistic effect for improvement in learning motivation is expected.

4. Conclusion and Future Issue

An experiment in performing distance education by a supplementary lesson learning function for an absentee student was conducted. The absentee student could not attend the lesson. The experiment verified whether increasing learning motivation was an effect.

As a result, the following conclusions became clear.

1) By applying the supplementary lesson learning function of the lesson assistance system, improvement in learning motivation is expected.

2) In the lesson using the supplementary lesson learning function, improvement in learning motivation is expected in comparison with the lesson not using this function.

3) The lesson using both the supplementary lesson and the target setup can be expected to most improve learning motivation.

It is thought that an absentee student's learning motivation can be improved by participating in distance education with a supplementary lesson learning function. Future work includes using a formative evaluation of this system. Evaluation of teaching materials will be necessary for students during supplementary lesson learning to gauge the student's reaction. The understanding and learning motivation of a student can increase more than in the conventional lesson by modifying the teaching materials depending on the reaction.

Next, it will be possible to introduce a lesson assistance system that assigns lessons automatically to a subject according to that student's capability and understanding. A student who understands a lesson is provided with advanced information, and a student who seldom understands a lesson is provided with basic information. Thus, it is thought that each student's study level can be raised by offering information according to the student's level.

Foreign Language Learning Motivation: Extensive Reading and Graded Readers

migjohns@mmm.muroran-it.ac.jp

Abstract

This paper describes an ongoing study evaluating the motivational effect of graded readers and extensive reading on Japanese engineering students learning English as a Foreign Language (EFL). The study evaluates attitudes and motivational orientations towards graded readers following a semester-long reading class which required learners to read extensively and take online quizzes via the Moodle Reader Module. Motivational orientations were assessed using the Graded Reader Instructional Materials Motivational Survey (GR-IMMS), a questionnaire comprised of adapted scales from Keller’s (2010) Instructional Materials Motivational Survey (IMMS) and open-ended items. Results of 272 (n=272) completed surveys indicated that the majority of learners positively endorsed extensive reading and the online evaluation system, and that content features, genre and text characteristics influenced learners’ perception of texts. Each of the cognitive variables examined in the GR-IMMS scales were also positively endorsed. The implications of these findings are discussed as they relate to Japanese engineering students learning EFL.

Introduction

While English as a Foreign Language (EFL) has traditionally been a required subject for Japanese tertiary learners in liberal arts or business departments, it has increasingly become a compulsory part of science and technology undergraduate degrees in that country as well. These requirements reflect a number of related trends, including: the growing importance of English as a lingua franca for science and technology, an increasing move towards internationally accredited credentials, and Japanese governmental policies promoting English as means to foster commerce, research and international understanding (Crystal, 2003; Kishimoto, 2013; Mok, 2006).

With the expansion of the English curriculum, EFL instructors teaching engineering majors have encountered a number of challenges associated with this particular population of learners, including their lower proficiency and interest in English, and the somewhat distracting role English plays in competing for time with engineering studies (Johnson, 2013; Koga, 2010; Kuwabara, Nakanishi, & Koma, 2005). These characteristics, combined with other cognitive and affective variables observed to play a role in the demotivational states in Japanese tertiary EFL learners (Berwick & Ross, 1989; Burden, 2002; Falout & Maruyama, 2004; Saito, 2007), contribute to the challenge of teaching EFL to Japanese engineering students.

In order to better meet and address the particular needs of specific populations of language learners, researchers have examined the role classroom factors play in facilitating learning. One important classroom factor that has been identified to directly affect learners is
instructional materials. In particular, instructional materials have been identified as having motivating and demotivating influences on learners (Chambers, 1998; Falout & Maruyama, 2004; Gorham & Mille, 1997; Peacock, 1997). Earlier studies conducted by the author have indicated that Japanese engineering students respond distinctively to different genres of instructional materials, and to their specific characteristics (Johnson & Johnson, 2012). The latter were found to be particularly evident in reading classes in which learners read extensively from self-selected graded readers (Johnson 2014a, 2014b). These findings reflect those of other studies which found that FL learners’ attitudes, degree of enjoyment, and level of interest were positively affected by reading extensively with graded readers (Al-Homoud & Schmitt, 2009; Cho, & Krashen, 2001; Critchley, 1998; Dupuy, 1997; Forrest, 1997; Hayashi, 1999; Iwahori, 2008; Mason & Krashen, 1997; Powell; 2005; Robb & Susser, 1989; Tanaka & Stapleton, 2007).

This study endeavors to expand upon previous research in this area, and on prior research conducted by the author, by further examining the motivational influence of graded readers on Japanese engineering students’ EFL learning motivation. The ultimate goal of this research is to identify instructional materials that appeal to the target population of learners, and to better understand how their constituent characteristics contribute to their motivational appeal.

Study overview

Japanese engineering students have been described as reluctant language learners (Nishizawa, Yoshioka, & Fukuda, 2010). One possible means of overcoming this reluctance, and to promote higher levels of motivated engagement, is though providing such learners with instructional materials that appeal directly to their needs, levels, and interests. The range of levels and content within graded readers series, and the self-selectivity aspect of extensive reading, suggest that it might serve to provide greater appeal to segments of EFL learners such as Japanese engineering students.

The goal of this study was to evaluate Japanese engineering students’ motivational orientations toward ER and graded readers following a semester-long reading class where they were required to read self-selected graded readers and take weekly quizzes online through the Moodle Reader Module. The data was collected from participants over two consecutive years in which the reading class was offered. It was thought that the retrospective evaluation of the materials and system used in class would provide insight into the types and characteristics of graded readers students found motivating, as well as other aspects of the course design that either facilitated or impeded motivated behavior. The following research questions reflect these goals and guided this inquiry.

RQ1: How did learners perceive the use of graded readers and the online evaluation system?
RQ2: In what ways did the use of graded readers and the online evaluation system affect learner motivation?
RQ3: What specific characteristics of graded readers contributed to their motivational appeal?

Methods

Data collection and analysis

Data collection was carried out with the Graded Reader Instructional Materials Motivational Survey (GR-IMMS), a questionnaire comprised of scales adapted from Keller’s (2010) Instructional Materials Motivational Survey and additional open-ended items (see
Appendix 1). Like the IMMS, the GR-IMMS measures attitudes, relevance, confidence, and satisfaction components of instructional materials according to Keller’s ARCS model of motivation (Keller, 2010). These scales have been demonstrated to be effective in evaluating motivation across a wide range of educational contexts and with a variety of different instructional materials (Bollinger, Supanakoorn, & Boggs, 2010; Corbalan, Kester, & Van Merrienloer, 2009; Jakobsdottir & Hooper, 1995; Pittenger & Doering, 2010; Rodgers & Winthrow-Thorton, 2005). The GR-IMMS scales were rewritten and adjusted to better assess the specific characteristics of graded readers. The GR-IMMS has been trialed and validated in previous studies where it has been demonstrated to have good internal reliability (Johnson, 2014a, 2014b). The GR-IMMS also contained a section of open-ended items which inquired about learners’ impressions of graded readers and the online system, and the specific characteristics influencing perceptions of graded readers. An open-ended format was chosen for these items due to the range and variability of responses it can elicit. It was hoped that such data would provide deeper insights into the range of impressions and characteristics that contributed to learners’ experiences using the graded readers and the online evaluation system.

The questionnaire was administered in the final week of a fifteen-week semester and required ten to fifteen minutes to complete. A total of 284 questionnaires were collected, of which 270 (N=270) were retained for analysis. Questionnaires that were discarded were those that were either incomplete or not appropriately filled out. Of the questionnaires retained for analysis, all had completed GR-IMMS sections, while open-ended items were filled out selectively by participants. GR-IMMS results were then entered into Predictive Analytics Software (PASW) version 18 to derive descriptive and inferential statistics. Open-ended item responses were translated into English, and responses to each item were coded and separated into themes. Following first round coding, themes were revised and re-organized with input from a colleague.

Participants

All participants were second-year Japanese engineering majors with specialties in applied chemistry and mechanical engineering. A total of 284 (n=284) students filled out questionnaires, although the data represents responses from 270 (N=270) completed questionnaires. The participants were of mixed English ability, although the majority was at a low-intermediate reading level. The reading class represented one of eight mandatory EFL classes students were required to complete as part of their general humanities requirements for their Bachelor of Engineering degrees.

Results

GR-IMMS results

Results of the IMMS indicated positive overall endorsement of the four scales used in the questionnaire. The most highly endorsed scale was Satisfaction (SAT), with a mean of 3.36 derived from the five-point Likert scale items. This was followed by Confidence (CON) (M=3.29), Attention (ATT) (M=3.01) and Relevance (REL) (M=3.17). The Cronbach’s alpha for each scale (CON $\alpha=0.71$; ATT: $\alpha=0.82$; REL: $\alpha=0.79$ and SAT: $\alpha=0.80$) indicated good internal reliability for each. While SAT was the most highly endorsed overall, its average range of 2.81 to 3.75 indicates a range of variability in responses.

The direction and strength of relationships between scales was investigated using Pearson product-moment correlation coefficient. Results indicated positive correlations between all scales (Table 3), with correlations falling between the r=.50 to r=1.0 range being indicative of a strong positive relationship (Cohen, 1988). These findings reflect the high correlational relationships between IMMS scales observed in other studies (Keller, 2010).

Open-ended item results

Overall impressions of graded readers

The first open-ended question was: “How did you feel about using graded readers?” A total of 211 responses were received for this item. The majority of responses were positive (78.6%: n=166), while 29, or 13.7%, were negative (see Table 4). The remainder of responses were either mixed (n=12: 5.6%), with students expressing mixed positive and negative feelings, or ambivalent (n=8: 1.8%), with such participants expressing that they had no particular feelings using graded readers. The most frequent positive results were associated with feelings of achievement or English improvement (n=29). Examples from this category of responses included “Reading every day made me feel like my English improved” (S255) and “It was very difficult at the beginning, but I got better at reading from the middle of the semester” (S63). Choice of content and book level was the second most positively endorsed aspect of the course, as exemplified by the response “I thought it was good, choosing books that matched my interest and level” (S110). Another highly endorsed aspect of the course was its perceived enjoyability (n=22). A sample of this type of response was “It was really fun, I enjoyed reading the books, all the different kinds of stories” (S59). A further area positively endorsed was “confidence” (n=18) where participants described increasing confidence the more they read, and with the more quizzes they passed. Two examples of this type of response were “I had absolutely no confidence in English, but this class really made me feel I can read because I could read a lot at my level. My confidence went up” (S20), and “It was difficult at the beginning, but I gained confidence the more I read. Passing the quizzes gave me confidence” (S73). The novelty aspect of this course also appeared to be a positive factor for learners, with 14 (N=14) participants describing the course as a new and unique experience, as expressed in the following sample response, “it was a new style class, I really haven’t had the chance to read English books, so I thought this was a good experience for me” (S80). Receiving the same number of responses was “other transformation”, which describes other types of personal transformation that occurred in learners beyond the changes in improvement and confidence described above. Such transformations included an increased interest in reading: “I tried hard to get the word count I needed, but I found I became more and more interested in the books and reading the more I read” (S179), or an increase in interest in English in general: “At first I didn’t want to do it, but after reading some books,
now I feel I’m more interested in English” (S44).

The first open-ended item received comparatively fewer negative responses (N=29). The most common category of negative response came from those who perceived the graded reader course as being difficult (n=18). Examples of this type of response included “it wasn’t interesting for me, reading those books was difficult” (S110), and “It was too difficult to read every week” (S135). A number of participants also negatively endorsed the class style. One example of this type of response was, “This kind of class was a pain, I’d prefer a normal class more” (S22). The final category of negative response came from those who stated that they had no interest in, or disliked, studying English (n=5). These feelings appeared to extend to extensive reading and the use of graded readers, as illustrated in the response “I don’t really like English so I didn’t like doing it (reading and the online quizzes) at all” (S27).

Preferred graded reader types

The second open-ended item inquired about the types graded readers participants preferred using. Responses fell into four categories: content features, genre, structural or layout characteristics, and publisher type or series (see Table 5). The five most frequent responses from each category will be discussed below.

The most frequently identified type of reader preferred was that with content features that appealed to learners (n=135). Participants particularly liked books that they perceived to be easy (n=38). They also identified readers that matched their personal interests (n=34) as being particularly appealing. Students mentioned graded readers with stories or themes involving such topics as soccer, opera, chess, and airplanes as being particularly appealing due to their appeal to their specific interests. The third most frequently cited content feature that appealed to learners was familiarity in terms of story content (n=22). With such responses learners mentioned particularly liking reading stories they already knew such as Huckleberry Finn or Sherlock Holmes as it was easier for them to self-monitor their understanding of the story. The next most frequently cited content feature liked by learners were understandablity (n=9) and daily life (n=7). Responses in the understandability category described readers with storylines, particularly character interactions, which were easy to follow, while “daily life” described readers which provided a glimpse into day-to-day activities such as work or school in other countries.

The second most frequently cited attribute of preferred graded readers was genre (n=95). Movie-related graded readers (n=24) were the most popular with students, with a
number indicating that they liked being able to check comprehension and compare movie-based graded readers with movies they had previously watched, or alternatively, to watch movies after reading to check their comprehension. The second most frequently cited genre was fiction (n=15), with students explaining that they liked following stories and their plots. This was followed by mystery-themed graded readers (n=14), about which learners expressed a keen interest in trying to solve the mystery as they read. The fourth most popular genre was non-fiction (n=8). Within this category learners described books about real places, businesses and events as particularly valuable in providing knowledge. The fifth most preferred genre was biographies (n=6). Learners expressed interest and excitement in reading details about famous people’s lives. Like non-fiction books, biographies appeared to appeal in terms of their inherent interest as well as their general knowledge value.

Participants also described preferred graded readers in terms of their specific layout or design “characteristics” (n=38). A number of students (N=14) identified pictures or illustrations as playing an important role in influencing their degree of enjoyment with readers. Student 87 even went as far as identifying what he perceived to be the optimum number of pictures a graded reader should have, “…if there were pictures every two pages or so, it really made the book more interesting; I could use the pictures to imagine the story”. Another important characteristic was length, with both short (n=7), and long (n=4), books appealing to different students. Those who liked short books liked being able to reading them quickly and effortlessly, and being able to complete their quizzes easily on the Moodle Reader Module. Those who preferred longer readers described enjoying following the flow and development of more drawn out stories and characters. A number of participants (n=5) also identified the printed word count on the backs of books as a characteristic that contributed to their enjoyment of graded readers. Such students explained that choosing books according to their word count allowed them to set weekly goals and read according to their own schedules. A final characteristic positively affecting students impressions of readers was their variety (n=4); that is their distinct visual appeal and presentation from book to book, series to series, and publisher to publisher. Students who identified this characteristic described enjoying going to the library and choosing from a wide variety of book covers and surveying the layout, content and presentation of readers prior to selection.

</table>

A number of students (n=12) also identified preferred books by specific publishers. The most popular books type in this category were those in the Cengage Foundations series
Graded readers from other publishers specifically identified by learners were those from MacMillan (n=2) and Penguin (n=2). Where graded readers from these specific publishers were identified, participants did not add any explanatory insights into why such series were preferred, although it is likely that such books represented the preferred content features, genres and characteristics identified above.

Disliked graded reader attributes

The third open-ended item asked participants what types of graded readers they disliked. The same three categories as above emerged, although with a slightly different order of frequency: content features (n=62), reader characteristics (n=36), and genres (n=31). The content characteristic most frequently cited as having a negative effect on learners’ perception of graded readers was “hard to follow” (n=24). Learners explained that readers with storylines that were difficult to follow, had too many characters, or dialogue that was hard to attribute to specific characters, contributed to negative impressions of particular books. The second most cited disliked reader characteristic was “difficult” (n=18). A number of learners explained that they didn’t like books that were more difficult than they anticipated, and felt frustrated when this difficulty resulted in them not being able to pass the reader’s online quiz. Another content characteristic that negatively influenced learners’ impressions of particular graded readers was their perceived degree of “darkness” (n=9). Dark stories were described as being violent, morbid, or depressing. An equal number of participants (n=7) disliked readers they perceived to be “uninteresting”. Such students explained that both readers that did not match their own interests, as well as those seemed dull, were particularly disliked. Unfamiliarity was another characteristic that negatively influenced learners’ perception of particular readers. Students explained that a lack of familiarity with particular stories and situations made it more difficult to contextualize and follow some stories.

Learners also disliked graded readers with particular layout or design characteristics. Within this category the most disliked feature (n=11) was a lack of pictures or illustrations. Participants who disliked such books explained that they were harder to engage and follow without pictures related to the story. Receiving the same number responses (n=9) were graded readers which were too easy or too short. Students who disliked this kind of graded reader explained that such books were so underdeveloped, and had such low word counts, that they were perceived to have essentially no real value. A similar number of students (n=8) identified long books as being among those they disliked. Reasons cited for this were the difficulty in staying focused over their entire length and in passing their online quizzes. A further characteristic of books that was evaluated negatively was “tight layout” (n=7). These were described as graded readers with lines that were too close together. Participants explained that pages with a tight layout were hard on their eyes and difficult to read.

Table 6: Open-ended item 3: Attributes of disliked graded readers

</tbody>
</table>
Participants also described a dislike for graded readers of particular genres. The most frequently cited disliked genre was biographies (n=8), which some learners described as not being as well-developed or interesting as fiction. These same reasons were also cited by a number of students who disliked non-fiction (n=6) and historical (n=5) genres. In both cases several learners also described a preference for fiction. Other genres identified as disliked were mystery (n=3) due to the difficulty in following some of the stories, traditional stories such as fables and folk tales (n=3) due to their uninteresting stories, and horror stories (n=3) due to their dark or unsettling content.

**Discussion**

The first objective of this study was to examine learners’ overall perception of graded readers. Data collected from the first open-ended item indicated that learners had an overall positive impression of learning English with graded readers and the online evaluation system. These results are reflective of the earlier findings with smaller samples of Japanese engineering students learning EFL in a similar educational context (Johnson, 2014a, 2014b). As this particular segment of learners has been identified as being “reluctant” in regard to language learning (Nishizawa, Yoshioka, & Fukuda, 2010), this result is encouraging as it provides hope that such positive attitudes towards instructional materials and procedures might result in increased engagement and improvements in learning outcomes (as seen in Bahous, Bacha, & Nabhani 2011; Christophel & Gorham, 1995; Gorham & Christophel, 1992; Meshkat & Hassani, 2012; Williams, Burden, & Al-Baharna, 2001).

The second goal of this paper was to evaluate how the use of graded readers and the online evaluation system influenced learner motivation. The overall positive endorsement of all scales within the GR-IMMS indicated that the graded readers and the online evaluation system appealed cognitively to learners in a manner supporting motivational engagement. High endorsement of items from the satisfaction scales (SAT m=3.36), when viewed with the first open-ended item’s endorsement of achievement/improvement, indicated that achievement motivation needs were satisfied. These findings reflect those of other studies which also found that learners felt that their FL skills improved after taking part in graded reader courses (Bell, 2001; Constantino, 1995; Horst, 2005; Horst, Cobb & Meara, 1998). The high frequency of selectivity as a reason for positively endorsing the course suggests that expectancies were met as learners found that the readers they selected satisfied their short-term goals. These are important results as expectancy and satisfaction of proximal goals has been tied to achievement (Wigfield 1994; Wiggfield & Eccles 1992). Although this type of achievement motivation has been said to be inferior to mastery-oriented motivation (Ames, 1992), for learners without a clear intrinsic interest in the foreign language the extrinsic motivation to read within an achievement framework in this type of class provides an initial impetus for engaging English books. As seen in a number of the open-ended responses, this motivation can give way to a more intrinsic orientation. This sentiment is reflected in the following responses to the first open-ended item, “At first I tried hard to get the word count I needed, but I found I became more and more interested in the books the more I read” (S179).

Another encouraging motivational finding was the high endorsement of the confidence items. This endorsement, combined with students’ strong preference for easy books as described in the open-ended item results, suggests that self-selection of books according to self-perceived ability supported students’ learning confidence. Self-efficacy is a key component for initiating and sustaining learner motivation in that learners who think they will be successful are more likely to initiate and carry through with positive learning behaviors (Pintrich & Schunk, 2002). As self-selected graded readers appear to promote confidence in learners, they should be promoted for use with this segment of learners, particularly considering the low levels of FL learning confidence generally present in Japanese EFL learners (see Johnson
The final objective of this study was to identify which types of graded readers learners liked using. The number of types of graded readers identified as being “liked” was over twice as many as those “disliked”. Within the sample used in this study it was clear that content features that aligned with learners’ skills and interests were perceived to be most preferred. A range of genres, from movies, to fiction, to mystery were also demonstrated to be attractive to learners, as were the physical layout and presentation features of the texts themselves such as illustrations, length, and featured word counts. The range of responses provided, with 34 specific types identified across four thematic areas, speaks to the variability of preferences in learners. This range demonstrates that EFL programs utilizing graded readers need a wide selection of titles in order to meet the varying interests and learning style preferences of learners (Day & Bamford, 1998; Murphy, 1987).

Conclusion

This study demonstrated that graded readers used in conjunction with an online evaluation system represent a positive curricular alternative for Japanese engineering students learning EFL. The positive endorsement of the satisfaction, confidence, relevance, and attention GR-IMMS scales indicated that graders readers combined with online evaluation appealed cognitively to learners in a manner that supported motivational engagement. These findings were supported by the open-ended items with learners expressing satisfaction with the improvement they achieved in the course, greater confidence from using self-selected readers according to perceived proficiency levels, increased perceived relevance derived from the selection of content congruent with personal interests and learning style preferences, and heightened attention due to a combination of factors including the novelty of learning and engaging English in new manner. Despite these positive findings, the limitations of this study need to be acknowledged. The situation-specific nature of evaluating learners’ motivational orientations toward a particular set of instructional materials or a specific course design may limit the generalizability of the results. Despite these reservations, the potential benefits of using graded readers and autonomous online evaluation systems represent a positive curricular alternative for reluctant EFL learners such as Japanese engineering students. It is hoped that through further research the value of these materials and approaches in motivating learners can be further examined.

Appendix 1

**Part 1: GR-IMMS Items and Scales**

**Confidence**
CON1: When I looked at the books, I had the impression that they would be easy.
CON2: The books were more difficult than I would like.
CON3: The more I read, the more confident I became with reading in English.
CON4: I could not understand many of the books I chose.
CON5: Choosing books at my level gave me confidence.
CON6: Reading the books gave me confidence in my overall English ability.
CON7: Passing the quizzes gave me confidence.

**Attention**
ATT1: The books are eye catching.
ATT2: The content of the stories helped hold my attention.
ATT3: The books were so difficult to understand it was hard to keep my attention.
ATT4: The books were dry and unappealing.
ATT5: The leveling of books helped me focus my attention.
ATT6: The content of the books helped stimulate my curiosity.
ATT7: There was not enough variety in the books available.
ATT8: I learned something interesting while reading.
ATT9: The variety of books helped keep my attention.
ATT10: Choosing books that interested me helped focus my attention.

**Relevance**
REL1: The content of the books were relevant to my interests.
REL2: The graded readers are worth reading.
REL3: I could relate the content of the books to things I have seen, done, or thought about in my own life.
REL4: The English content of the books will be useful for me.
REL5: I learned some valuable things reading the books.
REL6: The books were not relevant to my needs.
REL7: The content of the books is valuable.

**Satisfaction**
SAT1: Completing the books gave me a feeling of satisfaction.
SAT2: I enjoyed the books so much I would like to read more in the future.
SAT3: I really enjoyed reading the books.
SAT4: It was a pleasure using the online learning system.
SAT5: It was satisfying watching my word count rise.
SAT6: Passing the quizzes gave me a feeling of satisfaction.

**Part 2: Open-Ended Items**
1. How did you feel about using the graded readers in this class?
2. What types of books did you enjoy reading? Why did you like them?
3. Where there any types of books you did not enjoy reading? Why did you dislike them?
a. **Title:** Photovoice and TPACK: Using documentary photography and storytelling in teacher education

b. **Topic Area:** Teacher Education, Cross-disciplinary areas of Education

c. **Presentation Format:** Poster Session

d. **Sentence description:** This presentation will discuss photovoice, the use of documentary photography and storytelling, as a strategy for developing Technological Pedagogical Content Knowledge (TPACK) in teacher education. The presenters will provide an overview of photovoice and discuss its theoretical underpinnings, including its strengths and weaknesses as a research methodology and teaching strategy. This session will also display photographs and stories from two photovoice studies and discuss how photovoice aligns with TPACK.

Title: L2 reading fluency development: Successes and failures

Topic area: ESL/TESL

Presentation format: Poster session

Presentation description (54 words): This presentation explains and examines a series of longitudinal studies focusing on using timed and extensive reading to help EFL students develop reading fluency. The studies use both quantitative and qualitative data to explore actual and perceived gains. Fluency development is also modeled and the implications for teaching and further research are also discussed.

Abstract (169 words)

This paper provides a discussion of the results of a series of 4 longitudinal studies that utilize linguistic and non-linguistic variables predicted to influence L2 reading fluency to examine the successes and failures of L2 learners to improve their English reading fluency. The studies used online Timed Reading and Extensive Reading with participants from a mid-to-high level public and a mid-level private university in western Japan (N=613). In addition to the reading variables, a range of other variables was measured that includes vocabulary size, word recognition reaction times, working memory and speed of thinking. The relationship between the measured variables is explained using correlation and regression, ANOVA and latent variable growth curve modeling, and provides insight for reading researchers and teachers. Results from a short open-ended survey are also examined to discover student impressions of the required activities. Recommendations are made for further research into the issue, and how the findings could be used for Extensive Reading level placement or to assist decision making about remediation for weaker students.
Improving Online Forums for Pre-Conference Multicultural Collaboration and Communication

Todd Thorpe, Shigehiro Haruki, Andrew Atkins

Introduction

In recent years, the use of Online Asynchronous Discussion (OAD) forums has become an important educational tool to support a wide range of teaching and learning objectives. OAD forums have the potential to facilitate learning beyond the constraints of time and location if they are designed and used properly. Three months prior to a Model United Nations (MUN) conference called JUEMUN, the authors used OAD forums to facilitate pre-conference communication between 177 student chairs, delegates and journalists from 49 different universities. In this paper, the authors will explore past research on the benefits and challenges of using OAD forums for teaching and learning and explain how they were used to facilitate pre-conference communication. The authors will also share the results of an online survey and face-to-face interviews that were used to assess the overall effectiveness of the conference’s OAD forums. Based on these results, the authors will suggest some changes that could be used to improve the OAD forums for future pre-conference communication.

Benefits and Challenges of OAD Forums

OAD forums provide an opportunity for students to be part of a virtual community in which they can perform a common task of learning together by exchanging messages over an extended length of time rather than back and forth simultaneously. Past research on online asynchronous discussion forums exposes many benefits and challenges that educators should be aware of before using them as teaching or online communication tools.

Benefits of OAD Forums

There are a number of benefits to using online asynchronous discussion forums in teaching. As asynchronous forums allow students to participate in online discussions at any time and place, students are not only able to think about their responses before
posting them, but also post comments in any order or on any topic (Murphy, 2001). This extra time and freedom to formulate their thoughts and ideas has the potential to promote higher level learning such as analysis, synthesis, evaluation as well as clear and precise thinking (Garrison, 1993; Bonk & Zhang, 2006; Garrison & Kanuka, 2004). According to Warschauer (1997), the occasional reluctancy to interact in face-to-face communication due to issues such as race, gender, accent or status can be alleviated by using asynchronous forums. The freedom of asynchronous discussions allows for more flexibility in communication (McComb, 1993).

Ruberg, Moore and Taylor indicated that online asynchronous discussions may provide students with new perspectives, a way to imagine another point of view, or a deeper understanding of the material (1996). These claims are also highlighted by other studies that have shown asynchronous discussions and collaboration to increase students’ overall learning (Diaz & Entonado, 2009; Er et al., 2009) and shift the locus of control in favour of the student with less domination by the teacher (Althaus, 1997). Garrison and Kanuka praised this online collaboration and stressed that it is a necessary component to sustaining educational experiences over time (2004). While there are numerous and varied benefits, OAD forums are not without their challenges.

**Challenges of OAD Forums**

While many educators have praised the educational benefits of OAD forums, just as many have identified various challenges. Burg (1994) identified four obstacles when using OAD forums.

1. lack of visual and aural cues
2. working collaboratively
3. deciding why, when and how to contribute
4. feeling out of sync

In a survey in 2000, Tiene found that a majority of the respondents preferred face-to-face interaction and underlined four challenges to using online asynchronous discussion forums.

1. not having a computer at home
2. lack of spontaneity
3. the volume of messages
4. difficulty establishing momentum in the discussion
Other studies have also pointed out some additional challenges of using OAD forums. Hew and Cheung (2003) noted that participants' procrastination to respond to postings is a problem, while Oliver and Shaw highlighted that online “contributions were not highly interactive” among participants in their study (2003, p.56). Another challenge stems from the fact that text-messages are relatively deficient when it comes to conveying certain types of information (Matheson & Zanna, 1989).

There are definitely a number of obstacles and strengths that need to be taken into account when using OAD forums for teaching and learning. Understanding these benefits and challenges can have an enormous impact on their application and overall effectiveness in meeting educational goals. With these benefits and challenges in mind, how can OAD forums be employed to facilitate pre-conference communication between universities students from 49 different universities representing 25 different nationalities?

The JUEMUN and JUEMUN Journalism Conference

To fully understand how OAD forums were used to facilitate pre-conference communication, a firm understanding of the JUEMUN and JUEMUN Journalism conference is essential. Japan University English Model United Nations, commonly referred to as JUEMUN, is an annual faculty-organised Model United Nations (MUN) conference held in the Kansai region of Japan. JUEMUN Journalism is a collaborative multicultural journalism simulation that was incorporated into the JUEMUN conference in 2013. Both JUEMUN and JUEMUN Journalism have slowly grown into Japan’s premier English United Nations and journalism simulations.

JUEMUN

JUEMUN was founded by three Canadians who are teaching at different universities in Japan. Professor Craig Smith and Associate Professors Lori Zenuk-Nishide and Todd Thorpe have combined their MUN experience of over 50 years to offer a unique and innovative learning opportunity for university students around the world. The annual JUEMUN conference is hosted on a rotating basis between Kinki University, Kyoto University of Foreign Studies and Kobe City University of Foreign Studies.
Each JUEMUN agenda is adopted after careful and extensive deliberation and discussion by the founders. These chosen agendas are always issues of great importance to the world that need to be addressed with comprehensive and innovative solutions.

At each JUEMUN conference, participants experience cooperative hands-on learning, allowing them to confront an issue in English from the perspective of their assigned country. Through these experiences, during pre-conference online discussions, and in the conference committee sessions, participants develop an appreciation of differing viewpoints, the frustration of negotiation, the rewards of cooperation, and a broader view of the human side of international relations and diplomacy.

JUEMUN differs from other MUN conferences in that each country delegate is pre-assigned to 1 of 5 committee groups within a meeting room. Each meeting room of approximately 60 students is run by two chairs and two assistant chairs. Each of the 5 committees in a meeting room consists of approximately 8 to 12 students and deals with a topic closely related to the meeting room agenda. Table 1 illustrates each meeting room agenda and the committee groups for the 2014 JUEMUN conference. The number of students in each room and committee are shown in parentheses.

JUEMUN Journalism

For JUEMUN Journalism, participating students take on the roles of video, podcast and written journalists and report on what is happening in their assigned meeting room. Throughout the JUEMUN conference, 9 journalist pairs of one Japanese student and one international student, collaborate, explore, engage and finally create digital media broadcasts in English. These audio, video and written news reports are then uploaded and shared on an interactive news hub called JUEMUN journalism online. This allows conference participants and other website guests to enjoy and comment on all of the journalists’ hard work. An outline of the JUEMUN Journalism process is illustrated below in Figure 1.

JUEMUN has slowly grown in size from 51 to 177 participants since its inaugural conference in 2010. Due to this increase, the authors felt that an online platform to facilitate pre-conference preparation and communication was essential. With the goal of addressing these communication and preparation needs for the 2014 conference, the authors decided to add 5 online forums to the existing JUEMUN website.

**JUEMUN's OAD Forums**

In each of the 5 discussion forums, a number of discussion threads or topics were added by the authors. The sole purpose of developing the first online discussion forum, *General JUEMUN Information*, was to share information about the conference with the participants. Some of the topics under this forum included special meal requests, rules of procedure and documents related to the conference theme. The remaining 4 discussion forums were developed with the intention of fostering communication between delegates in the same meeting rooms and committee groups and journalists within the same news formats. The 5 forum themes and their discussion topics are shown in Table 3.

**Signing up for JUEMUN’s OAD Forums**

To prevent unwanted advertising and ensure overall security in the online forums, the authors asked all of the participants to sign up to become a member using either their Facebook, Twitter, Google, Microsoft or Yahoo account. After signing up, a message requesting membership was sent to the the administrators and shortly after this, a confirmation of acceptance was sent to the new member. As a new member, the participants used the password provided in their invitation letter to access the forums and begin communicating.

**Faculty Advisors Supporting JUEMUN’s OAD Forums**

While there were no specific online assignments or minimum requirements for the number of posts to be made by the forum members, the advisors were asked to foster the
participants’ communication by asking and answering questions and encouraging the members to communicate as much as possible.

**JUEMUN’s OAD Forums Evaluation: Methods and Results**

To evaluate the effectiveness of JUEMUN’s first attempt at utilising Online Asynchronous Discussion Forums, the authors developed and administered an online survey in English and Japanese. Some participants were also interviewed to find out more about their ideas for making the JUEMUN OAD Forums more effective.

**Online Survey: Method and Results**

One week prior to the 2014 JUEMUN conference, the participants were asked to submit a position or press paper from a submission page on the conference website. Before being able to submit their paper, they needed to answer four questions about the JUEMUN OAD forums. The four questions that were asked are listed below.

1. Have you signed up as a member of the JUEMUN online forums?
2. Have you read some of the messages in the forum?
3. How many comments did you make in the forum?
4. What are some of the reasons why you didn’t post more comments in the forums?

125 of the 155 delegates and journalists submitted their paper and participated in the online survey. Of these 125 respondents, 89 were Japanese students and 36 were international students. The results of the survey are illustrated below in Figures 2 to 5.

![Figure #2: No. of respondents who became a member of the JUEMUN online forums](image-url)
Figure #3: No. of respondents who read some messages on the JUEMUN forums

![Bar chart showing the number of respondents who read messages on the JUEMUN forums. The chart includes two bars for Japanese participants and international participants. The number of Japanese participants who read messages is 72, and the number of international participants is 25.]

Japanese Participants | International Participants

How many comments did you make in the JUEMUN Forum?
Interviews: Method and Results

Throughout the JUEMUN conference, the authors conducted 10 interviews to further assess the effectiveness of the JUEMUN OAD forums in hopes of uncovering more ideas to improve the forums for future conferences. The interviews were recorded using an iPhone and analysed a few weeks after the conference. The authors have highlighted some of the comments which have the potential to influence the future development of JUEMUN OAD forums.

Country Delegate (Japanese)

I know I should have posted some comments, but I wasn’t confident in my knowledge of the agenda or my English skills.

Country Delegate (International)

The process of becoming a member wasn’t clear and I didn’t know how to use the forum. I think having everything on Facebook would have been a lot easier because I know how to use Facebook.
Journalist (Japanese)
I was too busy to make any comments and I didn’t know what to comment about. If we had assignments to do with deadlines with examples, it would be easier for students who are doing it for the first time.

Chair (Japanese)
When I looked at the forum, most of the comments were simple introductions and mainly comments from the Advisors. Maybe the Chairs could be forum leaders and encourage the other students to comment more. This might make the forums more active.

Delegate (International)
I didn’t see the point of commenting as I thought I could do the preparation on my own. A lot of us were communicating on Facebook.

Delegate (Japanese)
If there were readings or videos related to the agenda with discussion questions, I probably would have posted some comments. It was a my first time to participate, so I was waiting for others to post, but not many did.

Interpreting the Results and Moving Forward
As this was the first time for the authors to use OAD forums to facilitate pre-conference communication, there are many strategies and changes that could be implemented to increase their effectiveness for future JUEMUN Conferences.

While the membership sign up and password requirements curbed unwanted advertising within the forums, the tight security also had its limitations on forum contributions as some students never signed up and many students found it inconvenient to sign in each time to make a comment. One alternative that was brought up was to use multiple Facebook pages instead of the five JUEMUN forums. Most of the students expressed the convenience of using Facebook and stressed that their familiarity with it would enhance the frequency of their posts.
Having the advisors as forum moderators proved to be a good idea, but a slightly different approach potentially could have yielded more positive results. Having the advisors post interesting and relevant topics and assign online tasks or activities were expressed as positive additions by many participants. Participants also mentioned that these activities could be facilitated by advisors, but also giving the meeting Chairs and head journalists more of a leadership role in the forums might spark more interest among fellow participants and possibly increase the frequency of comments.

Unfortunately, the 2014 JUEMUN OAD forums lacked direction and clear objectives. This made it very difficult for the student members and advisors to know what and when they should post. Many students felt that having clearer posting guidelines such as minimum posting requirements with deadlines would increase the activity and learning potential. One participant also expressed the need for a video outlining the process of becoming a forum member and posting comments.

**Conclusion**

While OAD forums are used as an educational tool to nurture teaching and learning objectives, they are definitely not without their challenges. Based on the research results, it is clear that the JUEMUN OAD forums have a long way to go in order to reach their goal of being an effective online facilitator of pre-conference communication and preparation. The authors aim to implement some changes to the existing forums to improve the effectiveness of pre-conference communication for future JUEMUN conferences.

Title: A glimpse at the propositional logic reasoning of prospective teachers.

Topic Area: Mathematics Education

Presentation Format: Paper Session

Description: This session describes work-in-progress research involving the reasoning of prospective teachers when faced with a question involving propositional logic. This session will present a question the prospective teachers were asked to solve and provide quantitative data regarding their solutions and qualitative data relative to the reasoning behind their solutions.

Authors:

Travis A. Olson

melfried@hawaii.edu

Abstract:

This paper describes the responses of prospective teachers related to a question involving propositional logic. Participants were given a set of four cards placed face up. They were told each card contained either a circle or star on one side, and either a triangle or square on the other side. Participants were asked to determine which card(s) from a selection of four must be turned over to verify the statement “Every card with a star on it has a triangle on it.” Data from the choices made by the prospective teachers will be provided along with examples of the reasoning used to justify the choices made. The data will be used to discuss the how the reasoning of the prospective teachers meshes with Standard for Mathematics Practice 2, Reason Abstractly and Quantitatively (National Governors Association Center for Best Practices and Council of Chief State School Officers [NGA Center and CCSSO] 2010), that states mathematically proficient students “…bring two complementary abilities to bear on problems involving quantitative relationships: the ability to decontextualize—to abstract a given situation and represent it symbolically and manipulate the representing symbols as if they have a life of their own, without necessarily attending to their referents—and the ability to contextualize, to pause as needed during the manipulation process in order to probe into the referents for the symbols involved.” (p. 6) From the mathematics they studied previously the prospective
teachers had the background to examine the question and create an abstract symbolic representation to use to identify the correct cards.

Abstract
This paper describes an initial look at the reasoning of prospective and inservice secondary mathematics teachers on a question involving a statement structurally similar to a conditional statement. This research deals specifically with participants who should have had the necessary course preparation in mathematics at the collegiate level to enable them to successfully answer the question. The importance of this research is related to content knowledge for teaching mathematics, psychological research on deductive reasoning, and using standards for mathematical practice being suggested for students in Grades K – 12. In general, participants were successfully able to see one line of reasoning related to the question, but over 50% did not successfully use a second line of reasoning necessary to obtain a full solution to the question.
Introduction and Related Research

This paper describes how prospective and inservice secondary mathematics teachers responded to a version of a question that is “the most intensively researched single-problem in the history of the psychology of reasoning” (Evans, Newstead, & Byrne, 1993, p.99). Participants were given a set of four cards placed face up. They were told each card contained either a circle or star on one side, and either a triangle or square on the other side. Participants were asked to determine which card(s) from the selection of four must be turned over to verify the statement “Every card with a star on it has a triangle on it.” How prospective and inservice mathematics teachers respond to this question is of interest to mathematics educators because of the connection to mathematical content knowledge, ability to reason about conditional statements, and the connection that can be made to three Standards for Mathematical Practice in the Common Core Standards of Mathematics (National Governors Association Center for Best Practices and Council of Chief State School Officers [NGA Center and CCSSO] 2010).

Desired content preparation for secondary mathematics teachers is best described in The Mathematical Education of Teachers II (MET II) (Conference Board of the Mathematical Sciences, 2012), with detailed descriptions of coursework/experiences in which prospective mathematics teachers should engage. MET II indicates, “A primary goal of a mathematics major program is the development of mathematical reasoning skills.” (p. 55), and one would envision this would mean the type of reasoning being addressed in the question we investigated.

Suggesting how to accomplish this can be seen in discussions of reasoning and proof within the document.

*In order to be able to recognize, foster, and correct their students’ efforts at mathematical reasoning and proof, prospective high school teachers should analyze and construct proofs themselves, from simple derivations to proofs of major theorems. Also, they need to see how reasoning and proof occur in high school mathematics outside of*
their traditional home in axiomatic Euclidean geometry. Prospective teachers can gain experience with reasoning and proof in a number of different courses, including a dedicated introduction to proofs course for mathematics majors, Linear Algebra, Abstract Algebra, Geometry, or a course on high school mathematics from an advanced standpoint. (p. 58 – 59)

The psychological background in which this question can be situated is related to several lines of research and is often discussed within the context of children’s ability to handle propositional logic (e.g. Ennis, 1975). In the discussion of what children can do, the context and structure of the question is often considered important. Citing numerous studies, Ennis writes, “What is it that children cannot do that adolescents can do? Both have the ability to reason in accord with at least some of the principles of propositional logic, and both have considerable trouble with logical fallacies.” (p. 24)

While much work related to this question and line of reasoning has not specifically dealt with mathematics, Stylianides & Stylianides (2008) discussed connections to mathematics education in the context of proof and deductive reasoning. They also address how prior work and discussion related to the question can be situated so as to address proof in school mathematics. The question we explored is attributed to Wason (1966) and is considered a classic with respect to the psychology of deductive reasoning. Participants are given some information and then asked how to verify the statement every card with a star on it also has a triangle on it. This statement can be considered an implication P --> Q, where P corresponds to If a card has a star on it and Q corresponds to then it has a triangle on it. Hence, being able to reason through statements like these clearly fits in the realm of learning mathematical ideas in college and is usually thoroughly discussed and use in any upper division mathematics course where justification and proof are required.

Regarding the connection to the Standards for Mathematical Practice (SMP), we identified
three of the standards related to this research investigation. While the SMP are for K – 12 grade students, the results of this research give some indication how prospective and inservice secondary mathematics teachers are able to engage in these practices. Specifically this question gave them the opportunity to engage in SMP 2: Reason abstractly and quantitatively, SMP 3: Construct viable arguments and critique the reasoning of others, and SMP 7: Look for and make use of structure.

**Methods and Findings**

The following question was given to a group of prospective secondary mathematics teachers and a group of inservice secondary mathematics teachers. The prospective secondary mathematics teachers (n = 10) were enrolled in an Abstract Algebra class at an institution of higher education in midwestern United States. This upper division class was required for a degree in mathematics or mathematics education at this institution. The assessment was given to them in the last two weeks of the semester. The inservice secondary (grades 6 – 12) mathematics teachers (n = 18) were enrolled at an institution of higher education in western United States. Hence, each participant had completed a significant amount of coursework in mathematics prior to completing the question.

Each participant was given the question in figure 1. They were to choose which Card(s) to turn over and explain their reasoning.

While data were collected separately for each group, for purposes of this paper, the data are reported as one group (n = 28). We first looked at how many of the responses were answered correctly, and then we looked at the explanations to examine how many correct responses were also explained with correct reasoning. This information is given in Table 1. It is seen that while 12 responses (42.9%) answered correctly, only 10 (35.7%) provided justifiable reasoning.
Answer the following question and explain your reasoning:

Each card has either a circle or a star on one side and either a triangle or a square on the other side. In order to verify the statement, “every card with a star on it also has a triangle on it”, which numbered card(s) must be turned over?

Figure 1. Question given to students

Table 1

<table>
<thead>
<tr>
<th>Correct Answer (Cards 2 and 3)</th>
<th>Correct Answer and Correct Reasoning</th>
</tr>
</thead>
<tbody>
<tr>
<td>12 (42.9%)</td>
<td>10 (35.7%)</td>
</tr>
</tbody>
</table>

It could be expected that those students enrolled in upper division mathematics courses or inservice courses for secondary mathematics teachers would be successfully able to answer this question and provide appropriate justification, but the data indicate such was not the case. The data in Table 2 show the number of times each card was chosen. Almost everyone selected Card 3, which does need to be examined, and slightly more than one-half selected Card 2, which also does need to be examined. However, as indicated from Table 1, these two selections were not always the only two made as 42.9% chose exactly these two correct solutions. These data show that Card 4 was incorrectly chosen 32.9% of the time.
Table 2

Number (and percent) of times a card was chosen, n = 28

<table>
<thead>
<tr>
<th></th>
<th>Card 1</th>
<th>Card 2</th>
<th>Card 3</th>
<th>Card 4</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1 (3.6%)</td>
<td>16 (57.1%)</td>
<td>26 (92.9%)</td>
<td>9 (32.9%)</td>
</tr>
</tbody>
</table>

In trying to understand the reasoning used by the participants, we examined the explanations provided as well. Samples of correct and incorrect reasoning are provided. Among the responses with a correct answer and explanation is the following thorough explanation that not only indicates why Cards 2 and 3 must be selected, but also why Cards 1 and 4 do not. This type of reasoning was not typical, but clearly demonstrates a level of desirable reasoning.

*Card 1 does not need to be flipped over because we already know it does not have a star as the card either has a circle or a star on one side. Card 2 needs to be flipped to determine if the other side is a star or circle. If it is a star then we know the statement is false. If it is a circle then you need to also flip card 3. Card 3 needs to be flipped to determine if it is a triangle on the other side. Card 4 does not need to be flipped because it already has a triangle and therefore if the other side has a star it further verifies. If it has a circle then it just is a card with a triangle and circle.*

Some participants thought about the process linearly in that if you tried a certain card and the result held, you would go to the second card. The following correct response provides a rationale that starts with Card 3 and examines scenarios that might happen to eventually show the statement true or false.

*If you turn card 3 and it has a triangle on it then you continue. If not it is false and you stop. If you turn over card 2 and it has a star it is false, if not the statement is true. It says every card with a star has a triangle, not every card with a triangle has a star.*

Among the answers with at least one of Card 2 and Card 3 selected, we find the following similar reasoning, but Card 4 was often included. In this instance, the selection was also viewed linearly, but the inclusion of Card 4 shows some confusion in the reasoning.

*1. Flip card three. If there is a triangle great, we go on, if it doesn't (is a square) then we've disproved the statement. 2. Flip card 4. If there is a circle, we've disproved the statement. If we get a star move on. 3. Flip card 2. If there is a star, then we've disproved the statement. If there is a circle, then given success in steps 1 & 2, the statement is true!*
The following is an example of a response is not only incorrect, but the justification seems to indicate that perhaps the participant was confused about the task.

*Card 4 must be turned over to verify the given statement which proves card 3 has a triangle which means 1 & 2 don't have a triangle or a star on them.*

To further examine the selections made, we looked at all 16 possible choices that could be made regarding choices made when turning over the cards. The number of times each choice was made was recorded and these data are shown in Table 3.

**Table 3**

*Number (and percent) of times a choice was made, n = 28.*

</table>

While there were 26 participants who choose Card 3, we see from Table 3 that 14 participants who selected Card 3 did not also only chose Card 2. Of these 14, five selected Card
3 only, five selected Cards 3 and 4, five selected Cards 2, 3, and 4, and one selected Cards 1, 2, and 3. Card 2 was the second most frequent choice and of the 16 participants who selected Card 2, all always also correctly selected Card 3. However, in four cases they also incorrectly selected either Card 1 or 4.

**Discussion**

The responses to the participants indicates that most of them recognized that in a P --> Q situation, if condition P is met, then one must check if condition Q is met (Card 3). However, less than half of the participants recognized that because P --> Q is logically equivalent to ~Q --> ~P, and ~Q is met (Card 2), then Card 2 would also have to be turned over.

This has implications for precollege preparation in mathematics for prospective secondary mathematics teachers as well as inservice professional development for secondary teachers, because the participants had successfully completed coursework where reasoning strategies required to answer the question have been studied. Yet, participants were not able to see how to use these ideas in a novel situation that is similar to types of questions secondary students are given to explore, both in geometry and in algebra. While engaging in college coursework a prospective secondary mathematics teacher or an inservice mathematics teacher would benefit by examining topics in school mathematics that mimic situations like the question we posed and reasoning through them to see how their college preparation is indeed preparation for teaching high school mathematics. In doing so, some of the vision of MET II, “Attending to the needs of prospective teachers by focusing on reasoning and proof across the spectrum of undergraduate mathematics courses that they take, helps them to make sense of mathematics—and makes it easier to understand, easier to teach, and intellectually satisfying for all course-takers. Thus,
attending to the needs of future teachers in this way benefits all undergraduates.” (2012, p xi - xii), might be accomplished.

Abstract

The movement to thrust forward Japanese education into the age of internationalization came to realization in 1982 with the formation of the Nakasone Government. The ambitious 1983 target of bringing 100,000 foreign students to Japan was finally achieved in 2003 under Prime Minister Nakasone’s original “International Student 100,000 Plan”. Since that time, The Japanese Ministry of Education, Culture, Sports, Science and Technology (MEXT) has focused its effort on internationalizing its universities by developing an educational system called the Global 30 Project (G30), a plan which is meant to attract 300,000 foreign students by 2020. The G30 Project and similar policies aim to transform Japan into an international education hub. Although these policies seem theoretically sound and viable, the intended outcome of internationalizing Japanese universities has fallen short of its goal. The policies that have shaped the internationalization of Japanese universities are based on increasing the number of foreign students on campuses to internationalize the institutions’, culture and curriculum. Data presented in this paper is based on surveys involving 96 respondents conducted at large prestigious universities in Japan. This study focuses on the reason foreign students select Japan as a destination for higher education as well as issues that affect international students on a daily basis. Analyses from the surveys indicate differences in how international students feel towards their respective universities in terms of support services and intercultural communication opportunities. Findings in this report will be used to identify problems and provide key recommendations on how to improve Japan’s attempt at internationalizing its higher education.

Introduction

According to the Japan Association of Student Services (JASSO) as of 2013, there were 135,519 foreign students enrolled in Japanese private, public and national universities (JASSO, 2013). At this rate of foreign student enrollment it would appear that the goal of 300,000 foreign students by 2020, set by MEXT is not attainable goal. The origin and original policies of the G30 Project were established in 2001 with the intentions of promoting 30 prestigious universities (Yonezawa, 2010). These innovative policies included a 15billion Yen budget to expand 30 institutions that would be recognized as the ‘internationalized core’. The core or key component of this venture of creating an internationalized core was to recruit international students to Japan.

Features of the G30 Project

The premise of the G30 project is to internationalize higher education in Japan. In 2009, 13 universities were selected to be part of the G30 project offering degree programs in a wide range of disciplines ranging from life science, agriculture, environmental studies, information and communication technology and social sciences to name a few. All courses are taught entirely in English; however, G30 students also take Japanese language classes as part of the curriculum. The G30 project consists of national and private universities; each university has autonomy over the organization, management, acceptance, curriculum and other aspects related to the education of international students.
Importance of Research

One key aspect of attaining the goal of attracting 300,000 international students by 2020 is to capitalize on the current international student population by educating the participants as effectively as possible. In doing so, G30 universities should be able to maintain and advance current reputational trends related to international education in Japan.

The data analyzed in this paper on international students’ attitudes and perceptions, highlights positive aspects and addresses negative issues that should be resolved. A well-implemented and effective program will drive future recruiting efforts needed to attain goal the attracting 300,000 students. Increases in international student mobility have furthered the optimism of the G30 project which aims to transform Japan into an international education hub. Although the policies of the G30 project and programs offered by various universities seem theoretically sound and viable, the intended outcome of internationalizing Japanese universities sometimes falls short of the desired target. The main focus of the policies to internationalize Japanese universities was concentrated in increasing the number of foreign students on campuses creating a culture and curriculum sought by international students.

This study will target the specific issues that need to be analyzed in order to make contributions to improve the Global 30 Program and to advance its intended purpose. It aims to provide a clear understanding of the complicated process of internationalizing Japanese Universities so that universities, administrators and the Ministry of Education can develop more effective methods and strategies for educating and helping to assimilate the foreign student population into Japanese society. It is imperative that Japanese Universities not only effectively educate international students but also develop a welcoming environment to encourage the graduates to stay in Japan upon completion of their studies and become productive members of the Japanese economy. This is one of the desirable and important goals of the Global 30 Program.

This study also attempts to provide additional scholarly knowledge on the importance of assimilating international students into Japan; it examines the current state of intercultural communication between foreign and domestic students at the thirteen Global 30 universities.

What Recent Research Suggests

According to Jane Knight’s definition of university internationalization (Knight, 2011) “internationalization of higher education is the process of integrating an international, intercultural, and global dimension into the purpose, functions (teaching, research, and service), and delivery of higher education at the institutional and national levels.” In 1984, Cummings conducted pioneering research into the complex patterns that influenced the immigration and migration of secondary education. In 1992, McMahon published informative research that pinpointed several key factors that impacted the decision of an international student to seek an education overseas. The “push” and “pull” model (McMahon, 1992) helped direct future research by Mazzarol and Soutar (2002) where three distinct stages were labeled in
the pursuit of higher education in a foreign country. First, the preliminary decision to study internationally is made. Inevitably, the decision to not study domestically is ultimately affected by a “push” factor previously published by McMahon (1992). The second stage of the decision process is choosing a host country, which is affected by the following factors: (1) awareness of host country, (2) recommendations from family and friends, (3) issues related to finance, (4) development in the host country, (5) close geographic proximity to the home country, and (6) Recommendations from family and/or friends who previously lived in the host country (Mazzarol et al., 1997, cited in Mazzarol and Soutar, 2002). The third and final stage is when the student chooses which university to attend.

In 1985, the Iwao study (cited in Chandler, 1989) carried out in Japan to classify key reasons why a foreign student chose to study in Japan; it identified an interest in Japanese language and culture as major factors behind the decision to study in Japan. Another early study by Hicks and Amifuji (1987) showed academics were the most important factors where students gained the most satisfaction out of improving their Japanese language abilities, obtaining knowledge that would benefit their future, and the potential to join work-study programs at a Japanese company.

Research Question

What aspects of higher education of international students in the G30 Program may be expanded, modified, or improved to enhance Japan’s international competitive position in attracting students worldwide?

Methodology

Data

The following data were collected via online survey company, SurveyGizmo, from two private and two national Global 30 universities in Japan. Data were collected from May 16th, 2014-July 31st, 2014. There were 96 total respondents with a breakdown of 52 Males (54.2%) and 44 females (45.8%). The Age range of the respondents was from 18-24 years old. Of the 96 respondents, 36% were 1st year students; 29% 2nd year students; 20% 3rd year students; and 15% 4th year students. There were no graduate students who took part in this survey.

As the number of international students has increased from 2.1 million students in 2002 to 3.4 million students in 2009, and is expected to increase to nearly 7 million by 2020, global student mobility is on the rise UNESCO Institute of Statistics (UIS). Increased competition in the form of the opening of new markets signifies the diversity of choices international students have in the selection process of deciding where to study. The factors influencing the decision process range from cost, distance to home country, competition, quality of education and issues related to obtaining a student visa to name a few. In order for Japanese universities, specifically G30 universities, to attract an increasing amount of quality international students, universities need to classify themselves in order to boost enrollment.

According to a study by Daily, et al (2010), in order to attract the most desirable students, the most important factors for international students are post-graduate employment, financial aid, reputation of the institution and accessibility of information. As the G30 program attempts to increase the number of international students in Japan and reach the goal of 300,000 students by 2020, it is imperative to understand the reasons why existing international students originally chose to study in Japan.

In Table 1, the first survey item to be explored, “my primary reasons for choosing to study at my university are related to the following”. The instrument used to collect data on this survey item was a Chi-Square test. The data represented in Table 1 clearly shows that the location of the national and private universities was of a moderate importance to the 96 respondents. 37.5% listed this quality as “important”. Conversely, respondents did select the “specific course of study offered (Major)” and “positive reputation connected to my university” as “Important” or 67.7% and 62.5%
respectively. These factors directly relate to a previous study by Mazzarol and Soutar (2002) where specific factors were characterized as having an impact on Australian educational institution for international and domestic students. The six variables identified in this study “were the quality and reputation of the institution, the recognition of the institution’s qualifications in their own country, the international strategic alliances the institutions had, the quality of the institution’s staff, its alumni base and its existing international student population” (Mazzarol and Soutar, 2002:87).

The second survey item identified reasons why international students decided to choose Japan as their country of choice. “My primary reason for choosing to study in Japan are related the following”, This Chi-Square Test item listed eight items that respondents ranked from “not important”, “somewhat important”, and “important”. Of the 96 respondents, 81.3% stated, “not being accepted to my first choice country”, as “not important”. This is significant in that it shows that for the vast majority of the students who took part in this survey indicated Japan was their primary selection for choosing a host country. This data corresponds to (Mazzarol et al., 1997) recognition of factors found to influence student selection of a host country. They acknowledged that the “knowledge and awareness” of the host country in the student’s home country had a direct influence on the availability of information related to the host country as a possible destination for overseas study. Also, part of this factor was the destination’s reputation for quality (Mazzarol et al., 1997). This theory also supports the data from Table 1 where 62.5% of respondents listed “positive reputation connected to my university” as an important factor when selecting which university to attend.

Another key factor in choosing to study in Japan is the “availability of financial aid and/or scholarships”, where 56.3% of respondents chose this variable as “important”. This factor is related to cost, another key factor identified by (Mazzarol et al., 1997). In addition, specific courses offered throughout the G30 universities seem to be somewhat appealing to international students. 52.1% selected “opportunity to pursue a career in my field of interest” as “important”.

As outlined by MEXT in the 5-point framework for establishing measures to successfully implement the “300,0000 International Student Plan”, the underlining reasons behind the G30 program are to internationalize higher education in Japan or “promote the globalization of universities” (MEXT, 2009). The thirteen universities chosen, as G30 institutions were to “increase courses taught in English. For Japanese universities to attract quality students, “raising the quality of educational and research in universities has become the most important factor in attracting high-caliber foreign students” (Kitayama, 2003, p. 72). As the Japanese language is of little use outside of Japan, the most effective approach to attracting foreign students was to offer full-degree programs in English. This was a means of attracting high-achieving international students “who otherwise would not have considered studying in Japan (Tsuneyoshi, 2005, p.??) The data represented in Table 2 clearly shows the importance of offering English degree programs. 65.6% of respondents reported that the “ability to study in English while living in Japan” was a major pull factor in decided to study in Japan. Only 6.3% of respondents list this reason as “not important”. English, as pull factor, and as the global language, is essential in attracting more international students, increasing the diversity on campus, and to international the domestic students (de Wit, 2005; Wachter, 2005).
Conclusion

The purpose of the research paper has been to analyze the G30 Project. Japanese university internationalization policies have evolved in order to attract more international students. However, it is still too early to declare if Japan’s recent policies of attracting more foreign students have been successful. In order for Japan to capitalize on the achievements made in the G30 program, recruitment efforts need to be expanded in Asia and throughout the world. Universities in the G30 program aiming to increase the amount of foreign students to 300,000 by 2020, need to realize the strengths of the program in order to market them more successfully. This study indicated the most important factors students consider in selecting a host country are specific majors offered, the excellent reputation of the select universities and the availability of obtaining a university degree in specific course content in English. Referring to Mazaarol and Soutar (2002) and the “push” and “pull” factors that greatly affect the movement of international students across global borders, Japan universities and the administrators who dictate policy can work toward improving already existing positive “pull” factors while working toward enhancing further “pull” factors to attract more high-quality international students to Japan.

Investigating Difficulties of Learning Computer Programming in Saudi Arabia

Ali M. Alakeel
Department of Computer Science
University of Tabuk
Tabuk, Saudi Arabia
e-mail: alakeel@ut.edu.sa

Abstract— Learning computer programming is one of the main requirements of many educational study plans in higher education. Research has shown that many students face difficulties acquiring reasonable programming skills during their first year of college. In Saudi Arabia, there are twenty-three state-owned universities scattered around the country that provide free college education for Saudi students. Through a quick glance at the website of these universities, we found out that almost all of them offer the same course description and requirements for the computer-programming course. The poor performance of students in these programming courses, however, is always a hot topic during educational gathering held on the country, where it is always mentioned that students’ performances differ from a university to another and between different regions of the country. The main objective of this research is to investigate the reasons behind the major discrepancies in the performance students in computer programming course in three main regions of Saudi Arabia: East, West and North. For the purpose of this research, we will start by designing a questionnaire to be filled by a random sample students from each region determined for this study. The questions on this questionnaire are related to the socio-economic indices, learning environments indices, and the quality of teaching offered index. The results of the filled questionnaires will be analyzed and the results will reported in this paper.

Keywords—computer programming; learning difficulties; socio-economic indices

I. INTRODUCTION

Learning computer programming is one of the main requirements of many educational study plans in higher education [1]. Research has shown that many students face difficulties acquiring reasonable programming skills during their first year of college [2]-[4], and that learning computer programming is very complicated for many students at the first year of college [5].

Computer programming is difficult because students struggle to capture the required abstract concepts that are necessary to a program construction. The main source of difficulty does not appear to be the syntax or understanding of concepts but rather basic program’s planning [6]. Research shows that introductory programming courses have a relatively high fail rate. For example, Hagan in [7] states that programming was considered to be the most difficult and least interesting subject by most first-year students in all computing courses. Additionally, many institutes report dropout rates of 20-40 percent [8]-[14]. Because of the importance of computer programming and the difficulties faced by the college students, this topic has been investigated by many authors, e.g., [15]-[27].

In Saudi Arabia, there are twenty-three state-owned universities scattered around the country that provide free college education for Saudi students. Through a quick glance at the website of these universities, we found out that almost all of them offer the same course description and requirements for the computer-programming course. The poor performance of students in these programming courses, however, is always a hot topic during educational gathering held on the country, where it is always mentioned that students’ performances differ from a university to another and between different regions of the country. The main objective of this research is to investigate the reasons behind the major discrepancies in the performance students in computer programming course in three main regions of Saudi Arabia: East, West and North. For the purpose of this research, we will start by designing a questionnaire to be filled by a random sample students from each region determined for this study. The questions on this questionnaire are related to the socio-economic indices, learning environments indices, and the quality of teaching offered index. The results of the filled questionnaires will be analyzed and the results will reported in this paper.

The rest of this paper is organized as follows. In Section II, we provide a background and our motivation for the research. Section III discusses the survey used in this study. The result of the survey is presented and analyzed in Section IV. Our conclusions and future work is discussed in Section VI. Appendix I shows the survey used for the purpose of this research.

II. BACKGROUND AND MOTIVATION

Saudi Arabia is an oil rich third world country which is located in the southwest corner of Asia [24, 25]. According to 2010 statistics, the population of the country is approximately 27 millions [24]. Out of this twenty seven millions approximately 19 millions are Saudis and the rest are foreign workers. The area of Saudi Arabia is approximately 2, 150, 000 square kilometers. The country is divided into five main regions: Eastern Region (ER), Western Region (WR), Central Region (CR), Northern Region (NR), and Southern Region (SR). The capital of Saudi Arabia, Riyadh, is located in the central region and the
In this survey, shown in Appendix I, there are a total of 30 questions which are distributed among different socio-economic and learning environments indices that we chose to measure in this study. The main indices of the survey are shown in Table I.

IV. ANALYSIS OF SURVEY RESULTS

This section presents the survey results obtained after analyzing all of the 90 copies of the survey which were filled properly. For our analysis, we have used the SPSS statistical package, and employed descriptive analyses tools to obtain the following three main indicators: (1) Frequencies and Percentages, (2) Mean Values, and (3) Standard Deviations. Form the results of this survey, shown in Table II, we can deduce the following factors that might impact the learning of computer programming.

Some factors that may have positive impact on the ability of students to learn computer programming are:
1) The desire of students to use computers in the first place.
2) The ability of parents to use computers.
3) The importance of having a computer at the house for doing homework.
4) The importance of penalizing students for not doing homework.
5) Giving enough homework to cover all the topics of the course.
6) The importance of providing students with his own space to study at the house.
7) Instructor’s ability to make the lecture more interesting and interactive.
8) The ability of instructors to solve working examples with students during lectures.
9) The importance of providing students with assistance during lab hours by their lab’s instructor.
10) Giving enough homework to cover all the topics of the course.
11) The importance of having a computer at the house for doing homework.
12) The level of education of the father.
13) The importance of penalizing students for not doing their homework.

Some factors that may have negative impact on the ability of students to learn computer programming are:
1) Not spending enough lab hours by students to practice and do their homework.
2) Instructor’s dullness during lectures and inability to draw student’s attention during lectures.
3) Living with friends may distract students from doing homework.

The inability of both parents to know how to use computers.
5) Not having a computer in the house to help in doing homework and practice more.
6) The lack of knowledge of parents about computer programming

Some factors that have no or very little impact on the ability of students to learn computer programming are:
1) The monthly income of the father.
2) Whether the parents are divorced or not.
3) Whether the mother is employed or not.
4) The age of the student.

V. CONCLUSIONS AND FUTURE WORK

In this paper, we presented the results of a study that have been conducted to investigate some factors that may impact learning of computer programming in Saudi Arabia. For the purpose of this research, a survey was designed and the result of this survey was presented and analyzed. In this research, the survey concentrated only on three regions of the country. For our future work, we intend to perform more surveys in different regions of the country and to compare their results with results obtained by this study.

6. Abstract.

An important learning objective for a final year University course called "Living with Climate Change" was to engender critical analysis skills in the students around the issues of media representation of the science of climate change. To facilitate this, students were required to curate an eportfolio where they accumulated bookmarks using Livebinder and importantly add short descriptions and analyses of their content. They have to think critically about each site and articulate how the site has represented the science. As they look for and accumulate bookmarks, they develop gain an appreciation of good and bad sites, sites that misrepresent the issues or mislead the reader, sites that are clear or confusing and sites that are biased or balanced. The activity encourages critical analysis within a self-directed, self-motivated learning experience and encourages students to apply their subject-specific knowledge. It also encourages them to curate and evaluate the flood of information that is available online. It is also part of the coursework assessment. The students send the lecturer a link to their individual eportfolio via Blackboard. The lecturer then uses a set of pre-agreed criteria to assess the eportfolio online via Blackboard and to provide feedback. In a survey 79% of students found the eportfolio Livebinder exercise ‘useful’ and ‘engaging’ and 83% considered it an appropriate mode of assessment.

Career Planning Integration with Language Arts, Social Studies, Art, and Health and Life Skills at the Grade 1 & 2 Level in New Zealand

Abstract

With the use of both quantitative and qualitative data, this article presents on the effectiveness of having students in a grade 1/2 split class participate in a career planning unit consisting of various learning activities. This unit integrated not only some of the Alberta Education Curriculum outcomes from: Language Arts, Social Studies, Art, and Health and Life Skills, but also some of the outcomes of the New Zealand curriculum for Reading, Writing, Listening, Viewing, Personal Health and Physical Development. The presented career planning unit is outlined with clear explanations of the activities in which the students participated. Resources and templates that were used for evaluation purposes are also included. This career planning unit was delivered to a grade 1/2 split class in an urban area in New Zealand, consisting of 27 students from very diverse cultural backgrounds. Objectives of the unit were met with 85% of the students noting that this unit made them excited about what they could do with their life, 73% reporting that this unit helped them to learn more about themselves and increased their interest in learning more about different careers and 58% indicating that they learned a lot about careers.
This career planning unit was established to be successful at a grade 1/2 level by allowing students to engage in activities that developed student awareness of self, by discovering their unique interests, values, beliefs and skills. Further research in the area of elementary career/life interventions should be conducted to contribute to the knowledge and research in this field.

**Introduction**

Career education is often geared towards students in middle school and high school, as this is the time when many students usually begin to think about and prepare for their future. Career education can and should be implemented much earlier on in a child’s education than what typically occurs. If students start thinking about their interests, values, beliefs and skills earlier in life it is easier for them to make informed decisions about potential career choices. Informed career choices should be based on what is important and meaningful to a person. If students are taught to recognize what is important and meaningful to them as individuals, they will be equipped to make choices that reflect their beliefs and values throughout their lives. As a result, these students will be happier and enjoy the work they do and the lives that they live.

The world is rapidly changing and children must prepare for a world full of unknown possibilities. Teachers often refer to the students they teach as 21st century learners, and discuss with students what it means to be growing up in a world that is constantly changing. Incorporating career education within the regular curriculum can help prepare students for the
flexibility of the world in which they will grow up. Magnuson and Starr (2000) restated this point, that life is full of unexpected twists, that demand skilful planning and decision making abilities. The skill of being able to make appropriate decisions is not limited to adulthood, but is one that must be taught throughout childhood as the acquisition and application of the sub-skills necessary to make informed life/career decisions is developmental (Magnuson and Starr, 2000). One thing teachers can do is to encourage students to think about their goals, ambitions, dreams and career possibilities from the time they begin their school careers. Thus, enhancing the student’s self-awareness and creating the opportunity to explore what is personally meaningful to them as individuals.

This career unit plan encouraged grade 1 & 2 students to think about their personal interests through a variety of activities. Through these activities students discovered who they were as individuals, their likes and dislikes. Students recorded what they learned about themselves in a personal book. There is no doubt that likes and dislikes will change throughout out their lives, but often what is meaningful to them will remain consistent. Creating meaning for students also creates an intrinsic motivation for students to succeed. Palladino-Schultheiss (2005) emphasized the importance of early career interventions (activities) within the elementary school setting, stating that broadening educational goals beyond traditional subjects in an environment that nurtures and develops intrinsic motivation will promote independent self-determined behaviours. As students age and make decisions about what to do with their lives, and they have been taught to utilize what is meaningful to them while making those decisions, they will be motivated to be successful and to achieve their goals. This paper will outline one way that teachers may incorporate the aforementioned skills and behaviours into a career planning unit for early elementary students. This particular career planning unit integrates career/life planning
activities into the curriculum of a grade 1/2 split class.

**Context of Teaching Environment**

**School Environment**

The beautiful country of New Zealand is located in the south-western Pacific Ocean and is divided into two islands: North and South. The school in which this career planning unit was implemented was located in an urban center with a population of about 1.25 million people. The city itself is separated into different regions due to its size. This particular school was an elementary school that consisted of classes from Kindergarten to grade seven.

**Classroom Environment**

The classroom in which the career planning unit was implemented was a grade 1/2 split class. Within this school there were three grade 1 classes and two grade 2 classes. Since this particular class was mostly grade 2 students, they would often work with the other grade 2 classes. In the New Zealand education system much of the teaching is differentiated instruction. For subjects like Reading and Math students are broken into small teaching groups. These groups are determined by each individual student’s ability and needs as determined through testing and assessment. Most lessons start out with instruction to the whole class on the carpet, and then students are assigned more individualized tasks. While students are completing independent tasks, the educator teaches to a small group of students at a time. The differentiated instruction to small groups lends itself well to teaching a split class. Most mornings during Reading and Writing there was a teachers’ assistant in the room to help support all of the learners. During Reading, the teachers’ assistant would listen to individual readers and occasionally work with reading groups. During Writing, she would circulate around the room and assist students with
their writing tasks.

The classroom was made up of twenty-seven students (14 boys and 13 girls) with an approximate age range of 6.1 to 7.8 years. There was a lot of cultural diversity within the classroom with students identify with the following ethnic groups: 13 European, 2 Maori, 3 Korean, 1 Filipino, 1 Cook Island Maori, 1 East Indian, 2 Chinese, 1 African 1 Middle Eastern and 2 other. The cultural background(s) that students identify with can play an important role in the students learning. Culture can influence students’ choices with respect to jobs and may also impact how seriously they focus on their schoolwork. Some cultures exert a lot of pressure on students to do well, and choose professions that are considered to be successful.

Seven students in this classroom attended E.S.L. (English as a second language) classes once a week. E.S.L. students require special consideration as the language and meaning of words may be a barrier to their learning and understanding of the content presented to them. All of the E.S.L. students had average English speaking abilities. One of the E.S.L students also worked with a speak/language therapist once a week. There were four students with special abilities and eight students with special needs in this 1/2 split class. All of the students were capable of completing the activities within the career planning unit entitled, “All About Me”. Only one of the students required extra help when completing some of the written components.

In New Zealand, schools are rated by decile, which reflects economic and social factors of the community surrounding it, ten being the highest rating. This particular school had a decile rating of 9. The majority of the students were from middle to upper middle class families. Many of the students participated in extracurricular activities such as piano, dance lessons and rugby.

**Integrated Curriculum**

The original context for the career planning unit “All About Me,” was based on the
Alberta (Canada) Program of Studies for grade two English Language Arts, Health and Life Skills and Art. The career planning unit fits into the English Language Arts curriculum because students express and represent feelings and ideas as a result of completing career planning activities. The students used various forms of media to communicate their feelings and ideas. Some of the media that students used throughout this unit included drawing and finger painting. By representing their ideas and feelings in this manner they also be achieved Art expression learning objectives. These activities allowed students to explore their interests, talents and abilities. Exploring talents, abilities and setting goals also meets objectives from the Health and Life Skills curriculum.

At the school in New Zealand the career planning unit was incorporated into the New Zealand curriculum for Reading, Writing, Listening, Viewing and Personal Health and Physical Development. There are many similarities between general learning outcomes in the Alberta and New Zealand curricula. By incorporating literature and shared reading into the activities students interacted with the six strands of Language Arts: Reading, Writing, Speaking, Listening, Viewing and Representing. These six strands of Language Arts are features of both the Alberta and New Zealand curricula. Reading to students was also used throughout the unit, and shared reading was one of the two approaches to reading outlined by the New Zealand Ministry of Education.

Career Development Rationale

The career planning unit, “All About Me”, addressed the career development needs of the students by getting them on the right path to making meaningful decisions about life and future career choices. Through this unit, students discovered that they were unique and what they liked to do to reflect that uniqueness. By getting to know themselves better and discovering likes,
dislikes and talents they were able to make meaningful connections throughout different aspects of their lives. When students know what is important and meaningful to them they are able to make decisions with greater ease and better confidence. Grade 1 and 2 is just the beginning for these young students, they will continue to grow and learn more about themselves as they mature into adults. To build upon a stable understanding of themselves at such a young age creates a concrete base on which they can build their future selves, with meaning being at the centre of the structure.

Learning Outcomes

Alberta Curriculum Outcomes

Through the completion of the various activities in the career planning unit the grade 1 and 2 students met the following learning outcomes from the Alberta Programs of Study for English Language Arts, Health and Life Skills and Art. The particular outcomes achieved with this career planning unit are:

*English Language Arts:*

1.1 Discover and Explore

- Express ideas and develop understanding;
- Express or represent ideas and feelings resulting from activities or experiences with oral, print and other media text;
- Experiment with language and form; and
- Use a variety of forms of oral, print and other media texts to organize and give meaning to experiences, ideas and information. (Alberta Learning, 2000)
**Health and Life Skills:**

Group Roles and Processes

R–2.8 recognize and value strengths and talents that members bring to a group; e.g., identify skills each member can offer;

Learning Strategies

L–2.4 recognize that it takes time and effort to accomplish goals;

Life Roles and Career Development

L–2.5 recognize, acknowledge and respect that individuals have similar and different interests, strengths and skills each member can offer (Alberta Learning, 2002).

**Art:**

PURPOSE 1: Students will record or document activities, people and discoveries.

Concepts:

A. Everyday activities can be documented visually.

B. Special events, such as field trips, visits and festive occasions can be recorded visually.

C. Family groups and people relationships can be recorded visually.

D. Knowledge gained from study or experimentation can be recorded visually.

PURPOSE 2: Students will illustrate or tell a story.

Concepts:
A. A narrative can be retold or interpreted visually.

B. An original story can be created visually (Alberta Education, 1985).

New Zealand National Standards

The learning purposes and key characteristics that were achieved as outlined by the New Zealand National Standards for Reading, Writing, Listening, Viewing Personal Health and Physical Development are as follows:

**Reading:**

- Use punctuation such as full stops, commas, etc. to assist students in constructing meaning from the text and to enable a smooth and fluent reading style;
- Listen to stories;
- Read and respond to stories; and to
- Think critically about texts (Ministry of Education, 2009).

**Writing:**

- Plan their writing by using words or pictures;
- Be able to listen and follow instructions;
- Think about, record and relate their experiences/ideas in writing; and
- Identify and discuss similarities and differences between written work (Ministry of Education, 2009).

**Personal Health and Physical Development:**

Personal Identity

- Identify personal qualities that contribute to a sense of self-worth.
Relationships with Other People - Identity, Sensitivity, and Respect

- Describe how individuals and groups share characteristics and are also unique (Ministry of Education, 2007).

Key Competencies:

- Think carefully about their learning;
- Think about what they have heard/seen;
- Respond appropriately to what they have heard/seen (Ministry of Education, 2007).

Description of Unit Plan

The “All About Me” career planning unit consists of a series of activities and exercises that assist students in learning about themselves and their classmates. Career planning activity outcomes are to allow students to discover what their likes, dislikes, values, favourite activities and goals are. Through the activities in this unit students will showcase what they learn about themselves and who they are by creating a book entitled “All About Me”. The “All About Me” book is a compilation of the assignments and activities completed throughout the career planning unit.

In New Zealand the teachers are continuously assessing their students’ abilities as a way to gauge where students are at and allow them to effectively focus and drive their lesson planning. This testing is especially heavy at the beginning of a new school year as it is used to help place students into appropriate reading and math groups. As a result, the career planning lessons were not taught at a set time every week. The career planning unit was divided into six activities. These activities were placed into the schedule whenever possible. The idea behind the
career planning unit was to assist students in learning about themselves and thus equip them for making meaningful life choices. A detailed outline of each of the activities within the unit is now described.

**Activity 1 - All About Me**

In the first activity the career planning unit was introduced to the class. The teacher introduced themselves to the class, as it was the first week of school. The introduction included a PowerPoint presentation with pictures of the teacher, her family and things that were important to her. The teacher then proceeded to share some of her interests and hobbies with the class. It was then explained to the students that the teacher wanted to learn more about each of them and that they were going to make a book all about themselves. When they were done making the book they could share it with their parents, friends and with a peer in a buddy class (when this class would work with another class in the school).

Each student was then asked to start creating the cover for his or her book with the title “All About Me” on the front (see Appendix A for the template used). Small groups of students were taken outside the room to have their photo taken. Each student was allowed to chose where they would like their picture taken so that it was representative of something they enjoyed doing, like being on the slide or a place in the school they liked to spend time. The students then glued their picture onto the covers of their books. It took some of the student’s more than one lesson to finish their title page. The covers of the books were laminated to protect the pictures and to make the books more durable. The students were then asked to fill out an information sheet that included things like their birthdate, family information and a description of something that was special to them (see Appendix B for the template used).

**Activity 2 - I am Unique**
It was explained to the students that in this lesson they would learn how they are all unique from one another, and would be allowed to explore the process for discovering their individual talents. The class then read the story, *The Shape of Me & Other Stuff*, by Dr. Seuss (1997) (see Appendix H for the resources used). The story was made into a PowerPoint to ensure that all of the students were able to see it on the screen at the front of the classroom. The students read the story together as a class from the screen. This Dr. Seuss story is a brightly coloured book that introduces the concept of shapes through the use of pictures and whimsical text, for example “the shape of you, the shape of me”. This story was used during shared reading each day throughout the week. During Reading the class also read a shared poem called, *Only One Me*, by Jill Eggleton (n.d.) (see Appendix D and H for the resource used) to reinforce the idea that they are all unique. In both the story and poem the class focused their attention to the punctuation used and how it was used. The class practiced reading with expression and ensured that they always stopped at periods and paused for commas.

The teacher then explained to the class that we are all unique and led a discussion about what it meant to be unique, different or special. The students participated in a think, share, pair with a partner about how they were unique. Some of the students were given an opportunity to share with the entire class how they were unique. Students then wrote about how they were unique (see Appendix C for the template used) and decorated an egg using their fingers. Students took turns finger painting and decorating their eggs at the back of the room, while others continued to work on their writing assignment. The purpose of the egg activity was to show students in another medium how they are unique from one another. The class discussed how there are no two fingerprints alike; they are unique to each and every person.

**Activity #3 - I Want to Learn!**
This lesson encouraged and helped students to recognize the individual skills that they have. Students were then asked to think about and discuss things that they want to learn to do. This prepared students for setting goals in the future. It was explained to the class that in order to set goals they needed to think about what they can do and what they cannot yet do. This helped students realize what they would like to accomplish.

The lesson started with shared reading. First the teacher read two different “I Can” poems to the students. The class then read the poems together aloud. They were then instructed to pay attention to the punctuation in the poems. Reading aloud allows the students to practice their oral reading skills. After reading the poems students were asked to think, pair, share something that they can do and something that they would like to learn. The students were then given a poem template (see Appendix E for the template used). They were asked to complete the poem by filling in what they could do and what they want to learn to do. The teacher modeled how to create the poem with the template before the students started working on their poems. In modeling the teacher shared with the class some things that she could do, for example drive a car, and things she could not do like surf, which she would like to learn to do.

**Activity 4 - Leo the Late Bloomer**

In this lesson the theme “I can” will be carried over from the previous lesson. Students discovered that acquiring new skills requires time, interest and growth. The class was read the story, *Leo The Late Bloomer*, by Robert Kraus (1994) (see Appendix H for the resources used). This story was about a tiger named Leo who was not yet reading, writing, drawing or talking. Leo’s father was concerned that Leo was not doing things that others were, but Leo’s mother was not worried because she knew her son would do all those things, and more when he was ready to do so. A PowerPoint of the story was created and used during shared reading for the rest of the
week. After the story was read the students were asked two questions:

- Have you ever felt like Leo?
- What did you learn from the story?

Students were reminded of the last discussion they had about what they could do. This time they were asked to think about something that they had just recently learned to do or could not do last year. Students were asked to recall how they were finally able to do the new task and how they acquired the skill(s) needed to master that new task.

**Activity 5 - When I Grow Up**

In this lesson students explored careers and drew a picture of themselves at their dream job. The lesson began with the students gathering on the carpet where they discussed different types of jobs. The discussion was based around the following four questions:

- Do your parents work?
- What do they work at?
- What do they do at their job?
- What types of jobs can you name?

The students shared where their parents worked, what they did and listed some of the other jobs that they knew of. As a class they then looked at various books from the class library about different types of careers. Students were then asked to close their eyes and visualize themselves at their dream job, something that they really wanted to do in the future. Then they were also asked if it were possible that they could have more then one dream job? It was explained to them that they could have more then one dream job but, they were asked to pick just one for this activity. The class was then given a large piece of white paper on which they drew and wrote about themselves at their envisioned dream job.
Activity 6 - My Special Day

The My Special Day activity taught the students how visualization could be a valuable tool. Space was created for the students to lie down on the floor if they chose to do so. Students were also asked to close their eyes, keep there hands to themselves and listen carefully to the teachers voice. The teacher then proceeded to read a guided fantasy script entitled, *My Special Day*, (see Appendix F for the script used) students visualized what they would do if they could do anything they wanted on a special day off from school. Once the script was read, students were instructed to slowly and quietly sit up and open their eyes. Before they were asked to come to the carpet to listen and visualize, they had been given a paper with a space to draw a picture and write on (see Appendix G for the template used). After the visualization was complete they were directed to quickly go back to their desk and get to work writing and drawing about what they had visualized. Students were free to decide if they were going to draw or write first. The objective was for the students to be able to depict what they had visualized in a way that was easy for them.

After the students had completed their worksheet about what they had visualized, they were asked back to the carpet. The teacher then read the book, *Oh the Places You will Go*, by Dr. Seuss (1990) (see Appendix H for the resources used). This particular story was read as a way to wrap up the career planning unit. This book was chosen because of the message it gave students, which was that they were smart, had the ability do anything they wanted and to accomplish a lot in their lifetimes. The message of the story was discovered and discussed with the students and they were told that the teacher believed in them.

Evaluating Effectiveness

The effectiveness of the career planning unit and activities was mostly done through
observations while circulating through the classroom. As the students worked on their tasks the teacher walked around and discussed with the students the work that they were doing. If they were struggling with getting started, the teacher would question them about what were doing, how they were feeling about the activity, and if necessary provide them with extra examples to assist with clarification. For a quantitative evaluation of the effectiveness of the career planning unit the Career Coaching Across the Curriculum: Evaluation Form was utilized after the unit was completed (see Appendix I for the form used). This evaluation form provided valuable feedback regarding the effectiveness of the unit.

**Description of Data Collected**

Over the course of the career planning unit students participated in six different activities. Most of these activities were implemented in a class once a week. On average 93% of the students completed all six of the activities within the unit. Two students did not complete the All About Me and I Want to Learn activities, where as three students did not complete the I Am Unique activity. The activity that most students did not complete was the Leo the Late Bloomer activity, in which 4 students did not participate due to school absences.

<table>
<thead>

<td>4 (15%)</td>
<td>23 (85%)</td>
</tr>
</tbody>
</table>
Table 2 illustrates how students ranked each activity. Students could choose one of three options, *Not Good at All, Good* or *Great*. Overall, 95% of the students indicated that the activities were either Good or Great. The most well received activities were the All About Me, When I Grow Up, Leo the Late Bloomer and My Special Day activities with 100% of the students indicating that they were either Good or Great. The entire class appeared to enjoy the book, *Leo the Late Bloomer*, and many indicated in writing that it was their favourite activity. It should be noted that the Leo the Late Bloomer activity was also the one in which 4 of the students were absent.

<td>24 (89%)</td>
</tr>
</tbody>
</table>

Note: 95% of students indicated that the activities were either Good or Great.

In the written component of the evaluation, approximately half of the students wrote something. It was a little difficult for them to follow the evaluation sheet and they were not sure what to write. This could have been complicated due to the fact that this unit was completed at the beginning of the school year and for many students they were just getting used to writing.
again. Some of the grade ones found it especially hard so the teachers scribed for a few of the students. A suggestion would be to work one on one with the students to fill in this written section of the evaluation to ensure completion. The two questions that students were asked to write about with respect to the unit were: What did you like about the Life Roles and Career Development unit? And how could this unit be made better?

The main theme from what the students liked about the unit was the drawing and colouring activities. They also indicated that they liked that the activities were all about them. Some students wrote about which particular activities they specifically liked, for example one students said they liked the visualization activity. As for how the unit could be improved, this section of the evaluation did not receive a lot of feedback from the students. It is possible that some of the students did not quite understand how to answer that question, or may have gotten mixed up. One of the students who did respond wrote, “Make a forest”. He may have been referring to the new field located beside the new gymnasium, which is something that was made better at the school, in his mind. A few students said “to make it (the unit) more fun” would be a way to make the unit better, where as another student suggested that “we play a game”. This was a great suggestion and should be taken into consideration when implementing this career plan again. Looking into games or making up a game that would be suitable for this unit as a way to incorporate career planning objectives into other curriculum areas would be a helpful addition to the unit, especially for younger students.

As can be seen in Table 3, 85% of the students indicated that the career planning unit made them excited about what they could do with their lives. On average 70% of the students indicated that they Agree that the career planning unit achieved all of its objectives, helped them to learn a lot about themselves and careers. In addition 70% Agreed that the unit made them
excited about what they could do with their lives.

It is evident that specific information about careers was the piece students indicated they were not as sure about, with only 58% indicating that the unit assisted them with learning a lot about careers. There could be a number of factors that could have influenced this outcome, such as: the age and developmental level of the grade one students, language barriers for ESL (English as a Second Language) students, as well as a cultural barriers between the students and the teacher. Sometimes, topics and or certain words were used in class discussions that the students would not understand. It should also be noted that one student was away the day that the class completed the information on Table 3, as a result the numbers and percentages are calculated out of 26 students.

Table 3

<table>

<td>2 (12%)</td>
<td>6 (23%)</td>
<td>17 (73%)</td>
</tr>
</tbody>
</table>

Note: On average 70% of the students indicated that they Agree all four objectives for this career planning unit were achieved.
Many of the students enjoyed the drawing and colouring parts of the activities; this potentially could be attributed to the age and developmental level of the students. For some students who did not have effective writing skills yet, especially the grade ones, found it easier to express themselves through drawing or the use of other mediums. The majority of this particular class enjoyed drawing and coloring and took a lot of pride in their work. Many also enjoyed getting their pictures taken for the cover of their books, and some even mentioned it on the evaluation form as their favourite part of the unit. Numerous students in the class enjoyed participating in activities that were about themselves. At this particular developmental level, being 6 and 7 year olds, they were still in a very egocentric developmental stage of their lives; this may be a contributing factor to the increased positive agreement with Self activities being rated higher than others. The majority of the students also enjoyed the visualization activity and this could be due to the fact that this activity was explained thoroughly, and the students had been prepared for it in manageable steps. A few weeks before the visualization activity the teacher began to ask the students to picture in their minds the stories that were being read to them, instead of them just looking at the pictures. Visualization allowed the students to use their already active imaginations as a tool with which they could better understand themselves. Breaking down the activity and introducing it slowly created a better sense of understanding for the students, and as a result it was very well received.

In this particular career planning unit there was not enough time dedicated to the discussion and exploration of specific careers. This was evident at the end of the career planning unit when the final summative evaluations were reviewed, as students were less likely to agree that the unit assisted them in learning a lot about careers. The reason this area was not covered as thoroughly in the unit was mainly due to the fact that the internship was international, and
there were some differences in how the mentor teacher perceived the career planning unit compared to the Education program in Alberta. Although, the mentor teacher was accommodating and allowed the integration of the career planning unit into the curriculum, there was a sense that more important curricula would take priority. This difference in priority created a time crunch throughout the career planning unit and it was not given as much classroom time as it was designed to have. However, this can be appreciated and understood as part of the international internship and the differences between the Alberta educational system and the educational system in New Zealand.

There are numerous small changes that could be made to improve each of the activities, but the most significant change would be to dedicate more class time to the unit. Devoting more time to the discussion and learning about different career paths would be a positive addition to the unit. Guest speakers could then be invited to come into the class to talk to the children about their different career areas. If available parents could be invited as guest speakers, as it is always special for students to have their parents visit their class.

Additionally, a class display wall could be created so that each student could exhibit the work they had completed during the career planning unit. This would allow for enhanced learning opportunities regarding the differences and uniqueness of each student in the class. Changing the final lesson and having students share and present what they have learned with the rest of the class would also be a positive and appropriate way to wrap up the unit.

**Implications of Unit Plan**

There were three main positive outcomes from the implementation of this career planning unit. The first outcome was that each child was able to recognize and identify that they were unique. This was a very significant realization for the students, to understand that they are unique
and special in their own way. This self-awareness can often increase the students’ self-confidence and potentially provide encouragement when they may be struggling with certain things in their lives. For example, a student may not do well in school, but may be extremely artistic, thus giving them something else to focus on and be proud of.

The second positive consequence of the career planning unit was that over 81% of the class agreed that the unit made them excited about what they could do with their lives. Young students should be exposed to various activities, such as the ones within this unit, to give them the tools to start thinking about their futures. By sparking this interest within themselves, discovering what is truly meaningful for them, allows them to make informed decisions regarding the choice of activities and classes they pursue throughout their personal and educational lives. The more informed and meaningful their decisions, the more satisfaction and success they will achieve throughout their lives.

The third positive result of the career planning unit was that it enhanced how the teacher was able to get to know the students better. Using the career planning unit at the beginning of the school year was a great way to introduce the students to the teacher and each other. Due to the size of this particular school, all of the students may not have all known each other before school started. Specifically, in this class the grade 1 student’s did not know some of the grade 2 students. This enhanced understanding of the students’ interests, passions and abilities created a great platform for the teacher to build future activities and lessons around. Teachers would be able to increase the meaning of future activities for the students and potentially increase success and engagement by doing so.

**Conclusions**

The Career Coaching Across the Curriculum pilot program at the University of
Lethbridge, created an opportunity to learn about career planning theory and skills and how to blend this knowledge into the teaching environment. Admittedly, there was some scepticism as to how well it could be implemented into an elementary classroom. After developing and implementing a career planning unit for a grade 1/2 split class successfully, the scepticism disappeared. The career planning unit was easy to implement in conjunction with the other school subjects, and with a little creativity on the part of the teacher, could be integrated with many other curricular objectives.

Overall the career planning unit was successful at the grade one and two levels, as many of the students responded that it had increased their excitement with respect to what they could do with their lives. This enthusiasm is particularly important for this young age of only 6 and 7 years old, as they are at the beginning of their lives’ path. The more determined they are to continue on a meaningful path at an early age, the more successful they will be throughout all of the endeavours of their life.

Guided Fantasy Script

This is your fantasy about your special day. It is a special day because you don’t have to go school. Today you can do whatever you want to. Where will you go? To Disneyland? The beach? Play with your friends? It will help you to dream of what you “really” want in your life.

Close your eyes and allow yourself to get as comfortable as possible. Take some deep breaths and relax.

Think of yourself, somewhere 20 years in the future! This will be enough time to take further education towards the career you want.

See yourself waking up in the morning. Look around the room, before you even get out of bed . . . Now it is time to get up. Look around your home as you go to the kitchen for breakfast. Is there anyone there?

Now it is time to get ready for work. Return to your bedroom and look through your wardrobe considering what you will wear today. Is it something quite casual or will you wear a business suit, maybe you have a uniform to wear. See yourself getting dressed for work.

You leave now to go to work. Before going in, look around at your place of work. Is it a large or small building? Do you work inside or outside? Is it an institution, such as a school or a hospital that you are going into? As you go in, see who is there. What is the atmosphere like? . . . Is it fast paced and hectic or slow and relaxed? Are there lots of people or just one or two others or are you alone? Who greets you? Who do you talk to?

As you start your day’s activities, think about what you will do at work that day. Think
of the kind of skills you will be using and the tasks you will be doing . . . Will you work with
people: teaching, helping, curing? . . . Are you designing, writing, working with your hands,
drawing? . . . Do you work with numbers? . . . Do you work on a computer? . . . Do you work
alone or is there a group of people working with you? Imagine yourself going through your
morning activities.

Now it is time for lunch, how will you spend your lunch hour? . . . Consider the ways you
could spend your time. Have you brought a lunch or will you meet someone for lunch? . . .
Maybe you are so busy that you work right through your lunch hour or do you have an activity
that you do over the lunch hour? Imagine yourself enjoying your lunchtime.

The afternoon is here. Will you return to work? Will you return to the same place of
work? If not, consider what you will do and where you will go. Do you do the same activities in
the afternoon as you did in the morning? . . . Do you have a major project that you are
completing or do you do different tasks in the afternoon? Think about who you are working with
. . . are they young or old? . . . mostly males or females? . . . What is your supervisor like or are
you the supervisor? See yourself going through the afternoon’s activities.

It is the end of the working day. See yourself getting ready to leave. Think back over
your day and think of one thing you did that gives you a sense of accomplishment.

How will you spend your evening? Will you go out to dinner or go home? . . . Do you
spend your time with others or are you alone? Think about the activities that you could do in the
evening. Have you brought work home? . . . Will you take a course or maybe teach a class? . . .
Imagine yourself enjoying the evening’s activities.

Now it is time for bed. As you turn off the lights in your home, have one last look
around. Just as you drift off to sleep, think of one thing you are really looking forward to doing
tomorrow.

Now the fantasy is over. Take a few minutes to become oriented to the room again.
When you are ready open your eyes.

Go back to your desk write and draw what you imagined on your special day.

Follow Your Dream: Integrating Career Education into English Language Arts 20-2

Abstract

In this project, a career education unit called *Follow Your Dream* was integrated with the Alberta Education (2003) English Language Arts 20-2 program and delivered to 68 Grade 11 students at an urban middle school in Calgary, Alberta, Canada. The nine-lesson career education unit encouraged students to complete structured career planning activities and analyze a variety of poems related to self-awareness, perseverance, and ambition. According to student feedback after the final lesson, 96% of students somewhat or fully agreed that the unit had helped them to identify their personal values on self-fulfillment, 95% indicated that the unit had allowed them to discover their strengths and attributes, and 100% felt that the unit had enabled them to: (a) identify meaningful goals to pursue; (b) explore meaningful career options that promoted their individuality and strengths; and (c) evaluate their career options and their support systems to pursue their goals. On average, 90% of the students rated the activities as *Helpful* or *Very Helpful*. Overall, the career planning unit was very successful in its use of English Language Arts to engage students in career planning activities.

*Keywords*: adolescents, career planning, career education, self-awareness, English Language Arts
Follow Your Dream: Integrating Career Education into English Language Arts 20-2

Career exploration is critical during senior high school as students begin to engage in self-exploration and evaluate their future career options (Dupont & Gingras 1991; Gati & Saka 2001; Julien 1999; Super 1990). According to Taveira, Silva, Rodriguez, & Maia (1998), the process of career exploration and decision-making can be a particularly stressful time in an adolescent’s life. Adolescents may attempt to place the responsibility for making a career decision onto others and may even delay or avoid making a choice, which could ultimately lead to a less than optimal decision (Gati & Saka, 2001; Witko, Bernes, Magnusson, & Bardick, 2005). Therefore, senior high school students must be provided with the necessary career education, counselling, and tools to make meaningful choices for themselves and effectively transition into post-secondary education and/or the world of work. However, career counselling research also indicates a lack of resources for these students as high schools are challenged to provide graduates with the knowledge and skills to pursue individual career goals (Bloxom et al., 2008).

This paper outlines a cross-curricular method to directly implement career education for senior high school students through the study of English poetry. Eight poems (see Appendix A) were compiled for students to explore and analyze. These poems contained themes of self-awareness, ambition, and perseverance. The exploration of these themes was connected with career planning objectives as students engaged in purposeful exercises, questionnaires, and written responses to develop an understanding of their individuality, values, strengths, goals, and career options. Students collected all of their responses and results from the activities and compiled a personal career portfolio to show potential employers in the future. In addition to
meeting English Language Arts objectives and addressing English as a Second Language (ESL) outcomes, this poetry unit provided students with career knowledge and skills that they may directly implement in their lives after high school.

**Context of Teaching Environment**

**Demographics**

The career planning unit was implemented in a large urban Catholic School with 46 male and 22 female Grade 11 students who ranged in age from 16 to 19. Career education was delivered in two English Language Arts 20-2 classrooms as a poetry unit. There were 26 ESL students in both classes ranging from Levels 3 to 5 in English language proficiency. Nine students were coded with a learning disability which affected their acquisition, organization, retention, understanding or use of verbal and nonverbal information. Five students were identified with a mild to severe physical or medical disability in which their physical, neurological or medical condition required modifications to the learning environment. This primarily meant that these students were given breaks where necessary to avoid high levels of stress. Three students were coded with multiple disabilities, as they had two or more non-associated mild to moderate disabilities which included Attention Deficit Hyperactive Disorder (ADHD). One student was identified with a mild to moderate emotional/behavioural disability which was seen in chronic or pervasive behaviours that interfered with his learning.

Due to the school’s location and urban nature, students came from diverse cultural and socioeconomic backgrounds. The high number of ESL students significantly enriched the unit’s content by providing a variety of different worldviews, cultural experiences, and understandings.

**Cross-Curricular Integration**

This career unit was primarily integrated into English Language Arts, although it also met outcomes in the English as A Second Language (ESL) curriculum.
**English Language Arts 20-2 Outcomes**

The career skills unit achieved the following ELA outcomes as prescribed by Alberta Education (2003):

<table>
<thead>
<tr>
<th>1.2.1 Consider new perspectives</th>
<th>a. compare own ideas, perspectives, and interpretations with those of others, through a variety of means, to expand perceptions and understandings when exploring and responding to texts (p.17)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.2.2 Express preferences and expand interests</td>
<td>b. expand interests in a range of genres and in a variety of texts and text creators, and explain how the content and style of various texts appeal to audiences with particular interests and preferences (p. 17)</td>
</tr>
</tbody>
</table>
| 1.2.3 Set personal goals for language growth | b. set goals and employ strategies for language growth in relation to formal and informal personal communications and community involvement (p. 18)  
  c. identify and access learning sources and opportunities; assess, weigh, and manage risk; and demonstrate a willingness to continuously learn and grow (p. 18) |
| 2.1.1 Discern and analyze context | b. explain how a text can be studied to understand the context- or aspects of the communication situation within which the text was created [for example, recognize that specialized terminology in a text may represent a particular occupational group and provide insight in understanding the text] (p. 29) |
| 2.3.1 Connect self, text, culture and milieu | b. respond personally and analytically to ideas developed in literature and other texts (p. 35)  
  c. explain how the choices and motives of characters and people presented in texts may provide insight into the choices and motives of self and others (p. 35) |
| 3.2.1 Select, record, and organize information | b. select information and other material appropriate to purpose from a variety of print and nonprint sources (p. 42)  
  c. record information accurately and completely; and document and |
| 3.2.2 Evaluate sources and assess information | b. assess information sources for appropriateness to purpose, audience and presentation form (p. 42) |
| 5.1.3 Recognize accomplishments and events | a. use language and image to honour own and others’ accomplishments (p. 65) |

**English As a Second Language (ESL) Outcomes**

The career planning unit also achieved ESL outcomes, especially since 38% of the students involved were ESL learners. The following are the objectives achieved as prescribed by Alberta Education (1997):

| General Outcome 1: Students will use spoken and written English to gather, interpret and communicate information. | Specific Outcome:  
- Students will locate, gather, and interpret information (Levels 1-5) |
| General Outcome 2: Students will use spoken and written English to establish and maintain relationships | Specific Outcomes:  
- Students respond to questionnaires and applications  
- Students express opinions  
- Students explain actions, motivations and values |
| General Outcome 3: Students will use spoken and written English to make decisions, solve problems, and plan and carry out projects. | Specific Outcome:  
- Students evaluate information and ideas |
| General Outcome 4: Students will use spoken and written English to explore, respond to and extend ideas and experiences. | Specific Outcome:  
- Students express and explain personal responses |
Rationale

To facilitate career education and exploration, eight poems that focused on themes of self-awareness, ambition, and perseverance were selected for study. In the first week of the unit, students engaged in self-awareness activities and questionnaires to discover their interests, values, personal attributes, strengths, and weaknesses. The theme of self-awareness is crucial to career planning because students must first be aware of their individuality to determine what careers best suit their personal characteristics. The second week of the unit focused on ambition by allowing students to determine their individual goals and recognize potential challenges to these goals, such as financial obstacles. Exploring ambition and its associated challenges helped students to realize the importance of setting goals that are personally meaningful. The theme of the final week was perseverance, as students were encouraged to explore career options, create resumes, and develop a personal support system. The unit is entitled *Follow Your Dream* to encompass these three significant aspects of career planning: self-awareness, ambition, and perseverance.

This unit met the career development needs of high school students in transition to post-secondary education and/or the world of work because it focused on the reflection of their individuality, values, support systems, dreams, and career options. As they explored the given texts, culture, media, and society around them, students were able to affirm themselves as unique individuals and use their strengths and capabilities towards the exploration of personally meaningful career goals. In summary, the learning outcomes of the unit were as follows. Students were to:

1. Identify their personal values on self-fulfillment;
2. Discover their individual strengths and attributes;
3. Identify meaningful goals to pursue;
4. Explore meaningful career options that promoted their individuality and strengths; and
5. Evaluate career options and available support systems.

**Detailed Description of the Unit Plan**

The career unit was delivered in conjunction with the English Language Arts 20-2 Poetry Unit through a series of nine lessons which took three weeks to complete effectively. Each lesson took 85 minutes. The schedule of career education lessons and their associated activities are described in the following paragraphs.

**Lesson 1: Being Somebody**

This introductory class included the study of two poems to meet both English Language Arts 20-2 and Career Education outcomes. The first poem, “Introduction to Poetry” by Billy Collins (1988) was examined for imagery and other literary devices. This poem highlights the idea that readers may over-analyze literature when the purpose of certain texts is for readers to simply enjoy the art and engage in self-reflection. Expanding on the message of self-reflection, Emily Dickinson’s (1891) poem “I’m Nobody! Who are You?” was studied to understand the meaning of being a “somebody” versus being a “nobody” in society. In this poem, Dickinson makes an interesting point about the importance of being a unique, independent person rather than just being an ostentatious “somebody” in one’s social context. Students discussed different ways of becoming their own “somebody” in society, especially with their career goals and plans. The quote “Do what you love, love what you do” was mentioned to explain how one’s interests strongly shapes the person he/she is.
Students then completed the My Ideal Day guided imagery activity (Appendix B) in which they imagined their ideal work day from morning to evening. Students were asked to close their eyes and imagine a perfect day 10 to 15 years into the future. The teacher then led them through imagining virtually every aspect of this day, including where the students were, who they were with, what types of tasks they were doing, and so forth. Upon completion of the guided imagery activity, students wrote down the details of their ideal day and shared these details with a partner. The details they noted illuminated their specific interests, which were related back to the quote “Do what you love, love what you do.”

After completing the My Ideal Day activity, students then independently completed an interests questionnaire (Government of Alberta, Human Resources and Employment, 1999) to further determine other interests that could be helpful in their career planning. This interests questionnaire first asked students to determine various interests that they associated with their hands, feet, heart, ears, mouth, and eyes, such as playing soccer with one’s feet and knees. Students were then asked to consider which additional interests they would like to develop and/or rediscover. The students also identified interests that had always been important to them, and then considered which of these interests could be applied lucratively to start a business or bring in cash. They collected their responses to the questionnaire and the My Ideal Day activity in their portfolios.

Lesson 2: Going Against the Grain

This lesson focused on individuality and self-fulfillment under the constant challenge of conformity. Students examined the poem “1958” by Gwendolyn MacEwen (1987) which discusses the issues of blind acceptance and peer pressure in a high school environment. The descriptions of cliques and stereotypes in the poem led to an insightful class discussion on the
importance of staying true to one’s self, personal values, and beliefs. Students then transformed the “1958” poem into a 2013 version to identify current and relevant challenges with individuality, such as the peer pressures of staying up to date with the most recent trends.

After updating their poems, students then completed a values test (Government of Alberta, Human Resources and Employment, 1999) to add to their portfolios. This values test listed 36 values, such as security, variety, creativity, and stability, and asked students to rate each value as “Not Important,” “Important,” or “Extremely Important.” After rating the importance of each value, students were asked to select and rate their top six values that they would want to incorporate in their future work. Students’ responses to these tasks helped them to identify their most meaningful values and understand the significance of prioritizing these values in future career plans and goals.

**Lesson 3: Loud and Proud**

In this lesson, students examined the poem “Litany” by Billy Collins (2002), to appreciate the effective use of imagery and metaphors. The poem uses unusual imagery and metaphors to describe and highlight an individual’s special qualities and characteristics. After reading the poem, students watched a video of Billy Collins performing “Litany” on YouTube (Appendix A). The performance brought students’ attention to the poem’s elements, devices, and techniques, which achieved English Language Arts 20-2 outcomes. By experiencing the performance, students were better able to gain an appreciation for the effectiveness and artistry of “Litany.”

The purpose of examining “Litany” was to let students identify attributes and skills that made each of them unique. After experiencing the poem, students shared Pride Stories with partners, wherein they described a life experience that evoked a strong sense of pride. For
example, some students described personal accomplishments such as earning a scholarship or victory in a sports tournament. After students finished sharing their Pride Stories, their peers wrote down a list of specific skills that were required for the speaker to achieve such success. The speakers then read the list of skills their peers attributed to them and picked the top five skills that resonated most with them. Students included their written Pride Stories and peers’ feedback in their portfolios for further reference. This activity enabled students to feel affirmed in skills they possessed that could be transferable to career goals.

To further their understanding of themselves as capable individuals, students also completed a “What kind of person are you?” quiz (Government of Alberta, Human Resources and Employment, 1999) to reflect on personal attributes they were happy about and/or would like to improve on. This quiz provided students with a list of 23 positive characteristics, such as courteous, dependable, tolerant, and self-directed. Students indicated whether they were happy with their current level of each positive characteristic or if they would like to improve their ability to reflect each characteristic. Afterwards, students were asked to reflect on which characteristics they would want to improve and how they could work on these characteristics. These reflections were also included in students’ portfolios.

**Lesson 4: Life Regrets**

The purpose of this lesson was to encourage students to be self-aware and proactive about their goals and dreams, especially given the finite scope of life. Students were shown an infographic, “The top 10 regrets in life by those about to die” (n.d.), which was created based on interviews with residents in palliative care facilities. This infographic depicts senior citizens thinking about regrets that they have, such as “I should have made more time for my friends,” and “Happiness is always a choice, I wish I knew that a lot earlier.” According to the
infographic, the greatest life regret on the list was never having the courage to pursue one’s dreams.

The poems “Harlem” (Hughes, 1994) and “The Road Not Taken” (Frost, 1920) were read to address the topics of choices and regrets and further the theme of ambition in career planning. “Harlem” is a brief poem that invites the reader to consider what happens to dreams that are deferred, and to imagine whether these dreams wither, rot, or explode. In “The Road Not Taken,” the speaker describes a past decision to select one road over another at a fork in the path, and muses about the road that was not taken. The speaker acknowledges that the chances of revisiting the path are very slim, but wonders what the other path would have been like. The poems were studied and contrasted to allow students to develop critical responses and achieve English Language Arts 20-2 outcomes. These texts easily lent themselves to the career education theme of *Follow Your Dream* since they discuss the importance of developing courage to pursue one’s aspirations.

After engaging with the two poems, the class completed The 99-year-old Question. In this activity, each student was asked by the teacher, “If I ran into you later in life when you are 99 years old, and everything in your life had gone perfectly according to plan, what would you tell me you’ve done and accomplished?” Students responded to this question by listing the goals they wished to pursue in their lives. After completing their lists, they classified their goals into short-term, intermediate-term, and long-term pursuits. The teacher explained short-term goals take one year or less to accomplish, intermediate-term goals take one to five years to achieve, and long-term goals take more than five years to complete. Students shared their classified goals with a partner and included their lists in their portfolios for future reference.
Lesson 5: Skills to Sell

In this lesson, students read John Updike’s (1993) poem “Ex-Basketball player” to discuss the importance of maximizing one’s talents and abilities for as many options as possible in life. The poem describes a former athlete who was renowned for his exceptional basketball talent but did not go on to further his skills or seek other related career options. Instead, he now works as a gas station attendant. This poem was intended for students to realize how important their skills and strengths are in a dynamic and rapidly changing society.

After analyzing the poem, students completed an individual skills test (Government of Alberta, Human Resources and Employment, 1999) to examine the skills that they could transfer to various work situations. Students assessed the skills they possessed in several skill categories: numerical, communication, leadership, sense awareness, using logical thinking, service, organization, technical, self-management, and being innovative. Each category involved several specific skills, and students checked off the skills that they currently possessed. After checking off relevant skills, students were asked to create lists of the 10 skills they did best, the 10 skills they most enjoyed using, and the 10 skills that they would like to develop. Students then added these lists to their career planning portfolios.

Lesson 6: Multiple Choices

This lesson allowed students to take an online career matchmaker quiz that generated recommended careers based on students’ responses to questions about their values, beliefs, interests, and skills. This activity helped them to explore the wide variety of career options available to them and gain information about particular occupations of interest. This class was held in a computer lab where students were able to access the Career Cruising (n.d.) website. Students were able to create personalized planning accounts, complete a career matchmaker quiz,
explore careers of interest and qualifications, inquire about programs and apprenticeships in
different post-secondary institutions, and develop skills for employment such as resume building.
The class was spent exploring multiple career choices by reading and comparing work
descriptions from people who work in specific professions.

After reading about a number of different career options, students picked their top three
careers and printed off all available information from the website, especially the details on
required education and training. They compared the details between each career and included
this information in their portfolio. Students then reread their interests, values, beliefs, skills set,
and goals and matched them against each career to carefully evaluate their options. The purpose
of this activity was to convey why careers of interest should be self-gratifying. For example, one
student stated that travelling is an interest and goal so the career choice of being a flight
attendant was understandably fitting and meaningful to her.

Lesson 7: Taking Steps

This lesson was designed to allow students to identify the steps they could take towards
reaching their short-term and intermediate goals, including the pursuit of one of the three career
options they had researched. Many students realized the important step of gaining experience
through a part-time job or volunteer position. This led to the exploration of the Resumes section
in the Employment tab of the Career Cruising website. Students added all of the information
about themselves from their portfolio to the resume-builder, generated a resume, printed two
copies, and saved the file in their account. They then took one copy of their resume and swapped
with a classmate for peer review and feedback. This was a very effective exercise as students
took charge of their work and helped each other. It also identified how important it was to save
money or budget more wisely for their goals, especially in the case of post-secondary education.
Students engaged in a short budgeting exercise (Government of Alberta, Human Resources and Employment, 1999) where they tracked their daily spending in a given chart. With some math, students determined the annual cost of their current spending and gained an idea of how much they could possibly save now to meet the tuition and/or apprenticeship fees of post-secondary programs they wished to pursue after high school. Students were then provided with a “Tips To Help You Save Money” (Money Mentors, 2004) article to review. This article outlined numerous ways for individuals to save money on the needs and wants in their budget, such as housing, utilities, food, transportation, and recreation. Students then completed a short written reflection describing ways to personally save for their career goals and included this response in their portfolios.

**Lesson 8: Portfolio Day**

In this lesson, students worked in pairs to share their portfolios with one another. Students had 10 minutes with two peers to share what they had learned about themselves by briefly discussing their ideal day and their responses to the interests questionnaire, values, skills, and daily spending tests. They also briefly described the careers they were most interested in and how they were prioritizing short-term and intermediate-term goals towards them. While each student was presenting, peers filled out a completion sheet (Appendix C) that indicated which tasks the presenter had completed in their portfolio. To receive full completion marks for their English Language Arts minor task grade, students must have completed the nine unit tasks. Students were also held accountable for making the best of the unit by engaging in all activities and exercises that were available.

**Lesson 9: Rally your Allies**
This final lesson focused on the development of personal and professional support systems, especially in the pursuit of dreams and goals. The class read the poem “Alone” by Maya Angelou (1975) which highlights the essential theme that people need each other to illuminate their strengths and overcome obstacles. The poem helped show how success in our complex world depends partly on having a support system of people who can provide information and help when you need it. Students discussed how such people can serve as allies who can help them on their career path. The class made a list of potential allies which included parents, teachers, counsellors, friends, co-workers, and so on. They engaged in the final Relationship Assets activity (Government of Alberta, Human Resources and Employment, 1999) to strengthen and expand their support system. Students first read a definition of how potential allies should act, such as sharing information, helping others to succeed, and offering support to others. The students then identified potential allies in their lives and planned a time to contact them, share their portfolios, and/or ask if they could serve as a reference on their resumes. Students were encouraged to keep their portfolios and continue expanding them with certificates, awards, and testimonials. They were encouraged to view their portfolios as reflections of who they were as capable individuals.

Methods of Assessment

Formative Assessment

Each lesson was closely observed by the teacher for student engagement, responses, and suggestions. A formative assessment strategy that was frequently used at the end of lessons was having students rate the quality level with a show of fingers on a scale of one to three, where one was unsatisfactory, two was helpful, and three was very helpful. During the fourth lesson of the unit, students were asked to complete a mid-unit survey (Appendix D) about the activities they
had completed to that point. They rated each activity using the same three-point scale as
described above. Students also provided written suggestions which were immediately considered
to guide instruction and ensure an appropriate balance between poetry content and career
education.

**Summative Evaluation**

At the end of the unit in Lesson 9, students completed a Unit Evaluation Form (Appendix E). The summative evaluation was divided into several sections. In the first section of the survey, students were asked to indicate whether they had completed each of the lesson activities. In the second section of the survey, students were asked to rate the activities in terms of helpfulness on a three-point scale which included “Unhelpful,” “Helpful,” and “Very Helpful.” Students were also asked to make comments regarding the most useful aspects of the unit and aspects that could be improved. In the final section of the survey, students were asked to indicate their agreement with whether the unit’s five learning objectives had been achieved. Students were informed that their responses would be extremely helpful in making the unit as effective, relevant, and deliverable as possible for other students in their grade level.

**Assessment Results**

**Formative Evaluation**

During the brief formative assessment at the end of each lesson, the majority of lessons were rated by students as helpful or very helpful. After the midterm evaluation, student feedback regarding lessons up to that point was taken into account. A significant suggestion students made at this point of the unit was to share their discoveries with their peers. The teacher ensured that this suggestion was implemented in the subsequent lessons, especially in Lesson 8: Portfolio Day where students shared their portfolio with two other peers for feedback.
Summative Evaluation

Fifty-eight out of the 68 students in the class completed the survey due to absences on the day it was administered.

Part 1: Participation and completion. Participation information is presented in the following table.

3. This unit helped me identify meaningful goals to pursue

4. This unit helped me explore meaningful career options that promote my individuality and strengths

5. This unit helped me evaluate my career options and my support system to pursue my goals

Note: 98% of students somewhat agreed to fully agreed that this unit met all of the objectives.

Discussion

According to students’ responses, 98% expressed that they somewhat agreed to fully agreed that the five learning objectives of the unit were achieved. Seventy percent of students fully agreed that the unit objective of “[exploring] meaningful career options that promote individuality and strengths” was met, and 65% fully agreed that they were able to identify their personal values, meaningful goals, and a support system through this unit. Overall, these results suggest that students found the unit extremely helpful in allowing them to gain a greater sense of self-awareness and a better understanding of their future career options.

The activities rated by students as most helpful were determining their personal values, researching three careers and making comparisons, and saving money. This implies that these students at the Grade 11 level have a general sense of their personal values, strengths, and attributes as unique individuals. At this point in their lives, students prefer activities that provide them with information, tools, and support to pursue their meaningful goals, especially as they finish senior high school and transition into post-secondary education and/or the world of work.
One student highlights this point with her comment, “I really liked the research of career options and making comparisons. It really helped me choose what I’d like to do as a future job.” Another student expressed a similar opinion, as she “liked how it helped [her] see and realize what [she] want[s] to do after high school and [recognize available] job opportunities.”

Students provided suggestions for unit improvement in the written feedback portion of the survey. A majority of the suggestions involved having more class time and/or doing fewer activities to enhance the quality of career planning. Students rated the My Ideal Day and Pride Story exercises as being the least helpful activities in the unit. These activities were less structured than the questionnaires and some students had difficulty with the abstract nature of these exercises. Given that this unit was incorporated in a less academic classroom with a diverse student population in terms of learning abilities and English language proficiency, difficulties with abstract exercises are to be expected. However, with greater exposure to these abstract concepts and activities, students will grow more proficient and these types of activities will become more helpful for them. At this point in time, students expressed how they could have better identified their strengths and goals through more interactive and hands-on work, such as perhaps meeting with professionals in their careers of interest.

Integrating career planning into the study of poetry was advantageous because it brought the content to life for students. They showed increased participation in classroom activities as they were able to personally relate to the meaningful themes of self-awareness, ambition, and perseverance in the texts. The evident enthusiasm was channelled in students’ work, especially in their writing. Students showed eagerness to complete poetry tasks that they found purposeful and meaningful, which was reflected in improved English Language Arts marks. Career planning overall increased students’ engagement through the exploration and application of meaningful...
themes mentioned above. By engaging in a variety of activities, questionnaires, and writing responses, students were able to personally and practically apply their learning by compiling a portfolio for future employment.

**Challenges and Future Directions**

The biggest challenge with this career education unit was ensuring that there was enough time in the three weeks to achieve English Language Arts poetry outcomes and career education outcomes effectively. The unit was originally designed to study twelve thematic poems to provide more breadth and opportunities for literary analysis. However, after the first two days of the unit, it became clear that students needed more time to examine and relate to the poems. The number of poems was then reduced to ensure thorough study of terms, detailed analyses, and the close examination of the career education theme *Follow Your Dream*.

Another challenge in the unit was student engagement with certain poems and literary terms. While the majority of poems chosen appealed to most students, some had difficulty engaging with the texts at a personal level. An alternative strategy to this challenge is to include an English Language Arts assignment where students choose a familiar song to analyze the relevant theme of following one’s dreams. This would give students an opportunity to engage with poetry in lyrics and literary terms in a more interesting and meaningful way.

Future versions of this unit would do well to incorporate a larger selection of poems, including more visual and multimedia texts relating to the theme *Follow Your Dream*. This would enable differentiation for other grade levels in achieving poetry outcomes in the English Language Arts Program of Studies. The theme of *Follow Your Dream* can be carried forward to other English Language Arts units such as film studies or the exploration of non-fiction texts. For example, films such as “The Pursuit of Happyness” (Smith, Black, Blumenthal, Lassiter, &
FOLLOW YOUR DREAM

Tisch, 2006) could be viewed to examine the protagonist’s perseverance and ambition during his struggle to reach his life and career goals. Students could respond to the film by writing an analysis of how the themes of perseverance, ambition, and self-awareness were exhibited throughout the plot. Alternatively, students could combine an analysis of the film with personal reflections about their own personal goals and how they would overcome obstacles to those goals. These activities would allow students to engage in self-exploration and career planning using an English medium other than poetry.

**Conclusion**

This paper outlined a cross-curricular means to implement career planning and services for students through the study of thematic poetry on self-awareness, ambition, and perseverance. This career unit, *Follow Your Dream*, was designed to foster self-awareness in students as unique individuals with different strengths and skills to contribute in a dynamic society. Students were able to learn more about themselves and explore career options and tools from a variety of resources. Learning about oneself is crucial in setting meaningful career goals because it enables individuals to recognize their strengths and individuality. As the unit progressed, students were empowered to set personal goals for self-fulfillment and acknowledge the need to persevere through upcoming financial and emotional obstacles. Such a unit is essential for students at a critical point in their lives to enable an effective transition into the post-secondary education and/or the world of work they wish to pursue.

Guided Fantasy: My Ideal Day Activity

Script:

This is your fantasy. It will help you to dream of what you “really” want in your career and lifestyle. Try not to put up barriers for yourself. You will have a chance after the fantasy to come back to reality. For now, let yourself enjoy!

Close your eyes and allow yourself to get as comfortable as possible. Take some deep breaths and relax. Let go of any tensions and worries that you may have at this moment.

Think of yourself, somewhere 10 to 15 years in the future. This will be enough time to have taken necessary education towards a career, begin working in an occupation, and/or make any career changes.

See yourself waking up in the morning. Look around the room, before you even get out of bed... Now it is time to get up. Look around your home as you go to the kitchen for breakfast. What does it look like? Is there anyone else in your home?

Now it is time to get ready for work. Return to your bedroom and look through your wardrobe considering what you will wear today. Is it something quite casual or will you wear a business suit? Maybe you have a uniform to wear. See yourself getting dressed for work.

You leave now to go to work or maybe you stay at home... If you stay at home to work, imagine the place in your home where you will work. See yourself going to that place. If you leave your home, think about what type of transportation you will use to get to work. Think about the scenery you pass on your way to work. Think about how long it takes you to get to your place of employment.

Now you have arrived at work. Before going in, look around at your place of work. Is it a large or small building? Do you work inside or outside? Is it an institution, such as a school or a hospital that you are going into? As you go in, see who is there, what is the atmosphere like? Is it fast paced and hectic or slow and relaxed? Are there lots of people or just one or two other or are you alone? Who greets you? Who do you talk to?

As you start your day’s activities, think about what you will do at work that day. DO NOT try to think of a specific job title, but think more of the kind of skills you will be using and the tasks you will be doing... Will you work with people: teaching, consulting, helping, curing? Are you designing, writing, working with your hands, drawing? Do you work with numbers? Do you work on a computer? Do you work alone or is there a group of people working with you? Imagine yourself going through your morning activities.

Now it is time for lunch. How will you spend your lunch hour? Consider the ways you could spend your time. Have you brought lunch with you or will you meet someone for lunch? Maybe you are so busy that you work right through your lunch hour or do you have an activity that you do over the lunch hour? Imagine yourself enjoying your lunch time.
The afternoon is here. Will you return to work? Will you return to the same place of work? If not, consider what you will do and where you will go. Do you do the same activities in the afternoon as you did in the morning? Do you have a major project that you are completing or do you do different tasks in the afternoon? Think about who you are working with... are they young or old? Mostly males or females? What is your supervisor like or are you the supervisor? See yourself going through the afternoon’s activities.

It is the end of the working day. See yourself getting ready to leave. Think back over your day and think of one thing you did that day that gives you a sense of accomplishment.

How will spend your evening? Will you go out to dinner or go home? Do you spend your time with others or are you alone? Think about the activities that you could do in the evening. Have you brought work home? Will you take a course or maybe teach a class? Imagine yourself enjoying the evening’s activities.

Now it is time for bed. As you turn off the lights in your home, have one last look around. Just as you drift off to sleep, think about the one thing you are really looking forward to doing tomorrow.

Now that fantasy is over. Take a few minutes to become oriented to the room again. When you are ready, open your eyes and write out what you imagined in your ideal fantasy.
Appendix C

Peer Evaluation: Completion of tasks

Peer’s Name: _______________________
Marker: _______________________

Completed Tasks

Put a checkmark beside each completed activity:

1. Ideal Work Day description
2. Response to 1 question from interests questionnaire (p.3)
3. Completed Values Questionnaire and list of top 6 values
4. Pride story and list of recognizable skills
5. Completed Questionnaire: “What kind of person are you?”
6. 99 year old question and classified Goals
7. Response to “What skills can you transfer....” (includes 2/3 lists)
8. Top 3 Careers comparison sheet
9. Basic Resume

TOTAL: /9

COMMENTS:
Appendix D
Formative Assessment survey

Feedback on Career Planning

Put a checkmark where appropriate:

School Boards: Disappearing Dinosaurs or Champions of Effective Public Schooling

Dr. Bruce Sheppard
Professor

Dr. Gerald Galway
Associate Professor

Memorial University Newfoundland, Canada

Paper Presented at
Hawaii International Conference on Education
January 5-8, 2014
Honolulu, Hawaii
Although in recent years there appears to be a growing constituency who question the legitimacy of school boards (e.g., Alsbury, 2008; Beckham, Klaymeier-Wills & Weeks, 2011; Fusarelli, Kowalski & Petersen, 2011; Land, 2002; Lewis, 1994, Malen, 2003; Saatcioglu, Moore, Sargut and Bajaj, 2011; Williams, 2003), there is considerable evidence that school boards and the school districts that they govern “make a substantial difference in teaching and learning” (Hightower, Knapp,Marsh & McLaughlin, 2002, p. 4), are essential to advancing equitable and sustainable reform (Anderson, Leithwood & Strauss, 2010) and thereby contribute to successful public education systems (Firestone and González, 2007, Hightower et al; Honig & Coburn, 2008; Leithwood, 2010; McLaughlin & Talbert, 2003; Miller, 2010; Saatcioglu et al., 2011; Sheppard, Brown, & Dibbon, 2009; Sheppard, Galway, Brown & Wiens, 2013). For instance, in a report completed for the Canadian School Boards Association, Sheppard et al., 2013 concluded that school boards matter. Similarly, after having studied the administration and governance of one school district over a five-year period, Sheppard et al. (2009) concluded,

while there are some examples of successful schools that are professional learning communities, these are isolated cases that appear to have had minimal impact on public education overall. If collaborative leadership and organizational learning are to become the norm for schools, rather than something that occurs randomly in isolated cases as appears to be the current circumstance, the school district has the most potential for fostering that change. (p.34)

Although the central focus of Sheppard et al.’s (2009) research was related to school district leadership and its impact on schools and student learning, the authors observed that school boards perform an important governance role, particularly in periods of fiscal restraint and in the context of various political agendas of changing governments and various lobby-groups. They observed, as well, that school boards and the provincial school boards association have considerable influence in mediating the impact of both political lobbies and specific government agendas including major school board restructuring evident in various provinces in Canada and elsewhere over the last few decades.

Notwithstanding the continued support of school boards by some, others have observed that the relationship between elected school boards and the community has become increasingly adversarial. For instance, Fusarelli et al. (2011) argue that, considering the
changing demographic away from small rural communities toward larger urban centers, the original intent of the school board structure in public education--to provide a “form of representative bureaucracy” whereby citizens elect board trustees who they expect to generally match their community values when making decisions--is no longer valid. They observe that in the current context the relationship between elected school boards and the community has become frequently confrontational and as a result “many voters [have become] cynical about their ability to influence schools through elections, [as] they believe that school boards will pursue their own interests once elected…. Increasingly, citizens feel no collective sense of ownership of public education” (pp. 45-46).

Within this environment of increasing negativity toward school boards, several authors (e.g., Berends, Bodily & Kirby, 2002; Rush, 2005) have characterized school boards as inhibitors of meaningful public dialogue that could contribute to ongoing growth and improvement of public school systems. For instance, Miller (2010) reported that in one school district, school board decisions regarding organizational structure and staffing policies prevented the district from being able to appoint personnel to administer and provide oversight and analysis of the No Child Left Behind accountability data, thereby preventing meaningful application of the data that government and others perceived could have otherwise improved student achievement in some of the district schools. Although those supporting the No Child Left Behind program may perceive that this particular school board thwarted efforts to improve learning and thereby inhibited progress, others opposing that program may perceive it to be an example of the level of influence school boards can have as a local counterbalance to arbitrary state control. For instance, given the many debates in the US over the No Child Left Behind Act (Nichols & Berliner, 2005; Raudenbush, 2004), some have argued that having a legitimate authority such as a school board to represent local interests may highlight its value, rather than its weakness (Grubb & Oakes, 2007; Kohn, 2002). As a matter of fact, Sheppard (2012) contends that school boards can function as a counterweight to the infiltration of a corporate managerial agenda focused on increased control of education by government and the single-minded attention to standardized testing that have contributed to the displacement of professionally initiated innovation and “has presented a huge challenge to the sustainability of [meaningful] educational reform” (p. 112).
Interestingly, Moos and Paulson (2014) observe similarly, that the traditional Nordic approach to public schooling, founded on “a participatory democracy and a comprehensive schooling with strong local community roots, [has been] contested by [the demands of the transnational corporate managerial agenda] for accountability, standardisation and enhanced indirect steering from the stat[e] (sic) level” (p. 3). They contend that this observed shift in approach to educational governance has followed an agenda put forth by agencies such as the Organisation for Economic Co-operation and Development (OECD), who have had considerable influence on “national political culture and policies” (p. 2) in at least some member countries. For example, they highlight that one document (i.e., OECD, 1995) has been particularly influential in respect to the management of public bodies such as school boards within the context of the following themes or categories:

1. Devolving authority and providing flexibility;
2. Ensuring performance, control and accountability;
3. Developing competition and choice;
4. Providing responsive service;
5. Improving the management of human resources;
6. Optimising information technology;
7. Improving the quality of regulation;
8. Strengthening steering functions at the centre [and]

Although the context varies considerably from one OECD country to another, it appears that the OECD’s bent towards New Public Management principles has had considerable influence on school board governance in Canada, as well. Of particular note in Canada is the increasing dominance of the previously noted transnational agenda resulting in the consolidation of small local school boards into larger regional boards, and increased provincial control, ostensibly with the stated goal of improved efficiency and effectiveness (McCann, 2012; Sheppard, 2012; Sheppard et al., 2013). In Canada, a troubling side effect of these changes has been the creation of massive school boards serving huge geographical regions. Such structural changes have made it increasingly difficult for school board trustees to meaningfully connect with their local schools, parents and other constituents (Galway, 2006; Sheppard, 2012). Concomitantly, governments and their officials who may not have educational expertise and who have little contact with local school communities make all (or at least most) of the key decisions regarding education (Hall & Hord, 2006; Sheppard, 2012). For example Galway (2006) showed that senior executive positions in Canadian education ministries
are held by individuals with extensive public administration experience, but not necessarily within schools, school boards or other educational institutions outside of government. In fact, less than 40 percent of executives worked as educators or administrators in a school, college or university prior to working in government.

Within the previously-noted corporate managerial context, governments run the risk of conceptualizing education as a commodity, rather than a public good (Shaker & Grimmett, 2004). In such circumstances, the education agenda may be largely influenced by political considerations, such as the demands of special interest groups, as if education could be traded off like natural resources or other commodities, rather than on the basis of more ideal public purposes (Taylor, Rizvi, Lingard & Henry, 1997). In parallel with this shift in educational purpose, there has been an increasing focus on testing (e.g. PISA) and the ranking of students’ performance in comparison to that in other countries. This emphasis on testing and the subsequent ranking of countries, provinces, and states according to test results have forced school boards to “rely on a fairly restricted area of test items when they discuss education” (Paulsen & Moos, 2014, p.169). Furthermore, this appears to have diverted the attention of school boards away from important goals such as student equity and “preparing students for independent thinking and civic participation” (Meyer & Benavot as cited in Paulsen & Moos, 2014) that had previously been a central component of public schools’ “raison d’être.” Paulsen & Moos (2014) opine that the result of such a shift has limited school boards’ potential influence on students’ education.

It is apparent that these contextual changes have severely limited the influence of democratically elected school boards on government-driven plans for public education, yet they have been forced to deal with the often-negative consequences of these agendas. In spite of that, school boards continue to shoulder frontline responsibility for the implementation of these plans and as a result, in some jurisdictions, have become the primary target of the public’s loss of confidence in the public education system. We speculate that, paradoxically, this may have contributed to increased public support for even more centralized control by governments in some jurisdictions (Sheppard et al., 2013).
In spite of these concerns and contrary to various negative voices that cast all school boards as inhibitors of public dialogue, “school board data across all the Nordic countries show a strong agency in local democracy…[whereby] the boards emerge as proponents of local democracy in education” (Moos and Paulson, 2014, p. 173). Similarly, a recent School Board Association Task Force Report in Alberta, Canada conveys a spirit of optimism toward the future potential of school boards:

While the task force identified myriad barriers that impede school boards from functioning as truly robust local governments; [the task force authors expressed optimism] that school boards can overcome those challenges – and that many of the solutions are already in school boards’ hands. It will only take school boards to step up to the plate and take their leadership skills to the next level. (Alberta School Boards Association, p. 2)

Likewise, Saatcioglu et al. (2011) observed that in spite of some negative characterizations of school boards as dinosaurs left over from the agrarian past that do little more than contribute to inefficiency and political inertia…, [they] remain one of the oldest and most legitimate grassroots institutions in America…and they continue to play a central role in democratic governance and in mediating between local community preferences and broader state and federal policy choices. (p. 2)

Drawing upon the theory of social capital as a means of understanding “the link between the internal and external relations of group members…and concrete outcomes related to group or organizational performance” (p. 2), Saatcioglu et al. conclude, “school board social capital indeed plays an important role in improving financial and academic outcomes” (p. 29). Furthermore, they argue that school board engagement in bonding and bridging activities are central to their success. For instance, Saatcioglu et al. (2011) found that where school boards had established strong relationships (i.e. engaged in bridging activities) with specific external stakeholders such as parent-teacher associations/organizations, various civic groups and to a lesser extent with the business community, both financial and academic outcomes improved. Further, they observed that trust, information exchange and shared vision (i.e., bonding activities) have important effects on both improved school board expenditures and reading performance.

Interestingly, though, they found that although “school board social capital…plays an

---

1 Bonding activities include such things as facilitating the development of a shared vision, engaging in open/honest exchange of information, and fostering trust with constituents.
2 Bridging activities involve connecting with key external stakeholders.
important role [in] improving financial and academic outcomes” (p. 29), there was a two-
year lag before any manifestation of statistically meaningful effects. They muse that this
latter finding of delayed effects may have implications for the school board election
cycles and school board member professional development. For instance, it might be
wise if training for new school board members occurred early in a school board
member’s elected term and if elections cycles were slightly lengthened.

Within the context of a growing literature in support of distributed leadership in school
systems (e.g., Harris, 2009; Hallinger & Heck, 2009; Sheppard & Brown, 2014; Sheppard
& Dibbon, 2011), it is unusual that more attention has not been given to the role of school
boards and their potential to facilitate increased public engagement in the delivery of K-
12 education (Fusarelli et al, 2011). This is particularly so in light of Sheppard and
Dibbon’s (2011) conclusion that school districts are more likely than centralized
government policymakers to be successful in their efforts to directly impact school
administrators and local school effectiveness. Furthermore, they observe that their
“finding of the importance of [school board-governed] school districts as an important
systems link between government and schools is consistent with a growing evidence base
that school districts are essential to system-wide learning” (p. 136).

Although the aforementioned Sheppard and Dibbon findings relate specifically to school
districts and not to school boards themselves, McLaughlin and Talbert (2003) have linked
the success of school districts to supportive school boards. Furthermore, they have
concluded that school boards are essential to system-wide learning as they “promote and
invest in learning through the system -- in the central office, in schools, in cross school
teacher networks, [and] in units such as the business office that typically are excluded
from professional development focused on instruction” (p. 25). Having accepted the
validity of McLaughlin and Talbert’s contention that school boards are important to the
success of school districts, we believe those investigating the effectiveness of school
boards can legitimately draw upon the expansive scholarly literature that highlight the
importance of school districts in facilitating systems-wide school reform and
improvement (e.g., Firestone and González, 2007, Hightower, Knapp, Marsh &
McLaughlin, 2002; Honig & Coburn, 2008; Leithwood, 2010; McLaughlin & Talbert,
2003; Miller, 2010; Saatcioglu, Moore, Sargut and Bajaj, 2011; Sheppard et al., 2009).
Notwithstanding our previous argument in support of the value of school boards, we acknowledge that the voices questioning their relevance have steadily increased in many jurisdictions (Hess & Meeks, 2010; Land, 2002; Lewis, 1994; Dibbon, Sheppard & Brown, 2012). The most commonly articulated concerns include the failure of school boards to meaningfully connect with parents; public perceptions that they poorly represent the communities that elect them, and their apparent lack of effort or their inability to demonstrate their relevance to their constituents. As previously noted, several scholars (e.g., Fusarelli et al., 2011; Galway, 2006; Sheppard, 2012) have observed that some of these publicly expressed concerns may be related to the aforementioned trend over the past few decades, toward the consolidation of local school districts. In Canada, since the early 1990’s, provincial governments who are responsible for public education have significantly reduced the number of school boards and concomitantly the number of trustees, thereby greatly increasing the number of schools to be represented, the geographical region to be travelled and the population to be served by each trustee. It follows that these changes have made it increasingly difficult for individual trustees to connect with their constituents, at least in traditional face-to-face encounters. In that context, the central focus of this paper is to present the perspectives of selected trustees and school board directors/superintendents and executive directors of each provincial school boards association regarding (a) the relevance of school boards; (b) the nature of their connection with their constituents: (i) within school constituents (students, teaching professionals and support staff) and (ii) out-of-school constituents (parents, and other individuals and agencies), and (c) their perceived impact on public education and the work of schools.

---

3 The nomenclature for the sitting members of school boards varies by province or territory in Canada between schools board member and trustee. We have chosen to use the term trustee.

4 Although the nomenclature for the CEO of school districts varies by province or territory in Canada between director and superintendent of education, we have chosen to use the term superintendent.
Methodology

We adopted a research design that involves three participant groups: (1) school board trustees, (2) school district superintendents from Anglophone school boards in all Canadian provinces and territories, and (3) executive directors of each provincial school boards association. We collected participant data through survey and a series of focus group interviews in every province. In order to increase the validity of findings, we took considerable care to collect data from those trustees and provincial school board association executive directors holding office with the Canadian School Boards Association executive board in addition to school board trustees and school district superintendents from all provinces and territories. Three hundred thirty-one (331) school board trustees and 38 district superintendents from across Canada responded to the survey for a total of 369 respondents. As well, we conducted 21 distinct focus group sessions with school board trustees and school district superintendents over an 18-month period between December 2010 and June 2012. Each 60-90 minute focus group session included 5 to 10 participants. The focus group questions were developed through an extensive review of the relevant literature relating to school board governance and through information gathered from three consultation sessions: two sessions with school board trustees and superintendents of education conducted at the 2012 Canadian School Boards’ Association (CSBA) Annual General Meeting and one session with interested members of the Canadian Association for the Study of Educational Administration (CASEA) at its 2010 Congress.

The principal researchers (with some assistance from graduate students) collected data at different times and in differing locations and circumstances over the twelve-month data collection period (Meijer, Verloop, & Beijaard, 2002; Merriam, 2009; Miles & Huberman, 1994). Participant selection was conducted with sensitivity to gender, experience, ethnicity and regional geography.
Data Analysis
Data analysis of numeric and categorical data was consistent with generally established procedures outlined by Bok van Kammen and Stouthamer-Loeber (1998) and Fowler (1998). For the most part, we limited our analysis of the survey data to descriptive measures such as frequency counts and the calculation of mean scores using SPSS (2013).

Analysis of the focus group data for both studies followed the procedures described by Meijer et al. (2002); Merriam (2009), and Miles and Huberman (1994). We recorded each focus group session of 60-90 minutes, labeled each session with assigned pseudonyms for each participant, and subsequently had them transcribed by a professional transcriptionist. We analyzed the transcribed focus group data through the application of a qualitative data analysis program, QDA Miner (Provalis, 2011). Using this program, we coded separate data segments for school board trustees, executive directors of provincial school board associations and school district superintendents of education. Subsequently, we retrieved these coded segments and saved them as separate reports that facilitated the development of specific themes.

Though it may be reasonable to assume some bias in participants’ responses to our questions as all our study participants are school board/school district insiders, it is equally reasonable to assume that as individual elected representatives and appointed senior executives come and go with each election or appointment term and therefore are unlikely to have any long-term personal stake in the continued existence of school boards, the collection of their individual perceptions provide an important perspective of the overall worth of school boards.

Findings
School Board Relevance
As previously noted, in recent years many have observed a downturn in the perceived relevance of school boards in Canada. Given the dramatic population shift toward large urban centers and the resulting changes in school district configurations, school boards are now more dichotomous in their orientations, serving more, large urban populations and/or huge geographic rural regions. Because of these changes, some observers perceive school boards to have become anachronistic (Hess & Meeks, 2010). Within this
context, we sought the views of currently serving superintendents of education, executive directors of the provincial school boards associations and school board trustees regarding their perceptions of (a) school board impact, effectiveness, and what would be lost if school boards were eliminated and (b) the extent to which they perceive school boards are valued by the general electorate.

As previously noted, although some bias in favor of school boards might reasonably be expected, we believe the nature of our questions and the large distribution of responses of school board superintendents, provincial executive directors, and school board trustees provide important insights regarding school board relevance.

When asked, “compared to a decade or two ago, how strong and effective are school boards?” a school district superintendent in the Atlantic region indicated that she perceived school boards to be more relevant today than they were in the past:

I never worked directly with a school board twenty years ago, but just from the public perception, you seem to hear more from the school boards today than you did twenty years ago and…they seem…to have a higher profile in my opinion. They have become more vocal with respect to funding of education, for example, then they may have ten or fifteen years ago…. Certainly, within Nova Scotia they have become much more organized…than they would have been twenty years ago or even ten years ago.

In support of her colleagues view, another superintendent of education rejoined,

from the public perception, the value [school boards] bring to education…has …increased because education in this province has received so much focus and attention, and frankly, increased funding over the past five or six years…. I think the public looks really closely at what school boards do. Not from a taxation, money, governance, etcetera, not from that, but from the service that they provide for their children.

Responding to her colleagues’ comments as previously noted, a school district superintendent from New Brunswick lamented the elimination of school boards in that province:

[the government of New Brunswick] eliminated school boards [and as a result], many, many school areas and school communities now feel that their voice is not heard. They feel isolated, everything is done from Fredericton…and there are school councils, but they often can't get people to serve on them. So this local governance aspect of boards is a crucial component.

A superintendent from Quebec rejoined, “I would second that [because] in Quebec it is the only level of government that solely represents the English community, the only
level!” In spite of his stated support for school boards, he expressed concerns about current public perceptions of the value of school boards:

I personally don't think that the people understand what school boards do in a lot of cases. I think we have not done a very good job in helping them understand. I think they know what schools do, but I don't think they know what school boards really do. We are seen as … sitting in the big ivory tower, and furthermore, they don't know what … commissioners [school board trustees] or elected officials do.

Others expressed similar concerns relating to public perceptions of school boards’ worth. For instance, another district superintendent commented: “I think they are certainly recognized as the body that represents the schools in the … districts [in the province], but I don't know that they would have a lot of political clout.” Similarly, an executive director of a provincial school boards association in eastern Canada opined,

in [our province] school boards are experiencing less and less connectivity with the community and there is a lot of questioning about the relevance of school boards, so I’m not so sure that the community supports us as they once did.

Yet another executive director from a western province expressed a similar view:

In [my province]…in the rural areas there is still that very strong community support for the local school boards and their decision-making, but in the urban areas where most of the population is, there is not that support anymore.

Another observed that the school board for whom she worked was not highly regarded. In fact, it was her belief that they were not perceived as relevant, at all. Similarly, a superintendent of education in another province commented,

I've been part of a senior team for almost seventeen years and have worked in four different school boards in that capacity and I've worked with boards of trustees who have not been functional…and who have actually had a negative impact on the learning agenda…. If the board of trustees isn't focused on student achievement, isn't prepared to work together as a board team that sticks to that vision… then it causes the senior [administrative] team to spend an inordinate amount of time to try to keep some form of balance going and it disrupts. I've worked in situations that were so acrimonious that it would have been better to have no board at all and to work directly with government.

Similarly, somewhat as a summation of what she had heard from others in her particular focus group session, a trustee remarked,

that is a common theme across the country. The local autonomy that we had as trustees of school boards, which could be very reflective of the community, has been interrupted by a very politicized and centralized direction from our provincial governments which compromises quality I think.
Yet another trustee commented,

while society around us has changed we haven't changed. So now society is more questioning. Not that they disagree [with our decisions], they just have high expectations of the system. So they are asking questions, and when we haven't invited the community in and engaged them and we are still behaving in a way that was for a different time, that makes a disconnect.

Several others expressed strong views that for the most part, school board had lost the public’s confidence. For instance, a trustee observed,

when funding cuts come, you hear the people [say], “get rid of those school boards and save some money.” [They perceive] we are [focused on] consolidating schools and closing schools and busing kids long distances, and that is all they see us as doing. They never see us as doing good things [related to learning in schools].

In spite of the previously expressed concerns relating to public perceptions of the worth of school boards, when some of the same individuals were asked if they perceived school boards to be as effective and as strong as they were a decade or two ago, several responded immediately with an emphatic “yes”. Each acknowledged, however, that the role of school boards had changed. For instance, one superintendent commented, “They have different powers, but their importance to the communities is no less. If anything, it is more now than it was previously--to get that local voice!”

Another superintendent commented,

I've seen two sets of trustees who are both equally committed to the student achievement agenda and I've watched around me as boards struggle when trustees are not committed to that. Luckily, all of my experiences in senior administration in the last ten years have been positive ones where they have supported and committed to, right from the start, the student achievement agenda.

Similarly, a superintendent of education from British Columbia observed,

School boards can have a huge effect on the climate in a district. And that comes from how they approach the role or approach the job, what they see as their mandate and whether or not they view the role as an education role or a political role.

Speaking about his experience with his current school board, he perceives “a strong degree of advocacy for [local] communities:

Trustees, for instance, serve on committees such as the special education or a First Nations committee…. Their voices are brought to the school board table on behalf of their communities. So…one of the strong impacts that they have is that they bring those community voices to the table. We don't always get those voices coming through to us, so they…bring those voices.

A superintendent of education in Manitoba commented,

I think school boards are becoming more and more important even though there is that
public pressure to potentially eliminate them…. [If they were eliminated], I think you
would end up with a very bureaucratic system…. [and] you would lose a lot of
energy…at the school level.

Supportive of the previously articulated perspectives, a trustee offered,

I have been involved as a trustee for close to twenty years and I am thinking in the past
ten years…we have become more involved…. Prior to that, we were more rubber
stampers…. The [superintendent of education and other district officials] would
present stuff to us and would bring us ideas and things that we were going to do and
we would just rubber-stamp them… We would listen and would talk to…our
communities and stuff, but now we [have]…a much more active role than in the years
past.

In our view, the following comment by a superintendent of education in Manitoba
provides a suitable summary of what we heard from many participants throughout all of
Canada: “I'd say when they [school boards] are at their best, they are… ‘the keeper of the
flame,’ but you know there are some boards where the fire never got started.” Following
the previous comments, we observed many participants nodding their heads in agreement.

Our analysis of the focus group data reveals that the majority of our participants perceive
school boards to be relevant. It is equally clear that both trustees and superintendents of
education recognize that the majority of the voting public might not share their view. As
well, they acknowledge that the widespread school board focus on school system
restructuring that has resulted in the closure of hundreds of schools throughout most
provinces in Canada has fostered a negative public perception of their role. What is not
so apparent, however, is the extent to which current school board members recognize that
their engagement in school closures and system restructuring may be contributing to their
own undoing. There is good reason to suggest, however; that many of the “trigger
points” that have been the object of public backlash against school boards – school
closures and reorganization, loss of programs, teacher reductions, increased school
bussing distances – have, in fact, been driven by the so-called efficiency measures
imposed by their respective provincial governments.

**Connection with constituents**

In spite of the challenges resulting from both government-mandated school board
consolidation and school boards engagement in school system restructuring, school board
trustees indicated that connecting with and representing their constituents are among their most important roles (Figure 1). Fifty-six percent\textsuperscript{5} of our focus group superintendents of education (SE) and 50% of the school board trustee (SB) participants perceive school boards to be a voice for the local community regarding government policies and procedures and how they are implemented in local schools. Many in both groups believe, as well, that school boards ensure that school programs and activities reflect and maintain local values and culture (44% of superintendents and 39% of trustees); they believe they

\textsuperscript{5}This percentage and others that are based on focus groups participant responses identify the percentage of respondents who commented and shared similar views relating to particular questions, but it does not indicate that the remaining percentage of respondents shared contrary views. In case where contrary views were expressed, we have reported them.
provide an essential link between the community and local school district personnel who interpret and implement both government and school board policies (39% of participating superintendents and 33% of trustees), and they contend that they act as a buffer between government and local community (33% of both participating superintendents and trustees). As further evidence of their perceived connection with the community, 67% of school board trustee survey respondents specified that they engage parents and the larger community in determining district priorities for improving student learning (Table 1). As well, 80% of trustee survey participants indicated that they report to the community on progress in improving student learning and other district priorities (Table 2). In the context of each of the aforementioned roles, the majority of respondents (trustees and superintendents) perceive representation of and advocacy for parent and community expectations to be essential trustee roles. For instance, one school board superintendent commented:

When the advocacy piece is well lived, whereby they truly get what it means to listen to the local community, understand what the local community is saying and bring that to the board table where it doesn't just stay local, they somehow then have the ability to … take care of a larger geographic area…[and] their impact is huge. They understand how to represent the community and…how to be a corporate board and it's absolutely necessary…. I'm all for it, democratic voice, the voice of the people, oversight…. Where that doesn't happen, I think it becomes very, very troublesome.

Another observed,

school boards…provide a form of local governance that allows for representation by school groups, parents and so on in their various districts so that they have a voice and input that's useful in [the development of] policies and reactions to proposals.

A number of trustees felt that parents and school personnel placed value on their visits to local schools and their attendance at special events. Also, trustees in several jurisdictions indicated that they frequently receive requests from their constituents to attend school and advisory council meetings in schools in their electoral zone. Several emphasized that being able to maintain regular contact with constituents in the individual local schools is of central importance, noting that local contact allows trustees to bring local perspectives to the educational decision-making processes that might otherwise be obfuscated or entirely lost. For instance, one trustee from Newfoundland and Labrador opined that without school boards much of the educational decision-making would be centralized, thereby limiting the meaningful input from specific school communities:
You would lose out so much. You would lose the particular culture of the different regions…that translates into the values of that particular region…. How can a centralized power…[develop] policies that would affect Labrador City and St. John's, the same way? It is completely ridiculous!

A superintendent from Alberta indicated that she perceives her central role to be an advocate for public education in all the communities she represents:

I certainly wouldn’t want to see a provincial board. We’ve seen that in other settings and I don’t believe that works. Nor would I want to see an appointed board; I would just worry about the mechanics of that and whether [trustees] become political appointments. I think [elected trustees] add that value of the local community in their voice and guidance in that area.

Similarly, a Nova Scotia superintendent observed, “school board trustees are representative of the community--the values of the community--so the closer they are to the community the more the board understands what [that community] needs.” Another
commented, “a good school board can…foster local innovation and a good school board, because it is local, has a better chance to welcome and to accommodate local diversity.”

Correspondingly, a superintendent from Prince Edward Island opined that the lead role of school boards is to “mak[e] sure that policy reflects the needs, desires and wants of the community…. Trustees represent the community and are very quick to let the administration know what will go over and what won't go over.”

When asked what would be lost if school boards were eliminated, a school board provincial executive director from the Atlantic region responded, boards represent the shared power, the balancing of power and responsibility that was envisioned when quite some time ago people wrote the schools acts in various provinces. They deemed in their wisdom that you didn't need just one input into education; you need defined responsibilities and defined rights and powers at the local levels just as you need those definitions at the central level by government. So you know school boards are an important part of the living…that vision of a balancing of the rights and responsibilities.

A superintendent in Manitoba believes the board functions as… a representative group, [that allows] …educators…[and] administrators, to… hear the political climate out there; and…not just the political climate, but also the concerns. I don't know how we would go forward with decision making without somehow gathering that information from the community.

Agreeing with his colleague, a second superintendent from Manitoba commented, “it's good to have school boards who represent the people, and [who communicate] exactly what they want and what they need, and what their children want and what they need.”

Yet another superintendent (Manitoba) stated, I think [school board trustees] are certainly there to act collectively with the division mission and strategic direction, but they are also there as eyes and ears of their local areas. And I think that they are advocates for those cultures within our division, being a big geographical and socio-economically diverse division. Not to be parochial as a board member, but to bring forth issues through their constituents that we [superintendents] may not know otherwise.

Similarly, a superintendent from Saskatchewan observed, the people in Saskatchewan have high expectations that the board's going to be able to help [with two major issues]: [Ensuring] that their community through the school [1] provides an education for the kids… and [2] preserves the cultural roots of rural Saskatchewan.

School board trustees expressed similar perspectives, placing local representations as a central role of school boards. A trustee from Alberta believes “the main impact of school boards is being able to determine the educational needs of their particular community.”
She believes each community has different needs and to the extent that a trustee is elected locally by specific communities regardless of the geographic size or diversity, he or she has a mandate to work toward addressing the identified needs:

So just by way of example, if you have a community up North and the population is 80% aboriginal, there is going to be certain needs, certain types of delivery systems for education that may differ totally from what you would need in a big city like Edmonton…. And then with people who live in the community, but don't necessarily have kids in the school, they are more concerned quite often [with] the financial side of it…. They don't want their property taxes going up. They want to make sure [school boards] are being fiscally responsible and they are less concerned with what's actually going on in individual schools, other than maybe just as a casual interest if they see a story in a newspaper. So there are different publics that we are dealing with.

Another respondent opined,

We have to make education a public discussion… When [our publics] feel like they are engaged, they will come out and they will vote because they'll care. And they will be knowledgeable when they do…vote, that [the individuals] they vote for are going to make well informed decisions that are in the best interest of the local community.

One trustee from a small city, provided an overview of how school boards can facilitate local partnerships in support of public education:

We have gone into meetings with the city two or three times a year. We've gone into meetings with the chamber of commerce; we've gone into meetings with [another school board] and we bus together, so we use those efficiencies…because we are partners and we are friends and we trust each other. Also, we've entered into talks with our local college and then maybe a third partner…will be with health…. I don't think [the provincial government] could have done that from [the capital city]…. I think we had to be based in the local city--we all know each other, we respect each other and we work toward what is best for our entire community because that is what we value.

When the focus group facilitator asked if an appointed board could fulfill the same local purpose, the same trustee stated emphatically,

that would be a disaster…because…as I said earlier when we go and meet with our municipal counsellors and we go and meet with our MLAs, we are coming to them as equals. We have been elected and they know that.

Clearly, the majority of trustees and superintendents of education who participated in this study are convinced of the merits of school boards and the essential role they play as community and parent representatives. Although they perceive relatively high levels of current engagement between school boards and their constituents in determining district
priorities and in their reporting to constituents the school district progress relating to student learning and other board priorities, 61 percent of our respondents indicated that they would prefer an increase in the level of public and parent engagement in education.

**School board impact on the work of schools**

Eighty-four percent of the 369 school board trustees who participated in our study indicated that they believe school boards have a major impact on what goes on in schools (Table 3). They observe that school boards make policy decisions across a broad spectrum that includes school improvement, strategic planning, the provision of safe caring learning environments, budgeting, human resource management, the application of technologies and innovation in support of in-school learning, student achievement, etcetera (Table 4). Arguably, many of these items could be—and are managed in some jurisdictions—by a central government; however, the majority of our study participants (trustees and superintendents of education) believe that similar to other local authorities such as town and city councils, locally elected school boards are better positioned to make decisions based on locally identified needs.

Given our findings that 67% of school board trustee participants believe that their school board engages the local community in determining district priorities for improving student learning (Table 2) and 55% indicated that school councils provide input into their decision-making processes (Table 5) across a broad spectrum of policy decisions (Table 4), it appears that school boards make an important contribution to the democratic decision-making relating to public education.

Conclusion

Because this study is dependent on perspectives of school board insiders (superintendents of education, provincial school board executive directors, and local school board trustees), it is useful at this point to refer to our methodology. Although it can be argued legitimately that some bias or self-interest in support of school boards can be expected, the interpretive nature of the qualitative element of a mixed methods design does not purport to provide an “objective” analysis of the phenomena under study. The analyses of the focus groups and interviews presented here are the researchers’ representations of the lived experience of the participants who agreed to be a part of the study. The fact that we were able to include such a large number of trustees and superintendents in the research, and the pan-Canadian nature of the study, serves to further validate these representations. Alternatively, it may well be reasonable to question the extent to which other (external) individuals or groups would have the knowledge or insight to better assess school board relevance and their level of connection with their constituents.
Nevertheless, we acknowledge the nature (and some may say limitations) of our methodology and therefore, the claims we make in the conclusions presented in this discussion.

Throughout the course of this study, many trustees and superintendents throughout Canada expressed concern with the tendency of provincial governments to reduce the number of school boards and therefore increase the size of the constituencies that trustees must represent. They perceive that the increasing geographical size and the number and diversity of the constituencies that school boards must serve have contributed to low voter turnout for school board elections and public expressions of concern about the value of school boards.

Having studied the role of school boards and school district for several decades, we share the above noted concerns. Nevertheless, we remain convinced that even school boards that represent large geographical regions contribute meaningfully to maintaining a somewhat local democratic element to public education. Sheppard (2012) argues, the corporate managerialist approach that is typical of many OECD countries is not conducive to meaningful school reform…. Within that approach, rather than work in partnership with school boards, some governments have chosen to either control them or to eliminate them altogether…. While such an approach may give the appearance of improved efficiencies and heightened levels of accountability, and may even produce short term gains in test scores, evidence…suggests that the engagement of such an exercise over a long period of time is likely to stifle meaningful improvements in teaching and learning processes…. [Furthermore], what is most certain is that constant government imposed school board restructuring and the imposition of more centralized government control that is accompanied by an intensifying focus upon a narrowly defined student testing regime are not in the long term best interest of authentic student learning, social justice, or the continued development of an enlightened democratic society.

These findings show that both elected trustees and professionals working within the school district apparatus play a vital role in sustaining a local democratic element in Canadian education. One of the two researchers involved in this work spent a significant portion of his career as a senior public official in a ministry of education while the other held a parallel position in a school district. We observe that school districts provide an important conduit for what people in local communities and regions expect from schools. In one poignant example of how this plays out in school districts, one school trustee observed:
We still do a lot of stuff around programming and things that are unique and I think in British Columbia; [one of these is] the Haida Gwaii immersion program to keep kids engaged in schools to make sure they graduate. That’s not going to come out of central office somewhere where it is planned in Victoria. [It] has to come from a local community. So there is still a role [for school boards], but these [are] tensions that have developed because of …centralization.

Our work with trustees and administrators across the country show that they express concern over centrally determined education policies, that may be well-intended, but fail to account for local needs and preferences in children’s education, and for ethnic and language considerations. From local timetabling issues to community traditions and expectations for regional programming, the decay of local school governance is perceived to be detrimental to community interest for education. Interestingly, these are some of the same reasons for the constitutional responsibility for education by the provinces over the federal government. This respect for local authority over education remains one of the main principles proffered by the Council of Ministers of Education, Canada in the ongoing federal-provincial tussle over educational jurisdiction (Galway, 2006).

The consensus view of the participants in this study is that school boards and their enabling structures serve to protect the diversity of community and regional interests that is characteristic of the Canadian mosaic. Therefore, if we are to continue to enjoy good schools that produce well-educated and informed citizens, regional authority over education must be sustained. At the provincial level, this principle is as important today as it was when it was articulated 150 years ago during constitutional discussions about which aspects of civil governance would be allocated to the provincial and federal levels of government.

Having unquestioned conviction regarding the merits of democracy, yet acknowledging the truth in the words of Sir Winston Churchill "that democracy is the worst form of government except all the others that have been tried" (National Churchill Museum, n.d.), we are convinced that both elected school boards and the school districts that they govern matter a great deal. They contribute meaningfully to good financial management, enhanced programming, improved teaching and learning processes, the provision of safe and caring schools and ultimately, high quality public education for all students.

Abstract

Educators seek ways to improve the learning process such as stimulating students’ interest in subject matter, helping students visualize concepts, and heightening student-student and student-instructor engagement and collaboration. One valuable approach is through the application of technology.

_Educational technology_ is the use of technological resources, tools, and related instructional strategies to support and transform teaching and learning. Other terms for educational technology include _instructional technology, information communication technology (ICT),_ and _learning technology._

The objective of this article is to present key concepts behind educational technology and its use by instructors and students as foundation for those interested in integrating educational technology effectively into their classrooms. These key concepts include the background (provides a discussion of the historical context, benefits and challenges) and types of current and emerging educational technologies that can support teaching and learning.
BACKGROUND

Historical Perspective

In the 21st century, educators often associate educational technology with digital technology. However, there is a long history of technology innovations for the classroom before computers.

One could begin the historical context of today’s educational technologies with the printed book which was in general use during the 1400’s. According to Wilson, Orellana, and Meek’s interactive timeline (2010), the horn book, a wooden paddle imprinted with lessons, was present in early classrooms circa 1650. It was followed by such technologies as a magic lantern (a forerunner to the slide projector), the chalkboard, the postal service (which later supported correspondence courses), pencil, mimeograph machine, language lab equipment and many others. Arguably, modern educational includes filmstrips, overhead projectors, tape recorders, radios, televisions, film and other such devices. Sometimes, educational technology is specifically designed for education and contains subject-specific content; sometimes, educators repurpose the technology to support learning goals.

Initially, the focus of these past educational technologies was a one-way delivery of content, with no technological means of student feedback. Computer assisted instruction—with some electronic feedback—gained popularity especially in the 1970’s. The advent and development of the Internet and World Wide Web, in addition to providing a growing ubiquity of diverse content, offers rich opportunities for interaction with this content. These technologies provide opportunities for interaction between the instructor and student and among students anytime and anyplace.

Benefits

Roeblyer and Doering point out “old integration strategies are not necessarily bad; new strategies are not necessarily good” (2013, p. vii). Likewise, some instruction may benefit from technology; other instruction may not. In any instructional decision, paramount is the value added of integrating a specific technology in a specific way to meet specific student learning needs and curricular objectives. In this light, this section examines the potential benefits of educational technology particularly when there is an alignment of the technology with the desired learning outcomes.

Alignment with Different Learning Styles. Students learn in different ways and have various learning strengths, areas needing improvement, and interests. One way educational technology supports and transforms learning is by facilitating options for instructors to provide students with multiple paths to learning content.

Bonk and Zhang (2008) have suggested that there are four types of learners:

- Reader or verbal learners learn through written texts and spoken explanations.
- Reflective or metacognitive learners learn through observing and thinking about their learning.
• Visual learners learn through images.
• Tactile/kinesthetic or experiential learners learn by moving around or engaging in hands-on activities.

Educational technology supports the needs of each type of learner:

• Reader – Examples include e-Books, the World Wide Web, and educational podcasts (auditory content). If professors record their lectures, students may listen to them multiple times to increase understanding. Speech-to-text or text-to-speech capabilities, as well as online dictionaries open verbal opportunities for some learners. Learners can publish online their own Websites, books and podcasts.
• Reflective Learner – Examples include blogs (online journals) that allow students to record insights about their learning experiences, and then deepen understanding through feedback from others, within and beyond the classroom. Online discussion boards allow students to think for a time period before responding to a question asked rather than instantly raising or not raising their hand.
• Visual Learner – The Web provides a wealth of visual materials for learners such as videos, photography, and interactive diagrams. Through search tools, learners can easily find images and videos on most academic subjects. Online and mobile applications as well as purchased software and hardware enable students to create their own visualizations of concepts such as concept mapping tools, drawing and animation tools, timeline creating software, and digital storytelling tools.
• Tactile/Kinesthetic learner – Educational technology addresses this type of learner using virtual worlds, online laboratories, and web simulations. Students can use digital cameras, digital scientific probes, and other mobile technologies to move around their environment, take photographs or collect and analyze data that can then be immediately displayed. Even drag and drop technology on smart interactive white boards and in computer games provides kinesthetic learning.

Many other models of learning modalities can be helpful to educators for understanding how technology supports different learners and their learning needs. For example, Howard Gardiner’s *Theory of Multiple Intelligences*, posits nine distinct intelligences that people possess in varying degrees: (1) Linguistic, (2) logical-mathematical, (3) musical, (4) spatial [visual], (5) bodily kinesthetic, (6) interpersonal, (7) intrapersonal, (8) natural, and (9) possibly existential (Gardiner, 2004, p. 4.) According to Gardiner, too often, educators have focused on just the linguistic and logical-mathematical (Gardiner, p. 5), while each of these intelligences can be activated and strengthened to cultivate learning. Johnson and Lamb’s website page on multiple intelligences (2007) provides multiple examples of technologies that can support learning by activating and strengthening these intelligences for learning.

CAST (formerly the Center for Applied Special Technology) focuses its approach to learning on *universal design for learning*. It asserts the value of three principles to open up access to curriculum for all learners, including those with learning disabilities.
providing students with multiple means of representation of concepts;
allowing students multiple means of action and expression to demonstrate what they know; and
multiple means of engagement to keep students motivated. (CAST, 2011.)

Each of these principles can be implemented through different technologies, as described on CAST’s Website. For both Gardiner and CAST, as with Bonk and Zhang, educational technologies have the potential to help meet students’ diverse learning needs and preferences and to build new learning skills.

Engagement for Learning. Technology has the potential to transform learning through engaging students, but technology does not guarantee engagement. Also, engagement is a necessary, but not sufficient component of learning. Examples of poor teaching techniques with technology include tedious lectures by college professors who read from their PowerPoint slides, or whose slides have too many bullets and words and are hard to read. Likewise, students can be tasked to answer factual worksheets online that could just as easily be placed offline. Educational technology can make learning engaging when the instructor integrates the capabilities of the technology wisely and creatively.

The application of educational technology can facilitate engagement in learning by providing new vehicles for the exchange of information among teacher and students. These include classroom polling devices (also called audience response systems) where students can vote, prioritize elements, and perform open quizzes where the instructor and student can receive immediate feedback. Technology also makes it possible to provide multiple channels of communication among instructors and students to inspire learning beyond the classroom.

Examples of just a few ways educational technology can strengthen student engagement and transform learning include:

- Providing access to real audiences for student writing and providing new options for feedback online
- Fostering online connections between the students and immediate, up-to-date information and real-world problems
- Applying critical/creative thinking skills to a wealth of primary documents online, much of which were previously unavailable but now have been digitized.
- Eliminating student frustration by allowing students to engage in more challenging tasks through automating manual tasks.
- Expanding possibilities of collaboration and social learning, both within and beyond the classroom through online collaborative tools and social media.
- Providing multiple avenues for electronic publishing, enabling students to produce polished communication that inspires pride, while requiring creative decision making, across media.
Educational technology can also foster personalized learning and learner control which instructors can nurture. Even before Web 2.0, the hypermedia of the World Wide Web allowed students to choose which links to follow depending on their objectives and interests and create their own learning paths. Now, students can interact with some of Internet’s ubiquitous content by responding, asking questions, generating ideas, and collaborating. Learners can further structure their learning by signing up to follow someone’s blog or twitter feed, by constructing lists of their own resources through an aggregator that collects and delivers articles on a topic a student designates, or by joining a network of people on a certain topic they are studying. The term *personal learning network* is often used to describe this approach to learning.

Some educators have found exciting ways to provide learning through the use of learning games, simulations, and virtual worlds. As early as 2001, Marc Prensky explained how digital games might promote student achievement (p. 106) by providing enjoyment, structure, motivation, feedback; by having clear outcomes; and by involving problem-solving that sparks creativity. Refer to Klopfer, E., Osterweil, S., and Salen, K. (2009) for additional examples.

**Accessibility.** The role of educational technologies in providing accessibility to learning has several dimensions. First, learning is not limited to a classroom. Students can access educational resources anytime and anywhere as long as they have a computer or mobile device that is linked to the Internet. Moreover, institutions that provide distance education utilize an online classroom application called a learning management system (LMS). Students from global reaches can access an LMS and access course content, participate in discussions, take quizzes and exams, communicate with instructor and fellow students via its messaging system, and submit research papers for review by the instructor.

Another way educational technology provides accessibility to learning and the curriculum is through assistive technologies. According to the Public Law 108-446, Individuals with Disabilities Education Improvement Act of 2004, which included amendments to the Individuals with Disabilities Act of 1997 (IDEA), assistive technology is defined as follows:

"Any item, piece of equipment, or product system, whether acquired commercially off the shelf, modified, or customized, that is used to increase, maintain, or improve the functional capabilities of a child with a disability." (Public Law 108-406, Section 602.1)

IDEA mandates that assistive technology be considered for each child identified with a disability.

Some assistive technologies can help students effectively use computers and the Internet but assistive technologies include a wide range of devices that can help students communicate, learn, be mobile. These technologies support both physical and cognitive disabilities. Assistive technologies include simple devices such as pencil grips and more complex devices such as screen readers and electronic aids to daily living.

Web accessibility is another concept that opens information and curriculum to all learners. It refers to ensuring those with disabilities can use the Web: “that people with disabilities can perceive, understand, navigate, and interact with the Web, and that they can
contribute to the Web.” W3C.org provides guidelines for making the Web accessible to all, such as providing labels (alt tags) for images, transcriptions of audio and video, and clearly worded links that screen readers can describe. (W3C, n.d.)

Challenges

Cost. According to the American Council on Education as cited by Bradford, Prociello, Balkon, et al. (2007), total expenses related to higher education telecommunications are estimated in the neighborhood of $7 billion dollars. Acquisition of educational technology is often a costly investment. For example, average first-year costs for a learning management system typically range from just over $26,000 to $192,350. (Cobb, et al., 2011).

One trend is towards open source learning management systems such as Moodle. The software licensing cost of Moodle is nil; however, there many implementation and hidden costs such as setting up and customizing the application for the particular institution. Institutions sometimes join together in purchase options to lower costs.

Technical Issues. Unexpected technical glitches may occur whether caused by an individual computer or user, an internal server malfunction, or a regional Internet breakdown, or other obstacle. Browser and platform incompatibilities also cause problems. Organizations often set up a technical support groups to address these concerns, and instructors often prepare back-up plans.

Resistance to technology. Some students and teachers have a deep fear or dislike of technology. They insist that the traditional classroom lecture approach to learning is optimal and that technology adds minimal value in learning. The term, technophobic, is often used for this attitude.

Reasons for resistance include fear (that the technology will break down, students will know more than the teacher about technology, students will not need the teacher any more); time (a new technology takes time to learn), lack of sufficient professional development, and a general resistance to change.

Digital divide and digital equity. The digital divide refers to disparities or inequalities in access to and use of digital technologies, particularly computers and the Internet, based on such aspects of background as race/ethnicity, poverty, age, gender, country or other factors. Access generally relates to affordability issues and the type and quality of hardware and software students have available to them in their organizations (schools) and at home. Use refers particularly to the purposes for which the instructor and students integrate technology into learning. For example, are students in poorer areas using technology for mastery of factual information and students in wealthier areas using technology for more challenging tasks involving critical and creative thinking and production?

In 2006, Henry Jenkins and colleagues identified a new type of digital divide among students, the participatory gap. Jenkins argues that those who do not develop skills to communicate and collaborate with others online will be left behind. (Jenkins, et al., 2006).
Challenges in acquiring media literacy skills. Developing students’ and instructors’ media literacy skills is a growing need for learners across the age spectrum. Media literacy was important in the past, but as new media rapidly emerge along with new conventions, and as the amount of unvetted information across various media continues to grow exponentially, students need new skills to access, select, evaluate, synthesize, and create information. Students who use technology and media do not necessarily possess the skills to use technology for learning purposes or to use it critically. In the media saturated world of today, recognizing the advantages and limitations/risks of using each medium for a particular purpose becomes of paramount importance and must be taught. In addition, while the written word is as important as ever, interpreting and communicating across media and doing so effectively represents an increasingly important skill. Reading on the Web is also a learned skill, particularly given the non-linear (hypermedia) nature of the Web. The New Media Consortium has listed digital media literacy as one of the main technology challenges in both K-12 and higher education for several years, in its Horizon Reports on Technology. (K-12 Report: 2011, p. 5; and 2012, p. 9. Higher Education Report (2012, p. 9; 2013; p. 9). Teaching content through technology and teaching about technology and how to use it effectively often are deeply intertwined.

Security issues. Both educational technology and users may be vulnerable to online and physical threats.

Hackers may penetrate an institution’s learning management system, database system, or website and access confidential information such as grade books, personal information, or solutions to assignments and tests. Hackers have also been known to vandalize educational websites and conduct denial of service attacks on online academic sites. Hactivists, or hackers with a social cause in mind, may attack collegiate sites to protest policies and actions such as tuition hikes. Identity theft against individuals, including students and faculty, is another type of security violation that must be protected against. Overall, network security is a major component of an institution’s technology infrastructure when employing educational technology.

Physical threats to classroom technology include stolen or vandalized computer equipment. Misuse of the technology may result in malfunctioning equipment. One must not overlook damage to the technology due to natural disasters such as exposure to extreme temperatures and humidity, fires, floods and hurricanes.

Security also involves the ethics and safety of its users. Users of an institution’s network generally must sign an acceptable use agreement to use technology honestly and responsibly. Acceptable use policies require instructors, students, and/or employees to agree to follow a set of rules prior to being granted access to the network. These rules typically include not using the system to violate the law, not breaking into other accounts, not sending out viruses, worms or spam, and not harming others (e.g., through cyber bullying). Sometimes, rogue instructors and students can create serious issues by not complying with these acceptable use policies. Digital citizenship or how to behave responsibly, ethically, and with cultural sensitivity need explicit instruction.
TYPES OF EDUCATIONAL TECHNOLOGY

*Anti-plagiarism applications.* A key tool for instructors, anti-plagiarism software is used to check student assignments against a database of webpages, previously submitted student papers, library databases, and various journals and publications. The amount of matches translates into an index that the instructor uses to trigger an investigation although instructors also use this type of software to help students become better academic researchers.

*Augmented reality.* Augmented reality represents the layering of computer-generated content onto the physical, real-world environment. This content could be sound, video, graphics or GPS data. One example is a visit to a historic battlefield and having computer video and images displayed at specific locations using the student’s mobile device.

*Blogs.* These are webpages made up of frequently updated posts that are arranged in reverse chronological order. Examples of content contained in blogs include: opinions, news, photos and videos, poetry, mini-essays, project updates and fiction. Blogs can be used to encourage student reflection and sharing.

*Cloud computing.* Cloud computing is defined as a “model for enabling ubiquitous, convenient, on-demand network access to a shared pool of configurable computing resources (e.g., networks, servers, storage, applications, and services) that can be rapidly provisioned and released with minimal management effort or service provider interaction” (Mell, et al., 2011) Among its capabilities, cloud computing transfers part or the entire technical infrastructure (such as resources, software, and information) from the organization’s physical location to the “cloud” or a remote data processing and storage location via the Internet. This is an example of the software as a service (SaaS) cloud delivery architecture model (Cloud Security Alliance, 2009). The cloud can be used in an education institution to manage its resources including its learning management system, e-books, administrative files and other infrastructure elements.

*Computer and mobile labs.* Students and instructors benefit from computer and mobile labs that have preloaded software and provide access to learning management systems and Internet sources. Computer labs, with enough computers for an entire class or group of trainees, may be located onsite in particular rooms or in libraries. These collections of networked computers typically are equipped with a printer and needed accessories such as headphones and microphones. Alternatively, institutions may have mobile labs, which contain laptop or tablet carts that can be brought into an instructor’s particular classroom.

*Computer-based simulation software.* Simulations in the classroom engage students actively in a problem-solving scenario for learning. Students make decisions which will affect the outcome of the scenario. In one example, the use of system dynamics computer simulation allows students to experience the Great Depression by creating a model that reflects the environmental factors during the New Deal era. Students learn the complex interrelationships of these factors and how they play out in the economic outcomes of their decisions. (Chilcott, 1996) Other examples of computer-based simulation include virtual surgical dissection and stock market simulations.
Computer-based training modules. Students can sometimes take self-paced training sessions with textual and multimedia content, mixed with interactive activities and feedback. Often the student has to take a quiz at the end of each module to show mastery of content.

E-books and e-readers. An e-book is an electronic form of a printed book. Individuals access e-books through a small portable device called an e-book reader or a computer screen. E-books have a high capacity to hold content and thus take up much less physical space than a collection of print books. E-book readers also contain many built-in features. Some duplicate what can be done with a print book such as underlining and making comments. Features on an e-book not available when reading a print book include automatically saving one’s place, accessing glossaries, search tools, and sometimes linking to supplementary materials. E-books can be purchased instantaneously from any location with a connection to the web.

E-portfolios. E-Portfolios are virtual online repositories where students can provide evidence of their learning over time. This evidence takes the form of reflections, files, pictures, multimedia, blog postings, and hyperlinks. E-Portfolios can also be used for presentations, course-ending deliverables, case studies, documentation for institutional assessment and accreditation, and job-seeking resumes.

Laptops and tablets. Laptops are ubiquitous particularly in high school and college institutions. Its compact design, high capacity, wide range of functionality and inherent mobility makes it a critical tool for any student. Tablet computers are smaller, and offer unique capabilities including a touch screen.

Learning management systems. Both onsite and online classrooms utilize learning management systems for teaching and learning. Features include course content including the syllabus, class discussion areas, assignment areas, class announcements, e-mail and classroom messaging, calendaring, tests and quizzes, gradebook, and access to resources such as a library and university policies.

Mobile applications (apps) for education. Typically available for smartphones and tablet computers, mobile apps are software programs specially designed for these platforms. Mobile apps have been used to support educational purposes across disciplines. They also serve as tools for textbook price comparisons, time management, dictionary and grammar guides, scientific calculators, and language translation. These apps also serve as an extension to the learning management system where they allow students to download or interact with course content and administrative tasks.

Online office suites. Online office suites include word processor, spreadsheet, and presentation functionalities where users create and edit documents completely online. Also, these suites have collaboration capabilities which allow multiple users (including students) to review and edit each other’s online documents synchronously and asynchronously. These suites are useful for collaboration in team projects. Other uses include project sign-up sheets, student-designed surveys and for synchronous brainstorming.

Open educational resources (OERs). OERs, according to University of Maryland University College’s Information and Library Services Website (2013), are “any type of
educational material that’s freely available for teachers and students to use, adapt, share, and reuse.” OER’s include a range of learning materials, from full courses to course content, syllabi, articles, videos and other multimedia; free software tools; and implementation documents. See UMUC’s list of OER resources, as well as advantages and disadvantages of using OER’s on its library’s website. Creative Commons Licensing allows authors and creators to identify how they want other users to use their work (see CreativeCommons.org).

**Podcasts.** A podcast is an audio or video file that has been made available on the web. Interested parties can subscribe to a podcast, and the podcast can subsequently be automatically downloaded to one's computing device. Then the file can be transferred to an iPod or any mp3 player for listening or viewing purposes. A podcast can be educational material such as a lecture, a book reading or a training film. It affords students mobility when accessing the content.

**Social networks.** These serve a variety of communities consisting of Internet users. The community members often share a common interest or activity such as education and educational technologies. Social networks offer a wide range of capabilities including personal profile information, e-mail, instant messaging, customized interface, newsfeeds from friends, photo repositories, virtual gifts, external applications, and many others. Organizations and individuals also offer professional learning networks for those interested in particular subjects relevant to their professions.

**Video and image-sharing sites.** These are where people can view, upload and share video clips or photographs. Educational and disciplinary organizations, schools, and individuals often create their own education channel on video sites. These sites also provides for creative competitions with corporate sponsorship. Students can find rich resources on these sites for learning.

**Virtual worlds.** Virtual worlds allow students to develop their own persona in the form of avatars, and interact with others in an online environment. In the virtual world, students can discover new worlds, build their own environments, create social relationships and transact in an economy using virtual currency. Students enjoy new experiences such as flying while learning. The virtual world allows users to participate in economic, social, fantasy, and learning activities. (Mennecke, 2008)

**Web 2.0** refers to the term coined by technology publisher Tim O'Reilly in 2004, which describes online applications that allow anyone to publish, collaborate and share information and content. Web 2.0 technologies used for education purposes include wikis, blogs, social networks, and video and image-sharing sites. Other examples of Web 2.0 applications include:

- Mini-blog sites that have word limits and permits “following” the postings of an important figure or group
- Audio and video messaging tools that facilitate student-student and student-teacher synchronous communication across the globe for free (see also, web conferencing)
- File syncing software that allows the remote storage of content, accessible from any device
• Slide presentation sharing sites that serve as repository for educational content
• Social bookmarking and annotation tools that help students share links to resources
• Tools for note taking and web clipping for capturing content
• Screen capturing tools for use in student assignments and instructor presentations
• Audio editing tools for use in manipulating sound clips
• RSS readers (Really Simple Syndication) to facilitate feeds
• Easy-to-use online survey and quiz tools

For examples of other types of tools, as well as specific names of tools in each category, see such websites “Cool Tools for Schools” (2013) and “Free Technology for Teachers” (2013).

Web Conferencing Software. This communication tool facilitates real time education and training including lectures, sharing presentations, websites, and desktop applications, and collaboration and dialogue. Web conferencing software delivers audio and often video content. Instructors use this tool to engage the student live via educational content delivery, brainstorming, question-and-answer sessions, discussion opportunities, office hours, tutoring and mentoring, instant messaging and other activities.

Wikis. These are web sites that allow multiple users to easily add, remove, edit and change content in same document. It has been proven useful for a group of people to work together on a particular task asynchronously (“same place, different time”). These are useful for collaborative projects in the classroom such as group writing assignments, task management, student portfolios, science projects and proposal development. The collaborative encyclopedia, Wikipedia, is an example where individuals can add or revise articles that cover a wide range of topics.

FURTHER RESEARCH DIRECTIONS

A key educational trend involves massive open online classrooms or MOOCs which appear to be changing the landscape of education. These are high volume online courses that are free to anyone. Students have the chance of being taught by prominent professors from educational institutions at no cost. Leading companies behind this educational trend include Coursera, Udacity and edX. In these MOOC’s students have the potential to converse with students from around the world. Some universities are currently exploring ways to provide credit for these courses, but currently, because of the high volume and often the lack of an accompanying certification of completion, these courses have mostly been used for self-learning. However, this concept is rapidly evolving and appears to be a potential disruption to traditional educational institutions.

New technologies to support this concept are expected to be introduced and tested. The technical requirements include scalability to support large number of students, multimedia technologies to enhance the delivery approach and communications capabilities for attaining a global reach.

Another important area for research and exploration is measuring precisely the effectiveness of educational technology for improving learning. A particular challenge in this
type of research is separating out the role of the instructor from the functionality of the educational technology.

**CONCLUSIONS**

There will be new, innovative and useful ways to utilize technology to improve the quality of learning for students and heighten the effectiveness of instructors. When applied properly, technology will mean higher levels of interaction and productivity, increased accessibility, and improved efficiencies for everyone involved. The future looks very promising as the educational technologies grow and evolve to better meet the needs of students, educators and administrators.
REFERENCES

**ADDITIONAL READINGS**

**KEY TERMS AND DEFINITIONS**

Assistive technology: Tools and approaches use to help the functional capabilities of a person with a disability navigate and utilize computer devices.

Blog: Web pages made up of frequently updated posts that are arranged in reverse chronological order.

Creative Commons licensing: Creators are allowed to retain copyright and receive credit for their work while allowing others to copy, distribute and make certain uses of their work.
Digital divide: Disparities or inequalities in access to and use of digital technologies, particularly computers and the Internet, based on such aspects of background as race/ethnicity, poverty, age, gender, country or other factors.

Educational technology: Use of technological resources and tools to support and transform learning.

Learning management system: An online application focused on teaching and learning. Features include course content including the syllabus, class discussion areas, assignment areas, class announcements, e-mail and classroom messaging, calendaring, tests and quizzes, gradebook, access to resources such as a library and university policies.

Media literacy: a collection of communication competencies including the ability to access, analyze, evaluate and create media in a variety of forms including print and non-print formats.

Personal learning network: An environment where students can interact with some of Internet’s ubiquitous content by responding, asking questions, generating ideas, and collaborating.

Virtual worlds: An alternative universe that resides on the Internet which allows users to develop their own persona in the form of avatars and interact with others in an online environment.

Wiki: A web site that allows multiple users to easily add, remove, edit and change content in same document.
Using the Urban Environment as a Landscape for Learning

Learning Science in an Art Museum and a Department Store
Mary Jo Grdina

The introduction of the *Next Generation Science Standards* makes it even more imperative that we seek ways to show how science is done in the real world. Many groups of professionals are exploring ways to motivate young generations, especially women and minorities, to pursue STEM careers. In this presentation we will review research on learning in informal settings, share the history of *two* projects, and propose science lessons. Long before STEM became STEAM, we have been exploring physics in an art museum. With funding from Subaru of America, we have developed and piloted an iPad App that supports a traditional guided tour of *Physics at the Art Museum*. The four learning activities tested focus on Newton's Third Law, Center of Mass, Torque (Rotational Equilibrium), and the Nature of Color. We use artifacts found in the Philadelphia Museum of Art but the approach can be adapted to any art museum.

Given a choice of going to a mall or to a science museum, which will your students choose? The second part of this presentation describes one such initiative. *Science and the Magic of Macy's*, funded by the National Girls Collaborative Project in 2009, describes ways of learning about science in a department store venue. Again, we use Macy's in center city Philadelphia but the approach can be adapted to any department store.

Sport Science in the Urban Environment
Penny Hammrich

This program addresses the creative diversity inherent in learning by using sports as the context through which scientific principles can be explored. Through the vehicle of sports not only are students learning the underlying principles of science embedded in the mechanics of performing a sport; but also, they are learning the scientific principles in an atmosphere that embraces the psycho-social-creative-emotional connection to learning. For instance, everyday students learn how to ride a bike, throw a ball, and/or jump rope. They learn these activities in an environment that is non-competitive and non-threatening academically. What they are not aware of is the scientific and mathematics principles laden in performing these activities. In the classroom students learn these scientific and mathematical principles in a context that is foreign to their everyday experiences. They learn about the trajectory of a golf ball without connecting this principle with the actual practice of hitting a golf ball.

What is unique about the concept of this program is that the academic and the everyday experiences of students can be bridged through the creative process of using sports as a mechanism to learning science and mathematics. By using sports
as a creative vehicle for learning scientific and mathematical principles, the program is responding to the call for creating innovative and creative programs that provide access to the latest strategies in promoting science literacy. The following sport science concepts will be discussed:

<table>

A Candid Inquiry into Ethical Dilemmas
Constance Lyttle

During these times of unprecedented kinetic mobilization of family constellations, students with diverse backgrounds and experiences offer new challenges to educators. Correspondingly, educator diversity has begun to mirror that of their students. The possibility for conflict exists in most fields and ethical dilemmas occur daily in school environments, especially in the diverse environment of the urban classroom. Teachers of students with disabilities are continually challenged to make split second decisions, often mislabeled by Monday Morning Quarterbacks as ‘right and wrong’ or ‘good and bad.’

Fortunately, the teaching profession provides educators with professional standards to guide their ethical decision-making. Unfortunately, teacher preparation programs have given little attention to the application of these ethical standards. Even more pointedly, although professional associations are supportive of special educators providing professional standards, research shows that special education practitioners neither own a copy of, nor employ, the standards. See Rock, S. L. (1992); see also Cobb, H. B., & Horn Jr., C. J. (1989). Consequently, preservice and inservice teachers are unaware, not only of their field’s ethical standards, but also, of the best practices for resolving ethical quandaries. See Paul, French & Crangston-Gingras (2002); see also, Paul, Kane & Kane (1996). Consequently, teachers are left to their own devices and are periodically vulnerable to charges of professional conduct violations.

Session participants will review professional educator standards, apply them to commonly occurring ethical predicaments and gain an awareness and understanding of acceptable and unacceptable ethical behaviors, while discerning their own preferred strategies, thus avoiding potential liability accusations and ethical missteps.
Using a Flipped Classroom to Train Pre-service Teachers  
Lori Severino

The Drexel Special Education program is using our partner k-8 school to train pre-service teachers on increasing literacy skills in urban environments. Our Literacy in Special Education course is divided into two sections, one that focuses on the k-8 environment and one that focuses on the 7-12 environment. Students that take the k-8 literacy course on campus are given the opportunity to work with elementary aged students in a response to intervention setting. This particular course is a flipped classroom in which pre-service teachers learn the concepts in the five areas of reading: phonemic awareness, phonics, vocabulary, fluency and comprehension in an on-line environment. During their scheduled classroom time, pre-service teachers run a tier 2 literacy intervention at our partner elementary school.

During their time in the elementary school, the pre-service teachers work one on one or in small groups with children who are not keeping up with their peers in reading. The pre-service teachers, under the supervision of a university professor, assess students to determine a specific area of need in reading: phonics, fluency, or comprehension. The university professor helps pre-service teachers examine the data and formulate a plan for working with the elementary students. The partner school is in Philadelphia and all involved benefit from the experience. The pre-service teachers have closely supervised practice, the students are getting individualized help in an area of need, and the school district receives free services. This model is being further studied for other potential benefits to the pre-service teachers.

Using the Urban Landscape to Enhance Learning in Early Childhood Education  
Dominic F. Gullo

There is wide acceptance in the field of early childhood education that young children learn best in an environment that is relevant to their life experiences, one that is responsive to their individual strengths and needs, and one that stimulates hands-on activities. Projects are one way in which children can experience dynamic environments that encourage learning. Projects are described as in-depth learning studies focused on a topic or a theme. Projects can last for a week, for months, or for the entire school year. The urban landscape provides the backdrop in which early childhood projects can occur. In this presentation, participants will learn how urban settings such as parks, the zoo, museums, or the school neighborhood can be the place where projects are designed, developed, and implemented. With examples derived from urban settings, participants will learn about and discuss how projects
are constructed and used to facilitate children's acquisition of knowledge, skills, dispositions, and feelings. In addition, these examples will also elucidate how developmentally and culturally appropriate practice in early childhood can be implemented. Specifically, projects that take place within the context of an urban environment for children who live there will reflect:

- Age appropriate activities and materials;
- Individually appropriate activities and materials;
- Culturally and linguistically activities and materials; and
- Activities and materials that are relevant, concrete, meaningful, and that promote active engagement in the learning process.

Using a Rekenrek to support urban learners and their basic understanding of number.
Hope Yursa

With the adoption and implementation of the Common Core State Standards for Mathematics and their emphasis on depth of learning rather than breadth it is imperative that all early learners understand and master number sense, emphasized by the NCTM Principles and Standards for School Mathematics (2000). Characteristics of good number sense include fluidity and flexibility with numbers, understanding of the meaningfulness of numbers, capability to perform mental mathematics, and ability to look at the world and make comparisons between the abstract and the concrete (Gersten, Jordan, & Flojo, 2005; Kalchman, Moss, & Case, 2001; Robinson, Menchetti, & Torgesen, 2002).

This presentation will share the implementation of the rekenrek into pre-service teacher training. We will look at both the teacher candidates’ understanding of the rekenreks' purpose and the candidates’ reflections of the developing number sense in the students they teach in pre-student teaching experiences.

The rekenrek is a manipulative developed at the Freudenthal Institute in the Netherlands in the 1960’s. The rekenrek looks like an abacus, but differs in that it is based on a five-structure and not a ten-structure system. It is comprised of two rows of 10 beads, each broken into two sets of 5 by color (i.e., in each row the first 5 beads are red and the next 5 are white). The structure of the rekenrek can push young children toward mastery of patterning and partitioning activities, which are the essential components of subsidization strategies. Patterning involves helping students begin to see numbers as quantities that can be divided into various groups. Partitioning activities take patterns a step further by providing students the opportunity to break numbers into various groups as a means of solving a problem. McClain and Cobb (1999) concluded that these activities are critical for the learning process of addition and subtraction that need to be taught in combination and not as separate mathematic functions.
Professional Learning Communities at an Urban School

Lori Severino, Ed. D

Professional Learning Communities at an Urban School

Lori Severino, Ed. D
Penny Hammrich, PhD
Drexel University

Rationale

Professional Learning Communities (PLCs) are one of the best ways to implement change in teaching methods in the classroom. Teachers need the time and resources to discuss, observe, and reflect on learning models. According to Joyce and Showers (2002), “Theory or demonstration alone results in effect sizes for skill of around 0.5 of a standard deviation for refining existing skills and even lower for new skills. When demonstrations and practice are added, the effect size rises to about 1.18 in the average study. When coaching is added to the theory, demonstration, and practice treatment, skill continues to rise.” (p. 76) This gave us reason to believe that implementing PLCs, which includes theory development, practice in the classroom, and coaching by facilitators and each other, would have an impact on student achievement. Joyce and Showers (2002) also found, “a large and dramatic increase in transfer of training—effect size of 1.42—occurs when coaching is added to an initial training experience comprised of theory explanation, demonstrations, and practice.” Because this plan incorporates coaching in addition to the explanation of what works, research suggests the teachers will transfer this knowledge into every day practice.

Key Beliefs

The key beliefs during this year-long professional development are based on Joyce and Showers (2002) understanding that four conditions must be present if staff development is to significantly affect student learning:
1. A community of professionals comes together who study together, put into practice what they are learning, and share the results.

2. The content of staff development develops around curricular and instructional strategies selected because they have a high probability of affecting student learning—and, as important, student ability to learn.

3. The magnitude of change generated is sufficient that the students’ gain in knowledge and skill is palpable. What is taught, how it is taught, and the social climate of the school have to change to the degree that the increase in student ability to learn is manifest.

4. The processes of staff development enable educators to develop the skill to implement what they are learning. (p. 4)

In the PLCs, the school teachers studied together, learned what works, and reflected on what happened in their classrooms. The content covered during the professional development days included evidence-based instructional strategies that have been proven to effect student learning. The focus of the topics for were created based on the results of a teacher survey. The time given to the teachers during the school day to meet, discuss, observe and reflect allowed teachers time to develop the skills to be able to implement what they learned.

Goals

We had four main goals for the year-long professional development:

1. To engage teachers in the professional learning communities practice. Teachers are used to working individually in their own classrooms. Research has shown that working in small learning communities helps teachers to implement new initiatives and strategies. Teachers needed to understand what professional learning communities are, why they are important to the process, and how to work collaboratively in these communities.

2. To increase use of evidence-based effective skills/strategies in each classroom. There is a difference between research-based practices and evidence-based practices. An evidence-based practice has shown to be effective in improving student achievement. The faculty members were aware of evidence-based practices and brought the knowledge and theory necessary to help the school teachers use these evidence-based strategies in the classroom.
3. To increase student achievement in the areas of reading, math, and writing. The ultimate goal of this plan was to have teachers implement strategies in the classroom that would increase student achievement. Reading, math, and writing are integral parts of all subject areas. Improvement in these areas will mean improvement in the other curricular areas as well. Preparing students for college and career readiness is making sure their reading, math and writing skills are developed to the best of the students’ abilities.

4. To provide teachers with the time and resources to be able to implement an effective professional development plan. An effective plan must be implemented in order to be effective. Each part of this professional development plan was important to its effectiveness. Often, plans are started with high expectations and then the daily struggles of what is happening in the school gets in the way of continuing the plan. It is extremely important that teachers were provided with the time and resources to accomplish the goal of increased student achievement. It is expected that if the time and resources are implemented that the teachers and facilitators will follow through on that plan to the best of their abilities.

Educational Context & Participants

The urban charter school in which this study occurred was established about six years ago. There were 12 teachers with a graduate degree out of total 22 fulltime teachers. There were two teachers who are experts and highly qualified in their field, but are not yet certified. According to PA Charter School Laws, schools are required to have at least 75% of teachers certified, and they may employ up to 25% of non-certified, but highly qualified teachers.

Since inception, students at the school continuously outperform their peers from surrounding sending schools. In two of the three years of accountability, the school has achieved Adequate Yearly Progress (AYP). With its unique 7-12 grade configuration, the school provided students who have learning deficits the supports necessary for dramatic growth and the scaffolding necessary for continuity in learning achievement.
Not only does the school provide students with an outstanding education, the school provides a safe setting for learning. The school students are expected to maintain the decorum necessary for academic success, and, as a result, the school has dramatically fewer incidents than the surrounding sending schools.

The school community focused on academic excellence and committed resources to curriculum alignment with the Common Core. The school recognized that many of the incoming students lacked the necessary literacy skills to be successful across all content areas, and added additional focus and learning time toward reading. Providing greater differentiation, especially for high performing students was a priority, as well as developing data driven instruction to support individualized learning for all students. While the school does not plan to grow in grades or size, it does project growing in quality, improving Professional Learning Community experiences for faculty, and improving parent engagement.

The teachers are a significant resource to not only what students learn, but also how students learn. Professional development is one way to increase student achievement; however, it needs to be done in such a way that has proven results. Bruce and Showers (2002) propose “that if a teacher or a community of teachers engages, for a dozen days during the school year, in the formal study of a curriculum area or a teaching strategy that is useful across curriculum areas, and regularly studies implementation and consequent student learning, then the odds are that student achievement will rise substantially.” (p. 3) A good professional development plan that encourages teachers to make the changes in their own classrooms requires giving the teachers the opportunity and time to practice implementing the skills or strategies. This plan provided teachers with the time to discuss, implement and study their teaching strategies. To bring a teaching model of medium complexity under control requires 20 or 25 trials in the classroom
over a period of about 8–10 weeks (Joyce and Showers, 2002). In providing teachers the opportunity to practice skills during an eight week time period, the idea was that the skill would become part of the teacher’s repertoire. Data was collected over the eight week time period and evaluated to provide teachers the knowledge of whether or not that skill was effective. On-going evaluation and assessment of teacher effectiveness and student achievement is necessary to make decisions on implementation.

The National Staff Development Council (NSDC) provides Standards for Professional Learning. The following seven areas were identified as important for a professional development plan:

1. Learning Communities- Professional learning communities (PLC) are an integral part of this plan. Teachers in the school worked in groups of five or six to understand the knowledge/theory, discuss and reflect on student learning while implementing the knowledge, and evaluating student learning to determine the extent of the implementation.

2. Leadership- The school leadership had a vested interest in this plan. The school leadership supported this plan and helped foster teacher buy-in. The teachers leaders were an integral part of the Professional Learning Communities. They ensured that the PLCs were meeting, observing, and evaluating.

3. Resources- By accepting this plan, the school was willing to provide the resources of time, expertise, and finances in order to implement this plan. Teachers committed to the time they spent in Professional Learning Communities. Based on the teacher survey results, the teachers wanted to participate in PLCs.

4. Data- Teacher data was collected through surveys, small group sessions, whole group sessions, and questionnaires. The teachers learned how to perform action research in their own classrooms.

5. Learning Design- PD facilitators will provide theory and evidence-based research in the five areas of the plan. The university faculty members that provided the Professional Development have spent multiple years as practitioners themselves. They are aware of the most current
evidence-based practices for effective instruction. Cohran-Smith & Lytle (1999) state, “knowledge teachers need to teach well is generated when teachers treat their own classrooms and schools as sites for intentional investigation while considering knowledge and theory produced by others as generative material for interrogation and interpretation” (p. 250). This was the intent of this PD plan. Teachers treated their own classrooms as a place for research and used the theory of researchers in the field (Drexel Faculty) for the models or strategies for effective teaching. Once teachers in the school learn this process, the goal is for them to continue the process throughout their teaching careers without the support of the researchers.

6. Implementation- The way the plan is implemented was documented each step of the way. Implementation of the plan was evaluated for its effectiveness and sustainability. A separate study will be done of the practices put forth in this study.

7. Outcomes- Outcomes in teacher effectiveness were evaluated. The study investigated student growth as it related to effective teaching strategies.

This professional development plan included the necessary components of a high-quality staff development. The school teachers worked with experts in content knowledge and pedagogical skills. They had the opportunity to practice these skills and researched the results. The staff was given the time to implement this process during the school day with the help of colleagues and administrators. The plan included what Sparks (2002) identified as high-quality staff development:

- Focused on deepening teachers’ content knowledge and pedagogical skills;
- Included opportunities for practice, research, and reflection;
- Was embedded in educators’ work and takes place during the school day;
- Was sustained over time; and
- Was founded on a sense of collegiality and collaboration among teachers and between teachers and principals in solving important problems related to teaching and learning. (pg. 15)

Activities & Learning Experiences

The activities and learning experiences involved in this professional development plan were directly related to the school’s strategic plan and the results of the teacher survey. This
professional development plan focused on teacher identified needs. The plan relied heavily on Professional Learning Communities (PLC). “Professional learning communities” or “communities of practice” are the terms often given to schools in which staff members provide meaningful and sustained assistance to one another to improve teaching and student learning” (Joyce & Showers, 2002, p.55).

This was not only research-based, but was also the avenue of choice chosen by the teachers. The plan unfolded in three phases throughout the school year. Teachers received four full days of professional development before the school year began. PLC meetings were held after school on a bi-monthly basis, and additional full day inservices on teacher chosen topics were provided every eight weeks.

**Phase 1: In-service Prior to start of school year**-

**Day 1: Team Building, School Vision, Discussion of overall PD plan, Selection of PLC members**

A half-day in-service included activities that encouraged the teachers to work together- this was provided by a Drexel facilitator. Administrators discussed the school vision, the overall PD plan and the selection of PLC members.

**Day 2: Teaching & Learning in the Digital Age for the 21st Century, Student Engagement**

A half day in-service was provided by a facilitator (Drexel Faculty). This was an information session on the latest evidence-based practices for bringing in technology and improving student engagement. Teachers were encouraged to use part of the remainder of the day to make a plan for how they would implement/use these practices in their classrooms.
Day 3: The Common Core Standards and Implementation

A half-day in-service with ELA, Social Studies and Science/technology teachers on incorporating the literacy standards of the common core was provided by expert university faculty on the new Pennsylvania literacy standards. A half-day in-service with Mathematics teachers on incorporating the math common core standards was provided by expert university faculty in teaching mathematics. Teachers that did not teach these courses were welcome, but not required to attend.

Day 4: Teaching Writing Strategies, Working with Special Education and ELL Students, RtI and Progress Monitoring

A two hour presentation by a facilitator was provided for all teachers on evidence-based writing strategies for adolescents. Also, a two hour presentation by a facilitator was provided for all teachers on best practices, modifications and adaptations for special education students and ELL students. A focus on students with emotional behavior disorders was provided based on teacher requests for information in working with students with emotional issues. In addition, a two hour presentation by a facilitator with Special Education teachers on RtI and progress monitoring. Other teachers are welcome to attend also.

Phase II: Bi-Weekly PLC Meetings

Teachers were assigned to a PLC on day one of the five days of in-service. Those PLC teams met every two weeks throughout the school year. A specific topic was discussed, observed, and reflected upon every eight weeks. Five topics were covered throughout the year. During PLC time, a Drexel faculty member assigned to the group, was available to discuss issues, provide deeper learning and help the teachers reflect on their practices (Sparks, 2002, p.55). The Drexel
staff also engaged in classroom observations and coaching throughout the eight weeks in order to help with implementation. The five eight-week topics:

1. Classroom management, classroom behavior, student engagement

   This topic was also discussed during the initial in-service prior to the start of the school year. Since management, behavior and engagement is crucial to student achievement and important to start and maintain throughout the year, it was chosen to be the first topic of the PLCs. Results from the teacher survey showed they wanted deeper training in this area. The Charter school’s positive behavior support plan was reviewed and implemented. The skills learned and the strategies implemented continued through the entire school year.

2. Implementing the Common Core Standards

   As of July 1, 2013, the state of PA adopted the new common core state standards for English/Language Arts and Mathematics. New literacy standards for reading and writing in the content areas were also introduced. The second eight-week session focused on the different content areas. PLCs were rearranged according to content area. Teachers of English were all in the same PLC, teachers of mathematics were in the same PLC, etc.

3. Assessment and Differentiated Instruction

   Teachers in this charter school identified assessing students and differentiating instruction as an area of need in which they wanted to learn more effective strategies. For this eight-week PLC, teachers were grouped according to their area of instruction, similar to the groups for the Common Core Standard PLC.
4. Writing Strategies

This topic was chosen based on the teacher survey and supported the strategic plan on preparing students to be college and career ready. One of the issues seen at the college level is poor student writing. Writing skills can improve student achievement. Writing a summary reflection of a required reading also demonstrates comprehension. The new common core standards also require writing in the content areas. When all of the teachers are implementing writing strategies in their classrooms over an eight week period, improvement in student writing should be the result.

During the PLC meetings, student writing samples were evaluated to determine areas that need scaffolding and additional instruction. The teams decided, based on evidence-based research, how often students should write and what instructional strategies best meet the needs of the students.

5. Supporting Special Education and ELL populations

The strategic plan discusses closing the achievement gap. The teacher survey showed teachers wanted tools/strategies to improve instruction when working with students with IEPs and students where English is their second language. Each PLC decided on different ways to make adaptations and modifications and data was collected to see if some strategies were more effective than others, or if all were successful.

**Phase III: Full Day In-service** (one every 8 weeks during the school year)

These days were offered after the eight week implementation of the PLCs. This provided an opportunity to reflect on what occurred over the eight weeks. The topics for the sessions were similar to the topics for the PLCs. Teachers did not feel they needed additional inservice on the Common Core standards, but rather wanted to focus on effective instructional strategies. The
original plan of including another inservice on Common Core was replaced with an inservice on homework.

1. Student Engagement- During a professional development session, the participants were asked to read *Ten Steps to Better Student Engagement* by Tristan de Frondeville. Teachers then discussed and reflected on strategies they have tried and what the result was in their classrooms. Teachers shared their engagement strategies in small groups to encourage sharing of strategies that were effective.

2. Working with Emotionally Disturbed Students- During a half day professional development session, an overview of the characteristics of students with emotional/behavior disorders was given as well as descriptions of the different types of disorders that fall into this category, ie. Bipolar, obsessive-compulsive, conduct, anxiety, and psychotic disorders. Small groups of teachers were given case studies of students with emotional disturbances. Each teacher in the group was given a role to play in the case study and each group acted out a classroom scenario. A group discussion followed to determine which teacher behaviors escalated and deescalated student behaviors.

3. Assessment and Differentiated Instruction-Participating teachers were given a survey to identify how they currently differentiate instruction and use assessments in the classroom. The results of the survey were used to determine areas of need for support and development. Also, in small groups teachers participated in a cooperative controversy exercise. They were asked to read *Grading for Success* by Carol Ann Tomlinson. The teachers were divided into two groups and were asked to debate the issue of differentiated grading. A discussion and reflection
followed with a role play forcing them to be reflective on understanding differentiated grading from different viewpoints.

4. Writing- Teachers were led through an exercise in argument writing that they could use with their students. Teachers were provided a picture of a scene in which a man appears to have fallen down the steps along with a short narrative describing the events that led up to the fall (Hillcocks, 2011). A graphic organize was used to determine evidence, the rule and conclusion that can be drawn from the evidence and rule. Teachers implemented this activity in their classrooms and had the students use the graphic organizer to write an argument piece on whether they believed the scene was an accident or a murder.

5. Homework- Teachers were asked to respond to a series of questions regarding homework practices. A discussion of homework practices and alternative approaches happened in small groups and best practices were then shared with the main group as a whole.

Evaluation

The Professional Development Program was evaluated after each eight week stage. Drexel Faculty are in the process of identifying the strategies/procedures that were most effective. A teacher evaluation of the professional development plan was also given. Student achievement data in the form of formative, summative, standardized and curriculum based measurements is in the process of being collected. The results will be evaluated for effectiveness of the overall plan.
Preliminary Results

Data collection is in the process of being completed and results are in the process of being analyzed for overall effectiveness. Final results will be forthcoming. Preliminary results of the findings from an end of the year survey are encouraging.

When teachers were asked which topic covered during the PLCs was the most effective for them in their individual classrooms, engagement and behavior was the first choice with 30% of respondents choosing that topic. Positive behavior supports and differentiated instruction were chosen by 20% of the respondents.

Teachers were asked to identify strategies they learned from the PLCs that they implemented and found successful. One teacher commented that he/she brought “a lot more reading and writing into my classroom. I had students work on more assignments during the class period that would focus their attention on passages and their reactions, not just a summary.” Another teacher commented, “The argument writing activity, who dunnit mysteries, worked well with my students. They enjoyed it and were successful in writing their argumentative assignments.” An additional comment, “All English and social studies teachers are using the same model for writing a paragraph: T.R.E.E.”

The results of the overall effectiveness of the Professional Development Plan will be shared in the near future.

Impact on STEM Education: An Overview of Sisters in Science™, LLC

Sisters in Science™, LLC addresses the need for urban girls and boys in elementary, middle and high school to gain equitable access to science education. Specifically, this need is based on the rising research-based public concern over the equity gap in science, mathematics, and technology. Sisters in Science™, LLC offers six innovative science programs designed to foster equity, access, and inclusion in science, technology, engineering, and mathematics (STEM) education [see figure 1]. Sisters in Science™, LLC recognizes the significant impact intervention programs targeting girls and boys can have on academic success. In every respect, Sisters in Science™, LLC accepts the call for systematic reforms that understand the limitations girls and boys face in postsecondary education and employment opportunities in these fields.

Figure 1: Programs of Sisters in Science™ LLC

As evidenced by 15 years of program development, implementation and research in the area of equity in science and math education, the Sisters in Science™, LLC programs have shown to significantly increase students achievement in science and mathematics. Collectively, the programs were developed and implemented as Sisters in Science Equity Reform Project™ (SISERP). Recognizing the success for boys who participated in the programs, Figure 1 depicts the programs expansion to Sisters in Science Equity Reform Project™-Brothers of Science Equity Reform Project™.
Recently awarded the American Association of Colleges for Teacher Education’s (AACTE) Equity Award in Leadership, SISERP programs have been nationally recognized for exemplary accomplishments in programs and innovations related to leadership development and equity and access in education. Through receipt of the award, the Sisters in Science™, LLC programs serve as a model for others in the profession, advancing the agenda for equity, access, and achievement in education.

Implementation of the programs was originally funded by the National Science Foundation, over fifteen years ago, the Sisters in Science™, LLC programs focus on the diversity inherent in learning through various tools by which scientific and mathematical principles can be explored, analyzed, and communicated. By employing multiple vehicles to engage their interests, girls and boys are encouraged to become researchers and to explore the underlying principles. Rather than relying on teachers as the primary transmitters of information, the girls and boys gather expertise and information from several sources and disciplines. Like everyone, girls and boys are confronted with problems and questions inside and outside of the structured classroom. What they may not be aware of is that tools such as sports and technology can open the door for scientific exploration and create a network of resources from which to gather information either as primary sources or as a supplemental source.

**Program Goals and Objectives**

The Sisters in Science™, LLC programs have been developed to address the issue of equality in science and mathematics. The six programs have been designed to impact students, their families, teachers and school administration. The primary goal of programs are to provide urban school aged girls and boys with access to meaningful science, mathematics, technology, and engineering instruction in an environment unencumbered by the restrictions.

The objectives of the Sisters in Science™, LLC programs:

1) Broaden the participation of girls and boys in science based disciplines academically and professionally.
2) Foster equitable and inclusive practices inherent in achievement across the curriculum.
3) Develop a fair and equitable policy for science and mathematics achievement for students.
4) Create relationships between educators and researchers to overcome the inequalities that exist within the educational system.

**The Sisters in Science™, LLC programs**

The Sisters in Science™, LLC programs were established in the interest of providing equitable avenues for all students to pursue academic success in STEM disciplines. Incorporated into the six programs are comprehensive science curricula based on national standards, equity focused professional development for pre-service and in-service teachers, family education programs, informal and formal science explorations, and educational components such as Saturday academies, summer camps, and after-school programs.

- **Early Sisters in Science™ (eSIS) - Early Brothers of Science™ (eBOS):** eSIS-eBOS is the early childhood program that targets Kindergarten through 2nd grades. The program focuses on using science as a vehicle for literacy development. The program focuses on
earth, life, and physical sciences. There are 150 science activities that are sequenced in five levels per science activity based on the child’s developmental level.

- **Sisters in Science™ (SIS) - Brothers of Science™ (BOS):** SIS-BOS targets the grade range of 3rd – 5th grades and focuses on the urban environment. The SIS-BOS program is a multifaceted educational intervention aimed at increasing young urban students’ interest and achievement in science and mathematics. There are five modules that have four to five lessons per module. The modules are: systems, constancy and change, models, scale, and science process skills. Program components include an in school program, after school program, teacher training, family education, and summer camp.

- **Sisters in Sports Science™ (SISS) - Brothers of Sport Science™ (BOSS):** SISS-BOSS targets 6th – 8th grade and focuses on the use of sports as a vehicle for science exploration. The program provides hands-on, inquiry based sports science activities that allow students to develop a repertoire of experiences, which can then be used as the foundation for learning scientific concepts. There are a total of 8 sport science modules that focus on science and mathematics concepts in life, earth, and physical sciences. Each module lasts for 5 weeks. The sports are golf, tennis, fencing, basketball, track and field, volleyball, health related fitness, and soccer. Program components include an in school program, after school program, teacher training, family education, and summer camp.

- **Sisters in Science in the Community™ (SISCOM) - Brothers of Science in the Community™ (BOSCOM):** The SISCOM-BOSCOM project creates a much needed link between science educators and community/faith based organizations. The program has been able to engage adolescents and their families in STEM activities during non-school hours. By fostering a supportive network among the university and community/faith based organizations, the project bridges formal and informal science education. Through a comprehensive hands-on, inquiry-based curriculum, program participants can take their heightened awareness in the sciences into the classroom.

- **INFO-Sisters in Science Career Opportunities Matter™ (iSIS.com) – INFO-Brothers of Science Career Opportunities Matter™ (iBOS.com):** The iSIS.com-iBOS.com program is an intense science program for urban high school girls and boys. Combining technology, hands-on science explorations, and a yearly research project, the girls and boys are introduced to a wide number of STEM related careers. In an effort to promote awareness, the program teaches the girls and boys the different aspects of scientific research. This intervention matches the girls and boys with mentors in science based careers. The scientists guide the girls and boys through the process of research and completion of their project.

- **Sisters in Science Dissemination and Outreach Project™ (SISDO) - Brothers of Science Dissemination and Outreach Project™ (BOSDO):** Sponsored by the National Science Foundation, the SISDO-BOSDO project has been developed as a clearinghouse for information critical to the reform of equitable teaching practices in STEM education. The dissemination project provides teachers and researchers with research based information promoting the “best practices” in a movement toward gender-equitable science education. Not only does the program support various publications specific to gender equity and
science education, it also sponsors a yearly national conference and monthly gender

equity focused professional development opportunities for classroom teachers.

Data Sources and Program Evaluation
The effectiveness of Sisters in Science™, LLC programs in achieving its goals/objectives,
targeting each constituency and addressing needs, is determined through internal and external
assessments employing multiple methodologies. The data sources used to evaluate the
effectiveness of the project and document success include surveys, pre- and post- test results,
standardized test results, focus groups, targeted interviews, and digital portfolios. The evaluation
process is designed to not only describe and evaluate what occurs, but to explain what succeeded
and why. This information offers the greatest potential to transform learning and improvement
achievement.

Evaluation instruments track and measure:
> Student achievement indicators in math and science
> Students’ awareness of STEM careers and college preparation requirements
> Families’ participation in science activities and attitudes toward and comfort with
STEM
> Youth workers’ comfort with teaching inquiry-based science
> Activities contributing to sustainability
> Effectiveness of capacity building activities
> Quality and quantity of professional development

SISS-BOSS Program Results¹:
Findings over the years show that the girls and boys in the program have increased their interest
and achievement in science and mathematics and have noted the relevance of these subjects to
the sports in which they have participated to date.

¹ Data is available for the other Sisters in Science™, LLC programs.
The SISS-BOSS curriculum is standards based and has an equitable focus. The entire curriculum includes 32 activities driven by science and mathematics standards that feature a sport as the vehicle through which science or mathematics is learned. Pre-tests were administered at the beginning of the day’s activity, and post-tests were administered at the conclusion of the day’s activity. The pre-tests and post-tests were identical instruments. Four questions were asked for each activity. The students’ responses were open-ended, allowing them to express their understanding of the content. Each question was scored as correct or incorrect.

Gain scores were analyzed using a simple \( t \) test. Based on raw scores, the percentage of correct responses was used as the measure. The data consistently show statistically significant mean increases in content knowledge from pre-test to post-test, ranging from 28 to 60 percentage points (\( p<.001 \) or \( p<.0001 \) in each case). Looking at these gains in a different way, in every case, the lower quartile on the post-test exceeded the upper quartile on the pre-test. All results from the after-school program and Saturday academies are summarized in Table 1.

Report card grades from the first and last marking periods were also compared. The \( t \)-test results showed that the students’ achievement in both science and mathematics increased significantly (\( p<.05 \)) during the year, pre to post.

Finally, it is important to note that of the sixth graders who completed the program, 67% returned as seventh graders. Furthermore, 54% of all students who completed the seventh-grade program returned to participate as eighth graders. These retention rates speak volumes about the students’ attitudes toward the program.

**Conclusion**

Sisters in Science™, LLC programs concentrate on the need for urban girls and boys to gain access to quality STEM education by utilizing a variety of approaches to foster equitable science education. Specifically, this need is based on the rising public concern over the equity gap in STEM education; recognition of the significant impact intervention programs targeting urban girls and boys have on school success; and the call for systemic educational reforms that recognize the obstacles urban students face in the academic and professional STEM arena. The programs respond to the call for systemic educational reform by creating innovative programs that provide access to strategies furthering gender equitable science education.

ABSTRACT

Teaching people with chronic pain to use hand self-Shiatsu to improve sleep: A pilot study.

OBJECTIVE: Difficulty falling asleep (sleep latency) and staying asleep (sleep maintenance) are common problems for persons living with pain. Research demonstrates that sleep problems are, in turn, related to exacerbation of chronic pain. There is a growing evidence-base for a range of pragmatic, non-pharmacological sleep interventions that can potentially be incorporated into pain management programs. This study looks at the outcome of teaching musculoskeletal pain patients standardized pre-bedtime hand self-Shiatsu (HSS) to reduce sleep latency.

METHODS: A case series design, with participants acting as their own controls, was selected to facilitate hypothesis generation for this novel, under-researched, intervention. Sleep efficiency, latency and maintenance, sleep beliefs, pain intensity and basic participant demographics were collected at baseline with actigraphy and standardized self-report questionnaires. After 1 week of baseline data collection, the HSS intervention was taught to participants. Follow-up data was collected at 2 and 8 weeks post-intervention.

RESULTS: Data collected at baseline and the two follow-up periods revealed no apparent changes in the objective actigraphy data. However a trend toward improved self-reported sleep latency (time to fall asleep) and sleep duration (time spent asleep) emerged. A number of participants reported they were more concerned with increasing their period of unbroken sleep as opposed to their total sleep time and it is possible that HSS may be useful to apply during nighttime awakenings as well as before bed. None of the participants reported adverse effects of the intervention. Participants did not report any problems learning the technique and demonstrated that the combination of hands on demonstration, take home manual and reminder phone calls was the most effective teaching approach.

CONCLUSION: These preliminary findings are promising and future studies exploring the mechanism of action and with stronger control of treatment fidelity are indicated.
Title: Master of Science in Occupational Therapy students' beliefs about attributes reflecting 'scholarship'

Author: Cary A Brown, PhD Associate Professor,
Affiliation: University of Alberta
Address: Department of Occupational Therapy, University of Alberta, Canada
email address: (cary.brown@ualberta.ca) 780-492-9545

ABSTRACT

Background: Master of Science in Occupational Therapy (MScOT) students regularly receive feedback commenting on the scholarship of their work. However, 'scholarship' is a conceptually complex term and lacks clear operationalization. This makes communication of expectation between professor and student at times difficult and unclear. For example, feedback on assignments in the form of "lacks scholarship" is of little value when the concept has not been clarified. The goal of this paper is to present the findings from a survey of MScOT students' beliefs about attributes reflecting 'Scholarship'.

Approach: A search of the literature retrieved no assessment tool that identified nor measured the attributes of scholarship. Consequently we developed an in-house tool based on the work of Hodge et al (https://www.miami.muohio.edu/documents/about-miami/presidenUreports-speeches/From_Inquiry_to_Discovery.pdf)

Findings: Ninety-three 1st year MScOT students completed the survey in the 1st week of their 2nd semester in the program.

Students showed strong endorsement for most attributes of scholarship identified on the survey. Areas that were less strongly endorsed included:
- Seeking knowledge outside of course requirements
- The ability to apply theory to inform clinical decision
- Generating innovative research questions based on clinical experience
- Selecting appropriate methods to address research questions
- Contributing to scholarly scientific manuscripts
- Matching research question to appropriate methods
- Identifying research paradigms congruent with professional theory and practice.

Discussion and conclusion: Currently we lack sufficient information to draw conclusion. The findings may reflect a potential lack of student understanding and confidence in applying theory-to-practice. Alternatively they may indicate a perceived lack of time/need to seek information outside of structured course content. A third possibility is that these students' results indicate that they have insufficient clinical fieldwork to appreciate the need for theory and scholarship in the clinical setting. More study is needed to understand the disconnect between students' and academics' interpretation of scholarship. With more study we will be able to guide strategies to improve the usefulness and perceived relevance of feedback.
full paper
The purpose of this study is aimed to explore the real conditions and effects of play in teaching Taiwanese Romanization for Grade 5 students, and to investigate the difficulties in the process and solving methods. Play is a motivational tool to encourage and stimulate learning and attention. Based on a case study, the subjects were a total of 53 students in grade 5 from 2 different schools, taught by a researcher. Throughout 13 weeks research, the data was collected and analyzed by means of classroom observation, interviewing the students, reflective journal, surveys of opinions from students and Taiwanese teachers and document analysis based on SPSS.

Research findings are summarized as follows:
1. By incorporating games into Taiwanese Romanization Spelling, the researcher found the interaction between the teacher and students, the students’ reaction to Taiwanese Romanization Spelling learning, and the performance to be very different from normal Taiwanese classes.
2. Playing games while teaching Taiwanese Romanization Spelling has 5 significant advantages, both in teaching and learning aspects:
   (1) Promoting the students’ participation in learning Taiwanese Romanization Spelling.
   (2) Increasing interaction between the teacher and students.
   (3) Changing the attitudes in learning and using Taiwanese Romanization Spelling.
   (4) Improving social ability by having play with classmates.
   (5) Examining learning impacts, and achieving the objective of repeated practice.
3. The researcher encountered and finally solved some difficulties in Taiwanese Romanization Spelling, and many differences between the students from dissimilar classes.
Based on the results as above, the suggestions for Taiwanese Romanization Scheme and further study were proposed.

Key words: Taiwanese Romanization Scheme, Action Research, Play, Integrated Teaching
Introduction

Language is part of culture and culture is delivered by language. Without written language, culture likes a plant will soon die. Cai Pei Huo proposed using Romanization Spelling in Taiwanese that Taiwanese will expand farther and farther. (Kōo, 2002 : 3) Taiwanese is sound writing or alphabet writing language, yet most of the people in Taiwan neglect it (Lim, 2005 : 4).

Mother tongue has become formal subject in all of the elementary schools in Taiwan since 2001, then Taiwanese Romanization Spelling started to be used and taught in 2006. We have surveyed more than a decade of Mother tongue teaching, in order to understand the learning problems they have faced and how they interact and use it. Most of the students don’t seem to like Taiwanese Romanization Spelling and some of them even dislike it, and therefore we tried to motivate them by using different teaching methods. The ability of Taiwanese Romanization Spelling will help them speak, read and write which is the foundation to expand Taiwanese and we must take care to preserve our national heritage. The purpose of this research is that we sought to use games in Taiwanese Romanization Spelling teaching and analysed the data to find out if it was useful and effective to improve the interest in learning Taiwanese Romanization Spelling.

Limitation of the Research

There is a once week curriculum which is only forty minutes in the whole class, indeed it is not enough to be familiar with Taiwanese for the students. Most of the students speak Taiwanese with family members or classmates but that is for oral speaking not using the Taiwanese Romanization Spelling system. It seems that most of the students are not familiar with it and even some of them change different Mother Tongue subjects every semester. In this research, there are two groups of grade five students from two elementary schools. Both the experimental group and the control group were taught by the same teacher at the same semester on different week day.

Purpose of this Research

The policy of Mother Tongue Education in Taiwan has existed for more than a decade in the elementary schools in Taiwan. The purpose of this research is to try and detect the effect on learning attitude and problems in Taiwanese

---

1 There are more than sixteen Mother Tongues (dialects) in Taiwan, and the students have the right to change their Mother Tongue at the beginning of the semester. The spelling systems of all are different and this causes the students much trouble in learning.
Romanization Spelling. To discover the interest in learning the Taiwanese Romanization Spelling system in grade five students by using games and compare and analyse it between the experimental group and control group. We also wanted to solve insufficient teaching time\textsuperscript{2}, the skill of using Taiwanese Romanization Spelling system and motivation. We like to support another method of Mother Tongue teachers in teaching Taiwanese. Two sets of research findings provide an empirical background for this research. The first set of findings refers to the impact of the coherence of a text on comprehension and the second considers the benefits of active processing for learning.

Participants

The 53 participants are grade five students in the experimental group and the control group, living in Ba Dou area in Keelung. They were taught by the researcher during 13 weeks. The Experimental group has 23 students but one of them is a girl who has a learning disability, and the control group has 30 students. The researcher has no right to choose students in this research because of the students were placed in random access. This research was observed by the class’ preceptors during the 13 weeks.

\textsuperscript{2} Both of these elementary school have language classes as follow: Grade 1 to Grade 2 has 5 periods of mandarin, Grade 3 to 4 has 6 periods of mandarin which contain one period of reading comprehension and Grade 5 to Grade 6 has the same as Grade 3 to 4. We start teaching English in Grade 3, and the students are taught 2 periods once a week. On the other hand, we start teaching Taiwanese in Grade 1 but the students are taught one period once a week. Comparing the language subjects in Taiwan, Taiwanese faces the limitation of time which is hard to teach listening, speaking, reading and writing of Taiwanese well in forty minutes.
Most of the students’ mother tongue is Taiwan but 2 are Hakka and the rest of the 8 students have another mother tongue. Therefore 10 of the students’ families don’t speak Taiwanese at home, which means that the students didn’t have enough opportunity to hear or speak Taiwanese at home.

Procedure

Before the research began, all of the participants took the survey and pretests, and they also took the survey and posttests after being taught. During the 13 weeks, the researcher interviewed and counseled with the participants after each class which provided the researcher more information in order to adjust the games and curriculums in the following weeks teaching.

What is Play?

Play always happens in our daily lives, yet people don’t focus it. Some people think that play is part of our own amusement and it helps us to release the stress from real society (Tiunn, 2003:1). But why play? Learning is difficult for young kids, therefore play has an important role to the young kids. Play helps the young kids and teachers to dare with new knowledge. To participate in play, the young kids need to pay more attention in class which is motivation to the kids. John Adair described the words motive or motivation, however, suggest that something within you is at work, impelling or driving you forwards. And it may be a need, desire or emotion, but it leads you to act in a certain way. A motive, then, is an inner need or desire which is conscious, semi-conscious or perhaps unconscious that impacts on your will and leads to action of one kind or another. Of course you may have motives that do not issue any action. Play is the motivation to the young kids to learn new knowledge incidentally. Play is not only play for fun which plays an important role. Some provide more practice than the other, but some are not. Therefore we said that is the quality of play (Andrew Wright, 1984:3). Stipek refers to that motivation is relevant to learning because learning is an active process.
requiring conscious and deliberate activity. Even the most able students will not learn if they do not pay attention and exert some effort. If students are to benefit maximally from the educational curriculum, educators must provide a learning context that motivates students to engage in learning activities. Johan Huizinga\(^3\) provides another definition of play, which is explained in the sight of physiology. (Hairsh-Pasek, golindoff, Berk & singer, 2008; Tiůnn, 2003:1) Game and play has the necessary or useful function of science point which is accepted by people. Play continues to be taken seriously in the academic community, as evidenced by the scope of aspect scholarships across the human life span (Holzman, 2009; Hughes, 2010; Kuschner, 2009; Smith, 2010; Wood, 2013), across different contexts. Play and playfulness are considered to be lifelong activities: far from tailing off towards the end of childhood, play continues to develop in complexity and challenge (Broadhead, 2004; Wood, 2013). Most of the researchers are still trying to set up the definition of it because it indicates the potential variation and complexities of play as a social and cultural practice. Play activities involve a wide range of behaviours, actions and interactions, which may have multiple meanings for the player. Play can be regarded as deeply serious and purposeful, or trivial and purposeless. Play activities are motivation, creativity and learning, and they are given four types by researchers which are object play, pretend play, physical or rough-and-tumble play and guided play.

**Game is Play, Play is Game**

What exactly is play? Is it the same as game? Playing was created by children when they were not otherwise engaged in helping or learning. (Kim Brooking-Payne, 1996). According to Oxford Dictionary that game is a person’s performance in a game; a person’s standard of play; an activity that one engages in for amusement. Play is to engage in (a game or activity) for enjoyment; amuse oneself by engaging in imaginative pretence. Here we conclude game is play in Mandarin and Taiwanese. Jill Englebright Fox (2008) defines play, according to Webster's Desk Dictionary of the English Language, the word play has 34 different meanings. In terms of young children and play, the following definitions from Webster's are useful:

- light, brisk, or changing movement (e.g., to pretend you're a butterfly)
- to act or imitate the part of a person or character (e.g., to play house)
- to employ a piece of equipment (e.g., to play blocks)

---

\(^3\) Johan Huizinga (Dutch: [ˈjoːɦɑn ˈɦœyzɪŋaː]; December 7, 1872 – February 1, 1945), was a Dutch historian and one of the founders of modern cultural history.
• exercise or activity for amusement or recreation (e.g., to play tag)

• fun or jest, as opposed to seriousness (e.g., to play peek-a-boo or sing a silly song)

• the action of a game (e.g., to play duck-duck-goose)

Moyles (2005, 4) clarifies general usage in English, play can be deemed to be a noun, verb, adverb, adjective – the play or plaything, as in drama and toys; to play in relation to method or mode; to undertake something playfully; or distinguish any one meaning which might be attached to children’s play; it makes more sense to consider play as a process which, in itself, will subsume a range of behaviours, motivations, opportunities, practices, skills and understandings, as we have witnessed in the initial cameo. Fergus P. Hughes (2000: 2) claims that for an activity to be described as play, it must contain five essential characteristics from Vandenberg. First, play is intrinsically motivated it is an end in itself, done only for the sheer satisfaction of doing it. A second, related characteristic of play is that it must be freely chosen by the participants. A third essential characteristic of play is that it must be pleasure. Children must enjoy the experience or it cannot be regarded as play. A fourth characteristic of play is that it is nonliteral. A fifth, play is actively engaged in by the player. The child must be involved, physically, psychologically, or both, rather than passive or indifferent to what is going on. Game and play both has same meaning in Taiwanese and Mandarin. People have played games all the time, yet people don’t focus in this part which happens in our daily life all the time.

Classical Theories of Play

Play theories are divided into classical theories of play and modern theories of play (Stagnitti, 2004, Mellou, 1994). Classical theories of play originated in the nineteenth century and tried to explain the existence and purpose of play (Mellou, 1994). According to Johnson & Christie (1987), the classical theories of play all originated before World War I. They try to explain why play exists and what purpose it serves. The classical theories include surplus energy, recreation, recapitulation and practice theories, yet they can be grouped into two pairs. Hughes (1995) states early play theories, those that appeared in the latter part of the nineteenth century and the early years of the twentieth, emphasized the biogenetic significance of play. That is, they described play as an instinctive mechanism that either promoted optimal physical development or reflected the evolutionary history of the human.

Surplus Energy Theory
The surplus energy theory of play can be traced back of Friedrich Schiller, an eighteenth century German poet, and to Herbert Spencer. An individual generates a certain amount of energy to meet survival needs. It means any energy left over after these basic needs have been met become surplus energy. This extra energy builds up pressure and must be expended. This explains why the surplus energy theory is still so popular today. Anyone who has seen young children run out to the playground after a long period of sedentary work in a classroom (Johnson & Christie, 1987). The reasons for play is surplus energy, to discharge the natural energy of the body and get the greatest physical benefits (Hughes, 1995).

Recreation Theory

The recreation theory proposed by the German poet Moritz Lazarus stated that the purpose of play is to restore energy expended in work. According to Lazarus, work burns up energy and creates an energy deficit. The energy can be regenerated either by sleeping or by engaging in an activity which is different from the work that caused the energy deficit. Play is the opposite of work and that is the ideal way to restore lost energy (Johnson & Christie, 1987). The reasons for play in renewal of energy or recreation theory is to avoid boredom while the natural motor functions of the body are restored, and it also gets the greatest physical benefits (Hughes, 1995).

Recapitulation Theory

Recapitulation theory was discovered by the scientists before this century, the human embryo develops and it appears to go through some of the same stages that occurred in the evolution of the human species. G. Stanley Hall, an American psychologist, extended recapitulation theory to children’s play. According to Hall, children reenact the developmental stage of the human race in their play: animal, savage, tribal member, and so on. These stages of play follow the same order that they occurred in human evolution (Johnson & Christie, 1987). Recapitulation is to relive periods in the evolutionary history of the human species and it gets physical benefits, too (Hughes, 1995).

Practice Theory

Practice theory was proclaimed by Philosopher Karl Groos who believed that play serves to strengthen instincts needed for the future. Newly born humans and animals inherit a number of imperfect, partially formed instincts that are essential for survival. Play offers a safe means for the young of a species to practice and perfect these vital skills. The purpose of play is to exercise and elaborate skills required for adult life (Johnson & Christie, 1987). Thus, play is to practice and prepare for the future adult life. Practice theory means to practice for adulthood and
also to develop skills and knowledge necessary for functioning as an adult which gets in physical and intellectual benefits (Hughes, 1995).

All the theories are either unrealistic or unreasonable because of limitation in those theories. Exceptions are found in each theory for example it is hard to explain why the children still want to play even they are exhausted in the surplus energy theory of play. The recreation theory declares the purpose of play is to restore energy expended in work for adults but adults do not need more play than children. Although the classical theories are not perfect, they are still important in the history of play and they are also the foundation stone of influence in modern theories of play.

Modern Theories of Play

Modern theories were developed after 1920 and these theories attempted to explain the role of play in child development (Stagnitti, 2004, Mellou, 1994). Modern theories of play amid an age dominated by the scientific method and positivism. Modern theories of play attempt to do more than simply explain why it exists. They also try to determine play’s role in child development and, in some cases, to specify antecedent conditions that cause play behavior. They also try to explain play’s role in different aspects of child development (Johnson & Christie, 1987, Ellis, 1973, Johnson, Christie & Wardle, 2005).

Psychoanalytic Theory

Sigmund Freud, the founder of psychoanalytic theory, believed that play has an important role in children’s emotional development. According to Freud (1996), play can have a cathartic effect, allowing children to rid themselves of negative feelings associated with traumatic events. Play allows the child to suspend reality and switch roles from being the passive recipient of a bad experience to being the one who gives out the experience (Johnson, 1987). Johnson, Christie and Wardle (2005), play can help children to deal with unpleasant events and can help prevent these experiences from disrupting the child’s emotional development. Play can have a cathartic effect, allowing children to rid themselves of negative feelings associated with traumatic events.
Cognitive Theories

Piaget\(^4\), Vygotsky\(^5\), and others gained prominence in the United States in the last 1960s. Piaget who is a prominent researcher in play theory and research. Between 1929 and the early 1959s. Piaget crafted a radically new theory of children’s intellectual development. According to Piaget’s theory, children engaged in types of play that correspond to their current level of cognitive development. When the children gain the ability to use symbols, they begin to engage in symbolic and constructive forms of play. Play’s role in learning and development in Piagetian theory is somewhat complex. On the one hand, his theory maintains that play, by its very nature, cannot contribute to new learning. Therefore Piaget (1963) stipulated that for learning and development to take place, it must be adaptation. That requires a balance between two complimentary processes: assimilation\(^6\) and accommodation\(^7\). Piaget also believed that play allows children to practice and consolidate recently acquire concepts and skills through accommodation. Because assimilation is stronger than accommodation, this practice is critical. Piaget considered this practice and consolidation role of play very important because many newly acquired skills and concepts would be quickly lost if they were not repeated and integrated with other skills and concepts during play. Vygotsky believed that play has a more direct role in cognitive development and young children are to be capable of abstract thought because of meaning and objects are fused together as one.

Arousal Modulation

Arousal Modulation is theory claimed by D.E berlyne, g. fein and H. Ellis, which is to keep the body at an optimal state of arousal, to relieve boredom and to reduce uncertainty. Arousal modulation gets emotional and physical benefits. One of the distinguishing features of play is that it is intrinsically motivated. It is done for no apparent reason other than the sheer satisfaction of doing it. The motivation for some behaviors, however, cannot be explained in terms of basic physiological needs; these behaviors include play and exploration of the environment. Human beings, and lower animals as well, play with and explore their surroundings simply because

\(^{4}\) Jean Piaget who was a Swiss psychologist crafted a radically new theory of children’s intellectual development. His theory took hold in the United States during the 1960s, proposed that children go through a series of distinct stages during which their thought processes become increasingly similar to those of adults.

\(^{5}\) Lev Vygotsky who was a Russian psychologist and he believed that play has several roles in cognitive development. At the most basic level Vygotsky (1976) believed that make-believe play has a key role in abstract thought, enabling children to think about meanings independently of the objects they represent. According to Vygotsky, very young children are in capable of abstract thought because for them meaning and objects are fused together as one.

\(^{6}\) Assimilation is the child to incorporate new information into exiting cognitive structure.

\(^{7}\) Accommodation is the child to modify existing cognitive structures to conform to the reality of the physical world.
they want to; there is no reason for these behaviors attempted to explain play, therefore, by referring to the concept of internat, rather than external, motivation, and more specifically to the concept of arousal modulation (Hughes, 1995).

Bateson’s Theory

Play, according to Bateson (Johnson, Christie and Yawkey1987), is paradoxical. Actions performed during play do not mean what they normally mean in real life. When children engage in play fighting, the blows delivered denote something very different from actual hitting. Before engaging in such play, children must establish a play “frame” or context to let others know that what is about to happen is play, that it is not real. If a play frame is not established, the other children will interpret the mock blows as a real attack and respond accordingly. When children play, they learn to operate simultaneously at two levels. At one level, they are engrossed in their pretend roles and focus on the make-believe meanings of objects and actions. Bateson’s theory has stimulated interest in communicational aspects of play, prompting psychologists to examine the messages that children use to establish, maintain, terminate, and reinstate play episodes. It has led to the discovery that children constantly shift back and forth between their pretend roles and their true identities while engaging in sociodramatic play.

The modern theories support and help us to understand more about play and they attract the children in learning positively by using play in teaching. The current trend is towards play in teaching language (Chan & Lin, 2000 : 123-147 ). Play follows the spirit of instruction theory. In the processing of play, children are able to think in order to win the play without any certain model. Play is flexible to settle the problems they have met during the play. Mother tongue is a new subject in Taiwan and play in teaching Taiwanese Romanization Spelling will provide an active, happy and interesting environment for the children to learn it. It becomes naturally with listening, speaking, reading and writing. Shalva (2002) declares the purpose of play in teaching, play is not only play which leads all the students get involved in class activity and learning. The Taiwanese Romanization Spelling System needs more practice and skill to learn, play not only can help the children learn it without stress but also stimulate the motivation of learning.

Why Play is Important?

Fox (2008), indicates that both Fromberg and Gullo (1992) described play enhances language development, social competence, creativity, imagination, and thinking skills. Frost (1992) concurred, stating that "play is the chief vehicle for the development of imagination and intelligence, language, social skills, and perceptual-motor abilities in infants and young children” (Frost,1992,p. 48).
Jill also mentions that when children play, they draw upon their past experiences—things they have done, seen others do, read about, or seen on television—and they use these experiences to build games, play scenarios, and engage in activities. Children use fine and gross motor skills in their play. They react to each other socially. They think about what they are doing or going to do. They use language to talk to each other or to themselves and they very often respond emotionally to the play activity. The integration of these different types of behaviors is key to the cognitive development of young children. Therefore play is a very effective vehicle for learning.

Play and Cognitive Development
Jill Englebright Fox (2008) also indicates that the relationship between play and cognitive development is described differently in the two theories of cognitive development which dominate early childhood education—Piaget's and Vygotsky's.

Piaget (1962) defined play as assimilation, or the child's efforts to make environmental stimulus match his or her own concepts. According to the previous statement about Piagetian theory that holds play, in and of itself, does not necessarily result in the formation of new cognitive structures. Piaget claimed that play was just for pleasure, and while it allowed children to practice things they had previously learned, it did not necessarily result in the learning of new things. In this view, play is seen as a "process reflective of emerging symbolic development, but contributing little to it" (Johnsen & Christie, 1986).

In contrast, Vygotskian theory states that play actually facilitates cognitive development. Children not only practice what they already know—they also learn new things.

Parten's Five Types of Play
Play for young children assumes many different forms. Mildred Parten (1932) was one of the early researchers studying children at play. She focused on the social interactions between children during play activities. Parten's categories of play are not hierarchical. Depending on the circumstances, children may engage in any of the different types of play. Parten does note, however, that in her research with two-to five-year-olds, "participation in the most social types of groups occurs most frequently among the older children" (Parten, 1932: 259).

- Onlooker behavior—playing passively by watching or conversing with other children engaged in play activities.
- Solitary independent—playing by oneself.
- Parallel—playing, even in the middle of a group, while remaining engrossed in one's own activity. Children playing parallel to each other sometimes use each other's toys, but always maintain their independence.
• Associative—When children share materials and talk to each other, but do not coordinate play objectives or interests.
• Cooperative—When children organize themselves into roles with specific goals in mind (e.g., to assign the roles of doctor, nurse, and patient and play hospital).

Play is as important as water to fish, sunshine to plants, therefore play also plays a chief role in learning to children. It attracts and guides them to focus in learning new things, which leads them to dare with new knowledge, thus they learn how to be independent and cooperative in class.

Play, Games, Creativity, Problem Solving and Effect of Play

Play and play behaviours which take the important role, as Moyles (2005) claims that grappling with the concept of play can be analogized to trying to seize bubbles, for every time there appears to be something to hold on to, its ephemeral nature disallows it being grasped. Play and learning for young children are inextricably linked, the one often leading into the other. Research evidence has demonstrated that children’s level of involvements and engagement in play activities is an important indicator of their current level of development and learning and potential needs. Involvement and engagement being understood as ‘active participation’ (Moyles, 2005, Odem et al., 2004) that is ‘intrinsically motivated’ and ‘exhibited…’

Play and Language Teaching

Janet R mentains that Levy (1984) strongly supported the relationship play and language, on her conclusion she claimed that play is effect in learning languages and it also stimulates the expansion and creation of language learning. Play provides more language practicing and using and encourages language literacy. How play improves children’s language literacy, in her evidence of play, children’s language ability is expanded. Language includes phonology is concerned with pronunciation, syntactic consists of words and patterns components, semantic-language notes to use it properly and pragmatics is effective interaction. Play to children is automatic and free product, it is provided with great imagination, creation, curiousness and mentality. The distinguishing characteristics of play in teaching are interesting, competition, cooperation, education and proper challenge, in which need to match with intrinsic quality of education, otherwise play is play without goal. Therefore, a good teacher needs to know the connection between play and language teaching well in order to provide a joyful way to learn for the children.
Playing Games in Teaching Taiwanese Romanization Spelling

Moyles (2005,7) claims children have less and less time for play outside school, therefore play is import to attract children to pay attention in class.

- Play is important for children but it’s hard to justify to the mind and other teachers.
- Children really get fed-up with the pressure- they do need to play more.
- They learn better through practical, first-hand experiences but...
- Children’s social skills would be improved if we could provide more play.
- It’s important to give them some choice when they’ve finished their tasks.
- Children do tire of sitting down and need something active.
- They love doing messy things and I know I need to achieve a balance.
- I do believe that children learn through play but the world provides the written record.

For young children play and learning are inextricably linked, the one often leading into the other. Using play or games in teaching combines with activities, motivation and interesting which leads children up the garden path (Kang,2007:13-14) Play in leaning focuses on the purpose in children’s learning, the central idea to design play, games or activities is children according to the four parts of language learning ( Su,1999 : 3-4).

1. Listening: The output to input, sound from the teachers transmits from ears to children’s brain which is the nature teaching procedure.
2. Speaking: No matter children like or dislike, they have to speak to get involved with play.
3. Reading: Children participate with activites which use the reading ability to compete with the other competitors.
4. Writing: Writing is an easy task while children are playing games the writing ability is incidentally brought up.

In also indicates( In,2003 : 12-15 ) that using play or games in teaching will keep the interest of children to learn Taiwanese Romanization Spelling System. Therefore, she concludes five aspects of play in teaching. A first, children feel tired after a long time learning Taiwanese Romanization Spelling System, thus they do not pay attention in class or they feel low during class. If teachers support the children a game or an activity in the certain time, they will feel high. A second, play highlights teaching: when teachers explain again and again, the children may not understand Taiwanese Romanization Spelling. Thus we use play and review to improve the children’s Taiwanese Romanization Spelling ability. A third, let the children get used to speak Taiwanese fearlessly while they are having activities in
class. A fourth, teamwork is the major part of play or games. The children help each other no matter they have different ability when they play games. Under the stimulus of this inspiring motive, children bustle about with new energy and team spirit. A fifth, warm up is opening, reviewing, closing and powerful method to use. Even small and easy game brings the children in the learning situation.

Action research encourages the researchers to quest, discuss and judge through repeating thinking and practicing teaching procedure in order to understand the teaching situation then solves the problem and improves it (Tshuà, 2000:1). The way action research work is very systematical and scientific, and it is flexible policy to adjust and amend the educational problem. Action research combines action and research together which tries to shorten the theories and practical experience (Tshuà, 2000:6). The teachers are researchers and real workers, not only do they realize how to teach effectively, but also judge when they get involved with teaching. Schon indicates (1983; 1987) the teachers in action research are counselors, social psychologists and environment engineers. Each child may have different problems in class, in which come from individual family or personal pressure, thus good teachers know all the factors in learning and help the children instantly. Richard claims teaching is full of challenge and complexity and the distinguishing characteristic are as following (Richard D. Parsons, Stephanie Lewis Hinson, Deborah Sardo-Brown, 2002:7-10).

1. Teaching is Action

What is the main concept of teaching? We define teaching is as action. Teaching produces or inspires learning activity, in fact it embraces a professional specialty in each subject and transmits by teachers. How to lead children from the paper of books to be the part of children’s studying? Effective and professional teachers should set the goal of teaching and activities, organize the class then they interact with the children to understand and help them. If the classroom rules have been set, the children will well know with them and follow the steps of learning from the teachers. Again, effective and professional teachers should prepare well in their specialty in subjects to be ready for transmitting knowledge.

2. Teaching is art and science.

A teacher who knows how to teach effectively may not be an effective teacher because he must know how to transmit the curriculum which children would like to learn at first. E.W. Eisener (1982) indicates that a professional teacher not only designs a scientific curriculum but also teaches in artistic procedure. Richard claims that a successful teacher is a person of determination during the teaching activity. A teacher faces to different situation of teaching
contents, teaching methods, classroom management and adjusting dissimilar students immediately in order to attract the children attention in learning.

3. Statistics is Analysis Language

In many researches, statistics analyses are usually used to present the result. Statistics analyses tell significance to explain the difference of the data and prove the correlation between collection data and variance by no means fortuitous. Gân defines statistics is to collect, display, analyze, coordinate and explain the samples which infers the population and makes a scientific decision in the uncertain situations.

4. Teachers are the Action Researchers

J.T. Breuer (1993) suggests to improve education that correlation between researches and professional teaching should get closer. Teachers make the model of teaching through the unique in their researches. Doing researches and building the theory and making clear decision are on the basis of knowledge, experience, effective teaching method and making a self-examination by the teachers after teaching. Finding effective teaching methods is as important as a thoughtful research. A successful teacher must be the action researcher.

5. Teacher Student Truth Experience Action Reflection Experience Action Context Evaluation: A Practical Approach

According to reflect, judge and make decision, teachers are the action researchers who not only do the researches but also interact with the children. Thus an effective teacher should be an active participant and observer to proceed and explain the information he has collected during his teaching in class. To understand what he has done the procedures and to know why he has done them by reflecting and evaluating himself.

6. Actional Research

Work through the action research, an effective teacher is a professional teacher who proposes all sorts of hypotheses to explain, adjust, evaluate and amend his research. If he has collected as much as information and data then it is possible to proceed his actional research.

Wittrock & Farley (1989) claim that education is connected with psychology. The learning principles, evaluation of learning and practical teaching experience, in fact
that if a professional teacher is an artist, he requires more theories in his researches. Why does a teacher need more theories? J.T. Breuer (1993) indicates that theories bring out the function to fit researches.

Sir. Isaac Newton found Universal Gravitation help us why the apple falls down on the ground. Because of Universal Gravitation, the astronauts flew to the moon and transmitted the view of the moon on TV. We should realize the theory leads inventions and let us understand psychology in order to use in education. (Breuer, 1993; Richard D., 2002: 18)

Action research is a method in different styles that you use to achieve any data by the researchers who are interested in different topics. Play or game in Taiwanese Romanization Spelling teaching is a research on the purpose to help children learn Taiwanese Romanization Spelling happily and effectively.

The Teacher's Role

Jill Englebright Fox (2008) indicates the early childhood teacher is the facilitator of play in the classroom. The teacher facilitates play by providing appropriate indoor and outdoor play environments. Safety is, of course, the primary concern. Age and developmental levels must be carefully considered in the design and selection of materials. Once appropriate environments and materials are in place, regular safety checks and maintenance are needed to ensure that the equipment is sound and safe for continued play.

Teachers also facilitate play by working with children to develop rules for safe indoor and outdoor play. Discussion about the appropriate use of materials, the safe number of participants on each piece of equipment, taking turns, sharing, and cleaning up provides the children with information to begin their play activities. These discussions need to be ongoing because some children may need frequent reminders about rules and because new situations may arise (e.g., new equipment). Richard (2002: 22) also claims that researcher’s role and mission in actional teaching. On the first, teachers are the action researchers who don’t have to be professors and they have their unique researches to model their own teaching. On the second, teachers require their research data carefully in order to aim at their study. On the third, teachers are the classroom observers and action researchers. They are objectivity and qualify to observe and record what they have seen in the classroom.

According to the benefits of play in teaching, we have used it in action research in Taiwanese Romanization Spelling. In order to attract the children in class we design games in the curriculums, drill and demonstrate the games before class, and discuss the problems after teaching. Among the 13 weeks teaching, we finally collect the data from experimental group and contro group. The data is analyzed by using SPSS.
The children take the pre-test and post-test before teaching and after 13 weeks of teaching.

Score of Achievement Evaluation Test

Data processing and analysis

Two experimental groups of students before and after consonants, vowels, terminal sounds, tone, spelling and overall performance summary, previous results for covariates, single-factor analysis of the covariates.

Total of variables in the analysis, relevance of the inspection were variable and dependent variable in each group is the same, namely regression test of the homogeneity assumption within the group. Results as shown in table 6-3-1, as shown in the consonants, vowels, terminal sounds, tone, spelling and overall performance variables are in line with the Group's assumption of regression homogeneity ($f(1,49)=0.17, \text{and} 0.91, \text{and} 0.48, \text{and} 0.14, \text{and} 1.77, \text{and} 0.08, p>.05$).

Conclusion

Overall, using play in teaching Taiwanese Romanization Spelling improved the organization and clarity of learning Taiwanese in the four aspects that it was implemented in. Students indicated that they had a better understanding of Taiwanese Romanization Spelling and were able to write about each word in a more concise and deliberate manner. After the research, we are concluded that play helps children to learn Taiwanese Romanization Spelling and even Taiwanese. The
researchers found out using play in teaching Taiwanese Romanization Spelling has 5 significant advantages, both in teaching and learning aspects as mentioned in the summary as following:

(1) Promoting the students’ participation in learning Taiwanese Romanization Spelling.
(2) Increasing interaction between the teacher and students.
(3) Changing the attitudes in learning and using Taiwanese Romanization Spelling.
(4) Improving social ability by having play with classmates.
(5) Examining learning impacts, and achieving the objective of repeated practice.

The researchers encountered and finally solved some difficulties in Taiwanese Romanization Spelling, and many differences between the students from dissimilar classes. We also suggest that the teachers who are teaching Taiwanese Romanization Spelling should use play in their teaching or expand it in other subject teaching. Building a data base of games for the education departments should be a priority.

THINKING MAPS IN ENGLISH WRITING PROJECT FOR TAIWANESE ELEMENTARY
STUDENTS
Yu Shu Fan
17th Fl., No. 462-2, Xin Feng St., Keelung City, 202 Taiwan
e-mail addresses: joyce.yul@msa.hinet.net
joycelynn.yul@gamil.com
full paper

● Teaching goal: Improving students' writing skills by using Thinking Maps.
● Maps: Bubble Maps, Tree Maps, and Flow maps.
● Teaching time: 2 weeks for 5 times of teaching.
● Students: A class of students who have been learning English for more than 2 years.
  ◆ The students have the same ability in grammar and literacy, but they are not in the same age group. They have learned simple present tense, present continuous tense, past tense, past continuous tense, and future tense. Although they have known the tenses which are mentioned, they are still not ready to write a good essay by themselves. Thinking Maps provide a good way to build writing structures and get ideas together. It will be a good chance to use Thinking Maps.
● Teaching Materials: The students have learned the idea of the 3R's and have learned how important it is to protect our earth.

Map of the concepts
Warm up.
Activity: Let’s think about it!
Props: coins
Instructions:- Brainstorm and work together in a group.
-Talking with partners, take turns to flip a coin. Heads=move one step. Tails= stand still. Answer the question for the circle you land on. The first one to stand on the finishing square is the winner.

Start

What are you wearing?

Name five items which your partner wears.
Think of three accessories.

Name five adj.

Finish
Writing Activity
Lesson one
Activity-Recycling Doll

- Vocabulary teaching:
  - Warm up before you teach the new vocabulary including reviewing phonics which you may use in the writing.
- Activity: Let’s Change it!
- Have two teams or more in your class. Have students stand at the front of the classroom and let them observe each other for one minute. After one minute they can point out the difference of each other’s appearances. It doesn’t matter if they use single words or sentences as long as they can sound it out.

Prepare props that you want on the table. The students may use the props which you have prepared. Allot 3 minutes to play this game.

- SETUP: Talk with the class how important the 3R’s are and then discuss how to recycle, how to protect our earth and the students can make their toys without paying. Brainstorm together for all kinds of various objects that you can recycle at home or from friends instead of throwing away.
- BUBBLE MAPS AND TREE MAPS DEMO: Have students call out objects to recycle as you write them on the board. When you have enough objects, you may draw a doll in a bubble and let the students come up one at one time to fill the part of a doll. When you are finished, ask the class what other kinds of things they can use to make a recycle doll. Encourage creativity.
- DO: Pass out paper and read through the different materials on the board together. Let the students know that they can use these or other things to draw their doll. Put students in pairs or small groups. You are a supervisor as you walk around the classroom to listen to them. Students should have chances to discuss what they want to make and what things they can use to make it before they start drawing their own doll.
- WRAP: Let groups come up front and tell the class about their doll: what it is made of and what it is special.
- Make Your Own Doll
cans  string
Buttons  bottles
newspapers  sticks
Clothes                                other things
Draw a robot from recycled trash.

- Lesson two
- Writing Activity: Brainstorming
- BUBBLE MAPS AND TREE MAPS DEMO: Let students call out objects to recycle as you write them on the board. Introduce Bubble Maps and Tree Maps to the students then demo the maps on the white board. First draw a big bubble to
write the topic which you would like to demo. Second, ask the students the 6 WH questions draw more Bubble Maps on the white board to write down the ideas. (figure2-6) When you have enough ideas, start to write down key words or objects which the students need to make. You can let students come up one at a time and fill different Bubble Maps on the board. When you have more information, you may draw Tree Maps on the board to fill with more items.

- **DO:** Pass out paper and markers and read through the different Bubble Maps and Tree Maps together. Let the students know that they can use these or other things to draw their maps. Put students in pairs or small groups. When you are finished, guide students how to use the Bubble Maps and Tree Maps to show their ideas from their mind by themselves. Encourage creativity. Students should discuss what they want to make themselves and what other things they can use to make it before they start drawing their own maps. While the students are drawing their own map, you may walk around the classroom and help them as soon as you find them.

- **WRAP:** Let groups or individual students come up front and tell the class about their Bubble Maps and Tree Maps. You may give them more ideas.

- **Make Your Own Doll**

- **SET UP:** Review the ideas students came up with for in the ‘Brainstorming’ activity and discuss things you can recycle & what we can make with them. Write the questions from the hand out on the board.

---

**Thing we can make from recycled trash:**

<table>
<thead>
<tr>
<th>a recycle robot</th>
<th>a paper lantern</th>
<th>a paper toy gun</th>
</tr>
</thead>
<tbody>
<tr>
<td>a newspaper kite</td>
<td>a newspaper mask</td>
<td>a piggy bank a book holder</td>
</tr>
</tbody>
</table>

The following chart can be used to practice the students’ oral ability and share the ideas from their classmates. When they have the images and ideas from their classmates, they would create more imagination in their essay writing.
<table>
<thead>
<tr>
<th>What do you want to make?</th>
<th>What do you want to make?</th>
<th>What do you want to make?</th>
</tr>
</thead>
<tbody>
<tr>
<td>a doll</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>What recycled materials will you use?</th>
<th>What recycled materials will you use?</th>
<th>What recycled materials will you use?</th>
</tr>
</thead>
<tbody>
<tr>
<td>buttons, string, a sock, newspapers</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>What other things do you need?</th>
<th>What other things do you need?</th>
<th>What other things do you need?</th>
</tr>
</thead>
<tbody>
<tr>
<td>glue, markers, scissors, tape, needle, strings, cotton</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
After they ask the other classmates, they can draw Bubble Map as following.

### Bubble Maps

- **Writing Activity Lesson 3**
- **SET UP**: Review the ideas students drew Bubble Maps with in the previous “Brainstorming” activity. Make sure what students want to make, what recyclable items they have to use to make it, and what other things they need to make it. Write the 5 parts of an essay on the board as following:

  1. **Topic**
  2. **Introduction**
  3. **Body: First Paragraph**
  4. **Body: Second Paragraph**
  5. **Conclusion**

- **DEMO**: Talk about the different parts of the essay with the class: The ‘topic’ is the name of the essay. The “Introduction” is short paragraph which contains 3 or 4 sentences. The ‘bodies’ are very long; we write a lot of things to support the previous paragraph in the ‘body’ and give more information for it. The ‘conclusion’ is maybe explain what function a conclusion stress. Go ahead and review the word ‘paragraph’: the introduction, bodies and conclusion are all
paragraphs. You can also review the words ‘indent’ and ‘indentation’.

- **DO: Thinking Maps Essay Planning:** Take out the hand outs and read the questions in the outline paragraph. Read the Flow Maps together. Show how each paragraph has an ‘indentation’ of 5 spaces. After the class has read it. Go back over the questions and let the students answer the questions orally using the hand out. For the ‘Second Paragraph’, have the students underline the words ‘First, Second, Third, Then, After that’, and ‘Last,’ in the essay. Do make the sentences longer, have the students circle the conjunctions.

**Thinking Maps Essay Planning**

<table>

<th>How to Make a Recycled Doll</th>
<th>Topic</th>
</tr>
</thead>
<tbody>
<tr>
<td>How to Make a Recycled Doll</td>
<td>Top</td>
</tr>
</tbody>
</table>

**** Last week there was a recycle art show at school on Earth Day. Our teacher lead us to the world of recycling by making something out of recycled items because it was our responsibility to protect the planet where we live. Then our teacher told us to make a new thing with the recycle materials.

**Introduction**

**** Making a new thing all by myself without paying? I didn’t know what to make, so I thought for days. I walked to Auntie Annie’s house to ask her for help. When Auntie Annie gave me some ideas, I saw a pile of old clothes she wanted to recycle. There were old socks with holes in them on the pile. I walked over to look at it, then the idea came out of my mind that I could make a sock doll! I picked up the socks and thought about what other things I needed to make a doll. I took some recycled strings to fill into the body. Next, I found some old buttons for eyes and some brown string for hair in Auntie Annie’s bedroom. I even got a pair of sunglasses from her. I felt so excited that I went home quickly to make my doll. I ran into my bedroom to get markers, scissors, glue and tape. I was ready to start making my own doll.

**** First, I used a red marker to draw the shape of a doll on the sock. Second, I used the scissors to cut the shapes. Then I sewed the shapes together. Third, I used a black marker to draw a mouth, a nose and ears. After that, I sewed the buttons on for eyes. I cut the brown string into short pieces and glued them on for hair. After that, I tucked the old cotton into its body. The color of the eyes didn’t look great, so I put on the old sunglasses to make them
more beautiful. Last, I put my hand into the recycled doll. It was so cute!

Body

****It was amazing to me after I finished making my doll. I had a new toy without paying anything for it! Making the doll was a fun thing to do, too. My classmate said that my doll was really great. She liked it at once. If I have some free time, maybe I will make one for her.

Conclusion

● On Your Own: Let the students decide what they are going to make and guide them as they fill in their Thinking Maps. They can use one of the ideas from the Brainstorming activity, or they can think of something new to write about. If they are slow at deciding, you can encourage them to write ideas down.

● Use Thinking Maps to condense the demo essay.

● On Your Own: Lesson four

Pretend that you are finished making your recycled art. Please use the past tense and your Thinking Map to write your essay.

<table>
<thead>
<tr>
<th>Topic</th>
<th>How to Make a Recycled__________</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Introduction</th>
</tr>
</thead>
<tbody>
<tr>
<td>What did you make?</td>
</tr>
<tr>
<td>Why did you make it?</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Body: First Paragraph</th>
</tr>
</thead>
<tbody>
<tr>
<td>What recycled things did you use to make it?</td>
</tr>
<tr>
<td>Where did you find them?</td>
</tr>
<tr>
<td>What other things did you use to make it?</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Body: Second Paragraph</th>
</tr>
</thead>
<tbody>
<tr>
<td>What recycled things did you use to make it?</td>
</tr>
<tr>
<td>Where did you find them?</td>
</tr>
<tr>
<td>What other things did you use to make it?</td>
</tr>
</tbody>
</table>
Conclusion
How did you feel after you made it?
Who did you show it to? What did he/she say?

- Lesson four-Use your own map to write your essay.
- You may use Flow Map to write the main questions on each paragraphs.

- Conjunctions- Encourage your students to use conjunctions to write longer sentences.
Lesson five- Proofread the finished essay and rewrite it again. If there are any mistakes, then have your students revise their essay. Encourage each student to come up to the front and read their own essay to everyone.

Activity: Read out loud. Have the students in two teams, first ask them to name their team, then you may start your game. Set time for five minutes, then set the students in order. When the game starts, the first student from each team needs to come to the front and read their essay to everybody and it turns to the second one from team. When the time is up, the students who are at the front reading have to do some funny things, for examples, they may tell a joke or sing a song.

Goal of teaching:
1. The students can use the words and patterns they have learned.
2. The students can understand the demo reading.

3. Improving reading comprehension ability and having fun in reading and writing.

4. The students would like to use English to express themselves.

5. The students can write the essay by using Thinking Maps easily.

Grading the essay

1. On-line grading of the essay – Criterion is Educational Testing Service which was created by ETS Technologies, Inc.

2. Grading by the teachers: We can follow the grading system seen in figure 1. From figure 1 was created by a group of professors from Taiwan to be used for the College Entrance Examination In Specified Subjects. Therefore, the total scores of essay writing will be 20 points, as soon as we have the scores then we should have them times five to get the final scores.

Interview

After using Thinking Maps, I interviewed and quested my students about English writing problems they have faced. There are 17 students in this class and all of them thought English writing was a difficult job to do. After using Thinking Maps for 2 writings they have changed their feeling about English writing. 15 students thought Thinking Maps are connected with each other and form a whole. While they are writing by using the maps, they feel it becoming easier and clearer. Thus they are confident to finish writing their own essays. Only two students have different opinions, one student still thinks writing is not easy and the other thinks that she is confused about the maps. Most of the students think Thinking Maps are clear and they can list more ideas on the maps. Instead of imitation writing, most of the students can have more thoughts by using Thinking Maps. I think if all the students practice more and they will be skillful writer.
All of the students thought that English writing is not easy. They started writing after they had been learning English for one and half years, they looked at me with a puzzled frown and it took a long time to finish writing.

After introducing Thinking Maps to the students, they had more ideas and could organize their concepts together.
There are two students who still have problems with using Thinking Maps. One still feels confused and the other one is still worried about writing. It takes time to learn a new way which can help them in English writing.

大考閱卷中心英文寫作閱卷標準

寫作是運用特定語言的書寫符號將意念表達出來的一個歷程，不但具有最高階整合內化學習功能，還能培養邏輯力、組織力、思考力和創造力。一般文章基本結構可分為三個部份：開頭（introduction）、正文（body）以及結論（conclusion）。大考中心九十八學年度大學學科能力測驗成績單中，英文作文零分人數比例超過一成五，此現像對於英文非母語的台灣來看，大部份學生學習英文單字、片語、文法和句型等基本英文能力後，將所學腦力激盪後透過計畫（planning）、轉譯（translating）和檢視（reviewing）等歷程構思成一篇有效寫作（effective）的能力仍有再進步的空間。

人工閱卷標準
而在寫作的評分上，即使寫作技巧相近的兩個人，對於寫作主題的理解程度不同亦會影響寫作出的文章品質。一篇寫作的優劣，以教師批改主導檢查詞類、標點符號、句型時態等基本文法外，亦強調寫作中段落的一致性、文章的連貫性、結構邏輯性和整體統一性。

而大考中心97年評量考生撰寫英文作文能力，採整體式評分，如表1：英文作文總分20分，標準分為五等級：19-20分為特優級、15-18分為優級、10-14分為可級、5-9為差級分、0-4分為劣級，閱卷委員於閱讀完考生試卷後，於腦海裡產生一個整體（holistic）分數，再以分項式評分標準檢閱是否符合整體印象分數。

傳統人工閱卷雖有評分指標的客觀標準，但評分老師對於主題的了解的主觀認定也會影響評分寫作成績的差異，大考中心為使各閱卷委員評分標準一致，共聘請公、私立大學英文相關科系教授含正、副召集人共147位擔任閱卷委員，並分為12組，先後召開「英文科閱卷評分標準訂定會議」與「評分標準再訂定會議」，先就4000多份隨機抽取的考生答案卷詳加討論、分析、草擬評分標準原則，再對評分標準進行討論與修正，待評分共識一致後方進行正式閱卷工作，首次正式閱卷第一日下午4時，加開「第二次評分標準再訂定會議」，再度確定評分標準，並另外提供合選題卷作為參考，盼能更掌握閱卷之品質。若一、二閱分數差距超出許可範圍（英文作文大於5分），則由第三閱（由正/副召集人或協同主持人擔任）評分，以求閱卷之合理性與公平性。

figure 7 Luke’s Essay

How to Make the recycle Robot

My teacher told us to use junk make something, because making things is making new something. I was very afraid and worry because I couldn’t make something well this draw was hardest. If I knew very back, my family will really angry.

Just then, my friend was bright. I can use the broken computer and one bottle, water, and cans. So I went to the store to buy paint, scissors and markers to make the robot.

First, I used the broken computer and drew the mouth, second I used button for eyes. Third, I used bottles for legs. Then, I used cans for legs. After that, I used my hair to its face. It was so ugly.

Today, my trials said it was cool. I was very happy. It can make his work. We can play robots. This big not is very good. It took me make robot and it gave me a new toy.
figure 8 Luke’s Essay and his Thinking Maps

figure 9 Bubble Maps and Tree Maps
figure 10 Writing after using Thinking Maps

Yesterday, I looked many newspapers in my bedroom. I got an idea could use a newspaper, a box and a man to make my toy.

First, I cut the newspaper. Second, I glued the can for eyes. Then, I could use the black marker to draw hair. Third, I could use the red marker to draw the nose. For that, I glued the box for nose. The nose look so boring, so I black marker draw more interesting. Last, I looked my new toy!

I could have a free toy. It is my new toy. I will give my friend because her birthday is on May 21. I think she will very much.

figure 11 Vivian’s Essay and her Thinking Maps
The Second English Writing Project

Try to use Thinking Maps and guide students who have never learned English writing before. I would like to see the effect on Thinking Maps for the freshmen.

- Teaching goal: Introduce English writing to the students by using Thinking Maps.
- Maps: Bubble Map and Tree Map
- Teaching time: 2 weeks for 4 times of teaching.
- Students: Two class of grade 6 students who have been learning English for more than 2 years in Zhin Bin elementary school.
  - The students have the same ability in grammar and literacy, and they are in the same age group. They have learned simple present tense, present continuous tense. The students have never tried to write an essay before, this is the first time they learn how to write an English essay. Thinking Maps provide a good way to build writing structure and get ideas together. It will be a good chance to use Thinking Maps.
- Teaching Materials: According to the reading “Owl At Home” The students enjoy the world of English essay writing.

Writing Activity
Lesson one
- Vocabulary teaching:
  - Warm up before you teach the new vocabularies including reviewing phonics which you may use in the writing.
  - The grade 6 students have learned short vowels, long vowels and some consonants blends.
  - The literacy ability is limit because they have learned about 300 words. Through they haven’t learned a lot, it’s a great opportunity for them to try writing.
- Owl At Home: Read together with whole class and ask the students questions about the reading.
- Reading Activity: Relay Race Reading! Divide the class into two teams. Set 3 minutes then everyone reads one page. When the time is up the winner team gets 5 points. Make sure the students read correctly.
- Bubble Maps and Tree Maps Introduction: You show the students Bubble Map and ask 6 “WH” questions then you write down the main idea from the story.
Writing Activity: Lesson two-Brainstorming

- BUBBLE MAPS AND TREE MAPS DEMO: Review the story again. Let students call out objects from the story as you write them on the board, or you may help them. Introduce Bubble Maps and Tree Maps to the students then demo the maps on the white board again. First draw a big bubble to write the topic which you would like to demo. Second, ask the students the 6WH questions and draw more Bubble Maps on the white board to write down the ideas. You can let students come up one at a time and fill different Bubble Maps on the board. When you have more information, you may draw Tree Maps on the board to fill with more items. So far you may expand the students’ group words.

- DO: Have the students talk about their ideas. Pass out paper and markers and read through the different Bubble Maps and Tree Maps together. Let the students know that they can use these or other things to draw their maps. Put students in pairs or small groups. When you finished, guide the student how to use the Bubble Map and Tree Map to show their ideas from their mind by themselves. Encourage creativity. Students should discuss what they want to write about before they start drawing their own maps. While the students are
drawing their own map, you may walk around the classroom and help them.

- WRAP: Let groups or individual students come up front and tell the class about their Bubble Maps and Tree Maps. You may give them more ideas.
- Ask more information or share ideas each other.
- Sentence Build Up by using Conjunctions- Introduce your students how to use conjunctions and how to write the sentences longer.
- SET UP: Review the ideas students came up with for in the ‘Brainstorming’ activity and discuss the person or thing that they want to write.

![Diagram of Conjunctions](image)

- Writing Activity- Lesson three
- SET UP: Review the ideas students drew Bubble Maps with in the previous “Brainstorming” activity. Make sure what students want to make, what recyclable items they have to use to make it, and what other things they need to make it. Write the 5 parts of an essay on the board as following:

6. **Topic**
7. **Introduction**
8. **Body: First Paragraph**
9. **Body: Second Paragraph**
10. **Conclusion**
DEMO: Talk about the different parts of the essay with the class: The ‘topic’ is the name of the essay. The “Introduction” is short paragraph which contains 3 or 4 sentences. The ‘bodies’ are very long; we write a lot of things to support the previous paragraph in the ‘body’ and give more information for it. The ‘conclusion’ is short maybe explain what function a conclusion stress. Go ahead and review the word ‘paragraph’: the introduction, bodies and conclusion are all paragraphs. You can also review the words ‘indent’ and ‘indentation’.

DO: **Thinking Maps Essay Planning:** Have the students take out their Thinking Maps and read the main ideas together. Think about the person they want to write about and use Thinking Maps to make an outline. Show how each paragraph has an ‘indentation’ of 5 spaces. After the class has read it. Write down the Imitation writing on the board then go back the questions and let the students answer the questions orally using the map. For the ‘Second Paragraph’, have the students think more word to tie the underline the words and use Bubble Maps of Conjunctions to show them the concepts of ‘First, Second, Third, Then, After that’, and ‘Last,’ in the essay. Do make the sentences longer.

---

Conclusion

Writing Activity- Lesson Four

On Your Own - Imitation writing: Let the students decide what they are going to write and guide them as they fill in their Thinking Maps. They can use one of the ideas from the Brainstorming activity, or they can think of something new to write about. If they are slow at deciding, you can encourage them to write down some ideas.

After Writing: Encourage your students come up to the front and read their own essay and some of them may not write well but tell all the students that they have done a great job for the first time in writing, they will be better and better if they keep trying to write. Although this isn’t a long essay, this is good experience for them to get closer to the world of writing. A good beginning will help the freshmen.

Grading the essay: When you grade the essay, you may treat your students nicely. As the students try to write the first time, encouraging and motivation is more important than anything else. Once your students are interested in writing, they will learn more and write more.

Goal of teaching:

1. The students can use the words and patterns they have learned. Help the students build up their sentence. 能應用學過的單字、句型
2. Students group words into the appropriate categories as a way to analyze and gain a better understanding of the vocabulary. 能組織字彙、分析字彙、瞭解字彙用法
3. The students can understand the story. 能理解文章大意
4. Improving reading comprehension ability and having fun in reading and writing for the beginner. 閱讀理解力佳，樂於接觸
5. The students would like to use English to express themselves. 願意以英語表達想法
6. The students can write easily the essay by using Thinking Maps.
Grade 6 class’ Analysis

There are 23 students in this class and that’s the first time they have written an essay. They haven’t got any chance to try before in the elementary school, I questioned them after they learned how to use Thinking Maps.

Most of the students think Thinking Maps are useful tools which help their writing structure but six students still think writing is really difficult to them. Therefore, I look up for the reason. Those students’ English grades are under achievement and some of them have phonics and grammar problem in learning English. I have only taught this class for one year and I should have asked the previous English teacher. Since the previous English teacher had transferred to the other school for a few years, I haven’t got any information to find the reason.
Most of the students study in English cram schools in Taiwan. From the chart it is obvious that Thinking Maps make the students feel writing is not hard.

- **Conclusion**
  
  As you know, most of the students go to English cram school when they are having English course at school, yet their writing ability isn’t built up. It is hard to hold the ideas in our brain and Thinking Maps help the teacher save time. Instead of wasting time and having poor ideas that Thinking Maps will help most of the students in developing good structure providing more and more ideas for them to use in their own essay writing. We should follow to see the effective results after using Thinking Maps in English writing.

Abstract

In this paper, four distinct U.S. Department of Education’s Office of English Language Acquisition/ National Professional Development Grantees discuss five common challenges and strategies for addressing those identified challenges as they seek to implement all facets of their programs. The authors of this paper begin with a brief overview of the literature review as it pertains to the national scene as well as provide a context for professional development in the states of Arizona and Alaska, the two states in which the four grants are administered. The authors then provide descriptions of each of the projects, Teachers of English Language Learners Learning Community (TL³C), Academic Content Combined with English in Secondary Schools (ACCESS), Teaching English Learners Academic Content (TELAC), and Project LEAP (Language, Equity and Academic Performance). The identified issues of program requirements, recruitment, retention, results, and reality are subsequently addressed as are strategies for addressing each of these challenges. The authors conclude by providing suggestions for further consideration.
OELA/NPD Grantees’ Issues of Requirements, Recruitment, Retention, Results, and Reality when Implementing Professional Development Grants

The U.S. Department of Education sponsors a National Professional Development Program (NPD) through the Office of English Language Acquisition (OELA). According to the U.S. Department of Education (2014), the “program provides professional development activities intended to improve instruction for students with limited English proficiency (LEP) and assists education personnel working with such children to meet high professional standards.” Furthermore, grants are made to Institutions of Higher Education (IHEs) that have entered into consortium arrangements with State Education Agencies (SEAs) or Local Education Agencies (LEAs). Projects sponsored by NPD grants are designed to increase the pool of highly qualified teachers prepared to serve limited English proficiency students and increase the skills of teachers already serving them.

In this paper, four distinct OELA/NPD Grantees discuss five common challenges and strategies for addressing those identified challenges as we seek to implement all facets of our programs. The authors of this paper begin with a brief overview of the literature review as it pertains to the national scene as well as provide a context for professional development in Arizona and Alaska, the two states in which the four grants are administered. The authors then provide descriptions of each of the projects: Teachers of English Language Learners Learning Community (TL³C), Academic Content Combined with English in Secondary Schools (ACCESS), Teaching English Learners Academic Content (TELAC), and Project LEAP (Language, Equity and Academic Performance). Issues of program requirements, recruitment, retention, results, and reality are subsequently addressed as are strategies for addressing each of these challenges. The authors conclude by providing suggestions for further consideration.
Literature Review

A National Perspective

Increasing numbers of students from culturally and linguistically diverse backgrounds represent both a challenge and an opportunity to reformulate our current understanding of teacher professional development (Lee & Buxton, 2013; National Center for Education Statistics [NCES], 2002; Rumberger & Gándara, 2004). Specifically, the needs of students in public schools must be addressed in ways that are culturally sustaining (Paris, 2012). This approach involves an inclusive pedagogy that is open to the multiplicity of voices and ways of knowing represented in diverse classrooms. Concurrently, there is a national need for qualified P-6 professionals in the areas of ESL (English as a Second Language) and Science, Technology, Engineering, and Mathematics (STEM) (Nadelson, Seofert, Moll & Coats, 2012; Lee, & Maerten-Rivera, 2012). According to Lee (2011) more English Language Learners (ELLs) select to enter STEM careers than their native speakers counterparts. Consequently, there is a growing need of teachers who can foster the academic and English language proficiency of ELLs. In the current climate of global competition, it behooves those involved in the critical analysis of our educational system to consider issues of underrepresentation of diverse students and design support systems that ensure equitable representation of diverse populations across occupation and career pathways.

Views from Arizona

In Arizona it is estimated that there are 150,000 ELLs, which accounts for 13 percent of all K-12 students. Of those hundred fifty thousand, 90,657 (60%) were enrolled in 20 districts statewide (Arizona Department of Education, 2009). Although particular districts have high concentrations of ELLs, 210 of the existing 238 districts in Arizona reported ELL enrollment in
2006. Arizona’s educational environment for ELLs differs from many other states across the country (Davenport, 2008).

In response to the growing number of Latino English Language Learner students, Proposition 203 (English for the Children, A.R.S. § 15-751-755) passed in Arizona in 2000. This law significantly changed the classroom instructional practices for English Language Learners (ELLs) by severely restricting the options for native language instruction. A small number of bilingual programs continue to operate in Arizona through waiver provisions outlined in A.R.S. § 15-751-755. The text of English for the Children statute states that, “English learners shall be educated through sheltered English immersion during a temporary transition period not normally intended to exceed one year.”

Moreover, in 2006, the Arizona English Language Learners Task Force developed and adopted a 4-hour English language development (ELD) block as an instructional format through which to implement the Sheltered English Immersion (SEI) statutory mandate (A.R.S § 15-756.01) within the state’s English Language (i.e., English-only) classrooms. The subsequent SEI model requires that ELLs receive instruction for a minimum of four hours daily during the first year that they are classified as Limited English Proficient and continuing until classified as English proficient. Specific times (ranging from 15 to sixty minutes) are allocated for each area based on AZELLA proficiency levels, the English proficiency test mandated by the Arizona Department of Education.

**Teacher preparation in Arizona.** Since the establishment of restrictive language policies and the subsequent mandating of the 4-hour ELD block, the quality of teacher preparation with regard to ELL instruction has also been significantly impacted. The new requirements in accordance with Proposition 203 state that all persons who currently hold a valid
K-12 Arizona teaching certificate must obtain a provisional SEI endorsement (Mahoney et al., 2005). However, de Jong, Arias and Sanchez (2010) state that whereas Bilingual (BLE) and English as a Second Language (ESL) teachers had previously been required to take from 24-27 units of preparation, the new endorsement only required 6. This effectively dropped the number of preparation hours for teachers of ELLs from between 360 and 405 hours to merely 90. This mandate translates to approximately only 10% of the preparation time previously considered necessary to serve these students effectively. To further aggravate the issue, de Jong, Arias and Sanchez (2010) also explain that most teacher preparation in Arizona currently focuses only on increasing teacher knowledge of state policies related to SEI. Very little time is allotted to providing teachers with deep knowledge of second language acquisition (Arias & Markos, 2012).

Many new as well as experienced teachers demonstrate little knowledge of effective practices in second language education, including the integration of students’ primary language in the classroom and an understanding of how language proficiency impacts learning (Garcia et al., 2010). Although several studies have examined pre-service teachers’ beliefs about ELLs and their knowledge of the effective practices they should implement in the classroom (Olson & Jimenez-Silva, 2008), whether or not new teachers can negotiate implementing effective strategies with the minimal training they receive within current restrictive language policies is questionable.

Research shows that teachers with good preparation and pedagogical skills (Haycock, 1998; 2001) as well as full certification in their field (Darling Hammond, Chung, and Frelow, 2002; Darling-Hammond, Holtzman, Gatlin, & Heilig, 2005) make a positive difference in student achievement. It remains debatable however, whether 90 hours constitute good preparation and pedagogical skills when working with ELLs. Although all teachers in Arizona
are mandated to take classes addressing the needs of ELLs, several essential elements are missing from SEI endorsement as it currently exists in Arizona. With a heavy focus on strategies, there is little emphasis on addressing teachers’ dispositions towards ELLs, experiences with language diversity (Arias & Markos, 2012), and second language acquisition theory (Arias & Markos, 2012). The SEI focused teacher preparation does not fully prepare teachers to meet the multifaceted needs of ELLs (Wright, 2012).

The Alaska Context

Alaska has one of the densest ELL populations in the United States, as verified by the National Clearinghouse for English Language Acquisition, and yet only .0085%, (128 out of approximately 15,000) of Alaska’s currently certified K-6 teachers hold an ESL endorsement (as verified by the State’s EED Teacher Certification on May 3, 2011). This exemplifies the disparity between the number of ELLs in our classrooms and teachers with the language, literacy and content backgrounds to meet their needs. Similar statistics hold true for Alaska Native students. The disconnect between the intellectual capabilities of our ELL and Indigenous children and the knowledge valued and assessed by the public school systems creates the pernicious and fabricated gap that characterizes the rhetoric of education. It behooves those involved in educational reform at the K-12 and post-secondary levels to take action.

Schools are a powerful mechanism for linguistic and cultural revitalization (Fishman, 1991; Hinton, 2001). The question is how can schools become centers for language and culture revitalization as well as academic achievement in our western contexts? One way of achieving this goal is by embracing the principles and practices outlined in the literature of Culturally Responsive Schooling (CRS) (Castagno & Brayboy, 2008; Gay, 2000; Ladson-Billings, 2004; Villegas & Lucas, 2002) and Culturally Sustaining Pedagogy (CSP) (Paris, 2012). By definition, CRS involves “using the cultural knowledge, prior experiences, frames of reference, and
performance styles of ethnically diverse students to make learning more relevant and effective for them” (Gay, 2000, p. 29). Paris (2012) expands the ideas of CRS in his notion of culturally sustaining pedagogy, “This research and the pedagogical, curricular, and teacher learning innovations it forwards is interested not in relevance or responsiveness, but in sustaining and extending the richness of our pluralistic society. Such richness includes all of the languages, literacies, and cultural ways of being that our students and communities embody—both those marginalized and dominant” (p. 96). Our work is based in CRP and we expand it to Paris’s concept of CSP through our collaborations with teachers in our partner districts. Project LEAP is designed to train teachers to work in culturally sustaining ways in order to address equity and academic performance through language. The children of Alaska deserve no less.

**Teachers of Language Learners Learning Community (TL³C)**

The Teachers of Language Learners Learning Community (TL³C) Project is designed to focus on teaching and learning that empowers pre- and in-service teachers to effectively work with English language learners in underserved communities using pedagogical practices that support bilingualism. While the reality of linguistic diversity in our schools provides rich opportunities for language learning, it also presents a need for highly qualified teachers and programs to ensure that all students are provided with an equitable education. Initiated by Mesa Community College (MCC), the TL³C Project has partnered with local elementary school districts, university teacher preparation programs, and professional organizations to address the following related goals:

1. to increase the pool of highly prepared teachers of language learners (TLLs), and
2. to provide support for TLLs in various programs at local Title I schools.

To accomplish goal one, this project creates opportunities that aim to:
• develop highly qualified pre-service teachers who will complete coursework for their full
  Structured English Immersion (SEI) endorsement (required in Arizona) and their
  provisional ESL endorsement prior to transferring to the university to complete their
  elementary education degree with a full English as a Second Language (ESL) or
  Bilingual Education (BLE) endorsement and
• train and support higher education faculty in various disciplines who instruct pre-service
  teachers in effective teaching strategies and best practices for diverse learners.

To accomplish goal two, this project creates opportunities that aim to:
• develop STEM curricula designed for language learners that align to Arizona’s English
  Language Proficiency (ELP) Standards and the newly adopted Arizona College and
  Career Readiness Standards,
• provide training to improve best practices for effectively meeting linguistic and academic
  needs of language learners for TLLs, paraprofessionals and pre-service teachers, and
• provide in-class support through trained paraprofessionals and pre-service teacher
  assistants as well as resources, including STEM activities to support curriculum taught.

Requirements

Initial requirements for pre-service teachers into the teacher preparation program
component of our project included what we soon discovered to be idealistic and lacking
sufficient flexibility to ensure student retention through program completion. Pre-service
participants were required to be enrolled full-time and commit to completing 150 hours of
service-learning at elementary school sites per semester. With a community college student
population that includes a large percentage of students with limited financial resources and often
additional family and work responsibilities, the intensity of our program requirements resulted in
many of our initial program participants struggling to keep up. Recognizing that our pre-service participants should not simply complete program requirements but that they need time to process, apply, and reflect on their course learning and field experiences, we realized that building flexibility into our program requirements is essential to ensure that students complete the program successfully.

Our strategy for addressing the need for increased flexibility in program requirements was to develop a variety of options for program participation that respond to the challenges we found students were facing, as depicted in Table 1.

Table 1 Program Requirements

<table>
<thead>
<tr>
<th>Options</th>
<th>Credits</th>
<th>Service Learning</th>
<th>Meetings</th>
<th>Scholarship Maximum</th>
</tr>
</thead>
<tbody>
<tr>
<td>F/T student + F/T service hours</td>
<td>12-18/sem</td>
<td>150 hrs/sem</td>
<td>1 hr/wk</td>
<td>$2400 over 2 yrs</td>
</tr>
<tr>
<td>F/T student + P/T service hours</td>
<td>12-18/sem</td>
<td>75 hrs/sem</td>
<td>1 hr/wk</td>
<td>$1200 over 2 yrs</td>

<td>P/T student + P/T service hours</td>
<td>6-11/sem</td>
<td>75 hrs/sem</td>
<td>1 hr/wk</td>
<td>$1800 over 3 yrs</td>
</tr>
</tbody>
</table>

The addition of these program options has allowed our pre-service participants to create a more realistic schedule based on their individual realities. Consequently, rather than feeling added pressure, a greater sense of support from our TL³C community has been generated.

Recruitment

The TL³C Project award notification was announced less than four months prior to the expected implementation of program components, with the most pressing being the pre-service teacher preparation program beginning that fall semester. The limited time for recruitment emphasized the need for tapping existing connections and resources. For future planning, the first-year rush also highlighted the need to initiate recruitment efforts early and with strategic timing. Consideration of high school calendars, college recruitment fairs, and university
admissions deadlines should be factored into the recruitment timeline. Details such as high school testing schedules (for potential high school recruits) and community college midterm/final exam weeks (for current community college recruits) must also be considered to ensure that information shared is heard and that desired action ensues (i.e. program application).

Another recruitment challenge involved the professional development component of our grant, where we found ourselves struggling to fill our summer institute with TLLs from our official partner schools. This challenge alerted us to the importance of building relationships with program participants as well as encouraging higher levels of participation that not only further professional development but also validate the wealth of knowledge and expertise of TLLs. As we have developed and nurtured our relationships with TLLs at partner schools, we have seen an increase in their engagement as both participants and presenters/facilitators at our sponsored professional development opportunities. Furthermore, additional requests for higher levels of participation are coming from schools other than our official partner schools. Our strategy for addressing these requests has been to create Level 1 and Level 2 partnership sites, as indicated in the table below.

### Table 2 Partnership Levels

<table>
<thead>
<tr>
<th>Level 1 Partner Sites</th>

</tr>
<tr>
<td>TL(^3)C Consortium</td>
<td>All stakeholders invested in programs for language learners to be included in dissemination of information, communication and TL(^3)C sponsored events.</td>
</tr>
</tbody>
</table>

### Retention

As discussed in our Requirements section, our community college student population includes a large percentage of students who have limited financial resources, work part- or full-time, and/or have significant family responsibilities. MCC student demographics for 2014 show
the average age to be 26, forty-seven percent of students are from minority backgrounds, 68% are part-time students, and 47% are first-generation college students (MCCCD Institutional Research Information System, October 2014). The same strategy used to address our initial recruitment challenges also have also addressed the retention challenges posed by the nature of our student body. The increased flexibility in program requirements now provided through a variety of options for program participation reflects a more holistic and comprehensive response to student needs.

Going into year 3 of a 5-year grant and due to the part-time status of many of our pre-service participants, we are expecting to see a significant increase in our community college program completion rate. These pre-service teachers, as a limited number have done thus far, will then move into their next stage of program completion within our university partners’ BLE/ESL teacher certification program. Hence the retention through completion challenge is two-fold:

1. at the community college TL³C teacher preparation program
2. at the transfer university BLE/ESL teacher certification program.

While in the midst of this challenge, we have reaped the benefits of the complex program design that resulted in an inherent strategy for addressing the challenge. The opportunity presented through this two-fold challenge is in terms of through institutional collaboration and program mentorship as students move from the community college to the university. The various components of our project provide rich opportunities for ongoing interactions between college/university faculty, pre-service teachers, practicing TLLs, and school/district administrators. These opportunities have fostered the intentional creation of a broad network of support, which we refer to as our TL³C Consortium.
Results

In 1993, the Federal government enacted the Government Performance and Results Goals “to improve program management throughout the Federal government” (U.S. Department of Labor, 2014). The results that we report to the U.S. Department of Education in our biannual required reports have to address the GPRA goals. TL$^3$C has committed to the five GPRA Goals, with sub-goals that address specific components within each goal, identified in Table 3.

Table 3 TL$^3$C’s GPRA Goals

</tr>
</tbody>
</table>

TL$^3$C is a multifaceted grant that includes a range of participants including pre-service and in-service teachers as well paraprofessionals and faculty at MCC. The participants in our grant activities vary from semester to semester and often, sponsored event to sponsored event. For example, we provide various professional development opportunities throughout the year and who attends depends on pre-service and in-service teacher availability.
Because of the multiple components of our grant, collecting data that demonstrates how we have met each of the GPRA Goals has been challenging. Our instruments have evolved as we continue to refine them and adjust to best measure both the GPRA goals as well as other goals that the core team - composed of the Project Administrator, Project Director, Project Expert, and External Evaluator - has identified. Furthermore, all of the GPRA sub-goals are written such that they can be measured quantitatively. For example, sub-goal 2.3 states that “Annually, in-service TLLs participating in TL³C paraprofessional development will demonstrated a 20% increase or score 80% or better in their knowledge of STEMSS through a pre-post survey.” In additional to the quantitative measures, we are also collecting qualitative data to deepen our understand of TL³C’s impact. For example, a project goal not overlapping with a GPRA goal is understanding how pre-service teachers form their identities as teachers. Although this is not a GPRA Goal, it is a project goal that we are addressing through using focus group and interview data.

Because of our various foci, it has become critical as we have proceeded year to year with the grant to create and implement a systematic and coordinated plan to collect, analyze, report, and disseminate data from the grant. This has required a common vision for and understanding of the grant and it’s goals. It has also been important to develop a common vocabulary. For example, when addressing any professional development focusing on academic vocabulary development, we had lengthy discussions within our core team as well as with teachers in our partner sites about developing a common set of terms that would be used within professional development activities, STEM clubs, and lesson creation. The decision was made to use the terms to distinguish among various vocabulary levels - Tier 1, Tier 2, and Tier 3 - developed by Beck, McKeown, and Kucan, (2002).
Reality

It is essential that we acknowledge the political climate in Arizona in regard to issues impacting English learners. A number of policies stemming from legislature passed in Arizona between 2000 and 2014 have impacted the preparation of teachers of English learners and their students. More specifically, Jimenez-Silva, Gomez, and Cisneros (2014) reported that recent in response to the legislature, Arizona educational policies have been enacted that do the following: (a) severely limit bilingual education, (b) develop controversial funding solutions, (c) implement a segregated 4-hr English language development block, (d) mandate structured English immersion–focused teacher preparation, and (e) develop disputed identification and classification instruments. TL^3C is required to work within the policies that impact ELLs. All preparation of pre-service teachers and professional development activities for in-service teachers has to address the reality that Arizona is an English-only state for ELLs and that although dual language immersion programs are growing, they are often serving native English speakers learning a second language (Gomez & Jimenez-Silva, 2014).

As discussed in a section above which addressed the Arizona context, we stated that all teachers in Arizona are required to take two Structured English Immersion (SEI) courses that then provides them with an SEI endorsement from the Arizona Department of Education (ADE). One of the realities that TL^3C has had to address is the misunderstandings that exist in our educational community regarding the differences among an SEI, an English as a Second Language, and a Bilingual (BLE) endorsement. It has been a challenge to help pre-service teachers to see the value of an ESL or BLE endorsement that requires additional coursework and preparation.

An additional challenge for pre-service teachers served by TL^3C who are seeking to
become bilingual teachers is a lack of support for attaining Spanish fluency to a level that would allow them to pass the Spanish proficiency requirement that is mandated by ADE. Currently, pre-service teachers complete two courses in the same foreign language and although a significant number of our students are native Spanish speakers, they have not developed their Spanish proficiency enough to successfully become BLE endorsed teachers. TL³C has attempted to address this issue by providing a summer study abroad program in Guanajuato, Mexico to provide more exposure to Spanish in schools in Mexico. However, the program has not been as successful as we had hoped due to the time and financial commitments required of pre-service and in-service teachers. In addition, the Arizona political climate has not been supportive of travel to Mexico.

The current teacher preparation programs in Arizona do not provide any options for pre-service teachers who seek to become Early Childhood teachers with BLE/ESL endorsements. Therefore, another reality faced by TL³C is the inability to recruit pre-service teachers who would like to work with the youngest of our ELLs. Currently, TL³C is involved in collaborative conversations with universities about articulating such programs.

The final reality faced by TL³C is the need to constantly monitor and adjust all aspects of our program. The key has been to not remain static in any regard but instead, to adopt a mindset of being fluid and flexible. Whether the issue has been adjusting the requirement of service learning or redesigning the curriculum STEM clubs offered through TL³C, significant time and energy needs to be devoted to realignment between our goals and the services we offer.

**ACCESS**

Academic Content Combined with English in Secondary Schools (ACCESS), a five year, NPD grant-funded program from 2008-2013, provided secondary mainstream teachers of
English learners (ELs) a cohort based professional development program to support teachers’ development of knowledge, disposition and skills important for teaching English learners. As a university-school district program, ACCESS provided mainstream teachers with 18 graduate credit hours of professional development experience and coursework needed for obtaining the state’s English as a Second Language endorsement. Over the five years of the program, nearly 100 teachers from 12 urban schools completed extensive professional development in English as a second language coursework.

ACCESS’s professional development model included preparation for developing cultural and linguistic awareness, instructional knowledge and affirming dispositions (Lucas, Villegas & Freedson-Gonzales, 2008; Villegas & Lucas, 2002) as a means of effectively instructing ELs (Tellez-Waxman, 2006; Walqui, 2008).

The research of Cochran-Smith & Lytle, 1999; Echevarria, Vogt, & Short, 2009; Garet, Porter, Desimone, Birman & Yoon, 2001; Faltis & Coulter, 2008 informed ACCESS’s curricular and programmatic aspects for developing secondary mainstream teacher’s knowledge and skills.

The ACCESS program evaluation utilized qualitative and quantitative data including pre and post surveys, an in-depth post participation survey with emphasis on knowledge, skills and practice, interviews of teachers and administrators, and teacher observations using a SIOP protocol (Echevarria, Vogt & Short, 2009). The data, triangulated from a number of sources, indicate that teachers developed an overall understanding of the importance of EL students’ language and culture, the need for scaffolding and the importance of advocacy for EL students. The grant’s results are significant for both teacher professional development and university partnership programs focused on teacher development and for districts seeking to ameliorate instruction for ELLs in order to improve academic success.
Requirements

Participants of the ACCESS program were high school teachers from all content areas who taught at schools in a large urban district located in a metropolitan city in the Southwestern U.S. Participation only required that participants be teaching high school within the partnering district and that they complete an application process. All teachers in the district were eligible for participation. Upon application to the program, teachers were required to attend an orientation meeting in which they received information and directives for applying to the university as a non-degree student. Since the orientation was mandatory for participation in the program, it was often the case that additional orientation meetings had to be scheduled to accommodate teachers’ busy schedules.

Recruitment

One of the largest challenges of the program was recruiting teachers to participate in the program. Recruitment was mainly done through school visits, site-based meetings with teachers and administrators, and through referrals from participants already enrolled in or who had completed the program previously. Even though the grant provided many advantages for teachers: the cost of tuition to the university was covered, teachers completing the program were eligible to receive an ESL endorsement through the state, and the credits earned from coursework could be used towards a Master’s Degree at the participating university, still for some teachers, their heavy workloads often made participation prohibitive.

Retention

Retention was a continual challenge throughout the program which covered three semesters of coursework. Retaining teachers for the full length of the program was difficult. Approximately 20% of the participants began the program in one cohort and ended up
completing the program in a subsequent cohort. Flexibility was important for ensuring that teachers could complete all three semesters.

Each cohort began with twenty-four to twenty-eight teachers applying for participation. Of these, sixteen to seventeen teachers remained through to the end to complete their coursework. Over the five years of the ACCESS program, 99 teachers completed some portion of the ACCESS program with an 83% retention rate for completion of the entire eighteen credits.

To address the retention concern, ACCESS administrators arranged for special class times for courses held on the university campus in order to better accommodate teachers’ schedules. Some courses also met on site at schools within the district. Often there was a need to be flexible and make accommodations for students who were not able to complete the program or attend all classes. As a means of retaining students, the director would often contact individual teachers who were missing work or in danger of not completing a course in order to work out a plan for retention and completion.

Results

Over the course of the five year program nearly 100 high school teachers from many content area backgrounds successfully completed six foundational courses in English language education including coursework in: language minority education, bilingualism and second language acquisition, literacy in secondary BLE/ESL settings, parental and community involvement, assessment, and strategies for sheltered instruction. Data from pre and post surveys, teacher interviews and classroom observations show that ACCESS teachers grew in their understanding and knowledge of language development and the role of L1 use in the classroom to support English development. Teachers also moved toward greater sensitivity and value for bilingualism and for making positive connections to students’ homes, communities and cultures. In
classrooms, teachers incorporated more teaching strategies to support their students learning, and in particular, ACCESS teachers expressed a stronger sense of advocacy for their English learners after participating in the program.

**Reality**

In order to impact teachers, a professional development program must have teachers who are invested and open to learning and growing as professionals. Recruiting these teachers requires a great deal of time and effort. Getting buy-in from district and school administration is an important element in this process. When district administration, school principals and Assistant Principals were behind the recruiting efforts of ACCESS, it was much easier to recruit teachers for the program. Administrative support helped teachers be more invested and willing to devote the time and work necessary to continue in the program.

Once teachers were enrolled in the program, retention became the real challenge. A professional development program for in-service teachers must take into account the heavy workloads and priorities that teachers are tied to in their day to day work with students. For ACCESS to be successful and accomplish its goals, flexibility and individual support were necessities. It was imperative that coursework and assignments were relevant and responsive to teachers’ classroom contexts and the realities of teaching. Even then, many teachers needed more individualized options and support in order to be able to complete the program and be successful.

**TELAC**

Teaching English Learners Academic Content (TELAC) is a professional development program modeled after the previously established ACCESS program with modifications based on grant requirements and feedback from ACCESS participants. As a STEM initiative, this new
OELA/NPD sponsored project was developed specifically for middle and high school teachers of math, science, technology and English/Language Arts from several urban school districts located in a large metropolitan city in the Southwest. The goal of the project is to support middle and secondary STEM teachers to improve the academic achievement of English Learners (ELs). TELAC participants take two semesters of university coursework and a two-semester practicum that engages them on-going critical reflection and refinement of their practice through individual and group- learning activities tied to their school/classroom contexts. They also receive individual coaching and mentoring that supports their examination and refinement of instructional practices in support of ELL students.

Underlying the TELAC professional development model is the work of Dall’Alba and Sandberg (2006) in which they reframe PD as an “embodied understanding of practice” with a need to see professional development as developing understanding of, and in, professional practice rather than an accumulation of skills. TELAC utilizes this approach by tying program curricula and assignments to teachers’ classroom experiences and instruction and by providing classroom-based coaching/mentoring support for every teacher.

Research on TELAC utilizes a mixed-methods, qualitative and quantitative approach with data collected through participant surveys, interviews, artifacts, journals, and classroom observations. The research shows that teachers in the program developed and refined their teaching practices with more of a focus on language development through increased opportunities for listening and speaking, more group collaboration, an increase in reading and writing activities, integrating language objectives into lesson planning, more explicit teaching of vocabulary and language elements, and a greater focus on academic language teaching and learning. Teachers also reveal a greater sensitivity and awareness of the importance of culture in
learning with teachers actively getting to know their students’ backgrounds and looking for ways to use what they learn to build connections between students and the content being taught.

**Requirements**

Requirements for participating in TELAC are minimal. As a STEM based initiative, all participants have to be either current STEM teachers or English Language Arts teachers, as a result of the program’s connection to a university English Department. All of the teachers in the program are currently teaching at the middle or high school level in one of the partner school districts associated with the project. These schools represent areas of highest need and include schools with the large populations of English learners in this large metropolitan city. After applying for participation, teachers were required to attend an orientation where they received information about the program as well as support to apply for admission to the university. For some teachers, this process was a challenge in itself as it had been many years since they had attended classes at a university and the paperwork and requirements were an issue. A few teachers who were interested in the program ended up dropping or postponing participation due to the issues they encountered during this process. It was important at this stage to follow up with teachers to ensure that they were properly admitted and enrolled in order to begin the program as scheduled.

**Recruitment**

The program’s goal of enrolling twenty-five teachers per year has been difficult to meet, and as a result, recruitment has become one of the greatest challenges faced by program administration and staff. Even though twenty-six to thirty-six teachers apply to the program each year, only seventeen to nineteen end up actually enrolling in the program. Many of the teachers
who have applied but not completed the enrollment process cite changing or unexpected workloads at school, health issues, or personal/family concerns as reasons for not continuing.

Efforts to recruit participants include scheduling regular school site meetings with administration and teachers, following up on referrals from prior participants, and meetings with district EL coordinators and administration. We have also worked to align the program’s coursework with university graduate programs making it possible for teachers who complete the program to roll over their credits into established university Master’s programs. We have found this to be a strong motivation for some teachers in making the decision to participate in the TELAC program.

Retention

In addition to recruitment, retention has also been a great challenge for the program. Teachers’ workloads, changes to teaching schedules, and illness have made it impossible for some of the teachers to continue once they have begun the program. Implementing hybrid classes to reduce face-to-face class time has helped, but is not sufficient for making the load manageable. Some teachers report that the course workload and assignments have been too much for them to manage on top of their teaching loads at school. In response, we have worked to extend deadlines, modify coursework, combine assignments, and scale back on outside of class work by providing more in-class time for teachers to complete assignments. As a result, teachers have expressed that providing in-class time to complete coursework has been very helpful and appreciated.

Retention efforts have increased over the first few years of the program as we developed new ways of ensuring teacher completion and success. TELAC staff now make personal contact biweekly with participants to learn how they are doing and address any concerns or issues as
they arise. Coursework has been streamlined and consolidated and assignments modified to make them more manageable. In addition, we now begin coaching teachers earlier in the program as a way of offering support early on. By way of partnering with and garnering district support, we have also planned and implemented ELL and SIOP workshops for district administration to address their needs and concerns in supporting their teachers in working with English learners.

**Results**

Currently in our third year, forty-two teachers have completed or are now enrolled in a TELAC cohort. Teacher reported data show deeper understanding and awareness of EL students’ language and learning needs in the classroom. Based on the pre and post survey data teachers are moving towards more culturally and linguistically responsive teaching practices as a result of their work and experiences in the TELAC program. All teachers report making changes to their teaching practices that reflect greater awareness of their English learners and a greater sense of how to address students’ language and learning needs in the classroom.

**Reality**

Teachers today find it very difficult to work under federal, state, and local mandates, fulfill school expectations and directives and still meet the diverse learning needs of every student that enters their classroom. As a professional development program aimed at supporting the growth and development of teachers of English learners, we’ve found that teachers want to learn and become more effective teachers of their ELs, but to help them, we must meet them where they are at. We have to work with them to design and develop a professional development program that is relevant and responsive to their teaching contexts and professional learning needs through incorporating flexibility, trust, and caring.
The goal of Project LEAP (Language, Equity and Academic Performance), is to provide Alaska’s in-service teachers with the knowledge and expertise they need to facilitate ELL’s acquisition of language, literacy, and content knowledge, especially in the areas of literacy, mathematics, science, technology and engineering. In order to more effectively meet the needs of the ELLs in Alaska classrooms, we must improve the instruction they are receiving.

To accomplish this, we have developed and begun implementing a P-6 ESL Endorsement program that consists of 18 credit hours of graduate level coursework. Throughout the coursework, in-service teacher participants are involved in a variety of activities and study that impact their classroom instruction and cause them to reflect on their teaching practices. They are exposed to the current issues, policies, and laws that are guiding ELL instruction and practices, as well as receiving professional development centered around the State’s newly adopted English Language Proficiency Standards from the WIDA Consortium. Action research, case studies, student assessment data, and student work samples are utilized by teachers to assess their ELL’s language proficiency and used to guide their instruction to improve student performance. Teachers identify instructional strategies, curriculum materials, and content to enhance their instruction in the areas of STEAM to improve the way their ELLs are learning science, mathematics, technology and engineering in preparation for future careers.

Requirements

It was a common complaint that first semester: the workload was too much, the focus too “theoretical.” Our Project LEAP participants were not used to graduate-level work in which they were challenged and expected to become a part of the wider community of educators who are guided by research-based practice. Local school districts had in recent years offered many “500-
level” graduate classes, which had few requirements and little connection to research. In Project LEAP, our participants were expected to enroll in six graduate credits per semester while working full-time in schools. Our courses were rigorous. Too rigorous, we learned, as we lost nearly twenty percent of the enrolled students in Cohort 1 before the second semester started. Though most of the attrition happened before the add/drop period first semester, we simply had to consider what we could do to lower the workload and expectations without losing any of the academic vitality we hoped to foster.

Our strategy was multilayered: lessen the workload, make more of the content directly applicable, and continue to make connections between research and practice. We dropped a few assignments, added more hands-on activities, and continually assured our subsequent cohorts that the focus on research and theoretical foundations in the first semester was purposeful, and would pay-off when the focus turned to implications of the research for revised classroom practice (particularly via the action research project).

**Recruitment**

Recruitment was awkward in the beginning of Project LEAP, particularly because we didn’t allow ourselves a planning year. Our sense of urgency was guided by the need to build the capacity of the teachers to become effective and successful practitioners able to meet the academic and linguistic needs of an increasingly diverse population of students. Because of this decision we were building the plane while we flew it. Many of the questions that came up about the program were answered on the fly. However, with the help of school district partners, we had a healthy first cohort and have continued to be able to offer two sections (one face-to-face, one distance) for each subsequent cohort thus far. Our district partners are in charge of recruitment, and they have employed a combination of face-to-face discussions, such as in meetings with
principals, and advertising through brochures, district media, and email. Recruitment has not been an issue for Project LEAP as we are currently the only ESL-certification program in the state.

One of the strategies that we have used is to make sure that participants know about the commitment expected of them in Project LEAP. When they know at the outset that there are rigorous requirements, the participants who enroll already know what the program is all about, so we have less of an issue with retention. Our College of Education seeks partnerships with different districts across rural Alaska, and so we are extending the recruitment efforts to include teachers from these rural districts. As we prepare to review the applications for cohort three of Project LEAP we continue to receive inquiries by teachers from rural Alaska who are interested in the program. This is a positive step toward addressing the high teacher attrition experienced in rural Alaska.

Retention

As noted, in the beginning we lost participants because they were not prepared for the rigor of graduate studies. Participants struggled with working full-time and studying part-time. Retention will be an issue with professional development projects simply because teachers have professional and familial obligations that make it difficult for them to engage in professional development activities. There is only so much time in the week. However, we were able to improve our retention rate by dropping superfluous assignments, being flexible with deadlines and assignments, and making clear the connection between the theory and their day-to-day classroom life. Furthermore, we decided to include more collaborative assignments where teachers from the same grade level evaluated math and science curriculum and embedded culturally sustaining STEAM pedagogy.
Results

Preliminary results show that participants deepened their understanding of culturally sustaining pedagogies and were able to analyze and modify their current practices to incorporate new and more nuanced understandings about their practices. Some of these understandings were gained from class discussions, reviews of extant literature, and from discussions about practices that took place during the critical friends group interactions. Teachers were able to formulate and refine questions about their own practice. These questions, focused on ELLs, also involved teaching in STEAM and literacy classrooms as well as parental involvement, special education and inclusive classroom cultures. In one of the title 1 schools, the number of teachers deciding to join project LEAP increased from year one (1 teacher) to year 2 (4 teachers). This indicates that teachers who completed project LEAP were instrumental in creating professional learning communities within their school.

Reality

Teachers in today’s classrooms have many, often conflicting, obligations. Project LEAP has been impacted by participants whose districts require scripted programs that leave little room for teacher professional decision-making. Participants in such settings struggled to find opportunities to enact culturally sustaining pedagogies. In addition, current economic conditions in the state have resulted in budgetary cuts, which caused a lot of anxiety among participants whose jobs were on the line, or whose placements changed without their consent. These factors contributed to the general anxiety of participants who found it difficult to care about classroom practices within a context that did not treat them as professionals.

For beginning teachers, LEAP represented an opportunity to learn about culturally sustaining pedagogy alongside experienced colleagues. The beginning teachers also made
important connections that facilitated their initial year in the classroom. Overall, teacher reported that project LEAP was beneficial to their understanding of English language learners, and to the process of language acquisition. A testament to the value of this program is the fact that many of the teachers who applied to the second cohort of project LEAP came from the same schools as the teachers from cohort one.

**Conclusion**

Although significant challenges currently exist in our efforts to meet the U.S. Department’s goal of providing professional development activities to improve instruction for ELLs and assist education personnel working with such children to meet high professional standards, we have identified a number of strategies for addressing our five common challenges related to program requirements, recruitment, retention, results, and reality. Projects sponsored by NPD grants are designed to increase the pool of highly qualified teachers prepared to serve ELLs and increase the skills of teachers already serving them. All five projects discussed in this paper seek to increase the skills of teachers in distinct communities that present unique challenges as well as unique opportunities. It has been beneficial to all involved in these various programs to share challenges, strategies for addressing those challenges, concerns, and successes. We look forward to further discussions as we continue to systematically measure, quantitatively and qualitatively, the impact of our programs. Issues related to measurement of specific program goals merit further discussion as do issues of dissemination of our findings and program replication. It is our hope that our experiences can inform the next generation of programs dedicated to supporting teachers who serve English language learners.

Abstract
More and more information is being stored on the cloud; employers want their employees to be able to work with others. Google offers some useful tools to meet both of these needs. This workshop will introduce the audience to 50 practical uses of Google tools; we will follow this introduction by a more detailed, advanced look at some of these Google tools and apps. The workshop will conclude with a look at an awesome use of a Google script and introduce the audience to Google Scripts which offer programmatic access to most Google services including Gmail, Google Docs, Google Drive, Analytics, Google Contacts, Calendar, Maps and Analytics.
Pertinent files, how-to files, and other outlines are available to participants at http://edulink.org/hice/

CAUTION: COLLABORATIVE PROFESSIONALS AT WORK!

Abstract

General and special education teacher roles are changing as schools implement school-wide frameworks such as response to intervention (RTI). Special and general education teachers must now collaborate more as they plan and implement services for all students. Teacher candidates need to learn skills in problem-solving and handling issues faced when collaborating with other educators (Hamilton-Jones & Vail, 2013). They should have opportunities to take part in collaborative experiences through fieldwork and coursework (Conderman & Johnston-Rodriguez, 2009). General education and special education teacher preparation faculty must begin to model this collaborative planning and instruction. Our college has developed a teacher education program conceptual framework which prepares collaborative professionals who are competent in their own content and practice and can reflect and work with other educators to meet the needs of students. Our general and special education faculty model these collaborative skills as we meet to review courses and field experiences and support teaching within each of our classes. These collaborative efforts ensure that candidates are able to plan and implement instruction for all students in their classroom, despite types of diversity. In addition, candidates’ problem-solving skills, a pre-requisite for effective collaboration, are developed as they work through conflicts faced working together with candidates from other programs, with varying perspectives, training and schedules. In this presentation, we will share the ways our faculty works together to model and provide these experiences in collaboration.
Foundations of Success in Times of Change

Topic Area:
Higher Education & Other: Learning Center Management

Presentation Format:
Workshop

Presentation Description:
This interactive workshop will provide an overview of administrative topics relevant to professionals who are new to learning center management, including writing centers and subject area tutoring centers. The topics are relevant to professionals working in K-12 settings as well as postsecondary settings. The first half will focus on the administrative aspects of operating and maintaining a learning center. The second half will focus on methods for understanding and reporting data.

Foundations of Success in Times of Change

Presentation goal

The ability to properly lead a team is critical to the success of any organization. This presentation offers a solution to the issue of new learning center directors often having to gain knowledge about all aspects of a center on-the-job rather than ahead of time. By making information about learning center management—in all of its aspects—available at once to a group of new professionals, the workshop presenter hopes to help conference attendees think through the learning center cycle from start to finish. To be relevant to conference attendees, the workshop will help participants network with each other, learn about centers’ day-to-day operations, consider relevant literature and opportunities for research, find ways to extend learning/development opportunities to center tutors, and find ways to communicate the role that learning centers may play in an institution’s overall retention of students.

Session summary

Summary: This interactive workshop is focused on supporting new learning center professionals (Christ, 2001) in developing a toolbox of strategies, theories, language, and timelines that will aid them in operating a learning center from top to bottom—from A to Z.

The first half of the workshop will focus on the administrative aspects of operating a learning center (Boylan, Bliss, & Bonham, 1997; Ender & Newton, 2000). As a way to provide participants with a theoretical framework for learning center management, the presenter will also provide participants with an overview of the current literature in learning centers (Boud, Cohen, & Sampson, 2001; Ender & Newton, 2000; Topping & Ehly, 1998) and student development theories (Astin, 1993; Chickering, 1969; Chickering & Reisser, 1993; Evans, Forney, Guido-DeBrito, 1998; Thomas & Hixenbaugh, 2006). Participants will receive an outline detailing the yearly cycle of a learning center. Additionally, through discussion, participants will have an opportunity to work in a collaborative environment to learn what other practitioners in their field have in place in the following areas: hiring processes, expectations, training, marketing, ongoing professional development, program evaluation, and retention of student staff.

The second half of the workshop will focus on methods for understanding and reporting center data. In this current environment of evidence-based practice, it is important to highlight the impact learning centers have on the students who utilize their services (Gordon, Morgan, O’Malley, & Ponticell, 2007; Hill & Topping, 1995; Tinto, 1987; 2006) and to use the information to communicate with stakeholders. Using hands-on activities, participants will have an opportunity to take raw data and use Microsoft Office 2010 Excel to organize and analyze the data. Participants will also learn how to create charts in Excel and use pivot tables to interpret and report their findings. For this portion, participants are encouraged to bring their own laptops to fully engage with the material presented.

Learning Objectives: This presentation has the following learning objectives for participants who attend this workshop:
(1) become familiar with the literature on learning center and student development theories, (2) understand the cycle of operating a learning center, and (3) use Microsoft Office Excel to create charts and pivot tables in order to understand and report user data.

Title: Social Competence of Youth with Autism Spectrum Disorders: Exploration of a Peer Facilitated, Equine-Assisted Growth and Learning Program

Names of Authors: Darcy Miller, Phyllis Erdman, Sue Jacobson

Affiliation of Authors: Washington State University

Address of Authors: 321 Cleveland Hall, WSU, Pullman, WA 99164-2132 USA

Email Addresses of Authors: darcymiller@wsu.edu, perdman@wsu.edu, sjacobson@vetmed.wsu.edu

Abstract: Autism Spectrum Disorder profoundly affects 1 in 88 children, and their families and is characterized by atypical language, social competence, and motoric behavior (Centers for Disease Control, 2012). Social competence is a critical skill for success and consequently effective interventions are needed. This study was designed to examine the effects of a peer facilitated equine-assisted program on the social competence of youth with Autism Spectrum Disorder. The effectiveness of equine-assisted interventions for children with disabilities has been well-established (Bass, Duchowny, & Llabra, 2009; Pavlides, 2008) and equine interventions have been shown to improve social competence (Pendry & Roeter, 2013; Pendry, et al., 2013). Our study examined the use of non-disabled peers facilitating social competence in youth with Autism through an equine-assisted program. The effectiveness of using peers to improve social competence is well documented (Dunlop, et al., 2007). It was hypothesized that peer engagement during the equine-assisted program would positively impact the social competence of youth with Autism. A bounded case study design was used with three youth with Autism Spectrum Disorder and three non-disabled peers. The youth participated in a 10 week equine-assisted growth and learning program that involved a team approach to groundwork with horses and communication/leadership activities. Data collected included pre/post program social responsiveness scores, observed social and behavioral indicators, and pre/post program parent interviews. Results indicate that all three of the youth improved their social competence.

Abstract: Teaching with interactive technology is a promising but under-utilized instructional method that can help teachers support children with more intensive learning needs at varying development levels in preschool classrooms. This formative study was focused on examining the engagement of three young children with disabilities during group instruction when using technology compare to traditional materials. A single subject multiple baseline withdrawal method was used to determine if adding an interactive touch screen to group instruction time increased the engagement of children who were functionally non-verbal. Results showed variability across phases, but children increased their engagement during the technology intervention overall.
Avoiding Disgusting Discussion Board Questions
Dr. Vanessa Evans Huse-TAMUC
Dr. Rhonda Harris Taylor-Retired OU
Dr. Maribeth McAnally-TVCC

The Principles and Standards for School Mathematics of 2000 (National Council of Teachers of Mathematics) and the mathematics component of the Common Core State Standards of 2010 (Common Core State Standards Initiative) emphasize the importance of developing problem solving skills in mathematics. As summarized by the Principles and Standards, “This set of Standards reinforces the dual goals that mathematics learning is both about making sense of mathematical ideas and about acquiring skills and insights to solve problems” (National Council, “Standards for Grades 3-5”). Promoting such duality of skill development is particularly challenging in the contemporary, online mathematics class at the university level. And yet, the need is especially critical when teaching higher education students who will ultimately be responsible for instructing children. However, one strategy that facilitates problem solving is effective discussion questions, which can:

- Encourage critical or creative thinking
- Reinforcing [sic] domain or procedural processes
- Achieve social interaction and community building
- Validating [student] experiences [inside and outside the classroom]
- Supporting [sic] students in their own reflections and inquiries (Boettcher)

The link between effective questioning and problem solving skill development has long been understood in mathematics pedagogy. Historically, mathematics textbooks from the early part of the twentieth century required more higher-order problem solving than is evident in most
contemporary textbooks. For instance, a 1913 textbook entitled *Rural Arithmetic* contained problems that were "real and practical," and that presented students with “a chance to solve problems in which they and their parents are vitally interested" (Calfee iii). Consider this sampling of problems from that early 20th century text intended for students in elementary grades:

How long must a skirt be cut to measure 39 in. when finished, if it has two clusters of tucks each composed of five 1/4-inch tucks, and is lengthened by a 6-inch flounce? (Allow 3/4 in. for adding the flounce.) (54)

Which is the better proposition, to keep a young calf for 120 days, feeding it on an average 2 1/2 gal. of fresh milk per day, at 12¢ per gal., and then sell it for $18; or sell it at birth for $2 and make and sell butter at 20¢ per pound from the milk, which contains 4% butter fat, the skim milk and buttermilk paying for the trouble of milking and churning? (82)

In contrast to these historical examples which married real-life experiences with mathematics knowledge, too many current “traditional online discussion forum questions are ineffective to inspire critical thinking” (Strang 80). However, the cost of business as usual is untenable. Students’ future success is dependent on developing the real-life problem solving skills emphasized in the *Principles and Standards for School Mathematics* of 2000 (National Council of Teachers of Mathematics). As articulated by Waits and Demana, “Business and industry want employees who can think, read, and understand problem situations; work cooperatively in groups; understand and use technology; and communicate effectively with others" (714). Utilization of questioning strategies is one way to integrate promotion of “social interaction and community building” (Boettcher) with content mastery. The challenge of online
teaching of geographically dispersed students is also simultaneously an opportunity for using
discussion as a learning activity among student peers. Synchronous and asynchronous class
discussion promotes learning by interacting students that is not “limited by time and space”
(Darabi, Liang, Suryavanshi, and Yurekli 229). It duplicates the increasingly common digital
arenas for interaction in the workplace.

One strategy for fostering more robust discussion is to have students create the problems.
Silver, Kilpatrick, and Schlesinger (1995) emphasize that students need practice in formulating
mathematical problems for themselves. If they are always presented with well-formulated
problems that contain just the information needed for a solution, how can they learn to deal with
situations in which appropriate mathematical ideas and techniques are not obvious--that is,
situations in real life?” (14)

The *Principles and Standards* specifically address problem solving, and require that:
Instructional programs from prekindergarten through grade 12 should enable all students to—

- build new mathematical knowledge through problem solving;
- solve problems that arise in mathematics and in other contexts;
- apply and adapt a variety of appropriate strategies to solve problems;
- monitor and reflect on the process of mathematical problem solving.

Other approaches that are suggested for helping students develop problem solving skills
include asking students to restate ill-formulated or partially formulated problems, modifying
textbook problems so they are open-ended, and having students change existing problems
(Silver, Kilpatrick, and Schlesinger 14-15). But, how well-prepared are teachers of university
mathematics classes to implement the standards on problem solving in their own pedagogy? In
what practical ways are university teachers providing opportunities for their students to practice
critical thinking or “to engage in these more open-ended forms of mathematical thinking” (Silver, Kilpatrick, and Schlesinger 31)? And then, given their own course experiences, how well-prepared are those university students, as future mathematics teachers, to develop critical thinking skills in their own students?

A 2012-2014 teacher training institute, funded through a Teacher Quality Grant provided three semesters of professional development for twenty elementary and middle-school mathematics teachers. The goal of the Institute was to focus these teachers on developing algebraic thinking. Emphasis was placed on the development of higher-level questions for students, in the context of a variety of problem situations using algebraic concepts. Work in problem solving was built around Bloom's Taxonomy, with which all of the teachers were already familiar. Instruction in problem solving was predicated on several assumptions. First, it was emphasized to Institute participants that everyday life provides multiple problems well-suited for revision by the teachers. The following example was provided:

In this chart, a rental agency has outlined the cost of renting a compact car.

<table>
<thead>
<tr>
<th>Miles in One Day</th>
<th>Cost to Rent</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>23</td>
</tr>
<tr>
<td>100</td>
<td>43</td>
</tr>
<tr>
<td>200</td>
<td>63</td>
</tr>
<tr>
<td>300</td>
<td>83</td>
</tr>
<tr>
<td>400</td>
<td>103</td>
</tr>
<tr>
<td>500</td>
<td>123</td>
</tr>
</tbody>
</table>

This mathematical situation has no questions, providing only information. But even a layperson who reads it would begin to calculate costs. For instance, what would it cost to drive three hundred miles? This type of answer can be easily derived by reading from the chart provided. At a more sophisticated thinking level, a student might be asked to determine the cost
for driving ninety-nine miles by interpreting the data in the table. Obviously the second question requires more thought. An even more complex question could be posed to students: If you have fifty dollars to spend, how far could you afford to travel in one day?

Second, it was determined from the needs assessment survey that while the participants had been trained in their pre-service education courses to develop questions, many did not have experience in practicing this skill in a mathematical context. Their tendency was to rely on textbooks for problem solving experiences that they presented to their students. Obviously, this strategy is not adequate for preparing students to enter the twenty-first century workplace.

Therefore, the instruction for Institute participants began with a return to their common base of knowledge about educational theory, as manifested in Bloom's Taxonomy. When asked to develop questions on all levels of the taxonomy, the teachers tended to write good questions, but at only the lower levels (knowledge, understanding, and application). They exhibited an inability to easily produce higher level questions at the analysis, synthesis, and evaluation levels.

Returning to the example of the rental car, following are sample questions developed by the Institute participants and categorized by Bloom's Taxonomy:

**Knowledge**
1) What does it cost to rent a car to travel 500 miles?
2) For every 100 miles driven, the cost increased by how many dollars?

**Understanding**
1) What happens to the cost as the miles decrease?
2) Does the cost per mile increase or decrease with more miles traveled?

**Application**
1) What is the difference between the costs of traveling 500 miles in one day compared to the cost of traveling 200 miles in one day?
2) If you drive 300 miles one day, and 500 miles the next day, what is the total cost for the trip?
Analysis
1) Graph the data given, determining the proper scales to be used.
2) Find the algebraic formula to represent the data shown in the table.

Synthesis
1) If you needed a more expensive car, what would be the cost for 500 miles, if 0 miles cost $40 and 100 miles cost $75?
2) Based on the pattern represented in the chart, what would be the cost for driving 600 miles?

Evaluation
1) If you had $200 for a vacation, how many days could you travel? How many miles could you travel each day? Explain the logic for your decision.
2) The cost to insure each rental car is being increased by 20%. Revise the chart given to cover your new expense. Explain your method for the mathematical increase.

Experiences with this sample of in-service teachers in our program reiterate the need for teacher education programs to provide teachers the opportunity to develop online discussion questioning strategies using the principles of Bloom's Taxonomy, both for the educational experience of the teachers and as models for their own classroom while providing instruction to students. Teachers must be confident in their own abilities to solve problems and to create problems to be solved before they can facilitate their students' experiences in critical thinking and problem solving in mathematics.

“Online learning has been the subject of criticism for lacking what some scholars have considered fundamental elements such as social dialogue and interaction” (Darabi, Liang, Suryavanshi, and Yurekli 228). However, use of effective online discussion strategies counters that assumption. Effective design of discussion requires faculty attention to “structure, elements of interaction, a certain level of complexity, task orientation, clear expectations, and personal instructor involvement of the instructor in the course and her/his personal interactions with students” (Darabi, Liang, Suryavanshi, and Yurekli 229). Proper design of online discussion
questions will inherently promote the dialog and interaction needed for student synergy in problem-solving.

In designing online discussion, it is useful for faculty to remember the reasons for taking time to develop it. These include “to promote problem solving,” “to make connections among ideas and applications,” and to encourage reflection” (PBS). In designing discussions, a review of Bloom’s Taxonomy, especially the revised taxonomy (Anderson and Krathwohl) is useful, and there is an online resource that provides quick-use, how-to guides for utilizing Web 2.0 technologies with Bloom’s taxonomy, including suggested activities and keywords (Churches). PBS Teacherline offers via the Web a two-page list of questions for teachers to use in developing students’ mathematical thinking (“PBS Teacherline”).

It is also important to employ feedback strategies for student discussions that will forward the agenda of mastering mathematics content, promoting student confidence, and extending the new knowledge acquisition beyond the classroom. There are readily available resources to assist in development of evaluation for the student discussions, and they are also useful in the initial task of checking what needs to be included in the assignment (discussion) development. Online rubrics for such evaluation are available at http://www.uis.edu/colrs/learning/pedagogy/rubrics/.

Abstract

When conducting research that involves international collaborators, there is sometimes a necessity to have research instruments translated that retain validity and reliability. The international research team focused on the transformation of algebraic reasoning in middle school classrooms determined that an observation protocol validated in math and science classrooms was a necessary instrument for the research project. The paper includes a description of the constructs of AssessToday, process for translating the handbook, discussion of the visual model for the process, difficulties in translating from one language to another and future work to be done for validating the use of the Thai version of the observation protocol.

Introduction

U.S. and Thailand Mathematics Education faculty have a research collaboration regarding middle school mathematics teachers teaching of algebraic reasoning. Foci of this collaboration include research on short-cycle formative assessment, Lesson Study and mathematical knowledge for teaching (MKT). Although there is research on the effect of teaching for each of these individually, there is currently no research published on the integration of the three together. The overarching research question for the collaboration is what is the growth of middle school mathematics teachers’ knowledge and teaching of algebraic reasoning when they participate in lesson study that intentionally incorporates short-cycle formative assessment and mathematical knowledge for teaching into the process? Thus, the impact Lesson Study has in increasing teachers’ use of short-cycle formative assessment will be measured using the AssessToday: A Short-cycle Formative Assessment Observation Protocol (Eddy & Harrell, 2013).

Why Translate an Instrument?

The research collaboration includes the necessity to have instruments translated in both countries. This includes the translation of the validated observation protocol, AssessToday (Heitz, 2013). This handbook was originally written in English and needs to be translated to Thai in order for it to be part of the international research collaborative.
Theoretical Perspective

AssessToday is a formative observation protocol on teacher’s use of short-cycle formative assessment that was validated for secondary mathematics and science teachers (Heitz, 2013). The intense process of translating this instrument from English to Thai includes a team of both U.S. and Thai faculty. The paper includes a description of the constructs of AssessToday, process for translating the handbook, discussion of the visual model for the process, difficulties in translating from one language to another and future work to be done for validating the use of the Thai version of the observation protocol.

A definition of formative assessment is needed for the basis in which the observation protocol was developed. From Black and Wiliam (2009), formative assessment is defined as teachers, peers, and learners using evidence about student understanding of a concept to make decisions about what comes next rather than following a prescribed plan. The AssessToday (Eddy & Harrell, 2013) was developed with the practitioner in mind to provide both a descriptive rubric that addresses the formative assessment components during class instruction and promote conversations with teachers to increase focus on student learning. The creation of a short-cycle formative assessment observation protocol was the result of no observation instrument being available that encompassed the essential components analyzing teacher’s application for effective assessment of student learning during class instruction. Short-cycle formative assessment refers to the focus on the day-to-day learning of students in the assimilation of new information used to inform instruction.

Considering the definitions and the review of literature on formative assessment, seven constructs are included in the AssessToday. The seven constructs are: learning target, question quality, nature of questioning, self-evaluation, observation of student affect, instructional adjustments, and evidence of learning. The specific wording of the seven constructs was selected in order to meet two important goals. The first goal was to design an instrument that could be used by researchers or practitioners in any classroom situation. Since it is an observation instrument, the constructs were limited to actions observable during one period of instruction. The second goal in the design of the instrument was to use wording that was familiar to both researchers and educators. A brief description of each construct is described below.

The learning target refers to the content for which the students are to learn. Instruction needs to include a clear learning target where both the teacher and students are able to articulate and make judgments of learning. In order to determine effectiveness of the other constructs the learning target must align with the instruction.

Questioning makes up two of the constructs. Questioning quality refers to scaffolding questioning that is inclusive of prior knowledge (Popham, 2008) and the synchronizing between the levels of Bloom’s hierarchy of cognitive learning (Bloom, 1956). This includes open-ended questioning to understand student’s thinking of the content. An important aspect of questioning is the nature of questioning. This includes the wait time when questioning between the teacher and students as well as follow-up questions to diagnose the level of student understanding.

A fourth construct, self-evaluation, is the progress being made for meeting the learning target. This includes both the teacher and students to initiate students’ self-evaluation of progress toward meeting the learning target. Self-evaluation includes students having the ability to apply the strategies and skills needed to make judgments
about the progress being made and the action needed to make progress and meet the learning target (Black, Harrison, Lee, Marshall, & Wiliam, 2003).

The fifth construct, observation of student affect, is the impact the learning environment has on student learning (Cauley & McMillan, 2010). For students some observable behaviors include body language, facial expressions, and the quality of the work as they interact with the teacher and other students. The teacher’s role is to observe student behaviors and make appropriate decisions to facilitate students understanding toward the learning target.

The sixth construct, instructional adjustment, is the decision making process for determining if a student, a group of students, or the entire class needs instruction different or supplemented to what is currently occurring in the classroom (Guskey, 2007; Popham, 2008). Another aspect of this construct is the timing at which an adjustment is made to the appropriate audience in order for students to continue making progress toward the learning target.

The seventh construct, evidence of learning, refers to the information taken in that indicates that students have successfully met or making progress toward the learning target. Some of the evidence comes in the form of individual responses, all-student responses, and artifacts from student learning.

**Methodology**

The process for translating the *AssessToday* handbook from English to Thai followed the protocol as outlined in Table 1 with attention given to cultural as well as linguistic differences (Sakai, 2006). The translating team was made up of mathematics education faculty from Thailand, a doctoral student, and the authors of the handbook. The translators were native speakers of Thai and the authors were native English speakers. The first translator was a doctoral student visiting the United States as visiting scholar to contribute to the facilitation of the research collaboration. The second and third translators are mathematics education faculty and the fourth translator is an English Translator.

The first and second translators worked independently to create their own translation of the handbook (fig. 1). The first translator became familiar with the literature for the formation of the *AssessToday* by reading and attending a doctoral class on formative assessment. While developing the knowledge on the literature background, the translator read through the handbook and identified words that were unfamiliar with yellow highlights and words that were somewhat familiar with blue highlights. This was completed one construct at a time. After a construct was coded for unfamiliar and somewhat familiar words a discussion would occur with one of the authors of the handbook to clarify correct meaning and provide a more accurate translation.
Table 1

Timeline of Translating the AssessToday

</tr>
</tbody>
</table>

The third translator who combined the translations of the first two translators completed it by categorizing the translation in four steps. The first category, is to verify that structures, words and meanings are harmonious. This requires combining and polishing words for complete sentences. The second category, sentence structures are harmonious but there are word differences, which affects the meaning. Checking the different words based on English-Thai dictionary and then selecting the appropriate words according to context of the sentence made the combined translation. The third category, the sentence structure is different but using the same words, making the meaning different. This category included editing the grammar. The fourth category, the sentence structure and words are different, making the meaning different. This requires considering the translation deeply and checking the grammar and words used in the sentence before carefully deciding to write comparable Thai with the closest meaning to the English.

The fourth translator is responsible for translating the handbook from Thai back to English. The authors of the handbook compare Thai-English version to the original handbook. Once the Thai-English version is identified for any differences another revision will be made to the Thai translation. Ideally this would more accurately reflect the original English version.
Preliminary Findings

Translating the AssessToday handbook took longer than anticipated. As a result, these findings represent the work to date, which includes everything but authenticating the translation and making revisions to the Thai version of the handbook.

As discussed earlier the first translator was in the United States as a visiting scholar while conducting the work to translate the handbook. The second translator was in Thailand. This person too had to become familiar with the theoretical background and the vocabulary utilized. The second translator met on a weekly basis with the first translator to discuss their understandings of the literature and the vocabulary. However, each translator did his or her own translation. The second translator stated in her reflection of the process in regards to the weekly discussions “helped her understand and make decisions about the selection of Thai words in place of English words for those vocabulary terms in theory that have not been widely studied and there is no specific definition yet.”

Consistent with the literature in translating documents to another language (Sakai, 2006), there was difficulty in making a direct translation of the handbook. This included the grammar rules for the languages being different and words that were not part of the Thai language. The third translator had the task of making the translation of the handbook smooth and understandable.

The difficulty in translating is using the appropriate words and editing the grammar. Sometimes it is difficult to find Thai words, which have the same meaning as the English words. For example, the English word today is difficult to find the appropriate Thai word that will make sense for Thai readers. For the grammar, English
sentences using passive voice does not correspond with Thai sentence most of the time. Thai sentences are normally structured as subject + verb + object.

Conclusion

Eddy, one of the authors of the handbook in fall 2014 conducted a workshop with Thai teachers at the International Conference on Education Research by using a draft of the Thai version the AssessToday handbook. The first translator who completed her translation while in the United States translated during the workshop between the presenter and the teachers. The second and third translators were present for the workshop. This allowed them to witness the understanding of the teachers and make any necessary edits to the handbook.

Both the United States and Thailand teachers’ assessment practices still need improvement to assess student learning process and support the learning process. The translation of the AssessToday handbook assists the collaboration between the mathematics education faculty from the two countries to answer the research question: what is the growth of middle school mathematics teachers’ knowledge and teaching of algebraic reasoning when they participate in lesson study that intentionally incorporates short-cycle formative assessment and mathematical knowledge for teaching into the process?

Abstract:
Mathematics teachers are responsible for providing students opportunities to develop conceptual understandings, which requires teachers’ abilities to listen flexibly to students. The research team determined Mathematical Knowledge for Teaching (MKT) needs to be used as part of the research project in order to determine to what degree, if any, the participants have changes in their understanding not only of mathematics but also of what it means to teach mathematics. The framework of MKT that was developed by Ball and colleagues (Ball & Bass, 2003; Ball, Thames & Phelps, 2008; Hill, Rowan & Ball, 2005) created the Teacher Knowledge Assessment System (TKAS) study to address the need for large-scale evaluations of professional development focused on the improvement of teachers’ mathematical knowledge for teaching. This study utilizes the Learning Mathematics for Teaching (LMT) measures. The mathematical knowledge needed to respond to items on the LMT goes beyond only procedural knowledge and is in the context of a classroom. To be successful with the items, teachers must know why procedures work, which properties are true, which relationships are evident, and the rationale behind them (Ball, 2003).
While collaborating on research to examine teachers’ MKT, we have selected to focus on algebraic reasoning because while there has been extensive research of algebraic reasoning in the elementary grades, there has been minimal research that focuses on the “development of algebraic reasoning in the Middle Grades—the time period linking students’ arithmetic and early algebraic reasoning and their development of increasingly complex, abstract algebraic reasoning” (Knuth et al., 2011, p. 260).

The research network that is developing between the United States and Thailand for mathematics education involves researchers collaborating within and across countries. The initial project on which the network of researchers is working to measure the effectiveness of a professional development model at international and cross-cultural levels. Data collected during the implementation of the model will focus on the measurement of the impact that lesson study has in increasing teachers’ use of short-cycle formative assessment and MKT.

In order to be able to compare results internationally, MKT measures need to be valid across all research sites. Currently there are three MKT measures that focus on algebra: Learning Mathematics for Teaching (LMT), Diagnostic Science Assessments for Middle School Teachers (DTAMS), and Knowledge of Algebra for Teaching (KAT). While examining these, the research question for the project was kept at the forefront of the analysis. The KAT is more focused on algebra than algebraic reasoning, and our sample population is middle grades mathematics teachers. That eliminated KAT as a viable option. Then the researchers discussed the LMT and the DTAMS. Perhaps the most convincing argument for why the DTAMS was not selected is that for our project, we are particularly interested in teachers’ MKT, and LMT items are designed to capture mathematics knowledge as it occurs from the teacher’s standpoint during instruction, whereas the DTAMS mathematics content items (as opposed to the few PCK items that are also included) assess general mathematics knowledge that is relevant to the K-8 curriculum but not specific to the teaching of that curriculum. (Copur-Gencturk, Y., & Lubienski, 2013, p. 219)

Thus, the research team has selected to use the LMT scores, to report collective changes not individual teacher changes. Qualitative measures will also be implemented to support analyses of individual changes in concert with LMT scores.

Once the instrument was selected, the researchers had to deliberate the options for implementation of the LMT in Thailand. Should they be translated into Thai; new and different measures created in Thai; or, implement the LMT in English for Thai participants as well? While there is a benefit for data from the Thai projects being combined with the participants in the US to show a larger confidence in the data, there are enough differences between the LMT being used in the United States and in Thailand that the Thai researchers decided to translate the LMT measures into Thai and implement the LMT in Thai for Thai teachers. Some of the researchers had created MKT measures that are specific for elementary school, not for middle school and algebra. In Thailand the group will conduct the reliability and validity with three lesson study teams (one group from the North, one group from the Northeast and the other one from the South of Thailand). Each group will include teachers and internship students for improve their knowledge.
It is important to note that the *Teacher Education and Development Study in Mathematics* (TEDS-M) was translated into numerous languages, and data was collected and reported from 17 different countries, including both the United States and Thailand (Tatto et al., 2008). However, the TEDS-M was created to measure MKT of future teachers. Our current project is focused on measuring teachers already in the classroom. While the LMT was designed for classroom teachers and also validated for pre-service teachers, the TEDS-M has only been used thus far for pre-service teachers.

Sean Delaney was one of the first researchers to translate the LMT, which he directed to translate for Irish teachers. Since then, several others have translated the LMT to be used in Ghana, Norway, Indonesia and Korea (Cole, 2012; Fauskanger et al., 2012; Ng, 2012; Kwon et al, 2012). Following Delaney et al.’s (2008) method for translating, the Thai researchers will examine each of the items with respect to: “1. Changes related to the general cultural context; 2. Changes related to the school cultural context; 3. Changes related to mathematical substance; 4. Other changes” (p. 182). All of the researchers acknowledge that “translating such measures from one setting to another fairly similar setting is a non-trivial process” (p. 191), and it will require much collaboration between countries as well as significant work in Thailand.

Abstract: Based on growth in online enrollment, many faculty members are required to develop and teach online courses they had previously taught in a traditional, face-to-face classroom. The purpose of this qualitative study was to explore the experiences of eight faculty members at one public university who journeyed through the transformative process by developing and teaching online courses previously taught face-to-face. The methodology for this study was a qualitative framework. Data were collected using a semi-structured interview guide that investigated the transformative process through three stages: planning, implementation, and reflection. Each participant was interviewed in-person for approximately one hour. Data were thematically analyzed using the transformative learning theory by categorizing the data into the 11 phases an adult learner goes through during the process. Each phase was inductively analyzed for patterns, and then the relationships that bound these patterns together were identified and labeled themes.

Introduction

According to Allen and Seaman (2013), the number of students taking at least one online course at institutions of higher education increased by over 570,000 to a new total of 6.7 million during the fall semester of 2011. Based on the growth in online enrollments, many faculty members are asked to develop and teach online courses they had previously taught in a traditional, face-to-face classroom. To successfully transition to an online environment, faculty
members must have technology skills, content knowledge, and sound pedagogy. During the transformative process, several challenges related to the planning and implementing of the online course have been cited in the literature. These challenges include, but are not limited to, having the time it takes to develop and teach an online course (Lewis & Abdul-Hamid, 2006), having the ability to use available technology tools and/or learning management systems to support student learning (De Gagne & Walters, 2009), implementing appropriate pedagogical strategies in the online course (Brinthaupt, Fisher, Raffo, & Woodward, 2011), and adapting to the role of facilitator rather than being the “sage on the stage” (Johnson, 2008). Planning, preparing, and teaching online represents more than a paradigmatic shift in the way faculty work; it is initiating new ways to think about learning. As faculty transform their face-to-face course to online, that process and experience transforms them, too. The purpose of this current study was to investigate faculty’s experiences with transforming courses from face-to-face to online delivery while situating the transformative process in the 11 phases of Jack Mezirow’s Transformative Learning Theory.

**Theoretical Framework**

Jack Mezirow defined learning as “the process of using a prior interpretation to construe a new or a revised interpretation of the meaning of one’s experience to guide future action” (Wiessner & Mezirow, 2000, p. 5). Mezirow labeled this process transformation. He began his work in 1978 when he qualitatively investigated women returning to postsecondary study or the workplace after an extended time out. Concluded from this seminal study was that these women went through a personal transformation, and Mezirow identified 10 phases they experienced (Kitchenham, 2008). Over time, Mezirow’s work on adult learning evolved into the Transformative Learning Theory with an additional phase incorporated in 1991. However, it was not until 2003 when he provided a clear definition of his theory:

Transformative learning is learning that transforms problematic frames of reference-sets of fixed assumptions and expectations (habits of mind, meaning perspectives, mindsets)-to make them more inclusive, discriminating, open, reflective, and emotionally able to change. Such frames of reference are better than others because they are more likely to generate beliefs and opinions that will prove more true to guide action. (Mezirow, 2003, pp. 58-59)

Transformative learning is the process of effecting change in a frame of reference. “Frames of reference are the structures of assumptions through which we understand our experiences. They selectively shape and delimit expectations, perceptions, cognition, and feelings (Mezirow, 1997, p. 5). As stated above, transformative learning is an 11 phase process with four main components (Mezirow, 2007): experience, critical reflection, reflective discourse, and action. To begin, the adult learner has an experience. The learner then critically reflects; examines their own beliefs, goals, assumptions etc. in relation to the experience. The learner proceeds to take part in dialogue further examining new thoughts and ideas that have come out of the critical reflection. This dialogue consists of gathering opinions of others, whether through one-on-one conversations or with a group setting. The final step is taking action based on this new level of learning and perspective.

The Transformative Learning Theory was the theoretical framework for this current
Faculty’s experiences of transforming a course from face-to-face to online were investigated using this theory’s 11 phases. In Table 1 each phase is presented and operationalized for the context of this study.

</thead>
</table>
| 1. A disorienting dilemma                                             | • Why did faculty consider the transformation from face-to-face to online to be a dilemma?  
|                                                                       | • Did any new dilemmas emerge?                                                     |
| 2. A self-examination with feelings of guilt or shame                  | • What were the concerns/thoughts about faculty’s skills/abilities regarding being able to do the transformation? |
|                                                                       | • Did they think they could do it or not do it?                                    |
| 3. A critical assessment of epistemic, sociocultural, or psychic assumptions | • How did faculty compare and contrast online delivery to face-to-face?            |
|                                                                       | • What were faculty's presuppositions regarding: 1) the effectiveness of online teaching, and 2) the temporal investment? |
| 4. Recognition that one’s discontent and the process of transformation are shared and that others have negotiated a similar change | • Who did faculty talk with about the transformation process to confirm/disconfirm presuppositions and/or guilt/shame? |
| 5. Exploration of options for new roles, relationships, and actions    | • How did faculty start exploring online teaching, and where did they explore?     |
|                                                                       | • What did they learn?                                                            |
| 6. Planning a course of action                                         | • What were faculty’s conceptual frameworks for planning and designing their online courses? |
| 7. Acquisition of knowledge and skills for implementing one’s plan     | • What trainings/activities did faculty participate in to acquire knowledge and skills? |
| 8. Provisional trying of new roles                                     | • How did they transform their courses (e.g., strategies, meeting course objectives)? |
|                                                                       | • What did the teaching process look like?                                        |
| 9. Renegotiating relationships and negotiating new relationships (critical self-reflection) | • What relationships were formed through self-reflection? |
| 10. Building competence and self-confidence in new roles and relationships | • Did faculty become more confident and/or competent? If so, in what ways? If not, what was the impediment? |
|                                                                       | • Have faculty’s presuppositions about online teaching changed?                    |
| 11. A reintegration into one’s life on the basis of conditions dictated by one’s perspective | • Would faculty teach online again? Transform another course?                      |

Method
The purpose of this qualitative study was to examine the transformative process of faculty from one public university in the midwestern United States who developed and taught an online course they had previously taught in a traditional, face-to-face classroom. Eight participants, who met the criteria of having developed and taught an online course they had previously taught in a face-to-face course format within the last three years, were chosen to participate in the study. All eight participants were faculty who taught in a college of education and human development. For the majority of faculty, teaching an online course was a relatively new endeavor, taking place between one to six years previously. Of the eight faculty, three had developed and taught one online course, two had developed and taught two online courses, one had taught three online courses, and two had taught seven or more online courses. In reference to this study, all faculty interviewed developed and taught graduate level courses.

The research was conducted with the approval of the University’s institutional review board (#IRB-201404-426). Each interview transcript was assigned a code to maintain confidentiality. An interview guide (Kvale & Brinkmann, 2009) consisting of five closed-ended questions about demographics and 11 open-ended questions about planning, implementation, and reflection was developed and used by the researchers. Interviews were conducted in person by one of the two researchers and ranged in length from 45 to 75 minutes.

Prior to analysis of the interview data, a framework schema was constructed that identified the 11 phases of Mezirow’s Transformative Learning Theory with corresponding operational definitions that were derived from the literature and agreed upon by the researchers (see Table 1). An inductive process was used to examine the transcripts of the eight participant interviews. After each researcher independently coded the interview transcripts using the Transformative Learning Theory framework schema, the coded data were integrated into one document for inter-coding agreement by the two researchers. Any data that did not clearly fit within the specified Phase, were either moved to a more appropriate Phase or discarded. After agreement of data placement within the framework schema was conducted, the researchers independently analyzed the data within each phase for patterns. Together, the researchers compared the patterns and developed themes for each phase (see Table 2).

</table>
As a result of online teaching, faculty increased their confidence and believed they became better instructors in their face-to-face courses.

Faculty were satisfied with their courses after the transformation, yet had goals for improvement.

Most faculty were surprised they liked teaching online and were willing to do it again.

Boundaries were less defined in an online class, making them essential to establish.

Results

Phase 1: A Disorientating Dilemma

Theme 1: Courses were transformed because it was a departmental expectation rather than a personal choice. For most faculty, their courses had to be transformed for online delivery because they were part of a graduate, distant degree program. One member of the faculty admitted he initially did not want to do it, yet no participant directly challenged this expectation. Notably, one faculty member came to the university for the opportunity to acquire online teaching experience.

Theme 2: Course transformation took a significant amount of time, but compensation for this extra time was inconsistent. Faculty were in agreement they spent ample time transforming their courses. Most faculty were simultaneously developing and teaching the course. One documented spending an average of 30 hours per week. However, none of the faculty were given release time for course development, but some received payment. For those who were fortunate to receive payment, the range of compensation was $500 to $3000.

Phase 2: A Self-Examination with Feelings of Guilt or Shame

Theme 1: Technology skills needed developing. None of the faculty reported specific feelings of shame nor guilt on the outset of the transformation process. What emerged as a barrier was their lack of technology skills. When faculty were asked to rate their skills prior to teaching online, they had a mean of 3.8 (based on a Likert scale of 1 to 10). For some faculty, they did not utilize Blackboard® (online course management system) for their face-to-face courses, even though it was a university expectation.

Phase 3: A Critical Assessment of Epistemic, Sociocultural, or Psychic Assumptions

Theme 1: Faculty assumed the same level of quality could not be achieved with online instruction. What was most concerning for faculty was how a sense of community could be built. “Isolating” was used to describe online learning. They assumed interaction among
students would be limited, as would their interactions with students. Ultimately, limited interaction would affect learning outcomes.

**Theme 2: Pedagogical knowledge was critical with online teaching.** Faculty in this study were from a college of education and were pedagogical experts. Their presupposition was that technology would guide the transformative process, rather than pedagogy. Consequently, if technology guided the content rather than pedagogy, the teaching and learning process would be compromised.

**Theme 3: Not all instructors nor courses are suited for online delivery.** Some faculty assumed that instructors who were not good teachers in the face-to-face environment, would be even worse teachers in the online environment. It was believed that online teaching needed to be intentional and explicit. Beyond this, some faculty noted graduate students are better suited for online learning than those who are undergraduates.

**Phase 4: Recognition that One’s Discontent and the Process of Transformation are Shared and that Others have Negotiated a Similar Change**

**Theme 1: To negotiate their presuppositions, faculty had philosophical, broad-based discussions with instructional designers and faculty who were already teaching online.** The university’s instructional technology center hired instructional designers to assist faculty with course conceptualization and technological skills. Faculty sought them out, along with their departmental peers, to investigate presuppositions and to explore ways of transforming their courses.

**Phase 5: Exploration of Options for New Roles, Relationships, and Actions**

**Theme 1: Faculty’s dialogue with instructional designers and peers became more specific and skill-based.** Through professional discourse with other faculty and instructional designers, faculty’s presuppositions became disconfirmed. Thus, dialogue shifted from negotiation of presuppositions to acquisition of skills.

**Theme 2: Pedagogy led the exploration for quality assurance, which was influential on the selection of technology.** Most faculty held individualized training sessions with instructional designers and departmental peers. At the forefront of these sessions was how technology would support pedagogical strategies, rather than how pedagogy would be adjusted to the technology. For example, one instructor chose to use Second Life® (3D virtual world) because of how it supported her pedagogical strategy of building a community.

**Phase 6: Planning a Course of Action**

**Theme 1: Faculty used their previously taught face-to-face course as their conceptual framework for the online transformation, as it was pedagogically sound.** Because faculty considered themselves pedagogical experts, they believed their original, face-to-face course was of quality, thus these courses were their frames of reference. This established pedagogy led the
decision-making throughout the transformative process, not the technology, mainly because learner outcomes remained constant across the two delivery methods.

Phase 7: Acquisition of Knowledge and Skills for Implementing One’s Plans

**Theme 1: Faculty did not receive formal online course development training.** While some attended workshops, all preferred working one-on-one with instructional designers to learn how to effectively use technology to support pedagogy and/or to troubleshoot technology problems.

**Theme 2: Faculty sought pedagogical and emotional support from colleagues.** While, technology questions were directed at instructional designers, faculty established an informal support system with colleagues to discuss instructional strategies and assessments and to share their emotional highs and lows throughout their journey of transformation.

Phase 8: Provisional Trying of New Roles

**Theme 1: Faculty’s role shifted from the “sage on the stage” to the “guide on the side.”** Almost all faculty noted a transformation in their role; they shifted from being the leader to the facilitator. While some felt comfortable in their new role because students took more responsibility for their learning, others felt “sidelined” and like the “silent partner.”

**Theme 2: Faculty included similar face-to-face instructional strategies in their online courses.** To support these instructional strategies, each faculty member used a variety of technological tools. However, adjustments needed to be made in order to fit the online environment. Examples of adjustments included: replaced DVDs with online videos, reduced number of “in class” activities.

Phase 9: Renegotiating Relationships and Negotiating New Relationships/Self-Reflection

**Theme 1: Faculty who taught synchronously suggested online did not require a different type of instruction, whereas faculty who taught asynchronously felt differently.** Student interaction and discussion were more easily maintained in synchronous courses; so for faculty whose courses were discussion-based, this type of instruction most replicated face-to-face. For faculty who taught asynchronously, they had to become much more detailed and explicit in their instruction, as well as intentional about interaction.

**Theme 2: Some faculty noted feeling disconnected from students.** Faculty described this feeling in the following ways: “Felt like the silent partner, not the competent other,” “Outside looking in,” “I feel disempowered and disconnected,” and “I need to communicate face-to-face.” These faculty expressed a commitment to both understand this disconnection and to find ways to connect with students.

**Theme 3: Although most faculty liked teaching online, there were elements of face-to-face instruction that could not be replicated.** For some, the face-to-face environment still felt more “natural” because discussion was generated more abundantly; students were not able to
“hide behind the technology.” Additionally, they could better “feel the pulse of the class” for understanding.

Phase 10: Building Competence and Self-Confidence in New Roles and Relationships

**Theme 1: Faculty became more proficient using technology.** On a scale of 1 to 10, faculty rated their technological skills prior to teaching online as 3.8 (M) and after teaching online as 6.3 (M).

**Theme 2: As a result of online teaching, faculty increased their confidence and believed they became better instructors in their face-to-face courses.** Faculty stated they became detailed, explicit, and organized. They also incorporated more technology, mainly Blackboard®

**Theme 3: Faculty were satisfied with their courses after the transformation, yet had goals for improvement.** Faculty identified a feeling of accomplishment (e.g., “I did it!”). One even suggested being a model for other faculty when they go through the transformative process. Although satisfied, faculty’s future aspirations were on the horizon. They had goals to increase interaction, incorporate more activities, increase the amount of detail, and become more connected to students.

Phase 11: A Reintegration into One’s Life on the Basis of Conditions Dictated by One’s Perspective

**Theme 1: Most faculty were surprised they liked teaching online and were willing to do it again.** Some faculty liked how they learned to “let go” due to having less control and “go with the flow” when an idea or technology did not work. One faculty illustrated how she learned so much about herself because she was “pushed” to find different ways to teach. For another, “class time” became more application-based rather than a review of the required reading.

**Theme 2: Boundaries were less defined in an online class, making them essential to establish.** The main boundary that needed to be established was when faculty would be (and not be) available to students. This was specifically targeted toward managing email, because “24/7” was neither realistic nor healthy.

Discussion

When planning, faculty spent ample time with an instructional designer learning the technologies to support their self-identified pedagogy, thus compensation for course development was perceived as necessary. While all faculty agreed that developing a course was more time intensive, none of them were given release time in any form to plan and design their course, only monetary compensation. Compensation for development was perceived as necessary, yet there was an inequitable monetary compensation structure within the college, as well as no evidence of additional compensatory mechanisms, such as a course release or reduction in service expectations.
The majority of time faculty spent planning was with an instructional designer selecting and learning technologies to support pedagogy. Only one faculty member worked in a department that invested in a full-time director of distant education position. The others were solely reliant on the university’s center for instructional and learning technologies. This center was the only formal support structure for faculty with a focus on teaching them to independently navigate technology, consequently faculty were expected to become both content and technology experts. Beyond this, faculty had to invest time creating all frameworks to situate their content for presentation (e.g., wikis, Powerpoints). None of the faculty even suggested clerical support. Moreover, faculty had to informally solicit pedagogical consultations from peers due to their departments, college, nor university providing a more formalized service.

Faculty acceptance of online education is consistently cited as a significant barrier (Allen & Seaman, 2007), with many being hesitant due to lack of support, assistance, and training (Allen & Seaman, 2008). In this study, all but one faculty member transformed their course because it was a required course in a distant degree program, consequently making the transformation a requirement. Comparatively, Mill, Yanes, and Casebeer (2009) also conducted a qualitative study of faculty perceptions in a college of education. One of the findings was that administrative support was lacking both with infrastructure and compensation.

De Gagne and Walters (2009) did a qualitative metasynthesis of the online teaching experience across nine studies involving 203 participants. All of the studies documented work intensity with planning, designing, delivering, and evaluating online instruction, thus increasing faculty workload. “The process of designing and planning online courses is usually more time-consuming because instructors must create a more explicit and transparent course in an electronic format, which requires more deliberation in designing the process, structure, and evaluation, along with the interaction components of the course” (Anderson, Rourke, Garrison, & Archer, 2001; De Gagne & Walters, 2009). Results from their study suggested faculty need to be provided with continuous support that includes appropriate technology, ongoing training, and technical assistance, while administrators must evaluate faculty workloads.

While implementing their online course, faculty’s conceptual framework was their prior face-to-face course; interestingly, for those who delivered it synchronously, online did not require different instructional tools like it did asynchronously. Intriguingly, the professional literature suggested online not only needs different instructional and technical tools (Ray, 2009), but also a different type of pedagogy (Bates & Watson, 2008). The opposing viewpoint is that the pedagogical strategies remain intact during the transformative process, it is the medium and instructional tools that change. To illustrate, modeling is a well-accepted pedagogical strategy that went from a live demonstration in a face-to-face class to a recorded demonstration in the online class. In the current study, faculty reported how course objectives and accreditation accountability were not altered per learning format; pedagogy remained for quality assurance. This was confirmed with the findings in Johnson’s 2008 study in that “the conceptual framework, program outcomes, and student learning objectives do not change in web-based education. Students can acquire and synthesize new knowledge in this environment much as they do in a face-to-face classroom.”

For those who taught synchronously, their instructional styles were comparable to face-to-face in how students both participated in and lead class discussions/presentations. Faculty denoted minor alterations, such as a reduction in lecture time. For faculty who delivered their courses asynchronously, they also retained their conceptual, pedagogical framework from face-to-face but had to use different mediums/instructional tools for presentation of content and for
student interaction. For these reasons, a face-to-face classroom experience is difficult to replicate in the online environment without adjustments (Ray, 2009).

Keengwe and Kidd (2010) wrote, “…it is critical for faculty to not only strive to learn the technologies associated with online learning, but also understand the need to fundamentally change and transform their pedagogical approach” (p. 6). Faculty in current study were considered pedagogical experts for which their pedagogical foundation remained stable during the transformative process. Arguably, should the rudimentary principles of what constitutes quality teaching and learning be changed in the online environment? Online, web-based instruction changes the delivery not the art of teaching; undoubtedly, educators have a responsibility to uphold these traditional, educational principles (Johnson, 2008).

Upon reflection, faculty postulated that online teaching made them more efficient and effective teachers, even with their role shifting to facilitator. Because this study was situated in a college of education, most faculty were already pedagogical experts, yet online teaching further advanced their skills. They used more explicit instruction for clarity, enhanced content with new instructional tools/aids, and became more intentional about social interaction. Faculty in Johnson’s 2008 study illustrated how they were able to transfer newly learned web-based teaching strategies to the face-to-face classroom.

When teaching online, faculty find themselves in the role of learning facilitator rather than lecturer/teacher, and this change is one many faculty find themselves unprepared (Vaill & Testori, 2012). In the current study, the shift to facilitator was embraced by most, but uncomfortable for a few. Students taking responsibility for their learning is an expectation of most faculty, yet how that responsibility is operationalized varies from taking leadership roles in content presentation to taking responsibility for studying content presented by the instructor. Based on De Gagne and Walters’ 2009 qualitative metasynthesis, one of the most significant transformations was from lecturer to guide from knowledge dispenser to resource provider, and from authority to facilitator. Reflected by the recipient of the 2003 Sloan-C award for Excellence in Online Teaching, Bill Pelz, “…my ever-emerging philosophy of education increasingly diminishes the role of ‘the teacher’ in the teaching/learning equation. It took over 30 years of college teaching experience for me to realize that the learner is, for the most part, in charge of what gets learned.”

There was also growth in the affective domain of learning. Some faculty were able to “let go” (or at least “push the boundaries of control”) of the variables in online learning they could not control. Others noted a reduction in anxiety after conquering the mysterious world of online teaching. De Gagne and Walters (2009) reported that many faculty perceived online teaching to be stimulating and satisfying. This perception was shared by some participants in the current study.

Considerations for Implementing Lesson Study: Cross Country Implications

Abstract

Despite efforts made over the last two decades by institutions and organizations to improve the teaching of mathematics (e.g., Cobb & Jackson, 2011; National Council of Teachers of Mathematics (NCTM) (1991, 2000), the reform of teaching is still a weak spot in mathematics education. According to the research of Stigler and Hiebert (1999), many mathematics teachers are aware of reforms and claim to have implemented them; however, the Trends International Mathematics and Science Study (TIMSS) (Schmidt et al., 1999; Mullis et al., 2008) continue to reveal through the analysis of videos from numerous mathematics classes that the suggested reforms are not present (National Center for Education Statistics, 2003). TIMMS results have prompted calls for improvement in professional development (Borko, 2004; Bass, Usiskin, & Burrill, 2002; Darling-Hammond & Sykes, 1999; Stigler & Hiebert, 1999), and one growing consensus concerning professional development is the opportunity for teachers to collaborate with their peers (Clarke, 1994; Johnson & Blair, 1999; Kaur, 2012; Kilpatrick, Swafford, & Findell, 2001; Wilson & Berne, 1999).

To improve this situation, lesson study focused on assessment and mathematical knowledge for teaching (Ball & Bass, 2003; Ball, Thames & Phelps, 2008; Hill et al., 2005) seems to be a potential solution. Japanese education researchers found a strategy for creating meaningful collaborations among teachers through lesson study, which consists of pre/post-collaborative work among teachers and lesson observations (Lewis, 2000, 2009; Miyakawa & Winslow, 2013; Perry, Lewis, & Akiba, 2002; Stigler & Hiebert, 1999; Yoshida, 1999). More specifically, teachers engage in a process where they first establish goals and plan a lesson based on research and collaboration, teach the research lesson, and then reflect on the research lesson (Hunter & Back, 2011; Lewis, 2002).

One challenge is when lesson study is implemented in different ways and in this case in different countries. To that end the U.S. and Thai faculty have developed a quasi-experimental research design implementing lesson study to impact teacher’s mathematical knowledge. This paper shares that process and addresses the following questions:

- How is Lesson Study defined and implemented currently in each country by the collaborators?
- How might the differences and similarities impact a collaborative research design?
- What are the implications for findings related to the specific context of each country?
- Could the process and findings be transferable to other situations and offer insights into research in mathematics education around teacher learning and teacher practices?

It is the belief of the collaborators that together and in light of the similarities and differences we will be able to offer the mathematics education research community insightful ideas to address common issues across countries through the implementation of Lesson Study. The findings related to the above questions will be shared.
Considerations for Implementing Lesson Study-Cross Country Challenges

Collaboration Background

**Partnership Development**

In both the US and in Thailand the teaching and learning of mathematics is a key focus as it has economic, educational, and political implications. Mathematics education faculty in the US and Thailand have been independently working to impact transformational changes, but in working collaboratively have found that having a country-wide impact in a systemic form is a challenge. Mathematics education faculty from both countries were introduced through a variety of connections, and from these introductions a research network was formed with the common goal of making a difference in ways that would positively impact education and related policies in the respective countries. By engaging in conversations to address common problems, the research collaborative partners engage in problem solving and potential solutions, recognizing that differences in how people represent and solve problems is a strength of their diversity. By working together US and Thai mathematics education faculty reflect Hong and Page’s (2004) notion that, “because of their greater functional diversity, identity-diverse groups can outperform homogeneous groups” (p. 16385). Working together we can generate better ideas than when working alone in isolation.

**Algebra Focus**

The research groups across the two countries identified algebraic reasoning as a content focus as it was a common content goal for both countries. Additionally, while there has been extensive research of algebraic reasoning in the elementary grades, there has been less research
that focuses on the “development of algebraic reasoning in the Middle Grades—the time period linking students’ arithmetic and early algebraic reasoning and their development of increasingly complex, abstract algebraic reasoning” (Knuth et al., 2011, p. 260). The establishment of algebra as the gatekeeper course to college and career readiness has been well documented (ACT, 2005; Moses & Cobb, 2001) and the necessity for students to develop the foundational concepts and skills for algebra has been established (NCTM, 2000; National Governors Association for Best Practices & Council of Chief State School Officers, 2010). These foundational concepts and skills have been identified as algebraic reasoning, which is described as the process “in which students generalize mathematical ideas from a set of particular instances, establish those generalizations through the discourse of argumentation, and express them in increasingly formal and age-appropriate ways” (Blanton & Kaput, 2005, p. 413). The learning and teaching of mathematics for algebraic reasoning is significant, for “teachers’ abilities to facilitate the development of students’ algebraic reasoning is the most critical factor in algebra reform” (Knuth, et al., 2011, p. 260). Thus there is a mathematical focus for this research project on algebraic reasoning.

Lesson Study

Despite efforts made over the last two decades by institutions and organizations to improve the teaching of mathematics (e.g., Cobb & Jackson, 2011; National Council of Teachers of Mathematics (NCTM) (1991, 2000), the reform of teaching is still a weak spot in mathematics education. According to the research of Stigler and Hiebert (1999), many mathematics teachers are aware of reforms and claim to have implemented them; however, the Trends International Mathematics and Science Study (TIMSS) (Schmidt et al., 1999; Mullis et al., 2008) continue to
reveal through the analysis of videos from numerous mathematics classes that the suggested reforms are not present (National Center for Education Statistics, 2003). Even though mathematics teachers have the best intentions to adopt the latest research into their classrooms, teachers often merely change surface features (Gamoran et al., 2003; Knapp & Sowder, 2004; Stigler & Hiebert, 1999). This raises the question of how to systemically and systematically move this effort forward.

TIMMS results have prompted calls for improvement in professional development (Borko, 2004; Bass, Usiskin, & Burrill, 2002; Darling-Hammond & Sykes, 1999; Stigler & Hiebert, 1999), and one growing consensus concerning professional development is the opportunity for teachers to collaborate with their peers (Clarke, 1994; Johnson & Blair, 1999; Kaur, 2012; Kilpatrick, Swafford, & Findell, 2001; Wilson & Berne, 1999). Teachers are key to changing the way students learn mathematics (Dana Yendol-Silva, 2003; Darling-Hammond, 1998). According to Darling-Hammond and Sykes (1999), the professional development of teachers is essential to improving the nation's schools. Educators cannot be expected to undergo profound changes in their instructional strategies based on ineffective one-day professional developments commonly offered (Ball & Cohen, 1999; Bass, Usiskin, & Burrill, 2002; Clarke, 1994; Darling-Hammond & Sykes, 1999; Garet, Porter, Desimone, Birman, & Yoon, 2001; Harris, Stevens, & Higgins, 2011; Koellner, Jacobs & Borko, 2011; Smith, 2001; U. S. Department of Education, 1998, 2007). According to Professional Standards for Teaching Mathematics (NCTM, 1991), an essential factor in teachers’ professional development is the degree to which they “reflect on learning and teaching individually and with colleagues” (p. 168). To improve this situation, lesson study incorporating short-cycle formative assessment and mathematical knowledge for teaching seems to be a potential solution. The term “Lesson Study”
was first used by Lewis and Tsuchida (1997) for the Japanese “Jugyo Kenkyu” and became popular word when Stigler and Hiebert (1999) published *The Teaching Gap*. Lesson Study as an innovation was developed and implemented in Japan around 140 years ago (Isoda, 2004, Shimizu, 2006) and has attracted attention around the world (Isoda & Nakamura, 2010). It has been recognized and utilized for teacher professional development in many countries around the globe. This approach utilizes a strategy for creating meaningful collaborations among teachers through lesson study, which consists of pre/post-collaborative work among teachers and lesson observations (Lewis, 2000, 2009; Miyakawa & Winslow, 2013; Stigler & Hiebert, 1999; Yoshida, 1999). More specifically, teachers engage in a process where they first establish goals and plan a lesson based on research and collaboration, teach the research lesson, and then reflect on the research lesson (Hunter & Back, 2011; Lewis, 2002). Thus both the U.S. and Thailand have adapted and implemented a lesson study approach to support the teaching and learning of mathematics in their respective countries. This paper describes the collaborative efforts of a group of researchers from each country.

**US Adaptation of Japanese Lesson Study**

In the implementation of Lesson Study as used in the participating US universities in the pilot study, the lesson study cycle described by Lewis (2002) is used where goals for student learning are formulated by the teacher group. The teachers then plan the research lesson and then the lesson is observed by those that planned the lesson as well as a ‘knowledgeable other’ or outside experts. The lesson observation is followed by a reflection session where the focus is on student learning. At times the lesson is revised and a re-teaching episode is done at some sites. The following process of Lesson Study is used: cooperatively constructing lesson plans,
implementing those plans in the classroom, post-observation discussion of the lesson plans and individual teacher teaching progression.

Because the implementation sites vary across the US schools, detailed descriptions are not provided in this paper. In general lesson study has been implemented with both pre-service and in-service teachers at the US sites reflected here. They have been conducted in some form since 2006 with some instances of systematic implementation and others sporadic. Approximately 12 middle and high schools have participated at some level.

**Thailand Adaptation of Japanese Lesson Study**

Education reform in Thailand moved forward after the 1999 Educational Acts was enacted. One outcome was the adaptation of Lesson Study as a form of professional development to support teachers in improving their teaching practices. Lesson study was seen as a comprehensive, articulated process for examining practice that many Japanese teachers had already engaged in for many years (Fernandez, Cannon, & Chokshi, 2003). In 2002 the Faculty of Education at Khon Kaen University in Thailand began using lesson study as a professional development model in which they utilized an open-approach teaching method with their teacher education program and then in several schools (Nohda, 2000; Thinwiangthong, Inprasitha, & Loipha, 2012). The implementation of lesson study was started by introducing the ‘Open Approach’, that is using open-ended problems in mathematical activities with fifteen 4th year student teachers teaching in seven secondary school in Khonkaen City in 2002. The Open Approach is used as the teaching approach within the Lesson Study process. The four phases of this teaching approach are: posing open-ended problems, students’ self learning through problem
solving, whole class discussion and comparison, and summarizing through connecting students’ mathematical ideas that emerge in the classroom (Nohda, 2000).

The process was implemented implicitly without using the term ‘Lesson Study’ (Inprasitha, 2007). This phase was called “Incubation of Idea” (Inprasitha, 2011). The second phase expanded the Open Approach and Lesson study to two districts in Khon Kaen Province and was referred to as “Experimentation in Some Schools” (Inprasitha, 2011). Since 2006 school participation has grown from 2 to 60 with both primary and middle school participation. The third phase of the process called “Whole School Approach” was facilitated by a long-term collaborative project with the Ministry of Education in Thailand.

Maitree Inprasitha pioneered the introduction of Lesson Study and Open Approach into Thai mathematics teaching circles. The term “Lesson Study” was paraphrased by him to mean “Classroom Study” in order to make it comprehensible in the Thai context. This meaning is different from the meaning used in Japan because in Japan, the unit of study is “lesson” while in Thailand, the unit of study is “classroom”. The purpose of introducing these innovations into Thai classrooms was to improve the quality of classrooms using lessons as a tool for teachers to know their classrooms better from the perspective of knowing their students, understanding their ideas, realizing their own roles and recognizing classroom culture. Therefore, to introduce innovations into classroom practice it was essential to adjust steps or processes to fit in with the working culture of each locality. There are three phases in Thailand’s lesson study process. It includes the collaborative design of a research lesson (Plan), the collaborative observation of the research lesson (Do), and the collaborative discussion and reflection on the research lesson (See) (Inprasitha, 2010 & 2011). These are generally the same as in the US implementation. One major difference between the US and Thailand implementation is that in Thailand’s particular
implementation it is a weekly planning cycle through the year in the schools in which it is being done rather than a cycle during a semester in most of the US schools related to this paper.

**Differences and Similarities between Lesson Study in the US and Thailand**

**Differences**

Because of the approach taken in Thailand through Khon Kaen University one major difference between the two countries is that the approach in Thailand is more systematic and systemic than in most US schools and certainly in the US schools participating with the universities as part of this collaboration. Another specific difference is that in Thailand the process is done weekly and is a continuous part of the planning and teaching schedule where as in the US schools it is typically a multi-week cycle during a particular semester or over a period of a few months for one particular lesson. Thai teachers in Lesson Study use a translated Japanese book that has a very specific problem solving approach and almost always relying strictly on that textbook. On rare occasions they will seek outside resources to supplement their lesson. In the US schools there is not always a specific textbook and certainly different schools within the US use different textbooks and resources. In Thailand there is one curriculum but in the US it varies potentially from state to state. Even though many US states have adopted the *Common Core State Standards* (National Governors Association for Best Practices & Council of Chief State School Officers, 2010), not all have done so. In particular several of the schools that will be involved in the US lesson study as part of this collaboration are in Texas, a non-Common Core state, and use the *Texas Essential Knowledge and Skills* (TEKS) (Texas Education Agency, 2012), while other schools are in in different states and have a different curriculum that may or
may not align with the one in Texas. This is one reason that we have selected algebraic thinking as a content focus so that there is some commonality between the content in the lesson studies across the two countries. Finally there usually is a more cross grade approach taken in Thailand than in the US. For example in Thailand grades 1-3 work together to plan a first grade lesson the first year they participate in lesson study and then they work together to address second grade lessons the second year and then the third year third grade lessons. In some of the participating US schools there is a cross grade approach. For example in one US school grades 6-8 may plan together for a specific lesson in grade 7 and the team may be teachers from one middle school or may be from 2-3 different middle schools in the district. In other participating US schools they may be teachers from one grade level all from one school. Different models are used depending on the organization, willingness to participate, and distinct needs of the schools and teachers.

One area that may be viewed as a difference and a similarity relates to where the lesson planning focus begins and where the lesson reflection session has its focus. Both begin with student outcomes and student understanding. But because getting students to think and focusing on students’ ideas is a different approach for Thai teachers from the past, Thai teachers in lesson study specifically focus their planning, observations and outcomes in relation to student thinking so they always start from the student’s ideas and understanding. In the participating US schools the student focus is not as unusual but the change is related to the reflection session. Often teachers see this type of setting as an evaluation of the teacher and the facilitators of the US lesson studies really work to be sure that the planning team sees this as focused on student learning and that the reflection session is about student understanding, not on evaluating the teacher. Although both countries do have observers for the lesson that include both the teachers who were part of the planning team and also outside experts, there are some differences is how
the observers focus their work. In some of the US lesson study groups, the observers focus on a very specific area that is determined by the teacher planning team. It might be that one observer focuses on student interactions, another on questioning used during the lesson, or another on the role the materials or technology played in developing or hindering student understanding. In the Thailand approach the observers take a more holistic approach and observe all areas focusing specifically on student thinking.

**Similarities**

Both countries have adapted the Japanese Lesson Study approach for their situation to meet the needs of their schools, teachers and students. In both countries teachers choose the content to be the focus of the lesson related to their curriculum. When the lessons are planned it is always about student learning and student understanding of the selected content. Both have observers for the lesson and the reflection session is conducted in the same manner, specifically with the teacher going first and then observers provide their comments. In both countries the observers focus on student learning and understanding, not on the teacher’s role and ability. The teachers in both countries are often afraid of being judged and evaluated. Usually neither country gets to teach the lesson again after the lesson is taught and reflected on but the lesson is used for the next year. In some cases in the participating US schools the lesson is retaught the same day after the initial reflection session. Sometimes the second lesson is observed and other times it is not. A final similarity noted relates to teachers as observers. We determined that in both countries teachers often had difficulty knowing how to observe and how to specifically look at student learning. As a result this has become part of the training and orientation when teachers begin the lesson study process.
Potential Challenges in Designing a Research Study

Because there was the potential for many challenges as we began this process, the group has met multiple times using both face-to-face and on-line formats over the past two years to discuss approaches, instrumentation, and processes. We have found some common ground and some differences as well. Among the challenges in designing a research study we have faced differences in

- curriculum and textbooks,
- school culture,
- school year calendars,
- instrumentation,
- Lesson Study adaptations,
- the role of University faculty and graduate students, and
- language and vocabulary.

In each area through collaborative discussions we are finding ways to align, modify, adapt, and adopt variations in order for us to reach our common goal of improving teaching and learning of mathematics in our respective countries.

Pilot Study Collaborative Research Design

In both countries grades 6-8 will be the targeted grade levels with algebraic reasoning as the content focus. We found this designation to be a common area providing a better opportunity to analyze results and impact. Because the two countries have different school year calendars, US schools will conduct their lesson studies (three in total) for the pilot during 2015. Since
Thailand does this continuously, they will select three schools to include in the study during the same year.

**Context and Participants**

The US participants will be mathematics teachers at middle schools in the central US at which 50% or more of the students are eligible for free and reduced lunch. The focus will be at least three different school teams consisting of 4-6 teachers at each site. The rationale for focusing on teachers in these middle schools is that based on each of the respective districts’ data, historically the students in these schools are the lowest performing and they have a common algebraic focus. Since Thailand works with many schools across the country 3 school sites will be selected to parallel the participant numbers and student characteristics in the US. It is anticipated that there will be approximately 15 teachers and 90 students from each country engaged in the pilot study.

**Methodology and Research Questions**

A quasi-experimental design and qualitative constant comparative analysis involving multiple case studies will be used for the pilot study. While centered on the overarching research question, *What is the growth of middle school mathematics teachers’ knowledge and teaching of algebraic reasoning when they participate in lesson study that intentionally incorporates short-cycle formative assessment and mathematical knowledge for teaching into the process?*, the pilot study will seek to answer the following specific research questions:

1. What effects do lesson study have on mathematical knowledge for teaching algebraic reasoning?

2. What effects do lesson study have on middle school mathematics teachers' use of
short-cycle formative assessment?

3. What effects do mathematical knowledge for teaching algebraic reasoning have on middle school mathematics teachers’ use of short-cycle formative assessment?

**Lesson Study Instruments**

Both survey data and observation data will be collected from both countries at each site. Data will be collected from the following:

- Teacher attitude and belief survey
- Student survey
- Video Recording of lesson planning sessions
- Lesson Observation notes
- Lesson Plans
- Video recording of lesson
- Video recording of reflection session
- Teacher post-reflection questionnaire

We have ascertained that some of the instruments are very similar, and are in the process of translating and confirming which instruments will be modified and/or utilized. We are currently working on aligning our instruments and on their accompanying translations. We have found that we have some common instruments and others that have minor differences, and still
others that will need more work to align with both countries. We also are finding that there will be some instances of data collection that may be different at each site given their differences in implementation. This will have to be taken into account in the analysis portion of the study in order that appropriate conclusions and implications can be documented.

**Potential Interpretation and Generalizability Challenges**

**Conclusion**

As we move forward in this research endeavor there continue to be questions that we must consider. These relate to how these findings might be interpreted and applied in individual classrooms in the respective countries, the transferability of such a model to other countries interested in this collaborative approach, the challenges faced in implementation across two countries, and the generalizability of potential findings. We do believe that by working together we can learn from each other, strengthen our research designs, improve potential data collection instruments, and inform the broader mathematics education community, in an effort to support teachers and impact student learning. There are multiple collaborations in the mathematics education community that are going across the world. As we study these types of collaborative models, we continue to learn. Collaboration may very well be the way of taking a global approach to teaching and learning mathematics in an effort to support teachers across the world in their essential and critical work with students.

support change. New York: Teachers College Press.

Lesson Study-Cross Country Challenges

The use of high fidelity human patient simulation is increasing in nursing education programs. Simulation is used to help enhance students’ problem solving abilities, facilitate psychomotor, communication and assessment skills, and develop their level of critical thinking. Much of the current literature focuses on the effects of simulation on critical thinking, learning outcomes, building students’ confidence, enhancing students’ satisfaction with learning, and acquiring psychomotor skills. What is absent from the literature is research on how to use this teaching modality effectively. In a teaching-learning activity, the teacher carries out intentional behaviours to assist the student in the learning process. In these purposeful teacher-learner interactions, both verbal and non-verbal actions are carried out. The nurse educator’s actions are particularly relevant in a clinical simulation where the student is attempting to apply theory to practice, and the presence of the instructor may help facilitate the student’s learning through cueing, nodding or other verbal or non-verbal behaviours. This paper presents the findings of a qualitative study, an ethnography, used to examine nursing students’ perceptions of instructors’ cueing behaviours in a clinical simulation learning experience which they find effective for their learning.
Building a Public Face for Higher Education in Tennessee

2015 Hawaii International Conference on Education
January 5-8, 2015
Honolulu, HI

Title: Building a Public Face for Higher Education in Tennessee

Topic Area: Higher Education
Format: Paper Session

Description:
This paper describes a multifaceted faculty-driven initiative sponsored by the Tennessee Board of Regents System Office of Academic Affairs, a system comprised of 6 universities, 13 community colleges and 27 colleges of technology. The goal of this multimedia initiative is to invigorate faculty scholarship, teaching and research connectivity while informing the public of the economic benefit provided, informing the taxpayer of “What we do”, “How we do it” and “Why it matters”.

Abstract
This paper describes a multifaceted initiative to invigorate faculty scholarship, teaching and research connectivity while informing the taxpayer of “What we do”, “How we do it” and “Why it matters”.

Sponsored by the Tennessee Board of Regents Office of Academic Affairs, the 6th largest higher education system in the United States comprised of 6 universities, 13 community colleges and 27 colleges of technology serving more than 250,000 students, this faculty driven effort targets informing the general public through multiple approaches of the economic benefit provided by our institutions including building the next generation of faculty researchers.

Introduction
As in many states within the United States, the Tennessee taxpayer generally perceives teaching as a first priority at for state funded higher education institutions. Many faculty also share this priority with the expectation that they engage in research in support of their teaching, in essence to support practice. However, the current economic environment has resulted in institutions increasingly emphasizing that faculty acquire research funding through external funding sources to support their research and scholarship activities. Thus, an actual and perceived conflict of priorities for faculty and administrative demands on faculty are being increasingly experienced within higher education, especially in states such as Tennessee which has continued for the past decade to reduce state support for higher education. Faculty members who have primarily viewed themselves as educators do not always see the "fit" to this revised "institutional research agenda" as directly relevant to their teaching roles.

One approach to reconciling these seemingly discrepant roles is to engage in the necessary "critical conversations" which can demonstrate the relevancy of funded research to the educational process within higher education and to the general welfare of the taxpayer. This paper describes one portion of a value-added multifaceted initiative envisioned at the System level and transitioned to the institutional level with the support of faculty volunteers.
Method

Fifty plus faculty holding either legislatively established Tennessee Higher Education Commission’s Chair of Excellence positions and additional faculty identified through their successful competitive funding experiences in grant competitions offered at the System level were interviewed by a fellow faculty member and a System level administrator. While a list of interview questions was collected in the hopes of building a research model around the three primary research questions discussed below, the interviews were allowed to evolve during the dialogue to cover a broader spectrum of issues related to research. The first author engaged the researcher in a collegial conversation on the researcher's research involvements. The second author clarified any points of confusion, complex terminology, and proposed additional relevant questions after the initial set of questions were completed within the videotaped interview. (The minimum set of interview questions generated for the "critical conversation" can be found at the end of this discussion.)

The videos from the interviews continue to be edited into multiple, short clips around each common question for later use through several distribution channels. These venues include a *Critical Conversations* website which will feature various opportunities for researchers to connect with others with common interests, and researcher and teacher development opportunities.

Following the face-to-face video interviews, select interview participants along with additional System faculty were invited to submit articles for the System research journal, *Critical Conversations: An Interdisciplinary Journal*. The electronic journal is peer reviewed with the inaugural issue published in December 2014. It will be published three times per year offering both special topic issues and issues covering the breadth of research across the system which contributes to increasing the economy and quality of life in our state. Of the initial invitational submissions for the first issue, 60% were accepted for publication. *Critical Conversations: An Interdisciplinary Journal* will be hosted on the *Critical Conversations* website through accessible through the System website ([www.tbr.edu](http://www.tbr.edu)).

Research Questions Addressed

Three primary questions were addressed related to philosophy, infrastructure and tools, techniques, or technology:

**Philosophy.** *How do researchers successfully match the passion of the academic effort with the relevant needs of society?*
Institutions across the Tennessee Board of Regents System have been successful in responding to research funding opportunities with community and industry support in keeping with faculty members’ passion and the economic needs of Tennessee. This not an unexpected finding in this study but the recent increased funding of proposals with such support, a 23% system wide increase, seems significant.

Four potential correlating factors merit further investigation:
1) Increased funding encourages and expands the level of impact of applied research.
2) Immediate access to community & industry subject matter experts improves the external validity of the research model.
3) With a ready-made base of implementers, the faculty researcher and research team may have a greater sense of accomplishment.
4) Likewise, the pairing of university and community/industry create long term employment opportunities for students.

**Infrastructure.** *What resources do the researchers list as critical to their work?*

Students with relevant skills are the most scarce resource listed by participants in this study. Ironically, this supports the linkage of teaching and research as a complimentary to academic activities. Faculty are conducting applied research by gathering their interested undergraduate students into research teams. One Chair of Excellence in this study stated the becoming involved in his student research teams is so desired by students that a waiting list to join him has occurred. A follow-up study is underway to determine how student retention is impacted by student research involvement. This question has gained in increased interest in Tennessee as state funding for higher education has been changed from a headcount metric to a retention and graduation funding formula for state institutions.

The lack of proposal writing time is claimed as a second resource deficiency by participants. Faculty with heavy teaching loads are challenged not only to conduct basic research but also to submit proposals for external funding. Institutions in Tennessee have recently stepped up by providing increased customer focused (researchers) services to locate funding opportunities of specific interest to the researcher rather than disseminating lists of all available funding. Further, they are staffing supportive grant writers and connecting industry and community representatives with faculty and their teams.

**Tools/Techniques/Technology.** *What skill sets do the researchers self-identify?*

There were a wide variety of tools identified, as would be expected, when interviewing a diverse sample of research disciplines. A missing commonality in the researchers' toolbox was the availability of tier one
Building a Public Face for Higher Education in Tennessee

research facilities at many of our institutions. This issue is being addressed by the National Science Foundation's Experimental Program to Stimulate Competitive Research (EPSCOR) research infrastructure funding. The State of Tennessee has benefited from this program uniting faculty research efforts at tier one and two research institutions throughout the State to jointly create infrastructure at the tier two institutions. While this has had a measurable impact, it falls short of our needs in Tennessee for sustainable scientific discovery and economic development through intellectual property creation. Again, one source to cultivate in Tennessee is an increased partnership of community and industry supporters. The integration of co-located research space is also being addressed system-wide by a virtual geographically dispersed research park, as proposed by three of our institutions.

Discussion

This paper describes a work-in-progress on the necessary critical conversations to facilitate a broader understanding of the value-added nature of research conducted in state higher education institutions, its economic benefit, and its role in the quality of life within our state to the Tennessee taxpayer and general public. Deliverables from this research will include a social media campaign, a System research journal, and a repository of Critical Conversation videos designed for the following audiences:

- The next generation of Tennesseans and their school career guidance counselors who need tools to match interest & talents to career opportunities and the necessary curriculum.
- Elected officials and their staff who need "to the point" information relevant to legislation that impacts their constituents' well-being.
- Tennessee businesses and Tennesseans who need further exposure to the relevancy of higher education to their everyday lives and success.
- Faculty and staff throughout the system to discover fellow researchers in the State for collaborative efforts and support.
- An official historical record of research conducted by the Tennessee Board of Regents

The social media campaign involves several websites and blogs each designed for specific audiences listed above. The Critical Conversations journals mentioned previously will have a variety of articles to both inform the casual reader and also each of the specific audiences above. Edited footage of faculty interviews will be linked together under the title of Critical Conversations as a further supplement of efforts toward faculty scholarship, teaching and research connectivity while informing the public of the economic benefit provided.
Minimum Set of Interview Questions

1. What are you most passionate about in your research activities at this time?  
   (What are the most exciting points of your research at this time?)

2. What is the significance of your research (in your field, regionally, nationally, globally)?

3. Are there commercial applications for your research?

4. What intellectual properties (i.e., variety of intangible assets, such as musical, literary, and artistic works; discoveries and inventions; words, phrases, symbols, and designs; copyrights, trademarks, patents, industrial design rights, trade secrets) will be developed from the research?

5. Do you see the intellectual properties associated with your research turning into a commercial product or service?  
   If so, what would be the next steps in commercial development?  
   What labor force requirement would be needed for the commercial product or service?

6. What impact do you think your research will have on the economy of Tennessee, the nation or globally?

7. What are the next steps in your research?

8. What resources do you need to continue in your research?

9. What is needed for you to have the level of impact in your field you want to have professionally?

For university researchers with administrative roles,

10. What do you see as the potential impact of the research and graduate offerings on your campus as contributing to the development of the economy of the region where your institution is located, the state of Tennessee, the nation and the globe?

11. What do you see as your role in supporting research activities within the TBR system?
On Invisibility:
How Plato’s Divided Line Might Inform Educational Assessment

...[how should we address] issues that always seem to have the power to bewilder us...how are we to talk about the value of goodness or justice (or education)...[and] resist the spell that science seems to cast over epistemology...[we should not be] interested in the search for stable, eternally sound foundations and certainty and may very well regard that search as part of the problem: something from which we need to be released by a kind of therapy.1

Introduction

Educators may require therapy and Richard Smith offers timely advice for those who believe education is in crisis. It makes sense that educators concentrate on assessing students’ observable performances and actions (because they can) and do not concentrate on assessing students’ understanding and enlightenment (because they cannot). Constrained by government-imposed curriculum language where “learning goals,” “prescribed learning outcomes,” “evidence” and “proof” reign supreme, educators are asked to focus on that which is visible and measurable: actions and performances. Logically, educators are not expected to focus on that which is invisible or immeasurable: understanding and enlightenment. Further, given the limitations of curriculum language, well-intentioned educators may actually be discouraged from focusing on the invisible and the immeasurable, hired instead to simply observe and document whether “learning goals have been met” ... and their jobs depend on it.

How did we find ourselves in this crisis? We might begin by looking at our culture where, generally speaking, the looks or appearances of things are valued. Perhaps we have become a culture that privileges the visible and devalues the invisible.

---
To some extent, this is reasonable for it may be difficult to appreciate, understand and value that which cannot be seen. While reasonable, there are negative consequences in privileging the visible. Educational policy-makers have grounded assessment practices in visible, measurable outcomes -- and justifiably so, as how can educators assess or measure the invisible? Arguably, though, there are risks to privileging (and sometimes exclusively focusing on) the visible: If x cannot be observed, then x cannot be measured or evaluated. And if x cannot be measured or evaluated, then maybe x is not important, useful, worthwhile or even “real.” Such thinking can create an unintended consequence of devaluing or even sacrificing the more substantive, albeit invisible, aspects of education: student understanding and enlightenment – both of which are invisible and immeasurable but surely important and worthwhile.

Privileging the visible is evident in educational literature – particularly literature focused on the importance of language when framing learning outcomes. Consider the advice, for example, from the Centre for Teaching Excellence at the University of Waterloo, where it is suggested that “[t]o be meaningful, a learning outcome needs to be built around a verb that is sufficiently precise that it can result in a measurable, deliverable outcome.” Such advice is given as “…how do you measure knowledge, understanding, appreciation or learning?” Similar advice comes from the Schreyer Institute of Teaching Excellence at Pennsylvania State University, where it is suggested that “[d]ocumenting student learning is easier if you first specify what you want students to do [and use] verbs that involve specific actions and observable behaviors.” Schreyer Institute also offers “some words to avoid when writing objectives [including] know.

---

2 See Centre For Teaching Excellence at University of Waterloo website, http://cte.uwaterloo.ca
understand, appreciate, aware and familiar” as they are neither measurable nor observable. A brief on how to write learning outcomes, prepared by McMaster University, recommends that “learning outcomes should be observable and measurable” and that when writing outcomes, one should “avoid vague terms such as understand and know because they are difficult to measure.” It is significant that the authors caution educators to avoid certain frames and verbs, and stick to verbs that are observable and measurable. Further, each of the authors reference and include a list of “action verbs,” all of which appear to align with the thinking skills of Knowledge, Comprehension, Application, Analysis, Synthesis, and Evaluation, as outlined in American educational psychologist, Benjamin Bloom’s Taxonomy of Learning. The list and reference is supposedly provided to help the framer write observable learning outcomes. Unsurprisingly, such framing practices (including Bloom’s) are still used today and expected of teachers in the designing of lessons and unit plans. Such practices are also currently supported and expected in teacher training programs.

With particular attention to student evaluation and the problems educators subsequently face, the paper will explore how Plato’s description of the divided line might inform assessment practices in the future. If nothing else, perhaps the examination and exploration will provide an opportunity for some much-needed therapy for an institution in crisis.

---

Visibility and Invisibility

...it can be onerous to think about ideas because they are the things we think with. The difficulty is due to our minds being both a part of the world while also being our means of viewing the world – a notoriously problematic duality, which people keep “solving” for us though somehow leaving us with the problem. Our ideas serve us like lenses that greatly affect what we see. Mostly we take our idea-lenses for granted and assume we see reality directly. We don’t, of course, and it is useful now and then to try to reflect on our ideas – using other ideas, inescapably.6

Kieran Egan’s thoughts limn our crisis in education and provide further therapy for educators – educators who ought to consider that they are neither directly experiencing reality, nor aware of their “idea-lenses.” Using our idea-lenses, then, it is worthwhile to reflect on the ideas of visibility and invisibility and how they might influence education. Educators generally understand philosopher John Locke’s thoughts on education in the context of his empiricist beliefs. As an empiricist, Locke suggests that we rely on that which is observable, through our sensory experiences, to interpret and know our world. Further, humans learn, develop and are educated through such experiences. Arguing that the human mind is a like a blank slate, Locke asserts that one’s tabula rasa is filled with sensory experiences from an observable world. As he writes in his Essay Concerning Human Understanding,

Let us then suppose the mind to be, as we say, white paper void of all characters, without any ideas; how comes it to be furnished? Whence comes it by that vast store, which the busy and boundless fancy of man has painted on it, with an almost endless variety? Whence has it all the materials of reason and knowledge? To this I answer, in one word, from experience: in that, all our knowledge is founded; and from that it ultimately derives itself.7

Locke’s empiricist views in general, and view that the workings of the human mind are visible in particular, are significant assumptions – assumptions that some educational policy-makers hold today. Perhaps this partially explains why educational ideas like

understanding and enlightenment are “sidelined,” to say the least, and why observable actions and performances are embedded in current assessment requirements. But Locke also writes, “…in truth the ideas and images in men’s minds are the invisible powers that constantly govern them.”

Contemporary empiricists may very well concur with Locke that the mind’s workings are invisible. What we should attend to in education, therefore, are its visible performances and actions. It is not that there is anything wrong with attending to the mind’s visible performances and actions, but rather that curriculum assessment language ignores and dismisses perhaps some of mind’s most significant (though invisible) powers: understanding and enlightenment. Educational policy-makers have an investment in assuming (or at least saying they assume) that the human mind and its workings are empirically visible and observable. It justifies assessment policies – policies that require and expect teachers to observe, measure and assess. But exactly what are teachers assessing?

The idea of invisibility in Plato’s Republic may provide educators with some answers and therapy regarding educational assessment. Plato’s stories of the Ring of Gyges, the Allegory of The Cave along with his description of the divided line, can act as idea lenses for educators. Through these lenses, educators can appreciate how what they are evaluating is logically limited to the visible. More importantly, the most substantive parts of the educated mind, understanding and enlightenment, are invisible and therefore immeasurable.

Plato’s Ring of Gyges story helps us to consider the notions of both invisibility and observability, as they relate to educational assessment and evaluation practices. In the dialogue, Plato proposes a thought experiment in which we consider how we would
behave if we possessed a ring that made us invisible. Glaucon’s assertion that no one would be so incorruptible that he could, “…bring himself to keep away from other people’s property and not touch it, when he could with impunity take whatever he wanted…kill anyone, free all those he wished”9 leads him to conclude that man only appears just or virtuous so that he may protect his reputation and avoid punishment. No one possesses “an iron nature” and were the just man and the unjust man both given invisibility rings, Glaucon argues that their “…actions would be in no way different from those of the other and they would both follow the same path.”10 Suppose that Glaucon is wrong, however, and that there are incorruptible men who would never steal even if invisible. Perhaps such men believe that stealing, in and of itself, is wrong. Suppose further that such a just man and an unjust man (who would steal if he were invisible) both refrain from stealing while at market. In this case, the just man does not steal because he believes that stealing is wrong in and of itself. The unjust man does not steal because he wishes to appear virtuous, protect his reputation and avoid punishment. While inwardly, the men’s thoughts and motives are clearly different, outwardly their behavior is identical. They both appear just. From the perspective of an observer, then, there is a sense of inaccessibility, immeasurability and invisibility with respect to the private understandings of the just man and the unjust man. This is analogous to the educator’s sense of inaccessibility, immeasurability and invisibility of a student’s private understandings. Certainly educators can imagine a student who may outwardly appear to understand a formula in mathematics or a concept in science (as evidenced in a test mark or a verbal response to a question in class) when in fact, the student does not understand.

10 See Plato, Book II, 360c.
Similarly, it may outwardly appear that a student does not understand a formula in mathematics or a concept in science (as evidenced in a test mark or a verbal response to a question in class) when in fact, the student does understand. Regardless, educators likely know that evaluation tools are limited to measuring and assessing the visible (such as what a student can do or whether a student can complete a particular task) and that they are incapable of measuring and assessing the invisible (such as understanding or enlightenment). As earlier stated, however, while such invisible things in the mind are not assessable or measurable like actions and performances are, they may be more significant and influential in a student’s journey toward enlightenment and in developing a student’s understanding.

Like the Ring of Gyges story, Plato’s Allegory of the Cave and the related description of the divided line offer educators opportunities to reflect on current assessment practices. In his allegory, Plato describes human beings as prisoners in a cave who, tied in chains since birth, watch shadows on the cave wall and mistakenly believe the shadows to be reality. One prisoner eventually breaks free from his chains and ventures out of the cave, discovering reality and “seeing the light.” Wanting to similarly enlighten his fellow prisoners, he returns to the cave to explain his experience and inform the prisoners that while he has seen the truth, they see mere shadows of the truth. Predictably, the cave-dwellers are not persuaded of the truth of his account.

The prisoner’s dark cave is ironically the world of sight or the world of the visible, while the journey out of the cave to seek enlightenment and understanding is a journey toward the intellectual world of the invisible. As Plato writes,

…the prison-house is the world of sight, the light of the fire is the sun, and you will not misapprehend me if you interpret the journey upwards to be the ascent of the soul into the intellectual world according to my poor belief, which, at your desire, I have expressed,
whether rightly or wrongly God knows. But, whether true or false, my opinion is that in the world of knowledge the idea of good appears last of all, and is seen only with an effort; and, when seen, is also inferred to be the universal author of all things beautiful and right, parent of light and of the lord of light in this visible world, and the immediate source of reason and truth in the intellectual; and that this is the power upon which he who would act rationally either in public or private life must have his eye fixed.11

“Seeing” in the invisible realm outside of the cave differs from seeing with one’s eyes in the visible realm within the cave. It is significant, therefore, that Plato follows this dialogue with the description of the divided line, a related discussion to the Allegory of the Cave and one with important connections to educators’ current assessment practices. Consider the following diagram,

![Plato's Figure of the Divided Plane](image)

where Plato places noesis (understanding) and dianoia (reasoning) highest on the line, while pistis (opinion) and eikasia (images) are lowest on the line. The movement along the divided line mirrors the prisoner’s ascent out of the cave. That is, we all begin as prisoners, engaged by what we see with our eyes - “shadowy images” on the cave wall.

---

(eikasia). These shadowy images gradually frame our opinions of reality (pistis). In a cliché sense, we are all prisoners of our own beliefs. Eventually, however, we break free of our self-imprisonment and develop reason (dianoia), ultimately moving out of the darkness of our cave toward enlightenment and understanding (noesis). Understanding in this realm might be described as akin to “seeing” with one’s mind or soul but importantly, it is beyond the type of seeing with one’s eyes (eikasia) experienced whilst in the cave.

The journey out of the cave also mirrors the ideal journey of a student in pursuit of enlightenment and understanding. Peter Losin, in “Education and Plato’s Parable of the Cave,” describes how the journey is central to the idea of education and the role of the educator. As he writes,

…the upward journey out of the cave into daylight is the soul's ascent to the intelligible realm. The educator's task is a matter of turning souls around…Such reorienting of souls has affective or desiderative dimensions as well as cognitive ones. Early education…wakes up the spirited part of the child's nature and enables it to work together with reason, imbuing the soul with that order and grace necessary for later cognitive development.12

Losin further notes that, “…the cave is the region accessible to sight or perception; the world outside and above the cave is the intelligible region accessible not to perception but to reasoning.”13 The realm of the visible or sensible for the student, are the lowest forms of mental experiences, occurring deep within the cave. Such perceptions nonetheless shape the student’s opinions of reality. Significantly, reason and understanding (the highest forms of mental experiences) are beyond the visible and the sensible, ostensibly occurring in the realm of the invisible.

13 Losin, p. 50.
Plato’s description of the divided line and the journey out of the cave can help educators explore the negative consequences of privileging the visible. Beliefs and perceptions take place in the realm of the visible, deep within the cave. But such perceptions can be faulty and superficial. Current assessment practices can only measure the visible activities of the mind – faulty and superficial though they may be. Further, as assessment tools are focused on the observable or visible, including student assignments and prescribed learning outcomes, educators may only be measuring a student’s lowest “cave experiences” or pistis … their perceptions and opinions of “shadowy images.” It is significant that a student’s highest experiences, enlightenment or understanding (noesis), are unobservable and therefore immeasurable. The most elevated, arguably most important forms of knowing (understanding and enlightenment) may be an entirely invisible experience - at least an invisible experience to any outside observer such as an educator. Does government-imposed curriculum language ultimately force educators to keep students in the realms of pistis and eikasia? It is not so much that assessment of the visible is wrong but that such assessment is incomplete. In addition, there is a risk of mistakenly concluding that the invisible or immeasurable (such as understanding and enlightenment) are not important, useful or worthwhile.

Conclusion

…[the] so-called hard sciences that deal with the observable and measurable became socially privileged. The core reason for the privilege here is the ability to control and manipulate.¹⁴

Given that they are situated in the realm of the invisible and therefore the immeasurable, ideas such as attaining dianoia and noesis are not likely to reform

assessment practices any time soon. And sadly so. Ideas like proof, accountability, evidence, data and support seem to be unquestioned requirements of any worthwhile idea of education and tool of educational assessment. In The No Child Left Behind Act Of 2001, for example, the United States Congress passed legislation “with the goal of supporting educational practice based on scientific evidence.” The Act specifically outlines the guidelines and importance of scientifically-based research in Title IX, Part A, as it states that such research must: “employ systematic, empirical methods that draw on observation,” and that it “relies on measurements or observational methods.” The importance of observable, measurable assessment methods in education is also described as “closely aligned with approaches to research that are at home in the positivist paradigm.” The paradigm has as its underlying assumption that “the social world can be studied in the same way as the natural world” and “that there is a method for studying the social world that is value-free and the explanations of a causal nature can be provided.” Given the influence of these privileged paradigms and their accompanying methods on education, there is a risk that government-imposed assessment practices privilege the visible aspects of education (actions and performances) while devaluing the invisible aspects of education (understanding and enlightenment).

Philosopher, Jacques Ranciere writes of politics as disruption or interruption. As he states, “[p]olitics exists when the natural order of domination is interrupted by the

20 Mertens, p. 8.
21 Mertens, p. 8.
institution of a part of those who have no part.” 22 Maybe educators need to become more political – at least in this Rancierian sense. It is worthwhile to interrupt current educational dialogue and suggest that curriculum and assessment language may, albeit unintentionally, lead to valuing students’ observable performances and actions, while devaluing students’ understanding and enlightenment. Such an interruption makes room for new perspectives - perspectives that might include Platonic ideas not limited or constrained by the current, privileged assumptions of measurability and observability. Such an interruption might just be the therapy educators need in order to re-think, re-envision and re-invent our view of education and the role of educational assessment.

Abstract

Co-teaching implemented with fidelity has a profound impact on a range of learners with and without disabilities from a variety of cultures (Dieker, 2011; Murawski, 2010; Friend, 2008; Scruggs, et al, 2007 ). By effectively co-teaching and utilizing differentiated instructional strategies that promote student engagement, teachers will have a substantial impact on achievement for all learners (Marzano, 2010). Too often, administrators and co-teachers are not provided effective professional learning that teaches best practices for the 3 C’s of Co-teaching (co-planning, co-instructing, and co-assessing). Schools often focus on co-teaching in isolation resulting in a splintered approach to implementation and program implementation. The lack of a systemic support structure and underutilization of the special education co-teachers’ skills and expertise are commonly cited as the reason for in effective outcomes (Murawski, 2008; Friend, 2008; Scruggs, et al, 2007). This session is grounded in longitudinal research and evidence-based practices on effective inclusive practices from a variety of school communities across the country. The strategies presented are based on case studies obtained from successful inclusive school communities from around the country (Dieker, 2011; Murawski, 2010; Friend, 2008; Scruggs, et al, 2007).

Relevance to Learners, Families, and/or Educators of Diverse Groups

The instructional practices highlighted in this session have been successfully applied within both rural and urban settings, and have also been utilized to improve student engagement. When both teachers maximize their role and provide differentiated instruction, student engagement increases. Student engagement is pivotal to the success of students regardless of disability, culture or socioeconomic status (The Highly Engaged Classroom, Marzano, 2011).

Usefulness to Practitioners

Participants will gain a greater understanding of the need for focused collaboration in order to enrich the inclusive environment and vastly improve the capacity of schools to provide high quality educational opportunities for students with disabilities. In this session, I will provide
participants with a brief summary on the core components of effective implementation necessary for effective co-teaching along with how these components can be applied within the context of a co-teaching classroom. In particular, participants will gain information on how to create a co-teaching partnership that increases student achievement. The main focus of the session will be to provide participants with strategies and resources that they can take back and utilize to create successful inclusive communities with strong co-teaching teams.

This interactive workshop will address: (1) roles and strategies to maximize the power that two teachers with varying strengths and backgrounds can have on student engagement, learning and achievement (2) Universal Design for Learning differentiation instructional strategies to meet the needs of all learners. Participants will leave the interactive workshop with practical resources on how to effectively co-teach, incorporate innovative technology, and utilize differentiated instruction to increase student success.

**Participant Outcomes**

Participants will be able to:

1. Examine implications of successful co-teaching practices to student outcomes across rural, urban and suburban settings.
2. Apply core components of effective inclusive practices to improve co-teaching fidelity for all students.
3. Discuss ways to incorporate the Co-Teaching Components into new or existing co-teaching programs.
4. Describe instructional methods that are used to meet all learners’ needs and increase student achievement.

**Relevance to Learners, Families, and/or Educators of Diverse Groups**

The instructional practices highlighted in this session have been successfully applied within both rural and urban settings, and have also been utilized to improve student achievement. The co-teaching practices highlighted in this session have been successfully applied within both rural and urban settings, and have also been shown to improve student engagement and parental involvement, which impacts all students.

**Evidence of the Effectiveness of the Practice or Content to be Presented**

A. This session is grounded in co-teaching research and evidence-based practices. The strategies presented are based on research obtained on successful inclusive school communities (Dieker, 2011; Murawski, 2010; Friend, 2008; Scruggs, et al, 2007). Maximizing both educators in a co-taught setting strongly correlates to achievement for all students in the inclusive classroom. Using evidence-based practices, this interactive session will provide participants with a repertoire of instructional strategies for co-planning, co-teaching, and co-assessing to enhance student learning.

For handouts, slides, and further support on Co-teaching Practices contact Savanna Flakes at savanna.flakes@acps.k12.va.us and visit Readingforabetterfuture.com
Abstract

Feedback is required to support learners in skill acquisition, cognitive advancement and professional development (Archer, 2010) and is a useful strategy in the development of critical thinking (CT). Feedback also helps learners understand where they are, where they have improved, and what future development is needed. Effective feedback is used to promote desired outcomes.

The purpose of this study was to investigate whether nurse educators use questions as a form of feedback in evaluating students’ scholarly papers and if so, identify whether these questions are congruent with those levelled at stimulating students’ CT. It is also the purpose of this study to determine whether nursing students read and use the feedback and which types (e.g., questions, comments, check marks, and/or others) they prefer and why.

This study uses a descriptive/exploratory design. The population of interest are all students enrolled in two undergraduate programs at the FON, University of Alberta (Canada) and the scholarly papers they wrote in theory courses during the 2013/14 academic year (n=1748). The sample was one of convenience. Students were asked to submit hard copies of their papers in a secure Drop box after they blacken or whiteout their names and those of tutors. Participants also completed an online survey regarding their preferences and use of feedback.

Each paper was assigned a unique number and organized according to program, year/term and course. All types of feedback provided by educators, including questions, were extracted and recorded in an Excel spreadsheet. These will be coded and analyzed for the type of comments (corrective, directive, constructive and positive), and questions using Bloom Taxonomy as a
framework. Comments and questions congruent with CT (e.g., analysis, evaluation) will be summarized using descriptive statistics. Student survey data such as program, year of program, gender, et cetera will be summarized and analyzed using descriptive statistics. Participants’ responses to open ended questions regarding their reasons as to why they do not read and/or use tutors' feedback provided in their scholarly papers will be summarized and analyzed for themes.

This presentation will begin with an overview of learning process strategies, and the nature and types of feedback. This introduction will be followed by reporting on the findings of the study described above. Based on the analysis of the data, conclusions, recommendations and strategies to enhance the nature of feedback provided by educators to students in any course of study will be discussed.

Title: Characteristics of Non-Traditional University Students and The Challenges They Face In Pursuing a Graduate Degree

Topic Areas: Adult Education, Higher Education

Presentation Format: Paper Session

Presentation Description:
Non-traditional higher education students are the “new majority” on campuses across the nation. These students are 25-years or older, who have entered college for the first time, or have re-entered college after a break or gap in their education. Although enrollment of this student population is increasing, they are not completing their degree programs. This qualitative research paper describes characteristics of non-traditional university students and the challenges they face pursuing their graduate degrees.

13th Annual Hawaii International Conference on Education, January 6-9, 2013
Abstract

Student Paper

Background: Historically, postsecondary education and training have been a pathway to socio-economic mobility in the United States. According to the 2012 National Center for Education Statistics, enrollment of students 25-years and older increased by 42 percent from the years 2000 to 2010. These students are not traditional higher education students. In fact, they are represented in the research literature as “non-traditional” students.

A non-traditional college student is an adult 25-years or older, who enrolls in college for the first time or re-enters college after a break or gap in their college education. According to the Complete College America Report (2011), “Non-traditional students are the new majority student population” (p.6). These students are returning to college in record numbers, and for a myriad of reasons (Schaefer, 2010). Unfortunately, non-traditional students are not completing college degree programs. There is a body of research supporting the view that educational attainment is directly linked to occupational attainment. An uneducated and unskilled American population weakens the American economy and further lessens the quality of life for its citizens (O’Lawrence & Martinez, 2009).

Purpose: The purpose of this qualitative study was to identify characteristics of non-traditional university students and challenges they face in pursuing their graduate degree. This study’s empirical intention was to describe students enrolled in a graduate grant writing course at the University of Nevada, Las Vegas (UNLV) during the spring 2014 semester.

Methodology: This study utilized the qualitative research process of observations and interviews to describe adults learning in a graduate course at UNLV. Primary data collection consisted of taking field notes. The data collection consisted of face-to-face interviews with informants. The class participants consisted of a professor, eleven-student participants; six males and five females from diverse ethnic and racial cultures. Their ages ranged from the late 20s to late 50s. Three females and one male volunteered to participate in the interviews. There were four weekly classroom observations, and four hours of face-to-face structured interviews. The interviews focused on three areas; student’s demographics, reasons for attending college and challenges they face as university students. Transcriptions of interviews were shared for “member checking” with each informant for accuracy of researcher’s interpretations. In addition, the process of triangulation was used as a validation strategy.

Results: The results rely primarily on the interview data. Non-traditional students are proactive in balancing their education, employment, family and personal relationships. In addition, they have expectations and the determination to achieve their graduate degree, in spite of the challenges they encounter.

Conclusion: The overarching findings were that non-traditional adults are diverse and face unique challenges to pursuing their educational goals. This study’s findings suggest that UNLV must acknowledge and develop support systems that remove barriers for non-traditional university student’s pathway to degree completion. In conclusion, UNLV must provide more online courses and online degree programs. Future studies might focus on non-traditional freshman students.
The Use of the Capstone Course in the Assessment of
An Online Gerontology Graduate Program

Gary D. Kannenberg and Eric A. Goedereis
Webster University

Abstract

The twenty first century need for trained professionals in the growing area of elder care is clear. Higher education will be well advised to continue the development of gerontology-related educational programs that can address this need. In a higher education world that attempts to meet the educational, professional and personal requirements of the student and the profession, the more specific need for distance learning options has become essential. In 2010, Webster University, a leader in online global education, began to meet online training needs in the area of graduate education with a fully online Masters in Gerontology Program. A major concern in the development and implementation of this program is student and program assessment. This paper presents the student assessment methods used with the Webster University Online Gerontology Program and offers suggestions for colleagues at other institutions.
Providing evidence of program effectiveness in achieving program learning outcomes in the context of the overall assessment in higher education is essential (Majeski, 2007). Given population demographics suggesting an increasing market for individuals with both general and specialized training related to older adults, the assessment of student learning in Gerontology programs is a necessity and an ongoing challenge for those who work in higher education. Further, in light of a growing trend toward online education, the assessment of student learning in online programs presents unique issues that can be addressed in numerous ways by those academics who administer and teach in the online format. This article will focus on the assessment methods used in the graduate degree program in Gerontology offered online by Webster University.

The article will relate information about the program in general, the major areas of assessment used in the program, the components of the capstone course used in assessment and the attention paid to the particular needs and styles of learning presented by students who participate in this online Gerontology program of study. We will also offer suggestions for colleagues who may wish to implement similar assessment models at their own institutions.

**Overview of the Program**

The Gerontology Masters Program was redesigned and placed entirely online in
August of 2010. The authors of this work developed and implemented this online course of graduate study and both authors currently teach in the program. This program is currently offered at over 60 campus locations of Webster University. These campuses are all located within the United States. Students have three main options within this program. These options are: Master of Arts in Gerontology, Graduate Certificate in Gerontology, and the MBA. The curriculum of the Master of Arts in Gerontology (a 36 hour program of study) is designed to provide the student with the skills and knowledge necessary for careers related to gerontology. Within this framework, students are provided with a broad educational base concerning the impact of aging on individuals and cultures. The Graduate Certificate in Gerontology (an 18 hour program of study) and the MBA with an emphasis in Gerontology (a total 54 hour program of study) are both designed to expand students’ marketability and skills in their chosen professions by providing a broad educational base regarding the aging of individuals and society. This article will relate the student assessment methods used in the Master of Arts in Gerontology option. All GERN Program courses are offered in the nine week online format.

The majority of the students enrolled in the Webster University Master of Arts in Gerontology Program option are working, or have, worked in the field of gerontology. However, all students who enroll in any of the three program options have the opportunity to pursue a practicum experience. The practicum provides students with an opportunity to integrate coursework with first hand professional training within gerontological industries related to the older population. If chosen, the practicum can be pursued within the context of the students’ current employment setting or in a new setting.
entirely. The practicum experience should help students to begin identifying setting for consideration for future employment and expand their professional contacts within the field.

The Online Gerontology Program offers a variety of courses. These courses include; Gerontology, Economic Issues for Older Adults, Psychology of Aging, Physiology of Aging, Management of Programs for Older Adults, Research and Assessment in Gerontology, Social Science Perspectives in Gerontology, Issues in Gerontology Mental Health, Issues in Gerontology Alzheimer’s Disease and Related, Issues in Gerontology Transforming the Future of Elder Care, Issues in Gerontology Research and Writing Strategies, and Integrated Studies in Gerontology. All of the course offerings have specific learning outcomes related to the student on the syllabus and for which each professor is responsible for implementing during the process of the course. The learning outcomes for the required gerontology courses address the areas of gerontology program assessment required for completion of the program of study. The GERN 6000 course (Integrated Studies in Gerontology) is similar to a graduate thesis course. This course represents the final overall assessment of those eight assessment area and is related to the student in the course learning outcomes. These eight assessment areas represent the essential program level learning outcomes related to the student through their coursework and over their program of study in the Gerontology program.

The Eight Essential Learning and Assessment Areas

The eight Areas of Knowledge that this Online Gerontology Graduate Program considers to be essential are; interdisciplinary issues, economic issues, physiological changes, psychological issues, theoretical knowledge, empirical knowledge, management
and administrative issues, and social and political issues. Each of these areas are addressed in the required coursework that occurs before the capstone course (GERN 6000 Integrated Studies in Gerontology) and students must present evidence that they have knowledge in each of these areas as they proceed through these required courses. These eight areas represent the essential learnings that the student must attain and show evidence of attaining before completion of the Online Program in Gerontology. The eight Knowledge Areas are, therefore, directly related to the required coursework previous to the capstone course and are assessed, in total, through the capstone course.

The Capstone Course

Statement of Learning Outcomes

Each course in the Online Gerontology Program presents the student with relatively specific Learning Outcomes for that course. These Learning Outcomes help the student understand the knowledge, skills and abilities that are expected outcomes of their successful completion of the course. As has become common practice within higher education curriculum design, learning outcomes for each course are based on Bloom’s cognitive taxonomy (Anderson et al., 2000). Consistent with this taxonomy, each of the required GERN Online Program courses include at least one of the eight Knowledge Areas in their statement of Learning Outcomes. By the time students finish their required program coursework (before the GERN 6000 capstone course) they will have addressed each of the eight Knowledge Areas within the Learning Outcomes of their coursework. Thus, the Learning Outcomes of the GERN capstone course include all eight Knowledge Areas.
The Learning Outcomes related to the student on the course syllabus of the GERN 6000 course are;

1. The student will be able to develop a publication quality Review of Literature using APA publication guidelines.
2. The student will be able to fully research a topic in the field of gerontology and integrate research material into a publication quality Review of Literature.
3. The student will be able to construct a Critical Analysis and Application paper (evaluation) that integrates the material researched in the Review of Literature.
4. The student will be able to prepare and present a PowerPoint Presentation.
5. The student will be able to construct a single page critique of their PowerPoint Presentation.
6. The student will demonstrate the ability to integrate the following gerontology areas into the research, preparation and presentation of the requirements of this course: interdisciplinary issues, economic issues, physiological changes, psychological issues, theoretical knowledge, empirical knowledge, management and administrative issues, social and political issues.

The major assessment aspect of the GERN 6000 course can be seen in the last of these learning outcomes (6) that relate to the eight Knowledge Areas. Each of these eight areas are to be addressed in the Review of Literature assignment and any four of the eight areas are to be addressed in the Critical Analysis and Application paper. The student must document these requirements in their work and the course professor is responsible for a students’ successful completion of this requirement.
Assessment and the Major Course Requirements

Successful completion of the GERN 6000 course requires that the student complete and submit four assignments. These assignments include (1) Literature Review, (2) Critical Analysis and Application Paper, and (3) a power point presentation of both assignments. These assignments require students to demonstrate higher-level skills within the revised Bloom’s taxonomy model (Anderson et al., 2000). As Program Directors, we can then easily assess whether or not students are meeting the learning objectives at both the individual course- and overall program-levels. Consequently, the model we use in this course provides information on the degree to which lower-level courses within the program achieve their learning objectives. Assessment reports then help identify overall patterns of relative strengths and weaknesses within our curriculum. Further, this model affords us the opportunity to look critically at the overall program in order to evaluate the degree to which we are meeting our overall program learning outcomes. In short, this is an effective and efficient method of course and program assessment.

The Literature Review Paper. The completion of a publication grade literature review is primary focus of this class. The assignment is completed over the nine week duration of the course. Detailed information concerning the structure and content of the work are provided to the student in the online course materials. The basic weekly expectations for the assignment are communicated to the student on the syllabus with additional details found within the weekly content and assignments.

The literature review assignment is developed over the duration of the course. Each week, students are required to submit material in the development of this work.
Submissions begin in the second week of the class with a submission of the proposed title and basic outline of the project. Submissions continue with progressively more completed material being submitted for professor approval. The ‘TurnItIn’ function within our university’s course management software (i.e., Canvas by Instructure) is utilized for submitted material beginning in the fifth week. The professor for the course approves and relates information concerning improvement on a weekly basis via email, phone or both. The completed review of literature is submitted for final grading in the final week of the course. The review of literature must be a minimum of 35 pages (at a 12 font or less) and include at least 25 references. The paper must be publication grade and be written according to American Psychological Association Publication guidelines. The work must not contain more than two percent direct quotes, as determined by the TurnItIn Originality Report.

The review of literature must also include a document (provided to the student) that relates evidence (by paragraph and page) of at least one of each of the eight knowledge areas within the review. Thus, the student is responsible for identifying where and how he or she demonstrated evidence of each of the eight knowledge areas, which relate to the larger learning outcomes of the program.

**The Critical Analysis and Application Paper.** Students are required to prepare a separate 8-16 page Critical Analysis and Application paper. This Critical Analysis and Application work is also double spaced and APA style. It is an editorial and written in first person. This paper is to include a Title page, Introduction, Critical Analysis Section (4 page minimum) Application Section (4 page minimum), Reference page(s), and the LO Location page. This Critical Analysis and Application is graded (20 points max.).
Students are expected to begin working on this by Week 7, with the first draft due in Week 8 and the final version submitted in Week 9. Contrary to the Literature Review, this work is expected to be critical, both conceptually and methodologically. It is also expected that students will include an Application section in which they discuss how practitioners might integrate and apply the relevant research literature within the “real world.” This Application piece affords students the opportunity to make connections between the online classroom, academic literature, and their own professional lives. Further details, including grading rubrics, about these assignments, as well as the associated PowerPoint presentations, are available upon request.

**The Role of Faculty in Assessment**

**The Assessment and Monitoring of Program Faculty**

Given that our program is offered entirely online and staffed primarily by adjunct faculty, it is imperative that we continuously assess and monitor program faculty. One of the most significant benefits of program as currently constituted is that the online model provides a quality control mechanism. More specifically, whenever a particular course is offered, the Program Directors can feel confident that the instructor of record is aware of and understand the corresponding student learning outcomes. When we develop and revise our courses, we do so within a purposeful framework driven by course-specific student learning outcomes, which are then mapped on to the larger program learning outcomes. As noted above, the nature of the GERN 6000: Integrated Studies Capstone course allows us to identify relative strengths and weaknesses with respect to our program learning outcomes. We are able to quickly identify where there might be issues that warrant further scrutiny. By extension, we are also able to identify which faculty are
teaching courses that meet the required learning objectives. Thus, the monitoring of program faculty involves not only examining course evaluations (which are certainly an imperfect instrument for evaluating faculty performance, e.g., Gravestock & Gregor-Greenleaf, 2008), but also the extent to which students who complete earlier foundational courses are able to successfully demonstrate their learning across all eight of the knowledge areas covered within the program.

**Adaptation to Changes in the Field**

The eight Knowledge Areas assessed in the Gerontology Online Program represent major, program-level learning outcomes. These Knowledge Areas are considered essential for a well-rounded education in the field. However, these eight Knowledge Areas are general areas. Learning Outcomes found within the required (and elective) courses are often more specific. These course specific Learning Outcomes are often directly related to the Knowledge Areas and the specific content of the course. These more specific Learning Outcomes found in specific courses represent the detailed information often required in actual Gerontological practice. Since practice requirements are always in a state of change, it is often necessary to modify specific course Learning Outcomes to address these changes. The Program is also well-positioned to change or modify any of the general eight Knowledge Areas if changes in the field occur. To support this point, we are presently revising our learning outcomes to more explicitly map on to the Gerontology Competencies developed and endorsed by the Association for Gerontology in Higher Education (AGHE). Although these competencies represent a work in progress, we have begun to situate our current learning outcomes within the larger categorical competencies developed by AGHE. These include (1) Foundation
Knowledge and Skills (which provide an orientation to Gerontology), (2) Skills Needed Across Fields of Gerontology (which aim to identify and develop specific processes, tools, and skills for practitioners), and (3) Skills for Contexts of Gerontology Careers (which aim to provide hands-on experience in various fields of Gerontology).

At present, our course- and program-level learning outcomes have focused primarily on the Foundation Knowledge and Skills category, yet we have responded to students’ needs by developing new courses as demand warrants. For example, we have worked closely with our faculty to develop timely “Issues” courses focused particularly on the second (Skills Needed Across Fields of Gerontology) and third (Skills for Contexts of Gerontology Careers) proposed competency categories. These courses are more applied and professional in orientation and include Disaster Preparedness for Older Adults, Transforming the Future of Eldercare, and Research and Writing Strategies for Gerontologists. The program is, therefore, able to modify a wide variety of program or course level learning requirements dependent on changes in the field. This allows the program to quickly adapt to changes in the field while maintaining the overall academic rigor and quality of the program.

Summary

It is anticipated that the future of Gerontology practice in the United States will involve accreditation, which will undoubtedly require Gerontology Programs to document that specific program learning outcomes are taught to students and assessed by the program. This being the case, all Gerontology Programs must be able to readily adapt to changes in the field. We believe that our model of assessment in our GERN 6000: Integrated Studies capstone course provides a framework for adapting to such changes
while also monitoring and preserving the overall quality of the program. Although our model works well within the context of an online graduate program at a liberal arts university, we encourage our colleagues both within and outside of Gerontology to adopt this framework to suit the needs of their own programs at their respective institutions.

5. ABSTRACT: The study was motivated by the need to investigate the influence of academic productivity stress on performance effectiveness of lecturers in tertiary institutions in Cross River State, Nigeria. Four tertiary institutions were randomly selected for the study. Data on academic stressors and performance effectiveness indicators were collected from the sampled institutions. The one-way analysis of variance (ANOVA) with its associated post-hoc comparison differences was used. Findings revealed a significant influence of academic productivity stress on the performance level of academics among others.

Keyword: Academic stress, performance effectiveness, tertiary institutions, lecturers.

Integrated Communications Study – A Work in Progress
Topic Area: Curriculum, Research and Development
Format: Paper Session

This presentation is a work-in-progress report on a collaborative approach with program instructors to integrate curriculum objectives from the required communications course with their core technical courses. The purpose of this integrated approach is to develop the required skills in a more discipline-specific manner to improve engagement and proficiency in communication skills. The assumption is this approach will produce better communication skills than when the skills are taught in isolation.

Integrated Communications Study – A Work in Progress

This presentation is a work-in-progress report on a collaborative approach with program instructors to integrate curriculum objectives from the required communications course with their core technical courses. The purpose of this approach is to teach the required skills in a more discipline-specific manner to improve engagement and proficiency in communication skills. The assumption is this approach will produce better communication skills than when the skills are taught in isolation.

Focus Group:
The program of study for this approach is first year Computer Aided Drafting and Design (CADD) students.

Background:
The students in this program take one communications course in the second semester of their program though they must submit written pieces and deliver oral presentations in the first semester courses. Students have commented on this ineffective sequencing, also acknowledging their heavy course load in the second semester (which causes them to focus on core subject projects rather than those of the communication’s class). To address the perception of the communications course as an academic hurdle, my role will be to work alongside core instructors to teach the communications format(s) required in the discipline and grade the written component of the submissions; the core instructors will grade content and concept accuracy. We believe this approach will accomplish several goals:

- Introduce students to the required/preferred communications forms in the first semester of studies
- Improve the quality of submissions as the number of assignments will be decreased while the value of each increases (one assignment will affect grades in multiple courses)
- Enable the core instructors to reduce time spent instructing the written formats
- Emphasize the need for excellent communication with primary readers: employers, governing bodies, and clients
- Increase students’ awareness for the need to write effectively as a reflection of professional development and learning

The assumption is the more discipline-specific assignments will encourage the students to attend to writing and communications tasks throughout their semester’s studies rather than in a singular communications course. Structured rubrics will be developed and used for grading. Because there is only one group of students per year, a parallel sample group is not possible; therefore, the base for comparison will be past students’ submissions.

My presentation will discuss the preliminary findings of this approach as a communications instructor teaching cohorts in a specific discipline and encourage discussion on how this integrated approach might be incorporated with other writing across the curriculum initiatives.
**Students as Moviemakers: Applying Animated Video-Based Curriculum in Higher Education**

**Area:** Educational Technology

**Poster Session**

**Paper author:**
Amjaad Tariq Mujallid
PhD student
Department: Language, Reading and Culture
College of Education
University of Arizona (USA), King Abdul-Aziz University (Saudi Arabia)

Address: 3300 N Paseo De Los Rios Apt#23206
Tucson, Arizona 85712
amjaadm@email.arizona.edu

**Description:** This is a proposal for a future study aims to investigate the importance of supporting the traditional literacy (text) using the new literacies. The study will design and apply a curriculum for an undergraduate/graduate course about using technology in teaching. Then, an action research is planned to compare the results before and after applying it. The researcher focuses on video projects as an efficient method to provide knowledge for digital natives.

**Abstract**

One of the main questions in education has always been how to prepare young learners for their new world. Some studies claim that text is no longer enough for digital natives (Prensky, 2001), who need to explore knowledge beyond the text format. Exploring different types of literacies to support the traditional one (text), visual literacy, and especially videos, have come back to the field but with a different use. Students today are taking the director’s role instead of being merely watchers. Participating in this new trend, this abstract proposes a future study that aims to design a video project-based curriculum for using technology in teaching, where the students are the video makers. The study investigates three main questions:
- How to design a creative curriculum for higher education that integrates content knowledge into an ongoing video making process?
- What is the impact of using traditional literacy (text) and visual literacy (videos) on digital natives?
- What is the impact of using animation on students' learning and engagement?

To answer these questions, three steps should be completed. First, planning and designing a curriculum based on pedagogical and theoretical frameworks. Second, finding additional resources to assist students achieving the goal of this study. One of the tools has already been designed for this purpose is a mobile app named Animdeo. Finally, applying and evaluating the new curriculum on an undergraduate/graduate course at one of the southwest universities in the United States is necessary to move the study from the theoretical stage into learning environments. The main objective of designing and applying such a study is giving students the ability to:

- Demonstrate creativity in conveying messages and teaching contents.
- Evaluate digital tools available and choose the right one(s) for their purposes.
- Make decisions, think critically, and solve problems by organizing data.
- Research, find, and evaluate information whether digitally or printed.

The expected outcomes by the end of this study are:

- Promoting creativity in both teaching and learning.
- Encouraging students to be knowledge providers not merely receivers.
- Using the new literacies to complement the digital natives’ learning and lifestyle.
- Assisting students to be lifelong learners by developing the 21st century skills.

Retrospective Reflection in a PLC to Develop Preservice Teachers' Beliefs about Teaching Reading

Kit L. Blake, Ed.D.

blake@missouriwestern.edu
Abstract

Preservice teachers are confronted with multiple methods of teaching reading while studying in their teacher education programs. However, often a problem, beginning teachers revert to teaching reading based on the way they learned to read or they adopt the teaching practices of their student teaching mentors. Using retrospective reflection, preservice teachers revisited case studies they had written while teaching a struggling reader in a bi-weekly tutoring experience during a reading methods class. To reflect, participants journaled and then discussed in the format of a Professional Learning Community (PLC). Discussions related to what and how their student learned from them. Participants’ perceptions of how to teach reading were also discussed. Finally, the importance of reflection was discussed. Journals and transcriptions of the PLC discussions were analyzed by two coders using open coding procedures, and pre-post subject-comparison analysis. The researchers’ key focus throughout the study was to understand what the preservice teachers believed about how students learn to read and whether or not retrospective reflection after an applied learning experience changed the initial beliefs they held. Findings suggested that retrospective reflection has the power to change, confirm or deepen beliefs held by preservice teachers regarding how students learn to read and how to teach reading. Preservice teachers also learned the importance of reflection and the importance of differentiating their instruction to meet the needs of their students. Additionally, they gained professional voice and confidence as teachers.
Background for the Study

As a reading educator of preservice elementary and early childhood teachers for the past twelve years, I have continued to question how preservice teachers' belief systems are developed. Do the best practices, that I teach in my reading methods courses, become a part of the preservice teacher’s thinking and transfer to their teaching practices as beginning teachers?

My epistemology has been confirmed in the literature. There are many struggles when working with preservice teachers: the transfer of knowledge and best practices to their teaching (Bean, 1997; Hoffman, et al., 2005; Linek, Sampson, Raine, Klakamp, & Smith, 2006; Maloch, et al., 2003; Thomas & Barksdale-Ladd, 2000); and the difficulty in changing beliefs about how reading should be taught (Costa, 2000, 2008; Hoffman, et al., 2000; Risko et al., 1996).

Additionally, many preservice teachers are struggling readers themselves (Draper, et al., 2000; Lassonde & Blake, 2006; Lesley, et al., 2007); and many adopt the teaching practices they grew up with or the ones they observe from their mentor teachers in their field experiences (Hoffman, et al., 2005; Grisham, 2000; Bean 1997).

Having taught Reading Recovery for six years prior to coming to higher education, I had experience working with struggling readers. That work made me very reflective. Reflection is key in the learning process (Grushka, et al., 2005; Hoffman, et al., 2005; Linek, et al., 2006; Risko, et al., 2008). and preservice teachers need to internalize and develop teaching practices that produce student learning. Teacher educators have been successful in seeing beliefs change through reflective practice (Linek, et al., 2006; Mallette, et al., 2000). And it does not appear to be a matter of how much time (semesters) is spent by preservice teachers using reflective practice. Risko and her colleagues (2008) reviewed over eighty research studies and found that "many of the researchers, whose studies they reviewed, described changes in learning, beliefs,
and teaching within one semester" (p. 281).

The Purpose of the Study

The purpose of this study was to take a closer look at reflection and the developing reading knowledge of preservice teachers. Preservice teachers in elementary and early childhood programs at a Midwestern university simultaneously conducted action research on their own understandings of how students learn and their own understandings about reading pedagogy. Each participant re-examined the case study they wrote on an emergent/early reader during their reading methods class, Individualizing Assessment and Reading, which had an applied learning component. Additionally, they thought about reflection as a way to understand reading knowledge and pedagogy.

Research Questions

1. How does retrospective reflection in a PLC, after using Response to Intervention (RTI) in an applied learning experience, help preservice teachers develop an understanding of how students learn to read and an understanding of how to teach reading?

2. What do preservice teachers believe about how students learn to read and through retrospective reflection, do those beliefs change?

3. What do preservice teachers believe about teaching students to read and through retrospective reflection, do those beliefs change?

The Conceptual Framework

Reflective Practice

Preservice teachers and their transferring of knowledge to teaching practice has been a problem researchers have struggled to understand (Bean, 1997; Hoffman, et al., 2005; Linek, Sampson, Raine, Klakamp, & Smith, 2006; Maloch, et al., 2003; Thomas & Barksdale-Ladd,
But, Mallette and colleagues (2000) found that preservice teachers learned and applied their learning when they participated in field experiences where they made decisions about instruction and interacted with others to build their knowledge and beliefs about literacy. Whether a novice or an expert teacher, reflection is the ingredient that paves the way for future problem solving processes (Ferry & Ross-Gordon, 1998).

Reflection has a long history in American education beginning with the preeminent philosopher of education, John Dewey (1933). Dewey first used the term reflection, and defined it as "an active, persistent and careful consideration of any belief or supposed form of knowledge" (p.9.) Dewey studied reflection involving the interactions between the thoughts and actions of individuals in perceiving and questioning their environment. He claimed active consideration about what one believes or supposes about knowledge and its construction are critical for learning. Learning occurs continually as we experience and inquire about the environment.

Teachers are confronted continually in their classrooms with problem solving tasks when teaching students how to read. Donald Schon (1983) studied how reflective thought occurs when professionals are confronted with problem solving situations. Schon combined Dewey's concept of reflection with the situational context playing a role in the process where decision making occurs. The novice frequently failed to reflect on the problem solving process and therefore, in subsequent encounters did not apply what was learned. Conversely, through reflection, the expert chose among different approaches and developed a plan for the given problem solving situation. Therefore, developing as teachers involves continually reflecting on how and why students are learning in the elementary classroom and examining the beliefs held about learning and teaching. Thus, reflection is at the heart of teacher growth (Bunting, 2007;
Grushka, et al., 2005).

Researchers have tried to encapsulate the process of reflection to understand exactly what it is that makes the developing reading knowledge of preservice teachers transfer to their teaching practice. Risko and colleagues (1996) took their preservice teachers through a reflection process that yielded an understanding of the flexibility good teachers need to have when problem solving with struggling readers and making teaching decisions that are independent of a reading program. The researchers engaged their preservice teachers in reflective experiences that caused their initial “naïve conceptions” (p. 109) about literacy teaching to change. For reflective experiences, preservice teachers watched videos, examined case studies of struggling readers and engaged in small group discussions to develop their reading knowledge and reading pedagogy.

Group discussion that allows the members to hear the perspectives of others has also been found to deepen content knowledge (Brevig, 2006; Hoffman, et al., 2000; Santa, 2006; Bell, 2007), change beliefs (Costa, 2000, 2008; Hoffman, et al., 2000; Risko et al., 1996), develop reflective practice (Costa, 2000, 2008; de Jager, 2005; Hoffman, et al., 2000; Risko, et al., 2002, 2008; Santa, 2006; Bell, 2007; Arredondo & Rucinski, 1994; Campbell & Kmiecik, 2004) and develop pedagogy (Hoffman, et al., 2000; Risko et al., 2002; Clark & Medina, 2000).

Researchers have also found that preservice teachers use their personal experiences and values to guide their reflective work (Risko, Roskos, & Vukelich, 2002). In Risko and colleagues’ study, preservice teachers were aware of how their own perspective helped them remember information and make sense of course content. The researchers saw the power of their students’ personal experiences and the developing nature of reflective practice and noted that, because of reflective practice, the preservice teachers’ showed tendencies to adopt new
strategies as the semester progressed. Further, when developing reading knowledge, reflective discussion helps in learning the content of the text and course (Cantrell, 2002; Lassonde & Blake, 2006).

Placing preservice teachers in problem solving situations and promoting reflection on the process of learning is, therefore, paramount if we expect novice teachers to develop their knowledge and skills for teaching. Retrospective reflection which involves social interaction and exploratory talk, leads to reading knowledge - the framework for thinking about reading pedagogy (Brevig, 2006; McAlpine, Weston, Beauchamp, Wiseman, & Beauchamp, 1999). Reflection also enables mental structures long solidified and deeply rooted to change (Linek, et al., 2006; Mallette, et al., 2000).

**Methodology and Data Collection**

**Participants and Setting**

This study was conducted with four preservice teachers who were former students of the primary researcher, an instructor at an urban Midwestern university. Of the four preservice teachers in the study, two were Early Childhood Education majors, and two were Elementary Education majors. All were white females: two were in their early twenties, one was in her late twenties, and one was a non-traditional student. To avoid bias, all of the participants had completed all of their reading methods courses in the education program, and would not have the researcher again as an instructor or supervisor. A fifth pre-service teacher served as the research assistant and had only completed her first reading course, *Introduction to Reading*. Every effort was made to ensure the participants felt comfortable sharing in the discussions and there were no indicators to the contrary.

This qualitative research study was designed to take a closer look at retrospective
reflection using the participants’ case studies from the course, *Individualizing Assessment and Reading*. While taking the course, preservice teachers tutored emergent/early readers for twelve sessions and used Response to Intervention (RTI) to assess, diagnose, plan, and teach strategies to their tutored emergent/early readers. Students wrote detailed reflections after each lesson. The case studies were presented to their peers at the end of the semester.

**Data Sources and Analysis Procedures**

Participants were given a reflective task to prepare for each of the three PLC meetings. On their own, they individually responded to the task and then for the PLC meeting, the discussion centered around the topic of the reflective task (see Appendix A). Participants kept journals and the PLC discussion sessions were audio-taped. For the analysis, the audio-tapes were transcribed. The transcriptions were analyzed separately by the researcher and research assistant using open coding procedures, and pre-post subject-comparison analysis. The researchers’ key focus throughout the study was to understand what preservice teachers believed about how students learn to read and whether or not retrospective reflection in a PLC changed the beliefs of the preservice teachers? Each of the two researchers coded and analyzed the Individual Retrospective Reflection (journals) and the transcriptions from the oral interviews separately and then collaboratively conducted a cross-comparative analysis of their results. The member checking interview confirmed the findings of the data and served to triangulate the data. For the sake of space, the researchers have included their collaborative analysis of the journal data and the collaborative analysis (Appendix B) of the PLC discussions in this paper.

**Findings**

Two overarching themes about preservice teachers emerged from the data analysis: 1) transformation in beliefs related to how students learn and how to teach reading; and, 2) changes
in confidence about themselves as teachers of reading. Preservice teachers gave their perspectives on student learning and their understanding of how to teach reading from the two retrospective reflection sources: the applied learning experience (case study for class) and the retrospective reflection research study.

All of the preservice teachers felt that the applied learning experience and retrospective reflection (which occurred after each lesson they taught as the case study was written) gave them a knowledge base for working effectively with struggling readers. Through the retrospective reflection research project, preservice teachers made adjustments to their own understandings about how students learn and how to teach them.

All but one of the preservice teachers said that the retrospective reflection research study brought about changes in their beliefs about reading and teaching. Preservice Teacher A commented that her understandings did not change, but were validated and deepened throughout the retrospective reflection research study. The preservice teachers’ views of student learning expanded to include the importance of reflection, and the importance of assessing regularly to differentiate instruction and create lessons that are designed to meet the individual needs of the student.

Retrospective reflection and peer discussion made the preservice teachers more metacognitive by making them aware of what they knew and didn’t know (Blakely & Spence, 1990) about how students learn and how to best teach them. Enabling preservice teachers to talk about what they know and believe in a small group seemed to empower them with greater confidence as beginning teachers. During the discussions preservice teachers confidently voiced their opinions and even at one point challenged each other’s beliefs. By the end of the study, there was a definite shift from how the four students initially approached the idea of being a part
of the research study. Initially, one voiced her fear that she did not know enough to be involved. Another stated that she needed to be involved so that she would learn more about how to teach reading and openly admitted that she had not paid attention in class like she should have. Nevertheless, each participant finished the study more confident about themselves as beginning teachers. They each expressed excitement about teaching reading in their upcoming student teaching experiences and discussed how they hoped to assess students using RTI to ensure that their teaching was modified to meet the needs of their students.

Conclusions

This study confirmed what researchers have found about reflection and its power to change the perspectives or beliefs held by preservice teachers (Linek, et al., 2006; Mallette, et al., 2000; Risko, et al., 2002). Retrospective reflection was influential in changing the beliefs of preservice teachers. Further, because of the retrospective reflection done alone and in the small discussion group, preservice teachers became more confident as beginning teachers (i.e., more sure of what they knew about reading and how students learn, and the role they will play as teachers in helping future students learn to read).

Final Thoughts

The power of reflective discussion for helping preservice teachers develop their knowledge about reading and how to teach it (Arrendondo & Rucinski, 1994; Brevig, 2006; Risko, Roskos, & Vukelich, 2002; Smith, Rook & Smith, 2007) cannot be underestimated. As teacher educators, enabling preservice teachers to expand what they know about reading is paramount if we expect to produce confident teachers who become change catalysts in education.

Having students go back and revisit the case study they created on an emergent/early reader in a course with a field experience proved to be informative for both the preservice
teachers and the primary researcher. As reading educators, it is not only necessary but critical that we ensure our students are prepared for what we know will come.

As teacher educators, we must seek to understand how preservice teachers develop their reading knowledge in ways that it is transferred to their teaching practice. Retrospective reflection in an applied learning experience appears to be the first step to helping preservice teachers understand the complexities of teaching reading. Using retrospective reflection to revisit what preservice teachers believe about how students learn and how to teach (in a PLC) is a follow-up step that hopefully ensures that preservice teachers’ beliefs will be revealed and misconceptions corrected. It is important preservice teachers leave their reading education program and teach research based methods in their classrooms. Therefore, future research on the practices used by beginning teachers should be conducted. Empowering preservice teachers to be confident as beginning teachers is important if we don’t want them to slip back into teaching the way they learned to read or simply follow the teaching methods of the cooperating teacher in their student teaching experience (Hoffman, et al., 2005; Grisham, 2000; Bean 1997).

Appendix A

Directions Given to Participants:

**Session 1:** The research study will be outlined, and your roles as participants given. Data Collection #1 will be done. **INDIVIDUAL RETROSPECTIVE REFLECTIVE ASSIGNMENT:** Write in a journal the answer to this question: How do children learn to read?

**DURING OUR MEETING:** Whole group discussion (audiotaped) as the answer to this question is discussed.

**Session 2:** **INDIVIDUAL RETROSPECTIVE REFLECTIVE ASSIGNMENT:** Analyze your case study and lesson reflections from EDU 360, Individualizing Assessment and Reading. Look for 3 pivotal places where your student learned something new.

Example of Student Learning #1:

- ☐ Describe the need the child had. (your assessment or observation showed.)
- ☐ Describe the intervention you used. (the activity, what you said, etc....anything you can remember about the experience)
- ☐ Describe the student’s response. (reaction to your teaching, or discovery....describe the details)

Example of Student Learning #2:

- ☐ Describe the need the child had. (your assessment or observation showed.)
- ☐ Describe the intervention you used. (the activity, what you said, etc....anything you can remember about the experience)
- ☐ Describe the student’s response. (reaction to your teaching, or discovery....describe the details)
Example of Student Learning #3:

☐ Describe the need the child had. (your assessment or observation showed.)

☐ Describe the intervention you used. (the activity, what you said, etc.....anything you can remember about the experience)

☐ Describe the student’s response. (reaction to your teaching, or discovery....describe the details)

Now go deeper: Answer these 3 questions: In your opinion:

• What was it that caused learning to occur? (give the specific reasons you think the student learned)

• What does this tell you about student learning?

• What does this tell you about teaching?

DURING OUR MEETING: Data collection #2. Whole group discussion (audiotaped) as the answers to these questions are discussed.

Session 3: INDIVIDUAL RETROSPECTIVE REFLECTION ASSIGNMENT: Read the research articles on reflection that you have been given.

Make notes about the following:
STUDENT LEARNING:
Have your ideas about how students learn changed as a result of the applied learning experience? If yes, explain how they have changed.

Have your ideas about how students learn changed as a result of the research project and the retrospective reflection you did about student learning? If yes, explain how they have changed.

THE TEACHING OF READING
Have your ideas about how to teach reading changed as a result of the applied learning experience? If yes, explain how they have changed.

Have your ideas about how to teach reading changed as a result of this research project and the retrospective reflection you did about teaching reading? If yes, explain how they have changed.

DURING OUR MEETING: Data collection #3. Whole group discussion (audiotaped) - as the answers to these questions are discussed.

Session 4: Member checking interview.
Appendix B

**Researchers collaborative analysis - Journal Assignment for Session 1**

How do children learn to read?

**Participant A** believes meaning is the context for which learning to read occurs and students are constructivists of their own learning through building on what they already know (schema). She mentions discussions and writing as ways to deepen one's understanding.

**Participant B** believes children primarily learn through visual but will use meaning to decide if the word fits into a meaningful context. Children use letter-sound relationships to learn how oral language is translated into printed language.

**Participant C** believes a visual (graphophonic) approach is necessary to learning to read and says that learning to read begins before children enter the classroom. She also said that children learn differently and at different rates but believes that all children go through the same reading stages. She did mention that reading should be meaningful, not just the isolation of letter/sounds.

**Participant D** believes that learning to read begins at home when children are read aloud to. Meaning is essential when learning to read and connections from the oral language to symbols to words, and vocabulary to text are important.

**Researchers collaborative analysis - Journal Assignment for Session 2**

Analyze your case study and lesson reflections from EDU 360, Individualizing Assessment and Reading. Look for 3 pivotal places where your student learned something new.

**Participant A** – Student learning occurs in a safe environment. Initial assessment needed with a plan of intervention. Modeling of strategies is essential. Meaning oriented and understands the importance of reflection, planning and differentiating instruction. (Reading Recovery – RTI)
**Participant B** – Student started out using pictures and did not attend to print. Preservice teacher scaffolded the student with decoding – visually oriented in her teaching, however, she did teach rereading to confirm meaning. Student went from reading the pictures to using the words more, but at the end, teacher directed her to meaning to make sure it made sense. This preservice teacher appeared to shift in understanding meaning as primary to teaching reading.

**Participant C** – Used integrated teaching - cross-checking meaning and visual. Student needed chunking and to slow down and pay attention to the words. Also taught rereading to confirm meaning. Emphasized the importance of teaching as asking questions and putting the child in the situation of problem solving to learn. (“Rather than just telling the child the words.”) She also emphasized modeling for students to see and understand what they are to do when reading.

**Researchers collaborative analysis - Journal Assignment for Session 3**

Have your ideas about how students learn changed as a result of 1) the applied learning experience; and, 2) as a result of this research project? If yes, explain how they have changed.

Have your ideas about how to teach reading changed 1) as a result of the applied learning experience (ALE); and 2) as a result of this retrospective reflective research (RRR)? If yes, explain how they have changed.

**Participant A** – Changes:

SL & ALE= The course involved with the applied learning experience “modeled student learning and showed me what to watch for.”

SL & RRR = NO CHANGE – Her opinions and reflections were validated.

TR & ALE = Before the class she didn’t have a “deep idea” about how to teach reading. She now realizes working with one child only gives a glimpse of problems that can be encountered with
struggling readers. (There is more to learn.)

TR & RRR= NO CHANGE – Her opinions of RTI, reflecting, inferring, discussing, and synthesizing were validated.

**Participant B** – Changes:

SL & ALE= Has realized that students can be taught to read; that they are not just born that way. Strategies are what equip the student to learn how to decode.

SL & RRR= Students need to learn the strategies in a meaningful context and use books that are interesting. Moved from believing that students learn visually to the importance of meaning to ensure students are engaged and like reading [which is how she learned to read].

TR & ALE= I learned the strategies. Strategies must be explicitly taught.

TR & RRR= As a teacher, I must always be reflecting and adjusting my teaching in order to help students grow as readers.

**Participant C**- Changes:

SL&ALE= Still maintains students learn at their own pace. Now understands that what works for one, does not work for all. Attributes differences in learning to the construction of knowledge for each individual.

SL & RRR= Through reflecting she now sees that she could have made adjustments to her teaching so that the student would hopefully have progressed further and faster.

TR & ALE= “I have created my own ideas of how to teach students how to read.”

TR & RRR= Realized she should have taught differently to meet the tutored student’s needs.

**Participant D**- Changes:

SL & ALE = link strategies to hands-on meaningful experiences

Abstract

In recent years, Japan has outscored the United States at a statistically significant level on the Organisation for Economic Co-operation and Development’s (OECD) Programme for International Student Assessment (PISA). In the past (2000 and 2003), the United States scores were not statistically significantly different from those of Japan. This descriptive study describes and analyzes Japanese public elementary education in one prefecture in order to better understand practices and related policies that have led to Japan’s success. Data is comprised of classroom observations, elementary public school language teacher interviews, a self-reported survey from 58 schools in four cities across Osaka Prefecture, and newspaper articles. This presentation is limited to two themes that initially emerged from classroom observations—(a) learning environment (physical, mental, and emotional) and (b) classroom procedures. The participants in this report were 10, sample of convenience, elementary public school teachers in grades one, three, and five. Preliminary analysis indicated that the physical environment was sparse, but
mentally stimulating, and emotionally supportive. The environment reinforced
efficient and well-rehearsed procedures, which included opening and closing
routines, students’ oral responses, and readings. As a result, teachers were able to
capture and maintain student attention with briskly paced reading lessons.
Conclusions drawn from this study may be of interest to educators in the United
States.
Title: New Challenge: Transfer from Environmental Design to Art Department: Discussion on How to Balance Design and Art

Topics: Art Education  Reports on Issues Related to Teaching

Presentation Format: Paper Session

Description: After a long tenure in teaching product design for the Faculty of Environmental design I was presented with the challenge of moving my position from Design to an Art Faculty. Teaching Design to Art students represents challenges in a context in which design was never part of its curriculum. These challenges range from revised syllabus to political issues with both students and Faculty members. In this paper I will talk about strategy, case studies and thesis supervision adjustment that result in a successful transition between design and art.

After a long tenure in teaching product design to the Faculty of Environmental design I was presented with the challenge of moving my position from Design to an Art Faculty. Teaching design to art students represents challenges in a context in which design was never part of its curriculum. These challenges range from revised syllabus to political issues with both students and Faculty members. In this paper I will talk about strategy, case studies and thesis supervision adjustment that result in a successful transition between design and art.

This topic is not new, in fact several colleges and universities in the world are dedicated to teaching art and design in their curriculum; The Ontario College of Art and Design or the Art Center College of Design in Pasadena to name of few. But it remains a constant challenge, how to balance the two disciplines? I intend though in this presentation to focus on the issues raised by my transfer in the hope that it will apply to the general context.

I will introduce the current curriculum of the Department of Art at the University of Calgary, identify the area for improvement. How can we improve design thinking while retaining a true artistic vocabulary? How many design courses do we need to teach to have an impact on artist studio? How to we incorporate modern technology such as 3d scanning, rapid prototyping to Artist?

Synergizing Heart/Mind in Leadership: Applying Appreciative Inquiry
Nancy-Angel Doetzel, PhD

Abstract
Emergent scholarly inquiries about synergizing heart and mind within education coincide with post-modernist paradigm shifts towards appreciative inquiry, a constructive mode of research that is a shift from vocabularies of deficit to conversations of possibility. Different from most modes of research, appreciative inquiry promotes transformative dialogue and action by presenting positive questions. Heart wisdom is evident in this form of inquiry when participants begin to feel a sense of hope, excitement, co-operation and ownership about the future. Mind intelligence and heart wisdom should function as an interdependent dynamic; the heart’s latent capacity for universal intelligence and wisdom must, like the mind, be provided with models for its full growth and development. This paper demonstrates how an evolution in thought and research can mean synergizing heart and mind to formulate new of inquiry and knowing.

Introduction to paper
Throughout my investigative research careers within the fields of journalism, education and counselling, I have engaged in an Appreciative Inquiry process that resulted in a freedom to be positive and affirming. Applying an appreciative 4-D Cycle: discovery, dream, design and destiny (Whitney & Trosten-Bloom, 2003) promoted a constructive approach to my personal and professional interactions. Within this 4-D cycle, discovery involves seeking to “understand the best of what is . . . and what has been (p. 7); dream is an energizing exploration of what might be (p. 8); design is . . . statements describing what should be (p. 9); [and, destiny is] a series of inspired actions that support ongoing learning and innovation or what will be” (p. 9).

When employed by a community newspaper and radio and television station, I investigated the good news found within some tragedies; in the counselling profession, I encouraged clients to “act as if” they were already healthy and to find purpose in their
health challenges; and, while engaging in educational research, I asked study participants positive questions. This appreciative inquiry approach to my work has assisted me to mute some “critical, problematic and deficit-based voices” (Whitney & Trosten-Bloom, 2003, p. xi) that tend to cultivate oppression and reductionism within workplaces.

Examining Research

A major finding I discovered in my literature review and data addressing educational leadership was that when educators practise appreciative inquiry they can cultivate spirit within their workplaces (Doetzel, 2006). Spirituality within educational leadership is about connecting with the experience of re-awakening the sacred spark within oneself and others. Establishing discourses about spirituality within educational leadership assists educators to re-discover their heart wisdom, empowering them to view learning through a fresh lens.

Beyond traditional techniques of dispassionate research, an appreciative inquiry mode is a way of illuminating organizational factors that can nurture the human spirit (Cooperrider & Srivastva, 1987). This enlightening approach to research assists organizations to shift appraisal systems from blaming employees to analyzing systems through staff collaboration. By predicting a positive future within workplaces, appreciative inquiry is commonly preferred over research that suggests a repelling tomorrow (Doetzel, 2006). “Appreciation has to do with recognition, with valuing, and with gratitude” (Whitney & Trosten-Bloom, 2003, p. 2). Like elements of hydrogen and oxygen “that combine to make water, the most nurturing substance on earth, appreciation and inquiry combine to produce a vital and powerful, catalytic effect” (p.4). An appreciative inquiry process has been used to enrich spiritual development, heal people’s
wounds, and enhance personal relationships (Whitney & Trosten-Bloom, 2003). Our choices of words within conversations assist in the creation of our reality. Therefore, we should “speak of delight, not dissatisfaction. Speak of hope, not despair. Let [our] . . . words bind up wounds, not cause them” (Whitney & Trosten-Bloom, 2003, p. 60).

Examining the 4D appreciative inquiry cycle: discover, dream, design and destiny ((Whitney & Trosten-Bloom, 2003) within a literature review, assisted me to challenge assumptions that had distorted my views of research (Doetzel, 2006). Within my doctorate study, which addressed personal and professional spiritual development, appreciative inquiry was applied to the research questions: 1. How are the spiritual experiences of educational leaders understood and articulated by educators? 2. In what ways would this articulation of spirituality best contribute to the development of effective leadership? Appreciative inquiry was a constructive approach to my research that created space for new voices and expanded circles of dialogue to include discourses about spirituality. It encouraged the educational leaders participating in the study to establish systems that nurtured educators within their workplaces.

Appreciative Inquiry within action research is an intellectual descendent from the Aristotelean method of inquiry that aims to affect educators’ beliefs and actions. As a process consisting mainly of “sequences of interactions” (Ellis & Bochner, 2000, p.743), this approach to research challenges the hegemony of an established knowledge and power system (Salas & Tillmann, 1998) and focuses on introducing new strategies for educational leadership (Gay & Airasian, 1992). Such strategies encouraged the educational leaders participating in the study to
share personal narratives about spiritual experiences with one’s peers (Doetzel, 2006).

An appreciative inquiry approach to research centres more on discovering the practical effects of a study than developing new theoretical rigour (Gay & Airasian, 1992). “Its purpose is to improve school practices and at the same time to improve those who try to improve the practices: to combine the research processes, habits of thinking, ability to work harmoniously with others and professional spirit” (Best & Kahn, 2003, p. 20). In this form of action research, as applied to leadership studies, the knowledge generated has been referred to as “practical wisdom” (Toulmin, 1997).

Sharing stories within an appreciative inquiry approach to research is a primary step in breaking down stereotypes and connecting theory with humanity. As noted by Vanier (1998),

stories seem to awaken new energies of love; they tell us great truths in simple, personal terms and make us long for light. . . . When we tell stories, we touch hearts. If we talk about theories or speak about ideas, the mind may assimilate them but the heart remains untouched. (p. 90)

To awaken hearts and increase understanding, Jesus told parables, Hasidic Jews and Sufi teachers told tales and Hindus introduced stories.

“Storytelling can provide an opportunity for one to imaginatively engage in dissonant situations thereby increasing one’s capacity to see the world through more than one window” (Shakotko & Walker, 1999, p. 207). In my study, I attempted to understand participants’ truths from an appreciative inquiry standpoint, which is an
approach commonly used in action research (Doetzel, 2006). Schratz and Walker (1998) point out that appreciative inquiry encourages reflection about life experience and story-telling, which are keys to learning. “Being able to speak to ourselves and others about what we experience provides a means of editing and rewriting scripts of everyday life, enables the building of a mental reference system . . . and allows us to build the narratives that give meaning and interest to our lives” (p. 197). Sharing stories is an important means of constructing knowledge and creating teachable moments (Mishler, 1986).

Appreciative inquiry enables participants and researchers to engage in a story-telling process that generates new insights and new knowledge, and creates opportunities for participants to improve their own lives and the lives of their students (Mishler, 1986). For example, in my study participants were encouraged to question what assumptions they took for granted about educational leadership and the effects of them muting discourses about spirituality within the school environment (Doetzel, 2006). As one form of co-operative action research, appreciative inquiry supports a commitment and ability to collapse the division between objectivity and subjectivity (Pyrch, 1998a).

Appreciative inquiry “can be seen as a spiritual imperative” (Reason, 1998, p. 149) that objects to the Western world-view, as “based on a fundamental epistemological error that humans are separate from each other and the natural world” (p. 157). This form of co-operative inquiry is a means to obtain more accurate and more ethical data, because the research is based on people’s experiences and “engaged with people rather than did research on people” (p. 149). Therefore, study participants
are not treated like subjects. This approach to action research is a way of interacting with other individuals who share common concerns and interests; the goal is to make more sense of life, construct new and creative ways of viewing life and “above all to heal the alienation, the split that characterizes modern experience” (Reason, 1998, p. 162). Appreciative inquiry is a holistic approach to research.

**Conducting Research**

Applying Mill’s (2003) approach to inquiry as a guide, the process in my study consisted of the following four steps: 1. identifying spirituality in leadership as the focus; 2. collecting data; 3. analysing and interpreting the data by identifying themes; and 4. developing an action plan. Action research studies provide educators with data that can be used formatively to affect positively an educator’s professional disposition. The action plan that was developed in this study was a schemata suggesting ways educators could apply appreciative inquiry to cultivate spirit within leadership in their workplaces.

As a constructive mode of action research, appreciative inquiry illuminates factors that serve to nourish the human spirit and furnish new alternatives for social action (Ludema, Cooperrider & Barrett, 2001); asking positive questions during this inquiry about spirituality could have ignited transformative dialogue and action within human systems (Doetzel, 2006). For example, study participants may have been motivated to dialogue about and practise spiritual leadership within their workplaces while being actively engaged in cooperative relationships during the data-collection process.

Rather than select an activity related to spirituality that is measurable or interpretable by a researcher, a person may choose to walk or sing as an expression of
their spirituality (Mathews & Clark, 1998). Because only the walker or singer truly knows their intent, an outsider could not be certain whether or not this activity could be viewed as spiritual or non-spiritual. Taking this perspective into consideration, if a researcher attempted to analyse or dissect another’s perceptions of spirituality through a quantitative approach, misunderstandings could occur (Ulich, 1945). “Spirit may erupt at any moment and from any genuine act of creativity” (Fox, 1995, p. 123). Furthermore, telling a divine story that one has been “graced to breathe” (p. 121) could be an epiphany resulting in a true sense of connection with the divine. As stated by O’Murchu (1997), “meaning is embedded in story, not in facts” (p. 199). Research approaches such as appreciative inquiry help deepen an understanding of the spiritual aspect of human existence.

“Appreciative inquiry asks two basic unconditional positive questions” (Ludema, Cooperrider and Barrett, 2001, p. 193). To guide the development of my research questions, I reviewed the “Appreciative Interview Protocol” (p. 193) questions applied to Ludema, Cooperrider and Barrett’s action research inquiry. Their research questions, such as “2. what do you value most about yourself, your work and your organization?” [and] “4. what are the unique aspects of your culture that most positively affect the spirit, vitality and effectiveness or your organization and its work?” appear to be leading. However, appreciative inquiry questions “set the stage for what we later find and discover. The concept of the unconditional positive question assumes that whatever topic we choose to study, we can study it unconditionally, and in so doing, significantly influence the destiny of our organizations” (p. 189).
As suggested by Ludema, Cooperrider and Barrett (2001), I used leading sub-questions with the aim of focusing attention towards affirming matters within the participants’ personal and professional lives: 1. having peak experiences
2. acknowledging spiritual values and moral beliefs that influence effective leadership practices 3. recognizing changes that have added spirit and enthusiasm to their leadership and 4. noting effective leadership practices worth recommending to other leaders.

Within my working definition of spirituality, I stated that the terms “enthusiasm” “excitement” and “spirit” are interconnected with the term “spirituality;” this enabled me to apply these terms within the second set of questions.

Prior to data collection, I used an action research appreciative inquiry approach to developing my research questions (Doetzel, 2006). Drawing from the first key concept, 1. muting discourses about spirituality within educational systems and the second key concept, 2. examining moral issues within educational values, I developed and forwarded the first core question and two sub-research questions to participants:

**First core question**
How are the spiritual experiences of educational leaders understood and articulated by educators?

**Sub-question related to first core question and first key concept**
1. Think of a time when you felt the most excited, most engaged and most alive. What was it about this peak experience that you would define as being spiritual?

**Sub-question related to the first core question and second key concept**
2. What are some of the spiritual values and moral beliefs that influence the effectiveness of your leadership practices?
To answer the above research questions, data were collected on-line by giving participants questions by e-mail (Doetzel, 2006). The feminist, phenomenological and appreciative inquiry approach to the interview involved an interpersonal interaction in which participants were encouraged, by the questions, to share details of their experiences with the researcher. During an on-line interview with the researcher, participants were asked to reflect upon a specific instance, situation, person or event and then to explore the experience. This on-line interview served as a means to establish a relationship with each participant about what the experiences meant them. Throughout the process, the interview was guided by appreciative questions guided by key concepts located within the literature.

For each question, participants were requested to give a one-page (250 word) response within a month (Doetzel, 2006). After participants had answered the first set of questions, the researcher pasted their responses on a web-page and encouraged them to anonymously engage in an on-line discussion for two weeks. To keep the research process active and check out how participants were handling their commitment to the study, I contacted all participants by telephone. After a month, the process for administering and answering the first set of questions was repeated for the second set of sub-questions associated with the third key concept “shifting paradigms affecting educational leadership,” and the second core question. Also, the discussion page was also left open for further discussions.

Related to the third key concept, 3. shifting paradigms affecting educational leadership, I developed and forwarded the second core question and sub-research questions three and four to participants:
Second Core question

In what way would this articulation best contribute to the development of effective leadership?

Two sub-questions related to the second core question and third key concept

3. What are some changes in leadership practices that have added enthusiasm and spirit to your leadership?

4. What effective leadership practices would you recommend to other educational leaders?

As with the first set of questions, participants were interviewed on-line by the researcher before answers to their questions three and four were posted on the web-page for fellow participants to review and respond (Doetzel, 2006). When three weeks had passed, I contacted all participants as a follow-up. After keeping the web-page open for one month, I informed all participants that the data collection had been completed and the web-page would be closed. I thanked them for their rich contributions to the study.

Although e-mail interviews and web-page discussions were the two main sources of data collection, the research design process evolved to include some telephone communication, where I took on the role of facilitator, as suggested by Wadsworth (2001). Being a facilitator involved keeping the dialogue going among the participants and with the researcher. Therefore, I conformed to the needs of the participants, which included discussing the questions by telephone.

Data upheld Park’s (2001) standpoint that representational knowledge involves participants re-describing or re-presenting the object of knowing, which were their peak spiritual experiences. Also, the antecedent event of having a peak experience could lead
to the probable consequences of signifying and cultivating spirituality within the workplace. Experiences associated with “awakening spirituality within self” varied amongst all 10 participants, who presented them within the context of peak spiritual experiences (Doetzel, 2006).

Research Findings

The components of the following schemata (heart graph # 1) were constructed from participants’ responses to sub-question one, “think of a time when you have felt the most excited, most engaged and most alive. What was it was it about this peak experience that you would define as being spiritual (Doetzel, 2006)?” In the appreciative inquiry 4D Cycle, this schemata reflects the elements “discovery” and “dream” that involve searching for the positives of what are and exploring what could be (Whitney & Troten Bloom, 2003). For example, Airjordan and Stider associated awakening and cultivating spirituality with communing with nature; Meiling and Ayla suggested upbeat music helped them to tune into their spirituality, and Newday and Armary indicated that allowing themselves to be childlike cultivated their spirituality. The other four participants associated cultivating spirituality within self with the other components listed in this heart graph. This heart graph is a metaphoric diagram symbolizing a heart-centred model for cultivating spirit within self. The graph also complements the triangulated research design applied to this study (Doetzel, 2006).
Heart graph # 1: Cultivation of spirituality within self

From the findings, a schemata of cultivation of spirit within the workplace was also developed from 10 participants’ shared spiritual experiences as leaders. In the appreciative inquiry 4D Cycle, this schemata reflects “designing” and “destiny.” . . . statements describing “what should be” and “what will be” (Whitney & Trosten-Bloom, 2003, p. 9). The eight components of this schemata include 1. affirming self and others, 2. applying faith, 3. sharing leadership, 4. being accountable, 5. having a clear vision and mission, 6. being true to self, 7. being a positive mentor, and 8. being a continuous learner. These components indicate that leadership models include a heart-centred approach which would place the needs of educators and students ahead of the materialistic concerns of a consumer nation. The components were constructed from participants’ responses to sub-questions three: What are some changes in leadership
practices that have added enthusiasm and spirit to your leadership, and sub-question four: what effective leadership practices would you recommend to other educational leaders (Doetzel, 2006)?

In response to sub-question three, seven participants stated that “affirming self and others” added spirit to their leadership (Doetzel, 2006). Airjordan stated after being affirmed, he felt more confident about taking risks; Beau pointed out the importance of staying positive during challenging times; Luv said that to affirm the worth of her staff, she practises random acts of kindness, such as giving out inspirational cards, flowers, smiles and thank-you notes. She also provides muffins and doughnuts for staff. Meiling and Stider provided the gift of attentive listening; Habs and Newday affirmed themselves and others by practising servant leadership.

Five participants indicated that “applying faith to their leadership practices” added enthusiasm and spirit to their work (Doetzel, 2006). When he is feeling challenged, Airjordan questions what Christ would do in the same situation; Meilling, Newday and Stider said they lean on meditative and prayerful activity to help get them through difficult times at work. For example Newday applies the third step of Alcoholic Anonymous, “Let Go and Let God.”

Four participants suggested that “sharing leadership” added enthusiasm and spirit to their leadership (Doetzel, 2006). Airjordan referred to applying a collaborative effort; Armary suggested giving front-line status to staff; Beau discussed sharing leadership his responsibilities; Luv supported endorsing a synergistic flatter leadership model, inviting input from all stakeholders in the learning community.
Three participants indicated that “increasing their accountability” added enthusiasm and spirit to their leadership (Doetzel, 2006). Ayla used the example of becoming more accountable in the community and province, while progressing towards site-based management; Habs stated that his role has moved beyond manager towards a role of providing inspiration and hope for others; Sara noted that she had become a multi-skilled leader, assuming various roles to help articulate vision and direction for her school.

Two participants associated “having a clear vision and mission” with bringing enthusiasm and spirit into their workplaces (Doetzel, 2006). Armary and Sara stated when organizations have a clear philosophy and articulate the school’s mission, enthusiasm and spirit can flourish in the workplace.

In response to sub-question four, participants noted that being true to self, being a positive mentor, and being a continuous learner were effective leadership practices they would recommend to other leaders (Doetzel, 2006). Stider stated “being true to self” involves sheltering one’s soul with experiences, such as reading, meditating, singing and praying. Similarly, Luv indicated having balance in one’s life and taking good care of oneself is an important precursor to being an effective leader.

To “be a positive mentor” four participants indicated a leader must walk the talk by doing what they say they will do (Doetzel, 2006). For Luv this meant “leading by example;” and, for Sara it was treating others with respect to set a good example.

According to three participants, “continuous learning” is a factor influencing effective leadership (Doetzel, 2006). For example, Luv emphasized that “lifelong learning is not just a catch phrase but an integral part of being an effective teacher-
learner-leader.” Sara indicated that to be accountable, leaders need to retain a knowledge base through reading, networking, life experience and connecting with others.

In association with “shared leadership,” six participants recommended working as a team (Doetzel, 2006). For example, Airjordan stressed the importance of empowering others to share his leadership role rather than being a controller; and Ayla stated that “the more power you give away, the more powerful you are.” Additionally, in association with “affirming self and others,” five participants suggested “believing in self and others” should be incorporated into one’s leadership practices. Airjordan indicated a belief in self and others means taking risks and letting others do the same; according to Sara this belief involves knowing how to motivate staff. Also, affiliated with “affirming self and others” and “shared leadership,” two participants suggested that connecting with others helped them be more effective leaders. Luv stated making time to connect with people is a worthwhile time investment and Sara said connecting with others involves sharing her leadership role. Associated with “having a clear vision and mission,” participants indicated “having clear goals” encourages effective leadership. Airjordan stated that leaders need to set goals related to the school’s vision and mission; Ayla argued effective leadership involves “aligning the heart and mind to work together towards a goal.”

Applying heart-shaped images helps conceptualize a leadership model that aligns heart with mind (Doetzel, 2006). Half of the participants associated their experiences of cultivating spirit within the workplace with functioning with their minds and their hearts. For example, Sara stated that having a heart connection to her mind leads her to be more caring and compassionate towards herself and others. Heart graph # 2 represents a heart-centred approach to cultivating spirit within the educational workplace.
Heart graph #2: Cultivation of spirit within the educational workplace

The foregoing schemata (Heart graph # 2) indicates that leadership models should contain elements of contemplation and action that assist educators to become more spiritually attuned to their hearts while at work (Doetzel, 2006). The schemata also suggests that educators need to bring a spiritual condition into their workplaces by having a clear vision. This schemata places the cultivation of spirituality within the contexts of the interior, exterior, cultural and collective social. It represents participants’ indications that effective leadership practices involve applying mind and heart intelligence to decision making.
Implications

A paradigm shift towards educators seeking a more spiritual approach to leadership is gaining momentum in the twenty-first century (Dallarie, 2001). Many educators have acknowledged that only though a “reconstruction of a spirituality as communal and political can ways be found to reverse the damage of social and economic decline” (p. 34). They are recognizing their innate need to reconnect to the divine spirit, and become more socially active in mentoring moral values (Simington, 2003).

A new epistemology that distinguishes spiritual wisdom from knowledge and associates “conscientization” with morals is emerging (Purpel, 1989). As “paradigm pioneers,” some educators are revisiting “assumptions about the meaning, purpose, and function of education, [to] come to a new awareness” (Ocker, 1999, p.75). This new awareness can guide educators to help students discover their own truths, abilities and skills. Introducing a heart-centred approach to education “will take care of the body, soul, and spirit . . . [and] renew the educational system for the betterment of humanity” (p.76). Such a holistic approach to leadership will result in transitions within educational systems that could encourage a “natural hierarchy” perspective. Administering both a spiritual and scientific perspective to education could create a blend of “wisdom schools and “knowledge factories” within systems designed for learning. This perspective supports a belief that mind intelligence and heart wisdom should function as an interdependent dynamic; the heart’s latent capacity for universal intelligence and wisdom must, like the mind, be provided with models for its full growth and development (Doetzel, 2006).

Renewing educational systems involves replacing former dualistic hierarchical paradigms with a “natural hierarchy” perspective, which is “simply an order of increasing
wholeness, such as particles to atoms to cells to organisms, or letters to words to sentences to paragraphs” (Wilber, 1996, p. 28); it is acknowledging that the “whole is greater than the sum of its parts . . . [which] means the whole is at a higher or deeper level of organization than the parts alone” (p. 28). Although “wholes” are dependent upon parts, segments can exist independently, while lacking the effectiveness of functioning as part of a whole. In educational systems, where leaders practice appreciative inquiry, treat peers with dignity, and share leadership, the effectiveness of functioning as a whole in the workplace would support a natural hierarchy perspective.

Park (2001) suggests that educators need to broaden “the existing epistemological horizons to include . . . representational, relational and reflective knowledge” (p. 82). One sub-type of representational knowledge comprises portrayals of people, events or experiences that predict “antecedent events leading to probable consequences” (p. 82); predictions make it possible to “produce desirable events or to prevent undesirable ones” (p. 82). Another sub-type, interpretive knowledge, is “representational in the sense that we as knowers re-describe or re-present the object of knowing” (p. 83). Relational knowledge is “mind/heart knowledge” (p. 85), which means knowing with the head and heart simultaneously. Reciprocal interaction, such as story telling, conversing or hugging is an integral part of relational knowledge; it constitutes bringing people together and providing opportunities for them to strengthen community by connecting with one another. This interaction would be the design portion of the appreciative inquiry cycle, which involves introducing statements suggesting how an organization should be (Whitney & Trosten-Bloom, 2003).
Conclusion

This paper indicates that an integral part of reflective knowledge is social action, which aims to change the world (Doetzel, 2006; Park, 2001). This knowledge can be gained from the destiny step of the 4D appreciative inquiry cycle that involves inspired actions leading to continuous learning and innovation resulting in organizational changes (Whitney & Trosten-Bloom, 2003). People engaging in political activities can feel empowered and experience changes within themselves that exceed their intellectual comprehension. “Through action, we learn how the world works . . . ; we learn from the mind/heart” (p. 87). Park suggested that by broadening epistemological frameworks to include a triangulated perspective of knowledge, educators can gain competence from representational knowledge, connection from relational knowledge, and confidence from reflective knowledge. Thus, a triangulated perspective of knowledge may empower educators to engage in a holistic process of awakening, signifying, and cultivating spirituality within their workplaces. By cultivating all three forms of knowledge, they may feel liberated to work towards becoming more human and enriching both themselves and their workplaces (Doetzel, 2006). As suggested by Ghandi: we need to be the change we want to see.

Auto Ethnographic Research: Know Thyself

Nancy-Angel Doetzel, PhD

Abstract

A major goal of conducting “autoethnographic research” is to assist researchers to better understand the progressive journey of student learning in order to improve their own teaching strategies. This form of self-actualizing inquiry is a type of autographical narrative that explores a researcher’s life experiences. It is currently becoming widely used in the sociology of news media, performance studies, journalism, communication studies, management investigations and novels. In this paper, the researcher will outline how journal entries, newspaper columns, songs and diaries can all contribute to such an inquiry. The goal of the paper is to inspire other scholars to engage in this self-actualizing approach to research. Some life experiences shared within the paper will be examined and analyzed through an appreciative inquiry lens, which encourages the intention of working towards the highest and best in one’s life. The paper will commence with a brief literature review addressing auto-ethnographic research.
Introduction to Study

I acknowledge that no two people exist within the exact same reality, or construct duplicate meanings from their individual life experiences (Doetzel, 2011). Nobody views an event from an identical stand point, or shares a totally common perspective about life. Each of us embraces our own unique reality and versions of truth. What I share from my writings, within an autoethnography, is based on my own remembered reality, and the meanings I have attached to whatever challenges, I faced. I have written a book with a sincere commitment to present insights that I have gained from being a daughter, wife, student, journalist, friend, sister, educator, musician, researcher and cancer survivor. My autoethnography is heart centred and expresses my deepest felt truths. I commenced writing the book, after being diagnosed with cancer and informed that I may only have six months to live.

While on my scholarly journey to obtain my PhD, I apply teachings I received when studying to be a social scientist, therapist and educator (Doetzel, 2003). I examine my life experiences through the lens of appreciative inquiry, which encourages us to observe a glass as being half full, instead of half empty. I incorporate my newspaper columns, songs and journal entries to reveal my life story. Through my writings, I share ways I worked towards honouring my commitment in marriage, forgiving the man who took my brother’s life and applying spiritual insights gained from a childhood new-death experience.

My autoethnography is dedicated to my family and friends who have stood by me during
my fight to beat cancer and my scholarly journey towards obtaining a PhD. An autoethnography is a reflexive account of one's own experiences situated in culture (Fisher, 1986; Pratt, 1992; Russell, 1999). It puts in play a questioning of the positionality and the constitution of the self in autobiography.

Catherine Russell (1999) is convinced that, as literary genres, autobiography and ethnography both have a commitment to actuality, or factuality. She refers to Michael Fischer's (1986) discussion of the writing tactics of autoethnography as 'ethnic autobiography': they are meta-discursive, in that they draw attention to their linguistic and fictive nature. In the context of film and video making, autobiography becomes ethnographic from the moment that the maker understands his or her personal history to be part of larger social formations and historical processes, or, in other words, when the maker no longer understands him- or herself to be a 'self', as isolated ego or as solipsistic experience, but as a 'self' whose experiential self-realization occurs through intersubjectivity and intercorporeality. The self becomes understood as a staging of subjectivity, grounded in intersubjectivity and intercorporeality. In other words, the performativity of the self becomes apparent, not in any simple theatrical sense (which the word 'staging' might seem to suggest), but in the sense of having to be repeatedly performed or played out in distinct contexts, discursively and intercorporeally: a subject in sociality and historicity, not a 'self' in isolation. Subjective identities are irreducible to a single self, and may indeed be in conflict with one another. Thus, Russell argues, autoethnography becomes both a vehicle and a strategy for challenging those forms of identity which are imposed and for exploring discursive possibilities as authentic/inauthentic subjective identities.

Russell (1999) wishes also to include a positive "self-fashioning" within the category of autoethnography, for example in such writing, filming or video recording in which the
ethnographer represents him or herself as a fictional character within the narrative discourse, thereby inscribing a subjective doubleness within the text, whether linguistic, pictorial or visual in character. The imperial eye looking back on itself is also a subject in history and subject to history.

Taking into consideration some of the literature review, I commenced my autobiography with the experience of having been diagnosed with cancer and then shared the experience of surviving a “near death experience” (Doetzel, 2010).

Introduction to Old Heart Child’s Eyes: A Diary of Miracles

Chapter 1: Loving to live (Doetzel 2011)

Oh God, no! A life threatening illness cannot really be happening to me! There are too many experiences yet to be lived, too many songs unwritten, too many photos not taken, too many friends I haven’t met, too many stories untold, too many dances not danced, too much knowledge to be gained, too many students waiting to be taught. I feel like a helpless caterpillar attempting to dodge being trampled on and crushed before spinning a cocoon and ever reaching a full butterfly stage. I am anticipating some kind of divine intervention, to alter my circumstances. I am trying to view my circumstances through child eyes.

I love working as a photographer and reporter for a community newspaper. I am in the commencing stages of completing writing and singing songs for a new CD. I have just finished my university masters thesis and I have been accepted into several doctorate programs. I recently celebrated a major wedding anniversary, on the shores of Lake Superior, with Ken. I am very passionate about life and aspire to live a very long time.

Tears are flooding my face as major clouds burst within my thundering heart. Fragments of my life are flashing before me like lightening casting shadows upon my future. I stair at
photos of my father and brother and I feel a tugging-towards-heaven sensation. I question whether or not I am going take a sudden flight on the wings of God’s angels to join my brother and dad in heaven. Am I being called to return to my Creator, I ask myself? The thought of leaving some loved ones behind in this world, to unite with other loved ones in heaven, feels like a tug of war between two realms.

I scan the photographs on my wall reminding me of my childhood days. Pretending not to know what I knew was often a means of survival for me in a world demanding conformity to a set of norms. When not embracing my authenticity, I felt like I wasn’t being true to my Creator, to my Irish / Aboriginal culture, to my elders and to myself. Now, I am wondering if I can pretend not to know what I’ve just been told about my illness. Can I wash it away, like an ocean wave eradicates footprints in the sand? I question whether or not my nagging passion for living every day to the fullest has been some kind of indicator that my life could be cut shorter than I ever anticipated.

I recall teachings I received about appreciative inquiry. I reflect about the best of what has been and what is. I envision possibilities of the best of what might be. I think about the best of what should be, despite the cancer diagnosis. I apply faith and hope, while envisioning and praying for the best outcome to occur. I foresee myself being healed. This realm of possibility is within me. I believe in miracles.

Disregarding my fear and being courageous means I need to push forward and believe that I am in much larger hands than any doctor’s. I need to accept the best of “what is”. Watching the waves continuously hitting the shores of Lake Superior has a soothing effect on me, after I leave the clinic.

Communing with nature and being passionate about living has kept my spirit nurtured
throughout my life. During my school days, I often strolled through pathways in a forest close to the school, where I admired tall hugging birch trees and ascending rock cuts. In early evenings, I liked to walk to the shores of Lake Superior to savour the fiery orange colours of a sunset. By candlelight at night, I often read adventurous books and Biblical passages, and then wrote reflections in my treasured birch-bark diary.

The writings demonstrate my innate yearning to hold an unconditional positive regard for others. I am being taught by whoever I meet, and am willing to listen to. Within my writings, fact and fiction are bound in kind of a sacred discourse. I wrote intimate letters to my Creator, as a trustworthy friend. My blessings and sorrows are shared in these letters and I often request my Creator’s assistance in discernments. Everywhere I went, I carried a dairy, as if it was attached to my heart with a sacred golden string. It was usually tucked within my purse, beside my wallet. I believed that someday I may revisit my past experiences, through my writings, and perhaps discover a new version of who I am now, and who I was then, and what my truth is. I may come to recognize the “strange in the familiar” and the “general in the particular” when I re-read my reflections written in these dairies.

My printed notes etched in a ragged diary, with the title, “Grade 3 Mean kids,” tug my heart whenever I read my prose about having received “the ugliest kid award” at age 7. It was recess when my peers saw me relaxing beneath a birch tree on the school grounds. They rushed towards me laughing and then handed me a sketch of a skeleton wearing huge glasses and having one eye double the size of the other. (I was very skinny when in grade three and I did wear “coke bottle” type glasses that magnified one eye which I had poor vision in.) But, when I look back, I can recall that there were also other students who were very thin and wore glasses.
I was known in grade three, for having had the highest marks in spelling, English and math. Thus, students had requested my assistance in studying before tests. I recall running home from school, the day I was given the sketch, and weeping endlessly, while in my father’s arms. I asked him why kids were so cruel. He told me that I needed to forgive them, because they really were not aware of how hurtful their actions were. He told me to write a poem about my feelings, in my diary, and then to come watch a humorous television show with him.

Another diary, hidden in a trunk, contains many tear-stained pages with inscribed messages, I wrote during a lengthy hospital stay. At age ten, I was diagnosed with double pneumonia and spent recovery time in an oxygen tent in a hospital during the Christmas season. I coughed continuously and sometimes at night and I would totally lose my ability to breathe. I felt as if someone was strangling me, and when attempting to scream for help, I could not speak. I felt paralyzed and helpless lying in bed in a dingy hospital room, wondering if I would suddenly fall asleep and never wake up again. One evening, I fell into a very deep sleep and then awakened suddenly gasping for air. My lungs seemed to have stopped functioning. I called out to Jesus, and felt as if He was embracing me. Suddenly, a nurse started to pound my back and it seemed as if I was able to breathe again. She mentioned that I had been choking and would need to stay longer in the hospital. I was put into an oxygen tent to enable me to breathe.

On Christmas day, I begged my doctor to allow me to go home for Christmas to be with my family. I stayed up nearly all night long Christmas Eve with my brother and sister and then arose in early morning to open my gifts. During a peak moment of excitement, while ripping open a package containing a warm fuzzy teddy bear, I started to cough and choke and then gasp for air continuously. I could not breathe and my brother and sister yelled that my face was
turning blue, as I desperately gasped for air, and appeared to be passing out. I sensed myself suddenly flying around the room, seemingly to have exited from my body, after I was no longer able to breathe. Then, I acknowledged myself looking down at a lifeless self, lying motionless on our green living room carpet, and holding on to my precious teddy bear. I could clearly see and hear my brother and sister screaming, while my mother was speaking to a doctor on the telephone, and my father was calling out to Jesus, in prayer. I was unable to move or to talk. I could see my dad lifting my limb body from the rug, turning me upside down and pounding on my back. I recall feeling a powerful jolt, as if electricity had struck me, when I heard dad singing “Silent Night.” It seemed as if suddenly I was being called away from the arms of Jesus and beckoned back to a lovingly embrace of my dad hugging me. It appeared as if I had awakened from a very haunting emotional dream.

I was soon rushed back to the hospital and was put in an oxygen tent again. My lungs remained congested for several months and I was unable to return to school. I read books, wrote stories in my diary, and made rag dolls, to pass my time away while hospitalized. There were some suspicions at the time that I may have cystic fibrosis. However, I miraculously healed and returned to school after more than six months of being ill. According to my grade five teacher, I was excelling in my studies, and he suggested that I skip a grade. My memory and ability to focus in class appeared to have greatly improved. Like some kind of rights of passage, I had taken on the look of a mature studious learner. In my school bag, I always carried a sacred diary, which contained some reflections about my illness, about what I had viewed as a dream and about my experiences of returning to school, after spending months in the hospital.

When I lost one of my treasured birch bark diaries while on route to the Holy Land
many years after my lengthy hospital stay, I felt as if a part of my heart had been eradicated. I searched and searched and prayed and prayed. I thought that my sacred book may have fallen from one of my carry on pieces of luggage. Later, while touring sites where Jesus had wept and prayed, I questioned whether or not somebody was reading my diary, filled with self revelations. I encountered moments when I felt naked at the thought of someone entering into my mind and heart through my reflective writings. I wondered whether or not some kind of mystical occurrence had taken place. If so, would my sacred diary suddenly re-appear and miraculously fall into my beckoning hands?

Like a grieving child, I moped around for a few days while continuously searching for my irreplaceable dairy. I telephoned airline representatives to ask them to search for my treasure, as if it contained a monetary fortune. I was despondent when informed that my sacred memoirs probably had been swept up by the cleaners and heaped into a garbage bin before thrown into a dumpster and later burned with other refuse. I wanted to scream at the airlines representatives, to give voice to my writings. But my heart silenced me, with sensitivity towards innocent people just being messengers.

Now was the ideal time for me to start a new page of my diary. It was like experiencing a form of “tabula rasa” (being born with a blank slate) because I felt like my past was being erased and a fresh start was about to commence. An opportunity to let go of some of my painful history was presented. One of my major diaries was gone but so was yesterday. All I had to embrace was the un tarnished moment of the present. I had observed the sun setting on my past and rising on a fresh tomorrow. Again, it would be my choice how I would script my tomorrow, construct my reality and what I would enter into a new diary. What I would come to define as real would become real in its consequences. Perhaps at the right time, in the right
place, my former diary would re-appear. On the back cover of this dairy, my address and phone number had been engraved within a heart sketch. Beneath that information on the back cover was the Serenity Prayer: “God Grant me the Serenity to Accept the Things I cannot Change...the courage to change the things and the wisdom to know the difference.” I am hoping that this prayer will assist in bringing my sacred book back to me someday. I often visualize a needy person clutching my dairy and re-connecting with his/her Creator, the God of his/her understanding.

On the cover of a new diary, I wrote:

*We teach who we are. Our utterances are interpretive and may not represent an absolute truth. Therefore, I aspire to let my life speak. My life mission is to ignite spirit within whomever the Creator puts on my path. I believe that we may be the only book of wisdom that some people read, so we should be cautious about what our actions signify to others. It is by our actions that we indicate whether or not our intentions are genuinely heart centred. We are both spiritual and human beings, but not in a dualistic way, rather embracing two aspects of a single nature. The ways that we synergize our hearts and minds are our choice, and whatever happens to us, we can elect our reciprocation, which becomes our voice* (Doetzel, 2011).

Implications

It is hoped that my writings can assist scholars on a journey towards writing an autoethnography or inspire readers to work towards reaching their full potential selves. Some qualitative researchers (Fisher, 1986; Pratt, 1992; Russell, 1999) have expressed their concerns and support of autoethnography. They note the possibility for autoethnography devolving into narcissism, and suggest that in autoethnography, no matter how personal, the writings should always connect to some other element of life. Throughout my writing, I was reflective of this
concern. Chang (2008) warns autoethnographers of pitfalls they should avoid in their writing: excessive focus on self in isolation from others; 2. overemphasis on narration rather than analysis of culture interpretation; 3 exclusive reliance on personal memory and recalling as a data source 4. negligence of ethical standards regarding others in self-narratives; and 5. Inappropriate application of the label autoethnography. This researcher provided me with some guide posts, for my writing. This “autoethnographic research” aims to assist researchers to better understand the progressive journey of student learning in order to improve their own teaching strategies.

Research Objectives

The purpose of this study was to investigate how overlapping communities of practice impacted teacher candidates’ learning. It is based on findings from data collected in the initial year of a longitudinal study examining the impact of transformative pedagogies (Cranton, 2006; Mezirow 1991, 1995, 1997; Mezirow & Associates, 2000) by mentor teachers and teacher educators throughout teacher candidates’ four-year program and their initial year of teaching after graduation. In this phase of the collaborative self-study (2013-14), we were investigating the professional learning of teacher candidates enrolled in an introductory education course that included a lecture and school placement. In the past, links between the community of practice on campus and the communities of practice within the schools were not examined. We were interested in the development of these communities and in the investigation of how they overlapped. This paper examines teacher candidates’ experiences of shifting mindsets and professional identity within these overlapping communities of practice.

Theoretical Framework

Learning has been described as taking place through our engagement in actions and interactions embedded in culture and history (Lave & Wenger, 1991). Such engagement involves “being active participants in the practices of social communities and constructing identities in relation to these communities” (Wenger, 1998, p. 4, italics in original). The perspective of learning as increasing participation in communities of practice is embedded in a relational and situated understanding of knowledge (Lave & Wenger, 1991). This social theory of learning defines communities of practice as “a set of relations among persons, activity, and world, over time and in relation with other tangential and overlapping communities of practice” (p. 98). Here, a community of practice is socially constituted and produces learning, thinking and knowing systems of relations among members. The forming of identities is enabled by and integral to these systems of relations; learning involves the shifting of identities within communities of practice (Chapman, 2008; Handley, Sturdy, Fincham, & Clark, 2006; Lave & Wenger, 1991; Wenger, 1998; Wenger, McDermott, & Snyder, 2002).

Wenger (1998) links the formation of a community of practice and identity with three participatory dimensions: engagement, accountability, and negotiation. Engagement is dependent on developing an understanding of how to interact with other people within the community. Individual identity becomes part of the whole. Becoming accountable to an enterprise, for
example a professional vision, prompts members to consider certain possibilities that contribute to aligned perspectives of the world. Wenger refers to negotiation as the ability to interpret and make use of a repertoire of the community’s practice. According to Wenger, participation in a community of practice is a source of identity. This is where learning takes place.

The framework of our teacher education programming might be best characterized as the pedagogy of place (Gruenewald, 2003): the integration of teacher candidates into their home schools (practice) and the reinforcement of the essential links between the teacher candidates, their peers, and place through targeted course work (theory). Through this integrated process teacher candidates make connections to their schooling through a place-based introductory course. The goal is to have the teacher candidates see the relevance and importance of their studies since those studies have immediate causal effect on their present pedagogical context as professional teachers and, ultimately, the well-being of themselves and their students. In the context of our research, place-based education integrates teacher candidates’ professional community (practice) and targeted course work (theory).

Methodology

Collaborative self-study is closely related to communities of practice as teacher educators engage in a study of their pedagogy. In this research study, we were investigating how we might enhance our practice by explicating overlapping communities of practice. During the past two decades, there has been considerable research involving self-study (Bullough & Pinnegar, 2001; Hamilton, 1998; Kitchen & Russell, 2012; Kosnick, Freese, Samaras, & Beck, 2006; Loughran, 2004; Loughran & Russell, 2002; Tidwell, Heston, & Fitzgerald, 2009). Self-study, a methodology for studying professional practice settings (Pinnegar, 1998), is closely related to communities of practice as teacher candidates engage in attending to patterns in their practices (Kitchen & Ciuffetelli-Parker, 2009). In this research study, we investigated teacher candidates’ experiences of overlapping communities of practice and the process of theory-and-practice integration.

In our existing four-year Bachelor of Education program, teacher candidates in an introductory teacher education course spend one half-day per week in a school placement and three hours a week in an on-campus education lecture. For this year of the project, seventy teacher candidates were placed in cohorts of three to six in sixteen elementary schools. In order to encourage the development of overlapping communities of practice through unfolding and sustained discussions, we divided the course into two-week blocks. Prior to the beginning of each two-week block, teacher candidates were presented with an article to read and an open-ended prompt to respond to in an online discussion forum. The readings and discussion prompts reflected the five areas of competencies in our program: planning for learning, facilitating learning, assessment of learning, classroom environment, and professional responsibilities. In the on-campus class, small groups of critical friends discussed their responses to the prompt with respect to teachers’ roles within school systems. This was followed later in the week by an in-school seminar where six to twelve teacher candidates were invited to reflect on the discussion prompts within the context of their practice. The seminar was scheduled at the beginning or end of the half-day field experience of the first week. At the end of the field experience half-day, teacher candidates were asked to complete journal entries on a range of related topics and critical friends were invited to provide a response to these.

We were fortunate to have two peer tutors available to act as additional critical friends in providing feedback to initial online responses. The two peer tutors were teacher candidates in the
second year of their program and they provided additional questions to inform the in-class discussion in the second week of the block. The on-campus discussion with critical friends in week two provided an opportunity for teacher candidates to discuss their responses to the peer tutors and to the journal entries. Teacher candidates completed journal entries focused on their own roles and responsibilities within the teaching profession following the weekly field experience.

By deliberately integrating on-campus classes and in-school experiences, we hoped to gather data on teacher candidates’ experiences of overlapping communities of practice. Evidence of sixty-one participants’ experiences was documented from class assignments (reflective journal entries, responses to discussion prompts, and a portfolio) and from recorded seminar conversations. After the completion of the course, we conducted individual interviews with a convenience sample of ten participants. Conversations among teacher educators and researcher notes were included in the data.

In this phase of our longitudinal research study, we investigated experiences of teacher candidates’ within overlapping communities of practice. For the purposes of this paper, we have identified emerging themes within the participatory dimensions of engagement, accountability, and negotiation.

**Preliminary Outcomes**

The findings of this collaborative self-study suggest that the place-based course provided significant opportunities for engagement, accountability, and negotiation within overlapping communities of practice. Results indicate that teacher candidates experienced significant shifts in their professional identity as exemplified by one of our participants:

*For me I am a different person when I am in the schools and when I am at school. Like when I am at [the University] and I am in my placement. I am a very different person. I mean when I am at school I am here with my friends and it's school, but you don't have that same mindset. I mean when I am in my placement I am an adult, and I am... You know my mentor teacher even said, "There are two adults in this room that can help you," and I went “Oh me. I am an adult.” So you are a very different person when you are at [the University] and when you are in the schools. And so I think being in the schools for the seminar helped I think put it into that perspective. I became not a... I was... It was coming from the perspective of a teacher. Not the perspective of a [university] student.* (Emily, interview, March 26, 2014)

We conclude that teacher candidates’ abilities to form professional identities very early in their program were enhanced by their engagement in this place-based course.

As teacher educators, this study helped us become more attuned to patterns of participation and provided us with insight into experiences of teacher candidates as they were asked to engage in overlapping communities of practice. The results will enhance the learning experiences of our teacher candidates through a better understanding of our own practice as we design and implement more integrative practicum experiences as part of the third and fourth year of our program. This research links our developing professional knowledge to ways teacher educators can support the formation of communities of practice within teacher education.

The study examines the effectiveness of a picture fading strategy on immediate, generalization, and maintenance effects of Chinese functional vocabulary learning of adults with severe intellectual disabilities. A multiple baseline across-behaviors design was applied, which was divided into four successive phases: the baseline, the intervention, the generalization, and the maintenance phase. The participants were three Taiwanese adults with severe intellectual disabilities purposely selected by the researcher. The independent variable of this study was a picture fading strategy; the dependent variable was the number of times of correct responses of participants in every assessment of the intervention, generalization, and maintenance phase. The collected data were visualized by line charts, and were analyzed by visual analysis and the C statistic. Based on the findings, the researcher summarized the conclusions as the following:

(1) Picture fading could significantly promote the immediate effects of Chinese functional vocabulary learning of adults with severe intellectual disabilities. Based on the analysis, each participant performed significantly better in the intervention phase than in the baseline phase.

(2) Picture fading is effective in the generalization effects of Chinese functional vocabulary learning of adults with severe intellectual disabilities. Base on the analysis, each participant performed equally in the generalization and intervention phase.

(3) Picture fading is useful in the maintenance effects of Chinese functional vocabulary learning of adults with severe intellectual disability. The participants’ performance declined slightly from the generalization phase to the maintenance phase according to visual analysis, but the decrease was not significant according to the C statistic.
Title:
Excellence, Innovation and Wellness:
A Case Study in Workplace Transformation
Submission ID: 460

Author:
Dr. Marilyn Thompson
Associate Provost, Human Resources
University of Waterloo
200 University Avenue West, NH-3006
Waterloo, ON N2L 3G1 Canada
marilyn.thompson@uwaterloo.ca

Abstract:

Located at the heart of Canada’s technology hub, the University of Waterloo is consistently ranked as Canada’s top innovative university. Waterloo’s Strategic Plan has a single goal: to be recognized as one of the top innovation universities in the world. Outstanding staff and faculty are, and always will be, at the heart of Waterloo’s success. The ability to recruit, hire, support and retain the best possible employees is critical to our success across all areas. By strategically focusing our efforts on our people, we foster deep institutional pride and the professional growth of our employees as they achieve their full potential at Waterloo.

The process of building a robust employer-employee relationship requires the successful integration of key standards for excellence, innovation and wellness; and the ability to prioritize decisions based on sound data. This commitment at all levels of the university positions Waterloo as an international employer of choice for talented, motivated individuals whose support and engagement will ensure the institution’s continued success.

This interactive workshop will use the Waterloo Story as a case study of how a workplace can be transformed through integrating standards for excellence, innovation and wellness in all university operations, functions and programs; fostering continual improvement and cross-campus collaboration; enabling top performance from all staff and supporting them to achieve their full potential; and becoming a model for employee engagement that is founded on a strong value system.
Voices of Saudi kindergarten children: Views on learning activities and perceptions on gender and learner identity

Nazeeha Khoja

Abstract

This is a qualitative case study that investigated Saudi children’s views of the activities in their kindergarten classroom, and the degree to which the children’s views were reflected in their everyday experiences. The study also inquired into the children’s perceptions of themselves as learners in the classroom setting. The assumption underlying this research is that the practice of listening to and involving children in areas relevant to their lives may have positive influence on how they view themselves and how others view their potential (Clark, & Statham, 2005; Edwards, Gandini, & Forman, 1998). The site of the study was a kindergarten classroom in an urban city in Saudi Arabia. Participants were six children between five- and six-years-old; their participation included taking photographs, discussing their photographs, participating in two drawing tasks, and commenting on their drawings. Three main data sources were utilized including photo-voice, informal interviews and drawings. Children’s comments on their drawings were a secondary source of data.

I looked into the data through the lens of Vygotsky’s sociocultural theory (1978) and Bronfenbrenner’s theory of human development (1979). I analyzed the data using the constant comparative method (Roulston, 2010). Categories of analysis were combined across the data, resulting in nine categories representing the questions posed by the researcher and topics raised by the children. Children’s views revealed the gap between their experiences at school and their interest and experiences outside the school. The data revealed that the participating children preferred open-ended activities and the outdoor environment. The photographs taken by the participants showed the different perspectives through which children experiment and play in
their classroom, and their interest in their social world. Children’s photographs, drawings and interviews demonstrated how children bring their home experiences into school. Moreover, the data revealed children’s assumptions about their learner identity and gender identity, which reflect beliefs held in the Saudi culture. These findings showed that children are capable of participating and sharing their views and ideas even when such practices are not encouraged in their cultural context.

This study may enhance research on cross-cultural perspectives and expand knowledge on participatory visual methods and research with young children. Further, this study can make a significant contribution to the research literature on Saudi Arabian education, which in turn, may have a positive impact on Saudi children’s learning and development. This is especially important because the young Saudi generation comprises close to thirty percent of the country total population (Central Department of Statistics and Information of Saudi Arabia, 2007).
Abstract:

Cybersecurity is an emerging and fast growing academic and technical career field with increasing demands and challenges for higher education and educators. This paper proposes a community based service learning approach to enhance the effectiveness of cybersecurity education. The service learning approach is based on theories in knowledge management and technology acceptance. The proposed model in the paper theorizes that student experience and reflections from service learning activities are important contributing factors to their perceptions on the usefulness of cybersecurity technology and to their motivation to acquire and share knowledge in cybersecurity. The observations and analysis of the findings from a three-year longitudinal study of the service learning projects used for a college level course in the principles of computer information security lend support for the proposed model. The paper also discusses the value and benefits of the service learning approach to the learning goals of cybersecurity-related computing education.

Key Words: Cybersecurity, service learning, knowledge sharing, reflection, ethics
INTRODUCTION

Cybersecurity is an emerging and fast-growing academic and technical career field due to soaring and costly cybercrimes. College programs in Cybersecurity typically prepare graduates for entry-level positions, such as information security analysts. According to the US Department of Labor Bureau of Labor Statistics (BLS), employment of information security analysts is projected to grow 37% from 2012 to 2022, much faster than the average growth rates of 11% for all occupations and 18% for all computer related occupations [1]. There is a national shortage of cybersecurity professionals with the right knowledge and skills, and education is expected to be a major solution for the shortage [2]. Therefore, there are increasing demands and opportunities for cybersecurity education.

Meanwhile, serious challenges exist for cybersecurity education. Cybersecurity is a new area based on the traditional computing profession and requires students to have strong background and preparation in computer and information science and technology to succeed academically and professionally. However, there has been a perpetuated failure of education in the United States to prepare a strong and world-leading workforce in computing professions [3]. Major characteristics of this failure in US undergraduate computing programs include outdated curricula, declining enrollment, and ignoring service learning opportunities that build application skills [4]. The outdated curricula and course content and lack of knowledge application experience may be the leading cause for the gap between the students’ learning and the actual skills needed in the employment market. A recent graduate of Penn State in computer software engineering gives a vivid description of such a gap after his failure to find a
job despite the fact that he graduated at the top of his engineering class: “My college education left me totally unprepared to enter the real workforce. My degree was supposed to make me qualified as a programmer, but by the time I left school, all of the software and programming languages I’d learned had been obsolete for years” [5].

To address the cybersecurity needs and coordinate the national effort on improving cybersecurity education, training, and professional development, the National Initiative for Cybersecurity Education (NICE) was established in the United States. The mission of NICE is “to enhance the overall cybersecurity posture of the United States by accelerating the availability of educational and training resources designed to improve the cyber behavior, skill, and knowledge of every segment of the population -- enabling a safer cyberspace for all” [6]. This mission underscores the importance of both knowledge acquisition and knowledge sharing in the communities of our society for the benefit of everyone’s security in the cyberspace.

To help bridge the gap between college education offering and the job skills needed in the real world and promote knowledge sharing, this paper proposes incorporation of a community based service learning approach in cybersecurity education programs and courses. The proposed service learning approach provides valuable opportunities for students to apply their learning to the real world situations, gain authentic hands-on experience, improve their reflection and critical thinking skills, and share their knowledge with the community and cultivate a strong professional and community ethics that are critical to a successful career. This paper also reports and discusses the author’s experience in using the service learning projects in an online cybersecurity course during the past three years.
SERVICE LEARNING: THEORIES AND MODELS

Service learning is both a practical service and an experiential learning process that involves knowledge sharing and acquisition. Comprehensive analysis of 11 service learning research studies involving over 2,000 undergraduate students suggests that service learning has had statistically significant and positive effects on student learning outcomes [7]. In terms of cybersecurity workforce preparation, human capital and cybersecurity knowledge are the essential factors for achieving technical competence in the general cybersecurity competency model [8]. Knowledge is the contextual and high-value form of information and experience ready to apply to decisions and actions [9]. Knowledge consists of both explicit knowledge or communicable information and tacit knowledge, which is personal and intuitive insights and know-how originated from individual experiences and values [10]. Service learning provides such individual experiences for acquiring and sharing explicit and tacit knowledge. In addition, the theory of reasoned action states that individual perception and attitude are a determining factor of one’s behavioral intention that predicts one’s actual behavior [11]. Prior research results indicate a significant positive correlation between individuals’ cybersecurity knowledge and their intention and attitude toward cybersecurity technology [12, 13]. This paper proposes that service learning experience positively contributes to students’ motivation and success in learning. In other words, students’ service learning experience and knowledge acquisition in cybersecurity improve their perceptions and attitude toward cybersecurity technology, which in turn improves their motivation for learning behavior and success in cybersecurity education.

Service learning brings a number of positive pedagogical effects that enhance learning, among which the most significant ones are: gaining application experience, critical thinking
through reflection, developing professional and community service ethics, and improvement of attitude and motivation for learning. Through hands-on learning-by-doing service learning activities, such as community service projects, internships, practica, and research projects, students have made significant gains in their knowledge and skills and their ability to contribute to the welfare of their communities [14]. Service learning is a process that involves frequent reflection on knowledge and experience that enhances critical thinking and learning. Reflection is a critical thinking activity that demonstrates one’s abilities and skills in connecting experience, observation, theories, reasoning, and learning objectives. In service learning, reflection activities, such as written or oral reports and presentations, encourage and enable students to explore, discover, and evaluate relationships between the course content learned from readings, lectures, and discussions, and their real experiences from doing the service learning work for the community [15]. Service learning also contributes to the development of students’ professional and community service ethics. Through service learning experience, students learn to serve the community with pride and ethical behavior, increase their recognition of civic responsibilities and social justice, and develop a life-long habit of community service and civic involvement [14, 16, 17]. Students’ successful service learning project experience could lead to their higher perceived usefulness of the course content and materials and better attitude and intention to accept and use the course materials [18]. Prior research also indicates that service learning that integrates academic content and community service improves students’ academic interest and their attitude and motivation for learning, which leads to improved student engagement and retention [4, 19].
Service learning may occur in various forms based on different models. Heffernan (2001) identifies and describes six models for service learning [20]. Table 1 below summarizes the six models and student role and the stated benefit for each model. These models are primarily reflecting the types of service learning activities and emphasizing the perspective of the curricular design while ignoring the specific knowledge and skill objectives for student learning. The models are generic and not specifically designed for a certain discipline.

Table 1: Heffernan’s Service Learning (SL) Models

<table>

<th>Model</th>
<th>Student Role</th>
<th>Benefit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discipline-based SL Model</td>
<td>Regular presence in the community and reflection on course content</td>
<td>Improve understanding of theoretical concepts</td>
</tr>
<tr>
<td>Problem-based SL Model</td>
<td>Serve as “consultants” on specific community problem or need</td>
<td>Alleviate logistic difficulties for regular weekly commitments</td>
</tr>
<tr>
<td>Capstone Course Model</td>
<td>Apply previous course work to relevant service work in the community</td>
<td>Help students transition from theory to practice</td>
</tr>
<tr>
<td>Service Internship Model</td>
<td>Work 10-20 hours a week in the community with faculty guidance</td>
<td>Develop skills while seeing contribution to the community</td>
</tr>
<tr>
<td>Community-based Action Research Model</td>
<td>Work with faculty to learn research methods while serving as advocate for the community</td>
<td>Most effective for small classes and groups of students</td>
</tr>
<tr>
<td>Directed Study Additional/ Extra Credit Model</td>
<td>Work with an instructor to complete additional work or more in-depth work on a subject for additional credit</td>
<td>Good choice for self-directed and motivated students</td>
</tr>
</tbody>
</table>
Nejmeh (2012) offers a more fine-grained three-dimensional model, which includes project types, activity range, and project mode for service learning [21]. Compared with Heffernan’s models, Nejmeh’s three-dimensional model provides more specific categories of service learning activities with expected focus and skills. It is also practically more relevant to service learning in computing and cybersecurity education as the descriptions and examples are specifically based on computer and information science disciplines and sub-disciplines. Table 2 below summarizes the three dimensions of this model.

METHODOLOGY

The study in this paper is based on a longitudinal study using a community based service learning project assignment in a college level cybersecurity course. The study period is 3 years from the fall 2011 semester to the summer 2014 semester. The service learning project assignment is weighted as 10% in the student course grade. The project design includes the following topics related to the course content: training/tutoring (sharing cybersecurity knowledge and/or skills), professional services (providing expert advice on a cybersecurity issue related to the course content), system selection (identifying cybersecurity needs and recommending solutions), and support/help desk (providing technical support and troubleshooting on cybersecurity topics). The expected activities involved in the service learning project include research, analysis, testing, transition (installation), and assessment of cybersecurity issues and solutions. The project mode is curricular as it is primarily based on the cybersecurity knowledge, concepts, and skills in the course content.

The cybersecurity course for the service learning project in this study is delivered online using Blackboard. Detailed instructions for the project are posted in Blackboard. The service learning project instructions below give students detailed expectations and guidance on completion on delivery:

Project 4 – Part II: Service Learning (10 points)

Objectives: To conduct Service Learning on important cybersecurity topics covered in this course to demonstrate your knowledge and skills on certain information security topics learned from this course. The project also develops community service ethics.

1. Train or tutor a person in the community (e.g. a member or members in your family, church, or at work; or a business you know) in at least three topics of information security covered in this course. Examples of the training topics include information security risks (such as viruses, worms,
spyware, phishing, intrusions, etc.), preventive and protective solutions, risk analysis, and relevant legal and ethical issues covered in this course.

2. The student will then spend about 5-10 hours (including preparation, training activities, communicating with the trainee, and writing the project report) working with the trainee to improve his or her knowledge and skills in the topics.

3. Report your service learning experience in a numbered list or table format in the Word answer file. The report should include the following elements: trainee information/name, the three topic areas covered (each topic must be defined clearly using sources in this course), time spent, training activities, accomplishment (progress made), comments from the trainee, and your own reflection on the experience, what you have learned, and areas for future improvement.

4. Submit the completed Project 4 file at Blackboard by the due date.

**Alternatives:** Instead of training or tutoring, you may also choose to perform one or more volunteer community services for an individual, or a non-profit organization, or a business with permission from the owner or management. The volunteer services should be related to information security topics covered in this course. Examples of such services include:

-- Perform installation and configuration of information security software (e.g. anti-virus, firewall, security scanning, etc.)
-- Perform risk analysis of information security vulnerabilities, threats, and risks
-- Advise on protection strategies for computer and information systems or sensitive data
-- Evaluate and recommend information security software solutions and products

If you choose volunteer service, just complete and submit the report (see item #3 above) in a list format and substitute training with the volunteer service(s) and the trainee with the recipient of your service. Also include a letter or note from the recipient of your service to confirm your service experience.

You may team up with another student in the class on this project. Please submit your work individually if you work on a team.

While the service learning project is of curricular mode and is related to the cybersecurity course topics, the service learning design and instructions give student abundant freedom to choose and pursue their specific topics of interest. In addition, students are expected to communicate with the instructor for guidance whenever they have questions on the project. Students’ completed project reports are submitted electronically at Blackboard course site. Step-by-step instructions were given to students on how to submit their work and verify their submissions. The instructor grading and feedback for the project submissions are also posted in Blackboard for secured individual student access. The following section presents the data, findings, and discussions from the study.
FINDINGS AND DISCUSSIONS

The data collection for this study is based on the curricular service learning project used in an online cybersecurity credit course (CIT181) from fall 2011 to summer 2014. The total subject population is 268 registered students from 10 sections of the course in the past three years who participated in the service learning project. Table 3 below summarizes the data on the project type and activity range of the service learning reports submitted by the students. The Category column shows the specific project type and the activity range of student submissions. The Total column shows the total count of each category, and the Percentage column shows the percentage of each category relative to the total subject population (268).

</table>
The data in Table 3 above shows a variety of project types and a wide range of activities, which involve heavy hands-on experience of applying the knowledge and skills from the course to real world situations in the community. The project types include training/tutoring, professional service, recommendation on system selection, and technical support and troubleshooting on various cybersecurity topics covered in the course. The service activity range includes research, analysis, system testing, system installation, and performance assessment. Students performing the training or service as well as the trainees and recipients of the student service have reported remarkable experiences of progress and achievement in conducting hands-on activities on important cybersecurity issues, such as research, selection, installation, and assessment on anti-virus and firewall protection solutions and products to secure valuable personal computers and data.

The hands-on application experience from the service learning has contributed significantly to students’ success and enjoyment in learning. Over 93% of the student participants in the service learning project have reported an enjoyable and worthwhile experience of using their knowledge and skills, sharing their knowledge with the community, and learning something new on the cybersecurity topics for their project. The longitudinal assessment results also support students’ improvement in learning through the service learning project. The course success rate among the student participants of the service learning project in the 3-year study period is over 96%, which is 12% higher than the average success rate among the students in this course without the service learning project during the previous 3 years.
The service learning project experience has also developed students’ reflection habit and critical thinking skills, which are essential to their success in learning. Critical reflection is a fundamental component of all service learning experiences and pedagogy, which is especially important for STEM disciplines to assess and critique the community’s technology needs and the impact of service learning projects [22]. All the reports submitted for the service learning projects include a section of reflection and comments on the experience. For example, many students were surprised that the people they worked with had no idea about basic computer protection knowledge and skills. Most students have also reported that they realized that they need to learn more about a certain topic to do better on the service, such as analyzing computer data communications using a network analyzer.

The service learning project has also developed and improved students’ professional and community service ethics. Ethical behavior is especially important for information systems professionals as sensitive systems and information are often at stake [23]. Ethical behavior with a strong sense of responsibility and care for the well-being of others in the community is even more important for information systems security issues. Students have reported discovery of the importance of legal and ethical rules and guidelines for cybersecurity professionals, such as HIPPA for dealing with private health information in digital format. The majority of the students have reported great pleasure and pride in helping others in the community through the service learning project. The majority of the trainees and recipients of the service have reported positive behavior of the students, including being “responsible,” “professional,” “caring,” “knowledgeable,” “helpful,” and “patient”.
Another important reward for the service learning students is the improvement in their attitude and motivation for learning, which will have a long-term positive effect on their future education and career. Many students have reported that the service learning project is such an enriching and rewarding learning experience that they found the information security course content very useful and interesting and would love to pursue further education and a future career in this field. The increased interest and motivation for learning may be attributed to the actual hands-on learning, service ethics, and reinforcement from the community as a result of the service learning experience.

CONCLUSION

The curricular service learning project used in this 3-year study has improved students’ overall academic success as well as their reflection and critical thinking, professional and community service ethics, and attitude and motivation for knowledge sharing and learning. There are also two areas for improvement in the future. First of all, given the success of the service learning project, more course work and weight in grading could be devoted to service learning to maximize students’ learning through service. Also, there was little team work and collaboration with other students on the service learning project due to the challenge of the online course which is difficult for geographically scattered students to work together on service learning projects that require frequent physical presence together. This is a lesson learned. A potential solution is to design virtual service learning projects where students could perform service components individually in distributed locations while collaborating online in research, analysis, discussions, and assessment.

Abstract

Speaking and listening are the foundation of oracy, and our ability to successfully and meaningfully communicate and express ourselves is primarily dominated through the interplay between these two skills. Proficiency in verbally communicating in the English language can be considered as “a passport to global citizenship” (O’Neill & Gish, 2008, p. 2). Due to increased international mobility, English is recognised as a universal language in which effective communication skills in the language are of paramount importance across cultures today (O’Neill & Gish, 2008). Consequently, it is necessary for these students to develop their oral language skills to fully participate in everyday communicative contexts, and become an active citizen within society.

Connections surrounding the active engagement with music and cognitive neural plasticity have been identified by researchers due to the recent advances in neuroscience, in which such engagement evidence positive influences in language and speech functions. In society today and across all cultures, the components that make
up children’s daily lives are infused with music and musical experiences – social interactions and relationships, behaviour, home routines, and even play (Fox, 2000). Consequently, this exposure to musical experiences and the neurological similarities to oral language suggest that educator’s need to identify multiple strategies and programs for music involvement in classroom.

The purpose of this study is to identify the development of oral language in students with English as an additional language through music. Principles of structural cognitive modifiability within a mediated learning experience (MLE) has been created, implemented, and analysed so as to determine the extent to which music can assist in the development of oracy in EAL students. This study employed a single-subject experimental design (SSED) using a multiple baselines approach. SSED aims to help people in everyday contexts by providing practitioners with a means to individually evaluate evidence-based interventions and how they affect the performance and/or behaviour of each participant at an individual level (Burgard, Foster, Krasy & Radel, 2011).

The intervention implemented centred on the principles of audiation outlined in Gordon’s Music Learning Theory, and techniques used to gather data included: questionnaires, observations and anecdotal notes, semi-structured interviews, collection of official documents, and voice and video recordings. A mixed-methods approach to data analysis was used to evaluate students’ performance in oracy as a result of the music intervention. Qualitative data was thematically analysed using the electronic software NVivo to identify emerging themes and patterns in regards to the verbal fluency and prosody of students’ verbal output. Quantitative data was analysed for mazing behaviour using the computer software program Systematic Analysis of Language Transcripts (SALT-NZ). In addition, rating scales were used to evaluate progress in students’ prosody as a result of the music intervention. Both types of data were triangulated so as to support or refute outcomes of the research.
Comparison of Graduate Learning Experiences in Online Discussions and Face-to-Face Discussions

Abstract

The Internet and the rapid changes in technology have introduced a non-traditional learning format. This qualitative study used a phenomenological approach to understand whether the utilization of recent technologies impacted graduate student learning. The research questions explored the experiences of the graduate students and the role of discussions on their individual inquiry process. Graduate students from both, online and face-to-face, courses were interviewed. The study used coding techniques to sort the data and identify emergent themes that described the shared experiences of the participants using technology. Among the emergent themes, a majority of the students indicated that they preferred a traditional face-to-face format for learning.
Transforming the Field of Special Education Through the Redesign of the Pre-service Teacher Early Clinical Experience

Susan D. Johnson
Mercyhurst University
Erie, PA
June, 2014
Teacher education programs are under fire for their perceived inability to prepare quality teachers for teaching and nurturing diverse 21st Century students. The field of special education is particularly sensitive to the effects of this scrutiny. The importance of special education teachers to be well-trained, competent, and collaborative has long been recognized in the literature as vitally important for subsequent student success and progress (Oliver & Reschly, 2010). This need is compounded by the critical shortages of highly qualified special education teachers across the nation, especially in urban and rural areas (Johnson, Humphrey, & Allred, 2009) and for those students with the most significant needs (Cancio, Albrecht, & Johns, 2013).

To further influence the black eye that surrounds the field of teaching in the United States, special education, in particular, is plagued by high rates of attrition. 13.2% of special education teachers leave their positions each year (Plash & Piotrowski, 2006) and a staggering 50% of teachers leave the field by their fifth year of teaching (Johnson, 2004). There is considerable evidence that the first year of a special education teacher’s career is a critical time period and researchers are investigating ways to engage and support new teachers, including mentoring programs during the first year of employment in hopes of decreasing teacher attrition (Marshal, et al., 2013).

A study conducted by Brownell, Smith, McNellis, and Lenk (1994) investigated contextual variables related to teacher attrition and findings indicate that those who were committed to teaching individuals with disabilities stayed in the field longer. Additionally, those individuals who chose to stay in the field had higher self-efficacy, felt more prepared to teach because of their pre-service training, and exhibited more effective coping strategies than those who chose to leave. It is the pre-service training variable that could
be effected through direct instruction, and one, that could perhaps subsequently positively influence the other two variables: pre-service special education teacher’s levels of self-efficacy and ability to cope in various situations.

Trends in learning to teach: from isolation to inclusion

Although the field of special education has varied in its service delivery over the last century, at least one thing has remained consistent; special educators are expected to be trained to meet the unique needs of each individual student, and pedagogy has always been at the heart of special education (“The Council for Exceptional Children’s Position on Special Education Teacher Evaluation,” 2013). Pioneer programs, such as those of Gallaudet, Itard, and Seguin, prepared early special education teachers to instruct in highly restrictive and isolated settings, including institutions (Connor, 1976). Special education teachers were trained using a categorical approach to instruction and learned to teach to specific disabilities (Brownell, Sindelar, Kiely, & Danielson, 2010). During this time period, this included students who were mentally retarded, deaf, or those with speech and/or hearing impairments.

Compulsory education and advocacy endeavors for students with disabilities began to emerge in the 1960s and 1970s, with the passage of several landmark public laws, and special education teacher preparation programs consequently experienced a significant surge in numbers and interest. These teacher-training programs continued to focus on categorical conceptualization of disability and special education teachers were trained to instruct in self-contained settings. This categorical orientation in the 1970s eventually gave way to a non-categorical approach to instruction in the 1980s when severity of disability was evaluated instead of the disability itself.
The inclusion movement of the 1990s altered the role of the special educator and knowledge and utilization of operative collaboration strategies moved to the forefront of pre-service teacher programming. Instead of children with disabilities being secluded in separate buildings for their school day, integration and mainstreaming of these students occurred in regular education buildings. With this inclusive, collaborative approach, pre-service general education and special education preparation programs acknowledged the need for the two disciplines to be prepared together.

As a result of several large-scale studies funded by the Association of American Colleges of Teacher Education (AACTE) and the International Reading Association (IRA), a strong conceptual and empirical basis for vital program components of teacher training in general education has materialized, yet the research on special education teacher training is essentially nonexistent (Brownell, 2005). Valli and Rennert-Ariev (2000) published a review of nine national reform reports that targeted teacher education. Results indicate that, for both regular education and special education teacher training, there is a strong consensus for the use of authentic (field-based) pedagogy with a clear need for pre-service special education teachers to have clinical skills that can be explicitly implemented across a variety of instructional settings and with a diverse population of students.

The field of special education is once again evolving. The Individuals with Disabilities Education Act (IDEA, 2004) mandated that children with disabilities be educated in the least restrictive environment appropriate to meet their individual learning needs and that students with disabilities have access to the general education curriculum. The No Child Left Behind (NCLB, 2002) mandate calls for schools to be accountable for the performance of students with disabilities on assessments aligned to the general education
curriculum. Additionally, special education teachers are to be highly qualified in the core content areas in which they teach.

Since the passage of IDEA 2004 and No Child Left Behind, the fundamental aim of special education teacher training programs has been in instructing pre-service special education teachers to implement evidenced-based practices. The emphasis of NCLB on access to the general education curriculum for students with disabilities and on teachers who are highly qualified has left us wondering about the how of instruction. Specifically, what is the best mode for training students at the pre-service level to implement evidence-based techniques with confidence and fidelity?

Despite the need for the special educator to be inventive and adaptable in their craft, many university pre-service programs have held onto traditional methods of pre-service training that suggest the status quo and not necessarily those practices steeped in evidence of efficacy (Newton, Kennedy, Wilther-Thomas, & Cornett, 2012). Those responsible for the recruitment and preparation of special education teachers raise the question: How can we recruit and train special education teachers who will stay committed to the field and who are resilient in their quest to provide high quality instruction to students with disabilities? One possible solution may come in the redesign of pre-service special education teacher’s early clinical field experiences and the role of university faculty who are responsible for their supervision in the field.

**Existing trends within field experience placements**

It could be assumed that if teaching is a profession of practice, then practice should be at the core of teacher preparation. It is well established in the literature that expertise in any field is obtained through content knowledge mastery, in addition to the chance to
integrate that knowledge in real-life problem solving opportunities. However, it is
generally not until a pre-service teacher gets to their capstone clinical or student teaching
experience that they get to practice teaching. Many states require that students have some
early field experience prior to student teaching and so most teacher preparation programs
in the United States include early field experiences for pre-service teachers (Watson, Miller,
& Patty, 2011). Analysis of these early field experience requirements indicates, however,
that students are rarely exposed to robust experiences early in their educational careers.
Field experiences that occur early in a student’s pre-student teaching preparation program
frequently involve some level of observation of school-aged students and their teachers.
Other early learning opportunities include things like tutoring, assisting teachers or
observing school events. Many question the efficacy of such programming in truly
preparing pre-service special education teachers for work in the classroom.

The literature supports the idea of early field experiences as a litmus test to the pre-
service teacher’s consideration of teaching as a career. It allows for enlightenment of their
beliefs about teaching and may be a solution to the problem of attrition of newly hired
teachers. Pre-service special education teachers who lack quality early field experiences
tend to have significantly more issues adjusting to their role during student teaching and,
subsequently decide to either drop out of the teaching field completely or go onto graduate
but opt not to teach (Watson et al., 2011). Significant amounts of time and money could
have been saved had they been exposed to the challenges within the field earlier and had
the opportunity to choose another career path instead.

Recognizing that traditional field experiences approaches are failing to prepare pre-
service special education teachers to teach in, and across, diverse classrooms, some
university faculty are leaving the college campus classroom and are entering the field with their students (Pruslow & Owl, 2012) while others are utilizing modeling techniques (Evans, Williams, King, & Metcalf, 2010). This research has been limited to case study analysis within the university classroom, not actually administered with a student with disabilities in a classroom setting.

Some researchers have used graduate students to train undergraduates in the use of instructional methodology (Tryon & Schwartz, 2012) in hopes of pedagogy-specific transmission. This spin on supervised experiences is coined “expert coaching”. The authors, however, discuss the limitations of utilizing such an approach and note the extensive training component for both pre-service teachers and graduate students that make such a program work with fidelity.

Other approaches to learning during the pre-service special education teacher field experience have involved peer coaching, modeling ongoing self-reflection about field experiences, and traditional methods of essay and journal writing. The components and procedures of these practices are not well articulated and their effect on pre-service special education teacher's learning is unknown.

**Practice makes permanent: The how of instructing pre-service special educators**

It has been suggested that significant time in the field prior to graduation may serve to bridge the gap between theory learned in coursework and the actual practice of teaching (Zeichner, 2010), although simply adding more time in the field is insufficient for these purposes. It is apparent that something prescriptive needs to happen within the early special education field experience that allows the pre-service teacher to gain meaningful knowledge about the art and science of teaching. There is evidence that some special
education programs share features with programs considered exemplary in general education but it is becoming exceedingly clear that there are unique features that differentiate training in special education from that in general education.

Carefully designed coursework accompanied by structured field experiences allow pre-service special education teachers to gain knowledge in content area while simultaneously applying what they have learned in a classroom. Content area research supports the finding that when specific teaching strategies are taught through coursework and then are implemented in carefully structured field experiences, both general and special education pre-service teachers enhance their knowledge of, assurance in, and use of inclusive and evidence-based practices in the classroom (Leko, Brownell, Sindelar, & Murphy, 2012).

Working alongside university faculty who are coaching the pre-service special education teacher on distinguishing between, and subsequently implementing, evidence-based practices to identified students with disabilities could be the vehicle needed for pre-service special education teachers awareness and mastery of the teaching skills themselves. Hanline (2010) specifically posits that it is the pre-service teacher’s recognition of different instructional approaches that influences student learning, especially when the pre-service teacher can work 1:1 with a student. Hanline also reports that pre-service teachers indicate that their practical experiences are what allow them to connect content to pedagogy and to view best practices in real-life settings.

Cochran-Smith and Lytle (1999) suggest that effective teachers are capable of implementing various types of knowledge throughout their instruction. Pre-service teachers should, therefore, engage in these types of knowledge through their coursework,
field experiences, mentoring, and practical application. They posit that teacher knowledge can be categorized into three specific areas: (a) knowledge-for-practice; (b) knowledge-in-practice; and, (c) knowledge-of-practice. The authors describe knowledge-for-practice as the specific content knowledge of teaching, with the focus on content and pedagogy. Pre-service teachers typically gain this knowledge through coursework.

Knowledge-in-practice is the knowledge of teaching that comes from the experiences you gain while engaging in the practice. This includes information acquired while in field experiences. Knowledge-of-practice is seen in those who disseminate information, understanding and findings about their craft to others in order to further the profession.

Given that university students are beginning to request that professors are not only experts in their fields, but also are able to coach them in their learning process (Harden & Crosby, 2000), it seems as though coaching procedures should be provided to pre-service special education teachers in their field experiences. What better candidate for this role than the supervising university faculty who, not only teaches them the content of the course, but who is considered a highly qualified teacher themself? Better trained special education teachers stay in the field longer than those who lack sound training at the pre-service level (Brownell, Smith, McNellis, & Lenk, 1994) and addressing the contextual variables we can control as researchers is paramount to transform the field of special education.

**University faculty as clinical experience coach**

It is not surprising that coaching is gaining momentum in many organizations because of its potential to increase productivity, in addition to, being a means to developing
procedural knowledge (Price, 2009). In some professions, coaching is seen to empower the highest form of learning (Narayanasamy & Penney, 2014) and is seen as a useful tool for professional development.

There exists a wide range of definitions and descriptions for coaching used across disciplines with the majority found within the organizational and medical training literature. Historically, educational coaching has been seen as a critical component in gaining new skills and facilitating generalizable behavior changes (Joyce & Showers, 1982) for novice teachers in the field. It is used as a professional development tool for new teachers. Traditionally, initial training is completed on site and then coaching occurs, with trained staff implementing the new skills. Educational coaching includes functional and recurring delivery of prompts to the learner, modeling of skills, and positive feedback to safeguard fidelity of implementation. To reduce implementation errors, corrective feedback is given (Horner, 2009). There is no research base for utilizing university faculty as coach for pre-service special education teachers still in the training phase of their careers.

Coaching in a managerial sense has shifted in theory from a practice of control and on telling people what they need to do to the development of an interpersonal relationship intended to promote self-efficacy and empowerment (Batson & Yoder, 2012). Yoder (1995) evaluated career development relationships and their perceived effect on professionalism, job satisfaction, and intent to stay. Managerial coaching was perceived by staff to be the most frequently occurring and valuable relationship.

Medical training literature has a heavy emphasis on developmental relationships that are essential to the support and longevity of staff. The presence of these dyadic career
development relationships have shown to be positively related to job satisfaction and retention in nurses (Batson & Yoder, 2012) and the most frequently reported developmental relationships in the nursing and business literature are mentoring and coaching (Yoder, 1995).

**The role of the University faculty field experience coach**

Narayanasamy & Penney (2014) identify three types of coaching and among them is one-to-coaching that could be potentially useful in training pre-service special education teachers. The coach provides support in achieving specific goals on a one-to-one basis. When this type of coaching is paired with the Practice Spiral Model, also proposed by Narayanasamy & Penney (2014), powerful results could be obtained. The four stages of the Practice Spiral Model are: (1) Explain and demonstrate; (2) Reflect on learning; (3) Review progress; and, (4) Plan to practice again (Figure 1).

![Stage 1: Explain and demonstrate](image1)

![Stage 2: Reflect on learning](image2)

Figure 1: The four stages of the Spiral Model by Narayanasamy & Penney (2014)
The first stage of the model involves the coach explaining the relevance of a particular skill to the student clinician. Then, the coach and student clinician break down the skill into components and decide why it is performed in that way. The coach is responsible for summarizing the skill for the student clinician and then demonstrates it for them. Afterwards, the coach clarifies any questions the student clinician may have and gauges understanding through questioning and answering. This stage may last for a short period of time or an extended period of time, depending on the student clinician's competence.

The second stage of the model is short in duration and calls for the student clinician to reflect on their learning. Once this is accomplished, stage three begins. Stage three involves reviewing progress. The coach is responsible for restating and reviewing the task components with the student clinician and then watches as the task is performed. The coach assesses whether or not the student clinician is implementing the procedure appropriately, provides praise and reinforcement for progress being made or offers opportunities for clarification and further practice.

The last stage, stage four, involves practice sessions as needed with the coach offering praise for effective procedural implementation or correction with additional guided practice, if necessary. By using a conceptual framework that specifically addresses the shaping of pre-service special education teacher instructional behaviors, and with the addition of prompt fading, a coaching model that is flexible and broad enough to use with pre-service special education teachers at various levels of their learning careers is created.

Given the above framework, university faculty can utilize direct instruction to support pre-service special education teacher's learning through the modeling and
coaching of instructional techniques. Within the field, faculty supervise learning sessions, model various techniques, provide suggestions, and provide corrective feedback. This gives the pre-service special education teacher the opportunity to connect theory to practice, to make connections across coursework, and to develop reflective and diagnostic skills necessary for efficient, independent service delivery.

While coaching the pre-service special education teaching in instructional techniques, university faculty can simultaneously utilize a skill analysis framework (Price, 2009) to support skill development and focus coaching discussions. A skill analysis framework based on the work of Gobert (2005) and proposes it within the context of nursing. While healthcare professionals and pre-service special education teachers may not appear to have much in common, it can be rationalized that both are required to use skills explicitly and strategically, both need to assess and address developing situations, and each is responsible for producing results. Therefore, this framework could conceivably apply to the field of teaching as it does in nursing.

Gobert (2005) explained that the key premise of skill analysis work is that individuals tend develop templates in their mind that they use to determine how best to proceed in situations. Too often, we rely on routine, internalized protocols and rarely take the time to reflect on our understanding or accuracy of using them. The first step in skill analysis involves the pre-service special education teacher writing down a description of the skill as they anticipate performing it. This description should include what will be done procedurally, as well as, what they think will need to happen next.

Following this, the pre-service special education teacher is ready to work on the four components of skill described by Price (2007, 2008) (Figure 2).
Price (2007, 2008) describes four components of skill: declarative, procedural, “if this, then that” thinking, and available knowledge. These are addressed after the pre-service special education teacher has written down the skill as they anticipate it happening. The procedural aspect of the analysis is usually the first component that is addressed as individuals are typically confident about discussing what they can do and how they do it. The procedural component involves recounting what is done and why, as well as, determining the order in which it is performed and to what purpose. It assists the student with appreciating how he or she thinks about the skill. The coaches’ responsibility at this point is not in judging the work itself, but noting what was said, the sequence of tasks performed, and that which was conveyed by means other than verbal communication. Afterwards, the coach focuses the conversation on what actually occurred and in what sequence it occurred in. This assists the student with reorganizing a new mental template of procedures as they occurred during observation.
What emerges from this discussion of procedural steps, is a review of “if this, then that” thinking in which students are taught to consider many different choices that can be made at any given time. This step identifies the decisions made by the student. As practiced professionals, coaches tend to be automatic in their response to certain situations. This step in the framework of task analysis is not to prescribe certain actions for a variety of situations, but to look for traits or habits that the student and coach can review together so that an alternative procedure can be practiced for the next time.

The available knowledge pool described by Price (2007, 2008) can be likened to evidence-based practices in education. This involves relying on those practices that are steeped in evidentiary support and the knowledge that underpins the skill. Although it is described by Price as an equal component of the framework, I posit that this component should be considered first before any other components are considered. We should always be employing best practices with our students and practicing anything other than that is futile.

Conclusion

There is considerable merit in using coaching as an approach to help pre-service special education teachers develop their clinical pre-teaching skills. The construct and procedures of coaching by experienced, expert university faculty could prepare pre-service special education teachers to: (1) learn procedural knowledge; (2) develop self-efficacy, and (3) develop a commitment to the field of special education. While coaching has been historically employed in management, aspects of the process are amendable to other professions, such as nursing and special education teaching where sound clinical skills guide the work done.

This dissertation case study examines four student teachers as they participate in a community of practice focused on culturally relevant pedagogy for immigrant students in an urban elementary school. Despite a recently adopted scripted literacy curriculum, participant educators found ways to tailor their instruction to their unique student populations by developing a system in which they attended to the “non-negotiables” of the standardized curriculum while incorporating themes that reflected their diverse students’ lived experiences.

Extended Abstract

Purpose
In the United States, ten percent of students are English learners (ELs). This amounts to 4.7 million students, and the number increases every year (U.S. Department of Education, National Center for Education Statistics, 2013). In the past two decades, the state of Minnesota has seen a 300% increase in the number of ELs that its schools serve. Currently, as Minnesota schools educate 65,000 English learners across the state, teachers and school administrators are called to consider how to best meet the needs of this changing demographic. Given the longstanding opportunity gap between white students and students of color in the state, this challenge is particularly urgent (National Assessment of Educational Progress, 2009).

This dissertation collective case study seeks to shed light on the gap in understanding about how teachers learn to enact culturally relevant pedagogy (CRP) for ELs. Four student teacher participants are examined during their student teaching experience as they participate in a community of practice (CoP) focused on CRP for immigrant students in an urban, culturally diverse elementary school. The data generated from this research are aimed at answering the following questions:

1. How is understanding CRP for ELs socially mediated through participation in a CoP?
2. In what ways is pedagogy for ELs shaped by teacher candidate participation in a CRP-based CoP?
3. What do student teachers identify as obstacles to CRP enactment for ELs and how do they overcome them?

The objectives of this research are to learn from the experience of the four participants and draw conclusions about ways in which teacher education can be galvanized to better prepare culturally relevant pedagogues for immigrant learners in the current sociopolitical schooling culture.

Theoretical Framework
This study is undergirded by two theoretical frameworks. The first is culturally relevant pedagogy (CRP). Originally conceived in response to a need for schooling to be more relevant to the lives of African American students, Ladson-Billings (1995) defines CRP as:

A theoretical model that not only addresses student achievement but also helps students to accept and affirm their cultural identity while developing critical perspectives that challenge inequities that schools (and other institutions) perpetuate. (1995, p. 469)

The three central tenets of CRP are: social critique, academic success, and cultural competence (Ladson Billings, 1995). That is, in order to enact CRP, a teacher must demonstrate pedagogies that: engage students in critical examination of content, provide students with rigorous academic tasks, and take into account students’ home cultures.

Researchers assert that CRP is essential in closing the opportunity gap, as it recognizes the central role of students’ cultures in all aspects of teaching and learning and
it acknowledges and responds to the current schooling climate that places students from diverse cultural backgrounds in learning environments that do not mirror their home cultures and values (Langer, 1987; Petchauer, 2011; Price-Dennis & Souto-Mannin, 2011). CRP calls teachers to be made aware that students’ identities, beliefs, and behaviors are shaped by their culture (Gollnick & Chinn, 1998) and it presents a unique challenge to teachers in that they cannot present relevant pedagogies without first knowing their students. Phuntsog (2001) considers that the true test of CRP “may lie in its ability to create classrooms where race, culture, and ethnicity are not seen as barriers to overcome but are sources of enrichment for all” (p. 63). There is a wealth of research that touts the benefits of CRP. However, little is known about how teachers learn to enact it.

The second theoretical framework in this study is social learning theory. Social learning theory posits that learning is the result of observing and modeling the attitudes, displays of emotion and behaviors of others (Bandura, 1997). Bandura explains that “Most human behavior is learned observationally through modeling; from observing others, one forms an idea of how new behaviors are performed, and on later occasions this coded information serves as a guide for action” (Bandura, 1997, p. 22). Social learning theory considers learning to be an entirely social phenomenon and the result of one’s lived experience in social environments (p. 3). It is complementary to Vygotsky’s (1978) sociocultural theory in that they both argue that social interaction is a fundamental element in cognition.

The aforementioned theoretical frameworks serve unique functions in this study. While CRP serves as a model for equitable and relevant teaching for immigrant students, social learning theory informs the methodology of CoPs. Through social learning in a CoP, student teachers learn to enact CRP.

Modes of Inquiry

While the phenomenon of communities learning together is as old as humanity itself, the use of Communities of Practice (CoPs) as a learning theory and a framework for research was originally conceived of by Lave and Wenger in their seminal book, Situated Learning (1991). The authors employ social learning theory to challenge traditional theories of experiential and internalized learning as they explain and illustrate how people learn in social groups, or CoPs. In the introduction of the text, Hanks (1991) explains that “rather than asking what kind of cognitive processes and conceptual structure are involved, they [Lave and Wenger] ask what kinds of social engagements provide the proper context for learning to take place” (p. 14). Traditional notions of learning have focused on an individual’s independent acquisition of knowledge. While Lave and Wenger offer anecdotal examples that illustrate that ‘learning by doing’ is part of participation in a CoP, they argue that the membership in a community of learners and experts is more influential than “doing” alone.

Wenger (2006) defines CoPs as “groups of people who share a concern or a passion for something they do and learn how to do it better as they interact regularly” (Wenger, 2006, para. 3). In another definition, he focuses on the process rather than the product when he writes that learning is a process that is the result of participation in a social community. Tennant (1997) asserts that Lave and Wenger’s concept of situated
learning considers individuals acting as full participants in the world and generating meaning from their interconnectedness. Another notable difference between learning as internalization and learning in a CoP is “an evolving, continuously renewed set of relations” (Lave & Wenger, 1991, p. 50) that inevitably shape changing social constructs.

While community and social learning are essential to CoPs, there is a third needed component in order to differentiate CoPs from any social gathering. It is a focus on shared practice. Wenger (1998) posits that participation in CoPs “refers not just to local events of engagement in certain activities with certain people, but to a more encompassing process of being active participants in the practices of social communities and constructing identities in relation to these communities” (p. 4).

Wenger names the following four components as characteristic of CoPs: meaning, practice, community and identity (Wenger, 1998, p. 5). Figure 1 illustrates the interconnectedness of the four realms of CoPs and how learning takes place. For the purposes of this study, the outer bubbles (learning as doing, learning as belonging, learning as becoming and learning as experience) are used as a frame for analysis of participant learning.

Figure 1:

CoPs is a fitting theoretical framework for research about teacher learning in general because teachers work socially, as members of groups. They often gather together in intentional communities (regionally such communities are known as professional learning communities [PLCs]) and seek to learn how to improve their practice. My proposed dissertation study includes one focus group centered on CRP praxis that serves as a CoP. In the CoP, participants consider existing obstacles to CRP enactment and strategize how to overcome such obstacles so as to provide an education that offers windows and mirrors (Style, 1996) to immigrant students, in particular.

Data Sources

Data collection sources are: nine CoP meetings, weekly digital journal entries, pre-study, mid-study and post study interviews and frequent class observations. Data about participants’ socially mediated learning and its relationship to their understanding
of and enactment of culturally relevant pedagogies is coded and analyzed based on the framework of CoPs.

Results and Conclusions

Prior to the onset of this study, the researcher learned that a scripted standardized literacy curriculum that limited teachers’ abilities to enact culturally relevant pedagogies was adopted by the school administration. Student teachers and seasoned teachers found themselves required to read from timed scripts that reflected white middle class cultural norms that many of their students struggled to make sense of. Participants expressed frustration in CoP meetings as they realized that they would not be able to firmly abide by the administrator’s request to adhere to a rigid curriculum and attempt pedagogies that are culturally relevant to immigrant learners.

In response to this obstacle, one participant dismissed the mandatory curriculum and presented a social studies unit about human rights that was engaging, energizing and wholly culturally relevant to her student population. Two participants shared that they felt so restricted by the standardized curriculum that they struggled to find spaces in the day for cultural relevancy. The fourth participant developed a system in which she attended to the “non-negotiables” of the standardized curriculum while “weaving” throughout themes that reflected her diverse students’ lived experiences.

Findings illustrate transformed and culturally relevant pedagogies for ELs through participation in this low-stakes CoP despite ideologically competing mandates from school administration. Implications of this study call teacher education programs to consider implementing CoPs into the student teaching experience so as to yield new teachers who are prepared to enact pedagogies that reflect the lived experiences of their immigrant students. Such an initiative will help to bridge the gap between teacher preparation and teacher induction, while fostering an environment where empowering pedagogies are co-constructed amongst educators.

Scholarly Significance of This Work

Advocating for the preparation of culturally relevant teachers is crucial yet precarious, because teacher preparation programs graduate teachers into workplaces that often do not honor their commitment to culturally relevant teaching. For this reason, it is essential that teacher educators establish a strong and sustaining bridge from the ivory tower to the classroom. Price-Dennis and Souto-Manning (2011) assert that there is a “need to invite pre-service teachers to engage in fostering pedagogical third spaces which syncretically bring together mentor teacher academic expectations and student interests and cultural repertoires” (p. 236). CoPs can serve as such third spaces.

Although CRP is often touted as a solution to the opportunity gap, it is commonly misunderstood and little is known about how teachers can be prepared to enact it. Goodwin (2002) writes that this problem “must galvanize teacher preparation programs to rethink how their curriculum prepares pre-service teachers to work effectively with diverse students” (p. 157). Studies such as those of Dennis and Souto-Mannin’s (2011) and Hill (2012) are recent examples of research that examine how teachers respond to apparent opportunity gaps by tailoring instruction to reflect African American students’
lived experiences. There is a wide range of studies that investigate how CRP can be enacted for African American students. However, there is a dearth of literature that examines how CRP can be enacted for ELs. The limited studies that examine the role of CRP for ELs (Orosco and O’Connor, 2013; Salazar, 2010; Wortham and Contreras, 2009) support increased professional development for teachers in the area of CRP and call for additional research. This study responds to the dire need to research in the area of teacher learning and CRP.

This study explores how Japanese university students’ perceptions of their classes and instructor personality contribute to their overall rating of the English class. The study also investigates whether the students rate Japanese instructors and native English speaking instructors differently. Data was collected using a questionnaire comprised of instructional rating and teacher personality rating sections. The instructional rating section was based on the Instructional Rating Form (Tomasco, 1980), and European Portfolio for Student Teachers of Languages (Newby et al., 2007) whereas the teacher personality rating section was derived from Murray, Rushton, and Paunonen (1990). The study employed statistical analyses including multivariate analysis of variance (MANOVA), principal components analysis and regression analysis. The results of the study revealed that students’ perceptions of the class as interesting, organized and clear, positively influenced their overall rating of the class. On the other hand, their perceptions of their instructor as aggressive, dominant, anxious, and authoritarian negatively affected the overall rating. The findings also indicated that when it comes to Japanese instructors, personality traits such as being sociable, ambitious, intellectually curious, intelligent, and gentle influenced students’ overall ratings.

Applying a Holistic model to Medical Education:

Nancy-Angel Doetzel, Ian Winchester, Russell Sawa, Hugo Maynell, Debbie Zembal

Abstract:

Situating this study within a scholarly framework, Moberg (2008) suggests that “as scientific knowledge of spirituality increases, so does a greater need for further research on the topic” (p.12). He argues that studies of spirituality are still in their infancy after having been generally ignored in the medical, social and behavioral sciences until recently (Moberg, 2005). From an educational perspective, our study implications include applying findings to better facilitate a holistic medical teaching model that includes spirituality. This paper introduces some gaps within health care systems and presents some examples how the healing of some individuals has allegedly involved a form of spiritual intervention.

Introduction to Study:

In 1998, the World Health Organization (WHO) stated that a strictly biomedical view of patients will no longer be suffice for health care, given the mounting evidence of the value of spirituality and spiritual well-being to overall health and quality of life (Hartung, Henriques & Young 2012; Sawa, 2014 ). Their stance is echoed by numerous medical accreditation agencies and professional associations that now require patients’ spiritual needs be addressed. However, the Royal College of Physicians and Surgeons of Canada, who sets the medical model standards in Canada, does not specifically address spirituality ( Hartung, Henriques & Young 2012; Sawa,
Studies addressing spirituality within health care could support innovating new medical standards.

Considering spirituality is an essential component of the human condition, such studies are significant. “Spiritual well-being promotes better immune function, is a major determinant of quality of life in patients, helps patients cope with illness, improves energy level in the chronically ill, improves patient perceptions of quality of care, and can be an important coping resource” (Hartung Henriques & Young, 2012, p. 79). A major challenge for nurses has been trying to communicate appreciation for the spirituality of their patients. “Terminological confusion abounds and is responsible in part for nurses ‘reluctance to address their client’s spiritual needs’” (Heriot, 1992, p. 69) For the purpose of this study, spirituality is defined as a latent inherent truth awakened by contemplation, rituals, peak life experiences and caring acts of kindness; when awakened, spirituality is a sensation of the sacred, a sentiment of hope, a feeling of enthusiasm and excitement, and a heart-felt sense of interconnection with others (Doetzel, 2006).

Collingwood (1940) argued that science and spirituality are “inextricably united, and stand or fall together” (p. 41). Because the metaphysics of spirituality is a “science of absolute presuppositions” (Collingwood, 1940, p. 41), it is immeasurable and commonly ignored by scientists. “Spiritual oneness cannot be objectively verified, but our literature, our music, and our current yearning for spiritual connection” (Lerner, 2000, p. 49) verify its authenticity. Also, a transformed state of consciousness associated with spiritual experiences is “biologically observable and scientifically real” (Newburg, D’Aquili & Rause, 2001, p. 7). As a higher state of consciousness, a spiritual experience may have a neurological nature that alters the brain.
Research (Newburg, D’Aquili & Rause, 2001) suggests that whatever the nature of a spiritual experience, meaningful neurological functional change, takes place within both the brain and heart. This insight suggests that human nature has mental, physical and spiritual dimensions that are interconnected (Bateson, 1994). According to Pearce (2002), people’s hearts maintain a holographic electromagnetic connection with the mental, physical and spiritual dimensions of their being.

Spiritual experiences such as the peace of mind attained during meditation are evident in “both automatic shifts and hormonal changes observed during such states” (Newburg, D’Aquili & Rause, 2001, p. 44); experiments conducted with Tibetan meditators and Franciscan nuns demonstrated their spiritual experiences “were in fact associated with observable neurological activity” (p. 36). Other studies have demonstrated that people participating in spiritual behaviours such as prayer and meditation have experienced decreased heart rates and improved immune systems, and individuals involved with ritualised dancing, singing or chanting have experienced ineffable pleasurable feelings, by stimulating the brain’s cortical rhythms. Dyer (2001) noted that “just being in the energy field of those who meditate raises the serotonin levels of the observers” (p. 58); serotonin is a neurotransmitter in the brain that affects how peaceful and harmonious a person feels.

Prayer enhances people’s conscious awareness of their spirituality, which promotes a sense of well-being (Vaill, 1998). Research on intercessory prayer conducted in a controlled double blind study with 406 individuals found that both the subjects being prayed for and the agents doing the praying improved their measures of self-esteem (Dossey, 1999). Other studies “reveal healing can be achieved at a distance by directing loving and compassionate thoughts,
intentions, and prayers to others” (Dossey, 1999, p. 25). Thus, prayers may help in the healing process.

**Addressing Gaps**

One of the gaps within health care education is that Spirituality is absent in the Canadian competency framework (Sawa, 2014). In contrast to the United States and Great Britain, the literature is limited with respect to spirituality in undergraduate curriculum in Canada (Sawa, 2014; Hartung, Henriques & Young 2012). However, CanMEDS competencies required of Canadian physicians include the expression of empathy, compassion, trustworthiness, effective listening and respect for diversity. And, these particular expressions are associated with “spirituality,” as indicated in a recent study of spiritual healers (Sawa, 2014).

Sawa (2014) outlines examples of how the Americans tend to honor spirituality within their health care system. For example, the importance of compassion is a part of their Code of Medical Ethics: The American Medical Association developed a Code of Medical Ethics that suggested physicians should provide competent care based on respect and compassion-values, which can be considered as the core to spirituality (Puchalski 2014 p. 11., as stated in Sawa, 2014). The American College of Physicians indicated that physicians should extend their care to include psychosocial, existential, or spiritual suffering. In 2004, the field of palliative care cited spiritual, religious, and existential issues as a required domain of care (Sawa, 2014.)

Sawa (2014) and Hartung, Henriques & Young (2012) argue that a person’s spiritual well-being promotes a better immune function, which is a major determinant of quality of life in patients, as it improves their energy levels and understanding of compassion. Our research findings suggest that the expression of compassion is central to spirituality within most religious beliefs. Despite such acknowledgements about spirituality, the research team agreed that western
medicine has tended to overlook spirituality and spiritual healing and alternatively has focused
on a physiological aspect of health care that relates to the Greek era (Sawa, 2014; Winchester
Sawa, Doetzel, Maynell, Zembal & Motta, 2012)

“Spirituality” appears to mean different things to different people and often refers to an
individual’s attempts to find meaning in life which can sometimes include a sense of
involvement in the transcendent outside institutional boundaries (Winchester Sawa, Doetzel,
Maynell, Zembal & Motta, 2012). Constructs from our research which are somewhat at
variance with the current literature includes the finding that “divinity” is a consistent feature of
spirituality amongst all religions/cultures (except Buddhist) (Sawa 2009). Tied to this was the
construct of empowerment or energy. This energy was seen to flow from the divinity. This can
be applied to current concepts by viewing the clinician as a vehicle for divine activity. This is
exemplified by the love and compassion demonstrated by the healer. At the same time, each
person is viewed as having a nature, which contains divinity and grows towards a fuller and
fuller expression of this divinity.

Our research interests (Winchester Sawa, Doetzel, Maynell, Zembal & Motta, 2012) have been augmented by some of the team’s personal healing experiences. Reflecting on some data from the transcripts led me to reflect on my husband’s alleged healing experience. When he arrived home in excruciating pain one afternoon, I rushed him to the emergency room at a local hospital. We were informed, after an X-ray was taken, that his intestine had a blockage which prevented him from digesting any food, or releasing toxins. A physician suggested my husband would need surgery within the next few days to remove the blockage. When I informed a physician that I was bringing into the hospital room a group of
people to form a prayer circle, and a Reiki Master to assist with the healing process, he questioned my intention.

A multi-faith prayer circle composed of believers from Christian, Jewish and Muslim communities joined hands as they stood around my husband’s bedside and prayed together. I prayed in unison with a caring group of individuals who demonstrated compassion and hope, as they called out to a common God, while requesting divine healing. I felt electricity flowing in and out of me, as I prayed. And, I noticed my husband’s face was gradually taking on a healthy appearance.

After these prayers, my husband received Reiki from a member of our research team. He claimed the treatment had given him energy and a sense of wellness. The following morning, my husband’s X-ray showed a major change in the intestinal blockage and his physician suggested delaying surgery. Another prayer session, the following evening, appeared to have resulted in the blockage being totally removed, as my husband never required any surgery. Acting very healthy and happy, he left the hospital the following day. Several weeks later, the doctor stated that his X-rays taken did not show any evidence of the original diagnosis.

Previous to this experience of being prayed for, my husband had doubted my dependence on faith and prayer, when I was diagnosed with cancer. Being informed that an illness could annihilate my life within a few months, if I didn’t receive surgery, coerced me to look death in the face and embrace my dear life. During the traumatic moments of being within this life or death situation, I sought out spiritual healers and engaged in singing, dancing and writing before and after surgery. Several Shaman healers entered my life at that time, and I benefited from their spiritual interventions, ranging from rituals to prayers. “Through his heroic journey and efforts, the shaman helps his patients transcend their normal, ordinary definition of reality, including
definitions of themselves….and of their illness” (Harner, 1980, p. xvii). With Shamans, “caring and curing go hand and hand” (p. xviii). After spending time with two Shamans, I viewed my illness as a teacher and a blessing, not as an illness or a curse. I came to believe that some healing had already taken place before my surgery. On route to the operating room, I had also received the anointing of the sick by a priest, who prayed for the surgical procedure to result in healing. Later, my physician could not explain how or why I had healed from the surgery and cancer so quickly and successfully. He said that he had sensed angels in the operating room guiding him in the surgical procedure.

Researchers, such as D. Aldridge, in his article “Spirituality, Healing and Medicine” published in the British Journal of General Practice (Aldridge, 1991) support spirituality within health care. Additionally Graham and Al-Krenawi, Graham and Moaz, (1996) have examined the healing practices among the Bedouin that involve a spiritual component from the vantage point of Social Work. Both of these studies are very supportive of our present research activities (Sawa, 2014; Winchester Sawa, Doetzel, Maynell, Zembal & Motta, 2012). For example, Aldridge states:

The natural science base of modern medicine influences the way in which medicine is delivered and may ignore spiritual factors associated with illness. The history of spirituality in healing….reflects the growth of scientific knowledge, [relates to] demands for religious renewal, and [responds to] the shift in the understanding of the concept of health within a broader cultural context. General practitioners have been willing to entertain the idea of spiritual healing and include it in their daily practice, or referral network. Recognizing patients’ beliefs
in the face of suffering is an important factor in health care practice.

(Aldridge, 1991, p.224)

Recently, there has been considerable interest shown in England and Scotland, as well as in Australia, in encouraging health care workers to follow the lead of the World Health Organization which, roughly a decade ago, began to consider the possibility of adding “spirituality” to its definition of “health”. (See for example Cheungsatiansup’s (2003) article that proposes the inclusion of spirituality in assessing health.)

In Scotland the Scottish Executive Health Department (SEHD) requires all physicians to consider that they have a responsibility for the spiritual state of their patients and in guidelines circulated to the Health Boards in 2002 the SEHD required NHS organizations “to develop and implement spiritual care policies that are tailored to the needs of the local population”. Indeed, the Health Minister for Scotland had earlier expressed his determination to make spiritual care a central element in the way that the National Health Service cares for people, and that such care should be undertaken by the whole health care community (Chisholm, 2001).

Headley G Peach (2003) in Australia has written a number of articles on the necessity of taking the relationship between spirituality and health seriously as well as the need for more research into the linkages. In her 2003 article in the Medical Journal of Australia “Religion, Spirituality and Health: how should Australia’s medical professionals respond?”, she argues that a survey of the more rigorous studies looking at religiosity and the onset of, or recovery from, a broad range of medical conditions suggest a positive association between greater religiosity and a better health outcome. The evidence, she argues, is suggestive of a causal association but it is not conclusive.
According to a Priest healer, interviewed for our study: “anointing of the sick removes a spiritual blockage bringing the body/nature into balance, like pharmaceuticals, (unpublished Sawa transcripts, 2009). “Great Spirit is connected with the inner spirit of a person and a healer re-connects the inner spirit with Great Spirit (God). The source of healing is the Lord, God, Creator or Higher Power and the healer is a conduit. Physical healing is seen as the Lord freeing a person’s spirit or healing his/her soul by creating a harmony within the person. The healing occurs via prayer or healing Sacrament, “anointing of the sick” whereby an external power goes through a person and heals them spiritually, which gives them hope and forgiveness of sins. Forgiveness of sin occurs when the (spiritual) blockage, which is out of sync with the Creator, is removed (Unpublished Sawa’s interviews, 2009.)

Our research team (Winchester Sawa, Doetzel, Maynell, Zembal & Motta, 2012) concludes that there is considerable support in the medical research community for further work in the area of the relationship between spirituality, religion and health and in what follows we wish to report, in a general way, what our research group has been doing to add to the work done so far. With the exception of work of al-Krenawi, John Graham and Moaz, along with a few others looking at spiritual practices in diverse cultures, there is limited research on the wide range of spiritual healers who ply their trade in the North American context. To help fill this gap we have engaged in the work we wish to relate here.

**What is Our Research About?**

For the last five years we have been discussing our lead researcher’s interviews with a wide range of “holistic” healers drawn from a number of healing traditions that may be loosely described as “spiritual” healing practices (Winchester Sawa, Doetzel, Maynell, Zembal & Motta, 2012). Most of these healers have been in Canada or the United States though their
origins are often wider than this. Russell Sawa, our leader and a physician himself teaching at
the University of Calgary Medical School, conducted interviews with 30 alleged healers. The
interviewees were a purposeful sample drawn from a wide spectrum of healing practices. They
were identified by word of mouth and often from earlier healers interviewed. These healers
included Aboriginal, Shaman, Christian (both Protestant and Roman Catholic), Hindu, Buddhist,
Chinese, Wicca and “Energy” healers, including Reiki practitioners. Our objective was to
discover something of their claims to healing or even to curing and also to gain some
understanding of their approaches to healing that might prove useful to mainstream medical
practice in North America.

Each of the 30 healers studied was asked to offer narratives of their healing experiences
Sawa, 2014; Winchester Sawa, Doetzel, Maynell, Zembal & Motta, 20120. There was no
definite set of questions chosen in advance and they proceeded to tell their stories to the
interviewer. New interviews were added as themes arose and required more data for further
explanation. Whenever new questions arose, they were repeated in subsequent interviews.
Audio tapes were made of each and every interview and transcribed in totality. Our approach
was reviewed and approved by the Ethics Committee of the Faculty of Medicine at the
University of Calgary. Whenever a transcribed interview was available our team met to discuss
the interview in detail and to summarize it in terms of a collection of definite propositions
representing the content of the interview for further discussion and comparison. Our approach is
centrally in the qualitative research tradition and follows, in large measure, the approach
suggested by Bernard Lonergan in his book Insight. But it is also evident that we were guided in
large measure also by everyday commonsense in our trying to understand what our informants
told us.
Who are We?

Our team of researchers consisted of myself, an educator and sociologist who teaches at both Mount Royal University and the University of Calgary, Russell Sawa, a physician and Associate Professor in the medical school at the University of Calgary, Ian Winchester, an Associate Professor in the Faculty of Education at the University of Calgary, Hugo Maynell a retired professor of philosophy of religion, and Debbi Zembal a practicing nurse and energy healer in the Reiki tradition (Winchester Sawa, Doetzel, Maynell, Zembal & Motta, 2012). What we discovered early on was that on the one hand there were some striking similarities in the practices and claims of all of our healers interviewed. But equally important, there were striking differences among them. In this paper, we will try to summarize the most important similarities and differences. While each healer had interesting cases to bring to the interview, and while all such cases were plausibly characterized by what struck us as very honest and believable interviewees, we were disappointed on one point with practically all of the alternative healers interviewed. Not one of them kept good records of the physical or mental state of the patient before or after intervention by the healer in question. As our future work will proceed with our actually observing such healers in the context of their practice we are determined to make sure that such records are always kept in the future and are clear and unquestionable (Winchester Sawa, Doetzel, Maynell, Zembal & Motta, 2012).

Interventions in all cases involved the healers listening carefully to the patients coming to them with a complaint and subsequently making suggestions as to what the patient might do next or what treatment to follow (Winchester Sawa, Doetzel, Maynell, Zembal & Motta, 2012). Often the narrative of the healer involved the patient coming to the healer with a prior diagnosis made in the course of ordinary, western medical practice. These diagnoses might
involve such things as broken bones, tumours or cancers, infections that would not heal or go away or, in one interesting case; the patient’s suffering from being unable to enter the kitchen in his apartment due to a headless man blocking the way. In practically every case relayed to us the healer claimed to have affected a form of healing for the disorder.

**Healing vs. Curing**

Initially we (Winchester Sawa, Doetzel, Maynell, Zembal & Motta, 2012) assumed that what was meant was that a “cure” in the standard Western meaning of the term was what had resulted. But in fact in most cases, while the physical disorder was often claimed to be still present, it no longer blocked the patient from getting on with their lives in a normal or practically normal fashion. In some cases not only did our healer claim to have “healed” the patient in this sense, but also to have been involved in the process of the patient’s physical or mental disorder disappearing entirely, that is of “curing” in the ordinary Western medical sense. However in no case was supplementary material of the kind we would have liked to see offered us in the form of a prior medical diagnosis of the physical disorder with appropriate pathological study or post treatment study indicating the disappearance of the disorder.

Because of this sort of distinction forcing itself upon us frequently in our earliest study of these interviews, we began to make a practical distinction between “healing” and “curing” (Winchester Sawa, Doetzel, Maynell, Zembal & Motta, 2012). Something like “kissing it better” appeared to be systematically going on in the actions and results of practically all of our alternative healers using what they frequently considered as spiritual means of intervention.

**Ordinary vs. Paranormal Intervention**
Another distinction that forced itself upon us early on in our study of the interviews is that between what one might call claims of ordinary spiritual intervention and claims of paranormal intervention (Winchester Sawa, Doetzel, Maynell, Zembal & Motta, 2012).

Some literature we discussed within our group meetings was taken from the book, “Reinventing Medicine.” In this book, Dossey (1999) states “many studies reveal that healing can be achieved at a distance by directing loving and compassionate thoughts, intentions and prayers to others, who may even be unaware these efforts are being extended to them” (p. 25). Dossey believes that the “distant intention of prayer” is a major secret kept in medicine. “Every physician becomes a collector of anomalies that break the rules; cures and remissions that don’t fit the norm . . . get quietly filed away over the years (p.7). Prayer advocates are commonly suspected of promoting their personal religious beliefs under the guise of science.

One interviewee appears to have silenced some of his stories that appeared out of the ordinary (unpublished interviews, Sawa, 2009). As a physician engaging in healing work, this study participant claimed that he surrenders his intellect and analytical mind when receiving the Blessed Sacrament. He insisted that “perfect love casts out fear” and the “greatest weapon we have against illness is knowing Jesus.” To assist this interviewee with being an instrument for healing, he prays with his secretary before seeing any patients. His choice to pray appears to support Helminiak’s (1996) suggestion that spirituality is “deification through the Holy Spirit and in Christ” (p. 37). During his interview, this physician revealed that a female patient had calmed down and expressed a healing experience after she had touched a picture of Jesus, hanging on his office wall. He also told the story of a man with terminal cancer who was prayed for by him; and, later this patient’s ultrasound was reported as being normal, and the patient claimed he had been healed. Additionally, the physician articulated a case of a patient having
recovered from being in a coma, two weeks after he had prayed for this patient. And, following the healing experience, this patient had spoken to the physician about having a near death experience. To verify alterations in patient’s health conditions after prayer, all the successful healing cases reported by this physician are documented in his medical files.

When reviewing the transcript of this physician healer, I questioned why his successful stories of faith healing were being muted, rather than spoken about openly about with peers or written about in journals. Having his stories muted could be a case of withholding a major truth about complementary health care. I wondered if he feared being misunderstood by his peers or being labeled “unprofessional” by traditionalists within the medical profession. Finding answers to

*The Ordinary Spiritual Intervention*

The ordinary spiritual intervention was invariably connected with the concern of the healer to listen to and to understand the cultural, religious or philosophical presuppositions of their patients and how they understood their disorder, ailment, trouble or problem that had brought them to the healer in the first place (Winchester Sawa, Doetzel, Maynell, Zembal & Motta, 2012).

One might say that the healers all treated the patient’s “spiritual understanding” in the sense of the German notion of “geistewissenschaft” where “spirit” here is related in a central sense with how the person is imbedded in their particular culture or their particular understanding of that culture. This is not a common usage in the English language and it makes it rather difficult for us to talk well about the relationship of “spirit” to “culture”. We refer to the social sciences in this context, but that papers over the possibility that most of human spirit
resides in the context of human culture, a culture that is entirely man-made but is just as real for us as is bumping into a rock or a tree or being pulled downward towards the centre of the earth by the force of gravity after the manner of the world recognized by physics. In all such “ordinary spiritual intervention”, while there is understanding of the patient’s picture of the world from the vantage point of the spiritual or holistic or non-traditional healer, there may be primarily a compassionate regard for the patient and wise suggestions as to how better to conduct one’s daily life. This intention to help and the invocation of manifest love in the sense of *caritas* in Latin or *agape* in Greek was claimed by practically all of our healers.

To take one typical example, one patient came to a healer with an apparently incurable cancer (Winchester Sawa, Doetzel, Maynell, Zembal & Motta, 2012). The patient was terrified of dying with the cancer and unable to function any longer in everyday life. The healer was able to convince the patient that the best chance of cure was that the patient come to grips with that everyday life and carry on much as before. The patient understood this and with the aid of the healer began functioning again. The physical symptoms of the cancer subsided and the patient went back to a productive and useful life for a number of years before ultimately succumbing to the disease. This patient, in our terminology, was healed but not cured.

The reverse possibility also exists (Winchester Sawa, Doetzel, Maynell, Zembal & Motta, 2012). For example, suppose someone comes to a healer after having a breast removed for breast cancer but the patient cannot get through a day for the rest of her life without worrying about the recurrence of the cancer either in the remaining breast or somewhere else on her body. Even thought this patient might live until her nineties and suffer no recurrence of the cancer, she is medically cured of her cancer but certainly not healed. What our non-traditional healers often
do is to help such a person towards healing given a prior medical intervention of a curative kind so that they can get on with their lives in a normal fashion.

Paranormal Claims

On the other hand while a number of our healers engaged in what we might term intervention relating directly to the immediate cultural understanding of the patient in ways that are like “kissing it better” with a child, others made claims of the invocation of special and uncommon powers or interventions either by themselves, or by some form of guide in a world outside our everyday, or by the invocation of a higher power similar to that invoked by, say, Alcoholics Anonymous (Winchester Sawa, Doetzel, Maynell, Zembal & Motta, 2012). Such claims were common among Roman Catholic, Hindu, Shamanistic, Reiki and other energy healers. But they were not part of the claims of Wiccan or Buddhist healers.

Here are a couple of examples.

The case of Headless Max. One of our cases we refer to as the case of Headless Max (Winchester Sawa, Doetzel, Maynell, Zembal & Motta, 2012).

The case in question involved a patient coming to a spiritual healer because the patient could not enter into his own kitchen in his flat because he invariably encountered an apparition behind the kitchen counter, an apparition with no head. This headless being blocked the way into the kitchen for the patient in question. The story continued as follows. The patient worked in northern Alberta with an oil exploration firm. His daily work involved flying into remote regions of the lake and forest country of northern Alberta in search of geological information, usually with a colleague. In order to fly in and out of the remote location the patient and his colleague would arrive by helicopter and depart by helicopter. Sometimes the helicopter could not actually land, so the two colleagues would have to be picked up by their climbing up a rope
hanging from the helicopter. On one fateful occasion the patient climbed up the rope first and
the colleague second. But at some point while flying away to find a more secure landing point
before being able to get in to the helicopter the colleague simply fell off the rope and
disappeared, never to be found. On return to his flat the patient always saw Headless Max in his
kitchen. The healer was a Roman Catholic priest who told the patient that he was suffering from
possession by a demon, something that the patient, himself a Roman Catholic, believed possible,
and that the healer would do an exorcism of that demon which he did following the standard
Roman Catholic procedures. Headless Max disappeared, never to return. In this case a higher
power was invoked, namely God acting through the Holy Spirit as referred to in the Apostles
creed as a member of the Holy Trinity.

Perhaps of all our cases this one, which came early in our experience, has been
most important for us, for it permitted us to see a situation in which the separation between
healing and curing, which was generally an important distinction for us, dissolved or appeared to
dissolve (Winchester Sawa, Doetzel, Maynell, Zembal & Motta, 2012). On the other hand it
posed a number of puzzles for us in its own right. Was this a case of a psychological illness that
could only be cured by “spiritual” means? Was it important, for example, that “demons”
objectively exist who could possess an individual in such a way that they could not get on with
their everyday lives so long as they were so possessed even to the extent of not being able to go
into their own kitchen? Some of our research group believed in the existence of demons, some
in the possibility of their existence and some thought that such beliefs could not generally be part
of the common experience of mankind, though “real” for some individuals. Or was it sufficient
that both healer and patient (or sufferer, perhaps) believed in the existence of demons on the one
hand and in the possibility of exorcism of the demon through religious means on the other? Or
was it even possible, perhaps, that while a patient would have to believe in the demons which
“possessed” him or her, the healer need only enter into the “personal world” of the patient and
offer the exorcism as a for which the patient might believe could affect a cure without actually
sharing the reality of the world with the patient? Could, for example, the healer be effective
even though not sharing the personal world of the patient? We have not resolved these matters
to our satisfaction as a research group, but we continue to explore cases in which the healer
appears to be good at entering into the personal world of the ill person in such a way that healing,
if not curing, is possible through the intervention of the healer.

The case of an aboriginal patient and healer: common reality and extraordinary reality.

In another case an aboriginal patient was suffering from personal difficulties relating in
part to family relations and in part to physical symptoms (Winchester Sawa, Doetzel, Maynell,
Zembal & Motta, 2012). The healer, himself aboriginal, suggested to the patient that he would
dream tonight and that he, the healer, would join him in his dream and together they would visit
and approach some of the patient’s wise ancestors to find out what to do. The patient believed in
this course of action and engaged in the dream exercise with his healer, listened to his ancestors
in his dream with the guidance of the spirit guide that the healer had met and invoked for the
journey in the dream land and the patient engaged in the suggested course of action and was no
longer bothered by his personal difficulties or physical symptoms.

This again raises for us questions relating to the “worlds” inhabited by healer and patient
seeking healing intervention (Winchester Sawa, Doetzel, Maynell, Zembal & Motta, 2012). It
suggests, perhaps, that we have to distinguish between the common world of everyday waking
life for most of us, the common world of common sense and natural science, and the personal
worlds that are so real for the patients who approach alternative healers of the kinds interviewed.
Again some of our research team think that if something is part of the personal world of an individual seeking healing intervention then that personal world is in fact part of the “real” world, though perhaps an unusual extension of it. For others on our team a distinction has to be maintained between the common world of common sense and natural science, a world that all of us experience and where we can engage in common and repetitive activities on the one hand, and the private or in any event non-common world of individuals in which they experience extraordinary things not found in the common world. For those of us with this latter view, both the experiences of the common world of common sense and natural science are real experiences for us all, but in the case of the extraordinary experiences of some of the patients and healers, that part of their world is real for them but not real in the common world.

*Other cases.*

Generally for most cases related to us, the healer not only would find out how the patient’s suffering, disorder, disease or distress was related to their personal beliefs but might invoke a hypnotic state, or a state of meditation, or prayer with the patient (Winchester Sawa, Doetzel, Maynell, Zembal & Motta, 2012) Sometimes this might involve the healer describing to the patient how he, the healer, had entered the patient’s mind and met a spirit guide to the patient’s mental and physical states, perhaps by moving to the “Buddha plane” and directly experiencing the patient’s troubles and once knowing what the difficulty was returning to the everyday world to suggest a course of action to the patient. Thus for this healer sometimes cure and sometimes healing were invoked through paranormal means, namely, apparent answer to a joint prayer.

While a number of our healers were drawn from Shamanistic, Aboriginal, Wiccan, Buddhist, Hindu or Energy healing traditions, many of our healers were drawn from the Roman
Catholic faith, many being priests, bishops or lapsed priests now actively engaged in healing full time (Winchester Sawa, Doetzel, Maynell, Zembal & Motta, 2012). It was perhaps not surprising that the healers from the Roman Catholic faith believed that such healing as they could bring about was due to the healing power of God’s spirit, a spirit who they (the healers) felt as at best a conduit for. But the healers from most of the other traditions, Shamanistic, Aboriginal, Energy and Hindu for example, also saw themselves as a conduit of healing power or energy or spirit not their own. Indeed, only the Wiccan healer claimed to have healing power herself and to possess special abilities not related to a higher power as such.

On the other hand healers from non-Christian traditions did not speak of the intervention of the “Holy Spirit” or of God directly, but often referred more generally to the intervention of a “higher power”.

Energy healers often invoked a notion of “energy” which they sometimes claimed simply to be identical with the ordinary notion of energy as we find it referred to in contemporary physics (Winchester Sawa, Doetzel, Maynell, Zembal & Motta, 2012). This energy might be involved both in the process of diagnosis and in treatment, the patient’s energy conveying to the healer what was wrong and the healer’s energy passing to the patient and effecting healing and perhaps cure of the disorder claimed by the patient. We retain an open mind to these very diverse claims to special powers related either to long years of training or to their being in possession of special and unusual paranormal powers. Indeed, as mentioned above, only the Wiccan healer claimed to have healing power herself and to possess special abilities not related to higher power as such. While the Buddhist healer did not invoke a higher power, neither did he claim to be healing himself, but rather something more like leading the patient into a better path.
Discussion

Perhaps our most important findings were the distinctions we found ourselves having to make given the material at hand in the interview narratives (Winchester Sawa, Doetzel, Maynell, Zembal & Motta, 2012). First, we had to distinguish between healers telling us of those patients who were able to go on with their everyday lives after the healers’ interventions and those who we referred to as healed.

Second, we had to acknowledge claims to there being those who appeared to the healer to be free completely of their presenting symptoms and who they wished to pronounce as cured. Nonetheless, some of these seemed destined to spend the rest of their days living as if they were still in distress from their presenting ailment or complaint, for example, a now “cured” or completely removed cancer. However, the reverse was more often true, namely, that while the patient was rarely cured in a medical sense in that their presenting disease or disorder completely disappeared never to return, commonly they were able to go on with their lives as if the presenting disease or disorder was largely unimportant and no longer an impediment to living fully.

Third, it became clear to us that all of our healers worked with patients who came to them hoping to be healed and perhaps cured and that all of the healers had definite compassionate intentions to heal and perhaps cure. Thus we believe that the intentions of both the patient to be healed and the compassionate, loving intentions of the healer in the sense of caritas or agape are both crucial in the healing success of non-Western healing traditions. And a major part of this compassion was listening to and entering into the cultural world, the world of the deeply held beliefs, of the patient. The distinction between such healing by listening to and entering in to the world of the patient before offering advice or treatment that accepts and takes that world into
account and healing by the invocation of special and unusual powers of the healer appears to us to be central.

There was a meditative component in many of the interventions of our healers which paralleled in some respects the approach of the Aboriginal healers who had their patients enter into a dream world with them (Winchester Sawa, Doetzel, Maynell, Zembal & Motta, 2012). The invocation of prayer, of meditation, of breathing exercises, of relaxation and perhaps of hypnosis, seemed to us to be of this nature in the claims of many of our healers. We intend to study these claimed unusual, perhaps paranormal, powers more fully in future studies that will involve healers similar to those whose narratives we have just studied and are planning joint work with scholars in Indian and Israel as well as in Canada. In these studies, however, we will not simply ask the healers to tell their stories but will work with both healers and patients to follow their course of diagnosis and treatment by such healers, making sure that the lack of adequate prior diagnostic materials and medical follow up is not ignored.

Perhaps the most important result of our studies is that all of our holistic healers, from whatever tradition, listened carefully to their patients, attempted to understand and enter into their cultural heritage and world view, and offered suggestions and treatments with love and compassion that arose from that understanding (Winchester Sawa, Doetzel, Maynell, Zembal & Motta, 2012). If this approach could be encouraged in all of the next generation of physicians, surgeons and family practitioners coming out of Canadian medical schools, an improvement in patient health would most likely be made.

Finally, the suggestion of the Scottish Health Department (Chisholm, 2002) that further research should be undertaken to determine precisely which elements of spiritual care are effective will be at the centre of our future research undertakings in which we plan to work with
colleagues in India and Israel to engage in direct spiritual intervention in a variety of health related conditions (Winchester Sawa, Doetzel, Maynell, Zembal & Motta, 2012).

Abstract

International travel has often been difficult for teacher education candidates who wish to become more globally prepared because their schedules are restricted by the requirements of a general education, certification requirements, endorsement coursework, and sometimes an additional major. Yet those students who are able to not only study abroad, but who can participate and teach in schools abroad bring a level of cultural clarity and sensitivity to their own future classrooms and students. This paper will report on a three-part, scaffolded system that has proven successful in supporting both an international student teaching experience and confronting the challenges that attend student teaching placements in general.

Introduction

With more and more institutions of higher education emphasizing global awareness and citizenship within their mission/vision statements, international travel by college students from America has tripled in the past 20 years (Redden, 2013). While this statistic is exciting, international travel has been difficult for teacher education students who wish to become more globally prepared because their schedules are restricted by the requirements of a general education, certification requirements, endorsement coursework, and sometimes an additional major.

For many teacher education students, study abroad means postponing graduation for a full semester. Yet those students who are able to not only study abroad, but who can
observe and participate in schools abroad bring a level of cultural clarity and sensitivity to their own future classrooms. For those students who can take a full semester, new opportunities are available through university-to-university exchanges, third-party placements, or international academic contacts. For those students who cannot take a full-semester, we have developed a model of student teaching in an international setting that has been both satisfying and successful because of a scaffolded-support system.

The purpose of this paper is to describe this three-part system that has proven effective in supporting both an international experience and confronting the challenges that attend student teaching placements in general. The student teaching placements described herein refer to ½ semester, second placement student teaching experiences: The first half of the semester, the student is placed within a “home school” placement in Iowa, USA. In the second half of the semester, the student is placed in Belfast, No. Ireland for either an elementary or secondary placement, according to his/her certification level and subject-specific endorsement(s).

In education, scaffolding refers to the strategy to “support a task in order to build a firm understanding that will eventually allow students to solve problems on their own” (Woolfolk, 2014). Like physical scaffolding that provides support during a project’s construction, this educational scaffolding is not permanent, but is a support measure during concept or skill development. Beyond support, educational scaffolding as a process and product is also valuable because it provides a focus on just that area that needs attention. As Wiggins (1989) states, “In the mass of information that students are exposed to, what the modern student needs is the ability to see how questions both produce and point beyond current knowledge.” Structuring support for observable behaviors that challenge student teacher education candidates to both learn and grow, therefore, must be consistent and reliable in order to maintain that emphasis. Moreover, in applying this model to an international setting, students must be able to rely on the knowledge they bring to the situation while moving beyond that knowledge to adapting to the reality of the placement. In this model, scaffolding is provided for teaching
proficiency, international travel logistics, and cultural responsiveness to provide for a successful and international student teaching experience as in the figure below.

Figure 1. International Student Teaching Model

Part 1: Teaching Proficiency

While teaching effectiveness depends on a teacher understanding human development and learning theory, subject-matter competency matters. Darling-Hammond (2006) asserts that subject competency “provides the foundation for teaching. This means that teaching strategies must be learned in the context of specific content” (p. 82). Teacher education institutions must insist that their teaching candidates have a depth of knowledge about their endorsement subjects, but also have the ability to select, organize, and develop curricular materials in those subjects so that they are themselves independent and continuing learners. When student teachers move to an international placement, they must be ready to recognize the similarities and differences in curricular approaches and be ready to create lessons from the resources at hand and/or through electronic sources.

Standards that define subject competency allow teaching candidates to identify the concepts to be stressed, but instruction and assessment are the means that promote
student learning of those concepts and comprise the purpose of teaching--learning. “Curriculum is the place where the learner and content meet” (Darling-Hammond, p. 82). So student teachers must be ready to use active learning strategies to both focus instruction and engage students in their own learning. This curricular intersection includes subject-matter knowledge, but it also entails pedagogical knowledge. A strong pedagogical knowledge “involves a knowledge of teaching about teaching and a knowledge of learning about teaching and how the two influence one another” (Loughran, p. 1180). This is more than a “play on words.” It means that student teachers need to intentionally seek out knowledge about and for teaching practice such as learning theories, models of teaching, and the psychology and philosophy of teaching methods in order to move beyond the “what” to teach and “when” to teach it, to the “why” of making instruction meaningful within the context of student preparation and location. For example, a “flipped” classroom may work very well within some US locations, but simply not be possible in a location where technology is limited.

Teaching proficiency is also enhanced by a student teacher’s management skills that reach out to each student while “managing” the group. Bill Rogers (2007) recommends that classroom management and discipline move from a punitive emphasis to one concerned with guidance and instruction. “It is the way we teach and enhance a social order where rights and responsibilities are balanced…Teachers should, and most do, make every effort to plan for a positive working environment” (p. 51). Correction that is paired with encouragement and self-reflection can be gained by learning management skills such as creating clear and brief instructions, using positive structures (“please do” instead of “don’t do”), learning students’ names quickly, using agreed upon signals, and focusing on behavior that has been disruptive instead of attacking a student personally. In any classroom setting, including international settings, student teachers must follow the routines and management policies of their mentor teachers, but the practice of positive discipline that emphasizes guidance in following those routines and policies is appropriate anywhere.

Finally, attaining teaching proficiency is dependent upon knowing how and when to adapt curriculum to fit student needs. Today’s classrooms hold challenges that a
diverse, heterogeneous group of learners bring that must be balanced with state and local standards and targeted expectations. The good news is that these standards and benchmarks create high expectations for all students, but the challenge is to help each student maximize their learning. Dr. R. L. Canady asserts there are three groups of students in a classroom:

1. A group of 25%-27% of student who learn “in spite of us” who do their work and have support of significant others.
2. A group of 15% to 25% of students who are identified as having some exceptionality and receive additional resources.
3. A group of 37%-50% who learn because of the teacher’s skills and efforts who create appropriate instruction and assessment aligned with standards.

Gregory & Chapman, 2007, p. 5

A differentiated classroom is one in which curriculum adaptations are made to meet the unique needs of students so that 100% of the student have the opportunity to learn. These adaptations may be made in content, assessment tools, performance tasks, or instructional strategies (content, process, or product), but teaching proficiency now must incorporate strategies to differentiate instruction so that teachers use processes that are best suited for students.

Scaffolding Support for Teaching Proficiency

In order to support teaching proficiency so that the student teaching experience is indeed the capstone movement from student to teacher, a teacher education program can stress conceptual as well as pedagogical knowledge beginning with recruiting first year students to senior clinical experiences with the following actions.

1. Emphasize the importance of InTASC Teaching Standards as well as national standards for content areas from the very beginning of the program. These standards are then distributed across program courses and aligned with target assignments and assessments. A student must received a “C” or better on assignments to meet the standards. If a student does not meet a standard within a course after remediation, the student fails the course. While this may seem harsh, it is both a motivating tool and
support for students as they are offered remediation as a carrot and know that they will have to retake the course if they do not meet the standards required.

2. Define endorsement areas so that content areas both meet national standards and go beyond state minimum requirements to establish credibility and expertise that creates a level of confidence and comfort when teaching. Students must pass all endorsement courses with a “C” or better or retake the course. Like the InTASC Standards that are met in education courses to ensure pedagogical competency, subject-matter competency is established by completing all endorsement courses (including advanced courses) with a “C” or better. This emphasis on academic rigor is a part of preparation for international study as well. Students must have a 3.0 or better grade point equivalent and have met all teaching dispositions before they would be approved for international study. Those students who do go abroad represent their programs and university as well as themselves and must evidence a critical approach to thinking and learning.

3. Create clinical practice for students throughout their programs from the first year to the student teaching semester. A typical student in our program does 100-120 pre-student teaching hours in a diverse range of schools. In this clinical practice, students are expected to evidence growing pedagogical skills, but they are also assessed on specific behaviors that are aligned to our three main teaching dispositions: Learning Leader, Student Advocate, and Reflective Practitioner.

4. Establish benchmarks for teaching dispositions. At different points in their program, students are asked to rate themselves in their attainment of dispositional behaviors and form a goal for the next semester about those teaching dispositions. Mentor teachers in K-12 classrooms as well as faculty members also assess each student’s behaviors that evidence teaching dispositions.

5. Empower students to explore management techniques by having them create a classroom management plan for their future classrooms and practice strategies as part of clinical experiences.
6. Require teaching candidates to employ differentiated instruction. Teacher education students are required to develop and implement differentiated learning lesson plans in their methods classes, so they will be prepared to help each student learn.

7. Define program expectations clearly so that student teachers will know what is expected of them in the international site.

8. Place student teachers in a home site student teaching experience for ½ semester before they go abroad to ensure that teaching competency has been reached before they enter international classrooms.

**Part 2: International Travel Logistics**

Just as teaching proficiency is an evolving and continuing pursuit, the actual travel and on site living arrangements for an international student teaching assignment needs to be supported through pre-departure preparation and sustaining activities while abroad. Supporting student teachers through international travel logistics recognizes that college/university students experience stress in their modern lives; moreover, international travel, while exciting, also produces what researchers are labeling “acculturative stress” (Yu, et al. 2014). Yu et al. verified seven acculturative stress subconstructs as students traveled to a culture different than their own: “rejection, identity threat, opportunity deprivation, self-confidence, value conflict, cultural competence, and homesickness…. Acculturative stress was more common among international students who were not well prepared, married, and belonged to an organized religion” (p. 1). The first of these subconstructs are external: rejection, identity threat, and opportunity deprivation. The next three subconstructs—self-confidence, value conflict, and cultural competence—are intrapersonal. The last subconstruct, homesickness, is a broader category that, if reduced, does not tend to lower the stress in the other areas. In addition to these measures of stress, American students are also confronted with different currencies and converting dollars to those currencies, the necessity of a passport to travel relatively short distances, and differing visa requirements.
While acculturative stress is real, it does not mean that international travel and study should be avoided. Preparedness has long been recognized as a preventative measure of acculturative stress (Park & Rubin, 2012) and as a means of reducing interpersonal anxiety that is often an outcome of stress.

**Scaffolding Support for International Travel Logistics**

Preparing for the logistics of international travel for student teaching begins at least a full semester before the travel is to take place so that careful planning reduces stress through the following steps.

**Predeparture:**

1. Check transcripts, grade point, and disposition assessments to make sure students are eligible for international travel.
2. Help students understand and complete all paperwork required by the university for international travel.
3. Encourage students to meet with a financial aid officer immediately so that distribution of financial aid and scholarship monies while studying abroad is understood by all.
4. Provide third-party contact information if the placement would be made through a third party.
5. Set a deadline for acquiring a passport and an appropriate type of visa and provide web links that are available 24/7 for students to access these services. For example, students going to Belfast, No. Ireland can either process their visas themselves by going to the following website: [https://www.visa4uk.fco.gov.uk/](https://www.visa4uk.fco.gov.uk/) or they can go through Perry International ([www.perryvisa.com](http://www.perryvisa.com)) for visa processing at [http://www.perryvisa.com/visaRequirements/United%20KingdomStudentUSNew%20York.php](http://www.perryvisa.com/visaRequirements/United%20KingdomStudentUSNew%20York.php)
6. Help students choose courses that have been articulated in the past or can be articulated to courses in their programs.
7. Ensure that international placements are grade and subject appropriate so that the student teacher can be assured of reasonable teaching assignments.

8. Facilitate students’ background checks so that they might enter classrooms on site.

9. Encourage students to obtain an International Student Identity Card (ISIC) at http://www.isic.org.get-your-card The ISIC can be valuable when studying abroad. It is recognized worldwide and immediately proves that a student is eligible to receive available discounts on travel, accommodations and admission to museums, theaters and other cultural activities in more than 90 countries. It offers savings of up to 50% over commercial fares on intra-European travel and many other benefits, including illness and accidental death insurance coverage. Additionally, a 24-hour help line is available to holders of the ISIC.

10. Tell students to register with the US State Department to enroll in the STEP Program (Smart Traveler Enrollment Program). This is a free service that allows U.S. citizens traveling abroad to enroll their trip with the nearest U.S. Embassy or Consulate. This service also provides travel warnings and notifies U.S. citizens/nationals in the event of a disaster, emergency or other crisis, as well as plans for evacuation coordination. The U.S. Department of State is committed to ensuring that any personal information received by our overseas U.S. Embassies and Consulates pursuant to the STEP process, whether in person or otherwise, is safeguarded against unauthorized disclosure.

11. Review with students the Traveler’s Health information for the site to which the student is traveling at http://wwwnc.cdc.gov/travel

This site contains useful information about packing for one’s health and safety, and has generally good tips such as bringing an extra pair of glasses, health documents, first-aid kits, medical supplies, and supplies to prevent illness or injury.

12. Confirm housing arrangements and set up a communications link between the host institution and the home institution.

13. Hold a departure meeting one week before departure to check through 1-12 and answer any questions that may linger.
**Post-departure and On-site Communication**

1. Confirm the safe arrival and housing accommodations with students after they arrive via email.
2. Confirm that in-school placements reflect assignments that have been communicated earlier via the Internet.
3. Continue weekly logs from students in which they are given prompts that encourage reflection, goal setting, and sensitivity to diversity via Discussion Boards in Blackboard.
4. Collect beginning, middle, and ending blog entries from students that shares their experiences with their home school classmates and future student teachers who can gain vicarious experiences via the Internet.
5. Foster the completion of student teachers’ electronic portfolios via LiveText software.
6. Coach student teachers through any problems through electronic office hours.
7. Maintain communication with International supervisory contact.

Upon return, graduating student teachers are invited to share their experiences with classes and through their published blogs and to evaluate their international experiences so that the program can continue to build on success and improve where needed. Students who have had this experience also help to recruit students for future international placements.

**Part 3: Cultural Responsiveness**

The third part of preparing and supporting teaching candidates to student teach abroad is developing cultural responsiveness. Conway and Clark (2003) suggest that student teachers engage in a journey outward as they develop, but “they also have a journey inward when considering the self during the period of student teaching” (p. 98). Part of this inward journey is facing ethical decisions in the classroom and developing cultural responsiveness. Because culture is central to the way we communicate and receive information, student teachers must be ready to acknowledge and react respectfully to
students’ cultural background wherever they teach. Teachers in the United States face the reality that many of their students come to them with ethnic, linguistic, racial, and social class backgrounds that are different from one another and different from the student teacher. In an international setting, these differences may be even further marked. Cultural responsive or cultural relevant teaching was first espoused by Gloria Ladson-Billings in her seminal publication, *Culturally Relevant Teaching: The Key To Making Multicultural Education Work* (1992). Teachers who are culturally responsive use their students’ cultures as vehicles for learning and create a meaningful bridge between the home and school. In an international setting, study of the culture one is moving into is vital to connecting to students and creating or maintaining a community of learners. Accepting the new community and attending community events, studying the history of the new community, and avoiding comparisons with one’s own home community is culturally validating and enables international student teachers to make the inward journey valuable.

As international student teachers work hard to relate to their students and their students’ culture through culturally responsive teaching, they also face the stress of being separated from their peers and their own culture. For almost four years these student teachers have been part of an American college/university experience with its academic, social, emotional, and networking experiences that have led to their personal and professional growth. When the initial excitement of an international placement starts to wear off, these student teachers find themselves outside the normal rhythm of their days and may experience a type of homesickness that is related to their own culture and peers rather than a fixed location. Little luxuries such as unlimited ice, unlimited texting and phoning, and frequent showers that are not always available in international settings can become major issues unless international student teachers have been prepared for their new environment.

Finally, student teachers in an international setting have a unique opportunity to develop professional relationships with other teachers, administrators, and students internationally and to bring a differing worldviews back to their future classrooms in the United States with an ethnorelative view. Bennet & Bennet (2001) name acceptance,
adaptation, and integration as elements of ethnorelative thinking wherein a worldview is seen as a complex combination of worldviews that moves a teacher toward intentional changes that seek intercultural relationships rather than avoid them. Such relationships must always be sought and maintained at the professional level with sensitivity to varying administrative organization and cultural channels of communication.

**Support for Cultural Responsiveness**

In her book, *Culturally Responsive Teaching*, Geneva Gay asserts many educators believe that good teaching “transcends place, people, time, and context. They contend it has nothing to do with the class, race, gender, ethnicity, or culture of students and teachers” (p. 22). Yet individuals’ characteristics that name their gender, race, ethnicity, etc. are deeply embedded in their individuality and affect their learning. For example, promptness, attention, and eye contact can be influenced by cultural norms and lead to judging students as deficient and in need of “fixing” when they are simply conforming to social/cultural influences. A teacher cannot know all the cultural influences of his/her students, but a teacher can develop the sensitivity to place and people and investigate the cultural differences among his/her students as well as be awareness of one’s own cultural influences. To this end, our Teacher Education Program has done curricular mapping of 12 different characteristics of difference: English language learning, race, talented and gifted, at-risk, ethnicity, LGBT orientation, gender, sex, socio-economic-status, religion, immigrant status, and IDEA special needs designation. Each of these characteristics are “strongly addressed” at least twice within the education program through experiences that are multidimensional and may be identified as active learning measure, simulations, experiences with debriefing activities, or in-depth student reflections. They are also “addressed” in multiple courses by creating awareness through classroom discussion, activities, or authentic intellectual work.

International student teaching cultural “homesickness” and stress can be lessened through weekly coaching contact with university personnel at their home university. While phoning and texting frequently is very expensive from an international site, most international placements offer Internet services by which students can keep in touch. Asynchronous Internet communication also supports communication even though the
parties are in widely disparate time zones. We also publish three blog entries from student teachers abroad that are available to their friends and family back home. These blog entries are written by the student teacher, but edited by university personnel to make sure that they are ready for public presentation before they are published.

International professional relationships are encouraged by collaborating with the host institution to place student teachers’ living spaces in close proximity to student teachers from other countries so that students who have student taught abroad carry forward the experiences and connections that they have made. The electronic portfolios that students prepare as they graduate often carry reference letters from their international supervisors and mentor teachers which then offer a unique perspective on a teaching candidate’s potential for future employers. Ceremonies that mark the end of the student teaching experience at the international site have also be helpful and providing an institutional “home” away from home.

**Summary**

While teaching as a career is interesting, complex, and rewarding, it is also a career that engenders stress and anxiety for novice teachers which, in turn, necessitates support. The confidence and self-efficacy that is apparent in teacher leaders evolves from experience as well as education. However, in her study of student teachers and stress, Melissa Kelly (2014) states, “student teachers do not have the benefit of years of experience to help them deal with day-to-day classroom issues” (p. 1). These issues can be exacerbated by placements in international settings where travel logistics and cultural differences generate additional pressures when implementing educational knowledge, gaining experience, and learning in order to create a professional future. Scaffolding support through program preparation, meetings, materials, and technologies cannot alleviate all stress, but these supports can lessen the fear of the unknown and provide a coaching presence for student teachers as they gain confidence and independence performing as proficient and culturally responsive teachers in an international setting.

TITLE: Keeping Students Engaged Through Outreach Education: Going the Distance

TOPIC AREA    Rural Education

DESCRIPTION    Students who display chronic absenteeism often lose a semester or an entire school year. Typically, these students are given teacher-made materials or distance education modules in an attempt to keep them on track to graduate. However, once these students leave the physical building, they often become further disengaged and withdraw from school. The Going the Distance school completion program combines the expertise of teacher, social worker and community to re-engage lost students.

Keeping Students Engaged Through Outreach Education: Going the Distance Program

Overview:

Students who display chronic absenteeism often lose a semester or an entire school year. Typically, these students are given teacher-made materials or distance education modules in an attempt to keep them on track to graduate. However, once these students leave the physical building, they often become further disengaged and withdraw from school. The Going the Distance school completion program combines the expertise of teacher, social worker and community to re-engage lost students.

Background:

In December of 2011, the Going the Distance school completion program was born. The program arose out of observations that students displaying high absenteeism who were sent home with distance education materials or teacher made materials were likely to fail their semester or withdraw from school.

The Going the Distance school completion program provides a service for junior and senior high students of the Wild Rose School Division who cannot be adequately served in their current school environment and whose semester or school year completion is at risk. This may be due to behavioural or mental health reasons, as a result of a threat or complex needs assessment or because of physical health problems or a planned medical absence. The initial indicator for referral consideration is often a high rate of absenteeism from school. The Going the Distance Program has three core components; a relationship component, an academic component, and a community component. Students, and their guardians, agree to participate in all three program components in order to be a part of the program.

The Relationship component of the Going the Distance Program recognizes the importance of students having connections, or being engaged with, their school and community. We also acknowledge that a positive one-to-one relationship between a teacher and student is a powerful predictor of future academic success. To this end, students have daily contact with their program teacher via text messaging or emailing. Home visits and site visits to schools or other places of study are also made. Students can also choose to study at one of our two outreach schools.

The Academic component of this program makes use of “team-taught” distance education courses offered through Alberta Distance Learning Centre. Our teachers use these on-line and print courses and as team teachers, modify and mark according to the students’ needs. We are able to give students credit for what they have accomplished prior to leaving their home school so that, for them, less is lost.

The Community component of the Going the Distance Program recognizes that many children and their families need more than academic support. The social worker/case manager of the program assists students and their families to access a variety of programs available in their community and well as being a support to students and their families. Examples of community services accessed by students are Alberta Mental Health Services and McMan’s Parent Place. All students in the Going the Distance program either volunteer in their communities or participate in work experience.
Scenarios

1. Scott is a Grade 9 student who was referred because of school absenteeism due to anxiety. To date Scott is passing LA, Math and Social Studies courses and is a regular volunteer at the Good Samaritan Society both in the kitchen and recreation services. Although Scott is meeting regularly with the program social worker, we are looking for community supports to address Scott’s anxiety.

2. Haylee is 16 years old and a young mom. She is supported through our program and comes in regularly to Visions West Outreach School so she can have some dedicated time to do her schoolwork. Hayley has made arrangements for babysitting and we support her with transportation when her arrangements fall through. This arrangement has resulted in much greater academic success for Hayley who is in a combined grade 9/10 program. She is also has a mentor through McMan’s family services; a volunteer mom who keeps in touch with Haylee. The Going the Distance teacher and social worker make periodic visits to Haylee’s home.

Challenges

- Reaching students who exhibit school refusal behaviour (no wish to continue in school, externalizing disorders such as Oppositional Defiant Disorder or Conduct Disorder) as opposed to school avoidance (chaotic life circumstances, internalizing disorders such as anxiety or depression).
- Helping students see mental health services as a valuable option for support.

Summary

The Going the Distance school completion program endeavors to meet the needs of students with high absenteeism rates through a teacher, social worker and community collaboration. Students participate in all three components of this program including a relationship, academic, and community component. Of these three components, the relationship component is key. It sets the stage for student success in all components and is essential for student retention.
PANEL SESSION PROPOSAL TITLE PAGE

TITLE   Improving Life Chances Through Community Partnerships: A Wrap Around Approach

TOPIC AREA Rural Education

DESCRIPTION Students with behaviour challenges or mental health issues are not often successful with supports typically offered in schools. To improve the life chances of these students’ educators joined professionals from local community services, students’ and their families in a collaborative and solution focussed process. Keeping “what’s good for kids” as the guiding compass ensures participants think outside of the box to find creative solutions to complex problems.

Author(s)

Kathy Murch (B.Ed., M.Ed.) Director of Student Services, Wild Rose School Division

Kathy has been an educator since 1983 and is passionate about kids. Throughout her career, she has been a teacher, vice principal, Program Unit Funding Coordinator and is currently the Director of Student Services for Wild Rose School Division. She completed her Masters of Education in Special Education through Flinders University.

Darlene has a Masters degree in Child and School Psychology from University of Calgary. Darlene has taught for the Faculty of Early Childhood at Red Deer College for ten years, taught in the public system K-12 for nine years and is currently the Director of Wellness for Wild Rose Public Schools in Alberta.

Rocky Mountain House, Alberta, Canada   darlene.ferris@wrsd.ca
Overview:
Supporting students with behavioural challenges is not easy once school based strategies and resources have been depleted. Educators often ask themselves, “What else can we do?” Wild Rose School Division found that keeping “what’s good for kids” as the guiding compass and inviting community stakeholders into a collaborative process proved to be beneficial to students and their families.

Background
Historically, students with behavioural challenges who were unsuccessful in a traditional educational setting were provided with modules from the Alberta Distance Learning Center to work on independently at home. Although this met the requirements of The Alberta School Act by providing alternate programming, the approach was less than successful since completing these modules required students to work independently and to be self-motivated; two of many skills that are usually lacking in students with behavioural challenges.

The direction taken by Wild Rose School Division has been to organize a collaborative process involving the student and their family, representatives of the school and Child and Family Services, the School Resource Officer, Mental Health Therapist and any other resource that may benefit the student or family. Each meeting begins with the student and/or family expressing their hopes and dreams for the student’s future, highlighting the student’s strengths and motivating interests. Next, the family is asked to identify the steps needed to make this dream a reality. Together the student and family identify all barriers and challenges that are impeding the success of the goal. Once a goal and barriers have been clearly identified, the team collaborates with the student and family to see what resources are available to them and develop a plan of action. This solution-focused conversation not only supports the student and their family but also takes pressure off of the school with its limited resource base. The discussion that encourages teachers and leaders to focus on improving the life chances of their students rather than just test results promotes a willingness of staff to think outside the box and come up with creative solutions.
A Case Study:
When a grade 8 student with severe behavioural challenges was expelled from school, “Make this look different” was the direction Brian Celis, Superintendent of Wild Rose Schools gave to the Student Services Department. A meeting was organized with various community and school stakeholders including representatives from the school, District Office, High School Outreach, Mental Health, Mental Health Capacity Building pilot (MHCB), Family Wellness Worker (FWW), Family Community Support Services (FCSS) and the parents of the student. These stakeholders demonstrated a high level of commitment as well as great synergy and the result was an excellent example of what “wrap around” services could, and should, look like. The resulting program was multi-faceted and included: a Teaching Assistant accompanying the student to the Outreach School to work on curricular work under the supervision of the teacher; if the student’s anxiety level increased, arrangements were in place access work experience at the local pet shop; daily physical activity was provided by the MHCB Coordinator who met the student every morning to work out in the local gym; a division trustee secured the support of a local pilot who agreed to take the student on weekly flights; social connections were maintained with a specific peer who met to work on a collaborative project. The Mental Health Therapist advised the Family Wellness Worker and Outreach staff on how to prepare other students for working alongside this explosive student. The Mental Health Therapist continued to support both the student and the family on an ongoing basis. The mother of this student agreed to attend the Outreach to provide support in the afternoon if this need arose. Although it wasn’t without its challenges, this “community” approach to providing support for a student in need allowed the student to complete the grade 8 curriculum while remaining semi engaged and connected to his home school and community. Today this student has been successfully reintegrated into a regular high school program and is on track to graduate in June 2015. As a result of this success story, Wild Rose School Division has adapted this model to successfully support many other at risk students.

Challenges
- Maintaining social connections once a student has been removed from an integrated school setting is difficult. Reliance upon the family to ensure this occurs outside the school day has been somewhat successful.
- Family following through on expectations can at times be a challenge even with the support of the team.
• Buy in from all community stakeholders can be difficult. Collaboration is a voluntary process and working to grow team members takes time.

Summary:
Working together and maintaining a commitment to improve the life chances of all was not as difficult as initially perceived. Maintaining a focus on the right things, collectively accepting responsibility for all students as a community, and committing to making it work, we found that we were better able to provide effective and meaningful supports for all of our students.

Supporting Student Wellness and Achievement through Family Wellness

Overview:

Students who struggle at school often come from families who are struggling in the home. Supporting students in isolation of their families although expedient is not always effective. Hiring registered Social Workers allow schools to support student wellness and achievement in a more holistic and family oriented approach.

Background:

Four years ago Wild Rose School Division had access to only 3 community family wellness workers. These three workers were responsible for 17 schools and three alternative programs that served approximately 5100 students and their families. Over the past three years WRSD has assumed responsibility for the administration and supervision of the program and has grown it to include twelve workers. The program serves the communities of Rocky Mountain House, Drayton Valley, Caroline, Leslieville, Condor and Breton. In 2012-13 school year, the Family Wellness Program provided continual support to 560 individuals and families. Statistics for 2013-2014 school year shows an increase in workload to 1035 individuals accessing regular support and many others seeking a one-time emergency consultation.

The Family Wellness Program provides support to children, youth and families to assist them in reaching their potential both academically and personally. The Family Wellness Workers are available to enhance the development of a student’s educational, social and emotional experiences. They are able to provide assistance to students on an individual basis and may also facilitate group sessions dependent on the needs of individual schools. Workers are able to support clients through home, school or offsite visits. The program is a link to a variety of community agencies and advocates effectively in support of students and their families.

In collaboration with community partners and examining statistics, Wild Rose School Division recognizes the importance of providing the proactive support of Family Wellness Support when approaching mental wellness. According to Alberta Health Services statistics each year over 500,000 Albertans receive at least one mental health service from a physician. In a three-year period, over 33 percent, or one in three Albertans receive at least one mental health service from a physician. These rates are underestimates of the prevalence of mental health problems because they do not reflect the services that some individuals receive services from private providers. Further, preliminary results of a recent Alberta Report found that suicide rates for youth under the age of 18 more than doubled in the last year. Suicide is consistently a leading cause of death among Albertans. The importance of healthy mental development for our children and youth cannot be overestimated.

The Family Wellness Program is a crucial component of Wild Rose School Division’s wellness programming and is critical to our communities at large. Family Wellness Workers provide a majority of the school-based counselling services, which are not available through regular academic programming.
The Family Wellness Program would not be possible without funding and support from CFSA, Town of Drayton Valley, Town of Rocky Mountain House, Clearwater County, County of Brazeau, Red Deer Catholic Schools, Rocky Mountain House and Drayton Valley FCSS. Through these partnerships, and continual consultation with Alberta Mental Health, we are better able to foster safe and caring environments within our schools and throughout our communities.

Family wellness program goals align with the Alberta social policy goals in that they strive to protect the vulnerable. Family wellness workers assume the role of advocates for our youth and families who need help. The ultimate goal of a family wellness worker is to empower the individual to take control of their own lives and pursue goals that will fulfill their life and be successful in the community. Through education and community partnerships, individuals are given the skills and knowledge that they need to develop healthy and strong relationships. In our journey collaboration and partnerships have been crucial in developing our program to ensure that we meet the needs of both the individual and our community. Our partnerships with Children and Family Services, Royal Canadian Mounted Police and Alberta Health Services have been instrumental in moving us forward. Family wellness workers regularly access these partners for informal consultation as well as more formal Wrap-Around Meetings for more complex cases.

Our family wellness program also operates under the guiding principles of being flexible and responsive. This means that the program is set up with a person centered approach where flexibility involves being able to do what is necessary in a timely fashion as well as working with families that have children of all ages not just school-aged. Responsiveness includes providing short-term counselling and support or working with families to remove barriers in order for them to access other services. The family wellness worker ensures the most efficient and effective delivery of services for families by identifying and eliminating overlaps and gaps to make the best possible use of community, school and government resources. Family workers need to work where the children can access them and thus are primarily located in schools however they also work in community facilities, recreation centers, hospitals, or wherever else might be convenient for the individual.

Mental Wellness is a priority of Wild Rose School Division and as a result has hired a Director of Wellness to plan, monitor and supervise all of the division’s wellness initiatives. As a division we are talking about mental health openly and finding ways to get to students and families sooner. Throughout our division and our family wellness program our aim is to preserve dignity and instill hope.

The Outcomes of Family Wellness (Social Workers) in our Schools

- Family wellness workers address the entire family and do not treat the child as an isolated entity unaffected by its surroundings
- Family wellness workers work with clients in the surroundings where they are most comfortable (home, school or community)
- Family wellness workers make home visits; a lot is learned about a family situation by visiting the home
- Family wellness workers advocate for the family; sometimes when they advocate for the best interest of a child it will be against what the school is wanting
- Family wellness are able to take parents/clients to medical appointments including family doctors, pediatricians and mental health therapists
• Family wellness workers are able to follow the child to other institutions to help with transition, in past we have had our workers go to group homes in Edmonton, new schools, post-secondary institutions and even psychiatric hospitals.
• Family wellness have accompanied families to hospitals for emergency care for issues including suicidal ideations and other mental health
• Family wellness workers attend inter-agency meetings in their respective communities thus collaborate with and are connected to local referral sources
• Family wellness workers fulfill a community component; some offer parenting classes, Roots of Empathy Coordination, Community Family center operations, Boys and Girls Club, Mentorship Programs, Community Programs such as Go Girls, Safety Day Presentations
• Family Wellness are not a member of the teachers’ association and follow a Code of ethics developed by the Alberta College of Social Workers
• Family Wellness Workers are not tied to one school and can see students from the same family who attend different schools and get a bigger picture of what’s happen for the children and families
• Also since workers are not tied to one school if one case warrants a male worker or a female worker we can certainly accommodate.
Abstract

Activity theory (Engeström, 1999, 2001) views human activity as a system where agents (individuals) transform objects into outcomes mediated by tools through interaction with community (a group with a shared goal), rules, and division of labor (task divisions, power, status). Moreover, all activity systems are a part of a network of activity systems. This holistic and collective view of human activity has been increasingly applied in second language learning research. Furthermore, a core principle of activity theory that contradictions and tensions within and between activity systems serve as a driving force for learning and development is relevant to teacher development. The purpose of this paper is to analyze accounts of writing center tutors’ tutoring practices from an activity theory perspective and offer designs for a program that contributes to improving tutors’ professional development.

Primary data in this study consist of interviews with graduate student tutors of English writing in two university writing centers in Japan. Eight Japanese and non-Japanese tutors participated. The primary data were complemented by additional data including observations of tutoring, interviews with the writing center directors, and informational documents about the writing centers in which participants worked. These qualitative data were analyzed inductively against activity system components, activity system networks, and systemic tensions discussed in the source literature (e.g., Roth & Lee, 2007).

Preliminary analysis indicates that tutors’ tutoring practices can be effectively understood through an activity system, in which tutors (agents) work on objects/goals (e.g., the improvement of students’ writing and learning) through mediating tools (e.g., tutors’ own disciplinary and writing expertise and prior writing experience, and shared information and concerns with other tutors). In each activity system, various tensions (e.g., between students’ requests for proofreading and writing center rules against it) contributed to tutors’ development as they approached the tutoring strategically in order to resolve those tensions. Furthermore, tensions between interacting activity systems (e.g., writing center tutoring and students’ learning in regular writing classes) gave tutors an opportunity to see students’ learning from a larger perspective and thus facilitated their professional development. These findings reveal the robustness and usefulness of activity theory both as a
theoretical and an educational framework.

Based on the findings, suggestions for program design that contribute to tutors’ professional development are offered. Those suggestions emphasize raising tutors’ awareness about their prior engagement in writing practices and observations of students’ learning outside the tutoring context so that tutors can understand their work in a network of various interacting activity systems. Moreover, the suggestions help tutors develop tutoring strategies based on each component in the tutoring activity system.
Title:
Self-Efficacy Expectations of Primary School Children with regard to Specific Aspects of their Pragmatic Competence

Summary:
Self-efficacy is an important field of school research since it has an influence on the motivation and the level of perseverance when obstacles occur. As self-efficacy is related to academic performance it is indispensable to understand its mechanisms. This study deals with self-efficacy beliefs concerning the pragmatic competence of primary school children. As language is one factor for explaining unequal educational opportunities, the study aims to identify areas of communication children perceive as manageable or challenging.
Abstract

Introduction: Self-efficacy beliefs refer to individuals’ conviction to complete given tasks at designated levels. It is an important field of school research, as it has an influence on the students’ motivation to engage in a new task and the level of perseverance and resiliency when obstacles occur. This self-assessment does not only have an influence on the students’ achievement potential but it is also influenced by the academic performance and the teacher’s assessment (Kaya & Rice 2010). Self-efficacy expectations can be developed on a universal level, indicating an individual’s degree of confidence about the probability to master any kind of difficulty being faced with in life. Yet, the concept has more predictive efficiency when focused on a particular task or field of competence (Bandura 1998; Mutlo et al. 1991). When it comes to the question of gender differences among primary school students, the majority of studies does not find evidence for these differences. For example, although girls are judged superior writers, girls and boys do not differ in their perceived competence (Pajares et al. 1999; Pajares & Valiante 1999). But it is believed that differences begin to emerge during the age of adolescence (Schunk & Pajares 2001). In contrast, the socioeconomic status (SES) of the students does seem to have an impact on the self-efficacy beliefs of students: A low SES is presumably leading to weaker self-efficacy expectations (Pintrich & Schunk 2002), as parents in these cases are often not able to provide a stimulating learning environment or to get their children involved with motivated peers (Bong & Skaalvik 2003; Schunk & Pajares 2009).

At the beginning of primary school children mostly feel overconfident and highly efficacious about succeeding in a challenging task. They are often lacking task experience and peer social comparisons, which is why their accuracy for self-assessment is just being developed towards the end of primary school (Schunk & Pajares 2001). In addition, at the end of primary school students are being more and more provided with feedback of the teacher concerning their level of performance. The highly selective German school system leads to the students’ allocation to different types of schools after primary education, differentiating into schools for weak and strong learners. This early allocation gives students a straight feedback regarding their academic performance and often leads to a decline of the students’ confidence (Buff 1991).

As accuracy of self-assessment is often not thought to develop until fourth grade, only a small number of studies focusing on primary school students can be found. The number of studies in this target group is becoming even smaller, regarding the field of language competence, although language is one major factor leading to success in primary school and setting the course for the whole school career. Especially research on self-efficacy in the linguistic field indicates that the self-perception of competence is related to the actual academic performance. Writing self-efficacy beliefs of primary school students for example predict the actual writing performance (Zimmermann & Bandura 1994; Pajares et al. 1999). Regarding reading self-efficacy beliefs of primary school students, they were found to be reciprocally related to the level of reading fluency (Quirk et al. 2009). As current studies
mostly focus on self-efficacy beliefs regarding reading and writing skills, this paper focuses on the research desideratum of pragmatic competence. It is defined as an assessment of the current communicative situation and the decision to choose a certain verbal strategy in order to reach a communicative intention (Ingendahl 1975). The theory is located on a meta-level, as it describes the reflection of the situation, the evaluation of the conversation partner with his or her requirements and expectations and the consideration of the individual linguistic repertoire available. Pragmatic competence is part of the language acquisition process and is not completed by the time children enter school as the new conversational situations in school are part of this process.

**Research Objectives:** Introducing pragmatic competence as a new research area in the field of self-efficacy, the paper intends to reveal how primary school children in fourth grade perceive their pragmatic competence. According to the above presented state of research, it will be examined if there are gender differences or differences resulting from the students’ SES regarding the level of self-efficacy beliefs in order to detect possible risk factors. As there seems to be a correlation between self-and external assessment, different forms of external assessment in school will be examined: Correlations between the level of self-efficacy and the students’ grades in German class, as well as their tracking recommendation for secondary school will be analyzed. In addition, correlations between the students’ self-efficacy and the teacher’s assessment of the students’ pragmatic competence will be analyzed. Furthermore, it is worth examining individual problems students have with certain communicative situations to detect challenging communicative situations from the children’s perspective.

**Proposed methodology:** The main method to identify self-efficacy with regard to pragmatic competence is a newly implemented questionnaire consisting of a four-point likert-scale. The scale was piloted and reviewed before it was implemented in the main sample of 444 students. In addition the teachers were asked to provide information about the students’ last grade in German class, as well as their tracking recommendation for secondary school. In order to detect possible correlations between self- and external assessment, they were also asked to give an external assessment of their students’ pragmatic competence on a four-point scale (from very low to very high). The scale and teachers’ information are analyzed quantitatively. Apart from multiple choice items the questionnaire consists of open questions, describing specific communicative situations, asking students how they would communicate in the given situations and asking them to indicate what they perceive as challenging. These questions are analyzed qualitatively.

**Expected outcomes:** First analyses show that the internal consistency of the implemented scale is satisfying, having a Cronbach’s Alpha of .78 for self-efficacy concerning pragmatic competence. Reflecting the majority of studies about self-efficacy (Bandura 1998; Schunk & Pajares 2009), it is hypothesized that most children will have high self-efficacy expectations but there will probably also be a number of children with low self-perceptions. It is worth examining to what extent these children differ from each other in terms of academic achievement or tracking recommendation. This will also
indicate if the children are aware of the highly selective structures in the German school system. Conceivably there is an effect similar to the *Big-Fish-Little-Pond Effect*, as it is described in the theory of self-concept. As research indicates that the teachers’ assessment of their students is often not appropriate (Spinath 2005), it will be examined if there are correlations between the internal and external assessment in my sample. From a qualitative perspective explanatory patterns will be identified to help understanding the strengths and weaknesses primary school children perceive concerning their pragmatic competence. The mixed methodology in this research helps identifying structures that influence the level of self-efficacy and it also gives an insight into students’ individual explanatory patterns.

AMP Teacher Leadership Academy - Creating a Teacher-Led Model of Ongoing Professional Growth

**Topic Area:**
Mathematics Education

**Presentation Format:**
Poster Session

**Presentation Description:**
Instructional leadership promises meaningful opportunities for impacting cultural and pedagogical change from within the classroom. Teachers serve as researchers, mentors, and facilitators of professional development as master teachers.

The Arizona Mathematics Partnership (AMP) is a project supporting teachers in advancing their knowledge about the teaching and learning of middle school mathematics. This presentation will share plans for a Teacher Leadership Institute (TLI) designed to train teachers in developing the characteristics necessary to drive change.

Abstract:
AMP Teacher Leadership Academy - Creating a Teacher-Led Model of Ongoing Professional Growth

Research Objectives/Questions:

There are two main components of the Teacher Leadership Academy that we are interested in studying – the Summer CAMP and Action Research. The Summer CAMP was a weeklong overnight mathematics camp attended by 104 junior high youth that were engaged in a variety of mathematical projects and investigations led by teacher-leaders. By Action Research we mean a research project undertaken by teacher-leaders assisted and guided by professional researchers from AMP, with the aim of improving their strategies, practices and knowledge of the environments within which they practice.

The two initial research questions therefore are:

What affects can the Summer CAMP have on the teacher leaders’ ability to work collaboratively with teacher colleagues and improve their teaching practices?

How can the Action Research activities help develop leadership characteristics of the teachers in the Leadership Academy?

Proposed Methodology

The methodology chosen to investigate the research questions will be to engage in two case studies. One case will focus on the experiences and growth of a teacher leader who will be facilitating a collaborative community of learners (CCOL), a type of professional learning community, comprised of her own colleagues. The second case will focus on a teacher who will facilitate a CCOL for a neighboring district school at the same grade level as he teaches.

Multiple sources and techniques will be used in the data gathering process including interviews, surveys, documentation review, observation, and the collection of physical artifacts. Multiple pieces of evidence from the multiple sources of data will be used to uncover convergent lines of inquiry. One reason for choosing multiple cases to study is to help establish external validity and generalizability. The analysis techniques of cross-case examination and within-case examination along with an extensive literature review will be employed.

Discussion of Expected Outcomes:

Seeing the Need for Teacher Leaders
There has always been a need for administrative leaders on a school campus that serve as math coaches, division chairs, or principals. However, what is often overlooked is the importance of instructional leaders that are in the classroom full
time. These individuals help lead their colleagues through the process of improving the teaching and learning of mathematics through their example as exceptional teachers and their collegial bonds.

**The Creation and Purpose of TLA**
We recognize the importance of creating instructional leaders for the schools and districts we are working with in the Arizona Mathematics Partnership project. We have defined a teacher leader as one who strives to impact student learning; consistently assesses and seeks evidence of student success; and is a learner, improviser; and innovator. In an effort to provide the tools necessary to becoming such a leader we have created the Leadership Academy (TLA).

Leadership roles have begun to emerge and promise real opportunities for teachers to impact educational change without leaving the classroom. Teachers can now serve as research colleagues, work as mentors to new teachers, and facilitate professional learning communities as master teachers. Teachers also act as members of school-based leadership teams, instructional support teams and leaders of change efforts.

In spite of the fact that roles continue to expand, little is known about the teachers who take on leadership roles and their experiences. Researchers are only beginning to understand the complexities involved in creating and implementing leadership positions for teachers. This study is designed to add to the body of knowledge that exists about the characteristics and traits of teacher leaders as well as what an effective professional development model looks like that can advance individuals along the continuum of becoming a successful leader of mathematics educator colleagues.

**The TLA Plan**
The teacher leaders for the Teacher Leadership Academy are comprised of thirteen teachers who have completed the first two years of the AMP project participating in summer institutes and Saturday workshops that focused on building content knowledge primarily and CCOLs focusing on classroom implementation and collaboration.

The initial plan for the teacher leaders in the Teacher Leadership Academy is to participate in each of the following and what each will primarily address:

- **weeklong Summer Institute** – content knowledge, research skills, lesson planning for CAMP
- **Summer CAMP** – pedagogical knowledge, team-teaching with other teachers from different districts, teaching without a defined or predetermined curriculum
- **Saturday workshops** – content knowledge, pedagogical knowledge, and research skills
- **CCOL facilitators (9 of 13 TLs included)** – leadership
- **Action research projects in teams of 2-3 TLs** – knowledge for mathematics
teaching and learning

• Read research articles

Early Results
Although it is very early in the development and implementation phases of the teacher leader institute some successes and challenges have been observed. We have seen that the teacher leadership positions can yield significant personal benefits to those involved. Intellectual and professional growth and decreased isolation are personal gains teachers are reporting in their new leadership roles.

Intellectual and professional growth. Teachers are reporting that their knowledge of mathematical content and skills in teaching increased dramatically as a result of their involvement in leadership positions. New skills and knowledge also lead to increased confidence among lead teachers and a stronger commitment to teaching. Professional growth was more often effectual and the result of collaboration with peers in the CCOLs than activities separated from the normal school routine. Growth is occurring as lead teachers observed and assisted other teachers, worked with researchers, taught lessons alongside another teacher-leader colleague, and were exposed to new concepts and ideas.

Decreased isolation. Teacher leaders report a significant decrease in isolation as a result of opportunities to work with others outside of the classroom. Many teacher leaders are being successful in facilitating cooperation and collegiality more broadly among faculty members, thereby decreasing the isolation many teachers experience. This is primarily occurring through the Summer Institutes, workshops, math cAMP, and facilitation of the CCOLs.

We are finding that there are skills and abilities, which can be labeled and learned, make leadership more effective. Teachers need access to information and training of which we are providing through the Institute. From our early work, we see that the following set of leadership skills is important in the role of teacher leader:

• Promoting a clear vision and setting achievable goals
• Understanding the research literature and now to apply it to practice
• Effectively implementing the Mathematical Practices
• Taking initiative
• Persevering in the face of obstacles
• Analyzing and making adjustments/improvements
• Educating and building support with administrators
• Building a team spirit
• Providing support and encouragement
• Facilitating communication and reflection
• Celebrating and recognizing successes
• Exercising patience
• Networking with more experienced and knowledgeable mathematics education colleagues
A Study of the Need of Modernization for the Make-up Specialist Training

Barng Kee Jung
Assistant Professor, Dept. of Beauty Health Management, Daejeon University

I. Introduction

The application of makeup is not simply a means to express beauty; it is a way of representing various aesthetic values. Fusion is an important principle to explain the development of culture. Many methods have been developed to take advantage of technology, discovering its potential value. Visual media have evolved to increasingly integrate computer graphics (CG), incorporating a variety of fields. We study the need for modernization work on the utilizing media and design using 3D makeup simulation tools. The Make-up Specialist Training program is the Need to of Modernization. The purpose of this study is the beauty expert, special make-up artist, art professional education study program. The aim is to deliver more effective visual representations of the contents of the elements such as balance, proportion, rhythm, repetition, emphasis, contrast, harmony, and unity, using art makeup design. In this study, I was study use program the Electronics and Telecommunications Research Institute developed this is a three-dimensional facial avatar simulation program, which is available should you wish to use this tool.

II. Research Methods

This study is based on the creation of three-dimensional CG digital facial avatar makeup art, produced using simulation technology. Art makeup, such as face painting, body painting, and fantasy makeup, is a combination of the practical and artistic aspects of fine art makeup. Digital: step through the production process on the study; use the 3D CG Software deliverables. The Electronics and Telecommunications Research Institute (ETRI) developed a three-dimensional facial avatar makeup simulation program Software that generates a high-definition three-dimensional model using DSLR restoration technology. The camera identifies three lighting aspects: UV rays, polarization, and general lighting. An Internet-based literature search of research methods was conducted in order to establish a work plan. Research subjects and take advantage of the 3D-simulation program for the development of educational programs through a four-year college students majoring in aesthetics you chose. First, major college students make up course, and 15 weeks, 3 hours per week, 94 people, select class. Secondly, a major college team of six persons per design. Makeup design is color and
Gradation, form design elements. Third, the students presented the results and character design, fill out the questionnaire and analyzed the type of features. In this study the collected data is analyzed using the SPSS program to WIN: 21.0

III. Results and Discussion

Makeup design elements include point, line, surface, color, and texture. In this study, effective makeup design was interpreted as being based on the representation of particular elements, notably the design principles of balance, proportion, rhythm, repetition, emphasis, contrast, harmony, and unity. It is a compromise between 2D, 3D fusion of art for the human body make-up. Make-up of various design elements, colors, textures, shapes, lines, points, faces, etc. is expressed through. This study is the result of the measurement tools reliability verification for Cronbach's α usability 0.87, interestingness 0.82, was acquired 0.82, creativity 0.81. 3D simulation program satisfaction 0.95 all appeared to be an authoritative level equal to or greater than 0.80. The advantage of this program is to recognize that participants face 3D model 63.0 % the most in years. This program is called the delicate makeup skills learn to recognize significant technologies 65.2 % the most in years.

IV. Conclusion and Suggestions

The Make-up Specialist Training program is the Need to of Modernization. The purpose of this study is the beauty expert, special make-up artist, art professional education study program. CG three-dimensional simulations that use avatar character facial makeup to take advantage of media-based art makeup design is very new. I believe that evaluations and demonstrations the appropriateness of such a novelty approach for the medium is well worth researching, in order to increase the appeal of the medium. This study was recently under scrutiny in relations to digital simulation and various three-dimensional designs, in terms of how to take advantage of a wide range of applications, and how to apply the findings through media and the dissemination of basic research. This study applies the characteristics of the limited existing stereoscopic three-dimensional and digital simulation programs in order to take advantage of the empirical research, providing a basis to implement this research in a meaningful way.

Abstract:

Relating trends in large-scale science studies to how teaching and learning are constituted in different school environments in Sweden

This paper is based on an interest in increasing the understanding of trends regarding Swedish students’ knowledge in science by exploring the relation between results of large-scale studies (PISA and TIMSS) and how science teaching and learning are constituted in different school environments. Previous large scale studies point to an explicit downward trend in Swedish students’ performances in science over the last decade. Our analyses indicate that a reinforced knowledge segregation of Swedish schools and declining results among low- and mid-ranged performers explains a main part of the trend. In this paper we analyze how this trend could be related to and visible in different activities in a science classroom perspective in Sweden today. This means to analyze the use of language and science classroom discourse, in theoretical and practical parts of the classroom activities. In addition, it involves exploring different school areas which have either a large proportions of high achievers or low performers or areas that experienced a substantial improvement or decline during this period. The purpose is to analyze the empirical material which comprises examples of teaching and
learning sequences, in a selection of these different schools areas. Our expectations are to increase the understanding of how national trends from large-scale studies are constituted and become explicit, distinguish success and decline factors and identify suggestions of practical action programs for science teaching.
The Impact of Student Athlete Personality on the Preferred Coaching Behaviors

Drew Zwald
Professor
Georgia Southern University
School of Health and Kinesiology
Statesboro, GA 30460-8076
dzwald@georgiasouthern.edu

Abstract:

There has been extensive research, albeit with varied results, on how demographic information has impacted athletes’ preferred coaching behaviors (Beam, Serwatka, & Wilson, 2004; Sherman, Fuller, & Speed, 2000; Burdette, Joyner, & Czech, 2012). Variables such as gender, skill level, and type of sport have rendered mixed results, suggesting that they might be limited in explaining preferred coaching behaviors. Little research exists on athlete personality and preferred coaching behaviors. Therefore, the purpose of this presentation is to identify the correlates of leadership preferences, specifically, among athletes across varying personality traits. The sample will be collegiate female and male athletes. Understanding each athlete’s personality characteristics and, when necessary, adapting coaching behaviors may provide for better experiences for both athletes and coaches. Therefore, this presentation is geared toward current and future coaches and coaching education instructors.
Title: Approaching classroom dialogues – Using spy glasses for data collection

Topic area: Science education (or if there is an area related to methodology within educational research)

Format of presentation: Paper session

Description:
In this paper we discuss the possibilities of using spy glasses in order to capture both students’ talk and their actions in the science classroom. The rich data material highlights the possibility of approaching all students’ actions in the classroom but also points to the necessity of having an analytic focus when studying the comprehensive material. The results show that spy glasses can be an important analytic tool for studying learning situations in the classroom.

Authors:
Eva Davidsson, Teacher Education, Malmö University Sweden. eva.davidsson@mah.se
Pernilla Granlind Enochson, Department of Education, Linnaeus University, Sweden. pernilla.granlind-Enochson@lnu.se
Anders Jakobsson, Teacher Education, Malmö University Sweden. anders.jakobsson@mah.se

Abstract:
Many studies within educational research seek to investigate students’ dialogues for studying learning situations. One difficulty is however to approach students’ discussions in action. In this paper we discuss the possibilities of using spy glasses in order to capture both students’ talk and their actions in the science classroom. This methodological approach makes it possible to come close to all students’ actions when working in small groups or doing laboratory work. This means that the spy glasses register their discussions with each other but also what they are doing with the laboratory equipment, what they write or what they focus on in a written text. This methodological approach provides a very rich data material and many hours of recordings for one single lesson. In order to approach the comprehensive data material we suggest clear analytic foci and iterated analytic phases. The preliminary results show that spy glasses can be an important analytic tool for capturing student dialogues and studying learning situations in the classroom.
ABSTRACT

H. Jerome Freiberg, Ed. D.
John and Rebecca Moores Professor
Director and Founder, Consistency Management & Cooperative Discipline
University of Houston
440 Farish Hall
Houston, TX 77204-5026
freiberg@central.uh.edu
ABSTRACT

H. Jerome Freiberg

Consistency Management & Cooperative Discipline® (CMCD®) is a classroom management program that moves beyond discipline into a comprehensive person-centered Behavioral, Instructional, and Organizational (BIO) management model (Freiberg, 2012), intended to increase student acceptance of personal responsibility for learning and behavior while decreasing disruptions and improving climate and student achievement. Much of how we teach (K-12) is a function of our classroom management concerns. However, management is more than student discipline. Using over 50 classroom and instructional management strategies, CMCD moves teachers toward a management design that is preventative and pro-social, while empowering student voices and ownership. The synergistic BIO components provide support for teachers to maximize student self-discipline, engagement, and learning.

Behavioral Management strategies increase teachers’ abilities to prevent problems and intervene in ways that solve problems to provide a consistent and cooperative classroom. Effective elementary teachers prevent classroom disruptions before they occur by positively interacting with their students using person-centered classroom management systems that create healthier learning communities (Cornelius-White, 2007; Freiberg & Lamb, 2009). CMCD behavior strategies are designed to move students from passive tourists to active citizens by equalizing student opportunities for taking personal responsibility. Students become engaged in classroom operations by taking on roles as Classroom Managers (Freiberg, 1996; 1999), cooperatively developing rules by creating a Class Constitution, and resolving conflicts using the Peace Table and Vine of Kindness. CMCD classrooms have clear student responsibilities built by consensus, and consequences fit the context. Classrooms transform into caring communities where adults and students both take active roles in shaping their environment. Schools and classrooms characterized as communities show significant, long-term positive effects on academic performance, attitudes, and motivation (Bryk, et. al., 2010). A list of publications is provided on pages 6-7.

CMCD fosters positive classroom climate and student-teacher relationships by increasing opportunities for students to participate in the inner-workings of the classroom. Teachers support their students in leadership roles as class managers, from attendance-taking to computer operations to substitute managers. Hiring includes job applications, interviews, and job rotations every 4-6 weeks. Students who have healthier relationships with their teacher have higher social competence and increased social conversation and cooperation with peers (Pianta, La Paro, & Hamre, 2008). Similarly, teacher-student relationships are linked to children’s competence and provide protective factors against retention or referral for special education (Pianta et. al., 1995).

With caring classrooms, strong student-teacher relationships, and daily routines in place, instructional distractions and interruptions are minimized, enabling students to focus on learning (Slavin & Lake, 2008). CMCD creates a consistent, positive climate (Eiseman, 2005) with significantly fewer discipline referrals (Freiberg, Stein, & Huang, 1995; Opuni, 2006).

Instructional Management strategies, particularly in urban classrooms, enable teachers to move beyond lessons constrained by student behavior (e.g. lecture, direct instruction) toward models with greater student engagement (e.g. role-play, cooperative groups, hands-on learning centers). CMCD supports more interactive instructional methods with consistent daily routines that provide predictability rather than rigidity.

To establish and maintain active learning, teachers learn to change the way they and their students interact with the curriculum, moving from primarily teacher-directed instruction toward more interactive and cooperative approaches where students become vigorous participants (Freiberg & Driscoll, 2005). In CMCD classrooms, lessons begin immediately (using Starters), transitions are planned without time lost, and classes end with a Reflection/Exit Ticket where students describe what they learned. CMCD encourages active student
engagement with equal opportunities to respond to teacher questions. The teacher randomly selects from a Go-around Cup containing sticks with each student’s name and a student-selected individual praise word. Students are asked to work collaboratively, discussing their learning in pairs or mixed groups.

**Varying instructional delivery** changes daily practices that can improve student achievement (Slavin & Lake, 2008). As students transition to greater classroom management responsibilities, teachers find time for cooperative learning utilizing BIO management methods. CMCD teaches how to effectively manage cooperative groups and facilitate differentiation using learning centers, smart boards, or tablets. A synthesis of 20 studies on the effects of cooperative learning found that well-designed cooperative instruction had positive academic effects ($E = .44$); that held across all tested grades and subjects (Dean, Hubbell, Piltler, & Stone, 2012). For cooperative learning to be effective, several factors are needed: genuine respect for different perspectives, using differentiated student roles, building strong team relationships, and providing students with individual accountability (Igel & Urquhart, 2012). CMCD cooperative grouping strategies incorporate these elements into teachers’ management of active learning.

To improve classroom communication, teachers use Focus Signs or visual markers to share Learning Objectives, Lesson Activities, Homework, and a Countdown Poster for long-term assignments. These visual cues help students focus on learning tasks. Additionally, a student timer manager facilitates pacing. Cornelius-White’s 2007 meta-analysis found that classrooms with similar conditions had significant, positive correlations for student participation ($r = .55$), satisfaction ($r = .44$), self-efficacy/mental health ($r = .35$), and social connection/skills ($r = .32$).

The cornerstone of CMCD’s instructional management is supporting teachers in building student self-discipline, a condition necessary for teachers to use more active instruction and students to take greater ownership in learning. CMCD provides students a voice in the classroom through opportunities to take on classroom responsibilities and grow more connected. These are integral components of the CMCD process of developing self-discipline. Rogers (1951) defined self-disciplined students as those who: “are capable of intelligent choice and self-direction, . . . are critical learners, . . . adapt flexibly, . . . utilize all pertinent experience freely and creatively, . . . and cooperate effectively” (p. 387–388). In his two-year national study including classroom observations, Eiseman (2005) found that CMCD teachers showed: “increased teacher willingness to experiment with demanding instructional strategies” (p. 28). The instructional component in BIO builds student opportunities to accept personal responsibility, minimize student disruptive behaviors, save classroom time, and maximize learning (Opuni, 2006).

Organizational Management strategies allow teachers to maximize the physical and temporal environment of the classroom. Students collaborate with their teacher to improve the inner workings of the classroom, enhancing classroom functionality and giving more time for academic work. CMCD strategies enable students to know how and where to independently access learning tools with minimal disruptions (e.g., in/out subject trays and supply boxes). In a quasi-experimental study of 394 students (grades 3-5), student achievement gains were greatest in classrooms that were effectively organized (Doherty & Hilberg, 2007). CMCD strategies are designed to facilitate teacher and student self-organization by maximizing classroom flow and creating consistent patterns for student behavior (e.g., Managers and Open/Closed signs for resources).

To increase classroom functionality, CMCD streamlines routines. Managers facilitate paper flow, turn a Teacher Time/Student Time Sign to define both teacher-led and student self-directed instruction, and assist classroom visitors. CMCD coaches assist teachers in creating consistent classrooms with predictable procedures and student-managed responsibilities, saving both teaching and learning time. With procedures in place, classrooms can function more effectively and promote deeper student engagement with the curriculum (Holt, Hargrove, & Harris, 2011).

By increasing time for academic work through CMCD BIO strategies, teachers and students can engage in meaningful interactions and learning. Aronson, Zimmerman, and Carlos (1999) found daily engaged learning
only occurred 38% of the time. In a multi-year evaluation study of 44 schools using CMCD, Opuni (2006) shows instructional management strategies saved from 2.2-5.4 weeks of instructional time over the course of a year—“time previously used for discipline and organization” (p. 8). CMCD BIO content focuses on preventing disruptive behaviors and creating more effective, consistent, and efficient learning environments for urban classrooms. CMCD strategies thus enable teachers to access a broader instructional repertoire.

**External Findings of Consistency Management & Cooperative Discipline®**

**August 2013** - The Office of Juvenile Justice Delinquency Programs (OJJDP) identifies CMCD as a research-tested Prevention model program that reduces youth involvement in crime. After a third-party review of CMCD’s research, CMCD was also selected by OJJDP for inclusion in its Model Programs Guide in the School/Classroom Environment category. [http://www.ojjdp.gov/mpg/](http://www.ojjdp.gov/mpg/)

**November 2012** – (Communication from the U.S. Department of Justice’s Office of Justice Programs) Congratulations, your program, Consistency Management and Cooperative Discipline (CMCD), has been identified for inclusion in CrimeSolutions.gov! (OJP email to CMCD, 2012). Crime Solutions is an effort by the U.S. Department of Justice’s Office of Justice Programs (OJP) to identify effective, quality programs and practices in the fields of criminal justice, juvenile justice, and crime victimization to serve as evidence-based models for the field. Via a contract with Development Services Group, Inc., OJP has recruited expert reviewers to assess the evaluation literature on CMCD, which is now included in evidence-based online repository serving as a valuable clearinghouse of information about what works and what is promising in justice programs and practices.

**April 2010** - US Department of Health & Human Services (Head Start Division) identified CMCD as an “Area of Strength” in Gulf Coast Community Service Association Head Start/Early Head Start programs. It stated that the GCCSA had “strength in its implementation of a consistent learning environment through the use of an innovative classroom management system [CMCD].”

**September 2009** - Classroom Management – A Pathway to Student Achievement: A Study of Fourteen Inner-City Elementary Schools by H. Jerome Freiberg (University of Houston), Chris A. Huzinec (Houston Independent School District), and Stacey M. Templeton (University of Houston). CMCD programs show significant value-added improvement in reading and math and significant effects in reading and math after one year of implementation in elementary and for middle schools. CMCD students ranked in the 67th percentile in math and in the 64th percentile in reading. Control students ranked in the 50th percentile in both math and reading.

**September 2008** - Effective Programs in Elementary Mathematics: A Best Evidence Synthesis by Robert E. Slavin and Cynthia Lake (Johns Hopkins University). CMCD was identified in the top 11 programs nationally that significantly improved student mathematics achievement. CMCD improved math achievement although the program offers no mathematic content—student improvement linked to better classroom management and more time for instruction. Full report available in Review of Educational Research, 78(3), 427-515.

**Spring 2008** - Paul Harwood of The London Challenge identifies CMCD as a “very successful programme,” garnering “significant improvements in behaviour” See report titled Consistency Management and Cooperative Discipline programme, London Digest, 2(3). [http://www.ioe.ac.uk/about/documents/Study_Departments/LERU_LDigest2.pdf](http://www.ioe.ac.uk/about/documents/Study_Departments/LERU_LDigest2.pdf)

**August 2007** - CMCD is listed as a promising program to decrease South Carolina’s school dropout population in the At-Risk Student Intervention Implementation Guide published by the South Carolina Department of Education.
January 2006 - The Effectiveness of the Consistency Management & Cooperative Discipline® (CMCD) Model as a Student Empowerment and Achievement Enhancer: The Experiences of two K-12 Inner-City School Systems. Study by Dr. Kwame Opuni (University of St. Thomas, Houston) shows significant student achievement and school climate gains against control schools in two cities.

April 2005 - An Evaluation of Consistency Management & Cooperative Discipline® (CMCD®). J. W. Eiseman included CMCD in his “Implementation for Success” national study report. The study found CMCD improved student achievement and climate, with higher student engagement than comparison schools.

January 2004 - Documentation of structured analysis for selecting scientifically-based research: Instructional strategies and programs (Iowa Math Content Network Review, 2004). The IMCN reviewed a 2001 study entitled The effects of Consistency Management & Cooperative Discipline on student mathematics achievement in seven Chapters I elementary schools in the Journal of Education for Students Placed at Risk, 6(3), 249-270. On a scale from 1(low) to 5 (high), the IMCN rated the study’s findings a 4/5.

October 2002 - Project GRAD: A Comprehensive School Reform Model, Project GRAD/Houston 2001-02 Evaluation. Dr. Kwame A. Opuni and Ms. Mary L. Ochoa’s evaluative study shows that after one implementation year, 13 CMCD schools outperformed their comparison cohort in math and reading on the Stanford 9 test. Differences between project students and comparison students were statistically significant in both math and reading with effect sizes of >0.31. The study showed that CMCD teachers and students gain from 7 to 18.5 days of additional instructional time that would have been used for classroom discipline, equaling up to 3.7 weeks.

May 2002 - Dr. Frederick Mosteller, Director of the Center for Evaluation, Harvard University Department of Statistics, identified Dr. H. Jerome Freiberg as having excellent studies in research on CMCD’s program’s effectiveness.

June 2000 - The Center for the Study of Violence Prevention at the University of Colorado, Boulder Institute for Behavioral Science reviewed 116 Discipline and Violence Prevention Programs. They reported only four U.S. programs met its research criteria for multiple quantitative evaluations that were statistically significant, included third-party evaluations, were effectively replicated in multiple locations away from the home site, provided adequate support, and showed evidence of sustained effects. CMCD was the only comprehensive pre K – 12 program to be recognized.

January 2000 - The Chicago Annenberg/NLC CMCD School Achievement Data: Chicago Annenberg Challenge/ NLC Progress Report shows CMCD schools performing at or above national norms on the ITBS, with a 23% and 42% raw aggregate growth in reading and mathematics in 1998-99 compared to a city-wide growth of 4% in reading and 11% in mathematics. The number of students performing in the bottom quartiles in 5/5 CMCD schools decreased each year between the beginning of CMCD and the end of implementation, while the number of students performing in the Top Quartiles in 5/5 CMCD schools increased.

6. Abstract and/or full Paper:
COMMUNICATION IN THE MANAGEMENT FUNCTION OF PUBLIC
ELEMENTARY SECONDARY SCHOOL MANAGERS: STATUS PROBLEMS
AND ISSUES

Schools are perhaps the most complex of all social inventions. It is an organization that deals with the tasks of structuring, managing and giving direction to an intricate mix of human product that gives rise to unique problems of organization and management. It follows similar patterns of forming and attaining its desired hierarchy of goals. It is also considered as the sole agency in carrying out educational policies and functions of the state.

However, it is neither impossible for the organization to achieve its purpose nor perform its function unruffled without the services of competent, qualified, efficient and effective administrators and teachers. Given the varying attitudes, desires and experiences of different human beings, it is clear that management requires considerable knowledge and understanding of the basic communication process.

Good communication is necessary to influence, inform, and express feelings and coordinate human and physical elements of the organization into an efficient and effective working unit. When communication fails, organized activity also fails; uncoordinated activity or none at all, prevails.

Dr. Randy A. Din
Is an associate professor of Colegio de San Juan de Letran and Assistant Professorial Lecturer of De La Salle University in Philippines. He teaches Professional Education subject, Filipino Language and Asia Studies and author of different books in tertiary level.
INTRODUCTION

THE PROBLEM AND ITS BACKGROUND

Schools are perhaps the most complex of all social inventions. It is an organization that deals with tasks of structuring, managing and giving direction to an intricate mix of human product that gives rise to unique problems of organization and management.  

Like other organization, it follows similar patterns of forming and attaining its desired hierarchy of goals. It is also considered as the sole agency in carrying out educational policies and functions of the state.

Mark Hanson adheres to Everett Rogers’ view on organization as a stable system of individuals who work together to achieve common goals through a hierarchy of ranks and division of labor. A key function of organizational structure is to define channel, give order to actions and events, thus providing stability and predictability.

In a school setting, the structure defines roles and responsibilities of teachers and administrators as well as ensures that lines of coordination and control are in place. The structure serves to restrict and stabilize the flow of communication, making possible an orderly

2 Hanson, 1
distribution of information. The educational managers, considering that they are goal-setters, need basic knowledge of the nature and principles to everyday problem.

However, it neither is impossible for the organization to achieve its purpose nor perform its functions unruffledly without the services of competent, qualified, efficient and effective administrators and teachers. Given the varying attitudes, desires and experiences of different human beings, it is clear that management requires considerable knowledge and understanding of the basic communication process.

Raymond Zeuschner\textsuperscript{3} viewed communication as inevitable and irreversible, which means that once a message goes out, it cannot be called back. It can be modified, rescinded, neglected, distorted, or amplified once the message has been sent but cannot be deleted.

Communication takes place in a constantly moving stream of time and time is not reversible. Hence, the value of communication cannot be underestimated. Good communication is necessary to influence, inform, and express feelings and coordinate human and physical elements of the organization into an efficient and effective working unit. When communication fails, organized activity also fails; uncoordinated activity or none at all, prevails.

\textsuperscript{3} Raymond Zeuschner, \textit{Communicating Today}, 2\textsuperscript{nd} ed. (USA: Allyn and Bacon, 1997), 22.
Communication, according to Kaye,⁴
doi:10.1234/56789

. . . essentially involves the interpretation of
relationships and interactions between self and
others.

Hicks and Gullett⁵ further stressed that

communication is basic to an organization. It is
the cohesive bond between members of an
organization.

Guthrie and Reed⁶ also emphasized that

. . . communication links individuals, creates
and maintains individual and organizational
images or perceptions, and motivates,
assuages and persuades others. . . .

As asserted by Lee O. Thayer,⁷ the administration of any
organization can be accomplished only through communication. The
effectiveness of administrative organization within an organization is
therefore the best measure of the effectiveness of the administration of

⁶ James W. Guthrie and Rodney J. Reed, *Educational Administration and Policy:
Effective Leadership for American Education*, 2nd ed. (Massachusetts: Allyn and Bacon, 1991),
353.

that organization. Indeed, effective and efficient communication means efficient and effective administration.

Communication is the essence of effective management.\footnote{Richard A. Gordon, et al., \textit{Encyclopedia of School Administration and Supervision} (New York: Oryx Press, 1988), 65.} The ability to communicate is the most used and the most usable – hence the most valuable ability any administrator may exercise in his job. Communicating is indeed a very important feature within the activities of a school system. It is so pervasive and it is used at all times. It can be used effectively to promote better understanding and unity among all the members within the school organization. It can be emphatically stated that no one can manage any organization well that is not knowledgeable of communication principles and technique. It can be equally stressed that no school system can achieve its goal without effective, efficient and clear internal and external communication.

Communication management is an essential component of communication. As defined by Kaye, communication management is

\[\ldots\] the process of which people engaged in communicating, that is constructing, coordinating and clarifying meanings.\footnote{Kaye, 274.}

Successful administration and management requires the desired process to constantly altering conditions of modern technology. The changes prevalently going on in organizations as an effect of the introduction and use of information technology are now beginning to
experience the effects that these “smart machines” are causing. The outcome of this transformation is that the structures and processes of organizations are being changed and will continue to transmute fundamentally. This communication and information link allows the organization to take advantage of the opportunities and provides for uniformity among the different affiliated organizations and units within the system.

Hodge, Anthony and Gales\textsuperscript{10} emphasized that computerization undermines traditional forms of authority and breaks down barriers between job categories and functions. There are established evidences that the introduction of information technology is having an impact on structures and processes in organization. Information technology is permitting organizations to become more flexible and more organic. The interplay between information, information technologies and organizational design is key to the strategic success of the organizations.

As we look at the changes that are taking place in the organizations today, it is clear that success of school managers are dependent upon the existence of an effective and efficient communication which is best suited to the needs of the new millennium.

STATEMENT OF THE PROBLEM

The study attempted to determine the status, problems and issues of communication as a management function of school administrators in the Southern Tagalog Region.

Specifically, it sought to answer the following questions:

1. How can the teacher-respondents describe the administrators’ sending and receiving communication competencies when classified as:
   1.1. informative?
   1.2. affective?
   1.3. imaginative?
   1.4. ritualistic?
   1.5. persuasive?

2. To what extent does each school administrator vary according to their:
   2.1. Verbal communication abilities?
      2.1.1. group discussions?
      2.1.2. meetings?
      2.1.3. interpersonal?
      2.1.4. public speaking?
   2.2. Written communication abilities?
3. To what extent that each school administrator very according to their ability to act as:

3.1. sender/encoder?

3.2. message formulators?

3.3. channel users?

3.4. decoder?

3.5. feedback givers and utilizers?

4. How can school administrators describe communication barriers in terms of their:

4.1. organization size?

4.2. Selective perception?

4.3. Coding and decoding?

4.4. Filtering?

4.5. Information overload?

5. To what extent do certain group of school administrators’ employ/utilize the communication process? In which area of communication process do school heads find problems and difficulties?

6. What are the perceived problems and difficulties met by the school administrators that can distort the communication process in a hierarchical setting and in what way do they think they can be assisted to overcome such difficulties?
7. How can the respondents be described along with their communication styles?

8. What is the degree of communication efficiency of the school administrators as viewed by the administrators themselves and their teachers?

9. What empirical values can be derived from the findings of the study?

**HYPOTHESES**

Based on the statement of the problem, the following null hypothesis were formulated:

\[ NH_1 \] There is no significant variation in the school administrator’s communication process with regards to the following:

a. sending/encoding abilities

b. message they encode

c. channels they use

d. decoding skills

e. giving and receiving feedback

\[ NH_2 \] There is no significant relationship between the measures used by schools administrators in evaluating the effectiveness and efficiency of their communication.
NH₃ There is no significant relationship in administrators’ communication process with that of the noted problems and difficulties.

NH₄ There is no significant difference between the respondents’ responses on the administrators’ degree of communication efficiency.

CONCEPTUAL FRAMEWORK

Communicating is the work a school manager performs to create understanding among people so they can act effectively. More so, the management functions of planning, organizing, reviewing, controlling and directing or leading become operational only through effective communication.

The process of communication consists of asking, telling, listening, and understanding. The receiver hears, listens, understands, accepts, and actuates the message given by the source. In management, it is the exchange of information with subordinates, associates, superiors, and others about plans, progress, and problems.
The study dealt primarily with the dimensions of communication abilities among school managers. These included verbal and written communication abilities, as well as the ability to act as a sender, message formulator, channel user, decoder, feedback giver, and utilizer.

The research paradigm is illustrated in Figure 1. The input involved school managers’ sending and receiving communication competencies, communication barriers, communication style, and communication efficiency. The throughput focused on enhancing school organization and improving schools’ communication processes through comprehensive training design in communication. The output aimed to enhance and effectively organize school communication for effective and efficient schools.
communications as one of the management functions of a school manager. With this, communication skills, competencies, problems and issues are being covered.

As illustrated by the paradigm, the study is anchored on the belief that if there is an ideal organization communication process, then the school’s problem will be lessened considering that one of the cause of school’s controversies is a product of miscommunication.

The study identified independent variables as the following: the school managers’ sending and receiving communication competencies, communication barriers, communication process, communication style and communication efficiency. The intervening variables are the school managers’ verbal and written abilities, and their ability to act as sender, message formulator, channel user, decoder, feedback giver and utilizer.

The dependent variables are the enhancement and effectiveness of the school organization, and the effectiveness and efficiency of the school’s communication process.
DEFINITION OF TERMS

For greater clarity and understanding, the following terms were defined as follows:

**Attitudes** – refer to source-receiver’s entire personality. One’s feelings about oneself often cause one to structure communication a particular way.

**Channels** – are links that connect the source and the receiver, the observable carrier of the message.

**Communication** – is the process by which ideas, thoughts, opinion, information and feelings are transmitted from one individual to one or more others through a common language or set of behavior.

**Communication Apprehension** – refers to the fear an individual experience while communicating resulting to tension, embarrassment and shyness.

**Credibility** – refers to senders’ ability to transmit messages.

**Decoding** – means interpreting what the message means.

**Encoding** – refers to the transformation of ideas or thoughts into a form that will convey those ideas or thoughts to an intended receiver.

**Feedback** – enables the source to know whether or not the message has been received and interpreted clearly.

**Interpersonal Communication** – is an interactive process that involves a person’s effort to attain understanding and respond to it.
Knowledge and experience – refers to the source /encoder ability to communicate accurately and effectively about something he has knowledge and related to his past experiences.

Messages – are the content of the communication process. They may be verbal (written or spoken) or nonverbal (everything else, from gestures and movements to smells and objects).

Operational Efficiency – refers to the efficiency of the means and methods of communication. The administrators must know more about the available means and methods of communication and devising new and better methods to keep pace with the times.

Organization Communication – is the compound interpersonal communicational process across an organization.

Organizational Efficiency – deals with getting exactly the right amount of information to the right person at the right time.

Originator’s Thinking – refers to the originator’s ability to think well enough, to adapt to his attitudes quickly and to call upon a range of communicating techniques that will enable him to communicate successfully with most persons or groups no matter difficult the circumstances are.

Psychological Efficiency – refers to the accomplishment of making communication understood with the least possible emotional resistance or reaction.
Receiver Apprehension – refers to the fear to decode and interpret messages received.

School Administrator – refers to a person who applies administrative and supervisory techniques and procedures in operating the educational organization in order to accomplish the desired goals and objectives. In this study, it refers to school managers of public elementary and secondary schools.

Techniques – refer to skills and abilities applied in communication to make possible the most efficient and effective communication. Depending upon the techniques used, the administrator can communicate his meaning enthusiastically, positively and persuasively or unenthusiastically, negatively and persuasively.

SIGNIFICANCE OF THE STUDY

In the field of education, communication is an integral part of the school administrators’ and teachers’ professional equipment to share messages, ideas or attitudes that produce a degree of understanding that occurs in school among co-administrators, teachers, parents, students and other interested constituencies.

It is an inevitable instrument in getting things done and in sustaining and improving the will of the school staff to work together. As the administrator occupies a leadership position in the school or in the
district, it is vital to make them aware of their value in the organization and teachers as well.

The Southern Tagalog Region as one of the biggest in the country lies in a geographical location where it is confronted with problems and difficulties in communicating. Among these are organizational size, selective perception, communication filtering, information overload, poor choice of communication channels, and lack of feedback coding, decoding, and low level of technology.

The above-cited problems have unvarying solutions, but the researcher is plausible enough that they can be lessened if not totally extirpated.

Thus, the study draws significance to different groups of people in the academe.

First, to the **DepED Officials**. Since this study discussed the different communication issues and problems existing in the public school system, it is important that they are aware of it. Indeed, this study may serve as a guide in understanding the different problems being confronted by the school principals in terms of communication as one of important functions in their managerial functions.

Second, to the **School Administrators**. This study may give them the necessary feedback and may help pinpoint the strengths and
weakness of the communication process existing in the school
organization.

Third, to the **Future School Administrators**. This study may
serve as an eye-opener on the importance of effective and efficient
communication processes in the management of school system.

Fourth, to the **Elementary and Secondary School Teachers**. The findings of the study may be of help to them in identifying the
communication abilities of their respective school principal. Through
proper identification, problems may be lessened and avoided.

And lastly, to the **Future Researchers**. This study may be
important to them when they conducted studies related to this
undertaking. This may serve as their guide in exploring this scholarly
topic.

**SCOPE AND DELIMITATION**

This investigation may looked into the communication processes
leading to the different status, problems and issues being undertaken by the public school administrators and teachers in the Southern Tagalog
Region. The participants of the study included the selected district
supervisors, principals, head teachers and teachers of the school
divisions in Region IV. It was conducted during the school year 2000-
REVIEW OF RELATED LITERATURE AND STUDIES

This chapter presents literature and studies that are relevant to the present investigation and gives valuable insights about the topic of the research.

RELATED LITERATURE

In every organization, communication occurs constantly. It is the "lifeblood" that keeps the organization goes round. Many writers consider communication as the key to successful administration and functioning of any organization especially in a school system which utilizes the process of communication in the attainment of its goals and objectives.

In an organizational setting, communication is not only a matter of natural urges but of responsibility. Although the dynamic nature of the process is very difficult to isolate, it involves sending and receiving messages in various channels and networks as well as giving and utilizing feedback in performing it.

Communication is a whole process as adduced by Zeuschner. Several communication theoreticians agree that communication is a human activity, it is interpersonal, it is purposeful and

11 Zeuschner, op. cit. 22.
it is a process. The communication process is dynamic, continuous, irreversible and contextual. It is not possible to participate in any part of the process without implying the existence and functioning of its other parts.

Andres\textsuperscript{12} noted that it is useful for the managerial leader to have in mind the following principles of communications.

\textit{Principle of Line Loss} – which states that the more extended the communication, the less effective it tends to become.

\textit{Principle of Emotional Appeal} – argues that appeals to emotion tends to become communicated more readily than appeals to reason.

\textit{Principle of Application} – emphasizes that the more an idea is put to use, the better it is understand and remembered.

Hicks and Gullett\textsuperscript{13} pointed out that communication is basic to an organization’s existence as a manager spends up to 95\% of time communicating. Good communication is necessary to coordinate human and physical elements of the organization into an efficient and effective working unit. When communication fails, organized activity also fails; uncoordinated activity or none at all prevails.

\textsuperscript{12} Tomas D. Andres, \textit{The Effective Manager} (Quezon City: New Day Publishers, 1995), 107.

\textsuperscript{13} Hicks and Gullett, op.cit. 504.
Wright and Noe\textsuperscript{14} stressed that communication is an important skill of individual managers. Evidence suggested that communication ability is significantly related to a managers’ performance.

Not surprisingly, managers spend 80\% or more of each workday in such communication activities as meetings, phone calls and conversations. Of the remaining time, much is spent preparing or reading written communication. In fact, it is hard to think of anything a manager does that does not involve sending or receiving information.

Furthermore, from the perspective of each employee, the way that person communicates is important because it influences others’ evolutions of his/her abilities, attitudes and values to the organization.

Patrick E. Connor\textsuperscript{15} reiterated the American Management Association’s Ten Commandments of Good Communication. For him, sound ideas or well-reasoned decisions become effective when they are transmitted to others and achieved the desired action or reaction. Communication for him is a vital management tool.

On the job, one communicates not only with words but also though apparent attitudes and actions. Communication, then, encompasses all human behavior that results in an exchange of meaning. How well one manages depends upon how well one communicates in this broad sense.

\textsuperscript{15} Patrick E. Connor, \textit{Dimension in Modern Management} (USA: Houghton Muffin Co., 1978), 490.
Lussier\textsuperscript{16} cited that communication makes the organization go round. As the manager gets the job done through employees, they perform the five functions of management (planning, organizing, staffing, leading and controlling) through communication. The quality of communication has a direct effect on performance. Effective, free and open communication contributes to better performance and personal communication improves earnings.

Guthrie and Reed\textsuperscript{17}, Slocum\textsuperscript{18}, and Koontz and Weihrich,\textsuperscript{19} described that there are five component elements in the communication model. They include sender/encoder, messages, channels, receiver/decoder and feedback.

\textbf{Sender/Encoder} – Communication begins with the sender who has some thought, need, idea or information to transmit which is then encoded in a way that can be understood by both the sender and the receiver.

\textsuperscript{17} James W. Guthrie and Rodney J. Reed, \textit{Educational Administration and Policy: Effective Leadership for American Education}, 2\textsuperscript{nd} ed. (Massachusetts: Allyn and Bacon, 1991), 353.

\textsuperscript{18} John W. Slocum, \textit{Management} (USA: Addison and Wesley, 1982), 561.

Several factors affect the sender/encoder including communication skills, attitudes, knowledge and experiences, credibility and environmental and socio-cultural elements.

- Communication skills – To be effective, it is important that the source/encoder have good communication skills in the medium. If the message is verbal, good pronunciation, vocabulary and syntax are important. Written messages benefit from good spelling, skill in drawing, gestures and facial expressions are important.

- Attitudes – The source/encoder has attitudes that affect communication based on one’s entire personality. One’s feelings about oneself often cause one to structure communication a particular ways.

- Knowledge and experience – It is difficult to communicate accurately about something one has not experienced yet. If one has intimate knowledge or experience with something, one probably can communicate well about it.

- Environmental and socio-cultural elements – Everyone lives certain roles, occupies certain positions, commands certain restrictions. These and other elements in one’s environment and cultural background are reflected in communication.

Razik and Swason\textsuperscript{20} believed that the sender’s credibility is always at stake in an organizational communication. They anchored in Khandwalla’s notion that the source of information must be perceived as

knowledgeable to be credible. Once credibility is lost, it is difficult, if not impossible to regain within the organization where the loss occurred.

*Message* – is the source/encoder’s physical product. It is the idea that an individual hopes to communicate to the intended receiver. They may be verbal (written or spoken) or nonverbal (everything else, from gestures and movements to smells and objects).

Slocum (1982), cited five principles for increasing the accuracy of the encoding process.

1. Make the message relevant to the receiver. If receivers are to understand the message, they must be able to relate the information they are receiving to what they already know.

2. Reduce the messages to the simplest possible terms. The sender should use as few symbols or gestures as possible to communicate thoughts and feelings to the receivers. The simpler the message, the more likely it is to be understood.

3. Organize the message into a series of stages. A well-organized message increases the receiver’s understanding. It is probably best to develop one thought or feeling at a time so that the receiver is not overloaded. A message can be packaged into a series of stages with one stage completed before the next is introduced.

4. Repeat the key point of the message. The principle of repetition is important, particularly in oral communication, where words may not be clearly heard or fully understood the first time. The sender needs to use enough repetition to ensure clear understanding of thoughts and feelings.

5. Focus on the essential aspects of the message. Communication goals and key points should be sharply focused. This will avoid losing the message in details and
making it unclear. In oral communication, the impact of significant points can be heightened by a different tone of voice, pauses or hand gestures. In written communication, underlining or emphasizing key sentences and phrases can do it.

**Communication Channels** – Wright and Noe\(^{21}\) considered the channel as the style of transmission. It is the routing pattern that the message is to follow. Guthrie and Reed\(^{22}\) described it as the link that connects the source and the receiver. The channel through which messages travel provides another potential point of interference or distortion.

The choice of an oral or written channel depends on three important things: the importance of the message, whether a written record of the communication is needed, and whether immediate feedback from the receiver is needed.

Channels can also be formal. Formal channels follow the hierarchical structure of the organization. Informal channels are not found in the formal structure. These channels arise from employees talking, which have no official sanction and frequently contain a high proportion of misinformation.

Formal communication flows along the organizations’ lines of authority or task responsibility. Accordingly, there are three (3) kinds of

\(^{21}\) Wright and Noe, op. cit. 486

\(^{22}\) Guthrie and Reed, op. cit. 353.
formal channels used by managers: upward communication, downward communication, and lateral or horizontal communication.

In an upward communication, the message is directed toward a higher level in the hierarchy. It often takes the form of progress reports or information about success and failure of the individuals or work groups, reporting to the receiver of the message. Sometimes employees also send suggestions or complaints upward through the organizations’ hierarchy.

Upward communication should be encouraged because it provides feedback on how well employees understand the downward communication. Likewise, it can motivate employees to submit valuable ideas. It can provide an emotional release and at the same time, give the employee a sense of personal worth because a manager listens. To be effective, it must be allowed to occur freely.

Downward communication, on the other hand, involves a message traveling, to one or more receivers as a lower level in the hierarchy. The message frequently involves directions or performance feedback. Downward communication can be motivating when it includes praise and information about what is happening in the organization.

There are five reasons why managers use downward communication: (1) Job Instructions – communication pertaining to performance of a certain task, (2) Job Rationale – communication relating
a certain task to others in the organization, (3) Procedures and Policies – communication about organization policies, rules, regulations and benefits provided by the organization, (4) Feedback – communication about the individual job performance, and (5) Indoctrination – communication designed to tell the employees about certain events that the organization thinks important for employees to participate in.

Downward communication is probably the most frequently used channel in organizations. It may also be the mist misused since some managers place little emphasis on upward communication.

The third type, lateral or horizontal communication is that type of communication where message is directed to someone at the same level in the hierarchy. Formal communications that travel laterally/horizontally involve employees engaged in carrying out the same or related tasks. The messages might concern advice, problem solving or coordinating activities. The channels have become increasingly important for organizations that have adopted matrix structures because decisions need to be made quickly following the chain of command.

Informal communication is a type of communication outside the organization’s formally authorized channels.

The grapevine is the network for much informal communication. Grapevines develop in organizations to handle communication that the formal channels of communication do not handle. It is fast, efficient,
accurate, highly selective and discriminating and fulfills people's need to communicate, operates across formal lines of authority and supplements the formal channels. Because it is flexible and usually involves face to face communication, it is capable of transmitting communication rapidly.

The grapevine has some good and bad characteristics. It is desirable because it gives management insights into employee attitudes, provides a safety value for employee’s emotions, and helps spread useful information. It can also be undesirable because it spreads false rumors, and cannot be controlled by management and has no permanent members.

The old-boy network is an exclusive group that wields power through shared information. In an old-boy network, members share information to help one another along in their careers. It differs from other kinds of informal alliances among group of employees as its members have control over much of the organization resources.

Belonging to an old-boy network can be advantageous to its members, but from an organization’s perspective, it can be harmful. It limits some employees’ access to information and prevents the organization from readily tapping the potential of people outside the network.

Receiver/Decoder – The receiver is the person who gets the sender’s message. They are the ultimate goal of any message and they
are needed to translate the message finally into a form that people can comprehend. This link between senders and receivers is where communication interaction happens.

Decoding is the process by which receivers interpret messages and translate them into meaningful thoughts or feelings themselves. This process is affected by the receiver’s past experiences, intelligence, personality characteristics and expectations about the sender.

There are two major processes that affect the receiver: listening and feedback.

**Feedback.** Feedback refers to the verbal or nonverbal responses received from the individual or groups to whom the message is directed. Feedback implies at least a two-way communication. With feedback, the message originator can at least make a rough assessment of whether the message was received as intended. Feedback helps to detect misunderstandings when it is accurate and timely. If delayed or distorted by interpersonal or organizational “noise”, feedback may be useless. Feedback is most effective when it is obtained as close to the time of message transmission as possible.

Slocum\textsuperscript{23} cited five effects of feedback. It includes the following: (1) the action of the sender affects the reaction of the receiver, (2) reactions of the receiver serve as feedback and tell the sender how well the

\textsuperscript{23} Slocum, op. cit. 561.
objectives are being accomplished, (3) a sender who receives feedback that is rewarding will continue to produce the same kind of message; if the feedback is not rewarding, the message will eventually change, (4) the receiver exerts control over the sender by the kind of feedback he or she gives the sender, and (5) to improve feedback.

A communication is effective to the degree that it accomplishes the purpose intended. The only measure of communication effectiveness is the success a communication has in producing the desired result.\footnote{Thayer, op. cit. 3.}

The most important requisite for an effective communication is a clear, unequivocal purpose. Because the effectiveness of any communication is measured by the success with which it achieve its intended purpose. Without a purpose, any talk of effectiveness is meaningless.

Purpose is generally vague. To be specific, the originator of a communication must decide on three things:

1. What he wants the receiver of the communication to know after being exposed to the communication (information);
2. What he wants the receiver of the communication to feel like after being exposed to the communication and toward the originator, and
3. What he wants others not directly exposed to the communication to know and feel about it.

Beyond a clear and specific purpose, there are three basic determinants of communication effectiveness: 1) the originator's thinking, 2) his attitudes, and 3) his techniques. Communication effectiveness begins with the right kind of thinking ability, the proper attitude and full range of communication techniques.

The Administrator's Thinking. The effectiveness of any communication depends primarily upon the quality and effectiveness of the originator's thinking. For an effective performance in any endeavor, creativeness, clearness, accuracy and completeness must be reflected in the administrator's thinking.

In summation, the primary tool of the administration is communication, and thus that the administrator's ability to communicate effectively will be limited by, or facilitated by, the effectiveness of his thinking.

The Administrator's Attitude. The meaning of a communication does not seem to be complete until a reasonable notion of what the originator's attitude was at the time of communicating. In order to be consistent, one must have attitudes toward people and things. These attitudes provide the framework for organizing the world about us into meaningful patterns. The administrator must communicate with people
whom he does not know very well personally. His attitude will be reflected in his communication primarily by such qualities as tone, completeness, tact, positiveness, enthusiasm, friendliness and so forth.

Every quality that can be detected in any communication is a measure of the originator’s attitude toward his receivers, toward the subject of his communication, and toward the situation in which he finds himself.

The originator’s own attitude toward the receiver, toward the subject or toward the situation is the right one, the only appropriate one. The attitudes of the originator and the receiver play a great part in determining the meaning of the words uttered in a communication.

*The Administrator’s Techniques.* The administrator’s communicating techniques are reflected by such qualities in his communications as clearness, readability, direction, organization and presentation. It determines the level of attention and interest. Techniques reflect organization and cogency or argument, or significance of information. It affects all communication qualities, including those that reflect the originator’s thinking and his attitudes.

Communication efficiency may be thought of as a conceptual “measure” derived from a comparison of the expenditure (time, effort,
money, etc.) required producing a communication with effectiveness of the communication.\textsuperscript{25}

School administrators fall in any of the following communication styles: autocratic, consultative, participative and laissez-faire.

Accordingly, autocratic communication style demonstrates high task / low relationship behavior, initiating a closed presentation. The consultative communication style demonstrates high task / high relationship behavior, using a closed presentation for the task with an open elicitation for the relationship.

The participative communication style demonstrates low task/high relationship behavior, responding with open elicitation, some initiation and little presentation. Finally, the laissez-faire communication style demonstrates low task / low relationship behavior, responding with the necessary open presentation.\textsuperscript{26}

Efficiency can be appraised from two points of view: from the point of view of the originator or from the point of view of the receiver.

Planning improvement in communication efficiency consists of the following: (1) improving feedback channels, feedback evaluation and feedback utilization, (2) improving methods and means of communicating, (3) improving the attitude of the originator to ward those with whom he will

\textsuperscript{25} ibid.

\textsuperscript{26} Slocum, op. cit. 561.
communicate and toward the importance of communication problems in
general, improving the administrator’s ability to solve problems involving
communication, and improving the administrator’s techniques in
communicating, (4) improving the situation, and (5) improving the receiver.

There are different kinds of communication efficiency which are as
follows:

1. organizational efficiency
2. operational efficiency
3. psychological efficiency

Organizational Efficiency. The most important communication
problem is getting exactly the right amount of information to the right
person at the right time. To make communication efficient and effective,
one must know its purpose and its audience.

There are six ways wherein organization can be considered
efficient. First, it should be organized. Second, every man’s position – his
duties and responsibilities, his potential and direction – should be clear cut
and exclusive. Third, there must be a logical hierarchy in both line and
staff administration. Fourth, line organization and administration channels
should parallel communication channels. Fifth, methods of staffing and
promoting, as well as of evaluating job performance, should be
reevaluated with an eye toward eliminating deficiencies that lead to empire
building and promotion compulsion. Sixth, the desired goal of any organization has some action.

An efficient organization makes getting things done easy. Increasing the efficiency of the organization serves to improve the situation.

Operational Efficiency. Operational efficiency refers to the efficiency of the means and methods of communication. The means with which an organization communicates must keep pace with the ever-increasing speed of technological progress and cultural change. This means knowing more about the available means and methods of communication and devising new and better methods to keep pace with the times. Efficient communication depends basically upon the effective utilization of devices, means and methods. Communication devices, means and methods must support and facilitate the actions of the administrators.

Psychological Efficiency. Psychological efficiency refers to the accomplishments of making a communication understood with the least possible emotional resistance or reaction. To improve psychological efficiency, the misunderstanding that spring from the attitudes of both originator and receiver should be reduced.

Psychological efficiency of communication can be achieved through:
1. increasing satisfaction and decreasing frustration;
2. improving communication skills;
3. decreasing the “need” for “owning” information
4. improving the attitudes, the thinking and communicating techniques of originator and receiver, and
5. removing the barriers that hinder the smooth flow of the communication

Communication barriers from complete blockages to minor distortions can immerse at almost any point in the process.

Hanson\(^{27}\) identified the following barriers to communication:

*Original size.* Large, complex educational organizational has huge volumes of paper. There is always a chance that a message will get lost, thrown away and neglected. Reports need to be synthesized to enhance the possibility of misunderstanding.

*Selective Perception.* The occurs when people block out new information, especially if it conflicts with what they believe. When people receive information, they are apt to hear only those parts that conform to or reaffirm their beliefs. Information that conflicts with preconceived notions is either not processed or distorted to confirm preconception.

\(^{27}\) E. Mark Hanson, *Educational Administration and Organizational Behavior* (USA: Allyn and Bacon Inc., 1996), 229.
**Coding and Decoding.** The process of coding and decoding messages is always vulnerable to error. When the processes are alike, communication is most effective. When they are different, communication tends to break down.

**Filtering.** It is the process of altering or distorting information in order to project a more favorable image. This situation is somewhat understandable because no one wants to “look bad” in the eyes of his or her superiors.

**Information Overload.** This refers to receiving more information than what they can adequately process. When it occurs, the individual can respond in a number of possible ways.

Hanson\textsuperscript{28} and Hicks and Gullett\textsuperscript{29} conformed with Millers’ seven possible outcomes of information overload:

1. Omission – temporary failure to process some of the information
2. Error – processing incorrect information
3. Queuing – delaying responses during congested periods
4. Filtering – not processing certain types of information
5. Generalizing – reducing the levels of specificity
6. Multiple channels – processing information through other officials as in decentralization

\textsuperscript{28} Hanson, 229.

\textsuperscript{29} Hicks and Gullett, 504.
7. Escape – turning away from the task

*Low Level of Technology.* Hoy and Miskel\(^{30}\) pointed out that educational organizations have a relatively low level of technology. Thayer\(^{31}\) elucidated that the means with which an organization communicates must keep pace with the ever-increasing speed of technological progress and cultural change. This means, first of all, knowing more about the available means and methods of communication, and second, devising new and better methods to keep pace with the times.

**RELATED STUDIES**

The study conducted by Nassif aimed to develop proficiency in the discipline of speech of communication. Specifically, this field is defined as the educator’s use of speech delivery as a tool to effective and efficient communication of any topical content material to students.

This work focused primarily on the development of oral delivery styles and strategies for professional educators to enhance and improve the educational process. If these works provide educators with understanding of speech techniques, styles and patterns to enhance their

---

\(^{31}\) Thayer, op. cit. 3.
performance in the classroom, it will be contributing to not only the field of education, but also to future generations of both students and educators.

Nassif’s study focused on the development of a series of audiocassette learning programs designed to train instructors at the college level in the use of speech methods and strategies that will improve and enhance their classroom performance.³²

Meanwhile, the purpose of Watkin’s study was to: (1) conduct exploratory psychometric and statistical analyses of self rating measures of leadership (LEAD-Self) and communicator style (CSM) using a sample of male and female elementary school principals (N=251), and (2) determine any significant sex differences in the responses to the two measures.

The result showed that there were no differences between the men and women on the LEAD-Self leadership categories. Men and women chose the selling and participating styles. Also, no sex differences were obtained in the leadership adaptability scores from the LEAD-Self.³³

On other hand, Andree's study examined and explored the relationship between conflict management style and organizational communication climate as related to communication in Oakland Country, Michigan Schools. Four research questions were posed to determine the relationship between principals and communication climate and their buildings.

A significant correlation was found between non-confrontational communication style and descriptive vs. evaluative climate. When confrontational-solution oriented was correlated with five of the six dimensions of communication climate, the significant relationship between compromise-solution oriented and provisional vs. certainty and problem orientation vs. control principals who used this style were more likely to work in buildings where control and certainty were part of the climate. The six communication climate dimensions were not related to a controlling communication style.

The study further indicated that principals and teachers differed in their perceptions of communication climate (equally vs. superiority and provisional vs. certainty). A significant difference was found among principals on the four communication styles. Regardless of building level, principals tended to perceive similar communication climates within their
schools. The number of teachers and size of the building were significant predictors of a confrontational-solution oriented communication style.\(^{34}\)

The purpose of Miller’s study was twofold. First to determine the perceptions of public schools superintendents in Virginia concerning the competencies and skills they need as individuals to have strengthened in order to perform more effectively in their professionals role, and second to determine their perceptions of the ways in which these competencies and skills can best be delivered.

Percentage response totals were determined for each of the 88 competency items as well as the mean and standard deviation. Those percentage responses ranged from 16% to 57%. Of the 16 items identified most frequently, four items related to technology knowledge and use, and seven to students learning and instruction. Among the 16 items identified least frequently were three in communication skills and three associated with character make-up of superintendents.\(^{35}\)

Sage-Phillips’ study developed a valid, reliable, and useful instrument for principals to gain feedback from faculty and staff regarding their communication skills. The pilot instrument was developed after an

extensive review of the literature and consultation with experts in the field of communication.

Factor analysis procedures were used to reduce the instruments from the original 200 statements to 56 statements as a result of two pilot tests. One hundred and forty-two (142) participants in nine public schools and graduate educational classes at Wayne State University completed the initial pilot instrument. The analysis resulted in elimination of 143 statements.

The second draft on the instrument was completed by 205 participants in 16 public schools and various educational classes at Wayne State University. The analysis resulted in elimination of one statement. The initial test-retest procedure was completed by 68 participants in 5 public schools, using the remaining 56 statements. Within the five resulting factors, more than 50% of the items loaded high on more than one factor, failing to meet the criteria for the test-retest. Therefore, these items were eliminated, leaving 22 items for a final test-retest. Sixty-seven participants from one public school and graduate educational classes from Wayne State University completed the instrument.36

Likewise, Wenke’s study compared the attributes and characteristics needed to be an effective secondary principal today with those attributes and characteristics required in the past, from religious leadership to military-style leadership to the restricting movement of today, the study traces changes in the requirements for leadership today.

Findings of the study revealed that the attributes and characteristics necessary to be an effective secondary principal today have changed from the past. While the principal is still viewed as the “bottom-line” leader and must coordinate the every-day decisions and daily activities of the school, he or she must share the responsibility, and power with additional stakeholders – students, staff, parents, and community.

Today’s secondary principal must have excellent human relations' skills, communication skills, and knowledge of current and future educational trends. The effective principal must serve as a role model to his or her constituents, setting the tone and climate for the secondary school – which is critical to the success of the school.37

Bixler’s study provided an inventory of suggested primary qualifications and requirements for instructional directors in the public high schools. Major research findings indicated that the qualifications that

---

12 Sara Johnson Bixler, “The Qualifications and Responsibilities of Instructional Directors as Perceived by Teachers and Principals on Selected High School Campuses in Texas Education Service Center, Region 20,” (AAC 9718297 ProQuest-Dissertation Abstracts, DA1-A 57/12, June 1997), 4991.
received the recommendations from both teachers and principals included (1) at least five years’ teaching experience, (2) strong communication skills, (3) Bachelor’s degree with additional specialized training or a master’s degree in the particular subject area, and (4) knowledge of teacher appraisal system and instructional leadership training.

The recommended responsibilities included (1) administrative responsibilities – budgeting, department vision, coordinating with other departments, (2) mentoring new teachers, (3) meeting with department members each grading period, (4) assisting in the employment of new teachers, and (5) coordinating throughout the grades and campuses.\(^\text{12}\)

Parson’s study described and compared the skills needed in order to be a successful principal. Aspiring principals enrolled in CSLA (California School Leadership Academy), and experienced principals’ perceptions were used to describe and rate the skills. The researcher also sought to understand the reasons behind the frustrations of beginning principals by comparing the perceptions of aspiring principals with the perceptions held by experienced principals concerning the needed job skills.

The study’s implications for aspiring principals included (1) understanding the importance of knowing a variety of decision and problem solving techniques, (2) understanding the importance of collecting and analyzing data, (3) creating a clear vision for effective teaching and
learning, and (4) recognizing the importance of living the vision and communicating it to various audiences.\textsuperscript{38}

Consensus appears on the literature regarding the dependence of effective educational leadership upon the leader's ability to communicate.

John's study also determined the communication competencies necessary for effective educational leadership as perceived by public school principals. The revised communication activity questionnaire asked principals to rate their perceptions on the importance of personal confidence levels, in twenty identified communication skills in four different directions – toward superiors, co-workers, subordinates, and clients- using a Likert scale.

Results of the study showed that principals perceived all twenty identified competencies to be important. Consistently ranking among the top five in importance were: relationship building, giving feedback, soliciting feedback (interpersonal skills), and public relations (organizational skills).

Results also indicated that principals perceived themselves to be confident in the performance of all twenty communication skills.

Consistently ranking in the top three in all four directions were routine information exchange, relationship building, and listening.  

A exploratory study conducted by Walton, however, sought to examine relationships among teachers’ global-mindedness, their demographic characteristics and their classroom communication competence. The results of the study confirmed that age, history of international travel, and religion are salient predictors of teachers’ global-mindedness. Education was not a significant predictor to teacher global-mindedness of or any of the subscales but global-mindedness had a direct effect on teachers’ classroom communication skills.

The findings of Lesniak served as a basis for examining the vertical communication existing among the faculty teachers and administrators of Region IV who were the subject of the present study. He examined the difficulties in the communication relationship among superiors and subordinates in relation to other attributes of the communication system within the organization.

---

The statistical findings suggested that a close vertical communication relationship can be beneficial to a unit member. This statement was based on the evidence supporting the advantages proposed for closer communication relationship especially when exporting job progress. The nature of the benefit received from a close vertical exchange relationship can be expected to be better informed, more involved with decisions dealing with policy and managerial problems, more satisfied with organizational outcomes and most probably will enjoy better relations with most, if not all, organization members. The practical result of the study seems to suggest that the exchange process is building a feeling of commitment for the employee.

Both studies of Todt and Gregory were used as basis for examining the upward communication practices involved in this research study. Gregory described the teachers' participation in curriculum decision making by determining the types and frequency with upward communication. They used to influence much decision. It was reported that more written than oral messages were used as well as more formal networks than informal ones were used.

Furthermore, teachers as a group than as individuals sent more messages. Secondary teachers were found to have sent more messages.

as individuals than was expected while the elementary teachers sent fewer messages as individuals than was expected.

The study of Adegbola\textsuperscript{43} revealed the barrier facing and blocking the easy flow of upward communication in secondary schools in Orido, Nigeria. The blockade to upward communication and its utilization was composed of five major areas: human relations, the use of power, sympathy for the staff member, attitude towards criticism, and staff participation in decision making.

Sixty-five percent of the teachers strongly condemned the attitudes of their principals because of poor leadership. They accused the over-all administrative approach of their principals as demoralizing and causing setback to moral and academic standards of the school. Only a small number of the teachers favored the actions of their principals. And there was an overall lack of cooperation among school administrators and teachers.

Heath\textsuperscript{44} made an investigation to determine if barriers to effective communication perceived by subordinates (faculty persons) differed from those perceived by superiors (department chairpersons). Communication

\textsuperscript{44} Deborah Davis Heath, “Barriers to Effective Communication as Perceived by Faculty and Chairpersons in Private Undergraduate Educational International,” (Dissertation Abstract International, Sept.-Oct. 1983), 932 – A.
barriers in three private undergraduate educational institutions were examined. The findings revealed that the faculty and chairpersons shared common perceptions of most barriers. The chairpersons rated the barriers higher than the faculty though no significantly higher. The five top ranking barriers for the faculty and chairpersons included:

<table>
<thead>
<tr>
<th>Faculty</th>
<th>Chairperson</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Withholding information</td>
<td>1. Faculty translation</td>
</tr>
<tr>
<td>2. Lack of coherence</td>
<td>2. Concealment of thoughts</td>
</tr>
<tr>
<td>3. Defensiveness</td>
<td>3. Defensiveness</td>
</tr>
<tr>
<td>4. Lack of feedback</td>
<td>4. Premature jumping to conclusions</td>
</tr>
<tr>
<td>5. prematurely jumping to conclusions</td>
<td>5. Withholding information</td>
</tr>
</tbody>
</table>

The major contribution of this study was that it identified the difficulties as well as the common perception of barriers to effective communication among the members of a department or educational institutions. Identification of the barriers served as a basis on which to conduct workshops or training experiences in developing better
communication skills, specifically piloted to the common needs of a department or institution.

METHOD

This chapter deals with the study’s theoretical framework and methodology.

The first part, the theoretical framework, showcase the study’s foundation in terms of the written theories already proven and published. The other part, the research methodology, discusses the nature of the proposed study, its research universe and samples, the sampling design, instrumentation, data gathering design and date processing design.

THEORETICAL FRAMEWORK

This study is anchored on Stephen Covey’s theory that
According to Ludlow and Panton, managers need to be effective communicators to achieve positive results in today’s organization. In the school setting, school principals must also be effective communicators to avoid problems that will hinder an ideal daily operation of the school system.

Razik and Swason emphasized that the quality of a school’s communication seriously affects the nature of its effectiveness.

Sergiovanni cited the top three proficiencies on communication skills that must be possessed by a school principal. These proficiencies are following: (1) persuasively articulating their beliefs and effectively defend their decisions, (2) writing clearly and concisely so that the intended audience understands the message, and (3) applying facts and data to determine priorities.

Communication involves certain processes, materials, elements, methods, approaches and strategies that influence the effectiveness of communication. That is, the moment a person enters into this special relationship with another person, he begins to change the very nature of

---

46 Razik and Swason, 231.

communication with them. They begin to build trust and confidence with each other. In this context, the value of a private visit with each employee, a private lunch with a business associate, a private chat with a client or customer should be considered – a time when the attention is focused upon a person, upon his or her interests, concerns, needs, hopes, fears, and doubts.

To be effective in communicating, the school principal must know these basic things: (1) communication is not a one-way affair but an interaction process between the school principal and the teachers/employees, (2) feedback from the teachers is tremendously important for the principal since it will help him amend, reinforce, or change his message as necessary, and (3) the principal must not only encode the message correctly but must know what channels to use.48

Interpersonal communication, according to Cooper, is concerned with the relational as well as the content message of communication. It is through communication that relationships are developed, maintained and terminated.49

---

Thus, school managers must possess a well-developed repertoire of interpersonal communication skills in order to establish, maintain, and promote effective interpersonal relationships in the school system.

**RESEARCH METHODOLOGY**

**Research Design**

The study employed the descriptive research method. The researcher strived to explore, analyze, decipher and report the present status, problems and issues of the communication system of the schools in the Southern Tagalog Region with a view of getting groups of classified, generalized and interpreted data for the guidance or practice of the administrative staff in the new millennium.

**Problem, Its Variables and Measures**

The study was composed of nine sub-problems.

The first sub-problem described the administrators’ communication competencies along with the following variables: informative, affective, imaginative, ritualistic, and persuasive messages. Frequently, ranking, weighted arithmetic mean and chi-square statistics were used as statistical tools.
The second sub-problem exposed the abilities of the respondents as communicators. The variables used were verbal and written communication and its measures were weighted frequency, weighted arithmetic mean, and ranking.

The third sub-problem dealt with the extent of the administrators’ ability to act on the following variables as sender, message formulators, channel users, decoders, and feedback givers. Frequently, weighted arithmetic mean, ranking, standard deviation and t-test were utilized in the analysis.

The fourth sub-problem described the communication barriers in terms of organization size, selective perception, coding and decoding, filtering and information overload. Frequently, weighted arithmetic mean, and ranking were used.

The fifth sub-problem discussed the problems and difficulties encountered by the school administrators along with some areas of management. Ranking was used in treating the data.

The sixth sub-problem discussed the perceived problems and difficulties met by the school administrators that can distort the communication process. With this, regression analysis was used.

The seventh sub-problem described the respondent’s preferred communication style. Ranking was used.
The eight sub-problem revealed the degree of communication efficiency of the school managers as viewed by the respondents. Weighted arithmetic mean and ranking were used.

The ninth sub-problem discussed the empirical values that can be derived from the study’s findings.

**Research Universe**

Region IV was the research locale of this study. Commonly known as the Southern Tagalog Region, it was the researcher’s choice since this region has a unique environment. The entire region has different languages and thus communication plays an important role in the day-to-day operation of the school system. The researcher believed that communication problems largely take place in this area.

The region is composed of eleven provinces and eleven cities geographically located either on an inland or an island. The eleven provinces are as follows: Aurora, Batangas, Cavite, Laguna, Marinduque, Occidental Mindoro, Oriental Mindoro, Quezon, Palawan, Rizal and Romblon. On the other hand, the eleven cities are Antipolo, Batangas, Calapan, Cavite, Lipa, Lucena, Marikina, Puerto Princesa, San Pablo, Tagaytay, and Trese Matirez.
Elementary and high school principals, elementary district supervisors, elementary and secondary school teachers were included in the research universe.

**Research Sample**

The samples of the study was comprised of randomly selected high school principals, elementary school district supervisors, elementary school principals and selected teachers both in the secondary and elementary in the Southern Tagalog Region. The procedure used in choosing the samples was the systematic and purposive random sampling.

The selection of division-respondents utilized the purposive random sampling while the selection of principal-respondents and teacher-respondents used systematic random sampling.

The study's Division respondents were Batangas Province and Batangas City, Laguna Province including San Pablo City, Cavite Province and Cavite City.
The study's samples were broken down as follows:

<table>
<thead>
<tr>
<th>Province</th>

</tbody>
</table>

**Data Gathering Design**

The researcher prepared a letter addressed to the DepED Regional Director to ask permission to administer the questionnaire. Another letter was prepared addressed to the different Division Superintendents. After the approval, the researcher personally conducted the administration of the study's questionnaire.

Retrieval was done according to the availability of the respondents.

**Questionnaire**

The research instrument used was the questionnaire. This questionnaire stipulated information on the essential elements of the communication process and the problems encountered in the process.
The questionnaire consisted of two parts – the personal data and the questionnaire proper.

As mentioned, the questionnaire was pre-tested in the Division of Lucena City and Quezon. The purpose of the said pre-testing was to eliminate questions that were irrelevant, vague and nonsense. Questions that have the same meanings were then removed. Feedbacks, comments and suggestions that were relevant were taken for further improvement of the questionnaire. The questionnaires were also subjected to validity and reliability tests.

There were five (5) district supervisors, five (5) elementary school principals, five (5) secondary school principals, five (5) elementary grade teachers and five (5) secondary school teachers who participated in the dry-run.

There were two sets of questionnaire: Set I for school heads which included elementary and secondary school principals and district supervisors, and Set II for elementary and secondary teachers.

**Set I. School Administrator’s Questionnaire.**

Part I dealt with questions on the demographic profile of the school head respondents.
Part II included questions on the school administrators' communication abilities. This was a 5-point scaled questionnaire. This was a modified questionnaire from Pamela Cooper.

Part III dealt with the respondents' ability to act as a sender, message formulators, channel users, decoders, and feedback givers. It was also a five-point dimensional questionnaire.

Part IV of the questionnaire were questions on communication barriers. This time a 5-point Likert scale was used. This was also a modified version of Cooper’s questionnaire.

Part V with the problem on communication process being encountered by the school managers.

Finally, a preferred questionnaire on the principal's communication style was included. It showcased some situational problems on communications to test the school administrators' communication style. This was a modified version of Lussier's Determining Your Preferred Communication Style.

Set II. Teacher’s Questionnaire.

Part I of the said questionnaire dealt with the respondent's demographic profile.

Part II was a 6-dimensional questionnaire on the principals’ communication competencies along with selected variables. This was a
modified questionnaire from Cooper’s Personal Report of Communication Apprehension.

Part III included questions on the school administrators’ communication abilities. This was a 5 – point scaled questionnaire. This was also a modified questionnaire from Cooper.

Part IV dealt with the respondents’ ability to act as a sender, message formulators, channel users, decoders, and feedback givers, which was a five-point dimensional questionnaire.

Part V of the questionnaire were questions on communication barriers, this time a 5-point Likert scale. Again, this was a modified version of Cooper’s questionnaire.

Part VI dealt with the problems on communication process being encountered by the school managers.

Finally, a preferred questionnaire on the principal’s communication style was included. It showcased some situational problems on communications to test the school administrators’ communication style. This was a modified version of Lussier’s Determining Your Preferred Communication Style.

**Data Processing Design**

In terms of interpretation, qualitative description was applied after the necessary mathematical computations.
On the respondents’ communication abilities, the following were applied:

<table>
<thead>
<tr>
<th>Mean Range</th>
<th>Qualitative Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.51 – 5.00</td>
<td>Strongly Agree</td>
</tr>
<tr>
<td>3.51 – 4.50</td>
<td>Agree</td>
</tr>
<tr>
<td>2.51 – 3.50</td>
<td>Undecided</td>
</tr>
<tr>
<td>1.51 – 2.50</td>
<td>Disagree</td>
</tr>
<tr>
<td>1.00 – 1.50</td>
<td>Strongly Disagree</td>
</tr>
</tbody>
</table>

On the respondents’ ability to send messages, the following were utilized:

<table>
<thead>
<tr>
<th>Mean Range</th>
<th>Qualitative Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.00 – 1.50</td>
<td>behavior did not appear</td>
</tr>
<tr>
<td>1.51 – 2.50</td>
<td>opportunities were present but not demonstrated</td>
</tr>
<tr>
<td>2.51 – 3.50</td>
<td>behavior demonstrated occasionally</td>
</tr>
<tr>
<td>3.51 – 4.50</td>
<td>behavior demonstrated consistently with average effectiveness</td>
</tr>
</tbody>
</table>
4.51 – 5.00 behavior demonstrated consistently with obvious skills

On the respondents' assessment of communication skills, the following were used:

<table>
<thead>
<tr>
<th>Mean Range</th>
<th>Qualitative Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.00 – 1.50</td>
<td>Never</td>
</tr>
<tr>
<td>1.51 – 2.50</td>

**RESULT AND DISCUSSION**

This chapter presents the summary of findings on how the teacher-respondents perceive their administrators’ communication competencies and their ability to send/receive informative messages, affective messages, imaginative messages, ritualistic messages, and persuasive messages regarding the administrators’ feelings about communicating with other people when engaging in group discussions, meetings, interpersonal conversation, public speaking, and doing written communications.
Likewise, it tries to gauge their abilities to act in different communication processes such as sending/encoding messages, formulating messages, using channels, decoding/receiving messages, and giving feedback. It also shows the effects of the different communication barriers on the school principals and district supervisors, their assessment on their communication skills and their preferred communication styles.

**SUMMARY OF FINDINGS**

After applying the proper statistical treatment, the following findings were arrived at:

1. **DEMOGRAPHIC PROFILE OF RESPONDENTS**

That Batangas, Cavite and Laguna were the province division. Each province division has 10 district supervisors, 10 elementary school principals, 5 secondary school principals, 15 elementary teachers and 10 secondary school teachers with a total of 50 respondents from each division. The city divisions were Batangas City, Cavite City and San Pablo City which include 2 district supervisors, 4 elementary school principals, 2 secondary school principals, 5 elementary school teachers and 4 secondary school teachers with a total of 17 in each division.
That the biggest bulk of school administrators were between 50-59 years of age while elementary and secondary school teachers were between 40-49.

That out of the 201 respondents, only 23 were males and 178 were females. Only 19 were listed as single, 172 were married and 10 were widow/widower.

That educational attainment was proven to be the springboard to be promoted to higher position. The higher the educational level, the higher the position attained.

2. MESSAGE TRANSMISSION MEDIA USED BY ADMINISTRATORS

That face to face communication was the most used medium of communication in English with 32 responses or 44.44% from district supervisors, 33 or 42.86% from elementary school principals, 52 or 43.33% from elementary school teachers, 18 or 42.86% from secondary school principals and 34 or 40.78% from secondary school teachers.

That many of the administrators used memos as form of written communication according to 24 or 33.33% district supervisors, 30 or 35.71% elementary school principals, 42 or 35% elementary school teachers, 18 or 42.85% secondary school principals, and 34 or 40.48% secondary school teachers.
That many of the administrators have rated themselves 10, extremely fluent in English oral communication. Many elementary school teachers agreed that they are extremely fluent and gave a 10 rating while secondary school teachers rated them nine (9) only.

That many of the administrators have rated themselves 10, extremely fluent in English written communication. Elementary school teachers also find their administrators extremely fluent and gave a rating of 10 while secondary school teachers gave a nine (9) rating.

That majority of the administrator-respondents rated themselves 10 extremely fluent in Filipino oral communication and it was agreed upon by elementary and secondary school teachers.

That majority of the elementary school teachers and secondary school principals gave a rating of 10, extremely fluent in Filipino written communication. Many of the district supervisors, elementary school principals and secondary school teachers also find the administrators extremely fluent.

3. ADMINISTRATORS’ ATTITUDES WHEN COMMUNICATING WITH OTHER PEOPLE

That the most evident behavior manifested by school administrators is being comfortable while participating in group discussion. District
supervisors gave a rating of 1.33, elementary school principals 1.48 and secondary school principals 1.38 equivalent to strongly agree.

That elementary school administrators and district supervisors were consistent that they were calm and relaxed when participating in meetings with a weighted mean of 2.05 agree and 1.28 strongly agree respectively. Secondary school principals agreed that they were relaxed when answering questions at a meeting while a weighted mean of 1.71.

That both elementary school principals and district supervisors agreed that they have no fear of speaking up in conversations with weighted means of 1.84 and 1.70 respectively. Secondary school principals were very calm and relaxed in a conversation with a weighted mean of 2.10 agree.

That both elementary school principals and district supervisors conformed that they have no fear of giving a speech with weighted means of 2.05 and 2.17 respectively. Secondary school principals agreed that they face the prospect of giving a speech with confidence that earned a weighted mean of 2.33.

That district supervisors strongly agreed that they were confident in issuing memoranda to all concerned with a weighted mean of 1.27. Secondary school principals also agreed with a weighted mean of 1.76 while elementary school principals make sure that their grammar is correct when writing a letter with a weighted mean of 1.67.
4. TEACHERS’ PERCEPTION ON THEIR PRINCIPAL’S COMMUNICATION COMPETENCIES

A. Informative messages

That in terms of sending informative messages, elementary school teachers noted that their administrators ask effective questions to assess teacher understanding of information given in lectures with a weighted mean of 4.27, demonstrated consistently with average effectiveness. Secondary school teachers rated their principals 4.43 in terms of structuring informative messages effectively by using devices such as initial partitions, transitions, internal summaries and concluding summaries.

On the receiving ability, elementary school teachers delineated that their administrators were able to identify main point of teachers’ comment with a weighted mean of 4.55, demonstrated consistently with obvious skills. Secondary teachers identified that administrators can formulate questions that probed for the informative content of messages with a weighted mean of 4.24.

That both the elementary and secondary school teacher-respondents perceived that their administrators both demonstrated their ability to send and receive informative messages consistently with average effectiveness. It obtained average weighted means of 4.10 and
4.28 respectively in terms of sending and 4.32 and 4.17 respectively in terms of receiving.

B. Affective Messages

That elementary school teachers described that their administrators demonstrate energy and enthusiasm when relating to teacher with a weighted mean of 4.50 which means it is demonstrated consistently with average effectiveness. Secondary school teachers also find their principals consistent and effective in the demonstration of interpersonal openness, warmth, and positive regard for teacher with a weighted mean of 4.26.

In receiving affective messages, teachers noted that their principals/administrators offer advice tactfully if necessary with a weighted mean of 4.53, behavior demonstrated consistently with obvious skills by elementary school administrators and 4.38, behavior demonstrated consistently with average effectiveness by secondary school administrators.

Overall, administrators demonstrate consistently with average effectiveness their ability to send affective message with weighted means of 4.38 and 4.15 respectively and have also demonstrated consistently with average effectiveness their ability to receive affective messages with average weighted means of 4.38 and 4.19 respectively.

C. Imaginative Messages
That elementary school teachers believed that their administrators use vivid descriptive language with a weighted mean of 4.33, demonstrated consistently with average effectiveness. Secondary school teachers observed that their principal uses expressive vocal and physical behavior with 4.57 mean, behavior demonstrated consistently with obvious skills.

In terms of receiving, elementary school teachers revealed that their administrators were non-directive when encouraging teachers' creativity with 4.40 mean while the secondary school respondents viewed that their principal responded to the imaginative messages enthusiastically with a mean of 4.76, behavior demonstrated consistently with obvious skills.

In general, elementary and secondary school administrators demonstrated consistently with average effectiveness their ability to send imaginative messages with average means of 4.32 and 4.42 respectively. Elementary school administrators also demonstrated consistently with average effectiveness their ability to receive imaginative messages with average mean of 4.38 while secondary school administrators demonstrated this ability with obvious skills with an average mean of 4.51.

D. Ritualistic Messages

That in sending ritualistic messages, demonstrating appropriate behavior in performing everyday speech acts such as greeting, turn-
taking, and leave-taking got a 4.55 weighted mean as described by elementary school teachers. Modeling appropriate social amenities in ordinary classroom interaction best described their principals according to secondary school teachers with a weighted mean of 4.33, behavior demonstrated consistently with average effectiveness.

On the receiving ability, elementary school principals/administrators recognition of appropriate and inappropriate performances of social amenities got a weighted mean of 4.45 as rated by the teachers. On the other hand, secondary school teachers described that their principal recognizes when teachers perform everyday speech acts appropriately with a weighted mean of 4.48.

As a whole, elementary and secondary school principals/administrators demonstrated their ability on sending and receiving ritualistic messages consistently with average effectiveness.

E. Persuasive Messages

That in terms of sending persuasive messages, both group of respondents agreed that administrators offer sound reasons and evidence in support of ideas. For elementary school teachers this behavior is demonstrated consistently with obvious skills by their administrators with a weighted mean of 4.51 while secondary school teachers gave a weighted mean of 4.36, demonstrated consistently with average effectiveness. In receiving persuasive messages, administrators recognize underlying
assumptions of arguments of others according to elementary and secondary teachers with weighted of 4.55 and 4.36 respectively.

In totality, school administrators in both the elementary and secondary level demonstrated their ability in sending and receiving persuasive messages consistently with average effectiveness with 4.35 and 4.20 mean respectively.

5. PRINCIPALS/ADMINISTRATORS’ ABILITIES TO ACT IN DIFFERENT COMMUNICATION PROCESSES

A. Sending/Encoding Messages

That elementary and secondary school administrators clarify ideas, desires and purpose before communicating which got a weighted mean of 1.19 strongly agree for the district supervisors and 1.69 agree for elementary school principals. While secondary school principals describe well ideas to fellow workers/subordinates with a weighted mean of 1.48 strongly agree.

In summary, both the elementary and secondary school principals agreed that they have the ability to send/encode messages with average means of 1.83 and 1.77 respectively while district supervisors strongly agreed with 1.45 average mean.

That elementary and secondary teachers ranked first that their principals/supervisors show command of the language for the smoother
flow of the message, with a weighted mean of 2.19 agree and 2.57 undecided respectively.

That elementary and secondary school teachers believed that their administrators still need to improve their ability to send/encode messages as they gave an average weighted mean of 3.98 and 4.20 respectively.

B. Formulating Messages

That both the secondary school principals and district supervisors strongly agreed that they use clear, simple and concrete language with 1.38 and 1.22 weighted means respectively. While both the elementary school principals and district supervisors organize message carefully with weighted means of 1.60 agree and 1.22 strongly agree. Secondary school principals draft messages with receiver's needs clearly in mind with a weighted mean of 1.38.

In summation, district supervisors gave a weighted average of 1.27 strongly agree, 1.70 agree for the elementary school principals and 1.42 strongly agree for secondary school principals.

That elementary school teachers ranked last their administrators' ability to use clear, simple and concrete language with a weighted mean of 4.37 disagree while organizing messages carefully and drafting messages with the receiver's need clearly in mind ranked first with a weighted mean of 4.32 disagree.
Secondary school teachers gave the lowest rating to their administrators’ ability to formulate brief and direct message using familiar words with 4.67 mean, strongly disagree. Use of clear, simple and concrete language ranked first with a weighted mean of 4.43 disagree.

As a whole, elementary and secondary school teachers rated their administrators' ability to formulate messages with an average weighted mean of 4.34 disagree and 4.56 strongly disagree.

C. Using Channels

That district supervisors see to it that they provide a clear channel for transmitting information which got a weighted mean of 1.33 strongly agree. Elementary school principals keep the line of communication open first with a weighted mean of 1.64 agree while secondary school principals put in mind first that they clarify formal communication with a weighted mean of 1.29 strongly agree.

Overall, elementary and secondary school principals and district supervisors rated themselves 1.89 agree, 1.60 agree and 1.53 in using channels.

That elementary school teachers said that least manifested by their administrators is keeping the line of communication open with the lowest weighted mean of 4.43 disagree. Although utilizing informal channel such as the grapevine got the highest weighted mean of 4.08, it is also equivalent to disagree. Meanwhile, secondary school administrators
have the least ability to clarify formal communication with 4.45 mean. They 
\textit{disagreed} that administrators provide a vehicle for obtaining reactions to 
ideas that are being considered which ranked first with a weighted mean 
of 4.15.

Both group of respondents recorded the same average weighted 
mean of 4.30 \textit{disagree}.

\textbf{D. Decoding/Receiving Messages}

That all of the respondents find it easy to put together exactly what 
was said when they listen to people in authority. District supervisors rated 
themselves 1.50 \textit{strongly agree}, 1.79 \textit{agree} for elementary school 
 principals and 1.76 \textit{agree} for secondary school principals.

On the outset, the three groups of administrators rated themselves 
with average weighted scores of 3.26, 3.43, and 3.33 respectively which 
reveals that they are \textit{undecided} whether they have enough ability to 
decode/receive messages.

That administrators are somewhat afraid to receive new information 
acquired the highest rank with a weighted mean of 2.50 \textit{agree} for 
elementary school teachers while secondary school teachers feeling 
tensed when listening as a member of a social gathering got a weighted 
mean of 2.17 \textit{agree}. 
As a whole, the respondents are both undecided whether their administrators have the ability to decode/receive messages as elementary school teachers rated it 3.27 and secondary school teachers 3.26.

E. Using Feedback

That the district supervisors strongly agreed that they ensure feedback is intended to be helpful to the receiver with a weighted mean of 1.34. While elementary and secondary school principals both agreed that they monitor the environment by observing naturally occurring informational use, other individuals and how other respond with weighted means 2.00 and 1.52 respectively.

In general, all of them agreed that they have the ability to give feedback with 2.26 average mean for elementary school principals, 1.75 for secondary school principals and 2.21 for district supervisors.

That both the elementary and secondary teachers were both undecided whether their administrators present feedback without judgment with the highest weighted mean of 3.20 and 3.33 respectively.

Overall, the respondents both disagreed that feedback is utilized in the communication process by their administrators as elementary and secondary school teachers gave 4.04 and 4.00 rating on this aspect.
6. EFFECTS OF THE DIFFERENT COMMUNICATION BARRIERS, ASSESSMENT OF COMMUNICATION SKILLS AND PREFERRED COMMUNICATION STYLES

A. Effects of the Different Communication Barriers

That district supervisors put a message in the most favorable terms possible with a weighted mean of 1.53 agree. Secondary school principals ranked first synthesizing of reports, messages, memos, etc. with 1.33 mean, strongly agree. Elementary school principals rated both these aspects first with 1.95 mean, agree.

That elementary school teachers perceive that administrators process incorrect information with a weighted mean of 2.50 agree while secondary school teachers are undecided whether their administrators alter and district information with a weighted mean of 2.78.

B. Assessment of Communication Skills

That both the elementary and secondary school principals always project self-confidence and speak confidently before their teachers with weighted means of 3.74 and 3.76 respectively. Also, secondary school principals always make their reports accurate, concise, clear and well structured with 3.76 mean. On the other hand, district supervisors always
think carefully about a message before deciding how to communicate it with 3.92 mean.

**C. Preferred Communication Style**

That all of them have exactly the same attitude when dealing with different communication situation. That when someone comes to them and request to design a special training in communication approach, majority answered that they will convey understanding and support, help clarify what is to be done, and offer ideas. That 59.5% of the elementary school principals, 57.1% secondary school principals and 58.3% of district supervisors will do it.

That when someone comes to them to ask favor on the administration of the achievement test of students, majority will be supportive and will make changes together as a team with 69% responses from elementary school principals, 57% from secondary school principals and 86.1% from district supervisors.

That when someone calls them for a confidential meeting and tells that she needs some information to solve a problem, majority will respond in a manner that conveys personal support and offer alternative ways to solve the problem with 61.9% responses from elementary school principals, 52.4% from secondary school principals and 77.8% from district supervisors.
That when they have a supervisor work to be executed and completed in three days, majority will decide together what to accomplish with somebody who is experienced. It obtained 71.4% responses from elementary school principals, 57.1% from secondary school principals and 86.1% from district supervisors.

That when a PTA project needs to be completed before the evaluation, majority will explain the situation with the PTA president and together come to a solution to the problem. There were 59.5% answers solicited from elementary school principals, 81% from secondary school principals and 86.1% from district supervisors.

**CONCLUSIONS**

After evaluating the findings gathered, the following conclusions were thus made:

1. **ADMINISTRATORS’ COMMUNICATION COMPETENCIES**

   **A. Informative Messages**

   That administrators demonstrated their ability to send and receive informative messages consistently with average effectiveness.

   **B. Affective Messages**

   That administrators in the elementary and secondary levels have demonstrated consistently with average effectiveness their ability to send and receive affective messages.
C. Imaginative Messages

That elementary and secondary school principals/administrators demonstrated consistently with average effectiveness their ability to send imaginative messages. Elementary school administrators demonstrated consistently with average effectiveness their ability to receive imaginative messages and secondary school administrators only demonstrated this ability with obvious skills.

D. Ritualistic Messages

That elementary and secondary school administrators demonstrated their ability on sending and receiving ritualistic messages consistently with average effectiveness.

E. Persuasive Messages

That school administrators demonstrated their ability to send and receive persuasive messages consistently with average effectiveness.

2. ADMINISTRATORS’ VERBAL AND WRITTEN COMMUNICATION ABILITIES

A. Verbal Communication Abilities

That school administrators are comfortable while participating in group discussion.

They were calm and relaxed when participating in meetings. Secondary school principals were also relaxed when answering questions
at a meeting while elementary school principals and district supervisors were not afraid to express themselves at meetings.

That elementary school principals and district supervisors have no fear of speaking up in conversations while secondary school principals were very calm and relaxed in a conversation.

That both elementary school principals and district supervisors have no fear of giving a speech while secondary school principals face the prospect of giving a speech with confidence.

**B. Written Communication Abilities**

That district supervisors and secondary school principals were confident in issuing memorable to all concerned while elementary school principals make sure that their grammar is correct when writing a letter.

3. **ADMINISTRATORS’ ABILITIES TO ACT IN DIFFERENT COMMUNICATION PROCESSES**

**A. Sending/Encoding Messages**

That elementary and secondary school administrators believed they have the ability to send/encode messages while the teachers believed that their administrators still need to improve their ability to send/encode messages.

**B. Formulating Messages**

That the administrators believed they have the ability to formulate messages while the teachers said that their administrators don’t have the ability to formulate messages.
C. Using Channels

That the administrators strongly agreed they have ability to use channels while the teachers disagreed they have it.

D. Decoding/Receiving Messages

That the administrators were undecided whether they have enough ability to decode/receive messages just like the perception of the teacher-respondents.

E. Using Feedback

That the administrators agreed that they have the ability to give feedback while the teachers disagreed that it is utilized in the communication process by their administrators.

4. EFFECTS OF COMMUNICATION BARRIERS

That because of the communication barriers, district supervisors try to put a message in the most favorable terms possible while secondary school principals synthesize reports, messages, memos, etc. Elementary school principals both put a message in the most favorable terms and synthesize reports, messages, memos, etc. All of them were undecided whether they process incorrect information while secondary school principals disagreed that they alter and district information to project favorable image.
That elementary school teachers perceived that administrators process incorrect information while secondary school teachers were undecided whether their administrators alter and distort information.

Elementary school teachers identified the weakness of their administrators in putting a message in the most favorable terms possible while secondary school teachers have observed their administrators' deficiency in synthesizing reports, messages, memos, etc.

5. PROBLEMS AND DIFFICULTIES ENCOUNTERED IN EMPLOYING/UTILIZING THE COMMUNICATION PROCESS

That administrators were not able to utilize the fax machine effectively in the communication process. They were not also able to utilize informal channel such as the grapevine to serve as gauge for employees' concern and satisfaction.

That they least manifested keeping the line of communication open and have the least ability to clarify formal communication. They do not provide a vehicle for obtaining reactions to ideas that are being considered. They still have to improve themselves in using channels.

That they weren't able to describe well ideas to fellow workers/subordinates and give accurate instruction. Administrators still need to improve their ability to send/encode messages.

That administrators do not find it easy to concentrate on what is being said and put together exactly what was said when they listen to
people in authority. They still have to improve their ability to decode/receive messages.

That they were not able to monitor the environment by observing naturally occurring informational use, other individuals and how others respond. The feedback was not utilized in the communication process by administrators.

6. PERCEIVED PROBLEMS AND DIFFICULTIES MET BY SCHOOL ADMINISTRATORS THEMSELVES

That they have difficulty in employing multiple channels to stimulate a number of the receiver's senses as well reducing messages to the simplest possible terms.

That they have difficulty to use clear, simple and concrete language and formulate brief and direct message using familiar words. Administrators lack the ability to formulate messages and they don’t have enough ability decode/receive messages.

That administrators were somewhat afraid to receive new information acquired and feel tensed when listening as a member of a social gathering.

That they weren’t able to give playback on what others communicate. They were not sure whether they give feedback without judgment.
That administrators sometimes process incorrect information and alter and distort information.

That administrators have weakness in putting a message in the most favorable terms possible and deficiency in synthesizing reports, messages, memos, etc.

7. PREFERRED COMMUNICATION STYLES

That all of them have exactly the same attitude when dealing with different communication situations. That when someone comes to them and request to design a special training in communication approach, they will convey understanding and support, help clarify what is to be done, and offer ideas.

That when someone comes to them to ask favor on the administration of the achievement test of students, they will be supportive and will make changes together as a team.

That when someone calls them for a confidential meeting and tells that she needs some information to solve a problem, they will respond in a manner that conveys personal support and offer alternative ways to solve the problem.

That when they have a supervisory work to be executed and completed they will decide together what to accomplish with somebody who is experienced.
That when a PTA project needed to be completed before the evaluation they will explain the situation with the PTA president and together come to a solution to the problem.

8. DEGREE OF COMMUNICATION EFFICIENCY OF SCHOOL ADMINISTRATORS

That administrators project self-confidence and speak confidently before their teachers. They also see to it that they make their reports accurate, concise, clear and well structured and think carefully about a message before deciding how to communicate it. They unanimously identified that they occasionally communicate via all electronic media.

RECOMMENDATIONS

On the basis of the findings and conclusion presented, the following recommendations are thus made:

1. A suitable plan has to be worked out to bring order and efficient in their internal communication system.

2. A short-term course in effective communication is urgently needed by school administrators and an expert should be hired to give the course.

3. A medium or long-range plan for improving the communication skills of supervisory and rank and file personnel as well as the teachers should be instituted.
4. A high standard in written communication should be demanded and the value of good writing and oral communication should be emphasized.

5. Administrators should also be trained in the use of new technology such as the computer, Internet and fax machine to improve their communication ability.
Prevent and Alleviate Burnout for Educators and Helping Professionals

Prevent and Alleviate Burnout for Educators and Helping Professionals

Leslie W. Baker, Mary Ann Coker

Abstract

Burnout is a critical issue among educators. Burnout is defined “as a syndrome of emotional exhaustion, depersonalization, and reduced personal accomplishment” (Maslach, Jackson & Leiter, 1996, p. 4). This workshop will provide prevention on burnout and provide strategies for organizations and educators to manage burnout. The workshop will explore Secondary Post Traumatic Stress Syndrome/Compassion Fatigue and its effects on individuals and organizations. Stem the tide of educator departures by treating the main cause; burnout.

A Paper Presented at the 13th Annual Hawaii International Conference on Education Held at the Hilton Hawaiian Village Waikiki Beach Resort in Honolulu, Hawaii.

5th - 8th January, 2015
ABSTRACT

The study investigated the influence of laboratory learning environment on students’ learning outcomes in secondary school Chemistry. Specifically, the study investigated the influence of the five dimensions of laboratory learning environment on students’ performance and attitude to the learning of Chemistry. The population for the study comprised all the Senior Secondary School Three (SS III) Chemistry students in all the public secondary schools in Ondo State, Nigeria. The study adopted the descriptive research design of survey type. The sample for the study consisted of six hundred and ninety (690) students from the schools used for the study. Three research instruments were used for collection of data, namely: Questionnaire on Chemistry Laboratory Learning Environment (QLLE), Chemistry Practical Achievement Test (CPAT) and Chemistry Attitude Scale (CAS). Data collected were analysed using Analysis of Variance (ANOVA) and Multiple Regression. The result showed that there was significant relationship between five dimensions of laboratory learning environment and students’ performance in Chemistry ($F_{(4,684)}=678.96$, $P=.000$). Material environment had the highest contribution to students’ performance in Chemistry ($\beta=.345$, 34.5%). This is seconded by integration ($\beta=.219$, 21.9%), followed by student cohesiveness ($\beta=.173$, 17.3%), followed by rule-clarity ($\beta=.139$, 13.9%) while open-endedness ($\beta=.097$, 9.7%) had the lowest contribution. The result also showed that the relationship between five dimensions of laboratory learning environment and their attitude towards Chemistry was significant ($F_{(4,684)}=563.28$, $P=.000$). The result also showed that material environment had the highest contribution to students’ attitude towards Chemistry ($\beta=.645$, 64.5%). This is seconded by integration ($\beta=.267$, 26.7%), followed by student cohesiveness ($\beta=.196$, 19.6%), followed by rule-clarity ($\beta=.153$, 15.3%) while open-endedness ($\beta=.135$, 13.5%) had the lowest contribution. It is recommended among others that in order to encourage the development of scientific attitudes, teachers should make sure appropriate controls are established for these classroom environmental factors.

Keywords: Laboratory, Learning Environment, Students’ Learning Outcomes, Chemistry.
Introduction

Chemistry as a branch of science and the prerequisite subject for many fields of science contributes immensely to the technological growth of the nation. This includes agriculture, pharmacy, medicine, nursing, biochemistry and chemical engineering. Therefore, any nation that aspires to develop scientifically and technologically must pay attention to the quality of Chemistry education that is being taught in her schools. It is against this background that made the federal government of Nigeria to identify the specific objectives to be achieved in the Chemistry curriculum at the senior secondary school level in the national policy of education (2004) as follows:

- facilitating a transition to the use of scientific concepts and techniques acquired in Integrated Science with Chemistry;
- providing the students with basic knowledge in chemical concepts and principles through efficient selection of content and sequencing;
- showing Chemistry in its inter-relationship with other subjects;
- showing Chemistry and its link with industry, everyday life, benefits and hazards; and
- providing a course which is complete for students not proceeding to higher education while at the same time it is a reasonably adequate foundation for a post-secondary Chemistry course.

The policy recommends that science teaching and learning should be activity-oriented and student-centred such that students acquire relevant laboratory experiences. The achievement of these objectives will depend on and be influenced by the teacher, the students, the materials, the laboratory and how both students and teachers perceive them in relation to intended learning outcomes.

Chemistry is a core science subject and as such a credit pass in it is required before a student can be admitted in any tertiary institution for most scientific based discipline. The study of Chemistry entails the learning of concepts, established principles, laws and theories and also substantial activity-oriented laboratory work. These laboratory experiments are to demonstrate practically some of the principles taught in theory, test the validity of certain empirical chemical laws and illustrate properties of substances taught theoretically in the
classroom. Learning Chemistry means not only learning facts and concepts that describe the physical world at the atomic level, but also learning how to examine the physical evidences of chemical principles in a laboratory learning environment. Since Chemistry is a science based on experimentation, performing experiments within a laboratory setting is an important aspect of Chemistry work learning. Effective teaching and learning of Chemistry can only take place when theoretical explanations are complemented with actual practices in the laboratory. The teaching laboratory is the standard method of training students in the skills and values central to scientific investigation and important in the development of positive attitude to Chemistry. In the Chemistry laboratory, students work cooperatively in small groups to investigate phenomena. This mode of instruction has the potential to enhance constructive social interactions as well as positive attitudes and academic performance. Even though the knowledge of Chemistry to the society is very important, students’ performance in the subject as measured by their scores in Senior Secondary Certificate Examination (SSCE) is very poor.

The poor performance in sciences especially Chemistry in Senior Secondary Certificate Examination (SSCE) attests to the fact that Chemistry teaching and learning and the conditions under which they take place need to be re-examined. In recent times such a re-examination focused on assessing the laboratory learning environment of students and how laboratory can serve as a source for enhancing students’ performance in Chemistry.

The science laboratory, a unique learning environment, is a setting in which students can work cooperatively in small groups to investigate scientific phenomena. The environment in a laboratory is expected to be less formal when compared to the conventional classroom setting and presents opportunities for more interactions between students and with the teacher as well. Such greater interactions are likely to promote more positive social interactions that are ideal for creating a constructive and positive learning environment (Hofstein, Nahum and Shore, 2001).

Although teachers and students share the same learning environment, it is likely that their perceptions on such a learning environment differ. The nature of the Chemistry laboratory learning environment can make a difference on how students are motivated to achieve their set goals. The physical environment of the laboratory in terms of facilities, space, lightening, ventilation, workbenches and stools in the laboratory influences the safety and comfort of students and so may influence students’ attitudes towards a particular subject and the learning of such a subject. It can also influence the personal development of students. The laboratory
learning environment in which Chemistry teaching and learning occur is therefore likely to have a major influence on students’ learning outcomes and impact positively in enhancing Chemistry teaching and learning. Student perceptions of their learning environment influence how and to what extent they learn and retain knowledge (Aldridge, Fraser & Wood, 2002; Luketic & Dolan, 2014). This is not unique to laboratory learning, and has been the impetus for classroom environment research for several decades. There are different scales which assess classroom environment. Each scale has been classified according to Moos’s (1974) scheme for classifying human environments. The dimensions of human environments include relationships, personal development and system maintenance as well as change (Moos, 1987). This theoretical model examines learning environments through relationships, personal development, and systems maintenance/change. Relationship dimensions are those relating to the nature and intensity of personal relationships. Personal development dimensions refer to the path through which knowledge development progresses. System maintenance and system change dimensions refer the orderliness, clarity control and responsiveness to change in the environment (Moos, 1987). This work was built on Walberg’s research on psychosocial learning environments. This research explored the multidimensional nature of a psychological model of productivity.

Fraser later refined Moos’s work to make it more appropriate, initially to describe classroom learning environments, and then science learning environments. Fraser’s work with McRobbie and Giddings identified five dimensions: student cohesiveness, open-endedness, integration, rule clarity and material environment. Student cohesiveness describes how well students know each other’s, work well together, and support one another. Open-endedness refers to students’ opportunities to design their own research and pursue individual interests to enhance their personal constructions of scientific knowledge. The integration dimension characterizes how laboratory activities are connected to theoretical material taught in the lecture portion of the science classroom. Rule clarity refers to the extent of the formal rule structure and how it is followed within the classroom. Material environment describes the adequacy of their laboratory materials and equipment. The Science Laboratory Environment Inventory was developed as a measure of these aspects of science learning environments (Fraser et al. 1993).

A few environment studies involving the concept of laboratory learning environment have been reported in Nigeria (Fraser, Okebukola and Jegede, 1992; Busari, 1993; Iroha, 2004; Aladejana and Aderibigbe, 2007). According to Fraser, Okebukola and Jegede (1992),
the various dimensions of the science laboratory environment, namely, student cohesiveness, open-endedness, integration, rule clarity, and material environment are substantially associated with students’ attitude towards science laboratory work. The laboratory learning environment allows students to interact with instructional materials through hands-on experiences, and through minds-on and inquiry-oriented activities.

From the foregoing, it can be argued that the reported poor performance of students in Chemistry at the secondary school level might be due to both students’ perception of the laboratory learning environment and the failure of teachers to conduct laboratory activities in a way that will make students more active participants in Chemistry teaching and learning situation. A learning environment that allows active participation of students in the learning process makes it possible for the students to have control over their learning and this leads to improvement in students’ learning outcomes. The poor performance in Chemistry and other related subjects may be reflecting the inadequacy inherent in the laboratory learning environments at the school level. It also appears from the review of available literatures, that the influence of laboratory learning environment on students’ learning outcomes in secondary school Chemistry class has not been extensively looked into in Nigeria. This paucity of literatures in this regard gives room for a need to conduct a scientific study on Chemistry laboratory learning environment. The focus of the present study was therefore to investigate the influence of laboratory learning environments on their learning outcomes in Chemistry.

**Statement of the Problem**

In recent times, poor performance of students in Chemistry in the Senior Secondary School Certificate Examination (SSCE) has generated serious concern among science educators. Consequently, researchers have worked on several causative factors such as inadequate laboratory equipment, teachers’ qualification and students’ inability to acquire some basic science process skills. In an attempt to address the problem highlighted above, some researches have been carried out through the use of carefully planned instructional strategies and models to improve the status of Chemistry teaching and learning. Despite all these efforts, students’ performance in Chemistry has remained consistently poor at the Senior Secondary Certificate Examination. (SSCE). All these strategies gave a little
improvement over the conventional lecture method, which is being used in our secondary schools. However, there seems to be a neglect of other important factors such as laboratory learning environment and patterns of interaction; hence, this study is to fill the existing gap.

**Purpose of the Study**

The purpose of this study was to investigate the influence of laboratory learning environment on students learning outcomes in Senior Secondary School Chemistry. Specifically the objectives of the study were to:

1. investigate the relationship between the five dimensions of laboratory learning environment and students’ performance in Chemistry;
2. investigate the relationship between the five dimensions of laboratory learning environment and students’ attitude towards Chemistry.

**Hypotheses**

The following hypotheses were therefore generated;

H₀₁: There is no significant relationship between the five dimensions of laboratory learning environments and students’ performance in Chemistry.

H₀₂: There is no significant relationship between the five dimensions of laboratory learning environments and students’ attitude towards Chemistry.

**Research Method**

The study adopted the descriptive research design of survey type. The population for the study comprises all the Senior Secondary Three (SS111) Chemistry students in all the public secondary schools in Ondo State. The study focuses on public schools located in the three geopolitical zones of the State. Two local government area councils were randomly selected in each zone for the study. Purposive sampling technique was also used to select four (4) Secondary Schools from each Local government area for a total of twenty four (24) Secondary Schools being involved in the study. The choice of the schools used for the study was based on the following criteria, schools with;

i. a standard and functional Chemistry laboratory and
ii. qualified and experienced Chemistry teachers.

In each school selected for the study, intact class of Chemistry students was involved in the study. The sample for the study consisted of six hundred and ninety (690) students from the schools used for the study. Three instruments tagged Questionnaire on Chemistry Laboratory Learning Environment (QCCLE), Chemistry Practical Achievement Test (CPAT) and the Chemistry Attitude Scale (CAS) were used for collection of data. The QCCLE was designed to assess students’ perceptions of their Chemistry laboratory learning environments. QCCLE consisted of 30 items measuring 5 different dimensions of Science laboratory environments (Student cohesiveness, Open-endedness, Integration, Rule-clarity and Material Environment) containing 6 items in each scale. The five response alternatives for each item were Strongly Agree, Agree, Undecided, Disagree and Strongly Disagree. The QCCLE was scored using a score range of one (1) for Strongly Disagreed to four (4) for Strongly Agreed for positive items and the scoring was reversed for negative items. CPAT was used to assess students’ performance in Chemistry laboratory activities. This consisted of a 5-option multiple choice of 25 items for which a table of specification was constructed to ensure content validity. The units of Chemistry covered include separation techniques, qualitative analysis and volumetric analysis. The scores of the students after the laboratory activities were taken as the performance in Chemistry. CAS was used to measure students’ attitudes toward the learning of Chemistry. This is a 20 item Likert-type of four options measuring 4 different scales of attitudes toward Chemistry (scientific inquiry, enjoyment of Chemistry lessons, leisure interest in science and career interest in Chemistry). This contained 5 items in each scale. The five response alternatives for each item were Strongly Agree, Agree, Undecided, Disagree and Strongly Disagree. The CAS was scored using a score range of one (1) for Strongly Disagree to four (4) for Strongly Agree for positive items and the scoring was reversed for negative items.

The instruments were given to experts in Chemistry education and test and measurement. Based on their comments, the instruments were corrected, restructured and hence refined in order to meet the face and content validity requirements. A trial test was carried out by administering the instruments on fifty (50) non-participating Senior Secondary School Three (SS III) students from one of the schools outside the local government area used for the study. The data obtained from trial testing was analysed using
Cronbach Alpha and a coefficient of internal consistency of 0.88, 0.91 and 0.69 were obtained for QCCLE, CPAT and CAS respectively.

Results
Hypothesis One
There is no significant relationship between five dimensions of the chemistry laboratory learning environment (material environment, integration, student cohesiveness, open-endedness and rule clarity) and students’ performance in Chemistry.

The analysis is as shown in table 1

Table 1: ANOVA Showing the Relationship Between the Five Dimensions of the Laboratory Learning Environment and Students’ Performance in Chemistry

The result in Table 1 shows that the relationship between five dimensions of the laboratory learning environment and students’ performance in Chemistry was significant (F(4,684)=678.96, P=.000). Therefore, the null hypothesis stating a non-significant relationship between five dimensions of the laboratory learning environment and students’ performance in Chemistry was rejected. This implies that there is a significant relationship between five dimensions of the laboratory learning environment and students’ performance in Chemistry. The table also shows that the independent variable (five dimensions of the laboratory learning environment) accounted for 83.1% of the total variance in the performance of students in Chemistry.

To find out the relative contribution of each of the variables of the independent variable to the performance of students in Chemistry, multiple regression analysis was considered and the result is as shown in Table 2
Table 2: Relative contribution of learning environment variables to students’ performance in Chemistry.

Table 2 shows that all the learning environment variables contributed significantly to the students’ performance in Chemistry (t (720)=2.73, P<.05). That is, material environment was significant (t (720)=9.38, P<.05), integration was significant (t (720)=6.34, P<.05), student cohesiveness was significant (t (720)=4.55, P<.05), open-endedness was significant (t (720)=2.92, P<.05) and also rule- clarity was significant (t (720)=3.69, P<.05). Table 3 also shows that material environment had the highest contribution to students’ performance in Chemistry (β=.345, 34.5%). This is seconded by integration (β =.219, 21.9%), followed by
student cohesiveness (β = .173, 17.3%), followed by rule-clarity (β = .139, 13.9%) while open-endedness (β = .097, 9.7%) had the lowest contribution.

**Hypothesis Two**

There is no significant relationship between five dimensions of the laboratory learning environment (material environment, integration, students’ cohesiveness, open-endedness and rule clarity and students attitude towards Chemistry.

The analysis is as shown in Table 3.

**Table 3: ANOVA Showing the relationship between five dimensions of the laboratory learning environment (material environment, integration, students cohesiveness, open-endedness and rule clarity and students attitude towards Chemistry.**

<sup>a</sup> = Adjusted R. Square = .884

The result in Table 3 shows that the relationship between the five dimension of the laboratory learning environment and students’ attitude towards Chemistry was significant (F <sub>(4,684)</sub> =563.28, P=.000). Therefore, the null hypothesis stating a non-significant relationship between five dimensions of the laboratory learning environment and students’ attitude towards Chemistry was rejected. This implies that there is a significant relationship between five dimensions of the laboratory learning environment and students’ attitude towards Chemistry. The table also shows that the independent variable (five dimensions of the laboratory learning environment) accounted for 88.4% of the total variance in the attitude of students towards Chemistry.
To find out the relative contributions of each of the variables of the independent variable to the attitude of students towards Chemistry, multiple regression analysis was considered and the result is as shown in Table 4.

</table>

* = Significant at P<.05 Alpha level

Table 4 shows that all the learning environment variables contributed significantly to the students’ attitude towards Chemistry \((t_{(720)}=2.13, P=.033)\). That is, material environment was significant \((t_{(720)}=17.92, P=.000)\), integration was significant \((t_{(720)}=15.74, P=.000)\), student cohesiveness was significant \((t_{(720)}=5.03, P=.000)\), rule-clarity was significant \((t_{(720)}=3.138, P=.002)\) and also open-endedness was significant \((t_{(720)}=10.26, P=.000)\). Table 5
also shows that material environment had the highest contribution to students’ attitude towards Chemistry ($\beta = .645, 64.5\%$). This is seconded by integration ($\beta = .267, 26.7\%$), followed by student cohesiveness ($\beta = .196, 19.6\%$), followed by rule-clarity ($\beta = .153, 15.3\%$) while open-endedness ($\beta = .135, 13.5\%$) had the lowest contribution.

**Discussion of Findings**

The results of hypothesis $H_0 1$ showed that there was significant relationship between five dimensions of laboratory learning environment (material environment, integration, open-endedness) and students’ performance in Chemistry. The results also showed that the five dimensions of the Chemistry laboratory learning environment were positively correlated with students’ academic performance. These associations are positive for the scales of Material Environment, Integration, Student Cohesiveness, Open-endedness and rule clarity scales. This implies that in classes where the students perceived satisfactory material environment and greater integration, student cohesiveness, open-endedness and clear rules, there will be improvement in their performance. The findings of the study also revealed that student cohesiveness is the least favourably perceived dimensions of the Chemistry laboratory environment, followed by rule clarity, with integration being the most favourably perceived. This is in line with the finding of Henderson, Fisher and Fraser (1995) that integration of practical and theory components of course are aspect of the learning environment likely to promote favourable learning outcome.

The result further showed that students show relatively favourable perceptions of their Chemistry laboratory lessons, with the lowest score occurring for the open-endedness scale. It seems that experiments in Chemistry laboratory lessons are normally organized with clear procedures which the students must follow in carrying out laboratory activities. The lower score on open-endedness scale has been also reported in several previous studies (Gidding and Waldrip, 1996; Wong and Waldrip, 1996). The result was also in agreement with the findings of Aladejana and Aderibigbe (2007) that the five components of the science laboratory environment were positively correlated with students’ academic performance.

The analysis further showed that Chemistry students perceived greater integration between theory and practical. The integration of the Chemistry laboratory activities with the textual materials informed students that each investigation contained important chemical ideas that were directly related to the concepts being explained. The finding was supported
by Akpan (2012) that learning environment could have potential influence on students’ achievement. It is also observed from the findings of this study that students’ perception of Chemistry laboratory learning environment correlate positively with students’ performance considering the regression summary for students’ performance and Chemistry laboratory learning environment. This means that students’ perception is relevant towards the determination of performance in Chemistry.

The results of analysis of hypothesis $H_02$ showed that there was significant relationship between students’ perception of the Chemistry laboratory learning environment and students’ attitude towards Chemistry. It is observed from the findings of this study that the entire laboratory learning environment variables contributed significantly to the students’ attitude towards Chemistry. The results also indicated that material environment is the least favourably perceived dimensions of the Chemistry laboratory environment, followed by open-endedness with integration being the most favourably perceived. This means that material resources for the teaching and learning of Chemistry are inadequate. This is in support of Adeyemi (2008) that there was inadequate provision of science laboratories and equipment in many secondary schools in Ondo State, Nigeria. The findings showed that the five dimensions of the Chemistry laboratory learning environment had significant relationship with students’ attitude towards Chemistry. Students perceived open-endedness as being significantly less favourable than all other dimensions. This means that close-ended laboratory activities dominate much of Chemistry education in the secondary schools in Ondo State. This corroborates the results of Kalu (2004) which reported that close-ended laboratory activities dominate much of science education in the secondary schools in Calabar Municipality. This is also in line with previous related research in science laboratory learning environments in other countries (Toansakul, 2007; Henderson, Fisher and Fraser, 1995; Wong and Fraser, 1997) that positive association existed between the nature of Chemistry laboratory environment and students’ attitudinal outcome. The findings of the study also revealed that laboratory activities are apparently only those that aim at verifying relationships already discussed in the class, especially since integration is the most favourably perceived dimension by the students. The implication is that the teacher is only training the students on how to follow instructions and manipulate laboratory equipment. This is not good enough since science laboratory work is meant to develop in the learners the skills of inquiry in science which goes beyond mere skills in manipulation of apparatus.
Conclusion

The study concluded that there is significant relationship between five dimensions of laboratory learning environment (material environment, integration, student cohesiveness, open-endedness and rule clarity) and students’ academic performance. It was also revealed that there is significant relationship between the five dimensions of laboratory learning environment and students’ attitude towards Chemistry. All the five (5) QCCLE factors are directly related to student’s performance and attitude towards Chemistry. That is, the more favourable the laboratory environment is, the more positive are the performance and attitude towards Chemistry and vice-versa.

Recommendations

On the basis of the findings of this study, the following recommendations are made:

1. The significant relationship noted between the laboratory learning environment measures of material environment, integration, student cohesiveness, open-endedness and rule clarity and student attitude to Chemistry should be of interest to science educators. In order to encourage the development of scientific attitudes, teachers should make sure appropriate controls are established for these classroom environmental factors.

2. To enhance the teaching and learning of Chemistry, teachers and administrator should pay particular attention to the low score in the open-endedness and material environment dimensions of the laboratory learning environment. This indicates areas where improvement can be made in the teaching and learning of Chemistry.

3. As this study indicated that material environment was one of the least favourably perceived dimension of laboratory learning environment, it is recommended that the government should provide secondary schools with resources, teaching materials, models, equipment and adequate laboratories for the teaching and learning of Chemistry. The federal government could assist through the Education Trust Fund (ETF) in funding Science laboratories in schools.
4. Seminars, workshops and conferences should be organized occasionally for both the Chemistry teachers and their students and this will help the teachers refresh their knowledge, especially on modern strategies of teaching and for students to develop positive attitude to learning Chemistry. During training, importance of five dimensions of the laboratory learning environment should be highly emphasized.

Abstract

How to enhance students’ interest in science topics is the main question authors want to explore in this paper. Using examples from TV science programs, videos and k-12 regular science classes, authors present the 4-step model of discourse analysis that can be used both to analyze the emotional content of discourse and to conceive a more interesting discourse in science classes.

Introduction

Emotion and its nature arouse the interest of philosophers, neuro-scientists, physiologists, psychologists and educators. Although the contribution to those different perspectives has enriched the discussion about emotions, we choose here to focus our approach on discourse. We are going to analyze emotion through the utterance perspective (Charaudeau, 2002) as emotion can be triggered through the appropriate use of words, sentences, expressions, and other non-verbal clues (Bossler, 2013).

Emotional clues, traces, hints, or markers are systematically embedded in TV science programs (as those analyzed in this paper), instructional videos (as the one shortly analyzed here) or science regular classes, with the goal to enhance interest on viewers, learners or students.

Discourse analysis
Charaudeau (2002) proposes that emotions are based on a subjective rationality, as the discursive subject has an intentionality when he speaks. Emotions are oriented towards an imaginary object, an object clipped from reality in order to become a real significant; and the relationship between that subject and the object occurs through the mediation of representations. The universe that circumscribe this subject consists of knowledge related to this person, his experiences and the values he assigned to them, which leads us to infer that emotions are linked to beliefs.

Promoting small shocks in the beliefs of the receiver (that is, the person who hears), while transiting its socio-discursive imagination, could raise the emotion evoked by the universe of beliefs. Other effects of pathemization are described as a combination of images and speech. In contemporary drama in its densest form (sensationalism) that combination is a common strategy when one seeks to attract and retain the audiences' attention and interest.

In our model we try to identify possible discursive emotional clues, hints, traces, or markers that could generate pathemic effects. Several authors (for instance Charauudeau, 2000, 2002) have tried to organize categories, in which we could recognize pathemic markers. We speak here about the speech beyond the rules of language use. In order to fully analyze discourse, we need to dive into the discursive mise-en-scène seeking to know what connects the speech circumstances (location, identities, relationships of intentionality and exchange physical conditions). These elements comprise a set of constraints from which the way of saying is more or less expected and meaning emerges as a result of the intrinsic relationship between the extra-discursive conditions and intra-discursive achievements. The communication subject (sender) makes choices about how to tell what shape its project of speech, according to the discursive constraints arising from situational constraints.

The presence or absence of linguistic signs is not sufficient to trigger emotion. Emotion on discourse is built upon utterance rather than linguistic markers, perceived through the fulfillment of this communication contract present in the socio-discursive imagination of the interlocutors.

---

1 Pathos, feelings and emotions, as opposed to reason.
The 4-Step Model of Discourse Analysis

**Aim of the model**

Our discourse analysis model aims to show and demonstrate how teachers can prepare more interesting classes in science education. The model wants to answer the following question: how can teachers design more interesting classes in science education?

**The model**

That is the question we want to explore using the 4-step model of discourse analysis. In order to achieve it, we systematically observed TV science programs (a Brazilian one called, “Globo Ecologia” and a Portuguese one called “ABCiência” – Caldeira, 2012), as well as analyzed instructional videos (informal ones – “How to remove…” or “How to fix…” computer related videos and formal ones – mostly from Khan Academy) and regular k-12 science classes.

The main authors and concepts we dialogue here are Charaudeau (2002) and the concept of communication contract; Charaudeau (2000) and Bauer (2000) and the concept of pathos, the pathemization of discourse and pathemic markers (markers, traces, hints, and clues that might trigger interest in the audience). In addition to them, Bakhtin (1986; 1992) and the concepts of the discourse theme (identification of utterance islands) and meaning (the sender discourse’s intention or the meaning as extracted by the receiver).

The 4-step model of the discourse analysis starts with the promise that the presenter / teacher makes to his / her audience (the communication contract): “Today we’ll have the most frightening class of our lives!” – says the teacher at the opening of a class about sharks, and other dangerous sea animals. Although this communication contract is sustained or revised through the discourse and the interaction process, here we accentuate its impact in the beginning of the communication process.

When the presenter says at the beginning of an instructional video on the anatomy of a neuron that those type of cells is at the top five of an imaginary cells ranking (Khan Academy, 2012) the purpose is to trigger interest in learner, in order that he keeps watching the lesson. When the discourse is built around poetic images triggered by words (the planet Earth as a blue dot in space, for instance) the purpose is to introduce in potentially boring
speech elements that soften the words of scientific knowledge while triggering interest in the audience.

Next step deals with the emotion associated with words and sentences. In a program about climate change, the presenter uses at the beginning of the program words like “death”, “destruction” and “victim”, finishing with “We live in a great danger!”. Words and sentences like those ones are emotional clues or traces that the presenter gives to the audience about the program content. However, when he says: “Scientists forecast is that at the end of the century the sea water will become 1 degree Celsius warmer than today. But that is not a future-only problem. Changes have already started/.../” (pathemic marker), the aim is to induce an emotional state in order to keep the audience watching the program.

The third step of the model is the theme: “Earth is sick again. Has a fever. Our civilization has grown without care and warmed the planet quicker than ever. This time... we are the comet” – clearly the theme is “Climate Change” (explicit theme), but presenter poses the man as “the bad guy” (hidden theme)!

The final step (the discourse intention or discursive intention of the mise-en-scène) is what the audience extracts as the intention in the presenter / teacher discourse. The man as the bad guy has a communication intention – the climate change is the result of men’s actions and each one of us must adopt behaviors to reverse those results (for instance, “Act Locally, Think Globally”).

Model applications: Examples

Therefore, to build this model we focused on these four essential concepts: communication contract, pathemic clues, hints, traces and markers, theme and discourse intention.

1. Communication contract

To Charaudeau (1992), in the study of any act of language we have a dialectical meeting involving the production process (sender) and the receiving process (receiver) placed in the same discursive universe. According to Charaudeau (2000), every discourse
staging incorporates extra-linguistic features, to the extent that the meaning embodies the presumed, the said and the context in which the speech occurs. For the author, the discursive mise-en-scène features 3 levels: The situational level, the communication level and the discursive level.

The situational level is materialized in the exterior space of the speech act. At the situational level, we seek to circumscribe the situation of discursive production. Television has its own impositions, quite different from the classroom, even when we considered that the theme developed (science) is common to both.

Example (Globo Ecologia)

Although Globo Ecologia has a similar structure of a news program it is not. Its presenter is a well-known young actor. He dresses casually and he starts the program on the beach. He replenishes its speech with unusual expressions in news programs, as “yeah” and he invites the audience to participate in the discourse (“Did you think about it before?” or “Do you remember when we talked about…”). He speaks in a slowly and leisurely way, as if to make sure that the ideas will become clear and the words are properly pronounced. The concise, objective, and short, distinctive phrases typical of television news does not appear in this program. Rather, the transcript of the program looks like the text in a book, including fragments that are more similar to poetry, as in the following example:

Presenter: A blue dot on the Universe. Earth has several billion years and in this time suffered a lot of changes. It had five major extinctions. At the most famous, 65 million years ago, an asteroid extinguished the dinosaurs. Our planet always recovers, but it needs a lot of time in order to life come back in full strength. And biodiversity returns in a bunch of colors, shapes and sounds. Earth became sick again. Has a fever /.../

The communication contract states that the program is a serious one (as it deals with scientific information and knowledge), but with a little poetry (aiming to soften the potentially dull scientific information).
For the determination of the communication contract, it is of special interest the purpose or the language "acts-how". Charaudeau (1997) identifies four purposes of the informative speech: the "know-how", the "think-how", the "how-to-do" and the "how-to-make sense". The "know-how" searches the transmission of factual and phenomenal knowledge to the instance of reception. However, another purpose can arise: the "understand-how" purpose (Bossler, 2004). It is not enough to know-how, sometimes there is a concern and a commitment of the communicating subject to explain, so that his interlocutor understands what he/she is presenting.

2. Pathemic clues and markers

Words like “explosion”, “boil”, “burned” and “severity” can exert a pathemic effect. The pathemic marker we identified was “risk of pain”. Pain as result of an accident is suggested and serves as a premise to the discourse organization, as we can observe in the following example.

Example (ABCiência)

Presenter: A water explosion. And boiling water for it matters... If I had grabbed the glass with my hand I could have burned myself with severity.

But words as “warning” and “danger” have another pathemic effect. Those words are pathemic clues or traces associated with the pathemic marker “danger alert”. A danger warning is announced. A routine behavior can represent a huge risk. The following example gives us several clues of how that idea is built:

Example (ABCiência)

1. C: Manuel, what are we going to see now, another experiment?
2. M: It’s not an experiment. It’s a warning, Carlota, a danger warning.
3. C: Danger?
4. M: Exactly
5. C: And what is the danger?
6. M: Look, something a lot of people do at home and don’t know how dangerous it is: Boiling water in the microwave.
7. C: Ok. Explain how that can be dangerous.

3. The theme

According to Bakhtin (1986, 1992) the theme can be analyzed in two levels: the utterance level (there is, the meaning of sentences – a low-level theme) and the general topic of the speech (the factual content of the speech – a high-level theme – Baktin, 1986).

The utterance as understood by Bakhtin (1986) has its full meaning perceived as the low-level theme. For the author, at this level the theme consists of a system of signs that seeks to adjust to the conditions of a given discursive moment. To carry out the theme, the meaning appears as a technical apparatus. There is no mechanical boundary between the meaning and the theme and there is no theme without meaning, and vice versa. It would be impossible, for example, to have the meaning of an isolated word, as when we learn a foreign language, without taking the meaning as the substance of a theme, there is, without constructing an utterance, an example (Bakhtin, 1986).

Bakhtin believes that beyond the theme, more precisely inside the theme, the utterance is equally gifted of a meaning. For the author (1986, p. 27), the "meaning is not in the word neither in the soul of the speaker, nor as well in the soul of the interlocutor. It is the interaction effect of the speaker and the receiver produced by the material of a particular sound complex". The stream of verbal communication provides the word with the light of its meaning. When we locate the enunciation and recognize the meaning we would be closed to identify possible emotional hints, clues or markers.

In the process of understanding, each significant isolable element of an utterance, and the full utterance, are transferred from our minds to another active and responsive context. For Bakhtin (1986), understanding would be a form of dialogue, standing for the enunciation
as a reply to another reply in the dialogue. Understanding is a process in which the speaker's word is opposed by a counter word. In the words of the author:

“Understanding the utterance of another (person) means to orient yourself towards that utterance, to find its proper place in the corresponding context. To each word of the utterance that we are in process of understanding, we match a number of our words, forming a reply. The more numerous and substantial our words are, deeper and real is our understanding.” (Bakhtin, 1986, p.32). Therefore, when preparing a draft speech, the communicating person could bet on possible effects, the intended effects, placing pathemic markers along the discursive path so that the interlocutor reach such effects as he / she is finding and recognizing them. However, it is a lottery, a gamble, since the presence of the markers does not mean that emotion will be triggered in the interpreting subject (receiver) as expected. There is an intention without warranty of achieving the intended effect.

We can expect, for example, that talking about the death of a person may have distinct pathemic effects if the listener is a family member or friend of the deceased or if it is a stranger. But commotion can also be reached if the listener integrates' a humanitarian group, to which the feeling of compassion is real. On the other hand, a relative could show himself devoid of any feeling about the death, if the affective bonds between the subjects had long ago been broken. In this sense the discourse may carry markers of emotion, but these markers only will be configured as triggers of emotion after they are submitted to the interpretive filter of the interpreting subject (receiver).

It is possible that even speech productions devoid of intention to thrill, can cause emotion on reception if the subjects meet in the discourse elements with a pathemic effect for them. It is common, for example, stage actors declare with astonishment that the audience sometimes shows’ different reactions as those intended and expected. They laugh when they should cry, they cry when they should laugh or remain unmoved by scenes of great dramatic intensity.

The communicating person can consciously maneuver the speech in order to add emotion inducers.; however, there is no way to guarantee the authenticity of what is declared at the production instance. In this case the speech is carrying an emotion inducer, but is unable to trigger it for lacking of authenticity, and is therefore questionable. Somehow the interpreting subject (receiver) finds illegitimate what is declared and does not sympathize
with such a move, possibly identifying in the speech signs of non-truth. As the saying states, "you can play the victim, but you do not impress me."

Therefore the theme of an utterance (its real meaning) is depicted in the interplay of words and sentences used by the sender in its communication process and the mind (including emotions) of the receiver (the audience).

At school teachers utterances are usually connected to school content (a factual content – for instance, Geography, Sciences, Chemistry or Biology), and sometimes are depleted of emotions. But at TV this is not the case. The high-level theme of the Globo Ecologia communication contract example is “Global Warming’ (or “Climate Change”), and the high-level theme of the ABCiência example is dangerous behaviors in our daily life. However both programs have very different implicit themes at the utterance level (the pathemic traces, hints, clues, or markers presenters put in their speech). Globo Ecologia utterance theme is the man as a planet predator and the need that Humanity change its behavior in order to preserve our planet (“life at risk” as emotional marker). ABCiência utterance theme is that science is not a difficult subject and that it can be found in everyday things (“danger alert” as emotional marker).

Most school subjects also have an explicit and factual theme (directly connected to school content – for instance, a Chemistry, Physics, or Biology particular content), but also have a hidden theme: for instance, science and technology as social endeavors or citizenship.

4. Discourse intention

The final step (the discourse intention) is what the audience extracts as the intention of the discourse. The man as a major actor on Global Warming has an intention – the climate change are result of men’s actions and each one of us must adopt new behaviors to reverse those changes, for instance.

To Charaudeau (1992, 2000, 2002), the presence of linguistic signs that denote emotion in speech would not necessarily result in the materialization of emotion in the discursive mise-en-scène, it can just have an intended effect. Put another way, the presence of words belonging, at first glance, to the semantic field of emotion as "scary" or "fantastic" just suggests the intention to thrill the reception in the project of the sender’s speech. Thus,
The lexical indicators of emotion are pathemic traces from which we are led to investigate in the sound scene possible utterances of emotion.

The meaning given by the subjects to enunciation would confirm that a particular pathemic trace would develop and turn to a pathemic marker. Bakhtin (1986, 1992) identifies the utterance as "an emerging island" of speech and this island has its contours which are dependent on the situation of enunciation and of the audience. For the author, the utterance is endowed with a significance that is neither glued to the word nor to the soul of the speaker or the listener / interlocutor. The significance arises as a product of the speaker and the receiver interaction.

From these pathemic traces we can investigate the island of enunciation in which they are inserted, and then we can verify the meaning intended by enunciators. Working with these islands of enunciation and their meanings, we arrive to the following communication contract, pathemic markers, theme and intention of the discursive mise-en-scène (table 1)

How to apply the model in Science Education

To better isolate the different four steps in a discourse, we start to transcribe *ipsis verbis* the words used in the communication process (i.e. discourse) and then we build a narrative table for each discourse (each program, instructional video or class analyzed – see examples of the presenters of Globo Ecologia and ABCiência, as the utterances transcribed can be put in a table – using the 4-step model table analysis (table 1). Naturally same discourse parts can and should be analyzed in two or more different model steps, as we can see in the following excerpts.

The teacher has teased her (blind) students saying: “Next class I’ll make it rain inside the classroom” – the class theme approached changes of water physical states. And each time she crossed with her students at school she said: “Don’t forget the rain inside the classroom next week!” Students were so interested to experience the rain inside the classroom that they arrived earlier in the classroom in the following week!

The opening sounds and images of TV science programs have the same purpose: to establish a communication contract with the audience with the promise that something special will happen in the following program. On contrary, most of the instructional video material analyzed starts the presentation with: “Today’s video is about...” without a promise of something different to the audience, establishing a flat communication contract (the audience knows that it will be a class as usual as the previous ones).
Teachers must be aware that they have an implicit communication contract with their students. That implicit contract is built at their first interactions with them, it is reinforced through the subsequent interactions and it is difficult to be suddenly changed. Nevertheless if they want (or need) to change it they must follow the rule: keep your promises!

When TV science programs presenters (“Globo Ecologia”) or teachers use words like “fantastic”, “innocence”, “kiss”, “death”, “victim”, “destruction” or “danger” (“ABCiência”) when explaining a science topic their intention is to draw the audience’s / students’ attention to the theme. Using strong pathemic words and / or sentences (as “A coral is where biodiversity is greater at (hesitation) sea environments... coral reduction or coral death also results on the death of all organisms that are coral dependents. Both invertebrates and fishes around corals as well as sea life around the corals will be damaged”) has a goal: to elicit strong emotional responses, increasing the audience’s (viewers or students) interest in the presentation / class (and usually presenters and teachers believe that interest has a strong correlation with learning).

To an effective use of the 4-step model in the classroom, teachers need to start the lesson preparation at its last step (discourse intention or intention of the discursive mise-en-scène), as the discourse intention should mold the communication contract, the choice and use of pathemic clues, hints, traces and markers (but always bearing in mind the explicit and or implicit themes of the speech). Teachers must answer the following questions if they want to have more interesting lessons: “What is my discursive intention?”, “How can I implement my discursive intention?”, “What type of communication contract do I want to establish with my students?”, “How can I establish that contract?” and “What type of emotions can I use in the classroom to enhance my students’ interest in the lesson?”.

Predictors of Improvement in Critical Thinking Skills Among Nursing Students in an Online Graduate Nursing Research Course

Abstract

The objective of this study was to examine predictors of improvement in critical thinking skills among nursing students in an online graduate nursing research course. A total of 35 students who had taken an online nursing research course within the prior 12 months and who were currently enrolled in the online graduate nursing program were sent a link to complete a survey via “survey monkey.” Time spent in graduate school, course satisfaction, and whether or not a student felt supported were all predictive of improved critical thinking skills. Connectedness remained to be the highest predictor of how much students felt their critical thinking skills improved.

Background

The College of Nursing and Health Professions at Drexel University had an enrollment increase of 273% between the years of 2005-2013. This statistic matches Allen and Seaman’s report that online education is growing exponentially and has become mainstream. While online nursing programs seem to be on the rise, there still is variability in delivery of the content in those programs to enhance learning (Buckley, 2003; Dellinger & Wells, 2011). Even further, questions have arisen as to what behaviors determine the quality of learning and instruction in distance education programs (Bata-Jones & Avery, 2004; Barakzai & Fraser, 2005; Dellinger & Wells, 2011; Moore & Hart, 2004). The issue of connectedness in the online learning environment has become increasingly important to examine and has been shown to be one of the biggest predictors of student satisfaction with the online course (Arbaugh & Benbunan-Fich, 2007; Chung-Do, Filibeck, K., Goebert, G., Arakawa, G., Fraser, D., Laboy, J., & Minikawi, D., 2013; Mahoney, 2006; Swan, 2002). Connectedness has been shown to consist of the concepts of trust, respect, and mutuality within the online environment (Chung-Do, Filibeck, K., Goebert, G., Arakawa, G., Fraser, D., Laboy, J., & Minikawi, D., 2013). These concepts of trust, respect, and mutuality impact both the faculty- to- student interaction and also the student- to student- interactions within the classroom setting.

Some pedagogical issues in online graduate nursing research courses have been examined (Abdel-Maksoud, 2007; Balakis & Sparks, 2010; Poe-Greskamp, 2010; Rust, 2006; Sherry, Fulford & Zhang, 2009; Sowan & Jenkins, 2013). One study examining the effect of the type of learning environment on perceived learning among graduate nursing students who were enrolled in a nursing research course found when comparing different types of learning environments- internet only with other types of learning environments- that the quality of instruction is more of an influence on learning then the type of teaching modality (Dellinger & Wells, 2011).
Still, very few studies have looked at which qualities influence instruction—such as those within the concept of connectedness—and those which influence outcomes of student learning—such as critical thinking in an online graduate nursing research course (Dellinger & Wells, 2011; Hunter, Pitt, Croce, & Roche, 2014). One meta-analysis study found problem-based learning improved critical thinking skills in nursing students (Kong, Qin, Zhou, Mou & Gao, 2013).

Critical thinking has been one educational outcome to learning in all Nursing programs and has been found to be paramount (Hunter, Pitt, Croce & Roche, 2014; Kong, Qin, Zhou, Mou & Gao, 2013). Nurses need to make critical judgments about many patient care issues. There also is agreement by credentialing bodies that universities need to initiate learning experiences to improve critical thinking skills (American Association of Colleges of Nursing, 2008). Yet, few studies have examined this aspect among graduate nursing students in an online graduate nursing research course.

Given the paucity of studies specifically examining critical thinking skills in an online graduate nursing research and those factors which might promote or help to improve this outcome, this study was developed in order to evaluate predictors of improvement in critical thinking skills among nursing students in an online graduate nursing research course at Drexel University.

**Objective**

The objective of this study was to examine predictors of improvement in critical thinking skills among nursing students in an online graduate nursing research course.

**Method**

A total of 35 students who had taken an online nursing research course within the prior 12 months and who were currently enrolled in the online graduate nursing program were selected by a designated individual at the University and sent an email with a link to complete and return the survey to “survey monkey” (an online depository). Human subjects consent was obtained.

The respondents were mostly female, Caucasian, married, and working full time. The average age of the respondents was 41 years old. They had a high aptitude for computer skills, most were working for 10 years or less and had been in grad school for 6 months to 1 year. They reported caring for dependents less than 5 hours per day and had received a grade of A in the class. Thus the sample was highly homogenous.

The data collection tool was developed for the study and consisted of four types of questions: a. Demographic data questions; b. A researcher-generated, open-ended survey asking as an example: “What classroom behaviors students liked the most”; “What classroom behaviors students could have done to make the course better and what could faculty have done to make the course better”; c. Closed ended questions asking such questions as: “How would you rate your computer skills on a scale from 1-10”; “Whether students worked full time”, “If they cared for a dependent and whom”; “Perceptions of faculty satisfaction and their satisfaction”, and “Letter grade they received in the course” d. A Classroom community scale
developed by Rovai (2002). This scale is a Likert scale with 20 items using two subscales- a. connectedness (i.e., “I feel that students in the course care about each other”) and b. learning (i.e., “I feel I am encouraged to ask questions”). This scale was highly reliable in this study.

Data were analyzed using SAS 9.2. The outcome variable was critical thinking skills. This variable was dichotomized as either “yes” or “no” regarding critical thinking improvement. Descriptive analysis was performed along with univariate analysis using simple logistic regression to explore the relationship between critical thinking skills and the various predictors, Multivariate analysis was performed to obtain adjusted estimates of the relationship between critical thinking skill improvement and the various predictors using multivariate logistic regression.

Results

When considering an improvement in critical thinking skills, time spent in graduate school (approximately *12.5 times more likely with a p value of .005) and course satisfaction were all significant predictors of improvement in critical thinking skills (approximately 11.5 times more likely with a p value of .001). Higher connectedness was associated with an improvement in critical thinking (approximately 11.5 times more likely with a p value of .001). Specific items most predictive of connectedness were: “confident others will support me, feel connected to others, feel like this course is a family, trust others and feel students in this course care about each other”. Males were more likely to report a high degree of connectedness.

Higher amounts of learning were associated with an improvement in critical thinking (approximately 1.3 times more likely with a p value of .01). Specific items most predictive were: “felt there was an ample opportunity to learn, felt as if the course did promote a desire to learn, felt educational needs were being met, received timely feedback.” Students with positive course satisfaction and positive perceived faculty course satisfaction were more likely to exhibit a high degree of learning. The relationship between an improvement in critical thinking skills and connectedness in the classroom remained the same even after controlling for demographic variables. A similar relationship was detected when examining critical thinking and learning after controlling for the demographic variables.

After adjusting for gender and the amount of time spent in graduate school, the only explanatory variable of perceiving an improvement in critical thinking skills was the connectedness variable (1.3 times more likely with a p value of 0.02.).

Discussion

This pilot study verified prior work that years of study predicted higher levels of critical thinking skills among nursing students ([Hunter, Pitt, Croce, & Roche, 2014]). Nursing associated experience was also predictive of higher levels of critical thinking skills in prior studies as well ([Hunter, Pitt, Croce, & Roche, 2014]). While the current study did find that males reported a higher level of connectedness in the classroom, prior studies found age and gender did not
predict critical thinking skills. This study found the biggest predictor of critical thinking skills to be connectedness in the classroom.

Conclusions

Faculty in an online classroom should be concerned about these predictors in order to enhance critical thinking skills among graduate students. They may consider structuring their online course to enhance student perceptions of their feelings of connectedness in the classroom environment. Since this was a pilot study, future studies might examine critical thinking using a larger sample size with more objective measures of critical thinking.

*These odds-ratios may not be precise estimates due to the small sample size.

Glocalization: Customizing Hawaii Kine Educational Exchanges for Rural Japan

The Big Island of Hawaii offers a myriad of educational opportunities beyond the obvious tourist attractions. Nevertheless, due to existing stereotypes of Hawaii, sharing these possibilities with potential students, scholars, businesspeople and government officials from rural Japan has become an issue of packaging. This work introduces various proposals and presentations designed to assure Hirosaki University administrators and prefectural government officials in Aomori Prefecture that there is indeed profound pedagogical value to educational exchanges with Hawaii Island.

Aomori-ken is one of the foremost agricultural prefectures in Japan. In addition to thriving apple production, there are strong fishing communities and leading aquaculture businesses that harvest scallops. The Agriculture and Life Sciences Department at Hirosaki University has developed kurenainoyume (http://nature.cc.hirosaki-u.ac.jp/kurenainoyume/english.html), a unique apple hybrid that is red on the inside, as well as the outside. The department also produces a number of value-added agricultural products, including its own brand of sake. In addition, the Science and Technology Department is involved with emerging alternative energy projects and there is an Earthquake and Volcano Observatory.

On the other side of the Pacific, the Big Island has tremendous and diverse bragging rights, as well. One can experience 11 of the 13 world climate zones, for example. Surprisingly, there are more than 100 varieties of avocados from which to choose, certainly more than are found elsewhere. From the ocean floor to the peak, Mauna Kea is the tallest mountain on the planet, and Mauna Loa has the largest land mass of any mountain, along with the world’s largest volcano. Astronomers gather from the four corners of the Earth to study the cosmos from atop Mauna Kea, where they may find themselves trudging through snow from November to March. Volcanoes National Park, to quote the experts, is world-renowned both for “its active volcanic activity in the mid-Pacific Ocean, and for its broad variation of eco-systems from mountain top to sea level.”

More so than any other island in the group, Hawaii Island retains many vestiges of ancient Hawaiian life, where the neighborhoods were divided into abu-pua’a (pig altars), essentially pie-shaped wedges of land where those from the pointy tip in the mountain area provided the fruit of the land in exchange for fish from the broad base that touched
the seashore. The *ahu-pua`a* are numerically assigned now and *ahu-pua`a 82*, Captain Cook, is home to dozens of coffee farms, a historic Japanese-style hotel, shopping and more. One of the study proposals for the university includes bringing large groups of Agriculture majors to Captain Cook and letting them work and study at the local coffee farms while attending lectures on agribusinesses, soil management, etc.

Hawaii Island is on the cutting edge of energy experimentation and fish farming, as well. NELHA, the Natural Energy Laboratory of Hawaii Authority is an ocean and science park that houses a variety of sustainable industries and research organizations. While much of the shrimp consumed by Northern Hemisphere Pacific Rim nations may be imported from Southeast Asia, it is a little known fact that many of those prolific shrimp farms began with brood stock from the clean Kona waters. Another study proposal includes mini internships for students at NELHA and other local businesses, organizations and agencies.

Hirosaki is known for its snow, while sea level on the Big Island is quite balmy, but it is interesting to note that the very character of the students is quite similar. Local students attending University of Hawaii Hilo have often lived quite sheltered existences. Many of them have never traveled outside the State. The local students at Hirosaki University are in the same situation. At both institutions it has been students that come from outside of the area that gravitate toward the foreign exchange programs. Another goal of these study plans is to focus on the concept of “small town to small town,” in order to engage the locals at both ends and encourage them to step up and go abroad. Making the exchange seem comfortable is a major key to the glocalization of the experience. The idea is to emphasize the small town appeal of the Big Island, as some of the rural students, local government officials and university office staff would rather be in a small town than a big city.

For all of these reasons, the Big Island and Hirosaki are well-suited partners. The mission is to get over the preconceived notion that “Hawaii = Waikiki.” Hawaii was first known to the outside world when Captain Cook landed on the west side of the Big Island, these projects focus on having history repeat itself.

**Target Project Type 1**

**Student Study Tours**
In this three-week format, students would be offered intensive English lessons and be exposed to some of the following local activities: coffee farming, value-added farm-to-table products, fish farming, marine biology products, new energy sources, etc. Evenings would include some special group lectures on agriculture, technology and education, as well as time with homestay/farmstay families. Students would enjoy weekend activities such as ocean sports, hiking, fluming, Kilauea, Mauna Kea, etc. Students would get academic credit and have language and cross-cultural classes prior to departure.

Challenge from the administration: The director’s main concern was that this program would create a bigger burden on the office staff

Possible remedy: Create a special class in the university’s English language center (EL) specifically designed to teaching students how to apply for passports and visas. Answer all of the FAQs of studying abroad for students before they actually apply to a program. This would have a spillover effect on already established exchange programs, as well.

Target Project Type 2

**Internships**

Students would be given a chance to have a brief work experience at a local business. NELHA, the Natural Energy Laboratory of Hawaii Authority, would be a prime source for potential internships. A U.S. intern at one research facility in the past year created a ballast device for use in fish farming, which the organization has adopted for full-time use, so there is already a positive attitude toward interns at NELHA.

Target Project Type 3

**Department Specific Trips**

The Agriculture and Bio Science Department has expressed an interest in taking an entire class of undergraduates in their department, some two hundred people, on an international trip. Plans have been designed to center the students at an old Japanese-American hotel in the Captain Cook area where they would have access to farmers and University of Hawaii Community College resources. There may also be a possibility of tie-ups with a senior citizen center in the area, giving the students a chance to practice English while giving of their time to the local community. Another proposal is to have pharmacy students from UH Hilo visit on an internship and work with 4th year Hirosaki University medical students on pharmacology.
Target Project Type 4:

**Study Tours for Government Employees**

Similar in design to Project 1, this would be customized to the needs and tastes of the government workers. For prefectural office staff, time with staff of the mayor of Hawaii County’s office and officials from community outreach programs such as the Hawaii Department of Education’s Community Children’s Councils would be arranged.

**Project to-do List**

1. Create a series of surveys to gauge and rework the stereotypes of Hawaii.
2. Begin a class that teaches overseas trip preparation
3. Submit additional projects directly to the Agriculture and Medical Departments.
4. Reassess the university’s present position on overseas exchanges and strategize to suit the current climate.
From Conceptualization to Reflection: Ensuring Robust Clinical Experiences While Meeting the Professional Standards for Elementary Special Education Teachers

Sheilah M. Paul, PhD
Medgar Evers College of CUNY

Abstract

A major challenge for teacher candidates is meeting the demands of the clinical practice experience which assesses how they make connections between their theoretical knowledge base and the real classroom experience. The critical integration of knowledge of and pedagogy in academic subjects, the use of research-based, scientifically proven strategies and assessment practices, and the understanding of the culturally and linguistically diverse learning needs of students at various developmental levels based on specialty professional standards form the basis for successful teaching and learning. It is this foundation that aids teachers in meeting the multiple teacher licensure requirements across States. Guiding teacher candidates in thinking about, planning, implementing and reflecting on these elements require a systematic approach to clinical practice. This Conceptualization to Reflection Model provides a unique approach for clinical supervisors and cooperating teachers to preparing professional teachers to meet the rigors of the teaching profession. It also serves as a guide for teacher candidates to help them navigate the journey from student to practitioner. Since each teacher preparation program serves a distinct student population, this comprehensive model is presented for one specific degree program: Childhood Special Education (Dual Certificate – Grades 1-6), but can be easily adapted to meet the diverse needs and developmental levels of other student populations.
Introduction

With the passage of No Child Left Behind and the Reauthorization of the Individuals with Disabilities Education Improvement Act, the need for “highly qualified teachers” became a front burner issue for teacher preparation programs. Not only are colleges and universities expected to produce teachers to fit the mold of “highly qualified,” but they are also required to demonstrate that their education degree programs include extensive practical experiences for teacher candidates (NCATE, 2008, CAEP, 2013). Teacher candidates must acquire and demonstrate that they have the professional knowledge, skills, and dispositions to interact successfully with diverse learning communities. For candidates pursuing special education as a career path, the Council for Exceptional Children requires that “all special educators are well-prepared, career-oriented professionals with the conditions that allow them to provide individuals with exceptional needs the most effective interventions and that encourage entering special educators to become career-oriented special education professionals” (CEC, 2002, Gersten, Keating, Yovanoff, & Harniss, 2001; Darling-Hammond and Baratz-Snowden, 2005).

Clinical practice experiences, the supervised internship in teacher preparation programs must be “carefully administered, sequenced, and supervised in all areas of the elementary curriculum” and should provide candidates with experiences in a variety of diverse settings. Candidates should also have a broad knowledge base, be adept at creatively using appropriate materials and resources, including technology, and should be able to collaborate effectively with other professionals in the field in order to enhance student learning (ACEI, 2002, 2007).

This clinical practice model for childhood special education teacher candidates is one that is rigorous in many ways. First, it ensures that candidates acquire in-depth knowledge of all the critical academic content areas: English Language Arts, Mathematics, Science, Social Studies,
the Arts, Health Education and Physical Education to teach students at the elementary school grade levels. To teach all students, teachers need to “understand subject matter deeply and flexibly so they can help students create useful cognitive maps, relate one idea to another, and address misconceptions. Teachers need to see how ideas connect across fields and to everyday life. This kind of understanding provides a foundation for pedagogical content knowledge that enables teachers to make ideas accessible to others” (Shulman, 1987).

Second, it ensures that all teacher candidates acquire knowledge and skills in special education to meet the needs of diverse and exceptional learners at the elementary level. “Teaching in ways that connect with students also requires an understanding of differences that may arise from culture, family experiences, developed intelligences, and approaches to learning” (Grimmet & MacKinnon, 1992). To help all students learn, childhood special education teacher candidates need to think about what it means to learn different kinds of material for different purposes and how to decide which kinds of learning are most appropriate in different contexts. Teachers must be able to identify the strengths and weaknesses of different learners and must have the knowledge to work with students who have specific learning disabilities or needs (Shulman, 1992).

A third area of rigor involves a series of early field experiences that precede the clinical practice experience to ensure that candidates know how to collaborate with school partners, design and implement multiple learning and assessment tools, including the use of instructional and assistive technology, and engage in action research and supervised practice with individual and small groups of learners in diverse settings. “Teacher candidates get a more coherent learning experience when they are organized in teams with experienced teachers and college faculty. Experienced teachers deepen their knowledge by serving as mentors and teacher
leaders. The early field experiences in partner schools help to create the synergy between theory and practice, while creating the move from the pre-professional to the professional role for candidates as they construct knowledge that is more useful for both practice and ongoing theory building” (Darling-Hammond, 1994).

Fourth, the model includes collaborative and interdisciplinary seminars and intercession workshops to enhance candidates’ content, pedagogical and professional knowledge, skills and dispositions. Acquiring this sophisticated knowledge and developing a practice that is different from what candidates themselves experienced as students requires learning opportunities for teacher candidates that are more powerful than simply reading and talking about new pedagogical ideas (Ball & Cohen, 1996). Teachers learn best by studying, by doing and reflecting, by collaborating with other teachers, by looking closely at students and their work, and by sharing what they see. The interdisciplinary seminars provide this professional development experience for pre-service teacher candidates.

The implementation of the New York State Common Core Curriculum and the need to include students with disabilities in schools’ assessment and accountability measures require teachers to have knowledge of and ability to teach subject matter (NYCDOE, Raising the Bar for All Students, NY City’s Special Education Reform, 2012). In this model, teacher candidates are prepared to teach all four foundational areas: ELA, math, science and social studies that incorporate the Arts, health and physical education components, and are prepared to address all these key areas to support students with both high and low-incidence disabilities in learning across these curricula areas. Candidates acquire a broad scope of interdisciplinary knowledge (12 credits) across academic content areas, then choose a subject area concentration (27-30 credits), and pass the teaching methods courses (pedagogy) in each subject area.
Content area and specialty workshops for special education pre-service teachers are continuously implemented at Medgar Evers College, and are supported by OSEP funding for personnel preparation since 2007. These extension professional development workshops continue to improve the content knowledge and pedagogical and professional skills of teacher candidates in the academic and non-academic subject areas. Special education collaboration in content area workshops have focused on academics for elementary special education, including lesson planning, adaptation, differentiated instruction, use of assistive and other technological devices, and current research-based practices in teaching and learning, such as Response to Intervention (RTI), Positive Behavioral Intervention and Support, (PBIS), comprehensive assessment practices, and culturally responsive teaching, among others.

The extended workshop curricula are implemented in collaboration with local service providers and district school partners. The curricula include the developmental learning goals identified by the Council for Exceptional Children (CEC) and the Common Core Learning Standards. They are also closely aligned with the Association for Childhood Education International (ACEI) Standards and incorporate the newest ed-TPA framework. These additional workshops, held during the winter and summer intercessions, are non-credit bearing and voluntary and engage candidates prior to, during, and after their clinical practice experience in a relaxed and collaborative mentoring atmosphere.

The need for teachers with subject-matter knowledge, content specialty skills, and enhanced pre-service clinical experiences prompted the development of this model. It responds to the critical need for “highly qualified” teachers to serve students in urban areas that are often characterized by their social and cultural differences. Reports on teacher quality revealed that “students in high-poverty, high minority, and low-performing schools are less likely than other
pupils to be taught by teachers trained in their subjects” (Ansell & McCabe, 2003). They reported that in high-poverty schools, there were 32% of students who were taught by core teachers without “at least a minor in the subject,” compared to 18% in low-poverty schools. Data on whether in-service teachers majored or even minored in core subjects they taught were reported in the US Department of Education Schools and Staffing Survey (1999-2000). The results concluded that students in high poverty and high minority schools “get the short end of the stick” (Ansell & McCabe, 2003).

The need for added preparation in content areas is reflected in the results of the national assessments each year. For students with disabilities, the chances of achieving proficiency in these content areas are even more daunting. Confounding the problem is the fact that most of the schools under review for failure to meet content standards are those schools identified as “high-need” – comprised of minority overrepresented groups of students – students with language differences and other socioeconomic disadvantages. The correlation between cultural competency and content knowledge and skills is evident. Medgar Evers College has addressed these issues in its teacher preparation programs and continually evaluates candidates’ ability to develop and teach developmentally appropriate, culturally and linguistically responsive lessons to students with disabilities in urban schools.

The pinnacle of this preparation is the Clinical Practice experience, which emphasizes the integration of theoretical constructs, acquired knowledge, skills and dispositions into carefully structured supervised experiences that develop the proficiencies required for “highly qualified” teachers. This process provides opportunities for pre-service childhood special education teacher candidates to engage in preparing and delivering content-rich and standards-based academic instruction for diverse learners in inclusive and special education settings. To achieve this goal,
candidates engage in a process that starts with conceptualization and ends with reflection to demonstrate what they know, understand, and can teach.

Precursor to the Clinical Experience: Early Field Experiences

Early field experiences provide learning opportunities for candidates to demonstrate increasing involvement in designing, delivering and evaluating instruction prior to their clinical practice experiences. Early field experiences begin with observations of learning professionals and environments, progress to immersion with individual and small groups of learners using and assessing instructional and behavioral interventions and end with active engagement in teaching and learning activities, including interactions with parents, students, teachers and the broader learning community. Early field and clinical experiences and related assessments support candidates’ development of themselves as learners and an understanding of the professional field, and their roles as teachers within the field. Field experiences are attached to specific and related courses to contextualize the learning experiences for candidates. These experiences include opportunities to shadow professionals, observation in education, parents and communities as school partners, technology in the classroom, working with individual learners, working with small groups of learners, curriculum research and design and assessment in education.

Length of Clinical Experience and Settings

As candidates progress from early field to clinical practice, they begin to embrace and articulate the standards of their professional areas. The Clinical Practice experience is extensive
and intensive and ensures that candidates have a range of diverse experiences where they can
demonstrate the knowledge, skills and dispositions requisite for the specialty field. Childhood
Special Education candidates must have a sound foundation of general education knowledge and
skills and demonstrate proficiencies in special education knowledge, skills and dispositions so
that they can effectively teach all children. To accomplish this complex and sometimes,
challenging dual role, childhood special education candidates complete two 14-week semesters
(1 year) of Clinical Practice.

Candidates provide instruction in two different settings (Specialized setting or a
Cooperative Team Teaching (CTT) classroom) during one semester and an Inclusive
classroom during the other semester. They also practice teaching students in two different
grade levels during these two semesters, a lower grade (1-3) and an upper grade (4-6) in their
elementary grade level assignments (Grades 1-6). These experiences serve to broaden the scope
of their practical experiences in teaching students with exceptional learning needs. Students in
the self-contained settings include students classified with severe to profound levels of
intellectual disabilities, speech/language disorders, autism, traumatic brain injury, cerebral palsy,
and other severe and multiple disabilities, whereas students in the inclusive and CTT settings
include students with and without mild to moderate forms of sensory, intellectual, physical and
emotional/behavioral disorders. Students with disabilities in these settings sometimes include
students at age-related multi-grade levels, based on the promotion criteria established at schools.
The selection of settings ensures that candidates’ clinical experiences include multiple settings
to demonstrate their specialty preparation, and meets the extensive requirements for dual-
certification.
Placement Decisions

To ensure that candidates gain the full experience of working with diverse students with a range of disabilities/exceptionalities, the Department’s special education clinical faculty and Field and Clinical Coordinator work collaboratively with partner school personnel to select experienced Cooperating Teachers who are licensed and practicing in the field to secure placements for childhood special education candidates. Site visits to schools and classrooms by clinical college faculty are carried out to verify suitability of placements. Conferences are held between cooperating teachers and clinical college faculty to discuss and review program expectations and assessment criteria prior to candidate placements to ensure that cooperating teachers understand their roles and responsibilities as facilitators and mentors for candidates and to establish a committed partnership in giving candidates the best classroom experiences.

Clinical Practice Evaluations

Evaluation of candidate performance during clinical practice experiences are conducted by both Cooperating Teachers and College Clinical Faculty using rubrics that incorporate the four assessment points identified in the model: Conceptualization/Planning, Implementation, Outcomes and Reflection. Each semester, the childhood special education candidate is formally observed and evaluated during the teaching of four subject area lessons addressing the appropriate Common Core Learning Standards: English Language Arts, mathematics, science, and social studies. In addition, each candidate must produce a videotaped lesson for evaluation. Therefore, over the two semesters of clinical practice, childhood special education candidates are
observed at least eight times, and engage in the evaluation of two videotaped lessons. After
classroom observation of each lesson, the candidate participates in a post-observation conference
with both clinical faculty and cooperating teachers to receive feedback on the implementation of
the lesson, including feedback on his/her professional dispositions during the observation.
Candidates are required to articulate this feedback in reflective essays to demonstrate their
understanding of the feedback as well as their openness to using suggestions to improve their
future practices.

The Conceptualization to Reflection Clinical Practice Model for Childhood Special
Education candidates encompasses five specific domains with key assessments at four critical
points for each observed lesson. Assessment is an integral part of the process as it informs
candidates about instructional decision making to improve student learning, evaluates student
achievement on various dimensions, and ultimately provides a basis for measuring program
effectiveness in teacher preparation. The comprehensive Childhood Special Education Clinical
Practice Evaluation Form is divided into three major Parts that encompass the four points of
evaluation: Part I – Conceptualization and Planning, Part II – (a) Implementation, (b)
Academic Content Area Methods, and (c) Candidate-Student Dispositions, and Part III –
Outcomes and Reflection. Inherent in these assessments are the specialty professional standards
that childhood special education candidates must meet: the Council for Exceptional Children
(CEC) Standards, the Association for Childhood International (ACEI) Standards, and the ed-
TPA framework, which are all closely aligned with the Department’s evaluation criteria. The
following summary table (Table 1) maps the assessment domains and their alignments to
professional Standards for Beginning Childhood Special Education Teachers.

</table>
These key assessment points reflect the Childhood Special Education clinical practice model, which begins with conceptualizing and planning to teach academic content to students with disabilities, actually teaching those lessons, then assessing student learning and understanding of the content, and using student baseline and performance data to finally reflect on one’s competency as a teacher.

**EVALUATION INSTRUMENTS**

The Clinical Practice Assessment Form uses the CEC Standards 1 to 10 as the basis for assessing Childhood Special Education candidates’ knowledge, skills and dispositions. In most cases, the assessment is further aligned with specific elements from the Individualized Common Core (ICC) and the Individualized General Curriculum (IGC) for beginning teachers of students with exceptional learning needs. The form is subdivided into four major parts:

*Conceptualization/Planning, Implementation, Outcomes* and *Reflection* to reflect the key objectives of the clinical practice experience that assesses Childhood Special Education candidates’ knowledge, skills and dispositions as well as their effects on student learning.

In planning and teaching integrated subject area lessons for elementary students with disabilities, candidates must first demonstrate their proficiencies in four academic content areas: *English Language Arts, mathematics, science* and *social studies*. Subject area assessment rubrics were collaboratively developed by special education and discipline-specific department faculty who teach these content area methods courses to ensure coherence with specialty standards. These rubrics are included in the comprehensive clinical practice assessment instrument and are used to evaluate candidates’ knowledge and skills in planning and teaching these critical content areas to students with exceptional learning needs.
THE CLINICAL PRACTICE MODEL

[Insert Graphic Here]

PART I: PLANNING

STEP 1a: THE CLASSROOM PORTRAIT

Candidates in the Childhood Special Education program are required to submit a School and Classroom Portrait to their College Clinical Supervisor during the first week of Clinical Practice. This Portrait provides a snapshot of the setting in which candidates are student teaching and includes details about the school, administration, community, student profiles, resources, and activities. More importantly, the classroom portrait provides information about the characteristics and needs of students so that clinical faculty can accurately judge whether candidates are catering to all the diverse needs of their learners in their conceptualizing and planning of instruction. In addition, a technology inventory informs the clinical faculty and the candidate about the resources available to support their instructional practices or the need to provide additional technology resources, including assistive and augmentative technology to implement lessons.

Components of School and Classroom Portrait

- Demographics of School
- Demographics of Classroom
- Special Features
- Technology Inventory
STEP 1b: CONCEPTUALIZING ESSAY

In PART I – Conceptualization, candidates are required to articulate their knowledge of special education content across all of the ten CEC Standards: Foundations, Development and Characteristics of Learners, Individual Learning Differences, Instructional Strategies, Learning Environments and Social Interactions, Language, Instructional Planning, Assessment, Professional and Ethical Practice and Collaboration. This knowledge base must be reflected in candidates’ conceptualizing essays and lesson plans to show candidates’ understanding of central concepts, tools of inquiry and structures of special education content (CEC 1). Knowledge about the development and characteristics of learners (CEC 2), and the impact of exceptional conditions on development, learning and motivation are requisite to teaching students with the full range of disabilities (CEC 3). Childhood special education candidates must know evidenced-based instructional strategies to plan and design innovative learning experiences (CEC 4) and must demonstrate knowledge of effective classroom management, behavior interventions and management to meet the individual and collective needs of students (CEC 5). In their conceptualizing essays, candidates’ must demonstrate the use of effective communication in articulating their own ideas about teaching and learning and know how to cater to the cultural and linguistic differences found among students in diverse learning environments (CEC 6).

The background knowledge from all the previous standards serves as the foundation on which candidates show their knowledge of instructional planning methods. Candidates must create lessons that give evidence of their knowledge of the Common Core Learning Standards, the City’s Scope and Sequence as well as the learning goals for elementary education in the
relevant content areas their lessons address. They must show how they use special education principles, such as modifications and accommodations to adapt instruction, including technology enhanced instruction, for their students with disabilities (CEC 7). Candidates must design assessments for each lesson – whether formal or informal, formative or summative – that accurately and fairly assess acquisition of knowledge and skills by diverse students with the full range of disabilities (CEC 8). Childhood Special Education candidates must articulate in their conceptualizing essays their knowledge of professional and ethical practice, including their respect for diversity, their stance as reflective practitioners and their willingness to explore the various institutions in the field of special education and grow as a professional (CEC 9).

Candidates must also discuss their collaborative responsibilities with their cooperating teachers and other school personnel, families and service providers as well as their ongoing consultation with their college supervisors (CEC 10).

The Conceptualizing Essay and Lesson Plan are done simultaneously to comprehensively reflect the thought process used for planning instruction for diverse Elementary school learners. On completing each conceptualizing essay and the lesson plan, the candidate submits these planning documents to their college supervisor who reviews their work, assesses it for readiness to implement and provides feedback to the candidate. The college supervisor uses the prescribed assessment rubric to evaluate the candidate’s conceptualizing essay and lesson plan. This evaluation is also formally discussed during the pre-conference meeting between the college supervisor and the candidate to ensure that the candidate is confident about the lesson objectives and teaching points as articulated in the written planning documents, as well as to provide opportunities for clarity of any recommendations made by the college supervisor.
Components of the Conceptualizing Essay

- The academic content to be learned by the students
- The purpose and use of the content for students
- The Common Core Learning goals addressed in the lesson
- The Candidate’s alignment with specialty professional Standards
- The Candidate’s knowledge base that influences the lesson (courses, literature, theories, research-based strategies, etc.)
- Any special characteristics about the students that will influence how candidates develop and implement the lesson, e.g. ELL, disability areas, special accommodations, modifications, etc.

STEP 2: LESSON PLANNING

Childhood Special Education candidates are required to adopt an inclusive stance to planning instruction for their learners. By inclusive, the author posits that a combined focus on general education curriculum content (academic subject areas) as well as individualized curriculum goals (based on the individual learning needs of students) form the basis for instructional planning. The aim of each lesson is to ensure that subject area knowledge is adapted to meet the individual needs of all learners. A recommended lesson plan format helps to guide candidates in addressing all the various components to consider when planning instruction for diverse learners with diverse abilities. This guide also serves as an audit for instructional planning in that it allows candidates to zero in on the key considerations for each lesson.

Questions to Guide Your Planning

I. Standard(s) Being Addressed 

What are the State standards for learning you are addressing in this lesson? How does your lesson show evidence of connections between what you are asking students to do and the standard(s) you are addressing?

II. Essential Question 

Can you think of a global question around which to create your lesson?

III. Teaching Point/Performance (GOALS) 

What will students learn? What will students do in order to meet the learning goals?

IV. Learning Activities

A. Mini Lesson 

Do you know your students well? When you do, you can plan learning to build on who they are. How does today’s lesson connect to previous learning? How does this lesson anticipate what will come next? What activities/what demonstrations will you structure and design in order to get students involved in learning that will build on who they are? What instructional adaptations are you making to ensure that all your students, including students with disabilities are actively involved in the learning process?

How will the materials/activities/content for learning be introduced to students? How will you demonstrate your teaching point/what you want students to learn?

B. Accountable Talk 

What will you ask students to talk about and what will you look for in student’s talk that will help you to know whether students are connecting to the Teaching Point/Performance Goals?
C. Guided Practice
How will students practice with your assistance or the assistance of peers what they are being asked to learn?

What activities/structures/materials will you provide for students to practice and reach the lesson’s goals?

D. Independent Practice
How will students practice what they are being asked to learn?

What activities/structures/materials will you provide for students to practice independently what they are learning in order to reach the lesson’s goals (whether in the classroom or at home)?

E. Adaptations
What accommodations and modifications will you include in this lesson to meet the individual learning needs of your students?

**Accommodations:**
Highlight the different learning needs of your students and summarize the accommodations you will make based on their individual learning differences.

**Modifications:**
How will you modify guided and independent tasks to meet the needs of your learners?

F. Summary
How will you connect the lesson goal(s) to previous learning and to learning that will continue into the future, so that students can feel they have learned and that what they have learned fits into other learning they have engaged in?

IV. Assessment/Evaluation of Learning
How will you know that all students have learned? What rubric will you use (what are your criteria for learning)? What modifications will you consider in assessing student learning? What activities/materials will you develop that will assist you in assessing what, how and why students learned and reflect the criteria you developed?

How will you reflect on the lesson and assess what occurred?
Feedback and Revisions

Prior to teaching an observed lesson, candidates meet with both their cooperating teachers and college supervisors to discuss their ideas for each lesson based on their classroom portraits, learning goals and curricula content to be covered by students in their respective settings. Using a Planning Rubric, candidates receive detailed and descriptive feedback from first the Cooperating teacher and then the College Clinical Supervisor on their lesson plans and conceptualizing essays. Candidates use this feedback to make adjustments or revisions accordingly before teaching each lesson. Candidates collaborate with cooperating teachers and college clinical supervisors to schedule observation dates and times for implementation of each lesson.

PART II: STEP 3: IMPLEMENTATION OF LESSON

PART II of the clinical practice assessment includes three subsections that focus on: (a) demonstration of teaching skills, (b) application of developmentally appropriate academic content, and (c) candidate dispositions as they interact with students. These dimensions are aligned mainly with CEC Skill-Based Standards from the CEC Initial Level Skill Sets in the Individualized General Education Curricula (IGC). During observation sessions, Childhood Special Education candidates are evaluated by partner school cooperating teachers and college clinical supervisors on the dimensions listed below.
(a) Demonstration of Teaching Skills

Teaching Students with Diverse Needs - Candidates’ lessons must reflect their awareness of the diverse characteristics presented by the students they are teaching and show that they are implementing adequate supports for them [CEC 2: ICC2K1, ICCEK2].

Using Adaptations for Diverse Learning Differences - Candidates’ instructional delivery must show how they use individualization, differentiation, accommodations and modifications to meet the individual learning styles and needs of their students [CEC 3: ICC3K5].

Using Effective Strategies to Promote Active Engagement in Learning, including Technology-Enhanced Instruction – Candidates’ lessons must highlight the use of evidence-based effective strategies, including the use of technology to teach requisite academic and nonacademic content. They must demonstrate abilities to select, adapt and use these strategies efficiently to promote active student learning [CEC 4: ICC4S3, 1GC4S1, IGC4S7, IGC4S10].

Practices and Behaviors of Developing Career Special Education Teachers – Candidates’ demonstration of teaching students with ELN must reflect their abilities to manage their classrooms effectively using positive behavioral intervention and supports, restating behavior expectations with students, and providing clear instructions for smooth transitions from activity to activity. Candidates must demonstrate positive teacher attitudes towards their students, other teachers and paraprofessionals in the classroom [CEC 5: ICC5S1, ICC5S5, ICC5S15].
Effective Communication – Candidates must model effective language with their students and use communication strategies and resources that promote student understanding of subject matter as well as enhance student communication skills, including the use of alternative and augmentative communication systems, when and where necessary [CEC 6: ICC6S1, ICC6S2, ICC6S4].

Using Effective Instructional Plans – Candidates must show connections to the scope and sequence and identify the learning objectives they are addressing in their lessons based on NY Content Area Curriculum. Their lessons must reflect adaptations of instruction and environment, and incorporation of instructional and assistive technology as needed to meet the individual needs of their students [CEC 7: ICC7S1, ICC7S9, ICC7S11, ICC7S12, ICC7S13, ICC7S15, IGC7S1, IGC7S2]

Using Appropriate Assessments for Instruction - Candidates must demonstrate their use of Curriculum-Based Assessments, as well as informal assessments throughout their lessons to monitor students’ understanding and mastery of subjects. They must show how they use assessment results, such as anecdotal notes to inform and guide their instruction, and provide feedback to students [CEC 8: ICC8S2, ICC8S4, ICC8S8; IGC8S3].

b) Content Area Knowledge and Skills

Application of Developmentally Appropriate Academic Content

Childhood Special Education candidates must demonstrate proficiencies in teaching general education academic content to students with exceptional learning needs. As such, they must show how they integrate and adapt instruction, assessments and environments, including making appropriate modifications and accommodations to meet the individual needs of their
students in Grades 1-6. These considerations are aligned mainly with specific elements from the Individualized Common Core and General Curriculum of CEC Standards 4 – Instructional Strategies, 7- Instructional Planning, and 8-Assessment. Candidates must demonstrate and are evaluated on their abilities to teach lessons in the following four academic content areas, including the use of instructional and assistive technology:

(i) **English Language Arts** – Candidates must demonstrate the use of reading methods that are appropriate for students with disabilities (IGC4S4) and guide students in identifying and organizing critical information (IGC4K7). They must teach students to use important concepts, vocabulary and content across the general curriculum (IGC4S13) and use strategies and techniques to strengthen and compensate for any deficits in perception, comprehension, memory and retrieval (IGC4S11). When teaching ELA content, candidates must demonstrate the use of systematic instruction to teach accuracy, fluency, and reading comprehension as well as writing (IGC4S14, IGC4S16). CSE candidates must evaluate their teaching of ELA and show how they are monitoring the progress of their students during and after teaching each lesson (ICC8S8).

(ii) **Mathematics** – The main objective of teaching mathematics to students is to increase their accuracy and proficiency in math calculations and applications (IGC4K6), and as such, CSE candidates must demonstrate the use of appropriate methods to teach mathematics to students with ELN (IGC4S5). Candidates must use appropriate adaptations and technology (IGC4S7), use responses and errors to guide instructional decisions and provide feedback to students (IGC4S12), and use task analysis approaches (ICC7S5) when teaching mathematics content to
students with ELN. Candidate must demonstrate ways that they are evaluating and modifying instructional practices in response to ongoing assessment data (ICC7S15), and show their modified and differentiated individualized assessment strategies that they use to evaluate instruction and monitor progress of their students with exceptional learning needs (ICC8S4, ICC8S8).

(iii) **Science** – In teaching science content, candidates must demonstrate their abilities to select, adapt, and use instructional strategies and materials according to the characteristics of their students with exceptional learning needs (ICC4S3). They must use appropriate adaptations and technology (IGC4S7), and identify and teach essential science concepts, vocabulary, and content across the general curriculum (IGC4S13). Candidates must demonstrate the use of task analysis (ICC7S5), and prepare and organize their materials to implement science lesson plans (ICC7S11). Candidates must develop, modify and use individualized assessment strategies to accommodate the unique abilities and needs of individuals with exceptional learning needs (ICC8S3), and evaluate instruction and monitor progress of their students during their lessons (ICC8S8).

(iv) **Social Studies** – CSE candidates must demonstrate their abilities to select, adapt, and use instructional strategies and materials to teach social studies content based on the characteristics of their students with exceptional learning needs (ICC4S3). They must show that they are able to develop and select instructional content, resources, and strategies that respond to cultural, linguistic, and gender differences (ICC7S8), use appropriate adaptations and technology (IGC4S7), and identify and teach essential social studies concepts, vocabulary, and content
across the general curriculum, including teaching students about diversity (IGC4S13). Candidates must prepare and organize their materials to implement social studies lesson plans (ICC7S11) so that all students are purposefully engaged in the lessons. Candidates must evaluate instruction and monitor progress of their students during their lessons (ICC8S8).

(d) Candidate-Student Interactions: Dispositions Assessment

Candidates are also assessed on 13 dispositions to evaluate their competencies in working with diverse students with ELN. The disposition competencies are aligned with CEC Standards 4 and 5, but specifically to elements in the Core Curriculum and the Individualized General Curriculum. Elements in Standard 4 that are addressed assess candidates’ modeling of self-assessment, problem-solving and critical thinking strategies as they teach students to use these techniques (ICC4S2) and their ability to modify the pace of instruction and provide organizational cues for students (IGC4S6). Candidates are required to demonstrate the use of student responses and errors to guide their instruction and provide timely feedback to students (IGC4S12). In reinforcing effective candidate-student interactions during instruction, elements of Standard 5 are assessed. Candidates must ensure safe, equitable, positive and supportive learning environments by giving students equal turns (ICC5S1), encourage active participation in individual and group activities by providing individual help, affirming students’ correct responses, giving praise and citing the reasons for praise, and teaching students how to give and receive meaningful feedback from others (ICC5S4; IGC5S4). Candidates must model respect and use skills to resolve conflicts (IGC5S5), and create an environment that encourages self-advocacy, positive intracultural and intercultural experiences for students by listening to them and accepting their feelings (ICC5S9, ICC5S13).
College clinical supervisors and cooperating teachers use a Dispositions rubric below to evaluate childhood special education candidates’ dispositions during implementation of each lesson. The goal is to provide adequate feedback on dispositions to candidates so that they can continually grow into their professional roles as teachers.

Disposition rubric adapted from the Los Angeles County Office of Education Teacher Expectations & Student Achievement (TESA).

**OBERVERS’ FEEDBACK – POST OBSERVATION CONFERENCE**

A post-observation conference with the candidate, cooperating teacher and the college clinical supervisor is held immediately after each observed lesson to provide feedback to the candidate regarding professional demonstration of instruction for students with exceptional learning needs. Following this conference, candidate must **submit reflections on student**
outcomes based on assessments used during lesson implementation, including samples of student work and data tables. Candidates must also write a reflective essay that summarizes the practical experience and their self-evaluation of their instructional delivery knowledge, skills and dispositions.

PART III: POST-OBSERVATION OUTCOMES.

Candidates are encouraged to use assessment data and feedback from observers to reflect on their practices as teachers of students with exceptional learning needs. PART III of the Clinical Practice Assessment focuses on Outcomes of each observed lesson and reflection on student learning. Candidates are required to show how the students’ performance data tables from the evaluation of each lesson taught inform them about what children know, learned and need to practice more, about which children master the content taught, which ones are getting it but need more practice, and which students may need a re-teaching of the concept. Candidates’ extension activities are included so that students gain more opportunities in and beyond the classroom environment to generalize and maintain knowledge of concepts learned. Teacher candidates in conjunction with their cooperating teachers continue to review and incorporate prior knowledge in subsequent lessons to monitor students’ progress and to ensure that all students master the content.

By engaging in the above activities, CEC Standards 4, 8, 9 and 10 are further addressed in candidates’ assessment and reflections on student work, and on their self-reflections for all eight lessons taught. Having collaborated with their cooperating teachers and, sometimes, grade level curriculum teams (CEC 10: ICC10S9, IGC10K4), candidates must discuss how their
assessments confirm children’s learning, how children varied in their responses to the assessments and why, and provide possible revisions to the assessments given the results and their own thoughtful critiques (CEC 8: ICC8S5, ICC8S7). In their overall self-reflections, candidates are required to reflect critically on lessons taught to consider how to provide more productive learning opportunities for children and how to shape their own teaching to do so (CEC 9: ICC9S8, ICC9S9, ICC9S11). They must consider in these reflections how the children in their classrooms differ and how that knowledge informs them about using families, colleagues and the larger school community, as well as the larger surrounding community to support children’s learning (CEC 4: ICC4S4).

PART IV: REFLECTION

STEP 5a: REFLECTIVE ESSAY

Childhood Special Education candidates are required to reflect on the outcomes of each lesson. In their reflective essay, candidates discuss the outcomes of the lesson in relation to how they conceptualized and implemented it. They reflect on the feedback from their cooperating teacher and clinical supervisor during the post-observation conference as well as their own feelings about what worked and what they could have done differently. Candidates analyze the student performance data to further understand the impact of their instruction on student learning. They discuss how they will use this information to enhance their own practice and improve student learning in future lessons (CEC 9).

In addition to reflecting on their own teaching and student outcomes, candidates also reflect on other dimensions that influence their clinical experiences, including classroom management practices, their dispositions and their collaboration with classroom personnel. As
special educators, teacher candidates are required to demonstrate their ability to work collaboratively with other professionals and support personnel to ensure that all children have appropriate and adequate support and guidance during instruction (CEC 10). They must also demonstrate the appropriate dispositions to promote social learning and engagement among students and show that they know and can use research-based behavior management strategies to maintain a positive learning environment (CEC 5).

STEP 6: TEACHING VIDEO

One of the most authentic assessments of instructional delivery and its impact on student learning is through the review of videotaped lessons. From 2007, this model emphasized this element of teacher preparation as part of the reflective process. CEC Standards 3, 8, 9 and 10 are further addressed in candidates’ assessment and reflections on student work, and on their self-reflections for all four lessons taught. Having collaborated with their cooperating teachers and, sometimes, grade level curriculum teams, candidates must explain how their assessments confirm children’s learning, how children varied in their responses to the assessments and why, and provide possible revisions to the assessments given the results and their own thoughtful critiques. In their overall self-reflections, candidates are required to reflect critically on lessons taught to consider how to provide more productive learning opportunities for children and how to shape their own teaching to do so. They must consider in these reflections how the children in their classrooms differ and how that knowledge informs them about using families, colleagues and the larger school community, as well as the larger surrounding community, to support children’s learning.

Candidates are required to videotape two lessons they conduct over the one-year experience of Clinical Practice. In the past, the videos were watched only by candidates and
their college supervisors. During January 2008 semester in which candidates attended winter intercession workshops provided through a US Department of Education Office of Special Education Programs (OSEP) grant, entitled “Preparing a New Cadre of Special Educators” (PANCOSE), the videos were used as a way to reflect on the first semester of clinical practice before candidates proceeded to their second semester-long experience. There was great success with this, and this practice was incorporated into the model so that this video critique and deconstruction became a regular part of all candidates’ learning.

Videos are accompanied by a copy of the candidates’ lesson plans, so that candidates can talk about and reflect on the relationship between planning and implementation. However, the entire video is viewed so that candidates can talk about motivation in learning, classroom climate, lesson and demonstration effectiveness, and dispositions. Candidates also learn how to talk critically about teaching and learning. This kind of critique is used constructively to improve teaching not to destroy the confidence of the candidate. All of this has had a positive effect on how well candidates are learning to teach: viewing videos together brings out the areas for explicit assessment, so that everyone is privy to this knowledge and candidates are exposed to how their peers teach. Such knowledge assists their own teaching by providing positive models and ways to reimagine what candidates already can do.

STEP 7: PORTFOLIO PRESENTATION AND EXIT CONFERENCE

The Exit process is the informal discussion between each candidate and clinical faculty about the overall clinical experience and includes the candidate’s evaluation of placement sites and their cooperating teachers. It is where candidates provide evidence of their knowledge,
skills, and dispositions related to professional practice of teaching and learning. They review their lesson packets, student outcomes data, the feedback from cooperating teachers and clinical faculty, their prior reflections on the observed lessons and write a new reflective essay of their growth in the professional field. This self-evaluation also includes their assessment of how they met professional standards based on their respective specialty organizations, always with the constructive eye on lessons learned and areas for improvement.

**SUMMARY**

The *Conceptualization to Reflection* Clinical Practice model for teaching students with exceptional learning needs in the elementary classroom has proven to be a useful tool in the evaluation of teacher candidates’ knowledge, skills and dispositions in the following ways:

1. It shows candidates’ ability to think deeply about appropriate and effective instruction for diverse learners;

2. It shows candidates’ own knowledge of subject matter as they prepare lessons in all critical academic content areas;

3. It shows candidates’ ability to connect theory to practice as they utilize some of the scientifically proven approaches and research-based strategies for teaching students with various disabilities;

4. It reflects candidates’ attitudes towards teaching students with disabilities in various settings and under practical, real-life circumstances; and
5. It reflects candidates’ ability to work collaboratively with others in the entire school community to meet the needs of ALL students.

With the recent adoption of ed-TPA (2013) as a New York State requirement for initial teacher certification, this Medgar model was well ahead of the curve in adopting frameworks for assessing effective teaching. Candidates will already have had the experience of constructive critique and reflection necessary to engage in formal evaluations of their teaching. It has led to the increased recruitment, hiring and retention of dual-certified teachers from Medgar Evers College into public and charter schools serving students with disabilities. According to Ronfeldt (2012), “Teachers who learned to teach in field placement schools with higher proportions of black, poor, and low achieving students were no more or less effective as permanent teachers, nor likely to remain teaching in NYC schools.” However, the College’s emphasis on serving these underserved groups contributes to the consistent pattern of recruitment and retention of its teachers in Central Brooklyn schools. From 2008 to 2013, 90-95% of graduates gained employment in these urban schools and retained their positions while 80-85% continued graduate studies towards the professional licensure and tenure track.

This Conceptualization to Reflection Clinical Practice model was piloted in 2004 and was tested and revised over the years as feedback from cooperating teachers, partner schools, candidates, clinical faculty and professional accreditation organizations helped to refocus and refine the assessment instruments. The result of this continuous improvement in the clinical practice experiences for teacher candidates is the very intensive and comprehensive process that takes teacher candidates from conceptualization to reflection over a one-year period of on-site supervised teaching practice, working with diverse learners in different settings in urban schools.

STEP 7
This poster presentation will share initial results of an exploratory research project designed to gain greater understanding of the student experience in global education programs (GEPs); with a focus on a specific GEP - the Mount Royal University (MRU) India field school 2014. 27 students participated in India 2014, during the month of May. As part of the process students took part in an extended pre-departure process, which included educational, personal and logistical preparation. Student views and attitudes over the value of this process were captured in both pre and post field trip questionnaires. The HICE presentation (January 2015) will focus more specifically on the students’ motivation in choosing to participate in the India field school project. Global education projects are a significant academic offering of institutions of higher learning, and these institutions will benefit from developing a deeper understanding why students take part in a GEP, and their expectations in doing so.
Spelling-Sound Discrepancy and its Effect on Memory of New Words in L2

Zahra Fotovatnia, Department of Psychology, Wilfrid Laurier University, Canada

Milad Masoomzadeh, English Department, Najafabad Branch, Islamic Azad University, Najafabad, Isfahan, Iran
Milad.masoomzadeh@gmail.com

Abstract

The purpose of this study was to determine whether type of grapheme–phoneme discrepancy (having a silent letter vs. having a wrong letter) had differential effects on memory of the phonological forms of new words and their processing rate in a L2 with a different script from the L1. To this purpose, 20 Persian speaking learners of English participated in a two phased experiment. First, they studied 34 pseudowords including 5 with a silent letter, 6 with a wrong letter, and 6 with congruent graphemes and phonemes. They saw a picture showing the concept the item expressed and the written form underneath, and they listened to the phonological form of the item. Then they received an auditory matching memory test in which they had to match the auditory name of the item with the correct picture. The pseudowords were presented through the Microsoft Power point software (2013) and the memory test was presented through the DMDX software (Forster & Forster, 2003). The paired samples t test was used to compare the performances on silent and wrong letter items. The results showed no effect of item type on accuracy and processing time. In other words, no difference was found for retrieving the correct meaning of the two different types of grapheme-phoneme discrepancies. The findings indicate that when learners learn a new language with a different script they may not pay a lot of attention to the written form, especially when the retrieval task requires the leaners to focus on the meaning and not the spelling of the words. Therefore, presenting or depriving the learners from the writing form does not make a big difference for learners in the early stages of learning new words.

Keywords: Orthography, Phonology, L2 word learning, accuracy, processing time, DMDX software
Introduction

The relationship between the orthographic and phonological forms of words varies across languages. Languages like Serbo-Croatian (Katz & Feldman, 1981) allow transparent relationship between the two. It means that grapheme–phoneme relationship is consistent and invariant. Therefore, the pronunciation of a novel word can be predicted by a relatively small set of rules. In English, however, the correspondence between spelling and sound is not transparent and there is not a perfect relationship between phonemes and graphemes representing those sounds. A phoneme can be realized by many different graphemes (e.g., /aI/ in mine, pie, and my), and a grapheme can also be realized by many different phonemes (e.g., the letter a in fate, pat, and wash). Besides, some letters are not pronounced (e.g., knight, psychology) while others might have wrong pronunciations (e.g., pizza, Xerox).

Although identification of written or printed words begins with the visual processing of letter symbols, there is substantial evidence that the phonological information behind the orthographic representations plays a crucial role in the process. In early studies, it was revealed that recoding of orthography to phonology occurs during or even before readers' access to the lexical entries of visually presented words. In lexical identification tasks, responses to target words can be printed by prior or immediately subsequent exposure to phonologically similar visual words (e.g., Bernet & Perfetti, 1995; Brysbaert, 2001; Drieghe & Brysbaert, 2002).

Orthographically presented words have been shown to activate phonological information, which is then used in identifying words and hence their meanings. In semantic categorization tasks where participants are asked to decide whether a particular word is a member of a semantic category (e.g., FLOWER), participants are more likely to commit false positive errors for homophone controls (e.g.,
ROWS) and pseudo-homophones (e.g., ROWZ) than for a spelling-matched control (e.g., ROBS, in Van Orden, Pennington, & Stone, 1990). This indicates that words that share phonological representations are confusable because identification of visually presented words depends on the phonological information readers access in orthographic words.

In Ota, Hartsuiker and Haywood (2009), three groups of participants including native speakers of English, Japanese, and Arabic were asked to do a semantic-relatedness judgment task on some English words. Native speakers of English were less accurate and slower in rejecting pairs that contained a word with a homophone related to the other member of the pair (e.g., MOON-SON) in comparison to spelling controls (e.g., MOON-SIN). This was also the case with the nonnative speakers of English, demonstrating that the phonology of L2 words is being processed in L2 visual word recognition too. The nonnative participants also exhibited homophone-like effects in judging pairs that contained a word differed phonologically from a related word by a segmental contrast missing in their L1. The results of this study show that not only phonological mediation can take place in bilingual visual word recognition but also that the phonology of L1, in addition to that of the L2, is active in the silent reading of L2 words.

It is worth and vital that orthographic knowledge modifies the nature of the mentally stored phonological information, and that the influence of orthography on spoken word processing arises indirectly from this phonological representation (e.g., Peereman et al., 2009; Perre et al., 2009). A description of how orthography might be included in the phonological system is given by Taft (2006b), who proposes an abstract phonological level of representation directly reflecting the pronunciation of the spelling of the word (i.e., an orthographically influenced phonological representation or “OIP”). For example, the word corn is represented at the OIP level with a post-vocalic r (i.e., /kɔrn/) even for non-rhotic speakers of English who do not pronounce the postvocalic r [kɔːn]. The evidence comes from the fact that non-rhotic
English speakers find it hard to recognize the homophony of a pseudohomophone that conflicts with its base word in terms of a post-vocalic r (Taft, 2006). For example, many non-rhotic speakers do not realize *cawn* is homophonic with *corn* unless they read it aloud. This implies that the representation of *or* and *aw* do not match in the underlying phonological system, and only coincide at the surface phonetic level.

As mentioned before, most research studies show the mediation of phonological knowledge in orthographic knowledge in word recognition and meaning retrieval. However, when it comes to learning new words in L2, the nature of interaction between the two systems might be questioned. Do L2 learners pay attention to the orthographic representation and use it as a cue for learning new words and their meaning retrieval later, especially when there is no one to one relationship between the phonological and orthographic representation? The issue is worth studying as research shows the mediation of phonological knowledge in word recognition and meaning retrieval in many cases. In fact, the question would be if orthography can be an important factor in learning new words in L2 and if the discrepancy between the phonological and orthographic knowledge can make a difference. In a nutshell, this study will provide grounds for investigating whether it is better to teach the spelling of new words along with the phonological representation when there is a discrepancy between the two. The following research questions are addressed in this study.

1. Do differences in grapheme-phoneme representation of pseudowords, having a silent letter, help learners to recall the meaning of pseudowords better and faster?

2. Do differences in grapheme-phoneme representation of pseudowords, having a wrong letter, help learners to recall the meaning of pseudowords better and faster?
2. Methodology

2.1 Participants

Twenty pre-IELTS male and female students who were studying English at Danesh Pajouhan institute in Esfahan, Iran, were selected to take part in the study. They were native speakers of Persian and their knowledge of English was limited to the courses they studied in language institutes and universities. Furthermore, they never had exposure to English in natural settings.

2.2 Materials

This experiment contained two phases: 1- studying phase and 2- testing phase.

2.2.1 Studying Phase

A list of 46 pseudowords with a byssillabic structure CVCV(C) containing phonemes that exist in English was selected. They were produced by Wuggy Generator Software. Each pseudoword was assigned a specific picture in order to make it meaningful. They were presented through the Power Point software (2013) such that each picture was displaying simultaneously with its written form and its pronunciation. Three kinds of items were used in the study phase (Table 1): (A) 6 congruent items with regular phoneme-grapheme correspondency (e.g. the spoken form [raudət], the written form <Rodat>, picture of panda), (B) 6 incongruent items with a silent-letter in written forms (e.g., the spoken word [b^nItl]), the written form <Butil>, picture of apple), and (C) 6 incongruent items carrying a wrong phoneme or letter in their written form (e.g. the spoken word [fɑʃəm], the written form <Fazam>, picture of cabbage). The pseudowords were presented in three different orders to counterbalance the order of presentation: WSC (Wrong letter, Silent letter, and Congruent letters), SWC and CSW.

<td></td>
<td>&lt;pooler&gt;, /puːvər/;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&lt;bafel&gt;, /bæʃəl/;</td>
</tr>
</tbody>
</table>

2.2.2 Testing Phase

Two different tests were used: 1- criterion test and 2- meaning recall test which are briefly discussed below:

2.2.2.1. Criterion test

In order to see whether the participants learned 90% of the words they received during the study phase, they got the criterion test. If they were not able to achieve 90% accuracy, they needed to go through the study phase again. Each Picture in this test was presented two times: once with a matched name and once with a different name.

3.2.2.2. Meaning recall test

Meaning recall test was given to the participants to see if they were able to recall the meaning of words taught to them in the study phase. The test was an auditory word-picture matching test that was like the criterion test previously
mentioned in which participants judged a spoken word on the basis of its correct label in each picture. Seventeen pairs were mismatched, six of which were congruent spelling items where congruent words were paired with wrong pictures. New auditory stimuli were prepared for the remaining 12 mismatched items: there were auditory words representing the incongruent spelled forms presented during training in study phase (e.g., auditory [b^ntil] and [fazəm], see Table 2). They were paired with their corresponding pictures (e.g., auditory [b^ntil] with a picture of an apple) to form six mismatched incongruent-silent-letter items and six mismatched incongruent-extra-letter items.

Table 2

Example of Mismatched and Mismatched Listening Test Items

<table>
<thead>
<tr>
<th>Stimulus condition</th>
<th>Auditory word at test</th>
<th>Picture</th>
<th>Trained auditory word written form(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>MATCHED between picture and auditory label</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Congruent</td>
<td>[roudət]</td>
<td>Panda</td>
<td>[roudət] Rodat</td>
</tr>
<tr>
<td>MISMATCHED between picture and auditory label</td>
<td></td>

<tr>
<td>Congruent</td>
<td>[roudət]</td>
<td>Panda</td>
<td>[roudət] Rodat</td>
</tr>
<tr>
<td>Incongruent-Silent-letter</td>
<td>[b^ntil]</td>
<td>Apple</td>
<td>[b^ntil]</td>
</tr>
</tbody>
</table>
Incongruent-silent-letter pairs were predicted to be as difficult as the incongruent-wrong-letter pairs. As mentioned before, in both types of incongruent mismatched items, pictures were paired with labels that sounded similar to the written labels but different from the labels heard in the study phase.

2.3. Procedure

The participants received the study phase, criterion test and meaning recall test in the same order in a quiet room. The instructions appeared on the screen and participants heard the presented words through their headphones while the pictures indicating their meanings were being displayed on the computer screen. The Word Power point (2013) and the DMDX software were used for the presentation of materials in the study and testing phases respectively. In the testing phases, the participants were asked to determine if each picture matched the pseudoword they heard in the study phase by pressing the Right Shift button (if they totally matched) and the Left Shift button (if they did not match) on the computer keyboard.

3. Results

The following issues were considered in data analysis. RTs were measured from target offset in millisecond. Missing data ranged from 0 to 9 (20.15% of data for each item). One of the participants made more than 20% errors. Therefore she was replaced with another one. Regarding the items, learners made about 34.8% errors on item 128 and 47.8% errors on item 134. Therefore, these two items were discarded from further analysis. The discarded items were pooler and moler and it seems that the similarity of phonemes in their place of articulation and number of phonemes might have confused the participants when processing these items.

First, the results of data analysis regarding accuracy of responses and then those related to reaction times are presented. All analyses (accuracy and reaction times) were based on correct responses while incorrect responses were ignored. The paired samples \( t \) test was used to compare the performance of the participants on
each item type. The following table shows the descriptive statistics related to the items.

<table>
<thead>
<tr>
<th></th>
<th>Mean</th>
<th>N</th>
<th>Std. Deviation</th>
<th>Std. Error Mean</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pair 1 mismatched wrong letter</td>
<td>.7950</td>
<td>20</td>
<td>.18418</td>
<td>.04118</td>
</tr>
<tr>
<td>mismatched silent letter</td>
<td>.8200</td>
<td>20</td>
<td>.19358</td>
<td>.04329</td>
</tr>
</tbody>
</table>

Comparing the mean scores shows that participants were more accurate on silent letters. However, this difference is not statistically significant as the following table shows.

<table>
<thead>
<tr>
<th></th>
<th>Mean</th>
<th>Std. Deviation</th>
<th>Std. Error Mean</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pair 1</td>
<td>mismatched wrong letter</td>
<td>-.025</td>
<td>.084</td>
</tr>
<tr>
<td>mismatched silent letter</td>
<td>-.13825</td>
<td>.08825</td>
<td>-.40</td>
</tr>
</tbody>
</table>

From the table, it can be concluded that the mean difference is not significant, \( t(19) = .46 \), \( p > .649 \). Next, RTs were compared.

The table shows that the mean scores are not very much different from each other.

<table>
<thead>
<tr>
<th></th>
<th>Mean</th>
<th>N</th>
<th>Std. Deviation</th>
<th>Std. Error Mean</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pair 1</td>
<td>mismatched wrong letter</td>
<td>2552</td>
<td>20</td>
<td>268.70483</td>
</tr>
<tr>
<td>mismatched silent letter</td>
<td>2542.2061</td>
<td>20</td>
<td>257.83000</td>
<td>57.65254</td>
</tr>
</tbody>
</table>

The \( t \) test run on the mean scores shows no significant difference between the means, indicating that both item types were processed at the same speed, \( t(19) = .251 \), \( p > .05 \).

**4. Discussion**
The aim of this study was to determine whether different types of grapheme–phoneme correspondence mismatches (e.g., adding a “silent” letter, and having a wrong letter) influenced learners’ memory of the phonological forms of words and their processing rates. To this end, 20 Persian speaking learners of English were given pseudowords to study and learn. For each item, the spoken form, the written form, and a picture showing its meaning were presented simultaneously. The items were of three types: one type based on regular English phoneme-grapheme correspondence, another type having a silent letter, and the third type having a wrong letter. The participants were later tested on their memory of the meaning of pseudowords in an auditory picture-matched test. Paired samples \( t \) tests were used to analyze the data. The results showed no significant difference between the performances on each type, neither for accuracy nor for processing time.

The results of the study are in contrast to Hayes-Harbs et al (2010), who found that orthographic representations can be part of the memory of the phonological forms of the words when the discrepancy involves a mismatch in a letter’s phonemic correspondent. This effect was observed only for wrong letter items and not silent letters. They attributed the lack of detrimental effect of silent letters to greater familiarity of native speakers with them. More research studies are required to shed light on this matter, as having a wrong letter is not unfamiliar to native speakers of English either. Hayes-Habs et al.’s study was conducted with native speakers of English, so the difference can be attributed to the participants. It seems that for Persian speakers learners of English both types are the same and neither can be different in any way from the other.

Attempting to show if the presentation of written form could affect the memory of the new words in L2 for speakers of Persian, a language with a different script from English, Masoumzadeh (2014) compared items with a silent letter and items with a wrong letter with congruent items separately. He found that performance on memory test for the phonological labels of pseudowords was slowed
down but no change was observed in terms of accuracy. He used the findings to conclude that second language learners whose first language has a different script do not use the written form accompanying the auditory label when learning new words.

On the basis of the findings, it seems that L2 learners do not pay a lot of attention to the spelling form of new words. One reason might be the limited capacity of working memory and the issue that simultaneous attention to both spoken and written forms is more demanding for L2 learners. Another reason can be lesser importance they give to spelling and priority they give to auditory labels as a clue to the meaning of new words.

Global education is an international movement driven by increasingly globalized interactions in contemporary society. Many countries and international nongovernment organizations (NGOs) recognize global education as one of the most important components of education and promote corresponding policies. Despite the progress made in this field, proposed educational policies and curriculum development schemes are still in their infancy, making assessments of their implementation difficult to accomplish. Some countries have declared that their educational aims in a globalized, interdependent world are reflected in the national curricula.

Nevertheless, many important global issues remain neglected or inadequately addressed. Although many global educators highlight the relevance of global education to all curricular areas, little empirical evidence supports its importance. This gap raises questions regarding the extent to which global education components are reflected in national curricula. To address this gap, content analysis was conducted to examine the extent to which core concepts for global education are reflected in Taiwan’s Textbooks. The analyzed textbooks totaled 84 volumes from all of the learning areas for six grades in elementary school. The distributions of core concepts for global education in the title of unit, competence indicators, teaching goals, teaching activities and the content of texts in elementary school textbooks were analyzed.

A session was devoted to training three graduate students from an educational institute to code for two training datasets. Scott’s (1955) pi was used to calculate the inter-coder reliability for each pair coder. There are two major findings. On the part of the categories of global education concepts, the textbooks emphasize on the ecological sustainability, lacking the categories on human rights and justice. Within the seven learning areas, there are more global education concepts in the Social Study Learning Area and Integrative Activities Learning Area, while lacking for the concepts of global education in the Math Learning Area and English Learning Area.

Finally, according to research results, we propose suggestions for the educational authorities, textbook publishers, school teachers and researchers. We also hope that
this study elucidates the relationship between national curricula and global education, leading to new research that consolidates findings on revising textbooks for global education.

Keywords: textbook, content analysis, elementary school, global education.
Title: A Collaborative Approach to College Math Readiness

Abstract

One of the major preparatory gap to achieving access and equity in higher education for low-income and under-represented students is the lack of preparation in math courses that would qualify these students for entrance into a college-level curriculum. Like other institutions of higher education the University of Hawaii (UH) has efforts to increase the math performance of high school and community college students. Because of the lack of preparation in math courses students are either denied admission or are required to complete additional non-college level courses prior to gaining access to college-level math and science courses. The lack of preparation in math leads to lower enrollments and less access to science, technology, engineering and math (STEM) majors. It also contributes to a higher number of students either leaving the campus or extending their college careers.

The preparatory gap in math courses is especially acute in the high schools that serve low-income and under-represented students. An additional factor is that many of these schools are rural and remote which does not allow for a direct contact for those schools with the resources available at the UH system campuses.

This case study documents the results of a pilot program to increase the number of students who qualify for college level math courses. The first objective was increase the pass rate of participants taking the COMPASS math test. The program offers access to online math curriculum along with using college students as mentors and tutors. The online math curriculum offers students a means to expand their knowledge of math concepts and math content. The
college students provide math tutoring to students when they need help with their homework or class assignments. The intent of the program is to provide additional math instruction to students both during and outside of their school time.

The participating students used the EdReady online system designed to allow participants to create a self-paced learning path for math content. After taking an adaptive assessment the system developed an individualized course of study that will help each student acquire additional skills and content knowledge according to their specific needs. In addition to using the online math content, participants utilized the services of UH students who provided tutoring/mentoring assistance for all project students using an online platform and using tutoring techniques developed by the AVID program. The content was made available 24 hours a day with the tutors available live online from 9 am to 10 pm Monday through Friday and 5pm to 10 pm on Sundays.

The pilot project identified potential participants from two groups:

1. Students who did not place into a college level math course after taking the COMPASS math placement examination.
2. Students planning to enroll at the community college in need of supplemental instruction prior to taking the COMPASS math placement examination.

These students were identified by the community college and recruited through the use of direct emails, announcements on websites, in-person presentation at new student orientation and advice from academic advisors.

The case study will document the key program components including:

1. Identification of student participants
2. Recruitment of student participants
3. Assessment of math skills and knowledge provided by EdReady
4. Development of individualized learning plan
5. Online Cyber-mentoring and math-tutoring provided by UH Manoa Online Learning Academy
6. Assessment of strategic partnerships among service providers
7. Results of program surveys

The case study will document the key resources within the pilot program including:

1. EdReady online assessment and planning
2. NROC staff support
3. OLA online cyber-mentors and tutors
4. Community College staff support
5. Program materials
6. OLA staff support
The key data elements for the case study include:

1. Data Sets from the Leeward Community College reports on developmental math
2. Data from the EdReady website including:
   a. Number of Logins: total number of times the student has logged into EdReady
   b. Last Login: the last date & time (provided in UTC time [Greenwich non-adjusted mean time]) the student logged into EdReady
   c. Time Spent Studying: the amount of time (n minutes) that the student spent in the online Resources provided by EdReady. This does not show the total time in the EdReady site or include time spent taking any Assessments (initial, pre- or re-tests).
   d. Score: the initial score after initial Assessment
   e. Score Gain: The difference between the student’s initial & current scores. If the student’s score has decreased since the Initial Assessment, the number here will be negative.
   f. Target Score: the score the student was working towards
   g. Reached Target: indicates if the student’s current EdReady score is greater than or equal to their Target Score.
Enhancing self-efficacy and interest in learning English of undergraduate students with low proficiency of English through participation in a collaborative learning programme

Self-efficacy and interest in learning English are two important factors influencing undergraduate students’ motivation in learning English. This exploratory study was designed to discover the perceived development of self-efficacy and interest of learning English through participation in a collaborative learning programme.

Five undergraduate students with low proficiency in English participated in the study. Focus group interviews were conducted after the completion of 12 tutoring classes of teaching experience. They were also asked to complete a pre and post-questionnaire on self-efficacy. The verbatim were transcribed and analysed using content analysis. Three themes were identified: increased some sources of self-efficacy in learning English, increased in self-efficacy in learning English, and gained interest in learning English. Quantitative data from pre- and post- mean scores on the language self-efficacy scale were collected. The mean increase in language self-efficacy score was 1.2, 95% CI = 0.027 to 2.13. Students had significantly increase in language self-efficacy scores (t = 3.57, df = 4, p = 0.02).

This study has important pedagogical implication. Collaborative learning programme might be an effective means in enhancing students' interest in learning English and becoming more self-efficacious in learning English.
An Experimental Investigation of Applying Cognitive Linguistics to Instructed L2 Learning

Abstract

For the past 20 years, the predominant linguistic paradigms have been based on abstract models that offered L2 researchers little in the way of useful, accessible presentations of grammar. Therefore, it is unsurprising that there has been a move away from attempts to apply theoretical models of language to second language instruction (Tyler, 2008). Cognitive linguistics, which is still a new discipline, is gaining recognition as a theoretical model that offers useful and accessible linguistic analyses to foreign language instruction. This paper reports on results of a study examining the efficacy of applying a cognitive linguistic approach to instructed L2 learning of various semantic issues. The findings obtained through three experiments provide support for the benefits of using cognitive linguistic analyses of the semantic issues even though the degree of efficacy in each experiment is varied. Furthermore, this paper talks about the necessity of development of pedagogical tools for applying this new linguistic approach successfully. As these experiments and other studies (Tyler, 2012) suggest, a cognitive linguistic based approach provides conceptual tools to address many aspects of language learning. However, its successful implementation depends heavily on careful preparation of teaching materials and on how much we can render its theoretical concepts accessible to learners.

1. Introduction

We basically draw on cognitive linguistic perspective toward languages as a theoretical model. This basic theoretical orientation rests on the idea that the mind and the body are not separate entities and we are likely to understand partially some abstract concepts by relating them cognitively to our own bodily experience (Gibbs, 2006). In the following we will discuss attempts to teach abstract linguistic issues: (i) (un)countability of nouns; (ii) polysemous senses of the verb *stand*; and (iii) English present perfect progressive. We will show that this method can yield certain positive results in each of these studies. The findings we gained through three experiments provide support for the benefits of using cognitive linguistic analyses of the semantic issues. All these attempts are based on the idea that learners can grasp meanings of linguistic forms through
their bodily and cognitive experience better than the conventional instruction in which no motivated nature of these issues is mentioned. As we will see soon below, all three experiments worked favorably for cognitive linguistic based instruction even though the degree of efficacy in each experiment was varied.

The organization of this paper is as follows. In the rest of this section, we will discuss some foundational assumptions of cognitive linguistics and its key concepts. In section two, we will talk about the research questions and three experiments. These experiments in turn are on countable/uncountable semantics, on polysemous verb *stand*, and finally on semantics of present perfect progressive. In section three, we will have a general discussion on implications we gain through these experiments. In section four, we will discuss how we can utilize our new perspective successfully into teaching and will conclude with discussing some remaining but important issues.

Although cognitive linguistics is a relatively new discipline, it is becoming influential. It embraces some closely related theories of language and they seem to be all based on the following two claims (e.g., Langacker, 1987; Radden & Dirven, 2007; Taylor, 2002; Tyler, 2012). First, unlike generative grammar, cognitive linguistics doesn’t assume a special-purpose language acquisition device. We don’t have to think of any form of special purpose device for language acquisition and learning. Therefore, the system of a language or grammar of a language is part of the humans’ general cognition. The cognitive processes which are involved in language use are also involved in other areas of cognitive activities. Second, language we use is a product of our interaction with the world. Linguistic knowledge is derived from language use. The language we encounter in our daily life is a source, from which we can infer form-meaning relationship. Real usages we encounter are the foundation of a language. In this sense language is usage-based.

Briefly we will introduce some basic key concepts to the extent necessary to understand the following discussion. The first key concept is “construal.” We use words to describe the world. However, the words we use for describing things and events never reflect a purely objective view of these objects and events. We see things through our perspective. Accordingly, the language we use reflects our perspective or certain ways of our viewing the world. Take rice and beans for example, rice is fine-grained and too fine to be counted, therefore, it is considered as mass noun or uncountable in English. Beans are large enough to be counted and consequently, they are countable in English. However, we need to remember this distinction reflects English speakers’ way of viewing these things. The second key concept is categorization. We will classify objects into a category. That is categorization. Categories are not clearly cut-off from each other. They have members that can be considered prototypical. And they also have peripheral members. Thirdly, the concept of embodiment comes into our view. Many people still believe that meaning is an abstract entity and it should be divorced from bodily experience. However, meanings of many words are grounded on our physical experience. For example, the phrase *look down on somebody* meaning *despise* is based on our experience of our bodily action. When somebody
despises another, he is most likely to take a stance of looking down on the person. And *stand out in math* is also an example of embodiment. If somebody is good at math, he is noticeable, therefore, he stands out. In this manner, many expressions are motivated by our bodily action.

### 2. Research questions and three experiments

#### 2.1 Research questions

We have two research questions. The first question is on whether a cognitive linguistic approach is applicable to teaching and learning English vocabulary or grammar. Grammar here means linguistic rules, covering syntactic, semantic, and phonological aspects of a language. The second question is how we can render cognitive linguistic concepts accessible to learners without assuming any prior knowledge. To respond to these questions, three experiments were conducted.

#### 2.2 First experiment: semantics of countable / uncountable nouns

The distinction between two classes of things, objects and substances are coded in English as count and mass nouns respectively. The first experiment is designed to answer how we can teach effectively the distinction using a cognitive linguistic approach. We can distinguish things on the basis of the following criteria in Table 1, which are shared by researchers in cognitive linguistics (Langacker, 1987; Radden & Dirven, 2007; Taylor, 2002 among others).

<table>
<thead>
<tr>
<th>Criteria for distinguishing countability / uncountability</th>
</tr>
</thead>
<tbody>
<tr>
<td>(a) These things which meet these criteria are seen as solid objects (countable nouns).</td>
</tr>
<tr>
<td>i. Boundedness—things which are individuated</td>
</tr>
<tr>
<td>ii. Distinguishableness</td>
</tr>
<tr>
<td>iii. Countability—things which have inherent boundedness and limited partitionability</td>
</tr>
<tr>
<td>(b) These things which meet these criteria are seen as substances (uncountable nouns).</td>
</tr>
<tr>
<td>i. Unboundedness—things which are non-individuated</td>
</tr>
<tr>
<td>ii. Undistinguishableness</td>
</tr>
<tr>
<td>iii. Uncountability—things which have unlimited partitionability</td>
</tr>
</tbody>
</table>

#### 2.2.1 Procedure

The participants in this experiment consisted of 58 Japanese college students who majored in English literature and communication. They had not had any prior experience in English speaking countries for more than six months. Their English proficiency levels ranged from 450 to 600 on TOEIC test.

The participants were divided into two groups, each of which has roughly equal variance
of English proficiency in terms of TOEIC scores. Group 1, consisting of 29 subjects, was given a cognitive linguistic explanation of the issue using the cognitive diagrams (Figure 1 below) that depict the above criteria graphically. Group 2, consisting of 29 subjects, was offered a conventional explanation of the issue. Both groups were offered chances to see the real things such as rice, beans, gravel, pebbles, grass seed, and sunflower seeds, and of touching them. Neither group was given explicit instruction as to whether these things should be categorized as count or mass nouns.

Table 1 above shows distinction criteria according to which one can judge each entity should be classified either into mass or countable noun. Even though this table grasps the semantics of (un) countability precisely, its terminology is filled with elusive notions such as boundedness, distinguishableness, and individuated distinctiveness. Understanding all these terms clearly places some burden on learners. Therefore, we need to render these theoretical concepts and the framework accessible to them. The possible answer to this requirement is the following diagrams which function as a visual reminder of the notions involved in the distinction. These diagrams are compact, simple, straightforward but precise descriptions of the criteria. By seeing them, the subjects can easily grasp the elusive notions visually.

As for countable solid objects, an instructor may follow this procedure:

(i) Point to a group of objects and say “three cars.” ( ⇒ countability)
(ii) Point to a single object within a group, outline it and say “a car.”( ⇒ boundedness)
(iii) Coming down along the line to a single object, outline the object and say “a car.”

( ⇒ boundedness, distinguishableness)
(iv) Stopping at the lowest object, say “we can’t go further down.”

( ⇒ limited partitionability)
As for an instruction of uncountable substance, the instructor may follow this procedure:

(i) Start with the uppermost square of “milk.” Poke the square with the finger several times and say “milk, milk, milk” (⇒ unboundedness, undistinguishableness)

(ii) Come down to a lower square of “milk” and repeat the same gesture as above.
(⇒ unboundedness, undistinguishableness)

(iii) Go further down saying “milk, milk,…” (⇒ unlimited partitionability)

The whole instruction procedure covering both countable and uncountable cases took approximately 15 minutes. Therefore, it was not time-consuming and nor laborious both for the instructor and the subjects.

2.2.2 Test and results

After the stage above, the subjects of both G1 and G2 were requested to determine if a testing item with a noun is grammatical or not by judging the noun either as countable or uncountable. The experimental group (G1) was allowed to refer to the cognitive diagrams whenever it was necessary. Some samples of the test are shown in (1) below (for more details see Appendix A).

(1) Samples of the test items
   There are a lot of gravels in the box.
   There is a lot of rice in the bag.
   There is a lot of grass seed in this tray.

Table 2 shows the descriptive statistics for T-test between G1 and G2. The result shows G1 unequivocally outperformed G2 and that there is a statistically significant difference between G1 and G2 (t (56)=4.23, *p<.05). The cognitive linguistic based instruction worked favorably.

2.3 Second experiment: semantic extension of polysemous verb take

This experiment was designed to measure the effectiveness of gestures to instruct various senses of polysemous word stand. Under the cognitive linguistic paradigm, it is a common understanding
that all of the senses of a polyseme are semantically motivated and form a network. In other words, various senses of a word tend to operate within radial categories with basic, prototypical senses lying towards the center, and figurative senses lying towards the periphery. Although semantic networks of prepositions such as over, in, on, etc. have been discussed in the previous literature (Beitel, Gibbs, & Sanders, 2001; Lakeoff, 1987; Tyler, 2012; Tyler & Evans, 2001, 2003 among others), senses of polysemous verbs have not been sufficiently discussed. It has been noted that non-native speakers tend to avoid figurative and peripheral usage of a word (Littlemore 2009). Based on my personal reflection, Japanese learners of English seem to be hesitant to use figurative usages of verbs and prefer to stick to more literal uses. The second experiment dealt with one of these polysemous verbs, namely, stand and discussed effectiveness of teaching of these senses in a cognitive linguistic based approach, in which gestures played a major role.

2.3.1 Procedure

The experiment started with a test at the outset (see Appendix B). 59 subjects (the same group of students in the experiment 1) were given the test to check their understanding of senses of 18 usages of the verb stand. These 18 usages were selected from Gibbs, Beitel, Harrington and Sanders (1994). See the procedure below:

(i) 59 subjects were given a test to check how many different senses of stand they knew out of 18.
(ii) A set of gestures for each sense based on image schema profile was shown twice to the subjects.
(iii) The subjects did a reetrial of the same test and were requested to write a brief comment.
(iv) The difference between the first and second trial was measured.

After answering the test with 18 different senses of stand as for the first trial, all the subjects saw gesture-like presentations of each usage twice. It took approximately 25 minutes for the subjects to see the whole gesture performance covering 18 usages. Each set of gestures corresponds to each usage of stand. The important thing is that these bodily actions are based on image schema profiles which had been found out experimentally by Gibbs, Beitel, Harrington and Sanders (1994). Through a series of experiments they concluded that these five image schemas were involved in all senses of stand. These five image schemas are “balance,” “verticality,” “center-periphery,” “resistance,” and “linkage.” To give an example, the phrase stand out in several sports is related to the image schema profile <CP-V-L-B-R> in this order of importance, and the phrase the boss always stands over me to <V-CP-L-R-B> (V: verticality, CP: center—periphery, R: resistance, B: balance, L: linkage, for more details about image schema profiles see Gibbs, Beitel, Harrington and Sanders, 1994)
2.3.2. Gestures representing the image schema profile

These gestures were actually performed by three teaching assistants (graduate school students) and the real pictures should be displayed as an illustration of what they did but here instead two illustrations are presented (avoiding infringing on the portrait right).

![Figure 2. Illustration of gestures](image)

The left-hand picture illustrates the phrase *stand out in several sports*, and the second one *the boss always stands over me*. In the contemporary gesture literature, there is a general consensus that gesture and speech express closely related meanings. Although the precise relationship between the modalities is not straightforward, there is good reason to consider gestures, language, and speech as a closely-knit system (Gullberg, de Bot, and Volterra, 2010). If gestures and speech are regarded as an integrated system, it may be a case that factors that play a role in deciphering gestures also play a role in understanding a language.

All language use involves two types of knowledge, declarative and procedural ones. The former is knowledge of a fact, such as “to form a progressive sentence, use *be verb + ~ing construction*,” while procedural knowledge is bound up with actions such as “drive a car.” If we apply this distinction to learning a verb meaning, we can claim that learning through the definition of a word on a dictionary is closely related to declarative knowledge acquisition. On the contrary, if a learner can grasp the meaning of a verb by simply observing the corresponding action and/or performing it themselves, its learning process is closely related to procedural knowledge, which, interestingly, means that a learner may get to procedural knowledge directly skipping the preliminary step of declarative knowledge through gesture viewing or performing.

2.3.3. The result of experiment 2

The difference between the first and the second trial of the test is measured for each usage in table 2 below. “Usage number” in the first column corresponds to each usage of *stand*, for
example, the usage number 1 corresponds to “let the mixture stand.” We gave the subjects two trials using the same test. We classified subjects’ answering patterns into four cases. Pattern 1 represents a case where subject’s first answer is correct. Pattern 2 represents a case where subject’s first answer is correct but the second wrong. Pattern 3 actually covers two sub-cases where a subject, starting with wrong or no answer, ends with correct answer. Pattern 4 also represents multiple sub-cases either where a subject, starting with wrong answer, ends with a failure, or where a subject, starting with wrong answer, ends with wrong again or no entry. Pattern 3 definitely represents a successful pattern in which the gesture instruction helped the subjects to infer the meaning of phrase. Pattern 4, to the contrary, stands for a case where the gesture instruction didn’t work and a subject was not able to reach the correct understanding of the phrase.

</tbody>
</table>

The last two columns of validity and invalidity correspond to the percentage of correct answers.
and wrong answers after seeing the gestures respectively. This table shows that the gesture instructions helped the subjects to understand some usages (indicated by *) while they didn’t work much for the rest (indicated by #). Although the valid cases slightly outnumber the invalid cases, we need to consider what factors lie between these valid and invalid groups of usages. Before we analyze that important topic, we will see some of the comments from our subjects who took part in the experiment. The participants of the experiment were asked to respond to an open-ended questionnaire which was designed to solicit their introspective comments on this instruction. Among 59 comments, 47 of them (79.7%) were positive feedback to this new method, while 12 comments (20.3%) were rather critical of it. See some representative examples:

Student A: “Some senses which I didn’t know at first just popped into my mind when I saw the gestures…”

Student B: “Phrasal verbs are always troublesome, but this is a good rescue from mere memorization of them…”

Student C: “This method works as long as concrete examples are concerned but the meanings of more figurative or peripheral usages are beyond this direct method, which, after all, is based on direct experience by observing the performances.

Students A, B talked about the advantageous aspects of the method, particularly A’s comment “senses popped into my mind” may imply that the knowledge he acquired through deciphering gestures had been organized into a procedural type of knowledge. However, student C’s comment summarizes the limits of the present idea clearly. These invalid cases (indicated by # in Table 2) are all concerned with figurative usages of *stand* while these valid cases (*) are connected with more or less prima-facie examples whose senses are easily inferable or transparent. Learners can grasp senses of phrasal expressions by observing the gestures and inferring the messages as long as they are inferable, otherwise they need further description which helps them follow a metaphorical extension path from a transparent usage to more peripheral one. Meanings of phrasal verbs cannot be exhausted just by image schemas. More factors must be involved. Further survey of this issue is strongly suggested.

2. 4 Experiment 3: semantics of English present perfect progressive

Experiment 3 was on semantics of present perfect progressive, which many of Japanese learners of English tend to consider difficult. This time, 59 subjects (the same group of participants as in the previous two experiments) were tested their understanding of the meaning of present perfect progressive. When we hear a sentence like “my father has been washing his car
since this morning,” we naturally infer that the washing action is still going on. However, a sentence like “I’ve been running” responding to a question “why are looking so tired?” doesn’t entail that running is still going on. The running process must have been ceased. This observation suggests that we have to assume two types of present perfect progressive. However, some grammar books published in Japan take continuation of process as a necessary condition and even claim that the lack of it renders the sentence ungrammatical. Therefore, learners feel puzzled when they come across some examples which obviously violate the rule which they assume to be true. This experiment was designed to respond to this elusive semantic issue and also to measure the effectiveness of applying cognitive linguistic insight to learning semantics of present perfect progressive.

2.4.1 Procedure

See the procedure of this last experiment:

(i) 59 subjects were divided into the experimental group G1 (n=29), and the control group G2 (n=30).
(ii) Only G1 was given cognitive linguistic explanation of the meaning of present perfect progressive using animated pictures. G2 was offered a conventional explanation.
(iii) Both groups took the same test.
(iv) The difference between two groups was measured statistically and analyzed.

2.4.2 Cognitive linguistic explanation of present perfect progressive

According to Langacker (2001) and Radden & Dirvfen (2007), the meaning of present perfect progressive is compositional, i.e., a combination of that of progressive and that of present perfect. First, the progressive functions for putting the end point of an action out of focus and puts focus on the durational phase. Second, present perfect functions for placing the event into the indefinite past. It also requires us to search for current relevance. The current relevance can be either a continuative state or a resultative state. This explanation is summarized in (2).

(2) Compositional analysis of present perfect progressive
(i) Progressive focuses on durational phase of an activity and puts the end-point out of focus.
(ii) Present perfect focuses on the present time and puts the event into indefinite past time.
(iii) Present perfect requires an interpreter to search for current relevance of the past event to the present time. Current relevance may be either the continuation of the activity to the present moment or a resultative state which is caused by the activity.

( Langacker, 2001 ; Radden & Dirvfen, 2007 )

The above elucidation captures semantics of present perfect progressive precisely and compactly
but still is not utilizable when one has to consider an aspectual feature of a sentence containing present perfect progressive. We need to translate the above criteria into more accessible description. A possible solution is displaying an animation which shows the compositional feature of the construction deftly, clearly and memorably. *Figure 3* with 3 pictures below was in fact a set of movable pictures with animation effects, which appeared in this order when it was displayed to the subjects.

![Figure 3](image-url)

*Figure 3  Compositional illustration of present perfect progressive*

This animation was shown three time to G1. The subjects in G1, who saw the animation, were instructed both to imitate “teaching gestures” (i.e., gestures used deliberately by a teacher to help his students) and to repeat vocal instructions simultaneously after the teacher, which were abbreviated statements similar to (2) above: “focus on the durational phase,” “put the end point out of focus,” “put the event back into indefinite past,” “search for current relevance,” and “current relevance can be either continuative state or resultative state.” This was conducted with an expectation of positive effects produced by combination of visual, vocal, and gestural modalities. After this stage all the subjects took the test, which asked them to judge each sentence with present perfect progressive as a case of (i) continuative action; or (ii) ceased action with a resultative state; or (iii) both interpretation possible.

### 2.4.3 Result of the test

Table 3 shows the descriptive statistics for T-test between G1 and G2. The result shows G1 modestly outperformed G2 and that there is a statistically significant difference between G1 and G2 ($t (57)=2.77, * p< .05$). Therefore, the cognitive linguistics based instruction worked favorably.
3. Discussion

We saw the outline of three experiments above. In this section we will consider the results of three experiments and the implications. All three experiments, particularly experiment 1 and 3, have shown favorable results for cognitive linguistics based instruction even though the degree of efficacy in each experiment is varied. Therefore, we can safely say that cognitive linguistics based instruction is beneficial to learners as far as linguistic items that we dealt with in these experiments are concerned. As for experiment 1, showing the cognitive linguistic diagrams illustrating visually the distinction between countable and mass nouns was beneficial and functional. As for experiment 3, the animation illustrating the compositional feature of English present perfect progressive was helpful. Teaching instruments such as the cognitive linguistic diagrams, and the animation were used to translate complicated concepts into directly perceivable and accessible to subjects without prior knowledge of cognitive linguistics.

Experiment 2 showed that using content-loaded, representational gestures to help subjects to infer polysemous senses of verbal phrases with stand was of limited efficacy. Even though there is considerable evidence that gestures affect perception and interpretation of language, their effects are still auxiliary particularly when used to show more figurative expression like “to get stood up for a date.” In order to make gestures more beneficial in teaching polysemous senses of this kind, we need to consider a combination of a cognitive diagram which helps learners to trace a metaphorical extension pathway with representational gestures.

4. Conclusion

We have two research questions. The first question is on whether a cognitive linguistic approach is applicable to teaching and learning English. The second question is how we can render cognitive linguistic concepts accessible to learners without assuming any prior knowledge. As an answer to the first question we can say that cognitive linguistic based approach is beneficial. However, at this present stage we cannot determine in what linguistic fields cognitive linguistics based instruction is effective and beneficial. I think it is simplistic to assume that all the findings in cognitive linguistics are applicable to teaching English. Cognitive linguistics assumes that a language is usage-based and that many aspects of language are grounded on embodied experience.

</table>
However, these tenets do not mean that cognitive linguistics is simple in its structure. To the contrary, cognitive linguistics is structurally-complex in its own right with a lot of sophisticated theory-internal concepts, which in turn requires teachers who desire to apply it to their teaching to concentrate on learning them over a prolonged period. At this stage we must confine ourselves to say that we need to have a lot more of further experimental evidence to show what linguistic aspects cognitive linguistics based instruction is favorably compatible with.

In relation to the second question, one condition we should remember here in applying cognitive linguistics based instruction to our teaching is that we should devise well designed, diagrams, gestures or animation which may represent notions and concepts of cognitive linguistics concerned concisely, precisely and clearly. Introducing jargons or technical terms from cognitive linguistics into a classroom seems to confuse our students.

Notes

1. Participants in these three experiments were from the same class. The total number was 59. These experiments were conducted on three different days with a week interval in July, 2012.
2. Original comments were written in Japanese. The author translated into English for this paper.

(18) to stand in the way

Appendix C: Test materials for semantics of present perfect progressive

Question 1 Read the following and classify each of which as case (i): where its process is still going on at this present moment; or case (ii): where its process has been ceased leaving current relevance to the present time; or case (iii): where both cases above are possible.

(1) You’ve been fighting again. I can tell that from your black eye.
(2) He has been fighting for an hour on the ring.
(3) John has been fighting.
(4) It’s been snowing. Look. The ground is white.
(5) It’s been snowing since this morning.
(6) It’s been snowing.
(7) Have you been crying? Your eyes are red.
(8) Kyoko has been crying for 2 hours.
(9) You have been practicing the violin. I can tell this from your violin bruise.
(10) I have been working all day.
(11) He has been trying to get Sally on the phone. But his attempts are all in vain.
(12) Somebody has been sitting in my chair. And it is broken!
(13) Somebody has been eating my soup and the bowl is empty.
(14) A: Why are you looking tired? B: I’ve been running.
(15) A: What have you been up to? B: I’ve been reading this book since this morning.

Question 2 Explain the difference in acceptability of (a) and (b).

(a) ? My father has been washing his car and now he is in the living room drinking coffee.
(b) My father has been washing his car and his clothes are still wet.
An Experimental Investigation of Applying Cognitive Linguistics to Instructed L2 Learning

Hideki HAMAMOTO

Kinki University

Abstract

For the past 20 years, the predominant linguistic paradigms have been based on abstract models that offered L2 researchers little in the way of useful, accessible presentations of grammar. Therefore, it is unsurprising that there has been a move away from attempts to apply theoretical models of language to second language instruction (Tyler, 2008). Cognitive linguistics, which is still a new discipline, is gaining recognition as a theoretical model that offers useful and accessible linguistic analyses to foreign language instruction. This paper reports on results of a study examining the efficacy of applying a cognitive linguistic approach to instructed L2 learning of various semantic issues. The findings obtained through three experiments provide support for the benefits of using cognitive linguistic analyses of the semantic issues even though the degree of efficacy in each experiment is varied. Furthermore, this paper talks about the necessity of development of pedagogical tools for applying this new linguistic approach successfully. As these experiments and other studies (Tyler, 2012) suggest, a cognitive linguistic based approach provides conceptual tools to address many aspects of language learning. However, its successful implementation depends heavily on careful preparation of teaching materials and on how much we can render its theoretical concepts accessible to learners.

1. Introduction

We basically draw on cognitive linguistic perspective toward languages as a theoretical model. This basic theoretical orientation rests on the idea that the mind and the body are not separate entities and we are likely to understand partially some abstract concepts by relating them cognitively to our own bodily experience (Gibbs, 2006). In the following we will discuss attempts to teach abstract linguistic issues: (i) (un) countability of nouns; (ii) polysemous senses of the verb *stand*; and (iii) English present perfect progressive. We will show that this method can yield certain positive results in each of these studies. The findings we gained through three experiments provide support for the benefits of using cognitive linguistic analyses of the semantic issues. All these attempts are based on the idea that learners can grasp meanings of linguistic forms through
their bodily and cognitive experience better than the conventional instruction in which no motivated nature of these issues is mentioned. As we will see soon below, all three experiments worked favorably for cognitive linguistic based instruction even though the degree of efficacy in each experiment was varied.

The organization of this paper is as follows. In the rest of this section, we will discuss some foundational assumptions of cognitive linguistics and its key concepts. In section two, we will talk about the research questions and three experiments. These experiments in turn are on countable/uncountable semantics, on polysemous verb stand, and finally on semantics of present perfect progressive. In section three, we will have a general discussion on implications we gain through these experiments. In section four, we will discuss how we can utilize our new perspective successfully into teaching and will conclude with discussing some remaining but important issues.

Although cognitive linguistics is a relatively new discipline, it is becoming influential. It embraces some closely related theories of language and they seem to be all based on the following two claims (e.g., Langacker, 1987; Radden & Dirven, 2007; Taylor, 2002; Tyler, 2012). First, unlike generative grammar, cognitive linguistics doesn’t assume a special-purpose language acquisition device. We don’t have to think of any form of special purpose device for language acquisition and learning. Therefore, the system of a language or grammar of a language is part of the humans’ general cognition. The cognitive processes which are involved in language use are also involved in other areas of cognitive activities. Second, language we use is a product of our interaction with the world. Linguistic knowledge is derived from language use. The language we encounter in our daily life is a source, from which we can infer form-meaning relationship. Real usages we encounter are the foundation of a language. In this sense language is usage-based.

Briefly we will introduce some basic key concepts to the extent necessary to understand the following discussion. The first key concept is “construal.” We use words to describe the world. However, the words we use for describing things and events never reflect a purely objective view of these objects and events. We see things through our perspective. Accordingly, the language we use reflects our perspective or certain ways of our viewing the world. Take rice and beans for example, rice is fine-grained and too fine to be counted, therefore, it is considered as mass noun or uncountable in English. Beans are large enough to be counted and consequently, they are countable in English. However, we need to remember this distinction reflects English speakers’ way of viewing these things. The second key concept is categorization. We will classify objects into a category. That is categorization. Categories are not clearly cut-off from each other. They have members that can be considered prototypical. And they also have peripheral members. Thirdly, the concept of embodiment comes into our view. Many people still believe that meaning is an abstract entity and it should be divorced from bodily experience. However, meanings of many words are grounded on our physical experience. For example, the phrase look down on somebody meaning despise is based on our experience of our bodily action. When somebody
despises another, he is most likely to take a stance of looking down on the person. And *stand out in math* is also an example of embodiment. If somebody is good at math, he is noticeable, therefore, he stands out. In this manner, many expressions are motivated by our bodily action.

### 2. Research questions and three experiments

#### 2.1 Research questions

We have two research questions. The first question is on whether a cognitive linguistic approach is applicable to teaching and learning English vocabulary or grammar. Grammar here means linguistic rules, covering syntactic, semantic, and phonological aspects of a language. The second question is how we can render cognitive linguistic concepts accessible to learners without assuming any prior knowledge. To respond to these questions, three experiments were conducted.

#### 2.2 First experiment: semantics of countable / uncountable nouns

The distinction between two classes of things, objects and substances are coded in English as count and mass nouns respectively. The first experiment is designed to answer how we can teach effectively the distinction using a cognitive linguistic approach. We can distinguish things on the basis of the following criteria in Table 1, which are shared by researchers in cognitive linguistics (Langacker, 1987; Radden & Dirven, 2007; Taylor, 2002 among others).

**Table 1**

<table>

</tr>
<tr>
<td>ii. Undistinguishableness</td>
</tr>
<tr>
<td>iii. Uncountability—things which have unlimited partitionability</td>
</tr>
</tbody>
</table>

#### 2.2.1 Procedure

The participants in this experiment consisted of 58 Japanese college students who majored in English literature and communication. They had not had any prior experience in English speaking countries for more than six months. Their English proficiency levels ranged from 450 to 600 on TOEIC test.

The participants were divided into two groups, each of which has roughly equal variance
of English proficiency in terms of TOEIC scores. Group 1, consisting of 29 subjects, was given a cognitive linguistic explanation of the issue using the cognitive diagrams (Figure 1 below) that depict the above criteria graphically. Group 2, consisting of 29 subjects, was offered a conventional explanation of the issue. Both groups were offered chances to see the real things such as rice, beans, gravel, pebbles, grass seed, and sunflower seeds, and of touching them. Neither group was given explicit instruction as to whether these things should be categorized as count or mass nouns.

Table 1 above shows distinction criteria according to which one can judge each entity should be classified either into mass or countable noun. Even though this table grasps the semantics of (un) countability precisely, its terminology is filled with elusive notions such as boundedness, distinguishableness, and individuated distinctiveness. Understanding all these terms clearly places some burden on learners. Therefore, we need to render these theoretical concepts and the framework accessible to them. The possible answer to this requirement is the following diagrams which function as a visual reminder of the notions involved in the distinction. These diagrams are compact, simple, straightforward but precise descriptions of the criteria. By seeing them, the subjects can easily grasp the elusive notions visually.

As for countable solid objects, an instructor may follow this procedure:
(i) Point to a group of objects and say “three cars.” (⇒ countability)
(ii) Point to a single object within a group, outline it and say “a car.” (⇒boundedness)
(iii) Coming down along the line to a single object, outline the object and say “a car.”
  (⇒ boundedness, distinguishableness)
(iv) Stopping at the lowest object, say “we can’t go further down.”
  (⇒ limited partitionability)
As for an instruction of uncountable substance, the instructor may follow this procedure:

(i) Start with the uppermost square of “milk.” Poke the square with the finger several times and say “milk, milk, milk  (⇒ unboundedness, undistinguishableness)
(ii) Come down to a lower square of “milk” and the repeat the same gesture as above.  (⇒ unboundedness, undistinguishableness)
(iii) Go further down saying “milk, milk,…” (⇒ unlimited partitionability)

The whole instruction procedure covering both countable and uncountable cases took approximately 15 minutes. Therefore, it was not time-consuming and nor laborious both for the instructor and the subjects.

2.2.2 Test and results

After the stage above, the subjects of both G1 and G2 were requested to determine if a testing item with a noun is grammatical or not by judging the noun either as countable or uncountable. The experimental group (G1) was allowed to refer to the cognitive diagrams whenever it was necessary. Some samples of the test are shown in (1) below (for more details see Appendix A).

(1) Samples of the test items
    There are a lot of gravels in the box.
    There is a lot of rice in the bag.
    There is a lot of grass seed in this tray.

Table 2 shows the descriptive statistics for T-test between G1 and G2. The result shows G1 unequivocally outperformed G2 and that there is a statistically significant difference between G1 and G2 (t (56)=4.23,* p< .05). The cognitive linguistic based instruction worked favorably.

2.3 Second experiment: semantic extension of polyseous verb take

This experiment was designed to measure the effectiveness of gestures to instruct various senses of polyseous word stand. Under the cognitive linguistic paradigm, it is a common understanding
that all of the senses of a polyseme are semantically motivated and form a network. In other words, various senses of a word tend to operate within radial categories with basic, prototypical senses lying towards the center, and figurative senses lying towards the periphery. Although semantic networks of prepositions such as over, in, on, etc. have been discussed in the previous literature (Beitel, Gibbs, & Sanders, 2001; Lakeoff, 1987; Tyler, 2012; Tyler & Evans, 2001, 2003 among others), senses of polysemous verbs have not been sufficiently discussed. It has been noted that non-native speakers tend to avoid figurative and peripheral usage of a word (Littlemore 2009). Based on my personal reflection, Japanese learners of English seem to be hesitant to use figurative usages of verbs and prefer to stick to more literal uses. The second experiment dealt with one of these polysemous verbs, namely, stand and discussed effectiveness of teaching of these senses in a cognitive linguistic based approach, in which gestures played a major role.

2.3.1 Procedure

The experiment started with a test at the outset (see Appendix B). 59 subjects (the same group of students in the experiment 1) were given the test to check their understanding of senses of 18 usages of the verb stand. These 18 usages were selected from Gibbs, Beitel, Harrington and Sanders (1994). See the procedure below:

(i) 59 subjects were given a test to check how many different senses of stand they knew out of 18.
(ii) A set of gestures for each sense based on image schema profile was shown twice to the subjects.
(iii) The subjects did a retrial of the same test and were requested to write a brief comment.
(iv) The difference between the first and second trial was measured.

After answering the test with 18 different senses of stand as for the first trial, all the subjects saw gesture - like presentations of each usage twice. It took approximately 25 minutes for the subjects to see the whole gesture performance covering 18 usages. Each set of gestures corresponds to each usage of stand. The important thing is that these bodily actions are based on image schema profiles which had been found out experimentally by Gibbs, Beitel, Harrington and Sanders (1994). Through a series of experiments they concluded that these five image schemas were involved in all senses of stand. These five image schemas are “balance,” “verticality,” “center-periphery,” “resistance,” and “linkage.” To give an example, the phrase stand out in several sports is related to the image schema profile <CP-V-L-B-R> in this order of importance, and the phrase the boss always stands over me to <V-CP-L-R-B> (V: verticality, CP: center–periphery, R: resistance, B: balance, L: linkage, for more details about image schema profiles see Gibbs, Beitel, Harrington and Sanders , 1994)
2.3.2. Gestures representing the image schema profile

These gestures were actually performed by three teaching assistants (graduate school students) and the real pictures should be displayed as an illustration of what they did but here instead two illustrations are presented (avoiding infringing on the portrait right).

![Illustration of gestures]

*Figure 2. Illustration of gestures*

The left-hand picture illustrates the phrase *stand out in several sports*, and the second one *the boss always stands over me*. In the contemporary gesture literature, there is a general consensus that gesture and speech express closely related meanings. Although the precise relationship between the modalities is not straightforward, there is good reason to consider gestures, language, and speech as a closely-knit system (Gullberg, de Bot, and Volterra, 2010). If gestures and speech are regarded as an integrated system, it may be a case that factors that play a role in deciphering gestures also play a role in understanding a language.

All language use involves two types of knowledge, declarative and procedural ones. The former is knowledge of a fact, such as “to form a progressive sentence, use *be verb + ~ing construction*,” while procedural knowledge is bound up with actions such as “drive a car.” If we apply this distinction to learning a verb meaning, we can claim that learning through the definition of a word on a dictionary is closely related to declarative knowledge acquisition. On the contrary, if a learner can grasp the meaning of a verb by simply observing the corresponding action and/or performing it themselves, its learning process is closely related to procedural knowledge, which, interestingly, means that a learner may get to procedural knowledge directly skipping the preliminary step of declarative knowledge through gesture viewing or performing.

2.3.3. The result of experiment 2

The difference between the first and the second trial of the test is measured for each usage in table 2 below. “Usage number” in the first column corresponds to each usage of *stand*, for
example, the usage number 1 corresponds to “let the mixture stand.” We gave the subjects two trials using the same test. We classified subjects’ answering patterns into four cases. Pattern 1 represents a case where subject’s first answer is correct. Pattern 2 represents a case where subject’s first answer is correct but the second wrong. Pattern 3 actually covers two sub-cases where a subject, starting with wrong or no answer, ends with correct answer. Pattern 4 also represents multiple sub-cases either where a subject, starting with wrong answer, ends with a failure, or where a subject, starting with wrong answer, ends with wrong again or no entry. Pattern 3 definitely represents a successful pattern in which the gesture instruction helped the subjects to infer the meaning of phrase. Pattern 4, to the contrary, stands for a case where the gesture instruction didn’t work and a subject was not able to reach the correct understanding of the phrase.

</table>

The last two columns of validity and invalidity correspond to the percentage of correct answers.
and wrong answers after seeing the gestures respectively. This table shows that the gesture instructions helped the subjects to understand some usages (indicated by *) while they didn’t work much for the rest (indicated by #). Although the valid cases slightly outnumber the invalid cases, we need to consider what factors lie between these valid and invalid groups of usages. Before we analyze that important topic, we will see some of the comments from our subjects who took part in the experiment. The participants of the experiment were asked to respond to an open-ended questionnaire which was designed to solicit their introspective comments on this instruction. Among 59 comments, 47 of them (79.7%) were positive feedback to this new method, while 12 comments (20.3%) were rather critical of it. See some representative examples:

Student A: “Some senses which I didn’t know at first just popped into my mind when I saw the gestures…”

Student B: “Phrasal verbs are always troublesome, but this is a good rescue from mere memorization of them…”

Student C: “This method works as long as concrete examples are concerned but the meanings of more figurative or peripheral usages are beyond this direct method, which, after all, is based on direct experience by observing the performances.

Students A, B talked about the advantageous aspects of the method, particularly A’s comment “senses popped into my mind” may imply that the knowledge he acquired through deciphering gestures had been organized into a procedural type of knowledge. However, student C’s comment summarizes the limits of the present idea clearly. These invalid cases (indicated by # in Table 2) are all concerned with figurative usages of stand while these valid cases (*) are connected with more or less prima-facie examples whose senses are easily inferable or transparent. Learners can grasp senses of phrasal expressions by observing the gestures and inferring the messages as long as they are inferable, otherwise they need further description which helps them follow a metaphorical extension path from a transparent usage to more peripheral one. Meanings of phrasal verbs cannot be exhausted just by image schemas. More factors must be involved. Further survey of this issue is strongly suggested.

2.4 Experiment 3: semantics of English present perfect progressive

Experiment 3 was on semantics of present perfect progressive, which many of Japanese learners of English tend to consider difficult. This time, 59 subjects (the same group of participants as in the previous two experiments) were tested their understanding of the meaning of present perfect progressive. When we hear a sentence like “my father has been washing his car
