EDUCATION SECTOR REFORMS IN CENTRAL ASIA
DURING THE POST-SOVIET PERIOD
Prof. Dr. Almazbek Beishenaliev
Vice Rector of International Ataturk- Alatoo University, Bishkek - Kyrgyzstan

The collapse of the Soviet Union brought with it an opportunity for educational reform in many Central Asian Republics that previously used the centralized Russian system of Education. A paradigm shift from a centralized, socialist market to a market economy necessitated reforms in education. The paper will briefly describe how 5 Central Asian countries made that transition and deal in depth with the burgeoning reforms and transformation higher educational system of Kazakhstan, Kyrgyzstan, Uzbekistan, Turkmenistan, and Tajikistan.

Central Asian states have gained independence in the beginning of 1990s. Together with the political and economic reforms, each of them attempted to restructure education system that they inherited from the Soviet past. With more than two decades of independence behind, today the five countries are still having trouble in reaching international standards of education. However, some perform better than others do. In Kyrgyzstan, frequent changes of government authorities and even violent ousters have stalled reforms in education, lacking continuity and stability in government's development vector. Civil war in Tajikistan has affected the education reform process, and overall poverty in the country does not allow large government investment into the sector. Rapid changes that Turkmenistan and Uzbekistan have attempted to implement lead to mixed results.

Many experts note that different outcomes of education reforms in these countries are largely explained by differences in their social discoveries as well as progress in embedding a market economy. In other words, the countries such as Kazakhstan, which performed more successfully in other sectors, including economy, tended to have more far-reaching reforms in education. As opposed to those countries, this preserved a large number of elements from the old command economy.

Key Words
reforms in education, Central Asia, reform, post-Soviet, curriculum and teaching methods, qualification requirements, self-financing mechanisms, extra-curricular activities, government educational policy, management capacity, highly qualified specialists, nepotism and regionalism, list of obligatory topics, consequences of regressive policy, market economy and open society, corruption in the education system, academic mobility of faculty members.

Introduction

The human civilization has always been placing its hopes for the future on education. Reforms in education sphere are a global process and an integral part of public changes occurring throughout the world.
The Central Asian states that gained sovereignty in the beginning of 1990s developed national education models of their own. Soon after independence, expenditures for the education sector have shrunk in the region, especially in Tajikistan and Kyrgyzstan. During 1990-2001, public expenditures on education in Tajikistan as percentage of GDP have declined from 9.7 to 2.4% and from 8.3% to 3.1% in Kyrgyzstan. Meanwhile, the world average expenditure is 4.1%. (Omirbaev, 2009:172)

KAZAKHSTAN

Among the Central Asian countries, only Kazakhstan has been internationally recognized as a country with a successful market economy. As said Kazakh President Nursultan Nazarbayev said, educational reform must aim at "every citizen of our country so that s/he receives a decent education and skills in order to become a demanded specialist in every corner of the world". In this regard, the goal is "to make the Kazakh educational system as well as its adult re-training closer to international standards" that is one of the thirty most indispensable target areas outlined in the new strategy of Kazakhstan". (Zharkynbaeva, 2008:6)

Overall, Kazakhstan has inherited principles and methods of the Soviet education and pedagogy. The existing legislation in Kazakhstan stipulates that a national education system, which is based on the principles of succession and continuity of educational programs, should be composed of four levels of education:  
1) pre-school education;  
2) secondary education (primary, secondary and vocational);  
3) higher education;  
4) post-graduate education.

The education re-structuring paradigm in Kazakhstan was grounded in late 1990s and shaped by the three basic documents such as the Law on Education, the State Educational Standards as well as the State Educational Program. The pivotal stone in reformation was the shift from a “Education for all” model to “Education by choice” principle. The goal of the reform was to integrate the educational system of Kazakhstan into the global education. An important step in reforming Kazakhstan’s education system was made in 2001 when the Education Ministry had approved the Classifier of Majors and Occupations in Higher Education, making enrollment requirements closer to the international educational standards, and particularly, to the Lisbon Convention on the Recognition of Qualifications concerning Higher Education, which Kazakhstan had signed far earlier than other CIS countries.

Moreover, an International Bolashak Fellowship Program has become quite successful in educating the cadres of the new generation. Since 2004, up to 3000 Bolashak fellowships are awarded annually. According to the official statistics, over 1700 people studied in some of the world’s best universities, including Harvard, Stanford, Cambridge, Sorbonne and others. However, during the first years of independence, one of the results of secondary schools’ development in Kazakhstan was the elitization of education. The number of specialized schools with additional paid services had increased attracting many of the best instructors. Meanwhile, the quality of education in ordinary schools as well as their teaching aids had decayed.

Moreover, by mid-1990s, some negative tendencies were under way in secondary education. During 1995-1997, the so-called "optimization" of educational institutions was implemented forcing 300 small schools to close.
All levels of education are institutionalized with the following set of elements and structures:

- The structure of education has been aligned with the International Standard Classification of Education;
- Enabling environment is being created to practice a 12-year-schooling model;
- Three-cycle degree system has been introduced to have Bachelor, Master and PhD degrees;
- Classifier of undergraduate and graduate education occupations has been approved with aggregated clusters of occupations being created;
- A national system of assessing the quality of education has been created that incorporates elements of independent external evaluation such as licensing, certification, accreditation, ranking, unified national testing (hereinafter referred to as the “UNT”), intermediate state control (hereinafter referred to as the “ISC”), comprehensive testing of university applicants and others);
- Issues concerning provision of free hot meals and free transportation for high school students are being resolved.
- In 2005, the Kazakh government placed an order to train 25,710 students for higher and post-graduate education, increasing it up to 35,425 in 2010;
- Access to internet is provided by 98% in urban schools and 97% in rural schools. In 2005, this figure was just 75% and 70% respectively. In total, 34% of schools are connected to the broadband internet;
- A network of specialized schools is created for gifted children, where courses are taught in three languages (Kazakh, Russian and English). Currently, there are thirty three specialized secondary schools;
- Universities are given much freedom in determining their curriculum. For example, the share of elective courses has increased from 40% to 50% for the Bachelor programs, from 50% to 60% for Master’s program and from 70% to 80% for PhD programs.

Yet, the education quality in Kazakhstan remains not highly attractive.

Preschool education:
As of July 1, 2010, the coverage of pre-school education in Kazakhstan had increased by 16.8% in comparison with the same period in 2005. Yet, the number of children attending preschool is still only 40% while this figure reaches 90-100% in the developed countries. Due to the increasing birth rate, annual growth for queuing in pre-school institutions is 5.7% in the country. This percentage is higher in five geographical areas of Kazakhstan due to the birth rate and migration, when it reaches.
On the average, 100 seats are provided for 111 children, while this figure is higher in urban area reaching 120 children. In urban area, every third child attends kindergarten while in rural area only 5 out of 100 children have this opportunity.
Inclusive education has not been developed properly. Out of 149,246 children with special needs, 29,212 people or 19.5% belong to the pre-school age children. There are 37 specialized kindergartens and 240 special groups for children with special needs that are attended by around 10,000 children, accounting for only 32.8% of total number.
In addition to the public pre-school institutions, private kindergartens have been opened. In 2005, there were 158 private kindergartens, but in 2010, the number increased to 284. During last years, the share of public funds allotted for pre-school education was around 0.1% of GDP. In the OECD countries (Organization for Economic Cooperation and Development), this share ranges from 1% to 2% of GDP.
Secondary education: the Constitution of Kazakhstan guarantees the right for free secondary education. Secondary education encounters problems related to poor logistical supply. Curriculum and teaching methods are also a concern.

As of July 1, 2010, there were 7,576 public secondary schools in Kazakhstan attended by around 2.5 million students. Local executive bodies as well as the Kazakh Ministry of Education and Science administer these secondary schools. Out of total number of schools, 64.6% are located in typical buildings, 35.4% of them are based in re-adjusted buildings and 201 schools are in emergency condition requiring urgent repair and rehabilitation. Moreover, 37.4% of schools have no direct access to drinking water; water is delivered in bottled tanks. Seventy schools practice three time shifts while one school delivers four-time shift. Overall, 25.1% of schools need a comprehensive repair.

Every fifth school does not have a cafeteria or buffet. Depreciation of equipment and furniture in school cafeterias reaches 80%. Moreover, 26.4% of schools do not have gymnasiums. Many schools do not have free public transportation service to be rendered by special school buses, which are to be funded by the government.

All the reasons mentioned above have delayed the introduction of a 12-year secondary education model in the country.

The number of children with special needs grows in the country. In 2005, there were around 124,000 children with special needs, but in 2010, this number increased, exceeding 149,000. Special education programs cover only 41.4% of them. There are no well-developed legislatorial regulations as well as financial stimulus to support teachers working with children with special needs. Moreover, public recognition for their service is also absent.

Every fifth instructor working in the secondary schools is aged 50 years and older. Out of total number of teachers, 13% of them have less than 3 years of working experience. Annual recruitment of new teachers composes only 2.6%.

There is a gender disproportion among instructors working at secondary schools with a vivid trend of feminization: 81.3% of teachers are women. Low wages (approximately 60% from the national average salary rate) and low prestige of teacher’s occupation have led to the drain of highly qualified instructors of secondary schools. Despite the rise in salary amount, a process practiced in the country since 2000, when the salary of education sector workforce has increased by 400%, their wages still remain one of the lowest in the country.

Vocational schools: The government statistics state that as of July 1, 2010, there were 786 vocational schools, including 306 vocational schools and 480 technical colleges. Compared to the same period of 2005, the number of vocational schools had risen by 64 pieces with 22.8% of them being located in rural area. At the same time, the lack of clear professional standards as well as qualification requirements developed for occupations trained in vocational schools has influenced on poor curriculum as well as inadequate training of students. As result, they hardly meet the demands of employers.

Universities: The enormous number of universities opened in 1990s has resulted in Kazakhstan outpacing England, Japan, Germany and Russia in terms of number of universities per person. In 2002, there were 11 universities per 1 million people in the country.

Today, there are 148 higher educational institutions, including 9 national, 2 international, 32 public, 12 non-civic and 93 private universities. Of this number, sixteen universities are registered as joint stock companies. Over 595,000 students study in these universities.
Corruption is one of the latent elements penetrated into higher education system of Kazakhstan. The higher education policy will not be effective unless concrete actions are taken to eradicate corruption.

Another concern is related to accreditation and licensing of universities. Some scandals accompanied these two processes. Three years ago, only 25% of all universities passed the first round of accreditation. The reason was trivial when the majority of universities were unable to meet the declared international standards. However, the disputing points were related to simple criteria such as percentage of teachers having doctoral degrees, percentage of teachers working full-time and sufficiency of classrooms as well as books in libraries.

It is known that annual tuition fee in some of the most prestigious national universities is around USD3,000-4,000. Within the context of Kazakhstan, opportunities of universities to earn money are significantly limited. Therefore, the financial support of university employees remains, first of all, as a government responsibility. As the Kazakh universities lack additional sources of income, the salary of university instructors is not high. This is another barrier for universities to attract young instructors.

Thus, reform of higher education system in Kazakhstan has been undertaken in familiar directions. It means that single educational domain is preserved thanks to both the old Soviet educational traditions and new “reformation” vector oriented towards international standards. At the same time, reforms of higher education in Kazakhstan are implemented more aggressively than in other Central Asian countries. They are grounded on the state goals of rationalization of the educational sector, and first of all, in terms of expenditures.

In Kazakhstan, the core elements in re-organization of higher education are reduction government expenditures for maintaining universities introduction of self-financing mechanisms in universities, and provision indirect financial assistance to the most gifted students.

Kazakhstan has recently started developing its own commercial system in providing education loans. The Financial Center was transferred into a joint-stock company where 100% of company's equities are owned by the government. It is planned that the Center will act as the guarantor of students when they receive loans from private banks.

Another type of financial assistance for young people in Kazakhstan is the Bolashak Fellowship Program. The fellowships are provided for the most talented students to study in selected universities worldwide. About 6,500 applications are submitted annually to receive the Bolashak fellowship. It can be assumed that one of the foremost objectives of the Bolashak Program is upbringing of future political and business elite of Kazakhstan, who are loyal to the strategy and principles of the present power holders.

KYRGYZSTAN

In Kyrgyzstan, the education sector was subject to drastic changes during the last two decades. New concepts, doctrines, government strategies and programs, regulations and other documents have been elaborated and adopted by the Ministry of Education and Science of the Kyrgyz Republic. The senior administrators of this body changed quite frequently. Within the period of 1991-2010, thirteen different Ministers have headed this government body. (For more details, please see Table #1 in Annex).

During 1991-2000, a period known in Kyrgyzstan as the early stage of transition to democracy, many critical documents were adopted in the country. They are the Constitutional norms related to education, a Law on Education, a National Doctrine and a
State Concept on Development of Higher Education and "Bilim" National Educational Program. Moreover, the state educational standards and licensing norms, regulations and requirements have been developed. Since 1991, the number of higher education institutions had increased from 12 to 54, including 22 private universities.

In his doctoral thesis entitled, Higher Professional Education in the Kyrgyz Republic is an Important Factor in Tackling Social Problems of Transitional Society; Abrahmanov has clustered education policy adopted in the post-Soviet Kyrgyzstan into two stages:

- Positive period known to be from 1991 to 1999;
- Stagnation period from 2000-2005 because “education system as a part of society facing crisis was subject to crisis that resulted in significant slowing down the reform speed». (Abdyrakhmanov, 2010:2)

The Law on Education adopted in 1992 and amended later in 1997 is the first document that laid the foundation for educational policy in sovereign Kyrgyzstan. The state "Bilim" (Knowledge) program was adopted in 1996. It specifies measures to improve legal norms, revise curriculum, ensure high-quality growth and social protection of students as well as teachers, and introduce stable financing mechanisms for educational institutions.

Since 1999, the Kyrgyz government has been paying close attention to the accessibility of school education. In this regard, the Zhetkinchek – "Access to Education" State Program, was approved. As a whole, the list of programs implemented in Kyrgyzstan include "XXI Century Cadre" Presidential Program adopted in 1995 "Araket" National Program on Poverty Alleviation (1998), "Women/Ayalzat" National Program (1997), the "New Generation" National Program (2001), «Education for All” National Plan of Actions (2002), the National Strategy of Poverty Reduction (2003), the "Rural School/Aiy Mektebi» National Program (2003), and others. First, these programs were aimed at securing access to and quality of education.

The above-mentioned state programs had positive results, but unfortunately, they were not implemented to the logical end. For example, programs such as "Bilim/Knowledge", "Araket/Effort" and "Zhetkinchek" were terminated because of the government change in Kyrgyzstan in 2005, when the so-called March Revolution took place. Since 2000, we begin to notice the development of long-term 2010-2025 and mid-term 2000-2010 policies. In May 2000, twenty-year long State Education Doctrine was approved that was considered an important step in enhancing cooperation between government and society in developing educational system.

Another strategic program, Comprehensive Development Bases, specifies on short- and mid-term objectives in democratization of school education in Kyrgyzstan. The key objectives of this program are provision of free education to children from poor families, orphans and people with special needs, however, the educational goals of this program was never finalized. The priorities for education system’s 2000-2005 midterm and 2000-2010 long-term development periods were highlighted in the Education Development Concept 2010. (Government resolution on education, 2002:37-55) To address problems of rural school education, a complex program entitled, "Rural School" was elaborated (Concept of Education development: 2002) in 2002. This program highlights the scope of measures concerning organizational and pedagogical development of rural school education, curriculum and education administration in rural area.
The same year, “Education for All” National Plan of Action was articulated and approved. It contained wide-range of actions aimed at improving the quality of basic education for all. These actions are formulated to comply with six goals of the Dakar Framework of Action - Education for All adopted at the World Education Forum. The mid-term evaluation of the ten-year period assessed the government and private educational programs, their activities and services, curricular and extra-curricular activities directed to meet basic demands in educating children, youth and adults.

To guarantee equal access to higher education and to eradicate corruption, the national testing was launched in 2002 with the financial support of the United States Agency for International Development (USAID) while the American Councils for International Education (ACCELS) provided the technical expertise. It is indispensable to remark that the national testing has positive results in general. Statistics says that in 2005 alone, 5,705 students were enrolled to public universities based on the national testing results, when “62% of fellowships were provided to students coming from rural schools. Totally, 32,809 schoolchildren participated in the national testing». (Kutbilim, 2003:5)

The changes in educational sector largely demanded legislative amendments. The Law on Education became "too tight" for all changes undergoing in education sector. (Dobayev, 2003:5) Therefore, it was decided to prepare a new version of the Law on Education, which came into force on April 29, 2003. Among legislative acts articulated by the Ministry of Education and Science within the last three years, the following strategic documents should be highlighted:

In 2008, the Education Development Strategy was amended for a period of 2009-2011 and it became a component of the National Development Strategy. (Progress report, 2011:1)

In 2010, a draft Concept for Education Development for a period of 2012-2020 was designed along with a draft Education Development Strategy for the same period to ensure continuity of reforms reflected in the Education Development Strategy for years of 2009-2011. (Progress report, 2011:3)

Implementation of current education reforms is now based on the Mid-Term Budget Forecast for Education Sector as well as key economic and financial indicators designed for 2010-2012. There was a rise in financial resources invested in education sector during last years. For example, the government expenditures for education in 2008 amounted to 9, 6 billion Kyrgyz Som, 11, 5 billion Kyrgyz Som in 2009 and 12, 5 billion Kyrgyz Som in 2010. Consequently, such a distribution mechanism, on the one hand, deprives the Ministry of Education and Science of the economic management instruments. On the other hand, as demonstrated by regular assessments of village councils accounting capacity conducted by the Education Workers’ Trade Union, transfer of schools under the financial management of municipal authorities had a negative impact on how labor legislation is implemented and particularly, how salaries, social subsidies and bonuses are calculated both to schoolteachers and pre-school institutions staff. J The Education Unit of the Trade Union constantly informs such discrepancies to governors, heads of provincial and district financial departments with view to maintain order in this domain. (Progress report of Labor Union, 2005:3)

In fact, in 2010, the Ministry of Education and Science distributed only 9% of funds allotted for education, which is 1, 1 billion Kyrgyz Soms out of 12, 4 billion Kyrgyz Soms meant for
educational institutions. To undertake reforms in education sector, international donors such as DANIDA, USAID, Soros Foundation-Kyrgyzstan, EC, Asian Development Bank, UNDP and UNICEF “provided consultancy and technical expertise in terms of loans and grants for a total amount of USD27,260,000”. (Regional study, 1998:3) UNESCO’s financial assistance to Kyrgyzstan ranges from USD 247,000 to USD730, 000.

The largest donor among non-governmental organizations is the Aga Khan Foundation. This foundation “financed the Initiatives of Early Childhood Development and allocated USD2 million within 2005-2012 to increase coverage and quality of kindergartens in some mountain areas of Osh province”. (UNICEF, 2008) This evaluation was carried out in 1998 within "Regional Study of Educational Trends, Challenges and Policy" that outlined positive impact of donors’ activities on education development system in Kyrgyzstan.

At the initial education reform stage, the Kyrgyz government pursued policy related to financing priority areas. Consequently, compared with 2001, the government expenditures for education sector by 2009 had increased four times, having outpaced overall trends of national economic development and government expenditures rate.

Currently, overall government expenditures for education exceed 11, 5 billion Kyrgyz Som or represents nearly a quarter of all public expenses. Out of this amount, 7, 5 billion Kyrgyz Som or 67% are spent for school education. "Over 62% of funds assigned for schools come from the republican budget. It covers salaries of school employees, food supply of 1-4 grades schoolchildren, school renovations, textbooks supply and a larger part of public utilities.

The vivid indicator demonstrating the decline of education quality in Kyrgyzstan was the results of the Program for International Student Assessment (PISA) in 2006. According to this study, local schoolchildren received the lowest scores and Kyrgyzstan was ranked the last among 57 countries.

Despite all efforts made by Kyrgyzstan, the PISA results in 2009 were again negative. Having analyzed the average indicators for each country, results of Kyrgyzstan were again the lowest under all three subjects among 65 countries involved in the study. “Totally, 4,986 fifteen year-old schoolchildren from 173 schools took part in this study. The assessment findings show that about 83, 2% of schoolchildren in Kyrgyzstan did not reach the minimal international standards in reading, 86, 6% in mathematics and 82% in science”. (Slovo Kyrgyzstana, 2010:27) Pursuant to the PISA regulations, in addition to the assessment of students’ skills, the OECD determines major factors influencing students’ learning abilities and results. It has been found out that these critical factors are as follows:

- GDP per capita of Kyrgyzstan. It is the lowest among all 65 countries involved in this study. In Kyrgyzstan, the GDP per capita is equivalent to USD 1,994 per year while it is USD 5,340 in China ranked the 1st in this study;
- Government expenditures per capita rate in absolute terms for students aged from 6 to 15 years. In Kyrgyzstan, these expenditures are the lowest among all participated countries and amount to around USD3,000 while in Russia it is equal to USD17,500;
- Salary amounts of schoolteachers. It is the core element. Those countries that invest much in teachers’ salaries have the highest results on education quality. (Sadykov, 2010)

One of the serious challenges in school education in Kyrgyzstan is the lack of capacity to assess students’ learning skills. School certificates do not reflect the real skills and risk to become simply a formal document confirming the graduation from school. In order to
tackle this problem, ensure "equal access" to higher education and particularly, to make
government fellowships accessible to youth coming from rural and mountainous areas, the
Education Minister has signed a decree to set up the National Testing Center. This center
introduced the testing technique in order to assess skills and knowledge of graduates of
secondary schools. As another achievement, we can indicate the National Curriculum
Framework that was developed and later approved by the Board of Education Ministry on
This document has become the foundation background for development of curriculum for
different subjects.

Higher education of Kyrgyzstan is represented by network of 52 universities of which 36
are state and 16 are private. Currently, over 218,000 students are enrolled in Kyrgyzstan's
universities. In 1990, there were 130 students per 10,000 people in the country, but now
this figure stands for 410 students. (Kutbilim, 2006) Thanks to open and adaptive higher
education system, the number of foreign students has sharply increased in the country
while many students from Kyrgyzstan study in overseas universities, including countries of
the CIS and Shanghai Cooperation Organization. (Www.24.Kg/News-Stall/Print:Page)

There are international universities in the country such as American University of Central
Asia, Kyrgyz-Russian Slavonic University, and Kyrgyz-Turkish "Manas" University, Kyrgyz–
Russian Academy of Education, Kyrgyz–Uzbek University and others. The list of foreign
universities include the Kuwaiti University named after Mahmud Kashgari-Baraksani and
International “Ataturk-Alatoo” University”.

In 1991, universities in Kyrgyzstan as well as education of students (their tuition and living
expenses) were fully funded by the government. However, in 2005, the percentage of
students whose education was covered by public budget fell to 12.1% of total number of
students. The average annual expenses per one student receiving government fellowship
amounted to 5,400 Kyrgyz Som, but the actual annual costs incurred by universities for
training of a student were two-three times higher.

The government financing of higher education was declining year by year, and became
dramatically insufficient. According to estimates of some universities, the government
funding covers only 15-20% of universities’ expenses required to train a specialist.
Therefore, the remaining expenses are compensated by students’ tuition fees. This means
that they co-finance training of students receiving government support. (Kutbilim, 2006)

Based on the analysis of reforms undertaken in educational sector of Kyrgyzstan, the
following conclusions can be made:
First, the government educational policy of sovereign Kyrgyzstan mostly focused on
addressing strategically important questions of education sector and respectively, on
improving socio-economic well-being of the country. The lack of continuity as well as
insufficient financing of state programs, have negatively affected effectiveness of
educational reforms, many of which were never finalized.

Secondly, to enhance effectiveness of educations reforms, it is necessary to:
- conduct monitoring and assessment of effectiveness of newly accepted programs,
doctrines and concepts;
- grant more autonomy and authorities to the heads of educational institutions in
distributing internal funds. Meanwhile, schools have to involve parents and boards of
trustees to planning processes;
o develop education system management capacity;
o the state needs to develop a precise mechanism of providing schools with highly qualified human resources. The state needs to increase the prestige of a teacher’s profession;
o actively attract investments into education sector. (Zharkynbaeva, 2008:174)

Thirdly, one of factors impeding the development of education system in Kyrgyzstan is the lack of economic control levers available to the Ministry of Education and Science. As it has already been mentioned, budget funds allocated for education are not distributed by the Ministry of Education and Science, but by the Finance Ministry that sends money directly to the village authorities and only then schools receive funds.

TAJIKISTAN

Tajikistan After gaining independence, Tajikistan pursued a policy to reform its economy and social sector, including education. During the period of independence, Tajikistan adopted the Law on Education on December 27, 1993 and its amendment on May 17, 2004, the Law on Primary Education and Law on Higher Professional and Post-Graduate Education, the National Education Concept, over 150 legislative and normative acts as well as regulations stipulating activity of educational institutions.

To introduce modern technologies and techniques into education process, State Programs on Computerization of Primary and Secondary General Education and Enhancement of Teaching and Learning Russian and English Languages for a period of 2004-2014 have been adopted. Introduction of the Law on Education on December 27, 1993 was an outstanding step in the process of creating a democratic legal secular state in Tajikistan. Since adoption of this law, the education system of Tajikistan underwent significant changes. (Law on Higher and Postgraduate Education, 2003)

At the initial stage of reforms, the school and higher education system remained by enlarge the same as it was during the Soviet period. The only change, which was introduced as an experiment in higher education institutions, was the creation of a multi-level structure to receive higher education. As the norms stipulated in the Law on Education passed in 1993 were executed, the country was able to ensure openness of education system as well as enabling the environment for growth of quantitative and qualitative indicators of educational institutions. This had also contributed to the reformation of education based on the world trends in the sector. The Law on Education established the structure of educational institutions ensuring a uniform system of continuous education through general education, vocational and special education, higher education and professional development.

The general nine-year education is obligatory. According to the Concept of National School Development accepted in 1995, transition to compulsory eleven-year education does not fully consider the national features such as the early marriages allowed in Tajikistan and other factors. This hinders the fulfillment of provisions specified in the Law on Education providing for exclusion of students, who reach 15 years, from education institutions. Many young men and women, who got married at the age of 17, can encounter difficulties in continuing professional education. According to the law, the minimum age and education duration at each cycle in a three-level of comprehensive school are defined by Statute on Comprehensive School and State Educational Standards on General Education. (Abrorov, 2013)
The structure of educational institutions set up by the law includes pre-school, general, specialized, extra-curricular and professional (primary, secondary, higher and internship) education institutions as well as bodies providing additional educational services.

The multi-level structure of higher education in Tajikistan foresees:

- Implementation of continuous education model with consecutive assignment of relevant qualifications such as junior specialist and specialists with Bachelor’s and Master’s degrees. These qualifications are awarded in accordance with the regulations approved by the Tajik government and the State Classifier of Higher Education Occupations;

- Integration of vocational education with higher educational institutions that creates additional opportunities for academic career and leads to education quality enhancement;

- Development of academic mobility seeking to consider specific features of students;

- Possibility of coupling education program in Tajikistan with subsequent training in higher education institutions in CIS and other foreign countries.

Actions taken to improve education system and enhance education quality have stimulated the demand for highly qualified specialists with higher education in Tajikistan and the rise in number of university students by more than 30%. The number of higher education institutions has also increased from 11 to 24. The Law on Education founded the governance principals over education sector where functions of Education Ministry, various ministries and departments having teaching and educational institutions as well as local municipal bodies are stipulated.

Ministries, government bodies and local authorities can create, re-organize and liquidate their departmental educational institutions. These bodies can appoint or dismiss the heads of these institutions, approve their general provisions and ensure observance of state standards by these educational institutions. They can also develop, approve and publish curriculum, programs and textbooks.

Management of educational institutions, which by law are independent legal entities, is carried out based on charters by their heads, who are appointed by the relevant public educational authorities. The heads of non-governmental educational institutions are appointed by their founders.

The state educational standards define basic requirements of education level for graduates of educational institutions, and are divided into national and regional components. The procedures for introduction of standards are defined by government while observance of these standards is carried out by those ministries and departments, which have educational institutions within their structures. To implement the state higher educational standards and in particular, requirements regarding ensuring continuity of higher education programs, the government decided to include a number of vocational institutions – colleges- into higher education institutions. This has allowed having continuity in receiving higher education at various levels, i.e. junior specialist, Bachelor, certified specialist and Master degree specialist. This was done not only to meet requirements of economy, but also to meet individual capacities of students. This also allows having academic freedom at the first level of higher education lasting two years.
Educational process in a college and university is carried out based on uniform curriculum and rating system assessing student’s knowledge. Based on the assessment results, a decision is made to either transfer a student to the next level of higher education or terminate his study. (Atakullaev, 2001) The government also sets up procedures for certification, accreditation and licensing of educational institutions.

Financing of education:
Basic principles of the Law on Education declare free general education and any first level professional education. At the same time, entire educational system of Tajikistan, including higher education, faces a number of chronic problems. The key one is insufficiency of government funds allocated for education. However, there are positive factors such as increase in number of sources of financing due to the attraction of funds from individuals and legal entities, including foreign ones, expansion of paid services, overcoming of demographic factor conditioned by dominance of school aged youth that is 40% of population. Overall, people younger than 30 years compose 70% of population.

The problems mentioned have not enabled Tajikistan to fully meet indicators of development in education sector. Integration of new financing mechanism, allowing educational institutions to attract additional sources of funding using market approaches, leads to renewal of substance and elements of education. Within recent years, curriculums at comprehensive schools have been exposed to change four times. Moreover, without any reason, new subjects and courses have been introduced. As a result, the number of subjects and academic hours have increased, but without the necessary teaching programs, textbooks and qualified teachers. So far, schools with Tajik language of education alone lack 57 types of textbooks. In particular, textbooks for 10th -11th grades are of extreme shortage. Those textbooks, which are printed abroad, have massive grammatical and factual typos.

From 1997 to 2005, 4,450 girls were admitted to higher education institutions from remote mountainous areas due to presidential quotas. However, only 383 of them received higher education diplomas. Studies demonstrate that there are serious shortcomings in selection and choosing programs for candidates receiving presidential quotas. Practices of selecting candidates based on nepotism and regionalism have not been eliminated. Due to unwillingness of students to study, their knowledge is poor. Moreover, 276 students who received presidential funding have been expelled because they missed classes. This figure is valid for a whole program period. More than 50% of students interviewed are not satisfied with how classes are delivered, and 60% of them are unhappy with their knowledge, abilities and skills.

Another very important reason of poor knowledge of schoolchildren and students is that selection, appointment and dismissal of heads of education departments, education units as well as principals of secondary schools are decided by local authorities. This is executed in accordance with the Law on Self-Governance. As a result, senior positions at regional, urban and regional departments of education and directors of schools are occupied by incompetent people, who do not have the required pedagogical education. Moreover, in a number of cases, directors of schools and their deputies have only general secondary education.

Overall, the main features of education sector in Tajikistan are as follows:

- Status of education as well as level of knowledge of schoolchildren at secondary schools do not meet the state educational standards;
- Education system needs radical reformation; the major factors and reasons of poor status of education are the shortage of teachers, student seats, textbooks and training aids, inactive research and methodical activity, lack of communication between public, parents, parents’ committees and association of teachers;
- Effectiveness of reform in education system largely depends on increase of government funds to be allotted for development of comprehensive schools and allocation of financial resources by regional and local authorities (Hukumat).

Since the independence, education functions have been considerably expanded and changed in Tajikistan. These functions are to ensure social stability and national unity, such as inclusion of cultural heritage, i.e. culture of ancestors, preservation and augmentation of moral, physical and psychological health of younger generation. Moreover, breeding creativity, active citizenship and responsible attitude towards citizens are also the key values to be promoted. In order to accomplish these state objectives, education sector and in particular, the general education needs to revise its values in the new system of education as well as upbringing and new understanding of functions and substance of education. Moreover, it is needed to explore, develop and exploit the advanced, progressive and effective pedagogical techniques and to have flexible democratic organizational forms of education, humanist values, democratic interaction, mutual understanding and creativity of faculty members and students in the training process.

TURKMENISTAN

During the last years, the education system in Turkmenistan underwent considerable changes that led to mixed results. The Law on Education adopted in 1993 stipulated that a nine year school education is obligatory in the country and is provided free of charge in public educational institutions (law on Education, 2009). Compulsory general secondary education has two steps: (i) Sovat (1st-3rd grades for schools teaching in Turkmen language and 1st-4th grades for schools teaching in Russian, Uzbek or Kazakh languages) and (ii) Bilim (4th-9th grades for school teaching in Turkmen language and 5th-10th grades for schools teaching in Russian, Uzbek or Kazakh languages).

Primary and secondary education underwent drastic changes during 2007-2012. Particularly in 2007, primary compulsory education was expanded from nine to ten years and since 2013, a twelve-year education became compulsory secondary education. Such actions were taken in order to harmonize education system of Turkmenistan with international standards and enable Turkmen students apply to foreign educational institutions. Yet, the problem is that changes in education sector were carried out quite rapidly in Turkmenistan. Nine-year and twelve year curriculums were changed without simultaneous development of corresponding textbooks or teaching methods. As a result, national school programs at senior grades often simply repeat and generalize materials of junior programs. Construction of new schools is the most visible result of reforms in education of Turkmenistan. In 2012, opening of 114 new schools both in cities and remote rural areas was declared. Nevertheless, the cost of construction and reconstruction is often overestimated. (Amendment to the Law on Education, 2007)

Equipment is often distributed selectively to schools. Many still lack equipment while the majority of them does not receive any equipment at all. Nevertheless, many teachers and school heads are afraid to damage equipment and therefore, they do not allow to use it during classes, or they expose it only during inspections or official visits. Furthermore, school instructors do not have a proper training in IT as a whole and especially, in software
and hardware use. Internet access is not available in all provinces most importantly, constant electricity shortage makes use of information technologies challenging. Even in the cities, Internet access is at low speed and censored by the government, which authorizes only certain websites. Thus, the idea of IT use in schools remains generally on paper and is far from improving the education system.

Chronic problem of Turkmen education system is lack of school textbooks. Nevertheless, some improvements are noted since 2007. New textbooks are published every year and shortage is partially covered. Teachers often complain about the quality of substance and unequal distribution of textbooks. New textbooks are often written by inexperienced authors or teachers without appropriate practical experience. Moreover, insufficient time (only 3-4 months) is given to develop new textbooks. As a result, many teachers are not in a position to use new textbooks in their classes and they still use the old Soviet textbooks published in 1990-1992. Education is often interrupted by such seasonal events as cotton picking. Although children from elementary schools are not obliged to work on the fields, teachers are not exempted from these works.

By the beginning of 2013 academic year, the standard school curriculum was developed and approved in order to correspond to the Concept of Secondary Schools Transition to the Twelve-Year System. Unfortunately, the expected de-ideologization of education has not happened. Studying "Rukhnama" regarded as "The Sacred Book of the First President" is still included into the list of obligatory topics for exams at secondary schools and universities. It is also an obligatory subject to pass in order to legalize foreign diplomas in the country. Nevertheless, since 2011 "Rukhnama" is no more a subject included into final examinations at secondary schools. Instead of this phenomenon, the cult of the second president Berdimuhamedov is being introduced now.

Although the president declared learning of foreign languages as one of the key priorities, in reality the situation has worsened within the last two years. The number of classes where education is provided in Russian language has remained the same, i.e. it has not increased. There were approximately 30 Russian classes in 2011 where only 750-1,000 out of 100,000 first graders could study. These classes are largely meant for ethnic minorities, but due to the great demand from parents, some Turkmen children also study in Russian classes., the re-institution of Russian schools seems extremely problematic in the future due to the shortage of teachers and immigration of Russian-speaking population as a whole.

At the outset of reforms, classes in English language increased in number because of decline of classes in Russian language. The number of classes in English language has increased and English has become an obligatory subject for all twelve classes since 2013. Programs of primary and secondary education in ethnic minority languages are largely absent.

The only foreign schools existing among elementary and secondary schools are Turkmen-Turkish schools, the Turkmen-Russian school in Ashkhabad and the International School of Ashkhabad where teaching is rendered both in English and Russian languages. There is also a small Sunday school sponsored by the Ukrainian Embassy. However, the Turkmen-Turkish schools started to be banned since 2011 as they were accused of teaching Islam in classes. At last, corruption is viewed as one of the main obstacles in improving primary education. Due to the shortage of vacant places in "prestigious" classes, which are generally Russian classes, bribes have become the norm. Moreover, teachers have to pay a
fine for being exempted from seasonal works on cotton fields, repairing of classes and purchase of materials such as chalk, papers, pens, markers and so on. These expenses are subsequently endured on shoulders of parents. Moreover, the practice of small bribes, in terms of food or livestock such as goats or sheep in order get higher grades is still widespread. The problem is that schoolteachers continue having low salaries. Teachers are often obliged to bribe the principal as well to keep their jobs. In return, school principals offer bribes to senior administrators in order to keep their position.

Higher education: Until 2007, Turkmenistan’s higher education was one-level. All higher education institutions have only five-year fulltime program where students are enrolled from secondary schools. Special secondary schools are the first tier of professional education. After declaration of independence, the number of higher educational institutions within had increased from 9 to 15.

Education in all universities is mainly conducted based on programs developed in the Soviet Union only with some additions reflecting the national features. During 1995-1996 academic year, there were about 32,000 university students, which is 1.3 times less than it was in 1990-1991 academic year. It is explained by the closure of evening and part-time programs where around a third of all university students studied.

Since 2007, universities were subject to large reforms. Extension of university programs to five year program (six year education is only applicable for medical schools) and exclusion of compulsory military service for young men as well as requirement to have work experience before the enrolment into university were the first and logical steps taken by the new president.

In 2012-2013, some preliminary talks, concerning opening of Turkmen-American University in Ashkhabad took place. If this project is successfully implemented, there will be opportunities to attract faculty members from abroad and in particular, from European, Turkish or Russian universities for the highly needed occupations such as lawyers, engineers, education specialists, IT officers and others. Opening of private universities planned for 2013-2014 could stimulate competition and attract highly qualified teachers both from Turkmenistan and abroad. This will give a chance for the young generation to gain high quality education.

Although university programs were expanded to comply with the international standards, it became clear that dismissal of former faculty members and researchers from universities during the last two decades has created a shortage of highly qualified staff. It will be difficult to fill this gap.

In 2011, the official statistics registered about 2,000 students who left the country to study abroad under the government’s financial support. In 2011, President Berdimuhamedov also permitted recognition of foreign diplomas, but it suspended in 2004. Nevertheless, students still need to verify their foreign diplomas in Turkmenistan, passing the exam on "Rukhnama", among others. Pursuant to inter-governmental agreement of 2009, graduates of Russian universities are exempted from this requirement.

However, there were problems in this area that damaged an overall positive picture. In 2009, students planning to study at American University in Central Asia in Bishkek, Kyrgyzstan and other universities abroad were banned to depart the country and some measures were initiated against those who study in "politically incorrect places".
Kyrgyzstan was included into a black list for Turkmen students and in 2011, the government of Turkmenistan introduced departure visas for this country. Authorities explained it by availability of universities in Turkmenistan and lack of demand for some programs in the country. Yet, students demonstrated their reasonable discontent while foreign embassies negatively assessed such steps. As of today, the situation remains unresolved and it is “forbidden” for many students to leave the country.

Foreign universities very often reflect a real level of secondary education of Turkmenistan in order to be enrolled in such universities; candidates need to take preparatory courses either at universities or secondary schools and/or to seriously prepare for exams by doing large-scale independent work or hiring tutors.

Meanwhile, situation with universities in Turkmenistan has worsened. After several incidents with students and criticism expressed by the president during 2009-2012, control at universities has become tougher. Due to the widespread fear of the rectors to lose their job, students were officially prohibited to drive cars or come to university by taxi. They were also forbidden to visit clubs, bars, and restaurants after some incidents where students were involved. On contrary, students are compelled to visit sporting events, holidays, conferences and other activities.

Corruption is one of the main problems in higher education. Although in 2012 President Berdymuhamedov ordered to install video surveillance equipment during entrance exams, such a measure has not helped to reduce bribes given to rectors and teachers by students. On the contrary, according to informal data, the amount of bribes paid in order to successfully pass exams to prestigious universities such as Medical Institute or Law Program of Turkmen State University had reached $40,000 and even $70,000 last year. Besides these expenses, students also need to incur official and unofficial expenses for obligatory medical certificates, translation of documents and notary services if they wish to enter a foreign university.

At present time, the main financial source of education system is the state budget. Additional sources are funds from public foundations, cooperatives, private enterprises and individuals, who pay for some types of educational services. According to the Turkmen legislation, the state, private and mixed educational institutions can exist. In late 1990-s, eleven joint Turkmen-Turkish schools and one Turkmen-Turkish university were opened.

Since 1993, the fiscal policy has been foreseeing decentralization of financing of social and cultural spheres, including education. Educational institutions began to be financed by local authorities. As a result, the share of expenditures for education in local budgets increased from 74% in 1991 to 83% in 1995. Financing of education through local budgets had to provide a more rational use of funds and meet local needs more precisely. However, although decentralization of financing did democratize the process, it also led to irrational use of government funds due to low qualification of local authorities. Annual amount of expenditures for education sector is defined by the Ministry of Economics and Finance, which considers proposals of the Education Ministry, State Association of Professional Education, Senate and other ministries and departments being in charge of educational institutions. After that, public budget is approved by the parliament.
After election of Gurbanguly Berdymuhamedov as the second president in February 2007, education has nominally become one of the priority sectors. New reforms were initiated to eliminate consequences of regressive policy of the first president Niyazov. During the last several years, the education system in Turkmenistan underwent considerable changes that led to ambiguous results. Expansion of coverage of schools and universities and rise in number of university students studying both in the country and abroad signifies a serious shift from policy of the first president. The statistics depicts that the number of university students accounts for about 24,000 people and around 10,000-15,000 people study abroad. This figure is getting similar to those indicators that were known in late 1980s when 40,000 students studied in universities of the Turkmen Soviet Socialist Republic.

Moreover, the main eccentric measures of former regime have been dismantled, including non-acceptance of foreign diplomas and the requirement to have work experience for enrollment into university. Many regard the latter requirement as the forced labor.

Some of the existing serious problems are highlighted below:

1) Corruption. As a whole, high level of corruption is inherent in all segments of education and it increases the cost of education. Moreover, promotion of a cult of president’s personality signifies that people, who are loyal to the president, are often appointed to senior positions instead of more or less independently thinking people.

2) Lack of human capital. Teachers with poor education and ideological stereotypes are not able to fill the gap originated after dismissal of former teachers. Faculty members and school principals always fear about their possible dismissal if they refuse execute instructions "from above". Poor prospects about possible enhancement of teacher’s capacity also harm the improvement of primary education. Moreover, the system of knowledge transfer from more experienced colleagues to less skilled cadre, which was accepted in the Soviet times, has stopped or is used selectively.

3) More equipment, but less substance. Although President Berdymuhamedov likes to speak about achievements in education, he prefers showcase and superficial reforms than having sincere attempts to make things better.

4) Growing distrust to foreign influence and in particular, to western one, high level of nepotism as well as bureaucratic and administrative barriers to students departing to study in "wrong overseas universities" are serious obstacles for reforms.

Despite the aforesaid, it would be a mistake to consider that all recent attempts of reforming have been unsuccessful. In fact, despite considerable obstacles many efforts have been made to somehow improve the situation in education sector in the country.

**UZBEKISTAN**

A state education policy and the Education Reform Concept in Uzbekistan have been reflected in the Law on Education as well as in the National Human Resources Development Program on August 29, 1997 by Oliy Mazhlis, the Uzbek parliament. The National Human Resources Development Program envisages replacement of the Soviet eleventh year secondary education by a nine year training at a secondary school plus three years in a college. After his re-election as the president in 2000. Only 20 cities and districts have shifted to a new education system covering only 40% of children. The Education Reform Concept developed in Uzbekistan pursues the following major purposes: (i) re-orientation of education system to market economy and open society; (ii) creation of equal
opportunities for education as a way to improve the living standards of population; (iii) betterment of financing mechanisms of education in order to ensure stable and high-quality educational services and to improve efficiency of resources use and (iv) advance management in education sector. (Law on Education, 1997) Nowadays, the education system of Uzbekistan consists of 10,790 different types of educational institutions where more than 7,3 million students are educated. Reforms touched upon all education levels.

Pre-school education: At the beginning of 2005, pre-school education system was represented by 6,603 various types of pre-school educational institutions, which covered 575,100 or 18, 4%, of children aged from 1 to 6 years. To guarantee continuity of pre-school and primary education, 193 kindergarten-school complexes and 73 home kindergartens with a capacity of 1,249 children were created. Pre-school educational institutions employed 62,200 workers and 20% of them have higher education.

General secondary education: Uzbekistan has established a significantly new system of nine-year general secondary education ensuring continuity for pre-school, secondary, vocational and higher education. Up to date, general secondary education is represented by 9,794 daily and 41 evening schools where 6,130,500 and 20,900 students are studying respectively. Out of these schools, there are 92 gymnasiums with 66,600 students and 284 lyceums with 93,700 students. One of the widespread teaching methods introduced in schools is teaching subjects in intensive and in-depth way. In 2004-2005 academic year, 2,853 schools introduced this teaching method with coverage of 473,000 students. The specialized schools covered 18,800 children with special needs. Moreover, secondary schools practiced compensatory education. Last academic year, 60,000 children were trained there. In 2004, secondary education in the form of external education was received by 4,844 schoolchildren.

Vocational education: According to the accepted model of education, specialized secondary professional (vocational) education ensures continuity of secondary education. Over 56% of graduates of the 9th grade continue their education in colleges and lyceums on voluntary base while the remaining students continue their education at secondary schools at 10-11th grades. Vocational education is represented by 65 lyceums with 30,500 students and 827 colleges with 757,600 students. Lyceums employ 2,600 teachers while colleges have 40,000 instructors. Out of total number of these teachers, nearly 93% of them have higher education.

Higher education: There are 63 universities (higher educational institutions) where 263,600 students study. The number of higher educational institutions systematically grows and since 1999, there has been rise in number of university students. Pursuant to the Decree No. 307-F of the Uzbek Cabinet dated July 20, 1996, the paid education system was introduced in the country.

Post-graduate education: Post-graduate education in the country is provided by 60 higher education institutions and 83 research centers. The Law on Education adopted on August 29, 1997 had provided the legal basis for re-structuring education and articulation of midterm measures seeking to ensure radical change in education system. Soviet system until 1997. That is, after 9 years of compulsory education at schools, students continued their preparation for universities at 10th and 11th grades or at vocational schools. Upon completion of 11 years of education, students studied at universities, which had more intensive character and were full of purely professional content. According to the Law on Education amended in 1993, since 1995 education in universities had shifted to a 2-level
system - a Bachelor’s degree (4-5 years of education) and Master’s degree (term of training is 2 years).

At the same time, the outdated methodical base of education system, incapability to have timely and high-quality substance of education, high drain of teaching personnel and low prestige of professional education were the foremost reasons that had led to reforms in education sector. Another central reason was the early marriages when 15-16-year-old young mothers were an additional demographic challenge in the country.

The Law of on Education adopted on August 29, 1997 had provided the legal basis to re-reform education at the national level and determined the midterm actions designed to significantly change the education system in Uzbekistan. After adoption of this law, relevant regulations and norms were developed to clearly define the essence of a new multi-stage education system highlighted in the National Human Resources Development Program. (www.uzbekistan.at/publish/rus) The stage-by-stage transition to a compulsory nine-year education has been taking place in the country since 1997 that coincides with the adoption of the last edition of the Law on Education.

In 1997, there were 9,627 secondary schools out of which 221 were primary schools, 1,896 secondary nine-year schools, 6,996 high schools, 85 specialized schools and boarding schools for children with special needs. The initial plan of authors of the reforms had envisaged training of students in lyceums for 97 occupations. The demand for labor force in a certain occupation has to be regulated by market in Uzbekistan while training of students is based on future prognosis featuring the nation-wide and regional demands in labor force. This is accomplished taking into consideration the structural transition being made in economy.

However, even within the new system, conditions at schools remain poor. Many students refuse to continue education in colleges or lyceums because they regard tuition being very high and unaffordable. The application for educational grants and fellowships remains very bureaucratic while vocational schools do not give the opportunity to receive free education. As students say, "informal" payments are the highest expenses they incur. First of all, it is conditioned by low salaries. Even working full-time, teachers are hardly able to pay their bills for utilities. Therefore, there is no need to speak any more about desire of teachers "to fully devote themselves to the work with students".

Moreover, the newly created colleges have no sufficient number of experienced faculty members. They lack textbooks as well as functional curriculum that could prepare students for enrollment into higher education. Therefore, many parents, who think that the old Soviet system was better, transfer their children to schools still practicing eleven-year education system. There is also shortage of rooms in colleges. The funds allocated for construction of new colleges are insufficient. As a result, some construction sites are often simply frozen.

In higher education, the systematic transition to multi-stage education system was undertaken in 1997-2000 known as a transitional stage and 2001-2005 as large-scale implementation stage. This multi-stage education system envisages the following programs featuring continuous education:
1) Bachelor's degree is a basic higher education that lasts for not less than four years of education. Bachelor's degree is based on general secondary education (12 years of education) or professional education at colleges and lyceums;

2) Training of certified specialists is training on a certain program or occupation for a period of at least one year. This training is based on basic higher education, i.e. Bachelor's degree. This education level has a functional character and is directed at the certain economic sectors. Yet, for some of occupations, it is not obligatory to have this education.

3) Master's degree is higher professional education for concrete occupation with a training period of not less 2 years one the basis of the Bachelor's degree and not less than 1 year if one is a certified specialist. Master's degree is pursued after the State Qualification Exams are taken and Master Thesis is defended.

By the time of adoption of the Law on Education and the National Human Resources Development Program, some elements of multi-stage education system were put into practice. For example, the Bachelor Diplomas were handed over to graduates of Business Administration Program, a program created at the Tashkent State Technical University based on the Agreement between the Ministry of Higher and Secondary Professional Education and "Renong Berhard". Malaysian Corporation Enrollment of students into universities is either commercial or provided by the government fellowships. Allocation of higher education fellowships started in 2001. Education in universities in Uzbekistan is now delivered in Uzbek, Russian, and Karakalpak languages. Certain programs are taught in Kazakh, Tajik and Turkmen languages.

In Uzbekistan, higher education is provided by 61 universities, in present time, 11,226 faculty members work in universities and 47, 1% of them have doctoral degrees. The introduction of a test system for entering into a bachelor degree program has become one of new noteworthy elements in higher education system in Uzbekistan. Administration of tests is carried out by the State Testing Center under the Uzbek Cabinet. The tests consist of of 5 sections: (i) native language and literature; (ii) foreign language; (iii) mathematics; (iv) history and (v) founding principles of statehood and rule of law.

At the second reformation stage, the following processes took place: In 2002-2003 academic year, an International Westminster University in Tashkent was opened, which was founded by Umid Foundation and the London Westminster University. The language of education in the university is English. The Uzbek-American Academy on Faculty Members Retraining was also established in the country. Thanks to foreign grants, projects, bilateral agreements and Ustoz Foundation, capacity of teachers is enhanced in the country. The World Bank, Asian Development Bank, OECE, GTZ, TACIS, USAID and ACCELS render financial and technical assistance for education reforms. Their assistance is provided in the form of investments, projects and grants. In 2002 alone, around USD 5, 8 million of foreign investments were attracted.

The following results are a few examples of reforms in education sector:
- Acquisition of electronic books for libraries.
- pursuing state policy to support gifted children and university youth.
- approval of the state educational standards of higher education as well as the standard curriculum for 131 and 664 for in Bachelor's and Master's degree majors consequently

However, despite all steps taken by the Uzbek government, the number of university students has been reducing within the last years as opposed to the growth of population. The number of students accepted for universities either under government fellowships or on a paid basis is defined within quotas annually established by the Uzbek Cabinet.
According to the current legislation, higher education institutions have no right to independently accept students over the quota established. By 1997, the education system in Uzbekistan was fully financed by the state budget. Education in the majority of schools and universities was provided at the expense of government budget. The paid education services are delivered by 22 lyceums created with assistance of the Education Ministry of Turkey and Silm Company. In paid lyceums, teaching of many subjects at senior grades is rendered in English language.

The large-scale measures undertaken by Uzbekistan within the National Human Resources Development Program foresee relevant public financing. To reform professional vocational education system and to establish colleges, it is planned to spend 90 billion Uzbek Sums from the public budget. Besides, to develop education system, Uzbekistan receives USD150 million loans from the Asian Development Bank as well as USD200 million loan from Japan, which needs to be returned within 40 years.

At the same time, the National Human Resources Development Program provides for the increase in funds from non-government sources by rendering paid educational services to individuals and legal entities. In this regard, restrictions on enrollment of students to universities on paid basis were lifted by the Cabinet’s Decree on Admittance to Higher Educational Institutions of Uzbekistan in 1997-1998 academic years. In 1997-1998 academic years, the enrollment on a paid system had no limitations for any major as the state grant was introduced due to the long-term loans released by banks.

Payments received for education in universities from foreign students under a paid system is regulated by universities themselves under "Regulations on Admission of Foreign Citizens to Universities in Uzbekistan". The Ministry of Higher and Secondary Specialized Education has published a list of 61 universities where admission of foreign citizens can be done on a commercial basis. The Ministry has also articulated the payment procedures for education of foreign citizens depending on the education level. Uzbekistan will not be able to create effective and competitive education system of the European model without cardinal changes of status of faculty members, increase in fellowship amounts, development of private universities, eradication of corruption in the education system, and increase in admission quotas.

CONCLUSION

The break-up of the Soviet Union has led to disintegration of the united titanic Soviet education system. In a historically new context, when post-Soviet Central Asian countries - Kazakhstan, Uzbekistan, Kyrgyzstan, Tajikistan and Turkmenistan - had obtained independence and owing to the new objectives to be achieved in education sector, it was required to develop a national educational policy. The education system in each of the Central Asian countries has its own distinctive characteristics, depending on political and socio-economic developments. However, the common Soviet legacy rather unites than separates the majority of contemporary education systems of these countries.

Changes in requirements for knowledge, skills and competences have predetermined the new tasks such ensuring equality in access to education, adaptation to continuous changes and uncertainties, enhancement in resources us efficiency, attraction of investments, management improvement and betterment of education quality. Therefore, these
objectives drive national, regional and universal changes that focus much on inclusion of these countries into a global educational domain, including the Bologna process. The innovative development of education as a phenomenon of modern culture is directed towards consolidation of competitiveness and improvement of international prestige of educational institutions and consequently, each country as a whole. Expansion of educational services, close and effective interaction between market of educational services and labor market, and academic mobility of faculty members, students and graduates of secondary and higher educational institutions would lead to the rise of the intellectual capacity of a country, ensuring its national security, preservation of its best historical and cultural traditions, including those available in education system.

The reforms in education system commenced in 1990s in post-Soviet Central Asian countries have not been completed yet, but are carried on.

HOME-SCHOOL PARTNERSHIP: SCHOOL AND FAMILY COOPERATION IN THE GLOBALIZATION PROCESS OF SOCIAL AND ECONOMIC RELATIONS

Sodikov Nozimdzhon Mahmadaminovich.
Program Director of the Tajik-American Cultural Association,
Washington DC, USA.

Abstract: Activity of parents and teachers in the interest of child may become successful only in case of collaborative efforts. This will help them to get to know the child, to see him in various environments, furthermore, the alliance of parents and teachers will lead to deep study of child’s individual nature, to formation of valuable benchmarks, and it will help to overcome negative behavior and its appearance in actions. It is highly important for teachers to establish partnership relations with the family of every pupil, and to create atmosphere of mutual assistance and harmony of interests. Moral values and guidelines for building sound life are initially instilled by the family. This article covers these issues in the context of the process of globalization.

Key Words: Moral values, e-learning, education technology, spiritual education, human values, social and economic indicators, psychological formation, cultural backgrounds, dialog with parents, mutual plans, educational environment, personality analysis, arena of self-realization.

Introduction. The accelerated development of science and technology has brought extraordinary changes and updates to the life and activity of people. According to the data [1] approximately 3.270.490.584 of world’s population use the Internet (June, 2015). Taking into consideration that world’s population is 7.260.621.118; it becomes obvious that 45% among them are Internet users. This service develops globalization process in rapid pace, and as a result with the assistance of the Internet people have wide possibilities to prune down their activities in all aspects of the life. One of the most significant structures in this sector is education and science.

Modern age dictates new requirements for the education of the younger generation. Today e-learning becomes important education technology. In analyzing features of e-learning can be found following [2]: by means of this technology, in 2011 users spent 35,6 billion $ for education; in 2013 the sum was 56,2 billion $; and in 2015 is predicted double consumption if this sum (Pic.1.). Moreover, the frequency of passing online courses by the students has also increased. According to statistics, 46% of students have taken at least one online course in 2013.
This kind of technology saves time and resources; it became popular because of ecological aspect. On the other hand, it should be mentioned that classic form of education always keeps its actuality. The reason is that moral and spiritual education can be achieved only by real interaction between teacher and student.

Figure 1. Expenses on Education

With the aid of virtual methods knowledge deepens, scientific researches facilitate, but the most effective method is a live communication between people. In kindergarten, primary and secondary schools the forming phase of children cannot take place in the virtual space.

About the necessity of connection between school and family.

The main task of today is the formation of a prototype of the person who knows and respects the human values. By forming a human quality can be realized creating a human value. The most important problem of today which worries the world community is the poverty of moral and spiritual world. For the personality is not enough high qualitative training and forcing knowledge. Today for the personality is important professional skill with a combination of moral and spiritual preparation, his awareness to be responsible for the actions. As the great Kyrgyz writer Chyngyz Aitmatov said: “The most difficult thing for human is being human every day.” Accordingly, the factor of educating of the human in the community stays as a main issue for all pedagogues.

School as a social institution has to adapt to new realities, to seek new ways and forms of interaction with other social partners, such as family. Convergence of school and family increases the effectiveness of educating the growing generation. Undoubtedly, school is one of the active subjects of educating the children. Its effectiveness is unquestionable; its influence on the growing generation in terms of personality of its formation is evident fact. However if the
school affects one more important aspect of pedagogical activity – increase of educational potential of a family, efficiency of joint educational activity of school and a family will repeatedly increase.

Changes in the social and economic life in the community lead us to the great turns in the system of education of Central Asia. The changes are also seen in the institute of the family. The monotony which is established at the Soviet schools is changed by a modern variety of gymnasiums, lyceums and other types of schools. There are levels and profiles of educating and developing activity inside one educational institute expanding the scope of services of additional education. This has increased the interest to the education system, provided the family with the real opportunities to choose the educational institution and a set of educational services.

At the same time, there was a noticeable stratification of society on social and economic indicators. Parents started comprehending specifics of their educational requirements and to form own requirements to education and training of children, according to their material and social possibilities. In certain sections of society, the social and educational level was higher from magisterial. As a result, the school was caught in the center of highly critical attention of parents, mass media and society at large. On the other hand, in the days of independence many families had left their children and went on earnings to other countries. Children in such families were left almost without guardianship and attention.

All this leaded to objective need of revision of roles in the relations of a family and school, for system of their interactions for educational and training process. Now it becomes more and more obvious that solving problems of education and training and socialization of the child can be achieved only in the integration of efforts of a family and school. Reduction of relationship and interactions of a family and school on the level which is adequate to new requirements and opportunities, is an actual task for any educational institution.

Role of parents in training.

An important factor in training pupil is society, a family in society. Medicine proves that an important stage in psychological formation is the age of the child from 3 to 6 years. As this age passes in the family, then in the kindergarten, the main responsibility at this time belongs to parents and tutors. The same conditions appear at elementary and high school. Exactly these two spheres of training have significant importance in the process of interrelation between family and school. The different ways of training in family and school lead to psychological distinction and have a negative impact to results of training process. The research revealed the main factor in discrepancy of pupils with high risk of low success in education is the weak support and attention of the parents. Cruel treatment of parents, irreconcilability are big risk of factors in educational achievement.
The environmental influence increases in the process of passing of children from kindergarten to elementary school, from elementary school to secondary, from secondary to senior while family’s influence weakens. However, a child spends much time in a family and by that, the influence of a family on a child is not lost. Therefore, the influence of parents on a child is strong. Here in the beginning it is possible to speak about a genetic factor. From the birth till 6 years parents solve all needs of children, and they are their first teachers. The period defining future character of the child is considered the period of a child development until 6 years. The status occupied by the child in a family, respect from parents and personal qualities of the child defines his future status and public position. The famous psychologist Bovlbi John who investigated the influence of absence of mother in a family proved that the children who grew up without mother may have physical and moral devolution, and its private life can appear in a certain threat. Such adverse attitudes towards the child in a family as a carelessness of parents, cruelty, lack of warm relationship or an excessive pampering of the child are the reason of disinterest of the child in study, his fear and nervousness. On the contrary, natives from a good family differ with good progress, with the persuasive speech, ability to make compound sentences and with the level of the question posing.

On the contrary, children from good families differ with good progress, with convincing speech, with skill to make compound sentences and a level of profound questions.

Now, alongside with the problems of child progress, existing in family, there are the questions requiring urgent decisions in kindergarten, in primary and high school. In the modern development society, in one class it is possible to meet children from different nationalities, different religious and cultural backgrounds. To talk about sequence of the program, it is important to reflect not on integration but on their adaptation. It is widely known that at each school, in each class, the finding of common language with children, who have been brought up in different psychological aura, requires significant pedagogical skill.

The areas of joint activity of school and family.

For solving above mentioned problems, it is necessary for close communication between school and family, and teachers with parents. By means of the profound communication of school and family it is possible to create an atmosphere of the real education. Friendship between the teacher and the parents, constructed on the basis of respect and understanding, allows to influence on reception of development and education effectively.

School is the educational establishment, one of which main functions is teaching (to give knowledge of the world, to teach to put them into practice, that the child after leaving school has been socially adapted, i.e. child is able to find the place in life, also to demonstrate capabilities and opportunities). Is school able to carry out this function without parents’ participation? The today’s situation shows, that it cannot. Therefore the family should establish
lasting communication with school and become a valuable part of school community. The family should become the participant of educational process, showing positive vital examples and cultural values and aiding in development of the individual, its socialization.

*In our opinion, the joint activity of family and school can be carried out in the following guidelines:*

1. The formation of harmonic requirements to pupils in family and at school.
2. Acquaintance of parents with the laws of protecting family and child.
3. Creation of the universal educational environment, which should be created by authority of parents and teachers. In such environment, there is no place left for all negative influence of street, mass media.
4. Correction of shortcomings during formation of child personality. Work with children who are in difficult vital conditions with a possibility of psychological support.
5. Increase of pedagogical literacy of the parents providing knowledge of children’s psychological features.

A teacher has to build a continual dialog with the parents. Getting the information about children’s psychological state, health, and behavior from the parents is a precondition for development of upbringing and educational process at school. In the beginning of the dialog with parents, the teacher should give positive information about pupils’ behavior and knowledge level at first, only then he may continue to speak about children’s weak sides. Parents do not like teacher’s direct statement about their children’s mistakes. It is known, that criticism as discrimination or jeers are not optimally taken by parents. In such cases parents’ reaction to the remarks is negative, and they relay responsibility on the teacher. For this reason the criticism must be constructive. In the created situation the teacher should show the ways and methods of solving the problem. The teacher must not look at parents from above and consider himself better. Careful listening and perception of the parents’ questions and requests will help in co-working. Recommendations given to the parents must be realizable. The teacher also should remember that the family status in community and its lifestyle can be different. It is natural that not all the parents equally welcome the teacher’s willingness to the dialog. As a symbol of tolerance and hope, the teacher in this situation, without giving up, considers the ways of close relationship with the family and he should be informed about the family’s home life and views. Mutual plan of the types and methods of work must be made together with the parents, keeping in mind that each child is a unique world, and it is necessary to take into account his needs. In order to resolve these issues in the world practice of tutors assigned to each class or class advisers’ certain methods can be considered.

**The teacher and the parents.** Essential role in upbringing and education, in preparing the pupils for life, in the formation of their active life position belongs to the teacher. The teacher is always a moral example and loyal attitude to own work for students. From this it follows that
the essence of a morally educated person is not only in the learned knowledge, ideas, experience, social behavior, but also in collectively developed personality relationship to reality. The teacher and the class adviser may discuss with pupils’ parents the following questions:

- Assessment of student’s achievement;
- Lessons learned well by the student, reasons;
- The organization of meetings with teachers of core subjects, that are difficult for the student;
- Teaching the student ethical behavior in society;
- Getting to know the student’s close friends and his circle of friends;
- The study of psychological, physical condition of the child, the personality analysis;
- Place of methods to promote and their timely application;
- Comparison of the student’s formation and tracking depending on the period;
- The search for methods of self-training, that are interesting for the student and the implementation of them;
- Mark and control of student’s attendance of the learning process;
- The student’s behavior at home and self-preparation for the classes;
- Motivation of the student, age psychology, health and important event;
- Give the direction to the student, which may contribute to the personal development of extracurricular cultural and intellectual level, etc.

In 2014-2015 academic year A. B. Beyshenaliyev and N. M. Sodikov conducted research on the subject "Educational changes of Central Asia from Independence Up to Now". Survey conducted by authors showed that there are topical issues connected with a subject. For example, since 1991 there are certain changes among pupils of Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan and Uzbekistan. The greatest part of weak schoolchildren was made by children of the migrants who were going abroad (especially to Russia), because of unemployment in Central Asia, or because of a low wage. Second reason: there were problems connected with early involvement of children of migrants to work, cohabitation with grandfathers and grandmothers, or with close relatives, shortcomings of control and mercy from parents, etc. As a result of poll it became clear that 96% of children confirmed a rupture of communication of parents with children. The phenomenon of such character, unfortunately, remains actual in the countries of the second and third world.

Support of education.

One of the important issues of In the lagging countries or countries with new ways of development is the lack of material and moral support of schools and education. Today education
system in the majority of continents doesn't work well enough. It is possible to consider that education needs support from the public. In this issue would be useful to study experience of the levers known as Waqf in the Islamic zone, Fund in the West and to follow an example of these organizations. Considering all above, it would be useful to study ways to support schools and to study experience of collaboration with parents. In many countries meeting of parents and their active participation in seminars is adjusted.

Stating an essence of support of education it is possible to allocate an active role of a family:

1. The family provides physical and emotional development of the person. In infancy and in the early childhood the family plays the defining role which can't be compensated by other public institutes. At children's, younger school and teenage age its influence remains to leaders, but stops being the only thing when influence of school increases.

2. The family plays the leading role and in intellectual development of the child. The American researcher Howard Blum at the end of the XX century made an interesting hypothesis that distinction in coefficient of intellectual development of the children who grew up in safe and dysfunctional families reaches twenty points, influences the relation of children to study, in many respects defining its success. At all stages of socialization the intellectual level of a family, interests of its members affect on intellectual development of the child, formation of its internal culture, aspiration to continuation of education and self-education.

3. The family is of great importance in mastering the person public norms in the course of his social development. It is connected by that approval, support, indifference or condemnation of relatives affect interests of the child, help or prevent it to look for exits in difficult situations, to adapt for the changed circumstances of life, to resist in the changing social conditions.

4. Family dorms the fundamental valuable orientations of the person which are shown in the social and interethnic relations. Style of his life, the sphere and level of claims, vital aspirations, plans and ways of their achievement is defined in the family. Values and the atmosphere of a family define also as far as it becomes the environment of self-development and the arena of self-realization of its members.

Conclusion.

Family and school are the key links in the education system of a rising generation. These social institutions have to deal with crucial tasks related to the moral training of the younger generation involving them in the life society in the terms of globalization, the moral destruction and devastation. This requires bringing a parenting practices that will meet life’s demands.

If in the process of education and upbringing, parents do not forget that they are initial educators and if a teacher, observing a certain subordination, will be able to let the student feel the love and parental care, it can be assumed that better conditions are created for a student.
Family, school and society, as a three prime factors of educative process, must feel their responsibility and take care of fulfilling and obtaining the results. If there are certain created conditions for studying at home, the house turns into a school, if warm relationships are established in a school, teachers become our second parents. Results of education and upbringing are the model of adequate and studious personality. As Kyrgyz government leader Ishak Razakov said: “If you are pure, if I am pure, then the society will be pure”. School-like house and house-like school is necessary for the establishment of bright future.

Abstract

This research aimed to 1) describe the communication structures and systems of selected colleges and universities in Cavite and Laguna; (2) determine the different communication factors affecting educational accreditation of selected HEIs in the research locale in terms of the following: individual communication orientation; team (departmental, interdepartmental, and management) communication orientation; and organization communication orientation; and 3) formulate a framework that would facilitate the educational accreditation process using the above mentioned communication factors. The researcher was able to develop the proposed communication framework for educational accreditation that could be used by higher educational institutions as a basis for planning and implementation of accreditation activities. The framework highlights the need to meet the accreditation requirements through identified inputs and outputs which shall be processed using communication activities such as person-to-person exchanges, meetings, visual materials i.e. bulletin boards and newsletters and guided by the communication quadrants.

Keywords: individual communication orientation, communication structure and system, organization communication orientation, team (departmental, interdepartmental, and management) communication orientation, educational accreditation
Preservice Teacher Candidates’ Perceptions of Differentiated Instruction (DI): Pre and Post Student Teaching

Abstract

Prior research on differentiated instruction (DI) in higher education has focused on individual courses (Ernst & Ernst, 2005; Hirsch, 2013; Mok, 2012; Varsavsky & Rayner, 2013), predominantly within teacher education (Chamberlin & Powers, 2010; Huss-Keeler & Brown, 2007; Griess & Keat, 2014; Joseph et al., 2013; Sands & Barker, 2004; Santangelo & Tomlinson, 2009). Limited research has considered the position of student teaching as a means for learning and practice of differentiation in student teaching (Brimijoin, 2002; Dee, 2011; Edwards, Carr, & Siegel, 2006; Tomlinson, Callahan, Moon, Tomchin, Landrum, Imbeau, Hunsaker, & Eiss, 1995). This study looked to link preservice teacher candidates’ perceptions of differentiation, pre and post student teaching, as well as note the role mentor teachers play in impacting preservice teachers’ plans for future use of DI in their own classrooms. A total of 135 preservice teachers were surveyed prior to student teaching as well as post student teaching to obtain information regarding their level of familiarity with differentiation and their plans for use of DI in their future classrooms.

Introduction

In the ever-changing world of education, diversity of student needs and learning has given birth to differentiated instruction. In order to meet the needs of student, differentiated instruction (DI) allows teachers to design lessons centered on individual student needs. Tomlinson, a leader in the field of differentiation, has stated that DI is a means by which teachers are able to meet the needs of students by “develop[ing] classroom routines that attend to, rather than ignore, learning variance in readiness, interest and learning profile” (Tomlinson, Brighton, Hertzberg, Callahan, Moon, Brimijoin, Conover, & Reynolds, 2003, p. 121). It has been suggested for students including those identified as gifted (Tomlinson et al., 2003; Tricarico & Yendol-Hoppey, 2012), as well as for special education students (Dee, 2011).

2011; North Carolina, 2013; Ohio, 2005; Texas, 2014; Virginia, 2012; Washington, n.d.), the same does not hold true for higher education. Many authors have argued that the practices associated with differentiation are needed in higher education (Chamberlin & Powers, 2010; Gould, 2004; Lightweis, 2013; Pham, 2012) and that in some instances it is occurring (Huss-Keeler & Brown, 2007; Griess & Keat, 2014; Sands & Barker, 2004; Santangelo & Tomlinson, 2009). The research, however, supporting and documenting the intentional design of differentiation in higher education remains small and is often only in reference to course work within a given class (Chamberlin & Powers, 2010; Huss-Keeler, & Brown, 2007; Griess & Keat, 2014; Joseph, Thomas, Simonette & Ramsook, 2013; Sands & Barker, 2004; Santangelo & Tomlinson, 2009; Mok 2012: Varsavsky & Rayner, 2013), and not in student teaching.

Student teaching is often completed during the last year or term of an education program. It has been viewed as the “most widely accepted component of teacher preparation” (Guyton & McIntyre, 1990, p. 515). Teacher candidates are placed in a classroom with a mentor teacher and using a phase-in process, the candidate takes over the role of teacher in the classroom with the cooperating teacher mentoring and supporting the candidate. Conderman, Morin and Stephens (2005) suggest that student teaching is the initial time for candidates to begin the professional thinking of an educator and engage in hands on practice. As a handful of authors have suggested, differentiation is a theory that is best taught hands-on with students and lessons, making student teaching the ideal placement for candidates to expand their knowledge and understanding of DI.

Participants within this study completed fifteen weeks of student teaching during the Spring 2015 term. All students started their student teaching placement in the third week of January. Middle Childhood (MC) and Adolescent and Young Adult (AYA) teacher candidates completed their student teaching in one placement. Intervention Specialist (IS) candidates completed one placement for their student teaching while IS candidates who also enrolled in the preschool special needs (PKSN) endorsement split their time between two placements; ten weeks in an IS placement and five weeks in a PKSN placement (preschool). Those in the Early Childhood Education (ECE) program with an additional endorsement of PKSN split their time with ten weeks in a primary (grade 1-3 classroom) and five weeks in a pre-kindergarten special education classroom. Candidates enrolled in ECE only, with no PKSN endorsement, completed all fifteen weeks in a grade 1-3 classroom. During student teaching, the candidates were required to solo a minimal of six weeks with all responsibilities of the classroom teacher as their role. Students also attended a seminar course on campus one night a week to support their student teaching and lay the groundwork for submitted nationally scored performance assessments (edTPA).

Literature Review

Two areas of research must be considered in light of preservice teachers’ level of familiarity with differentiation and their plans for using differentiation in their future classrooms. First, the role of differentiation in higher education and the use of differentiation in higher education was examined. In reviewing the works of
authors in the field, two themes are consistent: that differentiation must be taught in k-12 teacher education programs and supported by examples of mentor teachers in the field modeling differentiation. The second theme is that differentiation must be modeled by professors in higher education. Prior research has considered the use of differentiation as modeled to college students (Chamberlin & Powers, 2010; Ernst & Ernst, 2005; Hirsch, 2013; Huss-Keeler & Brown, 2007; Griess & Keat, 2014; Joseph et al., 2013; Mok, 2012; Sands & Barker, 2004; Santangelo & Tomlinson, 2009). Within multiple majors, research has been conducted with faculty documenting and modeling their instruction using a differentiated approach. A large abundance of the research has been conducted in teacher education (Chamberlin & Powers, 2010; Huss-Keeler & Brown, 2007; Griess & Keat, 2014; Joseph et al., 2013; Sands & Barker, 2004; Santangelo & Tomlinson, 2009). Only a few studies have been documented in other majors (Ernst & Ernst, 2005; Hirsch, 2013; Mok, 2012; Varsavsky & Rayner, 2013). The second area in which differentiation must be evaluated is within the student teaching experience (Brimijoin, 2002).

In regard to DI in higher education, one item that is consistent in the research is the type of course. In all instances, regardless of the content, DI in higher education is occurring in a standard classroom, not in the context of a practicum or student teaching experience. To date, only four studies have focused on DI in student teaching (Brimijoin, 2002; Dee, 2011; Tricarico & Yendol-Hoppey, 2012; Tomlinson et al., 1995).

Starting off the research in the field, Tomlinson et al. (1995), looked at three groups of undergraduate students and their learning of DI. The first group of students were taught DI in a workshop while the second group was taught DI in the workshop and also worked with supports during student teaching. A third group of preservice teachers was given no intervention, that is, the students did not attend any additional trainings on DI or have a coach. Tomlinson et al (1995) found that students who attended the workshop were different from those who did not attend based on their ability to state why differentiation was necessary in the classroom. Differences were also identified in how participants in the treatment group of workshop and coaching viewed advanced learners and struggling learners. With all three groups, a decline was documented, “all three groups were less positive after intervention in their attitudes toward differentiation than prior to intervention” (Tomlinson et al., 1995, p. 25).

In 2002, qualitative research was conducted to develop a theory in regard to the role of differentiation in student teaching. Brimijoin (2002) used a case study approach to consider the experiences of a preservice teacher candidate and a practicing teacher in regard to differentiation. Themes identified in the research that require further investigation include the role of DI in teacher preparation programs and long term studies of preservice teachers with differentiation. Building off Brimijoin’s (2002) study, this study will look to explore the level of familiarity of preservice teacher candidates with DI, pre and post student teaching, as well as their future plans for teaching.
In 2006, Edward and associates surveyed teacher candidates and teachers using a pre/post test design to determine the needs of preservice teaching candidates and their growth in regard to DI training. Considering both undergraduate and graduate special education candidates, Dee (2011) looked at the work samples (lesson plans) of preservice teachers. Dee found limited evidence that the participants were successfully planning for instruction that included differentiated instruction. Tricarico and Yendol-Hoppey focused their research on graduate students apprenticing in elementary classrooms. Through professional develop and support, Tricarico and Yendol-Hoppey (2012) found that with feedback and support, students were able to self-regulate and make improvements to their practice of differentiating instruction.

Stronge and Hindman (2003) reviewed research to identify what key attributes make for effective teachers, they found that “effective teachers differentiate instruction” (para. 14). For candidates studying to become teachers, national assessments require candidates to plan for diverse students and calls for differentiation (edTPA). Within the profession, standards for practicing teachers, as written by individual states, make reference to differentiation. Multiple states use the exact term, differentiated instruction, directly within their standards for the teaching profession (Alabama, 2014; Connecticut, 2014; Hawaii, 2014; Massachusetts, 2014; Missouri, 2013; Montana, 2013; Nebraska, 2011; New York, 2011; North Carolina, 2013; Ohio, 2005; Texas, 2014; Virginia, 2012; Washington, n.d.) While other states make reference to differentiation (Arizona, 2014; Arkansas, 2011; Colorado, 2000; Iowa, 2010; Kentucky, 2008; Maine, 2014; Michigan, 2001; Minnesota, 2014; New Jersey, 2014) within their standards for the teaching profession. Stronge and Hindman (2003) reviewed research to identify what key attributes make for effective teachers. They found that “effective teachers differentiate instruction” (para. 14). As we move forward in preparing teacher candidates, one must consider the current profession that calls for teachers to differentiate, the assessment of preservice candidates that requires differentiation (edTPA), and the teaching of the differentiation both in theory in higher education as well as modeling in the higher education classroom and in student teaching experience.

Building off of those areas in past research, the role of differentiation in teacher education and position of differentiation within the student teaching experience, this study was framed by two research questions. In order to establish the baseline of understanding of DI, candidates were asked their level of familiarity of DI prior to student teaching. Because student teaching is a hands-on practicum and the current standards of teaching call for teachers to differentiate, candidates were asked post student teaching about their level of familiarity with DI. The second research question was designed to determine if candidate’s plans for use of DI in their future classroom changed from pre student teaching to post student teaching. That is, did the experience of student teaching impact their view and future plans to use DI?

1. What is the difference in candidates' level of familiarity pre and post student teaching?
2. What is the difference in candidates’ future plans for differentiation pre and post student teaching?

Methods

A total of 135 preservice teacher candidates were surveyed during the first week of student teaching and then again during the last week of student teaching, Spring 2015. Candidates were from four different major programs of teacher licensure; Early Childhood Education (ECE), Middle Childhood Education (MC), Adolescent and Young Adult Education (AYA) and Multiple age grouping Intervention Specialist (IS). Breakdowns of the participants are presented in Table 1.

During the first week of student teaching, candidates were surveyed on two main areas; their level of familiarity with differentiation (on a scale of one to ten), and future plans of use with differentiation (one a scale of one to four- with one reflecting never plan to differentiate in my future classroom, two indicating plan to often differentiate in my classroom, three being rarely plan to differentiate in my future classroom, and four representing I plan to always differentiate in my future classroom). A total of 135 candidates were contacted to participate. Of the 135 who agreed to participate, 120 of the pre student teaching surveys were complete and used for analysis.

Post student teaching, candidates were surveyed again on the two questions. First they were asked to rate their level of familiarity with differentiation (on a scale of one to ten). In previous research, statements have been suggesting that preservice teacher candidates have limited experience and exposure to the concept of DI (Brimijoin, 2002; Dee, 2011). Second, they were asked to determine how often they plan to use differentiation in their future classroom. In her research on a preservice teacher, Brimijoin (2002) found that the candidate planned to differentiate in her own classroom following her student teaching experience that focused on DI. Using a Likert scale, candidates selected between never, rarely, often or always. A total of 135 candidates were contacted to participate. All surveys were completed and used for analysis. Finally, demographic questions were used to determine their licensure program (ECE, MC, AYA, or IS), see Table 1.

Data Analysis

For the two questions asked in both the pre and post student teaching survey, responses were compared using an independent sample t-test. As data was not originally coded with identifiers making a paired matched t-test possible, the independent t-test became the logical choice for comparison. Frequencies were obtained for the two research questions asked of candidates post-student teaching, by licensure area (ECE, MC, AYA, IS).

Findings
Candidates' Level of Familiarity Pre and Post Student Teaching

For the first research question, what is the difference in candidates' level of familiarity pre and post student teacher, the independent samples t-test revealed a significant difference between pre and post student teaching candidates' level of familiarity with differentiation, \( t(212)=3.52, p < .05 \). The standardized effect size was moderate (\( d = -0.45 \)). Pre-student teaching, candidates' level of familiarity with differentiation (\( M = 8.13, SD = 1.65 \)) was lower than the post-student teaching, candidates' level of familiarity with differentiation (\( M = 8.77, SD = 1.18 \)). That is, candidates reported feeling more familiar with differentiation post student teaching.

Frequencies of pre and post student teaching level of familiarity with differentiation by program are presented in Table 2

Table 2

| Level of familiarity means by program pre and post student teaching |
|--------------------|-----------------|-----------------|-----------------|-----------------|-----------------|
|                    | ECE             | MC              | AYA             | IS              | Total           |
| Pre Student Teaching | \( M= 8.56 \)  | \( M= 8.23 \)   | \( M= 7.08 \)   | \( M= 8.54 \)   | \( M=8.13 \)    |
|                     | \( SD= 1.47 \)  | \( SD= 1.22 \)  | \( SD= 1.97 \)  | \( SD= 1.02 \)  | \( SD= 1.65 \)  |
| N= 50               | \( N= 21 \)     | \( N= 23 \)     | \( N= 26 \)     | \( N=120 \)     |                 |
| Post Student Teaching | \( M= 9.11 \)  | \( M=8.7 \)     | \( M= 8.25 \)   | \( M= 8.9 \)    | \( M= 8.77 \)   |
|                     | \( SD= .86 \)   | \( SD= 1.08 \)  | \( SD= 1.44 \)  | \( SD= 1.30 \)  | \( SD= 1.18 \)  |
| N=54                | \( N=24 \)      | \( N= 36 \)     | \( N=21 \)      | \( N=135 \)     |                 |

Candidates Future Plans for DI Pre and Post Student Teaching

The second research question, what is the difference in candidates' future plans for differentiation pre and post student teaching, the independent samples t-test failed to detect a significant difference. That is, there was no significant difference in students' future plans to differentiate before and after student teaching. Table 3 includes candidates' future plans for differentiation by program, pre student teaching, and Table 4, post student teaching.

Table 3

| Future Plans for Differentiation by Program Pre-student teaching (N=120) |
|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
|                 | Never           | Rarely          | Often           | Always          | Total           |
| ECE             | 0               | 0               | 40              | 10              | 50 (41.6%)      |
| MC              | 0               | 0               | 12              | 9               | 21 (17.5%)      |
| AYA             | 1               | 6               | 14              | 2               | 23 (19.1%)      |
| IS              | 1               | 0               | 8               | 17              | 38 (31.6%)      |
| Total           | 2 (1.6%)        | 6 (5%)          | 74 (61.6%)      | 38 (31.6%)      | 120             |

Table 4

| Future Plans for Differentiation by Program Post-student teaching (N=135) |
|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
|                 | Never           | Rarely          | Often           | Always          | Total           |
| ECE             | 0               | 0               | 28              | 26              | 54 (40%)        |
| MC              | 0               | 1               | 14              | 9               | 24 (17.7%)      |
| AYA             | 1               | 4               | 24              | 7               | 36 (26.6%)      |
| IS              | 0               | 0               | 8               | 13              | 21 (15.5%)      |
| Total           | 1 (0.7%)        | 5 (3.7%)        | 74 (54.8%)      | 55 (40.7%)      | 135             |
Discussion

Past research has highlighted the need for teacher candidates to be taught the concept of differentiation in higher education classes (teacher education) (Gould, 2004). As Sherman (2009) points out, teachers that differentiate create “worthy teaching that responds to students individuality” rather than focusing on the masses and missing opportunities for learning (p. 57). The findings of the first research question support that candidates are aware of differentiation and that prior to student teaching they are familiar with the concept, thus supporting that DI is being taught in higher education. Post student teaching, the participants in this study reported that their familiarity was on average, $M = 8.77$, which was significant higher than their reported level of familiarity pre-student teaching ($M = 8.13$). In their 2011 research, Casey and Gable surveyed first year teachers and found that the majority felt their teacher education programs prepared them to differentiate instruction. This is in contrast to past statements regarding novice teachers’ understanding of DI pre and post student teaching. Tomlinson et al., (1994) felt that candidates’ drop in confidence level in regards to DI was due to their understanding of the complexity of DI post student teaching, as compared to pre-student teaching. Gould (2004) suggests that novice teachers can differentiate if they are given the opportunity to learn in settings that model and promote differentiation. That is, schools and more importantly classrooms selected for student teaching must contain cooperating teachers who are differentiating instruction to meet the needs of diverse learners (Tomlinson et al., 1995).

The second research question addressed the candidates’ plans for use of DI in their future classrooms. The findings were not significantly different between pre and post student teaching. That is, prior to student teaching, a total of 93.2% of the candidates planned to either differentiate often or always while post student teaching, a total of 95.5% fell into the two categories. In prior research of a student teacher learning to differentiate, Brimijoin asked the question of the preservice candidate, would she differentiate in her own classroom (2002, p. 232). In both this study and Brimijoin (2002) it was found that preservice candidates plan to differentiate. This study asked the frequency and again found that the majority planned to differentiate often or always.

Gould (2004) argued that for candidates to be successful at differentiation, learning must first occur in teacher education programs, with education professors “talk{ing} the talk and walk{ing} the walk” (para. 8). In contrast, past research (Richardson-Koehler, 1988) has found that candidates take on the dispositions and attributes of their cooperating teacher regardless of their university course work or training. If this is the case, then closer attention must be paid to the role of the cooperating teacher in modeling differentiation and their dispositions related to instruction. Prior research (Brimijoin, 2002) suggests that that there are instances in which candidates have been exposed to DI in student teaching. In Dee (2011), the argument was made that candidates need to be exposed to experiences in which mentor teachers are modeling and using differentiation.

Limitations
Multiple limitations exist with this study including the design as an independent t-test rather than a paired or matched t-test. Due to the lack of planning on the researcher's part, future research should plan to match participants' individual responses pre and post student teaching. Secondly, the t-test demonstrates that a difference does exists between the pre and post student teaching candidates' level of familiarity however the explanation of what the students felt impacted their increase in familiarity of DI is not stated. That is, future studies should consider a qualitative approach to develop a theory of what is occurring during student teaching to cause this increase. Finally, the assignment of students to mentoring teachers could also play a role in the findings but this study does not give background on the experience of the mentor teachers or their use of DI in their classroom. As Guyton and McIntyre (1990) state, it is necessary for “congruence between the on-campus courses and the experience of student teaching” as both must support the teaching of the theory and practice of DI (p. 516). Consistency is needed but that must start with higher education courses that model DI and follow with student teaching experiences that include cooperating teachers who support the teaching of diverse learners through differentiation. Tomlinson et al, (1995) state that “cooperating teachers can do little to guide student teachers in addressing students’ diverse academic needs if they, themselves, do not provide differentiated instruction in their classes” (p. 10). It is suggested that more studies be conducted to determine and connect mentor teachers’ classroom structure and instructional style and the impact it has on the student teacher (teacher candidate) in the classroom.

Title:
Increasing student engagement in higher education classrooms

Abstract:
Student engagement is just as important in higher education as it is in the elementary classroom! This paper highlights a research study on the engagement of students in higher education classrooms. Results of the study will be shared as well as implications for instruction in higher education classroom. This paper describes the methods of making classrooms more student-centered as well as the benefits to learning in a student-centered higher education classroom.
Learning mathematics is a complex process that requires a variety of theoretical lenses for understanding. Researchers from many disciplines (e.g., mathematics educators, applied linguists, educational psychologists, learning scientists) have investigated central questions of their discipline using a unique collection of videos on students’ learning. In this Panel Session, we discuss four papers that report research from the examination of a unique collection of video recordings from a longitudinal study of students’ learning mathematics.
Organization

Each paper illustrates a research application from the collection, which is housed on the Video Mosaic Collaborative (VMC) and is hosted by Rutgers University. Three of the papers employ the newly released tool, the RUAnalytic, which allows for the construction of a multimedia narrative by editing and annotating videos from the VMC collection. New VMCAnalytics created in one’s workspace are eligible for peer review and potential publication. The video collection and corpus of published VMCAnalytics are available to teachers, teacher educators, and researchers worldwide (see www.videomosaic.org).

The use of videos to promote teacher knowledge of student learning and improving practice is central to all the papers in this session: (1) Using video to study spontaneous transfer of mathematical ideas in problem solving; (2) Pre-service teachers in an educational psychology course creating VMCAnalytics to showcase their interpretations of cognitive and social development as young students work on mathematical tasks; (3) Using the VMCAnalytic to provide a case study of one bilingual adolescent's solving an algebraic problem; and (4) Studying in-service teachers’ (general education and special education) growth in recognizing students’ reasoning from video and teachers’ change in beliefs. The applications derived from this work have potential to improve practice.

The organization of the Panel Session is as follows: First, the introduction, background and rationale for the work presented are given. Then, the four individual research papers will follow; the concluding element of this Panel Session consists of concluding remarks and then an open session for questions and discussion from the audience.

1 Development of Video Mosaic Collaborative and the RUAnalytic tool, and research using these resources and the tool, has been supported by two grants from National Science Foundation (DRL-0822204 and IIS-1217087). The views expressed in this paper are those of the authors and not necessarily those of the NSF.
Introduction, Background and Rationale: The VMC Collection and RUAnalytic Tool

Carolyn A. Maher (5 minutes)

In order to make records of children's learning behaviors in mathematics more accessible and permanent, mathematics education researchers have, for decades, used videotaping of learning in classrooms. Careful examination of video recordings allows us to not only study how mathematical ideas are built by learners, but also to learn about the subtleties of student thought processes, to trace student cognitive growth in a social setting, and gain insight into how social processes influence personal cognitive development. The Robert B. Davis Institute for Learning (RBDIL) at Rutgers University has amassed a unique and massive longitudinal video data set (4,000 hours) that traces students learning mathematics over extended periods of time and situated in classroom or informal settings where conditions promote the development of reasoning, problem solving, and justification.

Using Video to Identify the Work of Transfer

Cindy E. Hmelo-Silver, Joshua Danish, Andrea Gomoll, Whitney Novak, Asmalina Saleh, Alejandro Andrade, Branden Bryan, Indiana University (15 minutes)

This paper presents the VMCAnalytic of Brandon, a fourth grade student, as he works on a mathematics problem and then discusses it during a clinical interview. Brandon transfers ideas about combinatorics from a problem involving towers of unifix cubes selecting from two colors to combinations of topping on a pizza. To reveal how this occurs, we analyzed how Brandon works to accomplish and recognize this—with a focus on how this was mediated by the unifix cubes, hand-drawn representations, and the interviewer.
Pre-service Teachers’ Investigations of Children’s Cognitive and Social Development as Revealed in their VMCAalytics

Marjory F. Palius (15 minutes)

This paper presents an exploratory study conducted in an Educational Psychology course, in which pre-service elementary teachers engaged in an intervention to study VMC videos and create a VMCAalytics. The purpose was to investigate how these activities might serve to deepen their understanding of school-aged children’s cognitive and social development. The intervention design featured a selection of videos from the primary grades, in which focal groups of children could be observed engaging in group work on mathematical tasks, beginning in first grade and extending to grade four. As an online module of the course, participants studied the videos and reflected on them with their peers via threaded discussions in small groups. This intervention was layered onto the regular course activities, which included readings and seminar-style discussion of the course text. The intervention continued with an introduction to the RUAnalytic tool and a hands-on training session in a computer lab. Participants selected a topic for their course project to create a VMCAalytics as a scholarly, multimedia paper on child development. After the course ended, participants were interviewed to reflect on their experiences and their learning through the intervention activities. This paper reports on the VMCAalytics created by the pre-service teachers and their perceptions of what they learned through constructing them.

Revealing Ariel's Algebraic Problem Solving: A Study of the Growth of Cognitive and Language Knowledge

Louise C. Wilkinson and Robert Sigley (15 minutes)

This paper presents a VMCAalytics featuring one adolescent's learning to solve an algebraic problem at the same time he acquires in tandem the mathematics register. The mathematics register refers to the specialized language used in mathematics teaching and learning; it is characterized by precision and linguistics in both oral and written language. This VMCAalytics presents an open-ended problem-solving task that requires Ariel to determine how many Cuisenaire rods are needed to build a
ladder with different number of rungs and to justify his solution. Over the course of 18 months, we see how Ariel first approached the problem, and then built his algebraic knowledge. His justifications increasingly utilize elements of the mathematics register. Ariel's success is revealed in the elegance of his solution, the understanding of his earlier work, and his confidence in offering clear, well-articulated oral and written justifications.

General and Special Teacher Learning from Video

Carolyn A. Maher and James A. Maher (15 minutes)

Videos have served as a powerful tool for tracing the students' development of mathematical ideas over time. Furthermore, teachers’ studies of videos of student learning provide knowledge about how students, under certain conditions of exploring open-ended problems and collaborating about solutions, learn mathematics. These studies have the potential to shed light on the complex set of challenges that special education students face in learning mathematics. These students are challenged by both the intricacy of the discipline and alternative styles of engagement with the discipline that constitute their preferred modes of learning. A four-month intervention, consisting of three cycles, provided opportunity for participants to work on mathematical tasks, study videos of students working on these same tasks, and implement the tasks with their own students. The special and general-education, middle-school teacher participants then analyzed their student work and shared student solutions with each other. Pre and post-test video and belief assessments showed that both groups grew and were equally successful in recognizing student reasoning from video, with 50% growth from each group. Further, about 67% of the special education teachers and 20% of the general education teachers exhibited growth in recognizing complete argument description of an induction argument to support reasoning. This growth rate difference between these two groups of teachers is statistically significant (p=0.0549). The results have important implications for professional development.

Questions, Discussion and Implications for Practice (20 minutes)
Advantages/Disadvantages of the Mathematics Modular System at Eastern Kentucky University

Topic Area of Submission: Mathematics Education

Presentation Format: Paper Presentation

2-3 Sentence Description: Accelerated programs (such as the Modular System) abandon the traditional, semester-based model in favor of a compressed or self-paced curricular framework (McTiernan, Palmer & Fulton, 2012). Accelerated and compressed programs make particular sense for mathematics, given students’ low success rates for completing a developmental sequence and advancing to and succeeding in college-level math courses (McTiernan, Palmer, & Fulton, 2012). These accelerated programs seem to help students to master the content in a shorter time frame.

Advantages/Disadvantages of the Mathematics Modular System at Eastern Kentucky University
By: Dr. Antoinette M. Davis

In most colleges and universities, mathematics is a subject that should be taken during the matriculation process. Some students can breeze through math courses while other students tend to get stuck on certain topics (such as: fractions and square roots). For students who need more time and assistance with these topics, the students would enroll in a developmental math course that uses the Modular System. The courses that utilize the Modular System at this institution are: MAT 090 (Pre-Algebra) and MAT 095 (Introductory Algebra).

“Effective with the Fall 2012 semester, the University’s two developmental math classes, MAT 090 and MAT 095 were each divided into three one-credit modules, with students progressing from one module to the next only upon successful completion of each module. Only the modules not successfully completed needed to be re-taken in a subsequent semester (EKU, 2013)”.

Accelerated programs (such as the Modular System) abandon the traditional, semester-based model in favor of a compressed or self-paced curricular framework (McTiernan, Palmer & Fulton, 2012). Accelerated and compressed programs make particular sense for mathematics, given students’ low success rates for completing a developmental sequence and advancing to and succeeding in college-level math courses (McTiernan, Palmer, & Fulton, 2012). These accelerated programs seem to help students to master the content in a shorter time than would be used in a normal semester course.

But the Modular System seems to be working at other institutions around the United States. Anne Arundel Community College in Maryland used a $40,000 Changing the Equation grant from the National Center for Academic Transformation to redesign its developmental math courses (Ashford, 2011). Students work on online math modules at their own pace (Ashford, 2011). The ability to work at their own pace is helpful to students so that they don’t feel rushed to learn a concept. In mathematics, it is better for students to learn over time in comparison to learning everything in one session. The ability to spend a longer time on the units where they have the most difficulty and retake the exam until they pass “reduces their anxiety,” said Alicia Morse, chair of the math department (Ashford, 2011).

Virginia’s community college system is adopting a modular approach to developmental math as part of a “systemic re-engineering” of the entire system to raise completion rates (Ashford, 2011). Instead of having to take a full developmental math course, Virginia’s modular initiative will allow a student who needs help in a particular area—such as fractions or proportions—to take an individualized, self-paced module on that topic (Ashford, 2011). These self-paced modules will be helpful to the student so that they can work on mastering the topic and move forward towards completing the course.

In contrast to Anne Arundel Community College, EKU does not allow students to work at their own pace. Each module (A, B, and C) is four weeks long and students must prove their mastery of the content in each of the modules by passing a Module Exam with 70% proficiency or higher. Each
semester is 16 weeks, so a student could pass Module A, B, and C in just 12 weeks (4 weeks x 3 Modules = 12 weeks). If a student does not pass Module A (for example), the student will remain in A for another four weeks. If the student does not pass Module A (or any other Module) for the second time, they will stay in that Module until they have mastered the content.

Here are some advantages to the Modular System at EKU:
- Students can complete all of the Modules in as little as 12 weeks.
- Students are able to complete their homework in an online format.
- Students have access to an instructor who can answer questions after the lecture.
- Students are able to utilize group work in order to work together to complete class problems.
- After completing all of the Modules, students have a chance to sign up for another course or they can use the extra four weeks to work on their other courses.
- Tutoring is available for students who need help after class.
- A Learning Contract is set up for students who do not pass the first time. This is a contract that is set up between the teacher and the student so that the student can work to be successful the second time around.

Here are some disadvantages of the Modular System at EKU:
- Students who do not pass the Module the first time tend to get discouraged with trying again.
- When students fail a Module a second time, they tend to withdraw from the learning process.
- The Modular System does not benefit students who need more than four weeks to learn the information. A separate System should be set up for students who need more time.
- The Modular System is set up on a Pass/Fail Scale. There is no in-between area in this System.
- Some students will stay in the Modular System for many semesters because many of them refuse to ask for help through difficult topics and some topics are just not understood by the student for many reasons.

As an MAT 090/095 instructor, I understand the fact that every student may not enjoy this System of developmental mathematics. However, as noted above, there are advantages and disadvantages of the Modular System at EKU. Each item should be considered from the instructor and student’s point-of-view. The Modular System has been useful in getting students out of developmental mathematics and into college-level mathematics. “Two-semester pass rates for MAT 090 and MAT 095 climbed to 91 percent and 83 percent, respectively, for 2012-13 (EKU, 2013). The main objective of this paper is to note that the Modular System has worked for the past three years at EKU and in the future, other options will be made available for students who need more time to pass the Modules. Lastly, the main goal is to help students get through the topics that they struggle with so that they can pass the Module Exam in each Module with a 70% or higher so that they can move forward in other college-level mathematics courses.

Increasing Mathematics Proficiency in College Math Courses: Ending the “I hate math” Syndrome
By: Dr. Antoinette M. Davis

Before students enter college, they already know whether they “like” math or they “hate” math. The sad part is: The students who hate math will have to find ways to conquer their fears so that they can pass the required amount of math courses in their college curriculum. In any event, their fear of math did not begin in high school; it began during their formative years of learning. Research shows that the development of mathematics skills early on may be an even greater predictor of later school success (Clements & Sarama, 2013).

Often times, these students do not have access to the resources that are needed to increase their mathematics proficiency. Too many children not only start behind, but they also begin a negative and immutable trajectory in mathematics, with insidious long-term effects (Clements & Sarama, 2013). All of the parts of a child’s mathematics experience can shape their mindset as it relates to mathematics learning in future years. A study that followed 273 students through their first year of middle school, found that students described math as less valuable and that they were investing less effort and persistence in the subject (Pajares & Graham, 1999). As time goes on, students with this mindset will have a negative view on mathematics and its use in their overall life. These negative effects are in one of the most important subjects of academic life and also affect children’s overall life course (Clements & Sarama, 2013).

Given the importance of mathematics to academic success in all subjects, all children need a robust knowledge of mathematics in their earliest years (Sadler & Tai, 2007). The question is: How do we increase mathematics proficiency in the younger years so that students will feel more confident about mathematics in their college years? The National Council of Teachers of Teachers of Mathematics (Principles and Standards for School Mathematics) (2015) outlines what each child should learn at each grade level:

**Pre-school - Kindergarten**

During this stage, children should begin to:
- count aloud
- compute the number of objects in a group
- understand that a particular number of objects has a fixed value despite the size or nature of those objects
- understand relative size and be able to sort objects by size and shape
- follow a sequence of two- and three-step commands
- be able to perform simple addition and subtraction computations

*Grades One to Three*

During this stage, children should:
- begin to perform simple addition and subtraction computations efficiently
- master basic math facts (such as, $3 + 2 = 5$)
- recognize and respond accurately to mathematical signs
- begin to grasp the concept of multiplication (grade three)
- understand the notion of measurement and be able to apply this understanding
- improve their concepts of time and money

*Grades Four to Seven*

During this stage, children should:
- recall basic mathematical facts, including multiplication tables, with ease
- become competent with fractions, decimals, and percentages
- begin to understand the relationships among fractions, decimals, and percentages
- develop facility with word problems
- be adept at estimating quantities and rounding off numbers
- develop basic computer skills

*Grades Eight to Twelve*

During this stage, children should be able to:
- employ an increasingly high level of abstract, symbolic thinking
o perceive relationships and make translations among decimals, fractions, and percentages
o deal easily with a wide array of equations, formulae, and proofs
o explain and illustrate mathematical concepts, rather than simply apply them
o plan and self-monitor during multi-step problem solving
o use calculators and computers with facility

In college, students should be able to demonstrate their knowledge of the NCTM material that was covered in all grade levels. There are various reasons why students have not retained this information. Many students either did not do well in math in high school, or are older and have forgotten what they learned (Rosin, 2012). It is essential for students to review each grade levels’ work all throughout the year so that students will be prepared to add to their current knowledge at the beginning, middle, and end of the school year.

In the drive to improve community college success rates, most attention has been focused on students taking the remedial or “developmental” courses they need just to be eligible to take college-level math courses (Rosin, 2012). When students complete these developmental courses, they will have the foundation that is needed in order to go into other mathematics courses. Sadly, many students stay in developmental math for a while because their foundation was not properly built in their K-12 years. At the college level, more than in many other subject areas, students approach math with high anxiety, which interferes with their learning; many delay taking a math class until they are too far along in their studies, while others are eager to get the math requirement over with, and end up taking classes beyond their capabilities (Rosin, 2012). If we can find ways to help students to overcome this anxiety (extra tutoring, working in small groups, etc.), then we can get students through these math classes and on to other classes so that they can complete their college degrees in a timely fashion.

In college, the students have various backgrounds such as: high school graduates with no kids, single parents with children, married parents with children, etc. Due to the varying degrees of students, many resources need to be made available so that these students can
succeed in their mathematics classes at the college level. Various resources are available (such as: TRIO) so that students can have access to tutoring and extra assistance with passing their college courses. Most of these programs offer progress reports so that students can find out where they are in each class at the midterm mark. This information can help students to improve their grades as they round the end of the term.

In college, students have the option of taking traditional and online mathematics courses. Chao and Davis (2001) found that there are many facets to the online success of mathematics courses such as: paying attention to the design and utilization of effective online pedagogy, maintaining active communication between students and the instructor, encouraging interaction between students in the classroom, and using computer programs like Excel as a way to illustrate statistical concepts in the classroom. These concepts can be used in the traditional classroom as well. Overall, research-based suggestions on online instruction emphasize establishing study groups early, modeling and reinforcing effective communication, identifying potential problems, and designing a plan for dealing with these potential problems (Tallent-Runnels et al., 2006).

According to Siadat, Musial, and Sagher (2008), students enter into a continuous dialogue with the instructor through a specific medium—the mathematics tests—where the instructor conveys his or her expectations and policies, and students respond through their performance. On these exams, students have an opportunity to show their proficiency of the information that is presented on the test. When students do well on exams, the instructor may feel that the students have a grasp on the information that was presented. However, when students do not perform well on these exams, it is an indicator to the instructor that more time should be spent on the material that was covered. Student performance, on the other hand, provides vital feedback to the instructor to adjust the pace and content of instruction (Davis, 2014).

In college-level mathematics courses, mathematics proficiency can be demonstrated by completing the following items:

- Receiving high-quality instruction in the classroom (Clements & Sarama, 2011).
- Instructors can allow students an opportunity to explore mathematics in a way that they understand it. A verbal understanding will be helpful in the mental understanding of the material.
- Instructors can ask students prompting questions that will show their mathematics competency of what is being studied.
- Instructors can allow students to work in groups on small projects so that they can use their knowledge to help other students in the group. Group work tends to be a great way to get shy students to speak out as they will not speak out in a large group discussion.
- Over time, students sense that they are competent and able enough to solve math problems; teachers can foster the sense that math is important and relevant by demonstrating the usefulness of math in the real world; teachers can find math problem challenges that are well-matched to the student’s skill level with clear goals and feedback; lastly, teachers can help students deal with math anxiety when taking tests (Muesse, 2014).

Overall, each student will enter the college mathematics classroom at a different level. Our goal as educators is to make sure that these students are able to demonstrate mastery of the mathematics information so that they can use it in real-world settings. The moment that students are able to demonstrate proficiency in our math courses, then the “I hate math” syndrome will leave and they will feel more comfortable in other settings where mathematics is used.

Abstract

This article presents on the effectiveness of having a grade 3 class participate in a career planning unit consisting of various learning activities. Students and the teacher evaluated the unit by utilizing both quantitative and qualitative data. This career planning unit integrated Alberta Education Curriculum outcomes from the following programs: Health and Life Skills, Language Arts and Social Studies. The unit itself is outlined with clear descriptions of the activities that the students participated in and also includes the resources and templates that were used for evaluative purposes. This career planning unit was delivered to a grade 3 class in a small rural community located in Southern Alberta, consisting of 20 students from a small town and surrounding farming households. Objectives of this unit were met with 60% of the students reporting that the unit plan helped them to learn a lot about themselves; 75% stating that this unit plan helped them to learn a lot about careers; 80% noting that this unit plan made them excited about what they could do with their life and 75% reporting that this unit plan made them want to learn more about different careers. Career planning is demonstrated to be successful at the grade 3 level by utilizing activities that teach and allow the students to explore their uniqueness in skills, assets and responsibilities in contrast with not only their classmates, but also with students from other countries around the world. Future research of a longitudinal nature is needed in order to collect data on the career paths of students with whom career planning units of this nature
have been attempted. This future data would prove useful in analyzing the long-term benefits and outcomes of career planning initiatives within the K-12 system.

Career Planning Integration with Health and Life Skills, Language Arts and Social Studies at the Grade 3 Level

Introduction

Increasingly teachers are being asked to incorporate learning activities regarding the world of work with other core curricular objectives. Nonetheless, the process by which this is to be accomplished is slowly beginning to be introduced into the K-12 level by linking career planning with other curricular outcomes. This movement is a positive one given the increasing evidence through research indicating that career development is a lifelong process that begins in childhood (Magnuson & Starr, 2000). Unfortunately, there have not been any evaluative studies on the effectiveness of linking career planning with other curricular outcomes at the grade 3 level.

Specifically, this paper will outline how career planning can be integrated into grade 3 classroom curricula. Throughout this unit, students were tasked with exploring the different skills and assets they possess and as they shared their results with the larger group, they were able to see the variety and unique attributes that other classmates possessed. The second half of the unit had students explore their responsibilities as students, and as contributing members of not only their families but also within their community. The class discussed how different skills, assets and responsibilities related to the careers that their parents held and to those represented in the various stories and literature they read. Students were not only considering their own identity in
terms of their individual skills, assets and responsibilities, but also to how these aspects relate to career development. Although structured for third grade, the unit is easily adjustable to instruction in any of the other levels by appropriately modifying the curricular outcomes.

**Context of Teaching Environment**

This career planning unit was implemented in a Grade 3 classroom located in a small town in Southern Alberta with a population of about 7,500 people. This school was an elementary school consisting of students from Kindergarten to grade four with a relatively equal distribution of town and farm based students. The mixture of backgrounds of the student body was beneficial when students participated in the career planning activities, as it expanded what each student’s experience was and what they could share, as many of their parents were employed in areas much different from one another.

The grade 3 classroom demographics and developmental level was varied. Half of the students were rural students, many coming from families who owned and worked on farms. There was quite a difference in the socio-economic status of the students’ families, with many of the students being from low-income families and some families were wealthier. Much like the distribution between town and farm based students, this difference between the socio-economic backgrounds added to the effectiveness of this unit as it assisted in showing the students a wide variety of different career paths when parental occupations were discussed.

Developmentally, there were also vast differences among students even though all of them were the same age. Select students in the class were weaker at reading and comprehension and received extra help throughout the week. When including literature into the lessons the content was always read out loud to the class and the connections to the lesson outcomes were
discussed together as a group. This approach was particularly beneficial to the students who struggled with individual reading tasks. One of the students in this classroom had severe autism and while he did not follow the same day-to-day schedule as the other students, he was present at the times during story readings throughout the entire career planning unit. His presence in the classroom was beneficial to the overall success of the unit as it also helped to illustrate the concept of student responsibilities in the class and community. A responsibility of the students was to act as appropriate role models for social interactions when relating to the student who had autism.

The goal of this unit was to be as cross curricular as possible, bringing in literature from different areas to help the students connect the curricular outcomes of the Health unit while also creating a fun and engaging project. The Social Studies unit that was being taught at the same time as the career planning activities were implemented was focused on three particular countries: India, Tunisia and the Ukraine. Connecting the Health unit with the Social Studies unit was meant to optimize the students’ opportunity to compare their lifestyle to those of children from around the world. This helped the students understand the different responsibilities of students from these other communities and emphasized the differences that are present in career planning among different communities and cultures.

The context of this unit falls under the Alberta Elementary Health and Life Skills curriculum and was produced to meet the Life Roles and Career Development outcomes. This unit fits into the Health curriculum due to its focus on observing and exploring student skills, assets and responsibilities. The various pieces of literature that were included throughout this unit were strategically chosen to meet the Health outcomes by supporting students in exploration
of their skills, assets, responsibilities and careers. Particularly, the following objectives in the Alberta Health curriculum included:

- **Relationship Choices**: Students will develop effective interpersonal skills that demonstrate responsibility, respect and caring in order to establish and maintain healthy interactions.
  - R-3.1 recognize the effects of sharing positive feelings on self and others;
  - R-3.2 demonstrate safe and appropriate ways for sharing and/or expressing feelings through words and behavior; and
  - R-3.8 develops skills to work cooperatively in a group.

- **Life Learning Choices**: Students will use resources effectively to manage and explore life roles and career opportunities and challenges.
  - L-3.5 examine personal skills and assets (ex. physical, verbal, intellectual); and
  - L-3.6 examine the responsibilities associated with a variety of age appropriate roles (ex. family member, friend) (Alberta Learning, 2002).

The inclusion of literature structured the unit in a way that exposed students to the six Language Arts strands: reading, writing, listening, speaking, viewing and representing. Particularly, the following Language Arts outcomes were covered:

- **1.1 Discover and Explore**: Express ideas and develop understanding:
  - Connect prior knowledge and personal experiences with new ideas and information in oral, print and other media texts; and
  - Explore ideas and feelings by asking questions, talking to others and referring to oral, print and other media texts.
• 2.1 Use Strategies and Cues: Use prior knowledge:
  o Share ideas developed through interests, experiences and discussion that
    are related to new ideas and information.

• 3.1 Plan and Focus: Focus attention:
  o Identify facts and opinions, main ideas and details in oral, print and other
    media texts.

• 5.1 Respect Others and Strengthen Community: Celebrate accomplishments and
  events:
  o Use appropriate language to acknowledge and celebrate individual and
    class accomplishments (Alberta Learning, 2000).

The unit also fit with the Social Studies curriculum by including comparisons to
communities around the world. Students were required to explore their own skills, assets and
responsibilities in relation to career planning and were expected to be able to compare their
experience with the communities of India, Tunisia and the Ukraine. The particular curriculum
outcomes achieved were:

• GLO 3.1 Communities in the World: Students will demonstrate an understanding
  and appreciation of how geographic, social, cultural and linguistic factors affect
  quality of life in communities in India, Tunisia, Ukraine and Peru.
  o 3.1.2 examine the social, cultural and linguistic characteristics that affect
    the quality of life in communities in other parts of the world by exploring
    and reflecting upon the following questions for inquiry:
      ▪ What determines quality of life?
How does daily life reflect quality of life in the communities (e.g., employment, transportation, roles of family members)?

- GLO 3.2 Global Citizenship: Students will demonstrate an understanding and appreciation of Canada’s role and responsibilities in global citizenship in relation to communities in India, Tunisia, Ukraine and Peru.
  - 3.2.2 explore the concept of global citizenship by reflecting upon the following questions for inquiry:
    - How are the rights, responsibilities and roles of citizens in communities around the world the same or different than those of Canadian citizens? (Alberta Education, 2005).

This career planning unit allows students to participate in activities that guide their exploration into the skills, assets and responsibilities that they already possess. A paramount focus of this unit was to illustrate how each student was unique. Through sharing the skills, assets and responsibilities that the students discovered about themselves, awareness was increased regarding the differences that existed amongst classmates. This unit not only presented how students were unique from one another, but also how each career was unique in the different skills, assets and responsibilities that it required. This unit made use of adaptations of the pride story, guided fantasy and meaning activities that were used to help meet the career development needs of the students. Most importantly, this unit emphasized that a career was not mainly a job; it also was part of a person, incorporating their personal interests, choices, skills and assets. By making this unit cross curricular there is no limit to where other teachers could successfully implement this type of career planning unit and/or activities, thus enhancing the student’s
experience. This paper will now provide a detailed description of the learning activities within
the career planning unit.

Detailed Description of Learning Activities

This career planning unit was taught once a week and lasted for 10 classes spread
amongst 13 weeks (3 classes were lost due to Professional Development days and one snow
day). The availability of two weekly computer classes gave the class the opportunity to provide
more class time for students to work on the career planning activities. The unit began with a
student interest survey. The bulk of the unit focused on meeting the Life Roles and Career
Development outcomes for the Health curriculum. Students explored their own skills and assets
and through comparison to Dr. Seuss’ *The Sneetches*, discussed how different skills/assets make
all people unique from one another, and a questionnaire was sent home for their parents to
answer.

After gathering information from their parents and discussing their parental
responsibilities along with the responsibilities of people from other cultures and communities,
the students were able to write sentences and pride stories about their own responsibilities. The
final lessons of the career planning unit focused on helping the students to discover what was
meaningful to them in their lives through the use of a guided fantasy and a written assignment.
The students were to describe one thing that they believed was important to them. The unit
concluded with a mini guitar and vocal concert performed by the teacher.

The career planning unit is divided up into 9 activities that will now be described in more
detail, it should be noted that most of the activities were completed in one class, but some do
require potentially two classes to complete.

Activity one – Unit Introduction and Student Interest Survey
The first activity of this unit was taught during the first class of grade 3. To start the activity the teacher introduced himself by reading an acrostic poem to the class. This poem went through the letters of the teacher's name and described interesting facts about himself and portrayed some of the meaningful elements in his life. Some examples could be “T” for travel or “H” for harmonic as both travel and music may both hold meaning for someone. The students were then given a student interest survey to fill out titled *Me, Myself and My Name* (see Appendix A for survey used).

**Activity two – The Sneetches**

This activity does require more than one class period to cover. The purpose of this activity was to have students explore their own skills and assets and to establish themselves as unique individuals. Before reading *The Sneetches*, definitions for skills and assets were established with the students. The definitions that were used were:

**Skill:** the ability to do something well (e.g. carpentry)

**Asset:** is a useful or valuable quality about you that would help others (e.g. hard working)

The students were asked to observe the cover and predict what kind of people the creatures in the book would be. The activity continued with the reading of Dr. Seuss’ *The Sneetches* (see Appendix G for Resources used) a story about two social classes; Sneetches with star belly badges (the elite) and Sneetches without (the downtrodden). The social prejudice between the two groups allows for a new comer, Sylvester McMonkey McBean (an entrepreneur of sorts) to enter onto the scene and take advantage of the Sneetches. The Sneetches have to work together to solve their problems, regardless of class. Mr. McBean teaches the Sneetches about the cost of pointless prejudice. Following the story, the students were asked the following discussion questions:
• What feelings emerged as you listened to the story?
• What are some things that can be learned from the Sneetches?
• What is the moral of this story?
• How did the children Sneetches learn to act?
• Are we like the Sneetches? Is it difficult to tell each other apart?

After the class discussion students were given the Sneetches handout (see Appendix B for worksheet used) and were given the task of writing three sentences that described two skills and one asset they had. After completing the sentences, students were asked to draw a symbol on the Sneetch’s belly that represents something important to them. After all the Sneetches were finished, the students read their sentences aloud to the class. While the students read their sentences, the teacher, recorded on a whiteboard the skills and assets that they indicated. After all the students had shared the class discussed the list of assets and skills with the following questions:

• Are there skills/assets on here that you have that were not in your sentences?
• Did everyone have the same skills/assets as you?
• Did this activity help you see how we are unique?
• Why is it helpful to know our skills and assets?

After the discussion, the class revisited The Sneetches story. Students were asked if the Sneetches in the story were unique and whether they showed different skills and assets? The characters in the story did not show any unique skills or assets and the only way they distinguished themselves was with the presence (or absence) of the star on their belly.

Activity three – Is There Really a Human Race?
This activity began with reading the story, *Is There Really a Human Race*, written by Jamie Lee Curtis (see Appendix G for resources used). Continuing with the discussion of skills and assets from *The Sneetches*, the class discussed what skills and assets were needed in common careers such as a police officer, firefighter, teacher and a doctor. The Jamie Curtis story assisted in this discussion as it helped to further the idea that we are all unique. The moral of the story was that people are not all racing each other to get to the same end goal. Connections to skills and assets can easily be made with this book, one page, for example, shows babies in their cribs, each one is holding objects that show the skill or asset that they will grow up to have. The closing illustration was useful during the class discussion as it showed a ‘World Yearbook’ with faces and names of the occupations the individuals depicted held. This activity concluded with a statement that reinforced the idea that not everyone is working towards the same career, that all people are unique and everyone has different skills and assets that assist in determining what careers are a best fit for each person.

**Activity four – Responsibility Around the World**

This activity was conducted on a Friday. At the beginning of the week students had been given the responsibility questions (see Appendix C for questions used) that they were to take home and answer with their parents. Students were asked to find out what their parent’s job was and a responsibility that they had at their job, at home and in the community. When the students had collected all the information, students were given an opportunity to share their answers with the class. Meanwhile, the different jobs and responsibilities mentioned were recorded on a whiteboard. Students were asked to think back to the *Is There Really a Human Race* story and were asked if their parents were all racing against each other for the same jobs. Students were
then asked to look at the recorded jobs and responsibilities and say whether or not all the jobs had the same responsibilities.

At this point in the Social Studies class the students were learning about Tunisia and on the same day as the aforementioned discussion of parental employment, the class discussed the responsibilities of men and women in Tunisian farming. Farming is a common occupation in Tunisia and many of the students in this grade 3 class also had parents who were farmers. The discussion regarding the responsibilities of men and women farmers in Canada and Tunisia was interesting because students were able to see the major differences between our two cultures and the way that farming as a career was treated. The class also looked at the responsibilities that students of similar ages from communities in India and Tunisia had. Many of the students in these communities have the responsibility to help out their parents on their family farm and cannot attend school as a result. The purpose of this comparison was to show that students in other communities often grow into the careers that their parents have and it was important for the students to realize the freedom that is available to them in Canada, with respect to career choice, is unique and something that they need to be grateful for.

Activity five – The Top Job

To strengthen the connection between learning about responsibility and career development the teacher read the class the story *The Top Job*, by Elizabeth Cody Kimmel (see Appendix G for resources used). This story is about a girl who is telling her class about the Career Day she spent with her dad who replaces light bulbs. When none of the other students seem interested in her father’s job, she still continues to tell her story, slowly gaining the students’ interest as she slowly retells the changing of the Empires State Building’s giant light bulb. Reading was paused with every new introduction of an occupation within the story, the
class would then brainstorm some of the responsibilities associated with each one. This book was great at showing how every occupation, even if it seemed dull at first, has a person that finds it fascinating and fulfilling.

**Activity six – Responsibility Sentences and Pride Stories**

The previous activities focused on the responsibilities of other people from around the world and their jobs. This activity allows students to explore their own responsibilities. During a computer lab time, students were tasked with first typing three sentences about responsibilities they had at home, in school and in the community. Then students were asked to think of a time when they were proud of themselves because they were being responsible, along with this they were asked to type a couple of sentences describing the moment and how it made them feel.

**Activity seven – Guided Fantasy**

For this activity, students spread out around the classroom to lie down and close their eyes. First, they were asked to think about the conditions in Tunisia and India that created obstacles for students and their career development. Some conditions mentioned to them as they thought about things were the poverty conditions in India and the high unemployment rates in Tunisia. Before beginning the guided fantasy activity, it was stressed that the students need to keep their minds open and to think about what they really want in their futures. A script was read (see Appendix D for script used) to the class to lead them through the guided fantasy process. After the class had completed the exercise they wrote what they had imagined on cue cards and had them share with the class their thoughts. Although there was initial concern that this activity may be too difficult for students this young, the responses that the class gave on their cue cards and how they contributed to the class discussion afterwards was a pleasant surprise. Many of the
students were able to describe the careers they saw themselves in and the lifestyle that they were living.

**Activity eight – Meaning Activity**

For the final assignment the students were asked to further explore what was meaningful to them. The class was asked to pick one thing to describe about themselves that they believed was important in describing who they were. For example, students could discuss an activity, a value or a relationship. Students had to describe their choice in written sentences and also explain why it was important to them (see Appendix E for worksheet used). After completing this written portion, students were to visually represent their writing. To assist in clarifying this activity the students were read a selection from *Bridge to Terabithia*, by Katherine Paterson (see Appendix G resources used) and were shown a clip from the film version of the book where Leslie reads to the class about SCUBA diving and Jess is afraid to write about his love of drawing.

**Activity nine – Wrap up Concert**

This particular unit was drawn to a close with a teacher performance. Two songs were performed for the class by the career planning unit teacher. Songs were chosen that had lyrics related to the concepts that had been emphasized throughout the unit. The first song was *Firework*, by Kay Perry (see Appendix G for resources used) as it is a song with a message that every individual has a chance to shine if they are willing to work for it. This particular song was sung with the intention that students would leave with the belief that they can achieve their goals with hard work and perseverance. The second song that was sung to the class was *Colorful*, by Verve Pipe (see Appendix G for resources used) and was the first song that the teacher had learnt to play on the guitar and sing simultaneously and because of this it was an example that music is
something that is meaningful to the teacher. They lyrics of this song also provided the message that reinforces self-confidence and choices.

**Data on the Career Planning Unit**

Throughout the unit, the data that was collected included surveys, written assignments, visual representations, cue cards and word-processed assignments. The first piece of data collected was the student interest survey and this proved to be essential to the career planning unit as it enabled the teacher to learn about the students and establish a rapport with them. The numerous activities were all centralized around meeting the Life Roles and Career Development outcomes from the Alberta Health Program of Study. While assignments like the written and typed sentences were used for summative assessment, cue cards (functioning as exit slips) were used to give the teacher a sense of how the activities had been received. The cue cards were particularly useful with the Guided Fantasy activity, because it showed that the majority of the students were taking the activity seriously and thoughtfully. Aside from the cue cards, the student evaluation forms were extremely helpful in determining the effectiveness of the overall career planning unit (see Appendix F for forms used).

Out of the 20 students in this class 75-100% of the students participated in all eight of the career planning activities. During the Me, Myself and My Name activity many of the students were absent and this can account for the 25% that did not complete the activity (see Table 1).

Table 1

*Completion of Activities*

<table>
<thead>
<tr>
<th>Activity</th>
<th>I didn’t do it</th>
<th>I did it</th>
</tr>

<td>2 (10%)</td>
<td>18 (90%)</td>
</tr>
</tbody>
</table>
The Top Job 0 (0%) 20 (100%)
Guided Fantasy 1 (5%) 19 (95%)
Meaning Activity 1 (5%) 19 (95%)
Wrap-Up Concert 0 (0%) 20 (100%)

Note: On average 93% of the students participated in all of the activities.

As noted in Table 2, 95% of the students rated all of the activities as either ‘Good’ or ‘Great’. These students especially liked the Wrap up Concert, the Guided Fantasy and the story *The Top Job*. The benefit of using the stories in the career planning unit was further substantiated by the amount and quality of classroom discussion that followed each story. These stories were helpful in keeping the students engaged during the lessons. It is difficult to determine if the 10% of the students found the story *The Sneetches* ‘not good at all’, or the worksheet that accompanied the story, as the two activities (story and worksheet) were listed together in the Activity List on Table 2.

Table 2

*Perceived Helpfulness of the Activity*

<td>20 (100%)</td>
</tr>
</tbody>
</table>

Note: Of the 93% that completed the activities, 95% of the students rated the activities as either Good or Great.

In the *What did you like about the Life Roles & Career Development* unit question on the student evaluation form, students were able to mention some of the activities and aspects of the unit that they liked. Throughout the student evaluations many of the responses mentioned that
they liked the wrap-up concert and the guided fantasy activities. Some other common comments were that students liked the Sneetches activity, learning about responsibilities, learning about other people’s careers and they appreciated the fact that they were able to write about themselves.

In the *How could this unit be made better* question on the student evaluation form many students took the initiative to be honest and thoughtful in their responses. One response suggested that there should be more art themed activities; this could easily be implemented should the unit be used again, and in this way elements of the Art curriculum would be achieved as well. Many of the students appreciated the guitar playing and suggested that there be more music included in the unit. Other suggestions included improving the take-home question sheets, providing more time for the unit and including more action (more activities).

Overall the students agreed with the given statements of evaluation in Table 3. For the first statement, “This unit helped me to learn a lot about myself” 60% of the students answered “I Agree” and 40% replied “I’m Not Sure”. As a suggestion for future improvement more emphasis should be placed on the personal interests of the students so they may learn more about themselves through this exploration. 75% of students agreed that “This unit helped me to learn a lot about careers”. 75-80% of the students agreed to the final two statements, “This unit made me want to learn more about different careers” and “This unit made me excited about what I could do with my life” (see Table 3 for results).

**Table 3**

The student evaluations forms were worthwhile as they specified to the teacher what the strengths and weaknesses of the unit were and would allow a teacher to modify the unit accordingly before it was used again. The suggestions for future improvement were very helpful and it was surprising how much thought some of the students gave when composing their responses. For example, the suggestion to add more art activities to the unit was particularly interesting as it would be beneficial to expand this unit into other program areas. The other helpful suggestion was to increase the time spent on the unit; this would allow the teacher the flexibility to branch out into other curricular areas such as Art.

The most effective element of this career planning unit was expanding it across curricular areas and this was successfully accomplished. Branching the unit into Social Studies and Language Arts assisted in keeping the students engaged. Students are most engaged when they see the relevance in what they are being taught. When students perceive a linkage between Health, Language Arts, Social Studies and their eventual careers and relationships students become more engaged. An example of this is when one student reported how her father (a drafter) helped her build a model chair at home. When she shared her model with the class the students were able to take a moment to discuss the different skills, assets and responsibilities that her father would have in his career as a drafter.

**Implications of the Unit Plan and Future Directions**
The final Meaning activity (wherein students were to write sentences and draw a picture about what is meaningful to them) could have been executed more effectively. Specifically, a smoother transition between the discussion on responsibilities and meaning needed to occur. However, during the wrap up concert student responses for the meaning activity were revisited. This allowed them to understand the importance of meaning in career. For example, during this activity the teacher was able to demonstrate how using music in the classroom was meaningful to him.

The main improvement that could be made to this career planning unit was to work on and enhance the overall cohesiveness. By improving transitions between the three main topics of the unit, skills and assets, responsibilities and meaning, would help the students to understand the connections between each topic. Another improvement would be to widen the curricula that were covered by the unit. As previously mentioned Art would be included next time, and with some creativity Science could easily be incorporated. It would be interesting to take some time to find a way to bring Math curriculum/outcomes into the unit as well.

One positive implication of this unit was that it focused on showing how everyone is unique. Through exploring our skills, assets and responsibilities and sharing them with the larger group, students were able to see that each of them was unique from one another. Through the process of sharing and stressing the importance of respecting the responses of one another, students were able to gain comfort in themselves as well as with others.

Another positive implication of this career planning integration unit was that it not only required students to think from a Health class point of view, it required them to also view the unit outcomes from Language Arts and Social Studies perspectives as well. Each school subject area establishes a different approach to viewing and thinking about new information. Through
the implementation of this unit students were able to see the connection between career development and how it has a place in all subjects and all points of view.

**Conclusion**

While deciding on how to create this career planning unit it was easy to establish a link with the Health curriculum as it fit into those curricular outcomes directly, but in order to increase effectiveness and interest, other areas of study were also included. When analyzing the Health outcomes it was interesting to see how limiting they were when thinking about creating activities around career development. In truth, career development can be used to meet many of the Health outcomes.

Career development does and should encompass all aspects and subjects in school. Each subject has something to add to career development and students should be able to experience it in a variety of ways in which the core subjects can present. Such units that introduce students to the world of work and assist them in understanding the connection between what they are learning in school and what will be expected in the workforce are essential in promoting not only life long learning, productive classroom environments but also future successes in transitions from school to work life (Palladino Schultheiss, 2005).

While instructing this unit one may find that it creates an atmosphere for not only student learning but also for teacher learning as well, one cannot help but to learn something more about themselves while participating in these activities. It is important that while teachers instruct students about careers they should keep in mind that they are also continuing to develop their own careers. Even experienced teachers find that there is still much to learn about the way they continue to develop their careers as they teach students. Throughout the experience of teaching this unit one could not help but to learn more about what they value and what is meaningful to
them. If this unit is taught with the attitude that the teachers own career development is complete and stagnant, the results would not be effective and potentially skewed. The great thing about teaching is that learning is continuous for both student and teacher; this unit is not an exception to this experience. It is an intriguing feeling knowing that not only are students learning from the teacher but the teacher is also learning about the different potentialities of their own future career path.

Appendix A – Me, Myself and My Name worksheet
ME, MYSELF, AND MY NAME

My name is ________________________________.

I am ___________________________ years old.

My birthday is ________________________________.

The people in my family are ________________________________

My favorite kind of food is ________________________________.

My favorite color is ________________________________.

Appendix B - Sneetches Worksheet
Appendix C - Take Home Responsibility Questions

Dear Parents,

In Health class we are continuing our Life Roles and Career Development unit and we are starting to discuss responsibilities in the workforce, at home, and in the community. I have asked students to take home this list of questions to ask at least one parent and record the answers.

Take you for your help and time,

Name

Questions:

What is your parent’s job?

________________________________________________

What is one responsibility that they have at work?

________________________________________________

What is one responsibility that they have at home?

________________________________________________

What is one responsibility that they have in the community?
Appendix D - Guided Fantasy Script

GUIDED FANTASY: IDEAL LIFESTYLE
SCRIPT:

This is your fantasy. It will help you to dream of what you “really” want in your career and lifestyle. Try not to put up barriers for yourself. You will have a chance after the fantasy to come back to reality. For now, let yourself enjoy!!

Close your eyes and allow yourself to get as comfortable as possible. Take some deep breaths and relax. Let go of the tension. Notice if you are holding tension anywhere in your body. Tighten that muscle and then relax.

Think of yourself, somewhere 20 years in the future! This will be enough time to take further education towards the career you want.

See yourself waking up in the morning. Look around the room, before you even get out of bed . . . Now it is time to get up. Look around your home as you go to the kitchen for breakfast. Is there anyone there?

Now it is time to get ready for work. Return to your bedroom and look through your wardrobe considering what you will wear today. Is it something quite casual or will you wear a business suit, maybe you have a uniform to wear. See yourself getting dressed for work.

You leave now to go to work. Before going in, look around at your place of work. Is it a large or small building? Do you work inside or outside? Is it an institution, such as a school or a hospital that you are going into? As you go in, see who is there. What is the atmosphere like? . . . Is it fast paced and hectic or slow and relaxed? Are there lots of people or just one or two others or are you alone? Who greets you? Who do you talk to?

As you start your day’s activities, think about what you will do at work that day. Think of the kind of skills you will be using and the tasks you will be doing . . . Will you work with people: teaching, helping, curing? . . . Are you designing, writing, working with your hands, drawing? . . . Do you work with numbers? . . . Do you work on a computer? . . . Do you work alone or is there a group of people working with you? Imagine yourself going through your morning activities.

Now it is time for lunch, how will you spend your lunch hour? . . . Consider the ways you could spend your time. Have you brought a lunch or will you meet someone for lunch? . . . Maybe you are so busy that you work right through your lunch hour or do you have an activity that you do over the lunch hour? Imagine yourself enjoying your lunch time.

The afternoon is here. Will you return to work? Will you return to the same place of work? If not, consider what you will do and where you will go. Do you do the same activities in the afternoon as you did in the morning? . . . Do you have a major project that you are completing or do you do different tasks in the afternoon? Think about who you are working with . . . are they young or old? . . . mostly males or females? . . . What is your supervisor like or are you the supervisor? See yourself going through the afternoon’s activities.

It is the end of the working day. See yourself getting ready to leave. Think back over your day and think of one thing you did that gives you a sense of accomplishment.

How will you spend your evening? Will you go out to dinner or go home? . . . Do you spend your time with others or are you alone? Think about the activities that you could do in the evening. Have you brought work home? . . . Will you take a course or maybe teach a class? . . . Imagine yourself enjoying the evening’s activities.
Now it is time for bed. As you turn off the lights in your home, have one last look around. Just as you drift off to sleep, think of one thing you are really looking forward to doing tomorrow.

Now the fantasy is over. Take a few minutes to become oriented to the room again. When you are ready open your eyes and write what you imagined in your ideal fantasy.
Appendix E - Meaning Activity Page

**Abstract**

This article presents a combination of qualitative and quantitative data regarding the effectiveness of integrating a career planning unit with the Alberta grade 8 Spanish curriculum. This unit combined Alberta Education Curriculum outcomes from Spanish Language and Culture program of studies and Information and Communication Technology, with aspects of career planning. The career planning unit is clearly laid out with descriptions of its activities along with the resources and evaluation templates that were utilized. This particular career planning unit was delivered to a small grade 8 Spanish class of 9 students, in an urban working class community located in Southern Alberta. Students evaluated the unit favorably with 89% reporting that this unit assisted them in learning a lot about careers, and 78% reporting that the unit both excited them about what they could do with their lives and made them want to learn more about different careers. The integration of career planning with the grade 8 Spanish curriculum is proven to be effective by combining the acquisition of a second language with increased student self awareness, goal setting ability, appreciation for different cultures and understanding of how a second language may assist in attaining future employment. Further longitudinal studies following the academic and career paths of students who have participated in this sort of career planning/curriculum integration would be beneficial in understanding the long-term outcomes associated with it.
Career Planning Integration with Spanish at the Grade 8 Level

Introduction

Linking curricular objectives and learning activities to the world of work has been a task increasingly assigned to teachers over the last few years. Nonetheless, schools are just beginning to create and incorporate career planning units across the K-12 level, integrating career planning activities with curricular objectives. As such, few studies have attempted to identify and examine how children explore the world of work and develop their initial, tentative occupational goals by focusing on their personal interests, beliefs and values (Hartung, Porfeli and Vondracek, 2005). This paper will demonstrate how student interests, values and beliefs can be incorporated and developed in a career planning capacity through the use of a career planning unit in a Grade 8 Spanish class.

Career planning encompasses more than just selecting an occupation. Rather, it is a lifelong journey consisting of self-discovery and insight along the way. One could utilize the terms career planning and life planning interchangeably. One key element of the career planning process is to assist individuals in learning about themselves; this self-awareness is fundamental to successful life planning. Therefore, it is important for the career planning process to begin early on in a student’s life. Hartung, Porfeli and Vondracek (2005) suggest there is evidence that steady progress in vocational exploration, awareness, aspirations and expectations, interests and adaptability in the early school years assists the development of personal identity and
connections with the social and interpersonal world. Students of all ages should be exposed to elements of the career planning process throughout their school years.

As teachers, we can assist students in their recognition and development of their unique interests, traits, skills and talents. Children need to know and recognize that he or she has something unique to contribute to their community. Activities to assist students in gaining awareness and appreciation for individuals within their classroom and other cultures are presented in this paper. This career planning unit will outline how to integrate career counselling practice with Alberta Education’s grade 8 Spanish curriculum. The activities summarized in this paper are not meant to replace curriculum, but to supplement existing curricular outcomes. These activities may assist teachers in pre-assessing the readiness of a Spanish class to discover their interests and to gain perspective on their individual learning styles, while simultaneously providing a relevant and engaging second language-learning environment. Throughout the career planning activities students learned self-exploration techniques and were encouraged to consider and discuss their personal interests, thus increasing self-awareness, but also increasing the meaningfulness of the Spanish grammar and vocabulary that they were also learning. This paper describes the context of the teaching environment, provides a detailed description of the learning activities, presents data on the effectiveness of these learning activities and concludes with ideas on the implications and future directions for integrating career planning activities into grade 8 Spanish classrooms.

**Context of Teaching Environment**

The Spanish career planning integration unit was implemented in a middle school located in an urban center in Southern Alberta, in a comparatively more working class area of the community. This community had a population of about 88,000 people, and the school, in
comparison with other middle schools in the community, had a much higher population of students with Individualized Program Plans (IPP’s) as well as a large number of students learning English as a Second Language (ESL). The multicultural student body at this school provided an excellent setting to promote the global citizenship aspects of the Spanish curriculum. In this particular class, there were not any ESL learners, however there was a student with a learning disability who struggled to focus throughout the class period.

The Spanish 8 class at this school was an introductory course; therefore students were all beginning with no prior, or limited, Spanish language knowledge, aptitude or experience. Consistent with many language classes in Alberta, the enrollment was fairly small, with only 9 students in this class. The small size of this course was initially thought to be an advantage, giving the teacher more time to spend with individual students as they navigated the process of self exploration; however with this particular group, the small student numbers tended to have a tranquilizing effect. Students were not extremely willing to share their goals in such an intimate setting; this phenomenon will be discussed later in the future implications section of this article.

Socioeconomically, the majority of the students in this class came from working class homes. While discussing careers and quality of life, almost all of the students admitted that their parents were not happy with their current careers. This was a meaningful discussion that occurred, as students were able to realize that they too could quite easily end up in a dissatisfying job like their parents. The hope was that from this unit, students would be motivated to dream big and to make smart decisions in their lives currently that could assist them in being successful later in life.
The Grade 7-9 Spanish Language and Culture Program of Studies has a clear and specific learning outcome of Personal and Career Opportunities under the general outcome of Global Citizenship (Alberta Education, 2010), specifically:

- Identify aspects of the history of the cultures of the Spanish speaking world that are of personal interest;
- Explore aspects of different cultures that are of personal interest;
- Explore personal reasons for learning Spanish;
- Explore personal reasons for learning additional languages and experiencing other cultures.

There were also many outcomes under the General Learner Outcomes of Application in the Spanish curriculum that was met through the use of this career planning unit. Specifically, that student’s will use the Spanish language to:

- Impart and receive information
  - Students will be able to:
    - Understand information, such as definitions, comparisons and examples;
    - Provide simple explanations; e.g., an enchilada is a Mexican food.

- To get things done
  - Students will be able to:
    - Respond to and make suggestions in a variety of situations and state personal actions;
    - State personal actions in the present;
    - Manage group actions;
- Express appreciation, enthusiasm, support and respect for contributions of others;
- Offer to explain or clarify (Alberta Education, 2010).

Career development outcomes for students were met through their participation in this unit as they had the opportunity for self-exploration, introspective reflection to assist in their identification of the true meaning of their interests, and motivation to complete and excel in the career planning activities. The students also utilized blogs, PowerPoint and other electronic resources to conduct research and present material in projects, which also achieved outcomes from the Information and Communication Technology Program of Studies learning outcomes:

- Students will use electronic research techniques to construct personal knowledge and meaning (Alberta Learning, 2003).

This paper will now provide a detailed description of the learning activities within the career planning unit.

**Detailed Description of Learning Activities**

The career planning activities were designed to engage any Spanish language learner, regardless of ability, background or familiarity with the language. These activities could easily be adapted to any level of Spanish, with the main alterations being made around increasing the amount of reading and writing done in Spanish representative of the level required for the course. Each learning activity will now be fully described.

**Activity One – La Fiesta (the party)**

Students are asked to imagine they are at a fiesta (a party) that has six different rooms containing certain types of individuals within each room. It was explained to the students that the people within these groups/rooms all share interests and personality types according to the
Holland’s Occupational Themes (see Appendix A for handout used). It should be noted that the names of the themes have been changed to the infinitive forms of the verbs that represent them, thus making comprehension at a beginner’s Spanish level more achievable.

The students were shown different posters that represented the different fiesta (party) rooms (see Appendix B for posters used). These posters were placed in different areas around the classroom. It was important that the students understood that the images and sentences outlined on the posters were only a sample of the many possible examples for those particular occupational themes; the themes were not restricted to the poster depictions. Students were allowed to move freely around the room to examine each poster and then to choose which room they would consider being a part of. If the students did not understand some of the words on a poster they were encouraged to look up the terms in a Spanish-English dictionary.

After selecting the fiesta (party) rooms that they felt suited them the best, the class participated in a discussion about how personality types can influence the types of jobs that people find interesting. For example one girl in the class was very artistic and the teacher discussed some potential career options that fit with an artistic personality type, for example an artist, cartoonist, photographer etc. This led into a discussion of how a person who has one personality type may not be interested in or well suited for careers that other people were. The teacher asked the students what they thought would happen if one of them was interested in art and one was interested in computers, but were in careers that were suited for the other person’s interests. The students discussed how the artistic person would probably hate working with computers and vice versa. The class then discussed why it was that some adults may dislike the their current jobs, and how interests and personalities may be a reason for this dislike. It was emphasized how knowing their interests and likes can assist them in choosing a career that they
will enjoy as adults. Choosing classes and programs that allow them to work towards a career in
the area of their interests was also discussed, along with how second language classes, like
Spanish, could assist in enhancing their career options.

**Activity Two – Los Próximos 10 años (The Next 10 Years)**

Students were asked to reflect and dream about possibilities as they thought about what
they would accomplish over the next ten years. The purpose of this exercise was to assist the
students in finding out what is truly meaningful to them, as well as allowing the teacher to see
what the students’ individual interests were. The teacher used this information to create options
for future learning activities according to those interests disclosed by the students. Students were
told to imagine that it was the year 2020 and after 10 years without seeing each other, they had
come to visit their teacher. The teacher (in 2020) asks the student’s future self, “What have you
done in the last 10 years?”

A discussion was started by the teacher, hoping to have students share some of their
insights and dreams, but it was apparent that the students had reservations about sharing and
discussing these personal ideas with one another, so students were asked to write down what
their response to the teacher would be (see handout provided in Appendix C). There were no
rules associated with this activity, students could write about their job, relationships, and
activities they engaged in, dreams or even nightmares. Students were asked to be open, honest
and sincere in their responses, and upload their completed assignments using Moodle (a learning
management system utilized by this school).

**Activity Three – Me Gusta (I like it)**

In order to assess comprehension of “me gusta” (I like it) sentences, a listening activity
assisted students with internalizing the significance of the phrase “me gusta” (I like it), as well as
enable students in distinguishing it from its negative “no me gusta” (I do not like). To practice this before hand, the teacher would say a verb to the class in Spanish (with actions to assist in comprehension) and have the students respond with ‘me gusta’ (I like it) or ‘no me gusta’ (I do not like it) according to their own interests.

The students were then given a quiz to assess their ability to distinguish a negative phrase from a positive one. This was a very basic and easy comprehension assessment (see Appendix D for assessment used). To adjust the quiz for students in higher-level Spanish courses, an instructor could administer the quiz in a dictated style, where the sentences were spoken and the students would record the dictated speech. As students noticed their responses to the ‘me gusta’ (I like it) quiz they were able to form a clearer picture of what their particular interests were, thus enhancing their self-awareness.

**Activity Four – Mi Día Ideal (My Ideal Day)**

In this activity students were asked to describe their ideal day. The Mi Dia Ideal (My Ideal Day) activity was initiated after a lecture on tense conjugation and telling time. The students were asked to describe their perfect day by writing 5 things that they would do throughout the day and at what time they would do each of them. This activity was completed twice, the first time in English in order to expedite the thought process, allow them to dream freely and to come up with meaningful responses without being concerned about how to state them in Spanish.

After the students had clarified, in English what their Mi Dia Ideal (my ideal day) was the teacher assisted the students in choosing Spanish verbs to appropriately describe their chosen ideal day activities. The teacher showed the students the infinitives for their responses and encouraged the class to try and conjugate them using the patterns that were discussed in the
lecture. When the students were ready to put their information into their activity table (see activity sheet used in Appendix F), the class used an interactive website (see Appendix H for resource used) as a reference to assist them in determining the difference between *de la mañana*, *de la tarde*, and *de la noche* (in the morning, in the afternoon and at night). Students created their timeframes by searching for clipart on the computer and inserting graphics to represent the different things they would do throughout the day.

When the class had completed their timeframes of their ideal day, they discussed within small groups how their days differed from one another’s. The discussions were held in English, as it was important for the students to have quality discussions, this was not going to be possible with their limited Spanish language capabilities at this time. The teacher asked the students to think about how it was they could make these ideal days a reality, by thinking about what choices they could make now, what planning they could do that would assist them in taking steps towards achieving the goals outlined in their ideal day.

**Activity Five – Choose Your Own Adventure**

As a culminating activity students were given a ‘Choose Your Own Adventure’ assignment. This assignment was meant to assist the students in continuing to discover their personal interests, while learning about Spanish culture and important Spanish speaking figures throughout history.

Students chose their Adventure from a list of options that the teacher generated to reflect the various Holland’s Occupational codes. The topics were generated from the teachers reading of their Me Gusta (I like) and Me Dia Ideal (my ideal day) activities, these more personalized topic choices created enhanced meaning to the students as individuals. Students could pick any of the options, but tended to choose the assignment that involved a topic linked to the theme they
had previously identified with in the earlier activities. The topics (Adventures) that students could choose from were:

- **Doer**: Report on the World Cup and team Spain. Tell the class about the World Cup finals game. Who won? How did the game go? Who was the best player on the winning team? Share some reactions of people from the country that won. Write a “me gusta” (I like) sentence about soccer or the World Cup.

- **Thinker**: Find stats on Spanish speakers. Tell the class how many Spanish speakers there are in the world? Which countries have the most? What are the main industries, foods and/or famous people in these Spanish-speaking countries? Write a “me gusta” (I like) sentence about Spanish speaking countries, people or about finding stats and information.

- **Helper**: Have a meeting during lunch or after school with your teacher to prepare questions to ask a Spanish-speaking student about how difficult it has been to move to a new country. Ask him/her questions about their life, personality, likes and dislikes. Get to know them a little bit and then write a report on how the class can help him feel more at home here at our school. Write a “me gusta” (I like) sentence about getting to know people or helping people.

- **Conviner**: Write a speech that you could give convincing other students they should take Spanish. Talk about why it is important to learn Spanish. What benefits could it bring to their life? Why you took Spanish? Why is Spanish important even here in our city? Write a “me gusta” (I like) sentence about learning Spanish.

- **Organizer**: Report on the geography of Spanish Speaking countries. How many Spanish-speaking countries are there? Tell the class about the different regions of Spanish speaking countries, for example Central America, the Caribbean, the Cone etc. Show the
class on a map where these countries are. Tell the class about the different landscapes such as: important mountains, rivers, lakes or oceans that are in Spanish speaking territories. Write a “me gusta” (I like) sentence about geography, organizing or working alone.

- **Artist:** You can pick to report on music (reggaeton), art (Frita Kahlo, Picasso or Diego Rivera), or literature (Neruda). Feel free to choose to do them all if you like. Tell the class where the chosen Artist was from and what their work or style was. Give some examples of their work (i.e. A reggaeton song, a painting from Kahlo or a poem by Neruda.) Tell what you think about the art and then write a “me gusta” (I like) sentence about art.

Students were asked to complete their chosen Adventure over the next week. After the week was up, students would then present to the class what they had worked on. Students were instructed that they must write one sentence that explains to the class something that they liked about their individualized assignment. For example, if the task was to draw the Mexican flag, a student could write and say: *Me gusta dibujar* (I like to draw). All students would be expected to share with the class what their task was in a 1-2 minute oral report in English. Students would explain what their task was and what they did or did not like about the task. Then the student would teach their ‘me gusta’ (I like) sentence to the class. The written report to accompany this assignment was expected to be ½ - 1 page in length (in English) (see Appendix E for student handout/template used).

After all of the presentations were completed the class discussed how having a choice in topics and being able to choose to work on something they were personally interested in changed their learning experience and interest in learning about Spanish cultures. The teacher discussed
how there is something for everyone when learning about Spanish and other cultures of the world, like in Canada other counties have hobbies, histories and other interesting facts that are comparable to what we enjoy here. Researching topics that are of interest to the students creates more dedication, passion and interest. Having the flexibility to choose their area of focus also created more autonomy and further enhanced their self-awareness. Ultimately, this unit taught students that learning is more enjoyable when we are learning about things that are of interest to us. Similarly, working in a job that is of interest to us is more enjoyable than working in a job that is not of interest to us. Simply put, students learned that they must think about their likes, dislikes and interests and to plan accordingly to ensure a happier future.

**Data on the Career Planning Unit**

The career planning activities were assessed by an evaluation given to the class at the culmination of the unit. Students were given a *Career Coaching Across the Curriculum: Student Evaluation Form* to complete. This form had three sections on it where students could evaluate different aspects of the unit: completion of activities, perceived helpfulness of the activities and overall evaluation of the career planning unit (see Appendix G for the evaluation used). The results from each section of the data collected will be discussed individually.

As indicated in Table 1 the majority of the students, on average 89%, completed all of the activities within the career planning unit, with the exception being the *Choose Your Own Adventure* activity where 3 of the 9 students were absent. It should be noted here to keep in mind the small sample size of this class when interpreting the results of the feedback.

**Table 1**

*Completion of Activities*

<table>
<thead>
<tr>
<th>Activity</th>
<th>I didn’t do it</th>
<th>I did it</th>
</tr>
</thead>
<tbody>
<tr>
<td>La Fiesta (the party)</td>
<td>1 (11%)</td>
<td>8 (89%)</td>
</tr>
</tbody>
</table>
Students perceived the individual activities positively with the majority, 98%, indicating that the activities were either Good or Great (see Table 2). Only one student indicated that they did not find the Los Próximos 10 años (the next 10 years) activity good at all. It should also be noted that La Fiesta (the party) and Los Próximos 10 años (the next 10 years) data was calculated out of 8 students total, as one student was missing from each of those activities and the Choose Your Own Adventure was calculated out of 6 students as 3 were missing the day that this activity was completed.

These activities helped to differentiate the learning within the classroom as the students had the opportunity to explore personal interests while learning Spanish vocabulary. Students were engaged and participated well in classroom activities and discussions, which all had a clear purpose to the Spanish that they were learning, and allowed them the opportunity to consider their individual interests and reflect on how they were different from others within the class.

**Table 2**

*Perceived Helpfulness of the Activity*

<table>
<thead>
<tr>
<th>Activity</th>
<th>Not good at all</th>

<td>3 (83%)</td>
<td>3 (17%)</td>
</tr>
</tbody>
</table>

*Note: Of the students that completed all of the activities, 98% of the students rated the activities as either Good or Great.*
When evaluating the entire career planning unit as a whole (Table 3), students agreed very much that the unit helped them to learn a lot about careers, made them excited about what they could do with their life and made them want to learn more about different careers with 67% of the students on average agreeing that all four unit outcomes had been met. Interestingly, only 22% agreed that the unit “helped me to learn a lot about myself” and 67% were not sure if they had learned a lot about themselves. This teacher perceived these students at the beginning of the unit, as confident in what they thought they liked, didn’t like and what their interest and future directions were. However, these activities challenged the students to reconsider all this. This left the students in a state of disequilibrium and therefore when asked to evaluate the degree to which these activities helped them learn more about themselves, their ratings were poorer (22%) than expected. The activities may have created a sense of not being so sure of who they thought they were or what their future path should be, thus influencing the greater number of students indicating that they were not sure if they had learned a lot about themselves (67%). Students may not have realized that this self-awareness and questioning did in fact increase their knowledge about themselves, even if it initially had generated a sense of uncertainty. Essentially, this state of disequilibrium eventually forced students into a process of adaptation regarding their view of themselves.

*Note: On average, 67% of the students Agreed that the career planning unit met the four objectives.*

**Implications of the Unit Plan and Future Directions**

When the career planning unit was introduced to the class, unexpectedly the students were not enthusiastic. This could have been due to a tendency for middle school aged students to
equate discussions about careers to the not as popular Health class. The unit had to be explained and ‘sold’ to the students to assist in changing their initial perspectives about the proposed career planning unit.

As was previously mentioned, there was a student who had some learning difficulties and as such tended to give up on tasks very quickly if they were perceived as difficult. For example, the student was not willing to participate in the Choose Your Own Adventure activity when it was presented in class. The student was not willing to choose any of the options given within this activity (this is most likely indicative of the lack of appealing options for this particular student). This student ended up missing the deadline for the assignment, but when offered to come up with his/her own topic, the student eagerly chose a video game as an area of interest. With some hesitation (due to the irrelevance it had to Spanish culture) the teacher allowed the student to pursue this option. This topic had the most meaning to the student and as such they were able to complete the task by writing a ‘me gusta halo’ (I like halo) sentence.

This particular obstacle was evidence of how important it is for students to find meaning in the activities and tasks that they are asked to complete. Finding meaning was the main objective of the career planning activities. It was difficult at times to assist students in finding meaning in studying Spanish and in finding interesting or diversified tasks for students to complete that held importance for them individually, however, it was not impossible. Once students worked collaboratively with the teacher to discover what their interests were, meaning for the students was infused into the activities. By utilizing some creativity, a teacher can modify any activity or curricular item to enhance meaningfulness for their students.

Another obstacle encountered while administering this career planning unit was the minimal amount of spoken Spanish that was used throughout the activities. For optimal second
language acquisition, the target language should be used as much as possible, preferably exclusively, but throughout this unit students had to build a bank of phonemes with significance in Spanish. The challenge in the unit and activity execution was in explaining the exploration process in Spanish in a way that the students were able to understand well enough to precede with the activity. In this particular class activities were explained in English, but with careful planning it could be accomplished in Spanish with the use of a combination of conjunction and gestures, visual aids and simplified language.

Another purpose for this career planning unit was to achieve relevant and motivating second language learning opportunities. Second language acquisition is most effective and significant when put into as real and as relevant of a context as possible. This Spanish class used the Spanish language to express their personal interests and preferences, making the learning relevant and authentic as the majority of the material and activities were completed in Spanish. This Spanish utility provided a meaningful context by which students were motivated to learn the necessary vocabulary and grammar needed to express their individual interests.

More focus could have been placed on the ‘dreaming big’ idea to allow students to engage in the career planning process and in potentially breaking away from their perceived social reality of what others have told them to do. In class discussions allowed a space for students to recount their dreams and to express or create goals and aspirations for their futures. Again, not only were these discussions personally meaningful for the students themselves, but at times they did not even notice how effective it was to teach Spanish through a career planning process.

In the future these career planning activities could also include lessons on how to write e-mails in Spanish to allow students the opportunity to communicate with local Spanish speaking
professionals who have careers in which the students were interested. There is a possibility to enhance and practice networking skills and talent pooling as some ‘experts’ could team up with others to work on group projects that would enlist all of the participants collective expertise to complete. It would also be beneficial to the effectiveness of the career objectives for this unit to explore the possibility of having a Spanish-speaking community member in as a guest speaker to talk to the class about their career, life, and experiences as someone who has emigrated from another country. This was in fact a suggestion from one of the students on one of the evaluation forms.

**Conclusion**

Student learning and engagement is exponentially enhanced when the material and activities are of relevance to the learner. This career planning unit provided meaningful activities that lead to engaged discussions and independent learning. Tasks were purposefully differentiated throughout the unit in order to cater to the individual learning styles and interest profiles of each student, thus allowing every student, regardless of developmental level or Spanish proficiency, the opportunity to excel on each assignment.

Through participation in a career planning process at a comparatively young age, these students increased their self-awareness and understanding of what their futures may look like. They became better equipped to make decisions concerning things like course selection and how this affects their future academic careers and thus employment opportunities. Students were encouraged to do what is natural to them, to investigate their interests, to dream and understand what it is that motivates them and what is needed in order to achieve those dreams.

The students who participated in this career planning unit gained an appreciation of and an increased ability in the Spanish language and associated culture, which only increased with
the acquisition of genuine Spanish communication skills. Through discussions students were able to recognize the presence and importance of hard working immigrant professionals within their community, and as such became better global citizens as they enhanced their appreciation for the interconnection of cultures and nations. The benefits of obtaining a second language to enhance opportunities in future employment situations were also realized.

Appendix A

La Fiesta (the party) Activity

You are at a party and you see that there are 6 different groups of people hanging out. You listen in on what they are saying and this is what you hear. Each group is talking about things they are interested in. You need to choose the one group that you would be most interested in hanging out with as well as one group that you would NOT like to be a part of.
Appendix B

Hacer – (to do)

Me gusta jugar deportes.  (I like to play sports.)
Me gusta trabajar con mis manos.  (I like working with my hands.)
Me gusta campear  
(I like camping.)

Me gusta hacer ejercicio. 
(I like to exercise.)

¡Soy activo! 
(I’m active)
Pensar (to think)

Me gusta hacer matemáticas y ciencias.  
(I like to do math and science.)

Me gusta mirar el cielo.  
(I like to watch the sky.)

Me gusta pensar.  
(I like to think.)

Me gusta investigar.  
(I like to investigate.)

Soy inteligente  
(I am intelligent)
Crear (to create)

Me gusta pintar.
(I like to paint.)

Me gusta hacer diseños.
(I like to make designs.)

Me gusta la música.
(I like music.)

Me gusta la moda.
(I like fashion.)

Soy creativo
(I am creative)
Ayudar (to help)

Me gusta enseñar
(I like to teach.)

Me gusta ser voluntario.
(I like to volunteer.)

Soy popular
(I am popular)
Convencer (to convince)

Me gusta vender cosas.  
(I like to sell things.)

Me gusta debatir.  
(I like to debate/discuss.)

Me gusta hablar.  
(I like to talk.)

Yo soy un líder  
(I am a leader.)
Organizar (to organize)

Me gusta trabajar sólo. 
(I like to work by myself.)

Me gusta la computadora. 
(I like computers.)

Me gustar organizar. 
(I like to organize.)

Me gusta limpiar. 
(I like to clean.)

Estoy organizado 
(I am organized)
Appendix C

Los próximos 10 años (the next 10 years) 2010

Es el año 2020 y después de 20 años sin vernos, tu vienes a visitarme. Te hago la pregunta ¿qué has hecho en los últimos 10 años?

Ahora, escribe lo que me responderías. No hay reglas. Puede tener que ver con el trabajo o no. Puede tener que ver con relaciones, actividades, sueños o pesadillas. Lo que tu quieras. Lo único que pido es que sea sincere.

It’s the year 2020 and after 10 years without seeing each other, you come to visit me. I ask you the question, what have you done in the last 10 years?
Now, write what you would respond. There are no rules. It can have something to do with a job or not. It can be about relationships, activities, dreams or nightmares. Whatever you want. The only thing I ask is that it be sincere.

¿Qué has hecho en los últimos 10 años? (What have you done in the last 10 years?)
Appendix D

Nombre (Name): __________

Listening Activity

Listen to the following sentences and decide whether the speaker said that they like the activity or not. Write “me gusta” (I like) or “no me gusta” (I do not like) in the box to the left of the verb when appropriate.

*I.e. If the speaker says that they like eating*
*Me gusta comer.*

Choose Your Own Adventure

Select one of the following tasks to accomplish within the next week. The following Wednesday everyone will present to the class what they did the week previous.

You MUST write one sentence that tells the class about something in your assignment that you like. I.e. If your assignment was to draw the Mexican flag you could say: Me gusta dibujar (I like to draw)

Everyone will have the opportunity to share with the class what they did in a 1-2 minute oral report where you will explain what you did and what you liked or did not like about it. Then you will teach your “me gusta” (I like) sentence to the class.

Your report should be ½ to 1 page long (in English). You will have a title and your name at the top of the sheet and the first line will be indented. At the bottom of the page you will write your “me gusta” (I like) sentence.

You will not have time to work on the assignment on Monday so if you have questions about how to do the assignment you must come see me at lunch or after school any day.

</table>
Adventures
Choose ONE

Doer: Report on the World Cup and team Spain. Tell the class about the World Cup finals game. Who won? How did the game go? Who was the best player on the winning team? Share some reactions of people from the country that won. Write a “me gusta” (I like) sentence about soccer or the World Cup.

Thinker: Find stats on Spanish speakers. Tell us how many Spanish speakers there are in the world? Which countries have the most? What are the main industries, foods and/or famous people in these Spanish-speaking countries? Write a “me gusta” (I like) sentence about Spanish speaking countries, people or about finding stats and information.

Helper: Have a meeting during lunch or after school with your teacher to prepare questions to ask a Spanish speaking student about how hard it has been to move to a new country. Ask him/her questions about their life, personality, likes and dislikes. Get to know them a little bit and then write a report on how we can help him feel more at home here at our school. Write a “me gusta” (I like) sentence about getting to know people or helping people.

Convincer: Write a speech that you could give convincing other students they should take Spanish. Talk about why it is important to learn Spanish. What benefits could it bring to their life? Why you took Spanish? Why is Spanish important even here in our city? Write a “me gusta” (I like) sentence about learning Spanish.

Organizer: Report on the geography of Spanish Speaking countries. How many Spanish-speaking countries are there? Tell the class about the different regions of Spanish speaking countries, for example Central America, the Caribbean, the Cone etc. Show the class on a map where these countries are. Tell the class about the different landscapes such as: important mountains, rivers, lakes or oceans that are in or on Spanish speaking territories. Write a “me gusta” (I like) sentence about geography, organizing or working alone.

Artist: You can pick to report on music (reggaeton), art (Frita Kahlo, Picasso or Diego Rivera), or literature (Neruda). Feel free to choose to do them all if you like. Tell the class where the chosen Artist was from and what their work/style was. Give some examples of their work (i.e. A reggaeton song, a painting from Kahlo or a poem by Neruda.) Tell what you think about the art and then write a “me gusta” (I like) sentence about art.
Appendix F

Mi Día Ideal (My Ideal Day)

It’s time to design your ideal day and write it down **en español (in Spanish)**! Tell me at least five things you would do on your ideal day, and tell me at what time you would do it. Then draw, paste or use clipart to illustrate your action.

The adjustment of internationally adopted children from Ethiopia: Parents' perspectives on issues of race, culture, identity and education

Nathalie Piquemal, Barbara Lebow, Tatiana Galetcaia, Carolyn Warkentin

Abstract:
Drawing upon the multifactorial model of parenting lens (Belsky & Vondra, 1989), this paper reports on findings from a funded study which, through qualitative interview data, explores the risk and protective factors that either hinder or enhance parenting in international adoption, with special attention to children internationally adopted from Ethiopia and to issues of intercultural/interracial parenting, race and culture, as well as attachment. The findings are organized around the following themes: Parenting characteristics; cultural and racial issues in schools and within family settings; and attachment. While findings suggest that parents feel unprepared to properly deal with loss and grief related trauma experienced by their children, findings also show that adoptive parents exhibit characteristics of resilience, commitment and proactive engagement, particularly in areas of heritage culture, attachment, and social support. Our findings also suggest that parents exhibit topic avoidance or remain, overall, unresponsive to issues of race. This study sheds light on the need to better prepare adoptive parents to issues of race in transracial families and to grief related trauma in international adoption.

Key words: International adoption, parents, parenting, qualitative research, race, culture, education, attachment, social supports, transracial

---

1 Research for this paper was supported by the UM/SSRHC Research Grants Program (Grant # 41317), at the University of Manitoba, Canada.
Introduction and research context

Despite widespread findings from studies around Romanian orphans adopted into Canada showing significant adjustment difficulties for children who have spent a large period of time in institutional care (Chisholm, 1998; Morison, Elinor, Ames & Chisholm, 1995), much of the research on international adoption shows, with consistency, that there is strong evidence of recovery and improvement following adoption (Welsh & Vianna, 2012; Palacio et al., 2011; Morison & Ellwood, 2000; Roby & Shaw, 2006; Trolley, 1994; Bartholet, 2006). Much research has shifted away from a deficit model focused on disabling factors to a social constructivist model that includes enabling factors.

Specifically, research shows that adoptive parents and children do better if they have stable, supportive relationships with extended family members and friends, have the support of a spiritual/religious community (Brodsky, 1999), receive respect of their heritage, and their cultural identification is a source of pride (Geissler, 1998). However, more research is needed on the factors that promote and support parenting in international adoption, as very few studies have focused on the experiences of adoptive parents themselves. Among those studies that do focus on adoptive parents, there is evidence to support that adoptive parents feel “less prepared for psychological and emotional challenges with their child, while they were most prepared for financial and cultural issues” (Paulsen & Merighi, 2009, p. 13). Studies also point to the need for more support during the post-adoption period, particularly in the area of mental and emotional health (McKay et al., 2010). However, studies also suggest that stress is not necessarily higher for adoptive parents as it is for biological parents, and, in fact, is even found to be lower (Gavin et al., 2005; Goodman, 2004; Mayberry et al. 2007), thus making the need for nuance between families through birth and families through adoption explicit.
Within the public arena, international adoption has been the topic of much public debate, ethical and, sometimes, political controversies. These debates and controversies, pervasive in public and social media, range in focus from a romanticized view of international adoption as a humanitarian undertaking to corruption and deception, thus pointing to the need for better informed discussions and debates, all of which ultimately influence decisions about those who are most vulnerable, namely orphaned children.

This paper reports on findings from a SSHRC funded study which, through survey and interview data, explores the risk and protective factors that either hinder or enhance parenting in international adoption, with special attention to children internationally adopted from Ethiopia through a Canadian international adoption agency. Reasons why adoptive parents deserve research attention is three-fold: (1) there is a dearth of research focusing on the factors that affect parenting in international adoption; (2) Adoptive parents’ experiences and perceptions present unique and significant challenges, particularly when positioned in a trans-racial context; (3) Notwithstanding the uniqueness of the adoption experience, there is transferability to be found in issues of displacement, race and cultural identity, attachment, and intercultural/interracial relationships.

**Research questions and methodology**

The purpose of the study is to identify the factors that either hinder or promote positive family adjustment, with special attention to personal factors (identity, beliefs, personal experiences) as well as contextual factors (support system, family context, social and
cultural context) and through the experiences and perceptions of adoptive parents. The specific questions that guided this study are as follows:

1. How do parents make sense of their adoption journey, with special attention to beliefs and strategies about parenting an adopted child, perceptions of their own adjustment to cultural and racial issues, attachment issues, as well as experiences with, and perceptions of, support networks?

2. What are parents’ experiences and perceptions of their adopted children’s process of adaptation, with special attention to attachment and sense of belonging to family, race, cultural identity, and heritage culture? Specifically, what are the factors, both contextual and personal, which, according to parents, have either facilitated or hindered their family’s adjustment? Last, to what extent have parents developed strategies to support such adjustment?

A qualitative approach using a semi-structured interview was used to collect data. Specifically, 16 families who have adopted children from Ethiopia, were recruited as research participants. Qualitative analysis began with verbatim transcription of interview tapes. Data was examined systematically to reveal patterns, which was then coded for in-depth analysis in the three groups of factors outlined in the theoretical model, namely child factors, parent factors, and social support factors.

At the time of interview, research participants were between 29 and 54 years of age, with most of them in their forties. Most of the research participants were married (13) while three (3) adopted as single parents. Two-third of the participants had one or two biological children before adopting. Research participants had been adoptive parents for two to ten years. In the interviews, they were asked to focus on those children of
theirs who were school-aged.

**Theoretical framework**

The multifactorial model of parenting was used as a theoretical lens (Belsky & Vondra, 1989). This model assumes parent and child behaviour is influenced by three groups of factors – child factors, parent factors, and contextual sources of support and stress that interact with each other. A research overview of these factors follows.

**Child factors.** Research hints that adopted children have a somewhat more complicated process of identity formation than non-adopted children, although the process is not necessarily more stressful, but depends, in part, on the parents’ understanding and support. If parents have openly acknowledged children’s adoptive status from their early years and have been open and responsive to questioning, then relationships will be predicated on truthfulness and trust, thereby enhancing development (Steinhauer, 1991). A survey of the research literature identified several factors that are related to unsuccessful adoption. Child characteristics include a higher number of previous placements, longer periods in care prior to adoption, high levels of aggression, previous diagnoses of conduct disorder, and a strong attachment to biological mothers. Characteristics of adoptive parents that increase risk of placement breakdown include low levels of self-esteem, flexibility, and capacity to manage their own anger, as well as poor relationships with their own parents (Steinhauer, 1991). The research frequently cited reviewed outcomes of Romanian orphans adopted into Canada, finding generally that early-adopted children under four months of age at adoption had fewer long-term problems than those adopted after spending more than eight months in an orphanage. As
a result, parents of later-adopted children must attend not only to their children’s medical problems, such as parasites and malnourishment, but also to their complex, ongoing psychological needs, especially difficulties with attachment. When examined after approximately three years in their adoptive homes, all children who had been adopted after spending eight months or more in an orphanage were found to have formed attachments with their new parents — a third displayed secure attachments, a third displayed insecure patterns typical of Canadian-born children, and a third displayed atypical insecure patterns. The children with atypical insecure patterns of attachment had lower IQs and more behavior problems, and their adoptive families had somewhat lower socio-economic status, although differences in income were not large and none of the adoptive families were living in poverty. The research speculates that, in general, children fared better if families had the emotional and financial resources to respond to their special needs. This study suggests that many factors interact to eventually contribute to the adoptee’s developmental progress (Ames, 1997).

**Parent Factors.** Research identifies a number of factors that contribute to positive parenting: the neighborhood, the parenting role, financial status, family, friends, personal characteristics, and spirituality (Reder & Lucey, 1995). The most studied parent characteristics that contribute to poor parenting are a childhood history of abuse and neglect, mental health, family conflict and spousal abuse, being an adolescent parent, and poverty.
Social Support factors. Regardless of the physical circumstances, social supports are a factor that can ease or exacerbate the normal difficulties and stresses of parenting. Emotional support includes love, caring, and empathy, while instrumental support encompasses both the material and behavioral assistance given to families. Cognitive support involves information, guidance, or feedback that is useful in problem solving in child management situations, and appraisal support is information provided to parents relevant to their self-evaluations. Social companionship involves spending time with others in various leisure or recreational activities. Parents and children do better if they have stable, supportive relationships with extended family members and friends, have the support of a spiritual/religious community (Brodsky, 1999), receive respect of their heritage, and their cultural identification is a source of pride (Geissler, 1998).

Findings and discussion
The findings are organized around specific themes, beginning with general parenting characteristics, then looking more specifically at cultural and transracial issues within family and school contexts, as well as attachment and bonding. The findings are presented within the context of each theme’s associated scholarly context.

General parenting characteristics. Research suggests that successful adoptive parents have the following characteristics, namely that they: Understand the ambivalent or strong feelings they may experience parenting a child with special needs; Attempt to develop an immediate relationship with the child; Take charge of their parental role, having an ability to delay the gratification of their parental needs; Find happiness in small
increments of improvement; Have a systems view of their family, develop support networks, share their parental role with other key adults, and practice self-care (Katz 1986; Paulsen & Merighi 2009). Adopted children with conflict and negative behaviors can bring surges of anger and unpredictable fluctuations in affection for a child that are upsetting for normal, healthy parents, which can lead to painful guilt and shame (Gill 1978).

Our findings indicate that adopted children had well prepared parents, who managed not to judge themselves too harshly for their negative feelings but accepted their inevitability given their child’s circumstances. One mother stated: “He was a very challenging young child – getting into everything – he was very fast and busy. I don’t think I coped well in the beginning. I yelled at him, and he was two and no part of me thinks that was appropriate. If I could go back… I wouldn’t do that. I’d be a lot calmer, but as a first time parent to a very busy child, it was…challenging.” This mother’s frustration with her son lessened when she recognized that “many kids do this…The more I communicate with him; even using joking and humor, the easier it gets.” Another research participant said, “For the first 6 months to a year I’d think what a horrible parent was I. I didn’t know what I was doing. He was into everything. It felt like an invasion of your space. I took a year off. It was important to me that I spend as much time with him as possible because soon he’d be at school full days.” This mother tried to help him cope by spending time together, recognizing his need for affection and for a predictable routine: “I developed a lot more patience and grace; things don’t really bother me anymore unless they’re things that are serious that need to be dealt with immediately. I
don’t have unrealistic expectations of myself anymore. I had a total transition as a parent.”

Research indicates that successful adoptive parents persist in loving behavior in the face of rejection, seeing their child’s behavior for what it is—a fear of needed closeness (Greenspan & Pollock, 1991). Our study participants stated that they knew their child’s rejecting behavior had nothing to do with them as parents, proceeding with the nurturing their child needed. One couple realized from the beginning that their daughter’s rejection was “not just to piss us off.” The mother explains: “She’s behaving this way for a reason. I don’t get offended by her behavior. I draw her closer and closer and work on good communication. Her behavior indicates fear and insecurity. I am getting skilled at getting the parental role back, without confrontation.” Our study participants did not equate their own lack of gratification to failure in parenting, having the ability to postpone their rewards for a long time—months, even years. The following two quotes speak to this: “For a long time she did not cuddle but I knew attachment would come. I said to myself that it will take a long time and we’ll work at it for as long as it takes. It took a long time to develop and we’re still working on it. She’s learned to trust adults and realized they can be fun;” “Emotional attachment wasn’t there at the start. To get through the hard times, I stepped back and got my own emotional expectations out of the way.” The families in our study report being active with their adopted children, assuming control, trying to anticipate behaviors, interrupting behavior-spirals early, providing praise, positive reinforcement, and physical affection. The adults took the lead in the relationship and were not deterred by the child’s protest or withdrawal.
Our study supports the research finding that successful parents are not focused on end goals, abandoning the hope of being ideal parents, striving only to help the child achieve success in small daily tasks (Younes & Klein 2014). The following parent’s testimony illustrates this point well: “We recognized that at first he was confused and scared, looking distant and detached, keeping to himself. We knew he would change over time. We empathized with him, saying it’s not that he doesn’t love us, it’s that he’s going through so much change. You want all this love when you see them, hoping for all this affection, but that takes time to build. We savor the moments of connection and increments of attachment.”

Research identifies that social support networks contribute to positive parenting (Reder & Lucey 1995). Parents and children do better if they have stable, supportive relationships with extended family members and friends, have the support of a spiritual/religious community and receive respect of their heritage, with their cultural identification being a source of pride (Brodsky 1999; Geissler 1998, Gill, 1978). All families in this study had a combination of family, friend, church, and adoption support networks, being successful creating, engaging, and mobilizing these networks. A research participant explains, “When family members were not available I reached out to my friends for emotional support and understanding. They helped me realize I was not failing as a parent – just struggling with change and adjustment. They helped me through this period.” The families report receiving emotional support that includes love, caring, and empathy; instrumental support, both material and behavioral assistance; cognitive support, involving information, guidance or feedback useful for solving problems in child management situations, appraisal support information relevant to their self-evaluations;
and social companionship involving spending time with others in various leisure or recreational activities.

**Adoptive parents and transracial issues.** Demographic trends show a rise in transracial adoptions, pointing to a significant percentage of ethnic minority children adopted by White parents. Research on transracial adoption has primarily focused on the extent to which White families may be able to support a healthy cultural identity development for their children, particularly when these children are ethnically identified as Black (Jackobson et al., 2012; Padilla et al., 2010). More specifically, research shows how White families can be ill-equipped to deal with systemic racial issues (Patton, 2000), further highlighting parents’ tendency to be colourblind (Simon & Alstein in Jackobson et al., 2012) and to speak along the lines of culture rather than race. The notion of colorblindness has been articulated in much scholarly work, particularly in the fields of Education and Social Work, as part of the construct of *White Privilege* (Leonardo, 2004; Schick & St. Denis, 2003; Neville et al., 2001). As such, the tendency of White dominant culture individuals to dismiss race (in order to dismiss privilege and systemic inequalities) appears to be a pervasive systemic tendency that is not the issue of just adoptive parents.

Overall, studies show that adoptive parents’ cultural engagement is more prevalent than, and often used in lieu of, racial consciousness. Our findings show that while adoptive parents can be quite proactive in terms of pre-adoption preparation around cultural and race issues, the reality of race and transracial issues can still come as a shock: “The other day when she said ‘I’m the only brown girl’, that shocked me,” explains a parent. When prompted further on the issue of racial incidents, most
respondents, when aware of such incidents, have a tendency to adopt a colourblind attitude, in that they explain these incidents as accidental, rather than as systemic. The statements “it’s just kids being kids” or “it’s not really an issue” are not uncommon. When prompted further, some participants would then recall an incident but almost seemed to mention it casually and as incidental: “Well, I guess there was that one day…” followed with “it’s really not a big issue.” When parents do integrate the notion of race in their conversation with their children, they do not necessarily understand race as socially constructed; rather, they talk about it in terms of shades of colours (pink, brown, etc.) potentially leaving children to make sense of race as social divides on their own. In one situation, a parent recalled her child initiating a conversation on racial issues (“I am the only brown kid in my class”) and when prompted about the context of the conversation, or about any follow-up, the parent reported not remembering and not knowing why the child made that comment. From the data collected, it appears that only traumatic events recognized as such by the parent, leads to an acknowledgment that their child has experienced actual racism rather than simply a dispute. A parent reports: “He was not going to stand beside a girl that is Black. This boy came after her right away with a skipping rope behind her and put it around her throat and cut off the air and she couldn’t get him off. And it’s because she was Black. She knows that.” This example is further explored in the following section on racial issues in schools.

**Race, culture and social inclusion in school.** Adoptive parents’ attitudes towards race and culture become more explicit and visible in the way in which they story their children’s socialization experiences at school. Research participants recognize the importance of a culturally diverse school environment for the purpose of the development
of a sense of belonging. However, the participants are quite divided in how they make sense of the importance of racial representation in their children’s school. Among those parents whose children attend an ethnically diverse school, some feel that their school is adequately diverse, that different ethnicities are respected, and that adoption stories are honoured, while others report incidents of discrimination or difficulties to fit in. Among those parents whose children attend primarily White schools, few see it as a deficit in the sense that they contend that it is up to their children to fit in, which happens at the cost of culture loss: “It’s not multicultural. They have to act white to fit in. I don’t think there’s any support for multicultural people really. That’s my view on it. They lose their culture because they have to act white to fit in,” explains a parent looking at assimilation as an unfortunate consequence of being a minority. In both culturally diverse and non-culturally diverse schools, data shows evidence of the difficulty that some adoptive parents have to acknowledge the reality of race in a way that does justice to the complex and often painful stages of identity development of transracially adopted children: “There is no difference. (…). Generally, it’s kids being curious kids, so it’s not anything being a really big issue,” which on several occasions appears to be the message given by parents to their children who express a concern about being a minority, or “the only Black person in class.” Our findings are consistent with the research cited earlier, in that adoptive parents appear comfortable and proactive around issues of culture but less so around issues of race. At times, it appears that it is the children who educate their parents about race by making the issue visible where parents want it to remain invisible: “We were grocery shopping and she said that woman is staring at me and I say that’s because she’s so cute. I’m belittling it right and she goes ‘no mom, it’s because I’m brown’ and I say
'yeah it’s kind of hard isn’t it?’” (mother of a 7 year old daughter). However, incidents of racism were reported and one was particularly traumatic: “Everybody in my class heard him—that he was not going to stand beside a girl that is Black. He made a big deal because she’s Black. (...) And then, this boy came after her right away with a skipping rope behind her and put it around her throat and cut off the air and she couldn’t get him off. And it’s because she was Black. She knows that.” The parent further reported that the school didn’t handle it well, in that they “put on a program that wasn’t racially correct.” When such traumatic experiences happen, parents realize they can no longer avoid the topic of race.

Despite this testimony, overall, in terms of school support for their children, most parents speak positively about schools and report feeling grateful and satisfied with the supports (academic, social/emotional) provided for their child. Research contends that caring school staff are essential in accommodating and supporting the unique issues surrounding adoption (Stroud, Stroud & Staley, 1997; Scarvelis, Beverly, Crisp, Beth, Goldingay, 2014; Schooler, 2014). While many parents reported academic struggles, they were often more concerned about social/emotional and behavioural issues. As a result, findings show a strong tendency of adoptive parents to position themselves as advocates in the areas of racism, classroom placement, belonging/fitting in, academic struggles, particular needs of child (routine, attachment, home-school, private school, behavioural), and identity. Parents advocated through communication with the school administration and teachers, volunteered in the classroom and offered resources and presentations to the school population as well as parents.
Adoptive parents’ cultural engagement. Research shows, with consistency across the board, the importance of adoptive parents’ cultural engagement, meaning the promotion of birth culture and traditions, language, as well as opportunities for bi-cultural socialization, for the successful development of adopted children’s identity and self-esteem (Song & Lee, 2003; Johnson et. al. 2007). A study conducted in the US (Paulsen & Merighi, 2009) posits that families’ cultural engagement may depend on available resources and cultural activities, meaning that those families with more cultural involvement are those whose children’s heritage culture is represented through social practices in the community. A combination of both cultural engagement and racial consciousness is necessary for the development of a healthy cultural identity (Samuel, 2010).

Our findings point to the evidence of cultural engagement for the majority of participants. Parents’ cultural engagement begins as they enter the adoption process, generally through readings as well as an educational seminar mandated by the Province and offered by the Adoption agency. Once the children are home, cultural events are intentionally sought where available, and include activities such as Ethiopian dance classes, multicultural events such as Folklorama, or specific holidays (Ethiopian Christmas and Ethiopian New Year), and language: “I made an effort to make sure that we were in an environment where people would speak Amharic,” confides the mother of an 8 year-old child. However, for a few participants parenting is the building of a family regardless of race or culture: “I think when you’re a parent it doesn’t really change anything whether that person is from a different cultural background or a different area.” Yet, even in this case, efforts are made to ensure that some cultural integration happens.
As this same parent further explains, “We incorporate the holidays that would be celebrated there. Like, we’re very aware of the Ethiopian Christmas and making sure we celebrate that.” Parents interviewed were also aware of the cultural loss that their children go through: “They lose their culture because they have to become White to fit in.” At times, parents believe that cultural loss takes the form of cultural resistance (against heritage culture) as a result of their children wanting to fit in and be accepted by peers. For example, parents report that their children do not always wish to participate in Ethiopian cultural events.

Within these layers of complexities in the development of the children’s cultural identity, parents interviewed overwhelmingly agreed with the importance of honouring Ethiopian culture and demonstrated evidence in making that happen: “We very much felt the need to incorporate his culture here,” explains a parent. While there is much evidence of culture integration, cultural socialization is less prevalent, as few parents actively seek socialization within members of Ethiopian backgrounds, a finding that is consistent with Quiroz’ s research (2010, p. 203). Rather, adoptive parents tend to seek other adoptive families when seeking cross-cultural experiences, with some explaining that they don’t always experience a sense of belonging within the Ethiopian community: “We went to the event at the park with the Ethiopian group and that did not go well. Our kids said that those children from Ethiopian families didn’t tend to include them. So we didn’t continue with that,” explains a research participant. The integration of culture into the family’s life extended to the inclusion of birth family, when it was possible: “We actually had a picture of their birth family on both of their walls by their bed in their bedrooms for a long time,” recalls a parent. A number of participants interviewed reported that the
connection with birth family was not encouraged by the Adoption Agency, further disclosing that they wish it were.

**Adoptive parents and attachment.** While adoptive parents’ problematic attitudes towards race issues should not be dismissed, what needs to be pointed out is the importance of the strength of the parent-child relationship, namely, attachment issues, in the successful adjustment of the child. In this area, our participants all show evidence of resilience and strength, having taken proactive measures when needed. Research shows that ethnic identification is not necessarily key to the adjustment of adoptees (Friedlander, as cited in Castle et al. 2011). Rather, attachment would appear to be the key factor in successful adjustment, and would even lead to positive identity development: “Although ethnic identity was not always found to be indicative of improved psychological adjustment, the role of familial factors including variations in adoptive family socialization and the strength of the adoptive parent-child relationship, appear to play an important role in facilitating the development of ethnic identity and positive psychological outcomes for this population” (Castle et al, 2011, p. 320).

Children of adoption have experienced multiple losses. The first and, arguably greatest, traumatic event would be infant separation from the birth mother and for older children, separation from birth mother or primary caregiver, extended family and community (Verrier, 1993; Bowlby, 1960). Families in this study have adopted children as young as 6 months old up to 8 years old. These children have all had unique background experiences; some lived with birth families for several years while others were raised by extended family or community members before relinquishment. In addition to suffering grief and mourning, these children had already experienced
fragmented care, multiple disruptions in attachment to a primary caregiver, thus had established various attachment disturbances. Additional circumstances include abandonment, institutionalization and foster home placements. Multiple caregivers were the norm up until joining their permanent families.

Our data around attachment leads to findings that are two-fold, one being parents’ perception of the child’s attachment, and the other one being parents’ perception of their own attachment to their children. Research participants reveal falling in love with referral photos, preparing special bedrooms, gathering information about birth country, connecting with other adoptive families, and researching the attachment process. Some even consulted an attachment specialist before meeting their children. Adoptive parents share diverse experiences that require infinite patience, optimism and time and the journey of attachment unfolded differently for each family. The literature states that, contrary to one of the most common misconceptions, successful development of attachment involves shifting a focus from closeness as the naturally happening product of the relationship dynamic to actual learning how to effectively regulate feelings between family members (Holmes, 1993). In other words, instead of focusing on how to build up a sense of being attached strategically, so to speak, parents may often take negative responses of their adoptive children to emotive prompts as absence of attachment. The awareness of this approach is particularly important when the child has been separated from the family of origin (Moore, 2006), had multiple caregivers and was not adopted in her early infancy. Our findings are consistent with Moore and Homes’ research. The study participants confirm that they had to recognize difficulties arising from the child’s removal from his birth parents or siblings, or learning about traumatic family events. The
uncertainty of what lies ahead for the child is combined with the uncertainty of the parent on how to help the child form new attachments. This proved to be particularly difficult for parents of children who could not make sense of “Why me?” As such, the statement “Why did they take me away from them?” was a recursive reaction from children that almost half of the participants had to work with as parents. The new parents in that case may become the victims of the situation where each side has its right to be hurt. By all accounts, the adopted child in the previous case compensates his hurt by aggressive actions, while his parents blame themselves for not knowing why and when some important part of their so much awaited journey went wrong. In the worst case scenario, an image of the relatives left behind can haunt the child for quite a while. Talking about her daughter’s hurtful memories, a participant explains: “I think she was grieving the loss of everything she had and still grieving the death of their mother. I think so very much. The death of her mother happened six months before she came.” This echoes the account of how leaving behind a sibling may compromise the ‘happily ever after’ that parents may have been hoping for, particularly when the sibling has been left behind in one of the birth country’s orphanages: “He has a half brother, but he called him brother and he often wonders, ‘why me and not him?’ So that's really difficult, because he's still there. He says, ‘I think it was because he was older and older kids can take care of themselves better”’ (the parent of an 8 year-old child).

The difficulties arising from the lack of experiences on how to overcome grief and sorrow related to the child’s past may be quite traumatic not only to the child herself but to her new parents too. Learning how to accommodate the child’s needs in her coping with the traumatic past requires much patience and understanding from adoptive parents.
as explained in what follows: “Anything that reminded him of the foster home was difficult for him. Going to bed was a difficult thing for him. The second night we put him to bed, turned out the lights, and left, all of a sudden we heard this screaming from down the hallway and he was crying and terrified of being in this room alone because he was used to sleeping with five or six boys. (...) Bedtime was probably an issue for the first year. Even then, bedtime was a negative thing... Not that he resisted it but he would cry.” The participants, whose journey took that dramatic turn, recognized that the grieving process may take years.

In terms of expectations and outcomes related to attachment, the majority of the research participants mention that they find themselves in the situation when, even prepared in theory, they lack skills of actually applying them in real life situations. The parents’ responses show how dramatically this can affect their parenting journey. The majority of the participants, even those with very happy family stories, mention that the family adjustment happens slowly, with ups and downs, through pain and uncertainties. Yet, the parents’ eagerness to get better prepared for the journey brings positive outcomes. Indeed, overall, our research participants overwhelmingly show proactive and positive attitudes toward attachment issues. Support actively sought by adoptive parents in this regard range from self-education through personal readings, to reliance on peers and professionals, and attendance at workshops. Even when attachment problems were reported, growth and positive developments were noted. A fierce mutual desire to have a family has been described to be a significant factor in establishing a strong bond: “With all the people that I know who have adopted, is the fact that the kids and families stay
together longer, because we wanted each other” (a single mother of two adopted children).

Children have been described according to a range from securely attached to still struggling with attachment, with positive attachment through resilience and growth being the most common denominator: “She is as attached as any of our children,” states a parent. Those few parents who report difficulties with their child’s attachment note that the child’s attachment is stronger with peers while more challenging with parents. The following testimony of the parent of an 8 year-old child is very explicit:

“It was challenging and it still is challenging. When we got home, very quickly we knew it was going to be very tough. In terms of attachment. I mean, we're in a course right now learning a lot more about this. But, very angry and lots of lashing out. Very very hard to comply with any requests. I mean, he didn't know the language either at that point in time. Very difficult to get him to attach. That's still an issue. He actually has attached, in terms of a parental relationship, more to his big brother and to us as parents. He's not as aggressive anymore. We literally had to hold and restrain him. He would kick and spit. So we've had to turn that into hugs.”

In this case, school is sometimes described as not conducive to healthy attachment to adults, leading parents to consider partial home schooling, which was the case of three families.
Recommendations and concluding remarks

Our findings suggest, that, overall, adoptive parents exhibit characteristics of resilience, commitment and proactive engagement, particularly in areas of heritage culture, attachment, and social support. However, our findings point to the need to better prepare and educate parents to issues of race, as well as to issues of loss and grief related trauma. Adoptive parents have a tendency to view race through a colourblind lens, meaning that many view racial incidents as accidental or interpersonal issues, rather than as social constructions and systemic issues. Only an extremely traumatic event involving physical harm appeared to have triggered an understanding that race is indeed an issue for their child. As such, educational seminars mandated by the Province and typically organized by adoption agencies or Social Service need to place a stronger emphasis on race and ethnicity in their “cultural diversity” section of these seminars, to better enable prospective adoptive parents to grasp the systemic differences between race and culture, with special attention to issues such as: How might race affect my child? What is my own positioning in a transracial relationship? How do I enter in a dialogue about race with my child in a way that helps build and acknowledges, rather than dismisses, who my child is? How may I help my child work through potential racial issues at school, with other family members or with friends?

In addition, while our research participants showed proactive engagement in the area of attachment, our data suggest that adoptive parents struggle when determining ways to best help their children through grief and loss. They would benefit from more
pointed workshops in two areas: (1) The varying degrees of grief and expressions of grief related to loss and displacements that their child will likely experience (particularly older children); (2) The resources, particularly of a professional nature (Counseling, specialized support at school, online support groups), that are available to them, and the likelihood that these resources will be needed.

This study presents the following limitations. First, research participants were recruited via an Adoption Agency, which could potentially suggest that only those with positive experiences volunteered to participate. Having said this, our research participants’ responses were nuanced showing both the pain and the joy in their adoption journeys. Second, the positioning of the authors needs to be teased out. One of the authors is a private practitioner who contracts with the adoption agency through which the research participants were recruited. Likely, a number of research participants volunteered because of a trusting relationship with this person. Two of the authors are adoptive parents themselves, which likely created a sense of intimacy and comfort during the interviews. The remaining author had no affiliation with the adoption world, providing the team with an external viewpoint. Further research should focus on the stories of adjustment of adopted children, which could be carried out through focus group or individual interviews.

A Perceptive Study on E-Learning With Physical Education in Chinese Universities: What Are The College Courses That Students Want To Take Via E-Learning?

Abstract: By reviewing the history of e-learning literature, it is not difficulty to observe how successful of e-learning courses and programs across the subject matters of science, language, history, and many other scientific oriented courses. However, questions such as “Is e-learning platform suitable for college level Physical Education, Kinesiology, Sport Study, Recreational, and Leisure Study?” and “What are the courses that students want to take on those subject matters?” etc. are still largely unknown questions for many educators. In the information age today, we are experiencing a variety of demands for physical wellness and health education from many sources. How an e-learning educational programming for Kinesiology and Physical Education can be adequately developed to meet such challenges is still one of the widely discussed topics today among educators. This paper describes a concept e-learning model based on an international survey result and the taxonomy of physical education.
Introduction

E-learning is one of the most referred learning platforms for distance education via the Internet, which also is a very popular means to reach students in anywhere at anytime. By reviewing the history of e-learning literature, it is not difficult to observe how successful of e-learning courses and programs across the subject matters of science, language, history, and many other scientific oriented courses. However, questions such as “Is e-learning platform suitable for college level Physical Education, Kinesiology, Sport Study, Recreational, and Leisure Study?” and “What are the courses that students want to take on those subject matters?” etc. are still largely unknown questions for many educators. In the information age today, we are experiencing a variety of demands for physical wellness, human performance, and health education from college level institutes as well as public wellness and fitness centers. How an e-learning educational programming for physical education can be adequately developed to meet such challenges is still one of the widely discussed topics today among educators. This paper suggests a concept e-learning model, including preferred subject areas and courses based on an international survey result and the newly formulated taxonomy of Kinesiology/Physical Education. The scopes and strategies of e-learning program that address the human performance and wellness topics are also described and discussed.

Background

In order to design academic e-learning programs for Kinesiology, Physical Education, Sport Study, Recreational and Leisure Study as the traditional study for human performance as well as emerging wellness and quality of life studies, a comprehensive concept model should be first defined and described, from which a better understanding of its scopes, attributes and characters of such program could be theoretically formulated. Is it important to define an e-learning model for Kinesiology/Physical Education? The answer is worth pursuing. A well-defined model will not only reveal the characteristics of Kinesiology/Physical Education, but it will also provide guidance for the development of new, or modify existing, online or in-classroom educational courses and programs. By doing so, the Physical Education profession will also stand to benefit in two-fold: first, by clarifying the vagueness of the definition of Kinesiology/Physical Education, and secondly, by identifying the attributes and characters for e-learning as well as in-classroom courses.

Since its emergence as a distinct discipline more than six decades ago, Physical Education has been broadly and narrowly included in many college’s curricula. This interdisciplinary field is expanding in response to the increasing demands from the various education and research institutes for skilled personnel in Kinesiology, Sport Psychology, Recreation and Leisure Study, Wellness and Health. The development of dedicated e-learning academic programs for such areas has become one of the major discussion topics among many colleges and universities.

“How is the scope of a curriculum for Physical Education defined?” “How to set up standards for accrediting such academic programs?” and “What are the career paths for the graduates majored in Kinesiology/Physical Education?” are the some of the most frequently asked questions.
Comprehension of such a diverse discipline like Physical Education requires a paradigm shift when attempting to define its attributes and characters. A simple approach would be to tolerate a reasonable amount of imprecision and uncertainty in defining a contemporary e-learning model for Physical Education. The results may not be perfect; nevertheless, a reasonable concept model may lead to a theoretical resolution for the understanding of Physical Education. With a clear described e-learning model, academic programming may also easily adopt the evolving new trends into the curriculum for applying new disciplines into a broad sphere of the real world reality of human physical wellness.

**A Theoretical Taxonomy of Physical Education**

In order to appreciate e-learning for Physical Education, it would be beneficial to first take a look at the attributes and characters of Physical Education. By doing so, we will have a better perception for the scopes of Physical Education, which will help us envision the upcoming challenges and prospective outcomes for the educational adventures via e-learning.

Although there is a variety of definition for Physical Education, they are comparable at their root level since they are all dealing with the principles of human physical wellness. Generally speaking, there are six attributes that Physical Education normally deals with. They are (in Figure 1):

- **Principles of Sport Skills and Techniques (P1)**
- **Principles of Human Advanced Performance (P2)**
- **Principles of Physical/Nutrition Wellness and Health (P3)**
- **Principles of Mental/Spiritual Wellness and Health (P4)**
- **Principles of Game Management and Social Promotion (P5)**
- **Principles of Adventures and Relaxation (P6)**

![Figure 1: The Attributes (Principles) of Physical Education](image)
The above Taxonomy is the foundation for the study of Physical Education. This taxonomy does not only illustrates the system of Physical Education:

\[ \text{i.e. upe} \in \{\text{uP1} \ \text{uP2} \ \text{uP3} \ \text{uP4} \ \text{uP5} \ \text{uP6}\} \]

The Taxonomy also depicts the scopes of the six attributes. Each of the attributes is a distinct subject area for study, which should be the emphasis for the academic courses and curriculum for e-learning.

Furthermore, each of these six attributes has five possible quantum characters in terms of purposes for human to participate in physical activities. They are (in Figure 2):

![Figure 2: Five Characters in Each Attributes of Physical Education](image)

These five characters delineate the ingredients of e-learning course for each attribute of Physical Education as shown in Figure 2, i.e.:

1) For Cognitive Understanding (Mind)
2) For Physical Health (Body)
3) For Mental Health (Spirit)
4) For Challenges and Achievements (Passion)
5) For Social Bonding and Connection (Social)
Methods and Results

(1) Instrument: Semantic Differential Survey Methodology

The Semantic Differential method will be utilized to construct the surveys scales in order to determine college students’ perspective toward the attributes and characters of Physical Education via e-learning. Semantic Differential scale is one of the most popular methods for assessing human perspective toward a subject matter in the field of human psychology, which is very similar to the pain assessment in nursing, in which 10 is the most painful and 1 is the least pain by patient’s self rating. The self-rating offers individual’s own feeling and perspective toward his/her pain. In the same fashion, when the subjects about Physical Education via e-learning are presented to the individual, the self-rating will reflect the feeling of this individual toward the asked subject matter.

There are two parts in Semantic Differential Scale: part one is a statement that tests the targeted participant’s feeling toward it; and part two is a series of paired bipolar adjectives with seven-point scale. The scales measure subject’s feeling toward polarized adjectives, which will be quantified from 1, the most negative, to 7 the most positive feeling toward the statement. Point 4 represents neutral perspective toward the statement. The average of the scores represents the overall feeling toward the assessed statement and is used for statistical analysis (Baumgartner & Jackson, 1987).

For this study, the paired bipolar adjectives were chosen according to three major factors of Semantic Dimensions: Evaluation, Potency, and Activity as the following:

- **Evaluation**
  - Good – Bad
  - Valuable – Worthless

- **Potency**
  - Deep – Shallow
  - Strong – Weak

- **Activity**
  - Happy – Sad
  - Active – Passive

Eight perspective statements will be constructed for assessment of student’s perspectives toward e-learning. Appendix A illustrates the survey instrument.

(2) Survey Results

Study participants were students enrolled in Physical Education classes in two universities in China. The students completed the survey for their attitudes toward taking online courses in
Physical Education (4 questions) as well as the purposes for taking Physical Education classes (5 questions). Using semantic differential rating scale 1 to 7 (1 is least and 7 being more favorable). Overall attitude toward taking online courses in Physical Education was calculated by summing the four area-specific attitude questions. The students also provided background information on gender, years in the university, level of computer competence, and majors of study.

A total of 370 students (77% females) completed the survey (94% response rate) from the two participating universities. Majority of the study participants (91%) were freshman or sophomore. Only 8.9% of the participant reported having above average computer competence. Most of the participating students are majored in Science (69.2%) and Engineering (24.6%). Table 1 shows the characteristics of the study participants.

The survey results on student's attitude for taking online courses in Physical Education in comparing with the difference based on students’ background information show the following summarized significant findings:

1. Male students had more favorable attitude on taking online Physical Education courses on mental health as well as overall attitude toward taking online Physical Education courses than female students.
2. Students in Science majors had more favorable attitude on taking online Physical Education courses on wellness and nutrition, and mental health as well as overall attitude toward taking online Physical Education courses than students in Engineering and Non-Science majors.

3. Sophomore students had more favorable attitude on taking online Physical Education courses on mental health as well as overall attitude toward taking online Physical Education courses than other students.

4. Finally it is important to notice that the attitude on taking online Physical Education courses did not differ among self-reported levels of computer competence in the students.

The survey results on the comparisons between student’s purposes for taking courses in Physical Education and their background information shows the following summarized significant findings:

1. Students with average computer competence reported taking Physical Education courses for the purposes of improving physical health and mental health compared to the students with above average computer competence, and taking Physical Education courses for the purposes of developing habits compared to students with beginner computer competence.

2. Students in Science majors reported taking Physical Education courses for the purposes of improving mental health, developing habits, and developing social bonding and connections compared to students in Engineering majors.

3. Sophomore students were more likely to take Physical Education courses for the purposes of improving mental health and developing habits than other Junior/Senior year students.

4. Overall the students were less interested in taking Physical Education course for purpose of learning sport and exercise skills.

The survey results on the correlations between the purposes of taking Physical Education courses and attitude toward taking online courses in Physical Education shows the significant finding:

1. Students reported taking Physical Education courses for the purposes of learning sport and exercise skills, improving mental health, developing habits, and developing social bonding and connections had more favorable overall attitude toward taking online courses in Physical Education.

2. Students reported taking Physical Education courses for the purposes of improving mental health seemed to have more favorable attitude toward taking online courses in Physical Education.

3. Students interested in taking Physical Education for improving physical health has less favorable attitude toward taking online courses in Physical Education.
Discussion

Although Figure 2 illustrates the equal balanced knowledge and skill sets among the five possible characters of Physical Education, the survey results suggest that student with different gender, experience in college, and their majors show different favoritism toward certain area of e-learning study in Physical Education: such as most of college students are in favor of taking Physical Education courses for improving physical and mental health and for the purposes of developing active habits, and not for learning sport skills. Therefore, the e-learning curriculum for Physical Education should address these needs, and to offer more courses to reflect these needs among Mind, Spirit, Passion, and Social wellness. As illustrated in the Table 2, male students had more favorable attitude on taking online Physical Education courses on mental health as well as overall attitude toward taking online Physical Education courses than female students; Students in Science majors had more favorable attitude on taking online Physical Education courses on wellness and nutrition, and mental health as well as overall attitude toward taking online Physical Education courses than students in Engineering and Non-Science majors; and Sophomore students had more favorable attitude on taking online Physical Education courses on mental health as well as overall attitude toward taking online Physical Education courses than other students. Therefore, the e-learning curriculum for Physical Education should address more on wellness, nutrition, and mental health.

Surprisingly, the survey result reveals that college students with different self-reported computer competence all have the favorite attitude to take online Physical Education courses.

Applying F-expert system (if-then) rules, a well-known concept in the field of knowledge-based systems, to the concept model of e-learning for Physical Education, the proportion of the knowledge from the five characters of Physical Education could be skewed to construct different scenarios to that college students have more favoritism.

Conclusion

This study proposed a newly constructed concept model for e-learning in Physical Education. The survey results suggest that college student have favorite attitude toward certain areas of Physical Education, especially for physical and mental health and knowledge in wellness and nutrition. The survey also indicates that college students have least favorite attitude toward learning physical activity course online.

The Challenges Facing School Autonomy:
Why parents are silent?

Sangkyu KIM

Introduction
In recent years, increasing interests of school autonomy has been linked to the crisis of the school. Although school autonomy is not a tradition in schooling (Eurydice 2007), however, school governance which have associated with parents and community members have become a critical way to shift school performances and share measures on the solution of student problems.

The functions of school autonomy have been designed differently in every country, the notions of school autonomy can also be interpreted variously. For instance, countries which have guaranteed schools’ discretion traditionally may enshrine a high degree of autonomy and accountability as well, while countries which have administered strong school management by state may allow discretion narrowly within frameworks of legislations.

With respect to involving parents, some countries including the US and the UK consider this as measures to improve educational results, while Republic of Korea (hereinafter ‘Korea’) and Japan consider this as deregulation to alleviate strong bureaucratic management. According to literatures, however, parental involvement in education is ascribed as “poor neighborhoods” (Henry 1996), “the passive players as an educational team.” (Kim 2014). Moreover, Fullan (2007) estimates, parents pursue finding meaning in activities related to “their own children rather than in school or system wide.” Compared to these arguments, as if Buchen (2005) found more successful cases, school governing bodies were to be committed to developing “the engagement of parents and community resources.”

In England, although school governing bodies performed critical role in school leadership on the one hand, vacancies of school bodies continue to be an issue on the

---

1 Doctoral Program in Graduate School of Education, WASEDA University. The author was in charge of high school policy and local education autonomy policy until 2013 in Ministry of Education of S. Korea.

2 Like Eurydice (2007) states “the school autonomy movement did not really become widespread until the 1990s,” European countries also do not have a tradition.
other hand (the House of Commons 2013). And then the role and responsibility of school governors have been confusing and unhelpful as well. According to reviewing Korean cases, school boards have challenges in terms of appropriate skills and representative characters as well (Kim 2007), especially the existence of ‘yes-man’ caused by confusing their indigenous roles (Kim 2014). In Japanese literatures, also poor operation and the presence of silent members are argued as issues at this time (Nakata 2010).

The study aims to explore on effectiveness of school boards in Korea and Japan. Two countries have criticisms which are commonly strong intervention by state, although their educational systems have less similarities than differences. For example, two countries have similarities in basic education system, in particular, school boards of two countries were effected by school governing body of the UK. Therefore, the criticisms on school boards may exist commonly in Korea, Japan and the UK. This study will try not only to propose keywords for an effectiveness on school autonomy as improving school performance but to help developing good educational governance.

Research Questions
To examine an effectiveness of school governing bodies, the study have set three research questions as followings:

First, what will take to mobilize for participating in parents?;

Second, how do schools reach out to parents and community for school improvement?;

Third, which changes have taken place in schools through school governing body?

Research Methodology

With respect to the methodology of the study, the three types of method will be introduced.

First, an interest of parent and community involvement in schools has been cited in hundreds of academic journal articles over the past decades. To examine the previous studies will be crucial work to understand current conditions of school autonomy obviously.

Second, in Korea and Japan, some questionnaires have been conducting on a nationwide scale by university and research groups. The author analyzes previous

---

3 Center for Family-School Partnership policy Research at Seoul National University in Korea conducts surveys and interviews on a nationwide scale
questionnaires. However, considering paper surveys elicit a great amount of nonresponse items (Fleming et al, 2014), and interview will be introduced complement to these items.

Third, interview includes members of parents, community and teachers. According to meta-analysis by De Leeuw (1992), “generally greater for telephone surveys than paper surveys.” Therefore, interviews will be conducted mixing telephone and face-to-face.

**Implication and Conclusion**

School boards can be crucial agents for school improvement, in addition, they are expected significantly to improve parental right in education. Regardless of these expectations, school boards have weak points and poor roles as follows. The one will be problems that concern system. In legislations, two countries have granted broadly to them as school autonomy and school governance as well. On the contrary, however, they are poorly designed accountabilities. Therefore, educational authorities will be crucial points in the issue of how school boards secure accountabilities to parents and communities. The other will be problems that concern their operations. In previous studies, poor operations were argued in two countries, e.g., board members has received little preparation and training for their roles, and/or parents and community members tend to be dealt with not as largely untapped resources who have expertise but as existence who fills in the spot. The study could explore similar results through analyzing questionnaires and interviews. Obviously, parents are significant as their children’s very first educators. Furthermore, considering the fact that school boards are mandated the complete schools kindergarten through high schools regardless of public and private in Korea, they are prospected greatly effective and good governances to make for improving school performance.

---

4 In Korea, equal funding and treatment of private (excluding private elementary schools) and public education is enshrined in laws and regulations pertaining to education. In this respect, Korean private school policy is similar to the Netherlands.

6. Abstract and/or full paper:
Integrating Pedagogy and Technology: Preparing 21st-Century College Faculty

The Integrated Readiness Matrix (IRM) began as a dialogue between Larry Tomei and Jim Bernauer regarding that “age old question of how you successfully integrate technology and pedagogy in higher education? What emerged was the IRM that is designed to allow faculty to confidentially assess where they believe they currently reside in terms of pedagogical and technological classroom skills. The pedagogical axis of the IRM is based on the levels of Bloom’s Taxonomy() and the technological axis is based on Tomei’s Technology Taxonomy() See fig. 1. Based on this IRM assessment, faculty will have a foundation upon which to build their own improvement strategies (Bernauer & Tomei, 2015).

While we believe that every faculty member can make progress on their own based on their self-assessment, we also believe that without ongoing organizational support, self-improvement efforts tend to lose momentum as time and circumstances move inexorably forward. Therefore, the challenge is to develop the organizational capacity to assist faculty efforts to move beyond their current pedagogical and technological levels in a way that meets their self-identified goals and in way that is more akin to an independent study model rather than one where the organization decides what is to be learned, when it is to be learned, and how it is learned.
Before we move forward with our discussion regarding the need for organizational support, we state that it is important to provide some additional background regarding both the reason for integrating pedagogy and technology as well as a brief description regarding theories of learning, domains of knowledge, and how the IRM incorporates these critical components.

Why Is the Integration of Pedagogy and Technology Necessary?

It is generally accepted that higher education faculty must develop and demonstrate expertise in scholarship, teaching, and service. Ideally, there should be strong connections among these three strands especially between teaching and scholarship. What we read and write should inform what we teach, and what we teach should help us to read and write more effectively. However, while these goals of the professoriate are interrelated, there is still much that is unique in each one of these components. When we enter a classroom and find ourselves front and center of a group of students, we are in many ways onstage just as if we are in theater. And while there are many similarities between acting and teaching, actors generally have specific lines that they memorize and recite while they are performing their part. Professors also need to perform but their script is typically an ad-lib. Props are generally not expertly introduced at just the right time as a faithful stage crew standing in the wings!

While the need to follow cues and a script give us greater flexibility in what and how we teach, it also puts a heavier burden on us in terms of how we can best impart knowledge to our students. We as teachers need to understand our subject matter deeply, and just like actors, we need to engage our student-audience in such a way that they want
to listen and learn and continue learning after they leave our classroom. Engaging students is basically the art of pedagogy, or androgogy, where the former is used to connote teaching children and adolescents while the latter term is used to refer to teaching adults. In a nutshell, teaching requires that we know not only our content but also how to share this content with our students in ways that engage them and that they can understand.

While teachers in higher education are hired primarily based on their content expertise, teaching students in the classroom requires much more than content knowledge. As discussed above, pedagogy is the art of engaging students in what it is that we are teaching. Socrates, Aristotle, and many others from ages ago engaged in pedagogy and explored different ways of teaching and the challenges faced by teachers of the past are shared by us today here in the 21st century. That is, although the knowledge explosion and the passage of time has certainly resulted in a tremendous increase in what is known as well as a recognition of what yet still needs to be learned, we are still faced with the basic challenge of how should we educate people in our society. In addition, the pervasive presence of technology in all its manifestations in our society, while it offers us the potential for expanding and enriching how we teach, it often brings with it not a small amount of confusion.

In recognition of these challenges, there appears to be a pressing need to help faculty figure out how to disseminate content expertise and ways of looking at phenomena with their students by drawing on learning theory and developing innovative pedagogical approaches that include the creative use of technology. And so, we begin our
discussion by looking at theories of learning and what they offer us in terms of developing effective pedagogical approaches.

Primer on Theories of Learning and Implications for Teaching

Bernauer and Tomei (2015) describe five schools of learning theory that underlie our current understanding of how students learn. These five schools are as follows with their brief conceptions of learning:

- **Behaviorism**: Observable changes in behavior -- not what goes on “in the head”
- **Cognitivism**: Input-process-output information processing model
- **Humanism**: Concerned with the person “as a whole” including emotions
- **Constructivism**: Must be “constructed” by each learner -- student-centered
- **Connectivism**: Networking that extends beyond the “curriculum” to cyberspace

While educational psychologists and sociologists have dissected learning into these five approaches, as Woolfolk (2013) indicates, “because learning is a complex cognitive process, there is no single best explanation of learning” (p. 9). While we support this contention, we think that it is not quite complete and so we offer the following revision-- “because learning is a complex cognitive process, there is no single best overall explanation of learning; however, specific desired learning outcomes match best to specific theories of learning.” This revised statement requires that we are clear about what we want students to actually achieve in terms of growth and accomplishments when they walk out of our classroom doors at the end of the term. Identifying goals and objectives based on what we judge to be of most value provides the necessary foundation for both what we should teach and how we should teach it.
The next section describes one possible configuration of the domains of learning around which we can develop our goals and objectives as well as a selected taxonomy that helps us understand these domains. It should be noted that because technology is so pervasive and important in our society, it is listed as a domain of learning. Technology is also a critical aspect of an expanded definition of pedagogy that includes other approaches such as cooperative learning, projects, and problem-solving.

**The Integrated Readiness Matrix: Matching Theories and Domains of Learning**

Here we list six domains of learning in alphabetical order with a selected taxonomy that seeks to address the specific domain --

Cognitive: Bloom’s Taxonomy
Identity: Marcia’s Concept of Human Identity
Moral: Kohlberg’s Stages of Moral Development
Motivational: Maslow’s Hierarchy of Human Needs
Psychosocial/Emotional: Erikson’s Theory of Psychosocial Development
Technological: Tomei’s Taxonomy

While we are cognizant of the importance of all of the above domains, Bernauer and Tomei (2015) focus specifically on the cognitive and technological domains (Chapters 3-5) in the Integrated Readiness Matrix (IRM). Our rationale was that we thought it important to first focus on the “core” mission of higher education that relates most directly to cognitive development and how technology and pedagogy can be integrated with this domain to assist the professoriate in promoting valued student learning outcomes across curricular areas from the liberal arts to engineering. However,
because human beings and human learners are complex and of “one cloth”, effective instructors recognize that the need to artistically and thoughtfully integrate the motivational, emotional, and moral needs and capacities of students with the act of teaching. In this sense, the IRM is incomplete and awaits further development.

The Integrated Readiness Matrix in Action

The IRM was designed to help college faculty confidentially self-assess where they place themselves in terms of pedagogical and technological expertise. It is then eminently possible for faculty to individually develop an enrichment plan that addresses any perceived weaknesses and therefore to move up to higher quadrants of the IRM. However, social and organizational support go a long way to help us achieve our goals, whether these goals relate to losing weight or gaining expertise in any field of endeavor. Therefore, while we believe that individual faculty can use the IRM to benefit their teaching and their students’ learning, we also think that organizational support coupled with individual initiative offers the most promising and enduring results.

In the next section, we offer a brief description of how we have begun to lay the groundwork for incorporating the IRM into a faculty development initiative at Robert Morris University. In the final section, we invite you to join us in this effort by collaborating with us as you seek to do the same at your own universities.

Robert Morris University launched its Center for Innovative Teaching and Directed Engaged Learning (CITADEL) in 2014. The Center offers programming, resources and support to all full- and part-time faculty at the institution. This fall, the CITADEL established a Learning Community for all interested faculty who were
teaching on the campus for the first time, regardless of whether they were new to higher
education (and therefore had not taught anywhere before) or had previous teaching
experience at other institutions before they joined RMU.

In September, the cohort was offered the chance to take the IRM. The data are to
be used to determine if the instrument needs further refinement. It also is available at any
time to any RMU faculty member, no matter no many years he or she has been in higher
education. Once a faculty member establishes where he or she stands on the matrix, a
series of recorded programs – generally ranging in length from 5-7 minutes – are
available to assist in moving the instructor to the next quadrant and ultimately to the
upper levels of pedagogy and technology.

**Topic:** Adult Education

**Format:** Paper Session

**Description:** The purpose of this presentation is to discuss the preliminary findings from studies which are exploring the self-directed learning (SDL) experiences, habits, needs and perceptions of a purposive sample of adult learners in a digital age. The presentation will include an overview of key concepts/principles of continuing professional education (CPE), SDL, digital, social and mobile learning. A summary of findings from semi-structured interviews with a purposive sample of health professional adult learners (rural and remote physicians) pertaining to
their SDL habits and the use of digital technologies will be summarized. Key implications for the field of adult learning and CPE providers will be discussed.

Abstract:

Continuing professional education (CPE) is a form of lifelong learning that involves maintaining competence to practice by updating knowledge and skills related to one's professional life. Mandatory CPE has expanded in recent years as a regulatory mechanism and is now quite common across many professional fields. Self-directed learning (SDL) activities are a widely recognized type of informal adult learning across many CPE systems. SDL can be explained as a way in which individuals plan, manage and evaluate their own learning, with or without the help of others. It has been shown to be as effective or better in learning in areas of knowledge, skills and attitudinal domains. Despite this, adult learners report a number of barriers to SDL, including concerns with their access to information (including the Internet) and the ability to use systems effectively to search and locate information relevant to their needs. The latter is particularly important given the increasing use of digital technologies such as the Internet and social media by adult learners. While the use of social media and mobile technologies in adult learning is growing, its value in supporting life-long learning is not well understood. There are limited models describing the SDL habits of adult learners in a digital age and there is limited evidence surrounding the use of social media and mobile technologies in mandatory CPE delivery systems. Further, little research has explored the unique contexts of health professional adult learners working in rural and remote areas, their patterns and habits of SDL and the effect of barriers to SDL on feelings of professional isolation. The presentation includes preliminary data collected from a scoping review and semi-structured interviews with a purposive sample of health professional adult learners. The study findings have implications for informing both post-secondary and adult education to improve the SDL skills of adult learners and enhancing CPE systems to better integrate SDL in a digital age.
What is Expected of Tomorrow’s World Citizens? 
–Rethinking cosmopolitanism and patriotism in global education

The trend of globalisation reinforces the interconnection and competitiveness of modern economic and social reality. The first two decades of the 21st century saw the announcement of a series of policy documents on global education in England and Taiwan. Concerning the terminology for global education, “global dimension” has been a widely employed term in England (e.g. DCSF, 2008; DfES, 2004; DfES, 2005; QCA, 2007) while “international education” is preferred in Taiwan (e.g. MOE, 2012). From these two governments’ policy documents on global education, it is found that they both consider global education as an approach to promote national economic competitiveness within the globalised world (DfES, 2004; MOE, 2012). However, in addition to economic consideration, a more fundamental normative question which has to be taken into account is what characteristics and capacities consist of an ideal world citizen. A dispute underlying the above question is whether it is appropriate to cultivate partial patriotism as the opposite of universal cosmopolitanism within global education. The question arises from potential tensions between the responsibility for others beyond national boundary which is emphasised by cosmopolitanism and the loyalty to and identification with one’s own country which is stressed in patriotism. It is said that partial patriotism will impede the development of universal cosmopolitanism.

A comprehensive debate on the tensions between cosmopolitanism and patriotism can be seen in the volume For Love of Country edited by Cohen (2002). In his reply
to Nussbaum’s (2002) arguing for cosmopolitanism over patriotism, Appiah (2002) proposed “rooted cosmopolitanism” or “cosmopolitan patriotism” (p.22) in order to reconcile the above tensions between cosmopolitanism and patriotism in the same volume. As Kymlicka & Walker (2012) put it, a feasible concept of cosmopolitanism for modern world has to recognise global citizens’ rights to local autonomy. Hence, it is of significance to integrate cosmopolitanism with patriotism which emphasise local autonomy and identities. Since Appiah’s rooted cosmopolitanism integrates both cosmopolitanism and patriotism into his theoretical framework, it is regarded as a relatively comprehensive framework to analyse the two governments’ policy documents on global education.

This paper will first introduce Appiah’s “rooted cosmopolitanism” as an analytical framework for the research. What follows is the comparison of the images of ideal world citizen between England and Taiwan by analysing both governments’ policy documents on global education. The findings will then be presented and discussed, and concluding remarks will be provided at the end.

**Appiah’s Rooted Cosmopolitanism: A conceptual framework**

The fundamental idea underlying Appiah’s rooted cosmopolitanism is that “a world of cultural and social variety” is a “precondition for the self-creation that is at the heart of a meaningful human life.” (Appiah, 2005, p.268). There are three key axes consisting of the conceptual framework of rooted cosmopolitanism: (Appiah, 1997)

1.**liberalism**

Embedding in the core of liberalism is the value of the individual. Appiah (2005) adopted Mill’s concept of individuality which is a necessary part of a well-lived life as the ultimate end of cosmopolitanism he defends. In his reply to Gracia (2006), Appiah (2006b) concludes three senses of individuality: to take responsibility for one’s life (i.e. to exert oneself to live well), a life of individuality (i.e. “who one is”), and the capacities a person exercises and develops in pursuing one’s ideal life. The last one has particularly fertile implications for global education.
2. cosmopolitanism

For Appiah, there exist many values worth living by and we cannot live by all of them. Hence, it is hoped and expected that different people and societies will realise different values. And cosmopolitans commit themselves to pluralism. As Appiah puts it, “[c]osmopolitans think human variety matters because people are entitled to the options they need to shape their lives in partnership with others.” (Appiah, 2006a, p.104) In other words, the variety of human forms of life provides individual choices to create oneself.

3. rootedness / patriotism

Rootedness refers to the loyalty to one local society that is counted as home. Appiah believes that people live best on a smaller scale such as the state, the county, the town, the street, the family as communities. This is because the freedom of creating ourselves requires a variety of socially transmitted ready-made local identities which are constituted by norms, expectations, demands, rights and obligations (Appiah, 1997).

Patriotism means the celebration of the institutions of the state within which an individual lives (Appiah, 1997). The importance of state manifests in its regulation of our lives through forms of coercion which require moral justification. Besides, state institutions are necessary for meeting many modern human needs and have great potential for abuse (Appiah, 1997; 2005). Appiah argues that all of citizens should respect for liberal political culture and the constitutional order it entails. He then defines liberal culture as “respect for the dignity and autonomy of individual persons” (Appiah, 1997, p.634).

Comparisons of Global Education Goals between England and Taiwan

In this section, the researcher will examine two official documents to compare global education goals between England and Taiwan according to Appiah’s framework of rooted cosmopolitanism. The comparison will focus on primary and secondary education.
1. England’s Global Education Goals

England’s global education goals are described in *Putting the World into World-Class Education* published by the Department for Education and Skills (DfES) in 2004. Compared to Taiwan’s white paper on international education focusing on primary and secondary education, the scope this document touches on is much more extensive, including higher education and development education in developing countries. There are three goals indicated in DfES’s (2004) global education document. Amongst the three goals, the first one is most related to primary and secondary education. The three goals and their sub-goals are listed as below.

Goal 1: Equipping our children, young people and adults for life in a global society and work in a global economy

1-1 To instil a strong global dimension (GD) into the learning experience of all children and young people. (There are eight key concepts students need to learn in global dimensions: citizenship, social justice, sustainable development, diversity, values and perceptions, interdependence, conflict resolution, human rights)

1-2 To transform our capability to speak and use other languages.

1-3 To equip employers and employees with the skills needed for a global economy.

   Generic skills for a global economy include:
   1-3-1 The ability to work comfortably in multinational teams
   1-3-2 Knowledge of different business methods, legislation and ways of working
   1-3-3 Understanding and appreciating different cultures
   1-3-4 Feeling confident when working in and with other countries

1-4 To move towards the international mutual recognition and improved transparency of qualifications.

Goal 2: Engaging with our international partners to achieve their goals and ours

2-1 To benchmark our own performance against world-class standards, drawing on best practice everywhere.
2-2 To develop our capacity to engage strategically with a wide range of partners across the world (including promoting international awareness and understanding, and developing an ability to learn from others).

2-3 To work with our European partners to realise the Lisbon goal that the EU should become “the most competitive and dynamic knowledge-based economy in the world”.

2-4 To share expertise and resources in support of the improvement of education and children’s services worldwide, particularly in Africa.

Goal 3: Maximising the contribution of our education and training sector and university research to overseas trade and inward investment

3-1 To promote further expansion in the number of international students at further education (FE) and higher education (HE) institutions, including increasing quality assured overseas outlets.

3-2 To make the UK an international leader in the creative and supportive use of ICT for education.

3-3 To promote the role of our universities as international hubs for learning and research.

3-4 To encourage education and training providers to work internationally in partnership with business.

2. Taiwan’s Global Education Goals

Taiwan’s global education goals are stated in Developing 21st Century Competencies for Our Next Generation published by the Department of Education in 2011 (English version in 2012). The competence indicators of international education for primary and secondary schools were developed based on the four goals and announced in 2012. The four goals are listed as the following.

Goal 1 – National identity

It is our goal, through the exposure of international education, that our youth will be able to further develop a strong national identity. Securely grounded in their own cultural history, our young people will be able to relate to their historic and cultural roots, which make them so unique. Becoming more aware of Taiwan’s place, in
history and within the international community, will enable them to better understand the responsibilities that they have regarding Taiwan and its future.

Goal 2 – International awareness

It is our goal to educate students to become globally literate and proficient citizens, especially in their understanding of the various cultural and global issues that they will have to face. We would like them to respect and appreciate cultural diversity and to be equipped with knowledge and skills needed for effective and successful cross-cultural communication.

Goal 3 – Global Competitiveness

It is our goal that through cross-cultural and international education learning opportunities, students will be able to make cross-cultural observations and to reflect on cultural diversity and cross-cultural communication.

Through the promotion of international education, schools will be able to assist their students with foreign language learning and proficiency, multicultural knowledge and effective cross-cultural communication skills.

Goal 4 – Global Responsibility

It is our goal to promote among Taiwan’s primary and secondary students, respect towards diverse ethnic, geographic and cultural population through an international education. Schools can assist students in cultivating a sense of responsibility towards the global community. Our primary and secondary students should be aware of their responsibility to assist and to maintain world peace, support and protect human rights, and to conserve our natural resources.

3. Comparisons of Global Education Goals between England and Taiwan

After reviewing both governments’ policy documents on global education, the research compares England’s global education goals with Taiwan’s according to Appiah’s framework of rooted cosmopolitanism consisting of liberalism, cosmopolitanism, and rootedness/patriotism. The result is demonstrated in Table 1.

</tbody>
</table>
Findings and Discussions

1. In the axis of liberalism, the concept of individuality as capacity to create one’s own life is emphasised by both governments. Individuals’ capacities to participate in global economic competition and labour markets are taken into account. In order to participate in global society, the importance of intercultural communication competence is also recognised by both governments. These capacities can facilitate individuals obtain and utilise each potential options and resources provided in a global world to creatively construct their lives. Furthermore, both governments paid much attention to the value of each individual. This can be found in both governments’ emphases on the learning of the concepts of social justice and human rights.

2. In the axis of cosmopolitanism, both governments stress the concept of cultural diversity. Knowledge of other cultures, ability to learn from other cultures, respecting for other cultures, and willingness to learn other cultures are all important competence elements with which both governments attempt to equip future generations for cultural diversity of the world through global education. The more one learn from the diverse cultures of the world, the more options and resources he or she can choose and utilise to create individual life.
3. A significant discrepancy between England and Taiwan is in the axis of rootedness/patriotism. In Taiwan’s policy document on global education, national identity and awareness are prioritised as a most fundamental and important competence which students should obtain in global education. This can obviously observed by the fact that national identity is officially designated as the very first goal amongst the four. However, the case of England is completely opposite to Taiwan’s. There is no clue to the emphasis on the development of students’ national awareness or identity in England’s official document on global education.

4. Even though Taiwan’s government especially emphasises the importance of cultivating students’ national awareness and identity, it should be carefully noted that there is no clear hint of explicit stress on patriotism in its policy document on global education. In other words, what Taiwan’s government stresses is rootedness, which is defined by Appiah as loyalty to one’s local society, rather than patriotism which refers to the respect for liberal political culture and the constitutional order liberal political culture entails in Appiah’s sense. Having said that, the respect for liberal political culture and the constitutional order is included in the curriculum of social studies in Taiwan (please refer to the Grades 1-9 Curriculum Guidelines – Social Studies Learning Area). In England, the respect for liberal political culture and the constitutional order is included in the citizenship programmes of study for key stage 4 (DfE, 2013).

5. To say that there is no emphasis on national identity in England’s official document on global education does not mean that overall English education system neglects the development of students’ national identity. As indicated in a global education document Developing the Global Dimension in the School Curriculum published by DfES (2005), the first aim of the National Curriculum which has a linkage to global education includes not only global dimension of students’ lives but also Britain’s heritage in order to develop students’ sense of identity. The original statement reads as follows:

The school curriculum should contribute to the development of pupils’ sense of identity through knowledge and understanding of the spiritual, moral, social and cultural heritages of Britain’s diverse society and of
the local, national, European, Commonwealth and global dimensions of their lives. (DfES, 2005, p.3)

The above statement suggests that England government does take national identity into account when setting its educational goals. However, it is also clear that England government does not give national identity priority amongst a variety of identities and educational goals. It is multi-layered identity from the local to the global which is emphasised in the National Curriculum instead.

**Concluding Remarks**

According to the above analysis, the ideal image of a world citizen portrayed by the global education goals set by England government is a person who has the sense of moral responsibility for universal values, such as human rights and social justice, the capacities for participating in global society and labour markets in order to extend the options and resources one can select and employ to create his or her life, and a willingness to recognise, respect for, learn, choose and utilise the diverse cultures of the world which are regarded as important resources for the construction of an individual life project.

The same ideal image of a world citizen also represented in Taiwan’s global education goals. More than that, Taiwan’s government especially emphasises the importance of national identity, including one’s own responsibility to the state, local identity, and national awareness. And the national identity is based on cultural identity and regarded as an ultimate end of global education. By contrast, the lack of the emphasis on national identity is not only found in the policy document by England government, but also can be discovered in educational practitioners’ perceptions of global education. Pike’s (2000) observation of British global education practitioners’ understanding of global education indicates that the term is perceived to be in the common interests of all people and the planet, and their nation, United Kingdom, is rarely mentioned.

It is worth making a deeper inquiry into the reason why Taiwan’s government emphasises the priority of national identity. At first glance, the term “international
“education” employed by the government reveals a hint of the rationale for the prioritising of national identity. As Frey and Whitehead (2009) put it, different from global education which seeks to investigate common human problems that transcend national boundaries, the essential concern of international education is the interest and action within nation-states. To put it differently, in terms of international education, the best point of departure to understand the world is own country as yardstick by which others’ countries’ similarities and differences are compared. This own-country-centred awareness might be an aftermath of anxiety for the homogenizing power exerted by globalisation, or without its ideological mask, Americanization or Westernization (Waters, 2001). Another reason for prioritising national identity could be attributed to Taiwan’s unique relationship with the People’s Republic of China (PRC). Due to the lack of recognition of its “nationhood” from the international community after losing its membership in the United Nations to the PRC in 1971, Taiwan’s government is actively and determinedly constructing and reinforcing its national identity through education (Law, 2004).

The prioritising of national identity also invokes a contention about how to reconcile a kind of universalism stretching our obligation to others beyond state border with a form of partiality limiting our obligation to those whom we share some sense of community and collective memory. According to Appiah (2005), the equal treatment of all is the responsibility of state, and states are appropriate domain of moral concern narrower than the human horizon. Hence, what all citizens in their own countries have to do is to respect for liberal political culture (i.e. the respect for individuals’ dignity and autonomy) and the constitutional order it entails. This is what Appiah calls “patriotism”. In short, cosmopolitan’s moral universalism can be achieved through the mechanism of state. If Appiah’s idea is desirable and feasible, global education should have a close cooperation with citizenship education.

Abstract

The Marietta College Education Department has designed and implemented a successful clinical partnership model that has aided in them being named one of the top teacher education programs in the state of Ohio. This model reflects changes in teacher preparation, k-12 student needs, and best practices for teacher candidates placed in the schools for clinical internships. Presenters will share the various partnerships created, involvement of mentor teachers, sharing of resources between the schools and Marietta College, as well as the manner in which Marietta College faculty are embedded within the partnership schools. Presenters will also share information regarding how these partnerships have positively influenced the local schools.

Keywords: School Partnerships, Clinical Internships
Executive Summary

The Professional Learning School Partnership program at Marietta College has yielded numerous opportunities for teacher candidates, Marietta College faculty, and K-12 educators at the partnership schools. Activities such as resource sharing, planning and decision-making, modeling best practices, and developing programs to meet the needs of public school students and pre-service teachers have provided valuable opportunities for growth and enrichment. Each individual partnership has a unique focus, meeting specific needs and fostering opportunities for the teacher candidates, public school students, K-12 educators, and faculty involved. The individual partnerships focus on early childhood education, fourth and fifth grade endorsements, literacy, intervention, middle school methods, and early field experiences in the freshmen year. Highlights of each partnership will be discussed, including the planning process, opportunities and challenges, the role of mentor teachers and embedded faculty, on-site course meetings, resource sharing, and training opportunities. Finally, initial information regarding the positive influences of the partnership program on the local schools will be discussed.

Partnership Overview

The early childhood education partnership with Harmar School is one of the first programs implemented as part of the clinical partnership model. Dr. Cathy Mowrer, serves as the embedded faculty member at this school and will examine the creation of this partnership, partnership growth throughout the past few years, special programming and resource sharing, and the creation of a year-long pre-internship/internship experience for early education majors at the school.
Literacy education coursework for Marietta College pre-service teachers has been held at two local elementary schools, Washington and Phillips. Both are within walking distance of the college, allowing pre-service teachers to work with students in both large and small groups throughout their literacy coursework. Dr. Carole Hancock serves as the embedded faculty member for literacy. In addition to coursework, methods, and diagnostics the literacy partnership includes a local Literacy Night in which pre-service educators prepare materials for students and parents. In addition, the Phillips partnership is hosting the first year field students for the freshmen initial field experience beginning in the 2015-2016 school year.

Dr. Bill Bauer serves as the embedded faculty member at the Beverly Center School for the Marietta College intervention licensure program. Coursework including diverse learners, behavior management, and instructional methods occurs in conjunction with this partnership. Pre-service teachers participate in the school-wide intervention program, inclusion settings, and professional development offered by the school. The embedded faculty member in turn delivers both formal and information staff professional development.

Middle school methods coursework is taught in conjunction with Jackson Middle school. Dr. Amanda Knapp-Witt serves as the embedded faculty member at the middle school, teaching coursework on-site in conjunction with mentor teachers who allow students to apply theory learned in coursework directly into the classroom. Middle school methods students interact with a variety of educational professionals in the school in addition to classroom teachers and interventionists, including administrators, the counselor, the school nurse, and the media specialist to learn about the unique needs of emergent adolescents and how the middle school team concept supports those needs.
The fourth and fifth grade endorsement for elementary education takes place at Belpre Elementary. Dr. Cathy Mowrer serves as the embedded faculty member at Belpre, working with K-12 educators to implement the necessary experience to prepare early childhood majors to obtain the fourth/fifth grade endorsement for their licensure. Dr. Mowrer teaches coursework and supervises clinical experience at Belpre as well as Harmer to provide elementary pre-service educators with as much experience as possible in the classroom setting.

**Partnership Components**

Components of these successful partnerships will be discussed, beginning with information regarding the planning process, assessing partnership development, and characteristics of successful partnerships. The importance of a memorandum of understanding to clarify the roles and expectations of both the higher education and public education parties with regard to resource sharing, pre-service teacher placement, and professional development opportunities will also be discussed. The individual roles of mentor teachers and embedded faculty with regard to pre-service educator responsibilities, on-site course meeting locations, interactions with K-12 students, professional development for school staff, and opportunities to work as part of the school community will be examined.

Clinical partnerships provide numerous benefits for all parties involved, but as with any program there are challenges associated with implementation as well. Challenges common to the partnership implementation process in general will be discussed, as well as unique challenges associated with each partnership, since each school has a specific focus with inherent opportunities for growth and development. Finally, initial information regarding the positive influences of the clinical partnership program in the K-12 partnership schools will be examined.
Increasing Student Engagement in Higher Education

Abstract

Teachers in higher education are faced with the challenge of engaging their students. The role of the teacher is to help students interact with the content, and have them create their own knowledge. Research shows that using effective teaching methods can stimulate student engagement, and that student engagement is associated with positive learning outcomes.

Consequently, the purpose of this study is to learn more about student engagement, and what can be done to increase student engagement in higher education. Current literature was reviewed, and focus groups were held to gain further insight. This study offers numerous solutions to increase student engagement including a framework of principles, and effective teaching methods.

*Keywords:* student engagement, higher education, teaching methods
Introduction

One of the challenges teachers face in higher education is that of engaging their students. Teaching requires not only a command of the subject matter, but just as important, effective teaching methods that are necessary to engage their students. However, some beginning teachers entering higher education are not prepared to teach (Lail, 2009). They use methods based on certain principles from what they have been exposed to, or by how they were taught, influencing the way they teach their own students. These methods are not necessarily effective for teaching and engaging students in higher education. Research has shown that using effective teaching methods can stimulate student engagement, and that engaged students are good learners (Bryson & Hand, 2007; Jang, 2008; Troisi, 2014). Knowing more about student engagement, and what can be done to increase student engagement might be useful to those individuals new to teaching in higher education.

In the spring semester of 2015, focus groups were held among college students to seek their perspective on student engagement. These groups agreed that there is more teachers can do to increase student engagement. Consequently, the purpose of this paper is to understand and learn what teachers can do to influence, and therefore, increase student engagement. First, a comprehensive literature review will be provided on the concept of student engagement including instructional methods and techniques. Second, results from the focus groups will be shared. Last, an action plan for increasing student engagement in higher education will be presented based on analysis of the literature, and results from the focus groups.

Area of Focus Statement

The purpose of this study is determine effective teaching methods to increase student engagement in higher education. Student engagement has been defined as involving students in
meaningful academic activities (Delialioğlu, 2012). The teacher’s role is to help students engage and interact with the course material so that students can create their own knowledge (Lumpkin, Achen, & Dodd, 2015). Results from the 2008 National Survey of Student Engagement at one university found that high levels of student engagement positively contributed to cumulative GPA and students’ perception of their overall academic experience (Webber, Krylow, & Zhang, 2013). Teachers in higher education are faced with the challenge of engaging their students. Therefore, by answering the following research questions, successful teaching methods should be uncovered that would aid in increasing student engagement for teachers in higher education.

**Research Questions**

1. How is student engagement perceived among college students?
2. What can teachers do to influence student engagement?

**Literature Review**

Researchers have described student engagement as a multidimensional phenomenon. Most definitions have included at least both behavioral and affective components (Handelsman, Briggs, Sullivan, & Towler, 2005). Others have noted student engagement as an interpersonal component where interactions with teachers, and other students were found to be an important part of the learning experience (Lumpkin et al., 2015). Hendelsman et al. found evidence of four dimensions of student engagement: general learning skills, emotional involvement with class material, participation/interaction with faculty and peers, and performance. Ahfeldt, Mehta, and Sellnow (2005) characterized student engagement as being actively involved by asking questions, or working collaboratively with other students.

Wittrock’s (1990) generative theory of learning states that students learn better when they are engaged during the learning experience. Answering questions and receiving feedback
increases students’ attention so they are more likely to encode the presented course material. By answering questions students are better able to gauge their level of understanding. Campbell and Mayer (2009) found that students who were engaged during a lecture performed better in the course compared to those students who were not engaged. Students who were engaged answered questions that were poised by the teacher who in return provided feedback. Based on these results, they suggested that teachers should consider using a questioning procedure during college lectures to promote student engagement in which a few lecture-related questions are asked by the teacher, answered by the students, and then feedback is given from the teacher.

Webber et al. (2013) used Astin’s theory of involvement (1993) and Pace’s theory on quality of effort (1987) as their theoretical framework in their study on student engagement. Astin’s theory of involvement (1993) and Pace’s theory on quality of effort (1987) address the issues of student involvement and engagement. The idea is that students will have a greater experience from college based on the time and effort they devote to their college activities. Time refers to how often a student engages, and effort consists of how fully the student devotes into the activity. Webber et al. found that students who reported more frequent engagement in academic and social activities earned higher grades, and reported higher levels of satisfaction with their college experience. They indicated that students may benefit with increased academic knowledge as well as personal and social skills in a collaborative learning environment that is both challenging and supportive.

Schlenker, Schlenker, and Schlenker (2013) viewed student engagement from a psychological perspective. They used the triangle model as their theoretical foundation. The triangle model was developed to deal with the nature and implications of accountability in interpersonal relations. According to the triangle model, student engagement is a direct function
of the strengths of three factors: prescription clarity, personal control, and personal obligation. They found that setting clear goals, teaching learning strategies, and encouraging students to believe in themselves, along with stressing the importance of personal obligation contributed to predicting academic engagement. Engagement, in turn, predicted academic success.

Bryson and Hand (2007) proposed that there are different levels of student engagement that lies on a continuum from disengaged to engaged, and that the same student can experience different degrees of engagement. Based on focus group discussions, student engagement was comprised of various levels of active participation in class activities. Enjoyment, enthusiasm, reading for pleasure of learning itself, and reading more than required about a subject were described as elements of student engagement. The disposition of the teacher appeared to influence the disposition of the student. The teacher’s enthusiasm about a subject, and teaching process increased student engagement. They concluded that students are more likely to engage if their teachers are engaged with them, and the teaching process.

Troisi (2014) investigated whether student management teams (SMTs) would be effective in increasing student engagement, and academic performance. A student engagement team is comprised of a group of three to five students who serve as liaisons between students in the course, and the teacher. The SMTs regularly meet with the teacher to improve the learning environment within a course. They work collaboratively with the teacher by improving communication, course content, evaluation, and assessment techniques. Students are either selected by the teacher, or they volunteer to be a member of the team. Troisi found that members of the SMTs were more engaged, and performed better in their courses.

According to the identified regulation model, teachers can increase student engagement by providing them with a rationale that they can identify with, and is of use to them. Studies have
shown that students will tend to invest more effort, and achieve more when a lesson is perceived
to have personal importance to them (Miller & Brickman, 2004; Shell & Husman, 2001). Jang
(2008) found that students’ engagement, motivation, and overall learning experience was
increased by providing a rationale in a supportive way.

Zeeman and Lotriet (2013) described a teaching approach based on the theoretical
framework of Heathcote’s (Heathcote & Bolton, 1995) ‘mantle of the expert.’ The ‘mantle of the
expert’ stresses the importance of allowing students to take part in making decisions in order for
them to become invested in the learning experience. The learning experience is based on a
partnership of generated knowledge and understanding. They demonstrated that by careful
reframing of the learning environment, students are not only engaged, but they can achieve a rich
learning experience.

Zhang, Shi, Yun, Li, Wang, He, and Miao (2014) investigated the role that self-regulation
plays in college students’ academic engagement and burnout. Self-regulation was defined as
being comprised of two kinds of process-oriented motivation styles: locomotion mode and
assessment mode. Locomotion mode was described as being goal-oriented, and assessment mode
referred to evaluation of alternatives in order to maximize progress once the activity has begun.
When students are making critical evaluations, and assessing where they are at in reaching that
goal, they are in the assessment mode. When students are focused on a goal, and making
progress, they are in the locomotion mode. Zhang et al. found that locomotion mode was
negatively associated with academic burnout, and positively related to academic engagement,
while the assessment mode was positively related to academic burnout, and negatively associated
with academic engagement. They suggested that teachers might be able to prevent burnout and
promote student engagement by encouraging students to apply goal-setting strategies, and have them focus on the learning experience, and not the final grade.

According to Doyle (2008) creating learner-centered environments can sustain, and promote student engagement. In learner-centered environments, students become active in their learning experience, and are now responsible for their own learning. Through an active research project, Lumpkin et al. (2015) assessed how students perceived active learning strategies that included working in pairs, writing a variety of exploratory assignments, and having small group discussions. Quantitative and qualitative data revealed that students valued participating in engaged learning activities. These students believed that working in pairs and having small group discussions positively impacted their learning. These students indicated that in-class writing, and small group discussions facilitated their willingness to answer questions in class. Lumpkin et al. suggested that teachers should incorporate a variety of more active learning strategies, and approaches to meet the academic needs of their students. Furthermore, they believed that soliciting anonymous student perceptions provided valuable insight for ways to improve course design and instructional approaches.

Hourigan (2013) developed a simple, and flexible model of active learning that promotes student engagement, known as ARC (application, response, collaboration). ARC encourages students to be present and engaged, and allows teachers to experiment with pedagogy. The key principles behind ARC were to have students make connections, respond and reflect, and collaborate with their peers. Activities, planned and unplanned, are weaved into the course that allow students to apply concepts or theories. Individually students would think through a theory, then collaborate in small groups, and discuss in class. Students would also apply the theory with real-world examples. Using a multitude of stimuli, such as an audio clip, or simply art, the
teacher would ask students to react, and reflect. This method had a positive impact on student engagement. Furthermore, syllabus are designed to recognize, and reward active student engagement. Students would receive small amounts of credit for active engagement, but in total would account for a substantial portion of each student’s grade.

Chickering and Gamson (1987) presented a framework that could be used to increase student engagement. According to this framework, students are more engaged when the instruction (1) increases student-teacher interaction, (2) stimulates cooperation among students, (3) encourages active learning, (4) provides timely feedback, (5) requires students to invest time in their assignments, (6) establishes high expectations, and (7) respects diverse talents and ways of learning.

Blended learning has incorporated these seven principles. Based on the literature, the most popular definition of blended learning is the combination of face-to-face, and online learning environments (Delialioğlu, 2012). These mixed modes of learning environments have potential to increase student engagement. For instance, Neumann, Neumann, and Hood (2011) examined the integration of technology during lectures in statistics from within a blended learning framework. They incorporated the use of technology that was comprised of online access to lecture notes, multimedia presentations, computer based simulations of statistical concepts, animations, and the use of SPSS statistical software package during the lectures. The results showed three global effects on student learning and engagement: practical application, understanding, and positive attitudes.

Junco, Heibergert, and Loken (2011) also used Chickering and Gamson’s (1987) framework in promoting student engagement. Their study examined the effect of using Twitter as part of an educational intervention on student engagement. They found that Twitter improved
contact between instructor and students, encouraged collaboration, promoted active learning,
provided prompt feedback, aided in completing tasks on time, communicated high expectations,
and showed respect for diversity. Students and instructors were active participants and highly
engaged in the learning process.

An additional promising method that has been effective in increasing student engagement
is active learning. With active learning, students become actively involved searching for
information to increase their comprehension of the course material. Delialioğlu (2012) found that
students were more engaged with active learning strategies when they were working in a
problem-based learning environment in comparison to the lecture-based learning.

Schrand (2008) encouraged educators to use technologies for active forms of student
learning, and not as “shovels” of passive learning in presenting course content (p.78). He created
interactive multimedia exercises that promoted active learning. Previous in-class exercises
required students to take slips of paper with different phrases, and assign them into one of two
categories: U.S. cultural value and non-U.S. cultural value. He used animation software in
creating exercises, in which all moving parts were digitalized, and programmed to be dragged,
and dropped on the computer screen. These exercises contributed to lively classroom
participation, sense of student ownership, element of play, and public display of student
performance. Student engagement was viewed as active collaborative participation in which
students practice, build, and create.

Teachers who use technology as a tool appeared to experience success in promoting
student engagement. Chen, Lambert, and Guidry (2010) investigated the impact of Web-based
learning technology on student engagement, and self-reported learning outcomes in face-to-face,
and online learning environments. Data for this study came from the 2008 National Survey of
Student Engagement (NSSE). Based on 17,819 respondents, they found that there is a positive relationship between students who engaged in course-related technology, and learning outcomes, and that the use of technology has a stronger impact earlier in the college experience. Williams and Chinn (2009) also found that online assignments using Web 2.0 technologies increased student engagement, and contributed to the level of connectivity.

Based on the review of literature, student engagement appears to have many meanings, and it is clear there are a variety of methods that teachers can use to increase student engagement. Research has shown that student engagement is positively associated with learning outcomes (Delialioğlu, 2012; Schlenker et al., 2013; Troisi, 2014; Webber et al., 2013). In order to obtain a deeper understanding of student engagement in higher education, college students were asked to provide their personal accounts of student engagement, and what teachers can do to promote student engagement.

**Data Collection/Data Sources**

In the spring semester of 2015, two focus groups were held among college students to seek their perspective on student engagement. A convenience sample of undergraduate students was selected from a private university in the western United States. The participants were told that any information that is obtained with this study, including their identities, will remain anonymous, and that their participation was voluntary. They were willing, and interested to provide their viewpoints. No harm was done to these participants.

A total of 10 participants participated in the focus groups. There were two freshmen, one sophomore and seven graduating seniors. The two focus groups were conducted at different times and locations. The author conducted the first focus group with six of the participants, and her teaching assistant conducted the second focus group comprised of the remaining four
participants. Each of the sessions lasted approximately 30 minutes. Participants in the first focus group were asked the two research questions: what is student engagement, and what can teachers do to influence student engagement. Participants in the second group were only asked the second research question. Data from the focus groups were taken directly from notes that each of the facilitators recorded at the time of the sessions. The researcher then reviewed the transcriptions, and generated the results based on the participants’ responses to the research questions. Summary of these findings were given to the participants to validate. The participants agreed with the findings.

**Data Analysis and Interpretation**

The definition of student engagement among these participants was not that different from the literature review. These participants characterized student engagement in terms of behavioral, interpersonal, and affective components. From the behavioral perspective, student engagement was described as being present and attentive. Students who are pre-occupied on their computer, or phone are definitely not engaged. These students are not present or attentive. They indicated that eye contact was a telling indicator whether students are engaged, or not. From the interpersonal perspective, both focus groups mentioned that the relationship and interaction among the teachers and their peers have a positive impact on student engagement. These same participants indicated that students who participated and contributed to the classroom discussion were definitely engaged in the learning experience. From the affective perspective, enjoyment was added to the definition. In their words, student engagement is “liking what you are doing.” As one participant indicated, student engagement is “what you make it to be.”

When the participants were asked what teachers can do to influence student engagement, the responses were similar to the suggestions made by contemporary scholars. These participants
indicated that teachers need to get students involved. Teachers should not rely on just one teaching method. They should use a variety of teaching methods. In addition to lectures, teachers should incorporate interactive, and fun activities that are related to the course material. For example, one participant mentioned the use of multimedia that has students using “clickers” to answer questions relating to the topic. A few participants indicated that teachers should teach from their hearts, and not the textbook. The textbook should be used as a resource. Teachers should create group, and project-based activities that promote active and collaborative learning. Another participant indicated that setting up the classroom in a u-shape structure can promote student engagement. Teachers can also make student participation a part of the student’s grade.

Both groups agreed that there is more teachers can do to increase student engagement. They stated that teachers need to involve, motivate, and challenge their students. They also need to create a safe environment for learning. Teachers need to remain stern, but positive. For example, participants from the first focus group referred to one particular teacher who “expects” involvement from her students. She promotes participation among her students by asking a lot of questions. She is clear about the assignments, and her students know that all of the readings need to be completed prior to class. She provides feedback, and makes learning fun, and interactive. As Bryson and Hand (2007) indicated, students are most likely to engage if their teachers are engaged with them, and the teaching process.

**Action Plan**

The findings from this study suggest that in order to increase student engagement in higher education, teachers need to get students actively involved in their learning experience by incorporating relevant, and enjoyable activities that promote student-teacher interaction, and student teamwork. Teachers need to create a safe learner-centered environment that respects
diverse talents, and ways of learning. They need to set clear goals, establish high expectations, and provide timely feedback. These recommendations are based on the review of literature, and results from the focus groups.

Teachers should also recognize that there are different components of student engagement, and that there are a variety of teaching methods that can increase student engagement. Behaviorally, teachers can provide a rationale behind the lesson that is being taught to engage students (Jang, 2008). Hourigan (2013) suggested that student engagement could account for a portion of each student’s grade. According to Campbell and Mayer (2009), incorporating a questioning procedure during lectures, and providing immediate feedback would also aid in increasing student engagement. From the interpersonal perspective, there were quite a few recommendations. Troisi (2014) suggested creating student management teams. Zeeman and Lotriet (2013) recommended allowing students to become stakeholders in the learning experience. Finally, Junco et al. (2011) introduced Twitter as a tool that teachers can use to promote collaborative learning, and increase student engagement. Addressing student engagement from the affective perspective, Schrand (2008) recommended incorporating interactive multimedia that is not only fun, but promotes collaborative learning.

Engaging students in higher education does not need to be challenging. Chickering and Gamson (1987) proposed seven principles for good practice in higher education, all of which are related to student engagement. A framework of principles, and suggested teaching methods have been presented in this paper. Research has shown that student engagement is associated with positive learning outcomes, and there are effective teaching methods available to those individuals new to teaching in higher education (Handelsman et al., 2005; Zeeman & Lotriet,
These teaching methods are based on certain principles that are effective in increasing student engagement.

This study is only a beginning. Some teaching methods may be less effective than others depending on the learning environment and course content. Additional research should be done to explore the degree of effectiveness of these proposed methods. The selection limitation of focus group participants may pose some constraints for students’ perceptions, values, attitudes, and personal account of student engagement. Including participants with varying degrees of motivation may reveal additional findings. Future researchers should continue to explore additional teaching methods that not only increase student engagement, but has a positive influence on the students’ overall academic experience. Teaching is an art, and requires an inventive mind (Berliner, 1993).

Motivating Students through Cooperative Projects in General English Classes
Abstract:

The purpose of this paper is to find out the effect of cooperative project in English class. Freshmen are eager to improve their English. In the General English classes, students are encouraged to make cooperative projects. This is an ongoing project so that the result of this study can be found at the end of the semester. While they are making their video or audio projects with their group members, they can use English to communicate with each other. Group projects can be the great chance to create new interpersonal relationship. Most students do not interact with students from the different majors in the elective classes.

1. Background of the Study

At H University in Korea, General English is three hour class per week. This is an elective subject however most students take General English 101 and 102 in each semester. In English class, students are supposed to develop their communicative competence. In the global society, they need to communicate with other people around the world. The medium of communication is English. Students are encouraged to improve four language skills.

There are around 30 students in each class. The purpose of General English is to provide an atmosphere for students to use English to communicate with each other. The academic ability of the students is relatively low; however, most of the students are motivated to improve their English. At the end of the semester, students are supposed to express their thoughts and ideas in English. The researcher/instructor tries to use various effective methods to motivate students. It is three hour class once a week. During the first two hours, students do ice breaking activities, cooperative work and presentation. In the last one hour, students do their individual work and the researcher/instructor goes around the classroom to monitor and help students. I particularly concentrate on shy students who need more help. Professors’ special attention is very important to the students. One piece of warm remarks by the professor can make a lot of difference to the students.

They are encouraged to discuss their projects with their group mates. Students can form the group of three or four to complete their group project. During the class, students can work together with their group members to complete certain task.

Students are supposed to meet the instructor at least once during the semester. Having a conference with the students is necessary to figure out students’ progress and problems. I would like to provide the best atmosphere to study and learn English.
2. Advantages of cooperative work

Students can develop interpersonal communication skill through cooperative work. Group members will have responsibility while they are doing cooperative project. The purpose of cooperative work is to enhance learning.

3. Requirements of the class

a) 1 video or audio project

Students are required to produce one video or audio project with their group members. They have to present their work at the end of the semester.

b) Visiting English speaking zone once a week or taking extracurricular classes

Students are encouraged to spend some time at English speaking zone where native speakers are around to help them. There are a couple of extracurricular classes run by native speakers such as cooking classes. Some students enjoy making projects and visiting English speaking zone. The more time students spend at English speaking zone, the better they can speak English.

4. Research

The following questionnaire will be used to find out students’ reaction about the class.

a) Do you like to visit English speaking zone?

b) Is visiting English speaking zone helpful for you to improve your English?

c) Are you able to communicate with native speakers?

d) Do you like to do cooperative project with your group members?

e) What are the advantages of cooperative project?

f) Do you like to make video projects?

g) Do you prefer to make audio projects rather than video projects?

5. Discussion

The deadline of the each project is the end of the month. Students can submit their recording or video project through kakao which is a smartphone application. The purpose of
the group project is to make students use more English in the comfortable atmosphere. The researcher tried to interview everyone after the class. Some students were shy to express themselves in the classroom. When they had a conference with the researcher, they expressed their opinion freely. The purpose of the English class is to make students more comfortable so that students will have lower affective filter.

Instead of forcing students to study English, I rather wanted for students to enjoy using English. When they try to communicate with English speakers successfully, that can fulfill the purpose.

6. Conclusion and Implementation

The outcome of the cooperative project is to develop students’ communicative competence and enhance interpersonal communication skill.

ABSTRACT

This study was conducted to determine the impact of interdisciplinary projects on divergent learner’s grades and interest/enjoyment of social studies and English/language arts. For each major unit taught in social studies, students were reading connected literature in English/language arts and then completing a connected project in both classes. At the end of the first semester, 52 divergent learners were identified through the Divergence Ranking Guide (Taylor & Johnson, 1999). Those student’s grades, surveys, and feedback forms gave a clear picture of the impact of this curriculum. These students saw an improvement in their English/language arts grades and an improvement in writing skills. There was not a quantifiable difference, however identified in their social studies grades. The study determined that curriculum could be more effective if the related projects were smaller, more connected literature was used, and daily lessons with interdisciplinary connections were made.
Peanut butter and jelly, language arts and social studies, some items are just made for each other. Last year, a language arts colleague and I piloted an interdisciplinary program focusing on connecting our English/language arts and social studies classes together through projects and literature. Students were be able to make connections and work across disciplines, which research proves is a needed skill in the twenty first century. Students should be able to draw connections and make inferences using all their subject matter.

In recent years interdisciplinary teaching and integrated units in education have increased. Beginning in 1994, the National Council for the Social Studies began a push for a strong integrated curriculum in schools (Lee, 2007). Now that our nation is well into the 21st century there has been a renewed interest in interdisciplinary research and education. Recent surveys of the future of jobs show an increase in the need for individuals who can understand, employ, and integrate knowledge and collaborate across disciplinary teams. This has led to the American Association of Colleges and Universities (AACU) to call for more interdisciplinary learning with a focus on working with interdisciplinary teams and knowledge integration. An example of this is St. John Fisher College in New York, which has conducted research on using interdisciplinary teaching by connecting British History with freshmen writing. Two professors noticed a lack of writing skills of incoming freshmen so they began to incorporate writing to learn exercises with each history reading and lecture (Dotolo & Nicolay, 2008). When children grow up and get their first job, they will be expected to transfer and integrate information across disciplines. This type of education gives students the skills they will need to be successful in these jobs (Boix et al., 2009).

Not only does the future show a need for the increase in interdisciplinary education, but the diversity of the students in our classrooms demand it. Students today do not respond to
conventional teaching methods due to year after year exposure to the same type of teaching (Seo, 2009). Interdisciplinary education gives students the ability to see links among different disciplines and enables them to use these skills and knowledge to relate their learning to real life situations. Students must relate to the material before they can begin to work with it. As they become connected with what they are learning, they can begin to personalize their learning by bringing in ideas and knowledge from other areas of their life (Lee, 2007). Putnam and Rommel-Esham (2004) concluded that, “by making relevant connections students begin to appreciate the past” (p. 347). When students are interested and relate to the topic that is taught in more than one area, they are more likely to pay attention and have the desire to learn (Lee, 2007). The National Middle School Association discusses the need for relevant and integrative curriculum. “Relevant curriculum creates new interests, opening doors to new knowledge and opportunities for ‘stretching’ students to new levels of learning” NMSA, 2003, p. 21). They continue by mentioning that a curriculum that is integrative helps students to understand the work around them and make it meaningful. “Since real life issues are by nature transdisciplinary, attention to them integrates the curriculum in natural ways” (NMSA, 2003, p. 23).

Interdisciplinary teaching appears in many different formats in schools across the nation. On the topic of integration of language arts and social studies, there are many different approaches from full co-teaching of the class to the use of literature in the social studies classroom. According to Turk, Klein, and Dickinson (2007), interdisciplinary teaching has a positive impact in the social studies classroom. Teachers are also affected positively by having an opportunity to collaborate, experiment, and try new strategies in disciplines that they may not be comfortable (Lee, 2007).
Interdisciplinary teaching can be approached in a variety of ways. The success of interdisciplinary teaching is based on the looseness or tightness of the teaching (Nikitina, 2006, para. 2). How the teacher approaches the integration determines the success of the student. Nikitina proposed that it was not the bond between disciplines but the focus on the individual disciplines and how each guides the other. Her proposal is that there are three interdisciplinary strategies; contextualized, conceptualized, and problem solving. All three approaches differ in the way knowledge is generated and the way connections are made among ideas (Nikitina, 2006).

There are different levels of interdisciplinary or integrated curriculum in schools. In his book on integrating language arts and social studies, Kellough (1995) argued that there are five levels of integration. His scale moves from level one, the least amount of integration to level five, the most integrated. Level one is the more traditional classroom where an individual teacher plans and conducts his/her classes and makes little attempt at cross curricular connections. It is Kellough’s belief that teachers should aim for levels four to five in their classroom to have disciplines boundaries begin to disappear (Kellough, 1995).

To assist teachers in achieving levels four to five of Kellough’s (1995) integration scale, cooperative learning is a strategy that must accompany instruction. In an integrated or interdisciplinary environment, cooperative learning can allow for rich discussions and engaged students. “Allowing students to partner on a particular assignment can engage them in the subject matter they are studying, help them improve their skills, and teach them the value of teamwork” (Bennett, 2015). Cooperative learning also allows for more student based research to occur. Through a cross-curricular environment, more topics can be explored and large-scale research with complex questions can be assigned (Tucker, 2015).
Literature used in social studies is a powerful tool to bridge the gap between past and present. In today’s classroom, many teachers argue over having enough time to teach state mandated standards. This study argues that using literature could help teachers adhere to time constraints by using engaging literature that pushes students’ critical thinking skills. Students find themselves wrapped up in the stories of history rather than the facts (Turk et al., 2007). Teaching writing skills can also help students develop skills needed in all subjects that include recall, summarization, evaluating choices, and extend new ideas. Social studies teachers can design writing assignments that have students think deeper about social studies concepts or events. By adding a combination of content literature and writing activities teacher can begin to fade subject borders (Graham et al., 2007).

The key to success of any curriculum is that it is relevant and challenging. The research clearly shows that there are essential guidelines for the success of an interdisciplinary curriculum. It is essential that this curriculum have clear goals and variety to be successful. Students need to be at the forefront of the curriculum by allowing their input, giving them adequate time, and promote cooperative learning (Lee, 2007). The other key to success is teachers must be willing to collaborate, encourage, and grow professionally. They need to create a safe and caring environment where students can collaborate and share work (Strahan et al., 2009).

Method

The study was conducted with 128 seventh graders (75 males and 53 females, 3 African Americans, 2 Hispanics, and 123 Caucasians) in heterogeneously grouped classes for social studies and homogeneously grouped for English/language arts. There are three levels in language arts: honors, advanced, and on grade level based on teacher recommendations and
standardize test scores. The social studies content for the seventh grade year is world history from the year 1600 to the present day.

Students began the year by taking a survey about their interest level, previous class performance, and learning preferences in language arts and social studies (See Appendix A—Beginning Survey). The survey consisted of ten rating questions with each having five choices from “Always” to “Never.” Past grades for each student in language arts and social studies were used to compare with the data received on the surveys to form a profile of each student in both subjects. As the year progressed, students were given a chance to provide feedback on their interests and performance after each nine weeks. This feedback was received through survey forms and student interviews. Grades were checked and compared with last year’s grades. One final time at the end of the first semester students were given a similar survey to the one used at the beginning of the year (See Appendix B—First Semester Survey). At that point students had been involved in two major projects and read many content connected literature pieces including novels, primary sources, picture books, and short stories.

The design for the first nine weeks interdisciplinary project centered on the topic of colonization. Students created a multi genre portfolio about a mock voyage of discovery and colonization. The main focus of the project was the writing of historical fiction journals that were based on the history learned in social studies class and the novel studied in English/language arts class. Along with the historical journals, students also created maps of their journey along with designing flags and writing their own charter to be signed by the king. In English/language arts, students read Blood on the River by Elise Carbone to parallel the study of the time in social studies. The book focuses on the Jamestown settlement and their relationship with the natives.
The project design for the second nine weeks centered on the study of the Age of Reason and Enlightenment. During the study, the students focused on philosophers and the question of what constitutes philosophy. Students created mock Facebook pages for major philosophers and scientists of this time period. They researched and decided who the philosophers and scientists friends would be, what they would have been doing, and what they would have liked. In English/language arts class, students worked on personal philosophy essays and learned to develop writing skills through multiple revisions that ended with a creative representation of their beliefs. This unit culminated with students attending Salon Day. In the model of the salons of the French philosophers and the Socratic seminar, teachers took their classes to the media center and students sat in groups and discussed their Facebook pages, philosophy essays, and current events. Teachers monitored the process and recorded the process where students comment and share.

Results

At the conclusion of the first semester, fifty two students were identified as divergent learners. The Divergence Ranking Guide, developed by Taylor and Johnson (1999), was used to assist in determining each participant’s level of divergence in the classroom. A divergent learner is recognized as an individual who does not relate to traditional curriculum, methods, school regulations or values. Perhaps the most critical overarching statement to be made is that whereas traditional learners can reach a level of comfort in a traditional classroom, thereby allowing upward movement in the motivational levels and true cognition, the divergent learner is stifled and anxious in the traditional classroom, preventing cortical activity from ensuing at an appropriate rate” (Taylor & Johnson, 1999, p.7). After all data was collected, including student
surveys, independently given feedback, and grades from social studies and English/language arts classes, there appeared to be no clear answer to the true impact of Humanities based projects on divergent learners. In regards to grades, the greatest improvement occurred in English/language arts classes where there was a 75% increase in the student’s semester grades in the 52 identified divergent learners. There was only a 9% drop in grades while 15% stayed within one to two points of their previous grade. In contrast, social studies saw a 29% decrease in student grades while 42% of students stayed within one to two points of their previous grade. The positive impact in social studies showed only a 29% increase in student grades.

Student feedback and survey results revealed student opinions and feelings about the Humanities program. Of the 52 identified divergent learners, twenty students provided written feedback that they enjoyed the Humanities classes, while ten claimed they did not like it. In the beginning of the year ranking survey, a high percentage of students “agreed” to “strongly agreed” with the statement that they do better on projects than on tests. Student end of the semester survey showed those numbers had greatly shifted to “not sure” to “disagree.” Three fourths of students ranked Humanities as helping their knowledge in social studies between “agree” and “strongly agree”, while 80% ranked that Humanities has helped their writing skills. On the topic of Humanities helping their time management skills, the data was split almost evenly with 60% ranking it between “agree” and “strongly agree” and 40% ranking “disagree” and “strongly disagree.”

Discussion

The data on the impact of Humanities projects and literature leaves room for discussion and improvement. At the simplest level it appears that the Humanities projects have improved student grades more in English/language arts than in social studies classes. In retrospect, the
study showed that the writing component of most of these projects is where the strongest impact was made. Both English/language arts teachers in the study attributed the 75% increase in grades to the writing aspects of the projects. Students worked on the writing aspects of the projects in both classes, but the grade only counted in the English/language arts class. Well over three fourths of the students said that they “agreed” to “strongly agree” that Humanities has helped their writing. The research showed that a strong interdisciplinary program can help students develop writing skills that can be used across content lines. Effectively designed writing assignments will begin to help students fade the border between disciplines (Graham et al., 2007). Developing student writing skills may well stand as the best facet of this Humanities program.

One of the down trends that was illuminated in the student surveys was a decrease in higher achievement on projects than on tests. This can be attributed to more work and rigorous expectations on these projects. Several students received low grades on the first project of the year, but have since shown improvement. In years past students have stated that the first projects of year shows them the expectations for Humanities. A high number of students wrote in their feedback that Humanities was hard work and very challenging. Lee (2007) stated that the success of any curriculum is based on it being relevant and challenging to students. This curriculum has aspects that the data show is definitely working, but there is much room for improvement. Major unit projects and connected literature is not enough to have a true impact on students. On Kellough’s (1995) scale of five levels of integration, in the researcher’s opinion, this curriculum is reaching a three, but has potential for level four to five. The program needs to move away from large scale, nine weeks long or longer projects, to smaller day by day or week by week interdisciplinary lessons that include connected literature. A portion of students mentioned that they were still working on the language arts part of an old project while they
were starting the next one in social studies. Part of this problem can be equated to this school having social studies every other day and having to move through material faster than the everyday English/language arts classes. If, as expected, this school moves to everyday social studies next year, this problem could corrected. Often times the projects are so extensive that English/language arts class’s end up doing more work for longer periods of time because they meet everyday. The writing assignments need to be continued because they are having an impact on the students. An interdisciplinary curriculum is key to the 21st century student. “Curriculum is integrative when students explore their own agendas and make meaningful decisions about their learning, often defying ‘arbitrary subject boundaries’” (Stevenson & Bishop, 2005, p. 104). They will be living and working in jobs that need individuals who know how to integrate, transfer, and collaborate across disciplines (Boix et al., 2009)

English/language arts and which ones you have not. What is your honest opinion of the
Humanities projects? Give me the good and the bad! What would make Humanities better?
Title:
Urban School Closure Across the United States: The Case of a Community-University Response in the Urban Midwest

Topic Area:
Educational Policy and Leadership

Presentation Format:
Paper Session

Description of paper:
The purpose of this study is to examine urban school closures across the United States and how leaders across a community in the Midwestern U.S. took action to reopen a high school that was closed. Findings suggest these leaders leveraged networks to negotiate a community-university social contract, took strategic actions, and formed a community-driven education task force. This study offers implications for educational leaders and concludes with implications for future research.

Abstract

After decades of educational and social inequality, many urban school districts face fiscal deficits, low-test scores, and declining student enrollments that have resulted in massive school closures. However, some urban communities are organizing against school closures to reopen public, neighborhood schools as community schools. The purpose of this study is to examine how leaders across a community in the urban Midwest took action to reopen a high school that was closed by its district. Using case study methodology, this study draws on interviews and document data. Concepts from social capital theory and social networks are used to theoretically frame this study and guide the analysis. Findings suggest these leaders leveraged networks to negotiate a community-university social contract, took strategic and socially connected actions, and formed a community-driven education task force. This study offers implications to guide leaders in similar urban contexts and concludes with implications for future research.
D. President Obama’s recent bid to increase the federal minimum wage from $7.25 to $10.10 has divided businesses and economists. Policy supporters generally argue that an increase in the minimum wage will support job growth, while opponents contest that it will not eliminate the root cause of poverty. This paper will engage in a policy analysis of guiding arguments both supporting and opposing an increase of the minimum wage.

I. Introduction of Minimum Wage Law & Current Status

The Obama Administration has submitted a legislative proposal to increase the federal minimum wage from $7.25 to $9.00 an hour in 2015. While individual states and cities have varying individual minimum wages that presently exceed the federal minimum wage, this proposal will set a floor on wages nationally, which will require many states to increase their current minimum. There is much debate among economists about whether or not minimum wage rates influence employment rates, poverty rates, and increase costs across the economies. This paper will discuss the policy development and emergence of history of minimum wage labor law, agenda setting and policy actor arguments supporting an increase, and policy actor arguments opposing its increase.

Policy Actors advocating for an increase in the minimum wage suggest that it increases the standard of living for the poor and will increase the growth of the middle class. Supporters also argue that it decreases the need for government support of the poor and drives productivity of the workers because employers demand a return on their increased contribution for labor.

Policy actors against the increase argue if there were no minimum wage then the market would drive wages, the cost of goods produced, the cost of goods sold, and thus a prevailing wage would come about naturally throughout different sectors of the economy. Employers would be able to hire people at whatever rate people were willing to do the labor. The theory is that the market would drive the price of the labor.

In many parts of the United States, local governments and states have set different minimum wages as the prevailing costs to live and work in the respective markets drive the wage. Government has stepped in to scale the wages according to their economies. Debates exist about the cost and benefits of minimum wage. Employers may choose to lower employment as the wages increase in order to offset the higher cost of employment. Overall,
the debate to increase the minimum wage has seen a bevy of mixed emotions, as employees would like an increase in the cost of living, but they fear that an increase in the hourly minimum wage will not solve the overarching problem of eradicating poverty.

II. Policy Development & Emergence of Minimum Wage Labor Laws

A. Organizational Implications for Creating a Minimum Wage

Minimum wage is part of a series of labor laws and ideas that both economists and governments have proposed as a way to support an efficient labor force and economy. This efficiency applies to business, not to the workers, and often benefits business bottom-line. When the law was first proposed, the intention of minimum wage was to increase the standard of living of workers, reducing poverty, and ideally increasing worker compensation while improving business efficiency. Before the law became a national fiat, Massachusetts had started non-compulsory ordinances for women and child labor. These ordinances started the conversation early in the twentieth century, and by the time of the Great Depression working conditions and wages were at all-time low. The society was ready to enter into a dialogue of change. Around the world other nations were beginning to debate the issue, and Australia was the first to offer a minimum wage.

B. Minimum Wage Debate- early 1900’s

The United States was not first to come up with a minimum wage for its labor pool, and federal laws are not universal throughout the country. In some states, the minimum wage rates are higher than the federal rate with some cities in those states having even higher wages. Most states and territories have minimum wage rates at the same rate as the federal rate. But in some states there may be no state minimum wage law, or the state may have wage rates lower than the federal rate. (Gramlich, 1976)

The minimum wage law was part of a greater movement of change and progress after the Great Depression. Workers were left with little or no support as the nation was recovering
Policy Analysis of Raising the Minimum Wage

from massive unemployment, child labor, poor working conditions, and a very long work week. President Roosevelt was committed to making the necessary changes through a number of bills. Legislation was created to address these and many other issues facing the nation’s labor force. Roosevelt believed that minimum wage was a way to guarantee a minimum wage that workers could rely on to support their families and get the nation working again. (Gramlich, 1976)

C. Minimum Wage Debate- 1930’s- present day

Roosevelt drafted the Fair Labor Standards Act of 1938 (FLSA) which included many different protections for labor and created the Wage and Hour Division (WHD) of the United States Department of Labor. This legislation came after many fights of judicial opposition; the FLSA had survived, not unscathed, after more than a year of Congressional altercation. In its final form, the Act applied to industries whose combined employment represented only about one-fifth of the labor force. (Roosevelt, 1937)

In these industries, it banned oppressive child labor and set the minimum hourly wage at 25 cents, and the maximum workweek at 44 hours. In order to get businesses to follow the new law, businesses were encouraged to sign an agreement and display a "badge of honor," a blue eagle over the motto: "We do our part." Patriotic Americans were expected to buy only from "Blue Eagle" businesses. In the end, only those businesses that supported minimum wage were patronized. Today, the WHD is responsible for the administration and enforcement of a wide range of laws which collectively cover virtually all private and State and local government employment.

III. Agenda Setting- Policy Actor Arguments Supporting Increases to the Federal Minimum Wage

A. Raising the Minimum Wage Promotes Economic Growth
Policy Analysis of Raising the Minimum Wage

Policy Analysts argue that opposing theories surrounding an increase in minimum wage and the population segment it affects have glaring inadequacies. Rather, evidence suggests that an increase in minimum wage does not negatively affect the economy, and in some cases may even increase economic growth. (Fox, 2006) Early economy theorist Paul A. Samuelson concluded that there was a “tremendous amount of certainty and doubt” concerning even the most elementary parts of wage determination and labor economics (Cunningham & McClure, 2005).

Many economists follow the standard neoclassical model regarding the minimum wage. This standard states that each employee is paid his or her marginal product, which is defined as the contribution he or she makes to the firm’s revenue. (Card & Krueger, 1995). Card and Krueger’s *Myth and Measurement: The New Economics of the Minimum Wage* continues the explanation that if a worker is earning $3.50 per hour and contributes the same amount to the firm’s revenue, and the government imposes a minimum wage rate of $4.25, then it is no longer profitable to employ that worker. The authors conclude that there are flaws in this standard neoclassical model.

Social economic revisionists argued that it ignores the human element. Kaufman (2012) wrote that prominent economist Gommons rejected parts of neoclassical theory because labor is human, and this model does not factor in work motivation, morale, unfairness, and inequity. In addition, it incorrectly assumes that employers always operate at peak performance and exploit every opportunity for profit. Card and Krueger discussed that higher wages could actually reduce worker turnover and increase productivity. Consequently, this would provide a shock effect, leading management to have better labor practices. As a result, this could lead some business to hire more people due to more output (Card & Krueger, 1995). Alan Greenspan has endorsed this “shock theory” and stated that positive
policy analysis of raising the minimum wage

productivity affects low inflation, and low inflation causes businesses to become more efficient because they cannot raise their prices (Card & Krueger, 1995).

Analysts studying Card and Krueger’s work conclude that state and federal increases in minimum wage meant that workers were taking home more pay, but employment rates did not decrease (Whitaker, Herian, Larimer, Lang, 2012). Rather, the authors stated that additional research supported that increasing the minimum wage was effective in reducing poverty than earlier wage increases, at least for dropouts and teenagers (Whitaker, Herian, Larimer, Lang, 2012).

B. Raising the Minimum Wage Increases Employment

Wessel (2004) continued the discussion surrounding Card and Krueger’s analysis and noted that they ran many regressions across states using as the dependent variable the change in the teenage employment-population ratio between 1989 and 1992. All of these regressions confirmed Card and Krueger’s results that in states where more workers were affected by the minimum wage hike, more workers did not lose jobs. Card and Krueger’s (1995) difference-in-difference study of the 1990–1991 federal minimum wage hikes compared states by the proportion of workers directly affected by the minimum wage and they found that employment losses were not higher in states with more affected workers. Card and Krueger interpreted these results as showing that the minimum wage did not decrease employment. (Wessel, 2004).

Dreir and Cohen’s (2013) Huffington Post article “Raising the Minimum Wage Is Good for Business (But the Corporate Lobby Doesn't Think So)” discusses that in 2003, San Francisco increased its minimum wage, however, the Golden Gate Restaurant Association called it a job killer that would "bankrupt many restaurants." In addition, the Association of Realtors said that many hospitality industry workers were "likely to receive pink slips and join the ranks of the unemployed." The article cites a 2007 study by University of California
Policy Analysis of Raising the Minimum Wage

economists, that in the aftermath, restaurant growth was higher in the city than in neighboring East Bay cities. Studies also show that in December 2012, the city's unemployment rate was 6.5 percent, well below the statewide average, and job growth in bars and restaurants has led the region's post-recession recovery.

C. Raising the Minimum Wage Increases Wage Dispersion, Reverses Rising Trend of Wage Inequality

The concept of the minimum arose from the idea that workers should be able to earn a “living wage.” Lawrence Glickman’s book *A Living Wage: American Workers and the Making of Consumer Society* defines it as “a wage level that offers workers the ability to support families to maintain self-respect and to have both the means and the leisure to participate in the civic life of the nation” (Glickman, p. 66). In the mid-1990s, organizers tied the modern living wage standard to the federal government’s official poverty line; they set the living wage at least high enough to enable a full-time worker to maintain his or her family above the official poverty line (Pollin, 2007).

While contemporary scholarship continues to find minimum wage increases are unrelated to poverty rates overall, analysts noted that job growth is higher in states that adopt more generous wage floors, and proponents increasingly emphasized the minimum wage as a way to reduce income inequality rather than poverty. (Whitaker, Herian, Larimer, Lang, 2012). As Pollin (2007) notes, the poverty line is deficient because it does not reflect the actual for providing for basic needs other than food, such as housing, health care, and child care. Pollin (2007) concludes that official poverty benchmark for the country is probably about 40 to 50 percent too low. In high-cost urban areas such as Boston or Los Angeles, that figure should rise by roughly an additional 25 percent.

Also, it can be argued that increases in minimum wage are necessary to reverse wage disparity and keep up with rising inflation. The real value of the minimum wage reached its
Policy Analysis of Raising the Minimum Wage

high water mark in 1968, peaking at approximately 56 percent of the average hourly wage. Since then, the real value has eroded due primarily to inflation and the sporadic nature of federally mandated increases (Whitaker, Herian, Larimer, Lang, 2012). The rate of inflation between 1997 and 2009 is likely to be about 3 percent per year. This means that the buying power of a $5.15 minimum wage will have fallen by about 40 percent over these years (Pollin, 2007).

IV. Agenda Setting- Policy Actor Arguments Resisting Increases to the Federal Minimum Wage

A. Minimum Wage Recipients Live Below the Poverty Line

Opponents who vehemently argue against raising the minimum wage state that a portrayal of Americans who earn minimum wage as poverty-stricken individuals is largely untrue, as the average family income of minimum wage above 150% of the poverty line. Opponents consistently quote this data directly from the US Census Bureau and Current Population Survey (CPS). Analysts also note that many minimum wage earners are ethnic minorities is also false—as 78% of minimum wage earners are White, 15% are African American, and 3% are Asian.

Source: Heritage Foundation calculations based on data from U.S. Census Bureau, Current Population Survey (CPS), 2011 and 2012 monthly surveys. Poverty and family income data are from the March Supplement to the 2011 and 2012 CPS. Minimum wage workers are those who report hourly earnings of $7.25 an hour or less.
Policy Analysis of Raising the Minimum Wage

The Bureau of Labor Statistics reports that only 4.7% of the entire workforce in America earns minimum wage or less, and more than half of them are young people who live with their parents while attending school. Additionally, nearly 19% of all minimum wage earners are employed in the hospitality and food service business, where their wages are supplemented by commissions and cash tips.

B. Raising the Minimum Wage Will Not Address Root Cause of Poverty

Opponents also argue that an objective of decreasing poverty by increasing the federal minimum wage is misguided, as it does not address the root cause of poverty. Quite simply, most of those who live in poverty are not minimum wage earners, but actually people who do not work at all. The chart below, with 24 years of data from the US Census Bureau, clearly shows unemployment and underemployment as the foundation of poverty. In essence, a decrease in poverty would occur by increasing the number of people working.

Common questions posed by policy actors address issues such as who is helped or aided by increasing the federal minimum wage, and whether there are any consequences of
Policy Analysis of Raising the Minimum Wage

increasing the federal minimum wage. Opponents conclude that an increase in the minimum wage would only help those who are already working now, and it would accomplish nothing for those who do not have a job. A majority of those looking toward minimum wage occupations are young workers, usually in school, and older workers who have left school. (Sherk, 2013)

A common argument is that an increase in the federal minimum wage would cause many of these young and low-skill/low-productivity workers with a high school education or less, to not be hired. This is due to the fact that many small businesses cannot afford to keep workers at higher wages. A 2012 study of the 2004-6 New York State minimum wage increase showed a 21% reduction in employment for less-skilled, less-educated workers, particularly those aged 16-24. A common phrase used among these policy actors is that a job with low wages is better than no job and no wages. (Sabia, Burkhauser, and Hansen, 2012)

V. Conclusion

Every day, the media is filled with headlines news articles of a declining middle class. Many are interested in solving the overarching problem of poverty, yet the heated debate emerges as to whether an increase in the federal minimum wage is a solution to this problem. This debate cannot be answered until we as a society come to a common agreement as to the purpose of the minimum wage. Is it meant to be a living wage, enough to support a family? Or, is it meant to supplement the income of high school teenagers, or those who have other primary breadwinners in the family?

Keynesian economics calls for more money in the hands of citizens, to consume more and stimulate the economy. For businesses that raise their prices to offset the higher minimum wage, that cost is passed onto consumers who will now have less disposable income to spread throughout the economy. Utilizing data and case studies provided by economists and researchers, two opposing perspectives on the Obama Administration’s
Policy Analysis of Raising the Minimum Wage

proposed legislation to increase the federal minimum wage were examined. Strong arguments for and against, and outlining benefits and consequences of increasing the federal minimum wage have been suggested by numerous researchers. However, there is yet to be overwhelmingly conclusive evidence to support either a boon or a detriment to the economy or labor market.

No absolute and definitive evidence can be shown to be injurious to the economy or labor market. While an overarching objective of increasing the federal minimum wage is to reduce poverty, any policy attempt that strives to decrease inequality, increase wage dispersion, equity, self-respect, and the morale of many working Americans should be supported by policy actors.

A New Internet Ethics Class based on Making an Internet Ethics UCC

Jongwan Kim
Division of Computer and Information Technology, Daegu University
Gyeongsan City, Gyeongbuk, 38453, Korea
E-mail: jwkim@daegu.ac.kr

Abstract
Internet ethics is one of the liberal arts courses in college. In order to effectively communicate with the students in the internet ethics course, we gave demonstration practice lectures by taking advantage of internet ethics related videos. Video presentation and its discussion helped students to recognize the internet ethical issues. However, simply watching the video was not enough, since the students just watched the content passively. Thus, we also assigned a group project. Each group, consisting of three students, was to make a user created content on an internet ethics topic. This team project based class methodology was effective for the students who proactively participated in class and helped them understand the concept. We have confirmed from a survey that the students’ understanding of internet ethics has been increased.

Keywords: internet ethics, video presentation, user created content, team project

1. Introduction

In the knowledge and information society where the Internet is used as a routine, various ethical problems have been happened more than in industrialized societies. Internet ethics, a branch of applied ethics, copes with internet related problems for the purpose of ethical inquiry defined by D. Langford. Internet ethics has evolved; from the seventies’ and eighties’ computer ethics to the nineties’ information ethics, and finally to cyber ethics or internet ethics in the twenty-first century. Internet ethics offers various views at the new difficult issues such as accessibility, censorship, privacy, and digital rights management facing internet users today. The subject, internet ethics, has developed due to the internet having the following characteristics; anonymity, non-face-to-face, collectivity, violence, altruism, pornography, and so on [1]. Because of the negative consequences that sometimes come with those qualities, society has felt the need for students to be educated in internet ethics. Internet ethics education is not only targeted on students of elementary, middle and high schools; it is also provided as a liberal arts course for university students.

Internet ethics teaching resources are being provided in textbooks and through the use of bulletin boards, as well as through the use of the internet and other multimedia technology. Videos and social networking services (SNS), such as Facebook, Kakaotalk and Snapchat, make it convenient for us to collect and share our resources. With the help of online resources and technology based application programs, students have become familiar with their class environment. Teachers can use online videos as class resources, and assignments, notices or FAQs can be posted or carried out using SNS or blogs. In addition, students and teachers are able to communicate through the use of instant messaging. According to a study done in the U.S., incorporating videos in the classroom leads to increased retention of information by students and helps them comprehend the material quicker than students who are not exposed to videos [2].

The following study was focused on university students, whom have attended internet ethics lectures, for several years. In order to increase the students’ learning habits, the students were given an assignment, in which they had to produce a video relevant to internet ethics. The students autonomously formed teams of three and produced an internet ethics related User Created Contents (UCC). In the students’ final report, the students were to include the project title, motive and the scenario or story of the project, along with how the UCC production class helped them proactively immerse in theory classes and video incorporated classes. To figure out if the UCC producing experience had learning effects on students, we compared the difference, between previous teaching methods and this new video producing method, through conducting a survey. The results are outlined in section 3. We present this new practice in hopes of this becoming an educational model for helping students proactively engage themselves in their studies.

In section 2, we outline the current situation of internet ethics education; in section 3, we focus on
the learning effects of the video production assignment in internet ethics education and analyze the results of the survey directed towards the students; and in section 4, we conclude the paper.

2. Related works

In 2001, information ethics education was implemented in elementary and middle schools to prevent information dysfunction in Korea. Now, most schools enact information communication ethics or internet ethics education. According to a study focused on schools and the government, as well as families and society, people feel the need for teenagers to be educated in terms of internet ethics [3]. Choi et al. applied media literacy, which has the ability to independently understand various types of media, to internet ethics education. In other words, they presented a teaching method where we teach students how to correctly use the internet, rather than completely blocking the internet from students. They wanted to promote the positive side of the internet by presenting this new and original method [4].

Meanwhile, there were studies where multimedia technology was incorporated into classes. Han conducted a study on information ethics lecture methods, including a UCC production project class. The experiment group’s change in attitude towards the topic, information communication ethics, proved the effectiveness of the method [5]. Ju et al. conducted a study on middle school students for the analysis of internet literacy effect through education of producing and using multimedia UCC [6]. Internet ethics education has been performed globally. Dadzie gave an overview of the various aspects of the subject. And he recommended the introduction of information ethics as a university required course for all freshmen and a stand-alone course covering plagiarism and SNS abuse in information ethics at department of information studies in Ghana [7].

In Korea, the Korean ethics council on internet published the most universally used internet ethics textbook [1]. The textbook [1] is directed towards adults or college students, and the author teaches students using this book. The teaching content, directed towards students, deals with the internet and daily life, legal issues such as copyright violation and internet dysfunctions such as cybercrimes. The textbook particularly explains to students how to avoid becoming a victim or an attacker by describing the pre/post response plan for any situation. Meanwhile in U.S. universities, the topic, computer ethics, is solely for students majoring in computer science related subjects. Classes in the U.S. target more professional ethical issues and have a different curriculum. The textbook used [8] covers privacy, freedom of speech over the internet, intellectual properties, cybercrimes and the responsibilities of a computer professional or specialist.

After looking at both viewpoints [1] and [8], it becomes clear that the two countries focus on different people and subjects. While the U.S. focuses on educating mostly computer related workers on specific computer ethics topics, Korea educates general internet ethics subjects to all adults and students to foster a better internet citizenship. In this paper, we propose a method, concerning the latter approach, to enhance internet ethics education effectively.

3. Enhancing Internet Ethics Understanding by Creating a UCC

When using only lecture materials for class, the university students couldn’t fully digest the information properly and were overruled by boredom. Thus, with the help of other professors and students, we collected videos related to the course. We tried a different method of teaching where we showed the parts of the videos and explained them briefly to the students. The results of this new method of guidance, shown in the lecture evaluation [9], were mostly positive; the students’ understanding of the course as well as the class satisfaction improved. However, since we used old fashioned videos that were collected long ago, the students’ interest rate was not too high. The students seem to need more independency, and just relying on videos made by unknown figures was not enough for better class effectiveness. Therefore, we developed a new procedure; the students now had to get into teams themselves and produce an internet ethics UCC. The impact in class effectiveness that came from the UCC project will be shown below:

During the first class, we briefly explained the course syllabus. We then notified the students of what their term project was going to be – the UCC production project. We also informed them that they would have to explain and write a report on what learning effects came from doing that project. The students who felt that the course work was too much of a burden, which was approximately 10%, dropped out of the course. We figured that producing a UCC individually would be too much to bear so we let the students split into teams of 3 and carry on with their project. By making this assignment a group project, the students’ doubts about the project reduced, and the project quality was at least up to the point of being average.

The assignment was, “Choose an internet ethics related topic and produce a video. Then write a report on how producing the video made an impact on your learning.” The assignment was collected in CD form, and it contained the outline and internet ethics UCC video. In the outline, the students were to include the project title, motive and the scenario or story of the project, along with how the UCC production class helped them proactively immerse in
theory classes and video incorporated classes. Interestingly, the students found the section where they had to write about the learning effects that the project had harder than actually creating the video. This was because they had to compare the difference between the usual class and the UCC project included class. In any case, if the video was a lot longer or shorter than the recommended length, a minute and forty seconds, we deducted points in accordance with the predetermined time range. We showed the students the evaluation criteria (Table 1) for reference.

Out of the 105 students, 38 teams submitted their projects. A few teams were composed of either 2 or 4 members. From all the UCCs submitted, we’ve chosen one as an example.

Case: Cyber violence reduction

The project title was, “Proper commenting on the internet.” Cyber bullying is a major issue on the internet as a majority of the population uses the internet daily. Cyber bullying and harassment through the internet sometimes even lead to suicide. Thus, the students were motivated to make their video on the reduction of cyber violence. Through their UCC, they wanted to spread awareness on the benefits of leaving nice comments on the internet and promote this action. The project comprises of three scenes, which are as follows.

In the first scene, one of the students posts a picture of her doing community service work and receives negative comments. She is hurt from all the negativity. This emphasizes the importance of writing positive comments. Figure 1 illustrates a captured image from this scene. In the second scene, a student having a hard time finding a job asks for advice on SNS. Many of her SNS followers gave her courage and wished her the best of luck in getting a job. This demonstrates how positive comments give students courage and hope. In the third scene, a student asks for help on finding her lost dog. As soon as she posts on SNS, she receives attention and useful information from many of her followers and finds her dog. These examples show the positive effects of leaving good comments on SNS.

The learning effects from completing this project are as follows. Before taking this internet ethics course, the students did not regard cyber culture highly. They only thought about handling internet ethics in the ubiquitous society. After completing the course, however, they attained a better knowledge of the ethical concept, cyber space. They could now judge what is the right and wrong thing to do on the internet. In addition, they realized there is much more to netiquette than V. Shea's The Core Rules of Netiquette that netizens should keep [10]. From making the UCC and looking at the many hurtful comments on the internet, they realized that they need to set an example of proper internet commenting in order for internet commenting culture to change and develop positively.

Figure 1. An example of leaving nice comments instead of bad comments on the internet

From the above, the students discovered from taking the course that there is much more to internet ethics than what they knew, beforehand. First of all, they learned that there is a more diverse range of internet ethics topics than what they thought, originally, and gained more interest in the subject. In addition, they attained concrete knowledge from watching the videos and began to regard internet ethics highly. Finally, from letting the students form the UCC videos, hands-on, they experienced more pro-active learning effects. The last point was especially important for this paper as it proved that the project was beneficial towards achieving class goal.

The description of the questionnaire items and its analysis are provided below. A survey was conducted at the final class day. To make a survey analysis for the Internet Ethics lecture, the author collected 7 questionnaire items from 99 students who, as volunteers, attended his internet ethics class during spring semester in 2014. All questionnaire items are as follows. Questions 1-1 and 1-2 are the same questions but were asked at different times.

Question 1-1: Do you expect internet ethics to be an easy course?

Question 1-2: Do you still think that internet ethics is an easy course?

Question 2: Was class effective without watching internet ethics related video?

Question 3: Did watching the internet ethics videos aid your understanding of internet ethics?

Question 4: Did the UCC production assignment aid your understanding of internet ethics?

Question 5: Was the UCC production assignment easy?
Question 6: Was the producing the UCC, compared to just watching the videos, more helpful for understanding the concept of internet ethics?
Question 7: Will you use the internet ethically, in the future, because of this course?

Each answer has 5 scales such as 1(= Strongly Disagree), 2(= Disagree), 3(= Neutral), 4(= Agree), and 5(= Strongly Agree). We performed frequency analysis for the survey using Statistical Package for the Social Sciences (SPSS). SPSS is the most widely used package programs by survey companies, marketing divisions of industry, government and education researchers, and others for statistical analysis [11]. From the frequency analysis of the survey responses, we could understand the distribution of responses. The bolded numbers in Table 2 show the highest percentages excluding the neutral responses.

<td>11.7%</td>
</tr>
</tbody>
</table>

As seen in Table 2, before taking the course, 61.7% of students thought that internet ethics would be an easy course; however, after the course, the percentage dropped to 20.3%. This is probably because there are many topics that need to be covered in the course. In classes without watching the videos, 46.8% of the students responded negatively to the course. 55.3% of students answered that watching the videos aided the process of learning. And 52.1% of students responded positively with the UCC project. Thus, it is clear that watching the videos and producing the UCC played a big role in helping the students understand the subject better. More students found producing the video hard by 9.6%. But despite the difficulty level of producing the UCC, it was found that the project did help the students understand the course curriculum. In fact, 54.2% of students found the project helpful – which was 3 times greater – compared to the 16% of students who did not. This study shows the positive learning effects that the UCC project had on the students. As seen on the table, many students have answered in question 7 that the course will help the students use the internet positively in the future.

4. Conclusions

This paper introduces the effective method of letting students independently form teams, produce a video on internet ethics, and write a report on how the project helped them to understand the subject better. As seen in one of the students’ examples, letting the students independently select a topic, create a story, and produce a video, was much more effective, in terms of achieving proactive learning effects, than simply showing videos created outside of class, to the students. This is further shown in the questionnaire results, above. If the government or public facilities were to offer interactive programs that would raise awareness and educate the public on internet ethics, in the future, the problems in society that come from the internet would decrease and a better cyber community would be formed.

ACKNOWLEDGMENT

The author thanks to 99 students for attended in the course and the surveys. In addition, he thanks to his daughter, Hannah Kim, for helping his grammar.

Exploring foreign language teachers’ identities development: A case study of a transnational native English-speaking teacher in China

Beidi Li
University of Auckland

beidili1214@gmail.com

Abstract

Language teacher development has been regarded as central to ensuring the quality of learning experience of many students around the world. In recent years, an increasing number of NES teachers have been recruited in English as a foreign language setting. One vital consideration is how well these teachers have coped with working conditions in foreign lands and developed over time. The present study investigates this pivotal concern by exploring the identities development of NES teachers in tertiary schools in mainland China. Drawing upon Wenger’s (1998) theory of identity formation and Bucholtz and Hall’s (2010) indexicality principle, this study examines participating NES teachers’ identities formation and transformation. A qualitative case study approach was employed and findings from one case were reported in this paper. Data were collected through questionnaires, life history interviews, non-participant classroom observation throughout six-month period of time. Results trace the trajectory of participating teacher’s identities formation from his educational and socio-cultural experiences as well as previous career his engaged in prior to entering teaching, to his engagement as an English language teacher with students and colleagues in local schools and in wider society. Findings highlight the complex effects of cultural, linguistic, social, personal and interpersonal elements on teachers’ ongoing identities transformation and the intertwined relationship between teachers’ identities development and their changing classroom practices. Findings contribute to the global efforts in better understanding language teachers’ professional development, and implications for attracting and retaining language teachers in EFL contexts and language teacher education around the world will be discussed.
Introduction

During the past two decades, more and more native English speaking (NES) teachers have been recruited in English as a Foreign Language (EFL) settings. These NES teachers are employed under national schemes initiated by governments, such as the JET (Japan Exchange and Teaching) program in Japan and EPIK (English Program in Korea) in Korea, or under institutional regulations and policies such as is the case in mainland China.

These cross cultural encounters have brought new questions to the changing landscape of the language teaching profession. One vital point of consideration is how well the significant amounts of NES teachers have coped with working and living conditions in foreign lands. However, a review of literature reveals that the experiences of NES teachers working in EFL settings remain under-investigated, as compared to the recent upsurge of research on NNES teachers (e.g. Braine, 2010; Kamhi-Stein, 2004; Llurda, 2005). A great proportion of the existing studies focused on examining students’ perceptions of and attitudes towards NES teachers (e.g. Liu & Zhang, 2007; Rao, 2010). It should be noted that understanding the reality of teaching involves exploring the meaning it has not only for students, but also for teachers (Tudor, 2001). Of the few studies that did give voice to NES teachers, most are one-shot interview or survey studies that provide hardly any indication of the day-to-day challenges they face and their professional growth. In essence, what is needed is in-depth, longitudinal study of NES teachers’ identities of how they understand themselves and their work, which is considered as a crucial component in the sociocultural landscape of classroom and in teachers’ professional development.

Theoretical framework

“Identity” is, in itself, a concept that defies easy definition. Overall, conceptions of identity have evolved from essentialist perspectives which located a static and fixed self metaphorically within a person to post-structuralist and postmodern understandings that view the self as constantly in flux, multiple, situated, and conflicting (Hall, 1996; Norton Peirce, 1995; Thesen, 1997). In addition, the notion of agency, as the ability of human beings to make a difference in the world (Giddens, 1984) is recognized as crucial to identity construction (see Day et al. 2006; Parkinson, 2008). A sense of agency empowers individuals to move ideas forwards, to reach goals, to maintain or further shape their identities and attend to tensions among them (Beauchamp & Thomas, 2009). In the present study, identity is seen as “being in continuous becoming” (Roth, 2004, p.8, as cited in Cross & Gearon, 2007), and adopted Norton’s definition of identity as “how a person understands his or her relationship to the world, how the relationship is constructed across time and space, and how the person understands possibilities for the future” (2000, p.5).

In much studies on teacher identities, researchers are increasingly recognizing the relationship between identity and language as an important conceptual tool in understanding the processes of identity formation and transformation (e.g. Alsup, 2006; Breckenridge, 2010; Clarke, 2008; Golombek & Jordan, 2005; Johnston, 1997; Kiernan, 2008; Liu & Xu, 2011; Pavlenko, 2003; Simon-Maeda, 2004; Tsui, 2007). Language in these studies is seen as a medium in and through which identities are constructed and enacted, and discussion on identity often revolves around its
discursive aspects through examining the discourse in which teachers engage as well as their narratives about life and teaching experience.

Although the role played by language in the construction of teacher identities has been investigated in the past decade, researchers have recently called for a more nuanced and comprehensive research approach (Cross, 2010; Varghese et al., 2005). Varghese et al. (2005) advocated the need for studies to take concepts of both “identity-in-discourse” and “identity-in-practice” into account. In “identity-in-discourse,” agency is “discursively constituted, mainly through language, focusing primarily on critical reflexivity”, while in “identity-in-practice,” agency is “seen as action-oriented and focusing on concrete practices and tasks in relation to a group” (p. 39). The concept of identity-in-practice suggests a mutually constitutive relationship between identity and practice (Kanno & Stuart, 2011). In order to distinguish between the discursively constructed identities and the identities that are enacted in practice, Kanno and Stuart (2011) referred to the former as “narrated identities” and the latter as “enacted identities”. Drawing these two lines of concepts together, thereby, can present a deeper understanding of identities as action oriented construction operationalised through concrete practices as well as discursive construction of personal and professional experiences.

Informed by such a combined framework, Wenger’s (1998) theory of identity formation and Bucholtz and Hall’s (2010) indexicality principle are used in order to understand how participants construct and position themselves in practices as well as how they negotiate and realize their identities with discourses. Wenger (1998) posits that identity forms from belongs to and engaging with the various groups to which people belong, and the three modes of belongs include “engagement”, which refers to the joint process of production and adoption of meaning; “imagination”, which enables people to create an internal picture of the world in which they engage; and “alignment” which enable people to assume an identity though affiliation with a larger group. According to Bucholtz and Hall’s (2010), indexicality refers to semiotic links between linguistic forms and social meanings, and identity relations emerge in interaction through several related indexical processes. In addition to overt mention of identity categories and labels, other indexicality processes include display evaluative and epistemic orientations to ongoing talk, as well as less direct means of positioning through implicatures and presuppositions and use of linguistic systems that are ideologically associated with specific personas and groups. Adopting these two theoretical lenses will combine macro and micro analysis, thus provide a fresh perspective and deep understanding of teachers’ “being” in a particular situation as well as their “becoming” across time and space.

Literature review

Having situated present study’s understanding of the notion of identity, this section turns to position this study in relation to current literature of empirical work on language teacher identity in the field of TESOL.

Research on teacher identities emerged as a significant strand in TESOL field during the past decade, and has been gaining momentum ever since. These studies have been conducted in diverse contexts, and generally followed four lines that touched on certain distinct facets of the complex English language teacher identities. The first vein of studies focuses on teachers’ linguistic identities, and particularly how the
The dichotomy between native and nonnative speakers has impacted on teacher identities (e.g. Diniz de Figueiredo, 2011; Jenkins, 2005; Reis, 2011; Tang, 1997). The central focus of these researches highlights the conflicts between being an English teacher and a nonnative speaker, and the dichotomy which has caused negative perceptions of and among nonnative speakers in general and teachers in particular. A second line of research (Amin, 1997; Motha, 2006; Nagatomo, 2012; Simon-Maeda, 2004) casts attention on English teachers’ social identities, such as race, gender, class and sexual orientation, and reveals that social identities are inextricable components of teachers’ identities and have tremendous impact on how they perceive themselves as ESL/EFL professionals. A third group of studies delves into the impact of participating in teacher education programs on their identities development (e.g. Clarke, 2008; Golombek & Jordan, 2005; Pavlenko, 2003; Tseng, 2011), and highlight the tension and confusion during the transformation of their perceptions of being ELT professionals while learning in the programs. In addition to the formation of teacher identities for pre-service teachers in education programs, an understanding of the transformation of identities across the trajectory of teachers’ careers caught the attention of the forth line of studies. In-service teachers have constructed ideals of selves based on previous teaching experiences, but such self perceptions may be challenged by intervention from local school authorities who favored the use of particular approaches to teaching and the adherence to teaching curriculums (e.g. Trent & DeCoursey, 2011), and local educational reforms (e.g. Liu & Xu, 2011; Tsui, 2007). Results from these studies highlight that teachers need to reconcile conflicting identities so as to cope with challenges through very complex process.

The above discussed studies provide perspectives on English language teacher identities by focusing on various aspects related to identities construction and transformation. In general, they have firmly established the complex multidimensional and multifaceted nature of English language teacher identities, the interrelatedness between identities and contexts, and the importance of understanding teacher identities construction in teacher professional development and empowerment. However, it should be noted that to date a considerable number of studies have focused on identities of NNES English language teachers, relatively few have focused on NES teachers, and even fewer have shed light on their identities construction and negotiation while working in foreign lands. In addition, researchers have recently called for a better understanding of the complexity and importance of contexts in teacher identities formation (Beijaard et al., 2004; Miller, 2009). Context and identity play crucial mediating roles in all classroom interactions and teacher work, and the classroom itself is a “complex ecological site in which unfolding events and processes shape the way in which participants think, feel and act” (Singh & Richards, 2006, p.154), and will thereby affect how teachers negotiate and construct their identities.

The present research aims at examining the identities development of native English speaking teachers working at tertiary level institutions in the state educational system in China. At the micro level, the present study differs from previous investigations in that it will examine teacher identities as manifested in their concrete teaching practices at interactional level in the classrooms through longitudinal classroom observations. Such fine-grained micro-analysis of identity-in-discourse and identity-in-practice within classrooms will enable a deep understanding of the present, concrete aspects of English language teacher identities. At the macro level, by conducting teachers’ life history interviews, the examination of teachers’ identities construction and negotiation will transcend the here-and-now, and combine through
teachers’ narratives the here and there, then and future within broader social, cultural, political, and economic environments in and from which their identities emerge. By exploring the identities development of native English speaking teachers in China, the study adds deep and refined knowledge to the field of teacher professional development, particularly in the realm of language teacher identities. The following three research questions guided this study: (1) What personal and professional backgrounds do participating NES teachers bring to teaching in China and in what ways do these backgrounds influence the formation of their identities? (2) How are participating NES teachers’ identities negotiated and transformed over time throughout their teaching and living experience in China? (3) In what ways do participating NES teachers’ identities manifest themselves in and impact on their classroom instructional practices?

The case study

The case study reported in this paper is a part of a larger study of the identities development of four transnational native English-speaking teachers in China. A qualitative multiple case study approach was adopted because case studies feature rich, thick descriptions of a single entity or phenomenon which is situated and embedded in particular contexts (Merriam, 2009; Paltridge & Phakiti, 2010). In this way, it can provide insights into the complexities of particular cases (Mackey & Gass, 2005). Further, a case study approach is especially promising in shedding light on various educational, social, cultural and economic contexts which shape and reshape individual’s identities, thereby making visible and meaningful the complexity of teachers’ understanding of who they are as English language teachers. Four native English-speaking teachers teaching English at three different public tertiary schools in China were recruited through purposeful sampling. Researchers (e.g. Creswell, 2009; Patton, 2002) have confirmed that the power of purposeful sampling lies in selecting information-rich cases for study so as to yield insights and in-depth understanding to research questions.

All ethical issues arising from this research were identified and resolved following the manual provided by the university’s Human Participants Ethics Committee. Consent from the school principals and teachers were obtained before data collection. The names of the participants and their affiliations were fictionalized to safeguard confidentiality. The teacher reported in this paper, with pseudonym James, was one of the four participants of the larger study.

The teacher and the context

James was born in Ohio, the United States of America. Because his father was a university professor in English and his mother was a middle school teacher, James had been interested in going to school and receiving education since an early age. After he received his bachelor’s degree with major in psychology plus minor in English and consecutively master’s degree in English from one top ranked university in US, he worked for two years as a psychological counselor for teenagers who were in residence at a correctional facility. Then he enrolled in a master’s program in creative writing at a different university in US. Upon graduation, he subsequently taught academic English writing course at a university in South America for half a year, business English writing course at a university in US for half a year, English
writing courses for five years in China at a private university. He had obtained a CELTA certificate in his spare time during his teaching at the first university in China.

At the beginning of this research, James just started his work at the observed public university in China to teach English writing courses to non-English major sophomore students who were enrolled in a joint program offered by the Chinese university and an American state university. He was assigned to teach four classes for sophomore students during the observed semester. Each class met twice a week. The course had a set textbook called *The St. Martin's Handbook (7th Edition)* (Lunsford, 2011).

**Data collection and analysis**

Primary sources of data for this case study included three interviews between the researcher and James, audio recorded non-participant classroom observations of James’ teaching over one semester and after observation follow up interviews, and field notes. Other relevant documents, such as course syllabi, class handouts, assignment sheets, textbooks, and samples of student work were also collected but served only to triangulate findings from interviews and classroom observations.

Three semi-structured qualitative interviews on a one-on-one face-to-face basis were adopted in order to create and maintain rapport with participant through personal level involvement. Researchers (e.g. Dornyei, 2007; Richards, 2003) have suggested that one-shot interviews are rarely able to produce full and rich descriptions necessary for worthwhile findings, and follow-up interviews should be arranged wherever possible. The first two interviews with James were conducted at the beginning of the semester, with the first interview focused on eliciting his experiences, including, among others, family backgrounds, learning experiences, pre service training and teaching experiences before he came to China and the second one focused on his working and living in China. The third interview took place at the end of the semester. It focused on his teaching practices during the observed semester and also served as a wrap-up with additional questions for further clarification of questions emerged during the entire data collection process. All three interviews were conducted in English and audio recorded.

Besides interviews, non-participating classroom observations of James’ lessons were also conducted. These observations were conducted once a week over three months’ period of time. The purpose of conducting classroom observations was to witness participating teachers’ concrete instructional practices and tasks implemented to groups of students, thereby to answer my research questions related to teachers’ identities in practice. Each observed class was audio recorded by a digital voice recorder placed at the front of the classroom. During observation, I sat at the back of the classroom to cause as little disruption to the normal flow of the lessons as possible, and took detailed field notes.

All of the data from interviews were transcribed by the researcher, since Ellis & Barkhuizen (2005, p.209) stated that “transcribing is an integral part of the analysis itself”. After the transcripts were proof read by the participant, I read through the transcripts thoroughly once to become familiar with the data and live through the participant’s experience. Then I conducted open inductive coding for sources of personal and professional experiences that influence the participant’s identities’ formation. I also looked for sources to which the participant attributed transformation of his identities as becoming a teacher through time and space. After examining
interview data, I moved on to micro level to examine the participating teacher’s enacted identities in observed lessons. Next, the macro and micro levels of examination of the participating teacher’s identities were combined and triangulated to examine how the participant perceived, positioned, and understood him self. Then similar codes from various sources were categorized together and organized to establish themes. A detailed report on the formation and transformation of James’ identities as an English language teacher is presented in the following section.

Results

Setting class rules to manage the class

One important discourse emerged in James’s discussion about his relationship with students was related to discipline. It appeared that he favoured regulative discourse and class management was of paramount value to him, as he commented “a big part of teaching is being able to control the class and manage it so that everybody is together” and “I feel this is important to create a working relationship, set boundaries and establish expectations for the students”. These interview data suggested that he deliberately positioned himself as an authoritative figure in order to effectively manage his class and students’ learning.

Such a position as a discipliner was reflected in his observed class management. For instance, he stressed and checked attendance at each lesson and put an emphasis on his class rules. He was observed to write lots phrases such as underlined or circled “NO TALKING!” and “NO EATING!” together with the bullet points of lesson agenda on blackboard before several lessons for students’ individual writing. In fact, James was observed to have spent little time and effort during lessons in monitoring students’ attention, because the students in both observed classes followed his rules that had been laid in advance. In particular, students all sat in set seats assigned by him at the beginning of the semester during the observed lessons. His rationale for doing this was to prevent students from chatting with friends in class and elaborated its reason in the following way:

“To admonish students for talking, and this is a psychological theory, differential reinforcement of incompatible behaviour, you reinforce behaviour, students can't seat next to their friends, and they can't really talk to each other coz there is a seat in between, so you don't have to always be like, hey quiet, don't talk. If they are not sitting next to their friend, they can't chat with their friend, so that behaviour is incompatible with what distracts the teacher or the other students from the class.”

In the above excerpt, psychological terminology, such as lexis of “differential reinforcement of incompatible behaviour” “reinforce”, was the means James used to rationalize his management practice. He had also adopted several other lexis which were associated with psychology throughout his interviews, such as “so they begin to realize this rewards system, read the material, think about it and then when you have the quiz, the questions will connect very well with the reading”. By using his repertoire of linguistic forms that were ideologically associated with psychology register, James demonstrated affiliation to and membership in his previous communities as a student of psychology.

In fact, interview data revealed that how James positioned himself in relation to his students during the process of his teacher identities construction was significantly
affected by his previous learning and working before he became a professional teacher. In addition to his study of psychology as discussed above, he had constructed a coherence that threaded his previous identity as a psychological counselor with latter one as a teacher. He mentioned that discipline reigned in his job at the correctional facility and it was important for him to set rules in place and firmly stick to set rules unless certain unexpected situation called for a flexible deviation. He compared in interviews the psychological traits between university students and teenagers in the correctional facility he used to work as “not much different” in that both of them thought “they can do what they want, they can get away with everything” and both were “not very well disciplined”; and he described his teaching as “it was ok and I already had a job in a group home as a counselor, so I already had the ability, that kind of control but not control, like the flexibility but also some rules in place”. His explicit invocation and juxtaposition of the identity label of “a counselor” in talking about his initial teaching experience illustrated the transference of his management skills through different professions.

From teaching composition to incorporating EFL teaching

When James initially started to teach in China, he drew on his position as an instructor of English writing skills established during his previous teaching experiences. Similar to his teaching of academic English writing, his instruction at both universities in China focused on teaching English writing skills appropriate to academic discourse, and was based on textbooks and syllabus with target skills set by his employing institution. Besides, he commented that “because this is an American degree, my English department in America has these goals, and this is what I'm doing in my classroom”, which reflected the discourse that legitimated his instructional practices was also an authoritative discourse.

While James relied on his previously established position as an instructor of academic English writing skills, he encountered challenges resulting from his Chinese students’ low English proficiency as well as the syllabus set by his employing institution. With a great portion of his students at UZ, their limited control of English lexical and syntactic tools to express their ideas turned out to be a major inhibitor in the realization of his previously established identity. On the other hand, his American department included a speaking component in his writing course syllabus in order to cultivate students’ ability to not only summarize a text in writing but to talk about it verbally.

Due to students’ low English proficiency, James had to reposition himself correspondingly. He modified his instruction to first focus on short essays and to postpone longer research papers until the middle of each academic year, as well as incorporated some vocabulary and sentence building when there was enough time in class. He pointed out “I had to adjust the course for the needs of the students to prepare for what goals were of my university, you have to change the class to fit the audience”, where his usage of modal verb “have to” implicitly displayed his affective frustration. In addition, based on the syllabus sanctioned by his employing department, James added a small component of presentation task to his course each semester. It appeared that James had been, and still was at the time of this study, focusing primarily on teaching academic English writing skills. The clash between his ideal identity as a writing teacher of academic English skills and his enacted identity as an English composition and language teacher was evident in the excepts below, as he
made a comparison between teaching algebra and basic math to justify his instructional focus and explained his alignment with his institutional goal of incorporating speaking element into his course even though he personally did not identify with the goal.

“This shouldn’t be a class about the sentence level; it should be about the essay level. (...) When I get my students here, they’re supposed to already know some English, I don’t cover grammar much in my class, it’s really not why I’m here, I’m here for writing class. It's like if you think of math and I am teaching algebra, I shouldn't have to cover addition, subtraction, multiply, that they should already know, two plus two, eight times four. Basic math is something they need to know already.”

Despite the clash between his narrated identities as a composition teacher and as an instructor of other English language skills alongside writing, James had enacted both positions during observed lessons. He had spend more than three quarters of four lessons’ time in giving lectures on target writing skills with reference to selected chapters in the set textbook and assignment outlines developed by him. Besides, the first two observed lessons covered oral presentation skills. He gave instructions on how to prepare for a speech with the aid of a speech card which provided an outline for article summary speech, and provided useful strategies for presenting such as eye contact, body gestures and so on. Then each student gave a 2-4 minutes oral presentation to summarize the articles they had read. Further, during all the observed lessons, before he would instruct on a textbook paragraph’s information about target writing skills, the whole class would usually listen to either his or a voluntary student’s reading the paragraph sentence-by-sentence, and he would at time correct some pronunciation errors and clarify the meaning of certain vocabularies that were important or unfamiliar to students.

**Developing culturally relevant pedagogical materials and tasks**

In addition to being a discipliner and instructor, James also perceived himself as an entertainer and stressed that “the worst was to have a boring teacher”. In the following excerpt, he overtly mentioned the identity label of a “clown”, and elaborated on the significance of creating a relaxed and interesting learning environment for the sake of making students more receptive to learning:

“I just use different topics to keep us all interested, just to make it something that they don't dread. It's a performance really, you gotta entertain students, it's like you are a clown, you gotta keep them engaged, or they are gonna shut you off. (...) I think it could be a good mix of you being strict, being in control, being flexible, being academically serious also being funny. You gotta blend it together, coz if it's always one, it's gonna feel too stifled, I think this makes a better, more relaxed learning environment.”

As an entertainer, James adapted textbook materials to make sample texts he used in class intriguing and culturally relevant to his students’ demography. During the first semester of his teaching in China, he quickly identified one problem of the textbooks set by his American department as that most of the sample paragraphs and essays were about American situations that his students had no experience of. Therefore, he only used information from set textbook as “a reference”, and he would select from various online websites suitable texts on topics which could relate to China and somehow connect with students’ life, and used as materials for students to read.
also wrote appropriate sample paragraphs and essays by himself to provide students with optimal learning opportunities of target writing skills.

James’s sensitivity towards cultural issues could be traced from two previous experiences he elaborated in interviews. First, his teaching in US of international students from around the globe enabled him to observe American culture from a new perspective. He found that answering students’ daily questions and reading their essays offered him a fresh look at things that he saw every day and took for granted. The second related to an incidence about an inappropriate slang he inadvertently used during his teaching in South America, which made him realise the importance of being sensitive to local culture. When he taught there, he occasionally used Spanish in class, and once he said in Spanish that he liked to eat chorizo, but he did not know that in local context the word chorizo for sausage was a very bad slang word until he received his students’ response of laughing hardly. It could be seen from his explicitly comment after sharing these experiences in interviews that “I learned to pay attention, to be careful” that his experiences of teaching various groups of students from multiple backgrounds in different cross cultural contexts raised his awareness to cultural issues.

In addition, James attempted to make the writing assignments he gave appealing to students. Over his years of teaching in China, he had created several writing projects that encouraged students to investigate their own culture and lived experiences in real life and write with enough substance. One instance he elaborated in interview was a project that involved sharing their memories of food culture through written essays and recipes of their favourite Chinese cuisines. In his view, this project not only made learning process more engaging, but also promoted an inclusive vision of writing that enabled his students to capitalize on their rich local cultural resources and have their cultural identity validated and maintained. Besides, it appeared that being a lover of food and cooking himself added authenticity to many writing projects he assigned to students which were related to food, and therefore, his identities as an English writing teacher had a personal touch to it.

Classroom observation confirmed James’s self-position as an entertainer who attempted to create a relaxed and engaging learning environment, and further revealed two particular strategies he used intentionally to entertain students. One was to incorporate Chinese in his instruction on vocabulary. He often asked students explicitly during vocabulary teaching for corresponding Chinese translations and attempted to learn related Chinese pronunciation. In doing this, he enacted a situated identity of a learner about Chinese language during his interaction with students, which transformed the unidirectional flow of information from teacher to students and engaged students more during class interactions. The other one was using local examples, especially by resorting to his knowledge of local practices and referring to anecdotes about his personal experience in China, to illustrate target skills and related points instead of using accompanied examples in the textbook. By referring to his personal experiences, James managed to establish a relaxing environment for students’ open sharing, thereby adding a possible interactional dimension in the classroom.

*Resisting assigned positions and initiating changes at departmental level*

During his identities negotiation, James at times overtly resisted the power relationship that existed in his employing department by not abiding by the
department’s pedagogical demand. For instance, at the first university he worked at, his identity as an autonomous teacher was contested by the department’s business-like attitude toward education and preferred ways of doing things. Such a tension was mainly illustrated in interview data as the types of writing assignments given to students, as the excerpt below demonstrated. The department dean wanted all English writing classes of the same level taught by different teachers to have the same assignments due to students’ complaints. James, however, thought it would lead to many possible instances of students sharing their work with others enrolled in a different teacher’s class. He described the university as “a consumer based school” and made the following comments:

“I think universities are adapting business models these days, too many times, students are treated like customers, when customer complains, the chicken's too spicy, the paper's too long, then the manager changes something. That's not how it's supposed to work, it's not how it used to work, and I don't think it's good.”

By referring to “how it's supposed to” and “how it used to work”, James drew on personal value system and traditional practice to illegitimate the inappropriately commercialized position as an educator which, in his view, the administrators at UZ projected. James’s explicit negative evaluation “I don't think it's good” fore-grounded the difference between his and the administrative perspectives on education and marked his disalignment with the administration at UZ and his stance of resistance toward the discourses of local community. Therefore, he negotiated his pedagogical autonomy with institutional demand and chose to not comply with the department’s requirement.

What’s more, during the process of his teacher identities development, James exercised his agency to share ideas with colleagues and initiate new practices in his institutional context. James stressed in interviews that “I always argued every year that we should have a different book, it wasn’t very good, none of the examples that were in there were culturally relevant to this demography”. His suggestion to his American department was accepted at his fourth year’s teaching at the second university and the set textbook was changed to one which James commented as “but even this one I think is not good”. Such realization of his suggestion through individual negotiation reflected the initiation of his active engagement in his teaching institutional context.

Discussion and conclusion

This study investigated the identities formation and transformation of one transnational native English-speaking teacher in China. For this particular case, the development of his identities as an English teacher rose from lived past and present educational and professional experiences. In terms of his previous learning experiences prior to coming to China, his educational background influenced his attitudes towards teaching with an emphasis on psychological approach. Besides, his professional experiences before he started to teach in China shaped the formation of his identities as a teacher. He transferred his management skill developed in his earlier work as a psychological counselor to help him relate with students with a stress on discipline in class. Later, his insights and skills developed during his transnational teaching experience prior to coming to China assisted him in adjusting pedagogical materials and task and relating with his students.
Even though James had formed his identities as a professional English composition teacher before he came to China and maintained aspects of his positions such as being an instructor of target writing skills and a discipliner in relation to students in China, he was faced with external challenges after he started to teach in China. Parts of the challenges were from classroom, including local students’ English language proficiency level and culturally inappropriate textbooks. Accordingly, he repositioned himself by incorporating instruction of language and academic skills and creating an engaging learning environment with intriguing materials and tasks for his courses, which had been confirmed and reflected in the observed lessons. In addition, he exercised his agency and negotiated tensions between individual autonomy and departmental demand at the first university he taught in China, and between personal pedagogical aspiration and limited available computer facilities that formed his working context. Torn between individual positions, class conditions, institutional prescriptions and societal practices, James still managed to build up his professional profile through taking professional training program and engaging in wider academic community during his working in China, and was committed strongly to his career as a professional English writing teacher.

Although the focus of the present study is on one transnational native English-speaking teacher’s identities development and the limited generalizability of case study is acknowledged, the implications raised go beyond institutional and national boundaries. First, for administrators and host teachers who hire and work with NES teachers in similar EFL settings, they should acknowledge the competencies these teachers bring with their cross cultural experiences and make informed efforts to retain NES teachers through necessary professional support. Second, for teacher educators in NES contexts who are involved in preparing NES teachers to teach abroad, they should acknowledge the insights and skills teachers bring into their professional teaching contexts from their previous careers and possibly incorporate teacher identity formation as an explicit topic of study. Last but not least, it is hoped that more studies will make visible and accessible the day-to-day realities of teachers’ identities development in the “expanding circle” contexts, paving the way to a better understanding of and a deeper inquiry into TESOL teachers’ professional growth.

NATIVE AMERICAN-BASED MATHEMATICS MATERIALS FOR UNDERGRADUATE COURSES: YEAR FOUR REPORT

Topic Area: Curriculum, Research and Development

Presentation Format: Paper Session

Description: This project develops and researches undergraduate mathematics materials based in the culture and mathematics of Native American Peoples for integration into undergraduate courses. Mathematics topics include probability, number theory, transformational geometry, and pre-service elementary and secondary education-related content. These materials--both paper and electronic--are classroom ready, and are developed and piloted in consultation with Tribes in the Rocky Mountains, Plains, Pacific Northwest, and Southwest. This is an NSF DUE TUES Type 2 funded project.

ABSTRACT: This session will present mathematics materials based on the culture and mathematics of Native American Peoples. These materials—both paper and electronic—are classroom-ready, and were developed and piloted in consultation with Native American Tribes in the Rocky Mountains, Plains, Pacific Northwest, and Southwest. It will also discuss the philosophy behind the materials, the need for them, and the success of their use in the classroom. This is an NSF DUE TUES Type 2 funded project.

The session will include topics from the following list:

1. The background, need and accomplishments of the project.
2. The relationship between culture and mathematics for Native American peoples.
3. A discussion of the progress of this project during Year Four.
4. The mathematics of Native American people that may be of interest to teacher educators and teachers of grades 9 – 12.
5. Examples of the classroom-ready materials selected from probability, number theory, transformational geometry, and pre-service elementary and secondary education-related content. Included are the statistics of contemporary mathematical problems facing Native Americans, like the high rate of diabetes.
6. The value of these materials for teachers in Native American Colleges and High Schools.
7. Connections between these materials and other select groups of students.
8. Suggestions for future research and funding.
Counselor Self-Exploration as it Relates to the Communication Process.

Dr. Paul De Sena, professor,
Loyola Marymount University, Los Angeles, California 90045

848 Sheldon Street, El Segundo, California 90245

pdesena@lmu.edu

During the course of the Presentation we will explore areas such as, pre-requisites required of ourselves before we enter the helping professions, basic guidelines of the counseling process, counselor emancipation from self as readiness for counseling including, the processes of observation and participation, communication vs. conversation, confiding vs. confession, clarity vs. solutions. I will also present a proposed structure to refer to within the counseling session for review. This structure may be especially helpful for beginning counselors and includes, identifying the concern, identifying the primary category of the concern, the steps in sharing the meaning of the experience and utilizing the appropriate style of responding.

Pre-requisites of the helping profession

1. We must sincerely want to enter the profession. We must want to work with individuals with concerns. We must have a continued passion and enthusiasm for what we have chosen to do or we will disintegrate into inadequacy.
2. We must be willing to give time. Counseling cannot be mailed in; it is a face to face relationship that requires a portion of our lifetime.
3. We must derive satisfaction from what we do if we are to replenish ourselves professionally. Most of us enjoy nurturing others, we touch people and they grow, there are those who touch people and cause them to shrink.

Basic Guidelines of the Counseling Process

1. Clients come to counseling because they want change in their lives. We can help to promote change by either adding or reducing forces in our clients lives. Adding forces involves giving advice, suggestions, information. Reducing forces is a more important counselor role in that it addresses what is it within the client that is preventing change.
2. The primary goal in counseling is emancipation. To help or clients become self-directing by introducing them to the skills of decision making, problem solving, critical thinking, risk tolerance, and confidence building.
3. An effective counseling session is not concerned with whether the client leaves either happy or sad but rather that they leave the counseling session thinking.

4. The primary tool of the counselor is communication.

5. The foundation of the counseling process is that it is a relationship. As in all relationships we must remember that it involves the changing process of relating. It is a verb not a noun. It requires on both sides, commitment, agreement and investment.

Counselor emancipations and transformations as readiness for counseling

1. Clarity -vs- solutions, counselors provide clarity of self and situations so clients can find their own solutions and make their own decisions. A counselor who gives advice is not helping the client to learn how to help themselves.

2. Observer -vs.-reformer. Observation is to be with something without a point of view. Our emphasis is not to reform but to observe the behavior that is being demonstrated. Our focus is on the problem as well as the client presenting the concern.

3. Understanding through the clients perception. We must see the world through our clients eyes not our own if we want to understand our clients world. Acceptance of our client is the residue of true understanding, and acceptance and understanding lead to mutual respect.

4. Communication -vs.-conversation. Communication we can define as sharing the meaning of an experience, while conversation can be defined as sharing the experience only.

5. Participation -vs- removed. We must invest ourselves 100% in being with those things we chose in life. To the extent that we do not, that is the extent to which we exist rather than live. The counselor must be “with” his client 100%.

6. Confiding -vs- confessing. Confiding is affective in nature, confessing is cognitive in nature. We gravitate to those we can confide in, we distance ourselves from those we feel we have confessed to. In confiding we do not feel as if we have lost one iota of our self concept or self esteem.
Structuring the counseling session

1. Provide a supportive statement recognizing the client's efforts. 2. Identify the concern as stated by the client, not what we interpret the concern to be. Discuss first what steps in sharing the meaning of an experience. 5. Utilize the appropriate styles of responding. 6. Incorporate techniques that facilitate communication. 7. End the session leaving the client thinking.

Identifying the primary areas of concern

Styles of responding

Sharing the meaning of an experience
1. Statement of the Item -(what is the concern). 2. Physical Awareness - (where is the pain or joy). 3. Primary Emotions and Feelings (loneliness, inadequacy, fear etc.). 4. Attitude-Point of View-(my fault or their fault) 5. Behavior - (what do you do). 6. Considerations-Beliefs -Ideas (that may impact the concern) 6. Images of the Future-(how does the situation affect future plans)

Samples of techniques in counseling

Listening, summarizing, reflecting, silence, open-ended questions, confronting, clarify, active listening, accurate empathy, evocative responding, etc.
Proceeding Submission

6. Abstract

Research indicates teachers’ beliefs in a specific adult development theory have an effect on their teaching. These beliefs provide the lens through which teachers view their teaching practices and the instructional needs for students. (Baumgartner, 2001) Teachers who know their development theory will be able to teach students and help students be successful in acquiring and retaining knowledge. The purpose of this investigation was to determine if teaching practices correlated with the self-identified adult development theory of teachers. Findings revealed that the majority of participants identified with the behavioral/mechanistic theory and showed evidence of practicing that theory in their teaching.
An effective field experience for pre-service education majors in online courses is an important component of teacher education programs. Partnerships between universities and K-12 schools are one way to provide positive experiences for pre-service candidates. One challenge in developing these partnerships is in the design of the field experience for online pre-service candidates. This study describes a partnership and activities between a university professor and teachers which was designed to enhance the field experience for pre-service candidates.
Title: Meeting Literacy & Music Standards through Sound Stories in the Music Classroom!

Name: Dr. Joseph A. Eppink

Affiliation: The College of Saint Rose, Albany NY

Address (Home): 6 Phillips Road
Rensselaer, NY 12144

Email: eppinkj@strose.edu

Description: Engaged activities and discussions lead participants to new strategies and understandings of the ever increasing task to include various standards, including those of literacy, in the music classroom. Sound stories will be highlighted throughout the workshop to guide these connections using the instruments and sounds of Hawaii. Participants will create examples of this style of literature and ensure that engaged learning, standards, and music excellence are fulfilled in the music education classroom.

Detailed Abstract of the Session

Music education has changed drastically within the last few years given the implementation of Common Core Standards, revised state standards, music education standards and even the newer requirement of adding literacy standards. Colleges and Universities that prepare music students for teaching are having to alter methods courses and standard lesson plan formatting in order to fit all of the new directions. Varied ways of teaching must now be evidenced that highlight strategies of incorporating all of the standards to the future teachers. In the classroom, music educators are also having to rethink lesson plans and teaching procedures to incorporate the ever growing standards. This requires greater attention and detail to planning.
The purpose of this workshop session is to guide music educators on all levels, from student teachers to even more experienced teachers, in their attempt to organize the possibilities that exist in music teaching to incorporate the various standards. Oftentimes the simplest strategy will go overlooked in the complexity of the requirements. The formal lesson plan will be used as a guide to illustrate the possibilities of easily incorporating literacy standards. From there, several suggestions and ideas will be gained through active participation how this can be simplified and brought together.

This workshop session is not meant to be lectured-based but rather one that participants are asked to participate, clarify thoughts, ask questions, and seek new understandings of the standards in terms of daily teaching in music education with the inclusion of literacy projects. After discovering elements of a sound story and experiencing various examples, the participants will create their own sound story and connect it to literacy standards in the music classroom. Participants will use Hawaiian hand instruments such as the frog instrument and various hula instruments including the Pu`ili. Moreover, participants may need to record birds, water, etc. to use in their literature creation. As participants create these literacy experiences and portions of lesson plans, they will discover strategies that can quickly meet the requirements of the standards for an enhanced classroom in music education.
Examining School Shootings Through the Lens of Margin
Albert H. Fein, Ph.D.
The Center for Organizational Reform (COR)

Abstract
This paper is based on a phenomenological study of school leaders who experienced a school shooting. Looking through the lens of “Margin”—what is left over after subtracting one’s “Load” from one’s “Resources”—this paper describes the Load school leaders felt in the aftermath of a significant crisis. Swenson describes two kinds of Load: external and internal. The data showed that leaders experienced both types. Examples of external Load cited by participants included extra duties, demands from the media for information, and legal demands. Examples of internal Load included feelings of responsibility for the shooting (even in the face of logic which said that there was nothing anyone could have done to prevent the shooting); the emotion work needed to present a calm and steady face to colleagues, the media, and the community despite inner emotions of deep sadness and feelings of being overwhelmed; and personal struggles that may be caused by exposure to a traumatic event or from exposure to individuals who have suffered trauma. Despite these examples of Load on leaders—and there were many others—leaders also drew upon Resources to cope with the unusual and demanding circumstances of leading a school under horrific circumstances. A few examples of Resources included support from others, being able to "stand outside" their experience in order to make sense of it, and focusing on the needs of others. Leaders experienced of school leaders significant "negative Margin" yet most came through their experience wiser and stronger. Their example, although specific to a school crisis, has implications for all types of leaders in other settings.

Introduction
Seventy-five percent of the almost 100 mass shootings listed in the Timeline of Worldwide School and Mass Shootings have occurred in the United States, beginning with the 1996 shooting in Moses Lake, Washington. However, further exploration of school violence reveals that such events are known to have occurred in the United States as long ago as the mid-1800s. However, it was the Moses Lake shooting that brought me to the study the impact of school violence on those who were leading schools and school districts. At the time of the shooting at Frontier Middle School in Moses Lake, I was serving as a principal in Spokane, Washington, just 90 miles east of the shooting site. I remember commenting to some colleagues that the job of school leader is already extremely demanding, so how much more so under the circumstances of extreme school violence? That question eventually formed the basis of my doctoral dissertation, which explored the experiences of leaders where school shootings occurred. Over the years, I have continued to write about the phenomenon of leading in times of crisis, especially
crises caused by extreme violence. In this article, I will explore the impact of crisis leadership through the lens of living systems theory or “Margin,”iv which I will outline below.

Margin

The concept of Marginv originated from the work of Richard Swenson, and is defined as what remains when Load is subtracted from Resources.vi In this simple equation \( R - L = M \), R represents personal Resources, which might include our health, financial security, education, talents and skills, social supports, and spirituality. Load (L) comes in two forms: external Load, the kind that is readily observed, and internal Load, which is invisible to others. Thus, the equation \( R - L = M \) can yield two possible answers: “positive” or “negative” Margin.

The ideal state for every individual, when our Load is subtracted from our Resources, is positive Margin. Without additional (or slack) resources, individuals cannot as easily respond to a crisis or develop creative responses to their problems. Our language is full of expressions that reflect the state of negative Margin; for example, “burning the candle at both ends,” “burning the midnight oil,” “running on fumes,” and “running on empty” come to mind. It is possible to sustain negative Margin, or “burn the candle at both ends,” for a time. But, in the same way that over-spending may lead to bankruptcy, if we live past our human capacities for an extended period of time, negative Margin will lead to only one of two consequences: (1) making a voluntary, fundamental change or (2) eventually, some type of collapse.

The beauty of Swenson’s work on Margin is that it frames an individual’s stress levels in living systems terms, but in a way that is easily understandable, as well as
providing a simple way to understand both first-order and second-order changes. In this study, I use the Margin concept to describe the experiences of individuals who led schools when a shooting occurred.

**Methodology**

The goal of this study—to better understand the experiences of school shootings through the concept of Margin—was best achieved by allowing participants to tell their stories in their own words; I therefore chose to conduct this study using phenomenological research methods. This approach describes the meaning, or the lived experiences, for individuals who share some particular phenomenon. Phenomenology relies on the analysis of participant interviews; the researcher searches for themes and for possible meanings interviewees attach to the phenomenon being studied. The researcher sets aside prejudgments and "brackets" his experiences, later relying on intuition to find themes and patterns in the data. In my original study, I interviewed 19 leaders from one of four school districts where school shootings occurred. For this paper, I drew from the transcripts of four participants, one from each of the four original sites visited. All names referencing participants are pseudonyms. At the time the interviews took place, “Brad” was a high school principal, “Dan” and “Ed” were school district superintendents, and “John” was a school district psychologist. All four had major leadership roles in the aftermath of school shootings that occurred at their respective sites.

**Resources**

The “R” in the Margin equation represents personal Resources. These can include a person’s perceived health, financial security, education, talents and skills, social supports, and spirituality. Participants mentioned two types of Resources: 1) internal,
those personal traits and skills they drew upon to lead during the crisis and 2) external, Resources that came from others.

**Internal Resources**

Ed described a kind of personal “inner strength” as one personal Resource he possessed: “It is testimony to the strength of the human spirit and the nature of us all that sometimes, in situations like this, you just reach down. I don’t know where you get it from, but it’s there, and thank heavens for it.” Although not mentioned as explicitly by other participants, all of the leaders with whom I spoke drew upon what Ed described as this “inner strength.” Sometimes past life experiences, particularly those where the participant successfully coped with extreme difficulties, served as a Resource. John described how his military experiences help him avoid “being emotionally impacted” by the horror of the shooting. He described a conversation with a colleague who told him, “I cry all the way home and I cry all the way in here in the morning when I come in.” John explained that he was able to distance himself emotionally because he had “been in a lot of stress trauma situations. We lost 13 men in one whack in Viet Nam. I’d been there so I had some coping mechanisms instilled.” Another school leader described how he drew upon his experience of the death of an adult child in much the same way.

Self-talk and the ability to focus on others were also Resources leaders drew upon. John haltingly described how he used self-talk to cope with finding a student who had been shot, “I just... I just...said [to myself], ‘It was just brain tissue. You’ve seen it before. Don’t worry about it.” The majority of leaders I originally interviewed described using self-talk as a Resource to cope with the crisis they faced; many coped by focusing
on the needs of others rather than on themselves: “I just focused on her [shooting victim]. Getting her to feel safe again” (John).

“Default” habits of being organized and personality traits were also a Resource. John described his habit of note-taking: “I got a notebook, legal pad and I’d jot my notes. I had notebooks strung all over that campus.” Brad recognized his need for alone time and structured it into his day during the height of the crisis: “I came out to school and stayed here for three or four hours by myself. By Saturday [several days after the shooting], I had a great need to spend some time alone.” Brad also coped by sharing time with his two-year-old granddaughter. He enjoyed that she did not “worry about what kind of a day I had, and was not concerned with the events…and was not going to ask any questions or feel sorry [for me].”

Ed told me, “I pride myself on not being so much of an emotional person.” The majority of the leaders with whom I spoke prided themselves on being able to keep their personal feelings private. This ability was interpreted as a Resource. However, the cost of impression management, also known as emotional labor, is high in such situations; I will, therefore, address emotional labor as a Load later in this analysis.

Ed also expressed confidence “that I was going to get through this. I felt it was going to be all right. I was quite confident.” Again, many leaders believed they would “get through this.” Such attitudes of confidence were experienced as a Resource, according to the Margin concept.

External Resources

By far, the majority of Resources leaders drawn upon during the crisis came from
external sources. “Other people were worried about me. I know that. They talked about it” (Ed). Regard and concern for leaders by subordinates and colleagues was a huge Resource for leaders. However, leaders also drew upon Resources outside of their districts for support.

*Outside experts.* Particularly in later school shooting sites, school leaders could draw upon the experience of others who had led under similar circumstances or who were experts in dealing with the media or with the trauma of violence. Often these external sources contacted the affected school leaders and offered their support. For example, Ed described how he was provided with “a public relations person who helped us with press releases and preparing ourselves for news conferences.” John “counted over 30 big satellite trucks” parked near his school and told everyone he worked with “to stay away from that area. Don’t you dare mention my name to anyone” [in the media]. John suggested to his superintendent and school board, “Why don’t we get the experts in here [from two different nearby sites where previous school shootings occurred]. I said, ‘Let’s bring them in.’ They said, ‘Okay, it's a good idea.’” Similarly, Brad received a phone call from a principal at a nearby school-shooting site. “He had told me the press was at his school for 12 days. He told me you can cut deals with the press—and so I started cutting deals with 'em. And the deal that I made with them—all the media really—what they wanted was a personal interview—and so I did lots and lots of personal interviews.”

*Government officials.* Officials from local, county, state, and even national government were also instrumental in providing support to school leaders. When the media tried to get students to offer statements at counseling centers, John expressed his frustration, and the local sheriff sent a warning to the media that anyone caught on school
grounds would be arrested and put in jail. John reported, “And he said ‘You will not be put in the same area that the shooters are. We will put you in the bull pen with the boy friends.’ [After that], we had no problems with them.” The sheriff assigned John a car and deputy for “errands or anything we needed to go pick up, supplies we had to fly in, or things we didn’t have and had to bring in. He could get there a lot faster than we could.”

State-level government officials also served as Resources to school leaders. John reported that the state Superintendent of Education provided “funds for counseling.” Ed described how one such official made a statement at an early press conference:

None of these politicians were trying to make political hay. He made the statement, “No amount of rational planning can defeat irrational behavior.” I thought a great deal about that because [irrational behavior] impacts me in my position. Because if that statement is true, what can we do about this [school-shooting phenomenon]? And I have come to believe that rational planning can, to a degree, defeat this kind of behavior, but not absolutely. And that’s where it causes some anxiety. We know that no matter how much we do, it will not guarantee that this won’t happen again.

Federal government officials provided support for some schools, including the Office of the President, in some instances. John reported that the President called and said “Anything you need, call. And he gave me his phone number. This will get you directly to me. Any red tape you need cut, or anything like this, call me.” John made such a call when a television executive informed John that a segment about the counselors at his site was going to be aired, much against John’s wishes. After John’s call to the President, the segment was cancelled. John also appreciated extra funding provided by the Department of Education and the presence of the National Guard at the shooting site.

**Counseling for leaders.** Counseling for leaders was provided in all cases, but the trend among the leaders with whom I spoke was either to not participate in counseling
(because they were too busy coping with the crisis), or to participate only perfunctorily.

Most reported they did not participate in formal counseling.

To be honest, I haven’t personally had any counseling services provided to me. I haven’t felt that I needed them, although I talked a lot to people about it, who were confidants and we could share and work through some things. I would say to anyone that goes through it, don’t be afraid to do that. (Ed)

Ed suspected that the crisis team leader was “maybe counseling me and I didn’t know it, but we talked a few times. That is important to do, because the effect is so profound. It really is.” Dan echoed Ed as he described how he did not let himself “get into [the debriefing] very deeply”:

The administration team did have a little debriefing session 10 days after the shooting. There had already been debriefings for everyone else. We needed to talk about it ourselves. A local expert, very adept at crisis counseling, who had been working with the staff, conducted a debriefing with us. I don’t think I let myself get into that very deeply. I just kind of did it and went on. I figured the phone was about to ring and there were papers to do. So I really probably never really debriefed it to the degree I should have. I don’t think anyone else did either. We tried to do that but probably it wasn’t real effective.

John led the crisis response team. He described how the team would meet “after all the counseling was over”:

About 10 of us every night. We would sit down at the end of the day and chit chat and talk and share our feelings. We debriefed each other…Any emotion we had that kind of spilled out because we were all professionals there, and we would unofficially debrief ourselves and take care of each other that way. It was so late, people were so tired, most of the counselors would scatter, except our group would make our plans and kind of debrief each other.

Team leadership. Another major Resource for school leaders was team leadership.

In every case, many people were involved in post-crisis management; leaders consulted with local experts and often delegated decision-making authority. Ed felt the team approach helped his district respond appropriately. “I would say the main reason was
because no one person was making the decisions. There were key people in leadership positions who collaborated together to make the critical decisions.

This approach was common at all sites. Dan assembled a post-crisis management team that included the board members, the school district insurance company and attorney, as well as other administrators.

However, there were times when “someone had to make the decision” [Dan], particularly when there were opposing recommendations for what actions were appropriate. Dan told his school board, “I’m going to need your permission, if you will, to violate policy…under extraordinary circumstances.” Like Dan, John was granted permission to exceed his usual scope of authority, which he had to do often.

Existing crisis response team. A major Resource at Ed’s site was an active crisis response team. Brad, John, and Dan’s sites had no such team in place and all had to scramble to deal with the massive demand for counseling services for students, staff, and community members. Ed called it “providential” that the crisis team “had scheduled a meeting” on the day of the shooting, just a few blocks away from the school where the shooting took place. “They were all there. And as soon as the call came in they were there actually before the ambulance and police people arrived.” The ability to respond to the crisis immediately became a key Resource in Ed’s district.

Community members. At all school shooting sites, community members stepped up to provide Resources. These included providing expertise, counseling services, food, transportation, and a myriad of other services.

Walmart and Kroger's brought truckloads—I'm serious—truckloads of food. One group brought us 12 frozen solid turkeys. We thanked them and we gave them to families of the deceased and wounded because they're going to get company.
Red Cross did all the cooking for us and the Salvation Army had a mobile canteen too. (John)

John also described how parents volunteered to drive the counselors to remote locations in the community, which allowed his team to serve many more families. Brad stated, “The community was very supportive. I think just about anything I needed done, there was somebody there to do it.”

Support from the community, at Ed’s site, also extended to the family of one of the victims. Ed described how one victim’s family made healing and “taking back the school” much easier because of their desire that their boy’s death…

[C]ount for something, and to learn from it, and be more caring. And that is just exactly what we wanted too. We were fortunate that the parents of the boy who died were not looking for vengeance or someone to blame, which is so often the case and it's natural.

As Ed points out, often parents of victims in other school shooting sites sued the school and its leaders. Lawsuits were a huge Load on school leaders.

**Load**

According to Swenson, Load comes in two forms: *external*—the kind that is readily observed, and *internal*—which is less visible to others. There were abundant examples of both types of Load in these incidents. External Load increased dramatically as a result of the crisis. Two comments capture the major kinds of Internal Load that leaders experienced: 1) Leaders had so many details to attend to, as John stated, “There wasn’t really time to think.” And 2) Ed’s comment that the crisis “was almost surreal. You don’t really believe it's happening, but you know it's happening.” The crisis impacted leaders’ communities, their school system, but also significantly impacted them personally.
External Load

Examples of external Load include increased work demands, meetings and appointments, “to-do lists,” health issues or those of loved ones, debt, interpersonal conflicts, and lack of social supports. All four participants highlighted in this study held positions of leadership at “ground zero,” three due to formal positions of authority they held (two as superintendents—Dan and Ed—and one as a school principal—Brad) and one who was placed temporarily into a position with authority (John).

The Load of all four leaders was immediately impacted due to demands for them to coordinate the various efforts needed to respond responsibly to the crisis. Coordination required hands-on attention to a broad range of issues. Even when they delegated some of the tasks to others, these leaders had to continually communicate with school board members, government representatives, law enforcement, hospitals, counselors, attorneys, other administrators, teachers and support staff, parents, students, and various other community members. Therefore, even though the crisis response in every instance “was a team process” (Dan), holding a central leadership role added tremendously to everyone’s Load: “There was team working on the counseling, a team working on the clean up, a team working with the press, working with parents, working with the funeral arrangements, everything had to be coordinated” (Dan).

Unknown territory.

Ed captured what all leaders felt at being thrust into a circumstance that they had never imagined they would face:

Suddenly you’re in a context that is beyond you, really. It is something you are not prepared for, that you haven’t got experience in. And the protocols aren't part of your normal everyday workings. It's just incredible. So it's amazing the kinds
of demands that were placed on you that time. It is just almost beyond comprehension.

As mentioned earlier, Ed’s district had a crisis team in place, typically to deal with teen suicide, accidental death of students or staff, and other crises that arise in the “normal” life of schools.

John, who led the counseling efforts in his district, faced circumstances where no such crisis team existed: “We started at zero. Nothing. I just never felt so alone. You look back at the enormity of what occurred and what was ahead of you and you have nothing. Zero. Nothing at all to go by.” This sentiment was true for all participants: none had ever had any type of training to deal with a crisis of the magnitude of a school shooting.

In fact, one silly reporter asked me, said “What training do you have to handle a crisis like this?” I said, “I had no training. I don’t know of any high school principal that has ever had any training with what you do when you walk out and eight of your students have been shot in the main lobby. I said, “I don’t know where you get that kind of training.” (Brad)

The horrific nature of a school shooting forced professional educators who were experts in child development, curriculum, and school leadership to deal with what the Public Relations Director at one site described as “what one expects to find in a war zone, rather than a school zone.” For example, Brad “told the janitors to be prepared to work late, to clean up the blood, and to fill the bullet holes and paint the walls. We were going to school the next day.”

As a consequence of the crisis, leaders had to deal with a myriad of complex issues and questions they could not have possibly anticipated before facing the reality of a school shooting: legal issues; liability; logistics related to counseling, care of students, teachers, staff, and community; when to reopen the schools; etc. Additionally, school leaders, including superintendents, were suddenly thrust into circumstances where their
authority became subordinate to the legal system. School property became a “crime scene” and district administrators had no authority to enter until law enforcement allowed it.

Leaders coped with a range of issues that added Load, from the inability to use of the phone lines due to overload, “to having to give attention to detail and concerns that you don’t normally have to concern yourself with” (Ed). The factor of unknown territory caused leaders to feel a high degree of anxiety due to the highly ambiguous nature of responding to the crisis.

Things like, should we visit the families of these victims? Which we certainly did. Should we visit the family of the boy who did the shooting? Which we did. How do we proceed with funeral arrangements and costs? What responsibility do we have there? … You're talking to your insurance people, and talking to lawyers. I mean there's just things that you would never in the course of a career experience, you would ever have to deal with, hopefully ever. (Ed)

Do we pay the medical bills? Were we at fault? If you pay them, are you? We don’t have a zero-fault process here. We are not at fault. Parents are thinking, we can’t afford, I have to buy meals and take all these trips. Can’t you help us out? Insurance issues. And it tugs at your sense of fairness. But, on a legal side, protecting the public’s interests here. We were dealing with employees who lost a child. Do they continue to work? Well, they can’t. You’ve got leave policies. They have bereavement leave—two or three days. They got sick leave. Go to the end of sick leave. Well, you’re done. You've got to come back to work, according to our policy. Do you? Well, you make a decision. (Dan)

Sometimes, decisions made with the best of intentions garnered severe criticism. Dan described one such occasion:

We declared a task force—a blue ribbon task force. What a mistake that was. One victim’s favorite color was blue. He was called “Baby Blue.” It looked like we were not honoring the other deaths with no intention to do that. We made a mistake.
Decisions regarding when to send students back to school after the shooting or when to stop lowering flags to half-mast often created controversy. Leaders felt that often there was no way to satisfy the needs of the school community.

*The media.* The impact on leaders to satisfy media demands was a load second only to the shooting itself. For example,

Newspapers, and everything, and television were here. They came from all over the world, remaining on school campuses, in some instances, for over two weeks. They wanted—demanded—interviews with students, parents, community members, and administrators at any cost. (Brad)

As Ed explained, “There is a saying about the media: feed the goat. And that means they will eat anything, but if you don’t feed them, they will find something to eat.” Brad described his strategy for “goat feeding”: “About every 30 or 40 minutes I would have someone go over to talk to the press and make sure they were getting continuous information.” The media had to be fed; however, leaders struggled to place limits in order to protect vulnerable people. Ed explained, “The first thing is to decide who is going to speak on behalf of the district. No one else then talks to the media. I was assigned that duty, as the superintendent.” Likewise, Dan and Brad took on that role in their respective districts. John announced to his team, “No one will talk to the press. Period.” John tried to insulate himself and his team from all media, however, could not avoid being significantly impacted by their presence. He said, “Our biggest problem was the press. They all but sunk us. We were inundated.”

All the sites faced bullying by the media, especially national and international media. When leaders tried to limit access to students and staff, media representative cited “first amendment rights” (John) and threatened lawsuits. The Sheriff at John’s site told the crisis team, “Let them sue us. Guess where the trial will be held?” Such a stance
emboldened school leaders and in every site, they placed boundaries on the media to
protect vulnerable people. For example, leaders limited reporters to specific media areas
and backed their demands with promised consequences: “If you were outside of this gym
interviewing anyone, then you would be escorted off the campus and your truck will be
impounded” (Brad). Participants shared many examples of unscrupulous efforts by
members of the media to “get their story” at any cost.

Participants at all four sites described feeling anger toward the media, but leaders
were especially wary of them:

There was a lot of animosity towards the press because people saw what
happened in places like Columbine, where people in their grief were exposed.
There was nothing private” (Ed).

Issuing statements becomes a little scary because you have no idea whether or not
some reporters are deliberately trying to inflame the situation or trip you up, or
create some controversy that they can then exploit.

Those that served as district spokesperson, and other leaders who shared their
experiences publicly, often paid a personal price. During my interview with Brad, he told
me:

The words came easy and the thoughts come easily. But after [this interview] is
over, I will not be in any shape to drive a car. It's easy to do right now where we
are sitting here, but when we get through, I will be so drained emotionally that I
won’t want to talk to anyone about anything for the rest of the night. You are just
emotionally drained.

Based on the data, such a post-interview response constituted a significant load for
leaders.

Trauma responses. The intense demand on leaders represented ongoing, relentless
Load. Dan’s experience represented the norm for all participants: “I never got anyone to
step in for me or any of the central office people. We pretty much had to keep going. It
took a tremendous toll mentally. Keep going, keep going.” As Swenson explains, when Load exceeds Resources, negative Margin results. Humans do have the capacity to function under circumstances of negative Margin, but only for a finite period of time. Without adding Resources or decreasing Load (in other words, making a voluntary fundamental change), sustained negative Margin leads to collapse.

School leaders endured significant negative Margin.

I felt like I had an ulcer. My stomach was upset all the time. I wasn't eating at all well. I stopped my exercising and probably haven’t come back to it since then [this statement made over a year after the shooting]. There was a physical sort of tightening of the chest—kind of an anxiety response—a dryness of the mouth. (Dan)

Participants reported dizziness, shaking, loss of appetite and other physical symptoms, but most universally reported was the inability to sleep. Brad described how he “hadn’t slept for two or three days, so you’re just kind of on automatic pilot.” He also described having “very vivid dreams” after which “I had to take a shower.” The crisis team leader from Ed’s district told me, “I was hyper-aroused for a week.” These physiological responses to trauma are normal, but “trauma” wasn’t a label extended to leaders under these circumstances.xiv

Concern for students and staff: Leaders faced previously unimaginable issues, and despite their best efforts to delegate some responsibilities, they felt tremendous responsibility to address multiple constituencies. Universal among leaders was the concern for students. “But, it was very important for the kids—that we get back to somewhat—what resembled a ‘normal situation’. And a ‘normal situation’ means classes and no outsiders” (Brad). Initially that concern was addressed by bringing counselors into the schools.
However, especially in sites where a crisis plan did not exist, leaders had to monitor carefully. “I had over 150 counselors sign in and nearly 50 clergy. We didn’t know their credentials because we didn’t have a plan!” (John). Protecting children from well-intentioned but inadequately trained counselors or clergy forced John to “fire some people who could not handle the situation or were not trained because they could do more damage.” How long to have counselors remain on campus was another concern. Brad described how he had to make a judgment about when to stop having counselors at the school. “Our objective was to get back to a normal situation as soon as possible—or what was as close to a normal situation as we could get. And that's what we did.” John placed “two counselors in every classroom on the campus, K through 12. I had my best counselors in areas where if the kid was having problems, you could take them in.”

Concern for students meant cleaning up blood-soaked areas of campus, repairing bullet holes, repainting, and sometimes major remodeling. John ordered the sidewalk where multiple victims fell replaced.

The kids refused to walk on it. We had to take it out. Destroyed that sidewalk. Took it all out because the kids wouldn’t walk on it. Bloody bodies were there. Neither would the teachers. So they came in, demolished that sidewalk, and put another one in the exact same spot. (John)

After the crisis had subsided, John was criticized for exceeding his authority by the new superintendent, due to the costs involved in such actions as replacing the sidewalk. Costs related to the crisis response were not a primary concern for leaders in the immediate aftermath of the shooting, but financial cost concerns were real and eventually became manifest: “We had high costs, maybe 10% of the total budget. Where is that going to come from?” (Dan). However, leaders were initially primarily concerned with human needs.
Parents were also objects of concern. In the immediate aftermath of the shooting, “the parents were just frantic to know about their kids” (Brad). Leaders often did not have information or were prevented from giving out information about students, even to parents. “It was a situation where you couldn’t tell them who was shot, so you had to stand there helplessly” (Brad). John’s concern for parents and community members led him to establish “phone counseling around-the-clock and [providing] counselors ready to go out if someone called up at two o’clock to say they can’t sleep and wanted to talk to someone face to face.”

John told of a woman who came to him saying, “I don’t know where my girl is.” I said, “You tell me her name and I’ll call around and see if we can find her.” And she said, “No, no, she was one of those that was killed.” She explained that she had been to multiple hospitals unable to find her daughter’s body. Additionally, she had no resources for paying for a burial or for clothing for the funeral, or any capacity to host family members who were on their way. John found the resources to support this parent.

Teachers and staff were also vulnerable and leaders took steps to meet their needs. John had teachers work with counselors the day before students returned to school after the shooting: "The therapy you're going through now will be the same thing the kids are going through, so you’re going to be familiar [with it].” John also placed a counselor on the busses where kids had been wounded or killed. “A counselor sat in the seat that they normally sat in so they could talk to the kids around them.” He also placed a second “counselor kind of up by the driver. And that worked great. The drivers were really reassured.”
All the participants shared concerns for students, parents, staff, and community members. Some were responsible for addressing these needs directly, while others delegated responsibilities to others. Ultimately, leaders felt responsible for easing the pain of the wide range of people impacted by the shooting.

**Internal Load**

According to the Margin equation, internal Load is not observable to others. Examples of internal Load might include the feelings we carry when we leave a small child in day-care to go to work, or the concern we have about an aging parent or a loved one diagnosed with a life-threatening illness. Worrying about how we are going to be able to send our children to college or feeling distrust of a co-worker or supervisor can constitute internal Load. Other examples of internal Load include striving for perfection or needing to be loved and cherished by others.

**Personal crises.** The concern people feel about an aging parent or a loved one diagnosed with a life-threatening illness is an example of internal Load. Ed “was waiting for bypass surgery at the time [of the shooting]” and John’s wife had been diagnosed with a serious illness and “had a doctor's appointment” the day of the shooting. These types of concerns were not shared publically and represented added Load.

**Sense of personal responsibility.** Leaders understood, intellectually, that they were not personally responsible for the shootings at their sites. Nothing they could have done could have prevented such events from occurring. Yet, they did feel enormous responsibility for responding to the crisis. Dan worried that someone would ask, “How could you let this happen?” He was grateful that “nobody really said that with the intent
to mean it. Sort of we joked about that: wouldn’t that be the worst question anybody
could ask?”

Some people were almost crying out, “Solve this problem. Put these kids back to
life. Get this school back together.” Being the one who is going to answer the
public, figure this out, get it done, get on to work and get everything back together
again. I felt that. I felt it was me that had that most responsibility. (Dan)

Similar to Dan, Ed, also a superintendent, described longer-term concerns he felt
responsible for: “What is going to be our long-term ongoing response for this? And how
are we going to deal with the way staff are still feeling about this? How are we going to
accommodate staff that have been traumatized?”

Another unrelenting sense of pressure on leaders was the fact that they knew
“everyone is looking for you for an example, so you just had to set the example that you
wanted everyone else to follow” (Brad). Being a role model constitutes internal Load.

Brad was one of two participants I interviewed originally who intervened directly
with the shooter before the shooter was subdued. His sense of responsibility outweighed
any thoughts of personal safety:

I could see a young man with a pistol standing over against that far wall where
you just walked through. Then you had to decide what you were going to do. You
had to decide real quick. Well, someone's got to go. Someone's got to stop him.
So I started out towards him, and I kept a concrete pillar between us as I went
towards him, and when the firing stopped, then I thought he was probably
changing clips and I needed to get to him before he changed clips, so I stepped
out.

Brad placed himself in harm’s way because he recognized, as the formal leader
responsible for the school, he was the “someone” who had to stop the shooter. Brad also
typified the kind of intimate relationship school leaders have with their students: “I was
the one that was here on the scene, not the superintendent. I was the one that knew the
kids. I was the one that knew the victims. I was the one that knew the shooter.” Building
leaders’ almost parental sense of responsibility for students was an example of internal Load. However, central office responsibility did not always mean less sense of personal responsibility.

I was raised in [town where shooting occurred]. I am a small town boy. Spent most of my life here. Loved the community. I was the principal of that school for nine years before I became superintendent. I mean, it's part of me. It's my baby. So it affected me very personally as well as professionally. (Ed)

For those leaders who became the district media spokespersons, there was added load, not only of giving interviews, but over the worry “that you might say something or do something would make it worse, that would create controversy. That is great deal of pressure on you” (Ed). Ed captured the ongoing sense of responsibility leaders felt once they passed the immediate demands of the crisis:

I don’t think when it's over that it is over. Because it's not over. After an immediate response, people are then asking, “What is your long-term response going to be? What is your ongoing response going to be?” A lot of pressure is put on you and you have to deliver on this. I mean, this can’t happen again. Do you understand?

The unrelenting pressure for not “letting this happen again” existed for all leaders, but most especially for superintendents such as Ed and Dan.

**Exposure to horror.** Ed described his experience as “almost surreal. You don’t really believe it's happening, but you know it's happening.” In part, the sense of unreality was shaped by leaders’ exposure to horrific events:

[The shooting] takes away your innocence. You lulled yourself into a sense of security. Can’t happen here. Small town. Family place. Non-violent. No preparation for this kind of thing. Then when it happens there, then suddenly you as an individual feel vulnerable” (Ed).

Personally witnessing horrific events, or what Ed called “the awfulness of whole thing,” is one of the preconditions for developing PTSD. Many leaders were personally
exposed to death. Brad, for example, held dying children in his arms. He described his feelings of helplessness:

And I go to the first little girl. She was laying over by that pillar. And I bent over her and just kind of looked at her. She had a bullet hole right there [points], and her brains were coming out and I just laid her head back down and I just went to the next student. It was just like, I can’t help her. You know and I just went to the next student.

Exposure to horror sometimes had a lasting affect on leaders.

Every now and then something can grab me. All of the deceased were taken away in ambulances except for one victim. That was the only body they left on the scene, they declared her DOA and the others they took to the hospital. They covered her up but I could still see her little foot sticking out about an inch from the cover. I told the cops “Cover that foot up. Every time I go by, I know it’s there. I can’t keep from looking. Please cover her foot up. That spot's really starting to get to me." (John)

Dan reported feeling “kind of uneasy all the time,” then, deeply sad. He went on,

Kids were dead, [name of teacher who was shot], I sat next to her at football games. I built my life helping kids and I see kids killed—the smell of blood and the trauma of that whole experience.

John shared “the first thing that impacted me was the terror that was there. You could just reach out and basically touch it.”

Schools looked like battlegrounds:

They were dragging some kids in the hall that had been wounded or with blood all over, bloody rags. We had no bandages. They were ripping shirts off of kids and binding with them: head wounds, chest wounds, lot of blood. (John)

However, John and Brad both also mentioned a second level of horror: discovering that some students had relevant knowledge prior of the shooting, but did not report this knowledge to an adult.

I sat down with the group of this one girl. I could see the brain tissue on her from another girl. She was sobbing and had blood all over. She said, “Why did they do it?” “Why did they do it?” I said "Who?" She named the shooters. And I said
“Who?” She knew who did it. And I said, “Well, how do you know?” She said, “He said he was going to do it, and said, 'Don’t come to school today.'” (John)

Similarly, Brad described “the low point of the experience.”

Two days later, I found out that the young man that did the shooting had the gun at school five days prior and several students had seen the gun and did not confide in any adult.

Such knowledge constituted internal Load because leaders’ assumption about the kind of trust they had formed with students was severely undermined by the revelation that students had important advanced knowledge but did not act.

The exposure to trauma directly, or indirectly by exposure to traumatized others, may have a long-lasting impact on leaders. Individuals who suffer trauma often experience flashbacks caused by some stimulus they associate with the event. For Dan it was cold weather.

As soon as it snows and it is a cold wintry day. When it drops below zero, I kind of (makes a sound) [revert] back into that. It trips you back into that trauma of how fearful you are.

For John, a trophy case caused a similar flashback response:

I walk in there and see some of the things in there. That bothers me, so I don’t look at it even now. When I get in the front door, I just avert my head because it bothers me. I don’t know why, but it does.

Ed described how the horror “all came back” just before he and a colleague were going to make a professional presentation about the shooting: “I had to relive it. It's a tremendously emotional experience. There's times when it's almost more than you think you can bear.”

Feelings. Participants described many different types of emotional responses. For example, leaders often recognized and spoke about feelings of guilt.

You felt very guilty about what had happened. You were the guy in charge and this had happened on your watch, so you carried that guilt, even though there
wasn’t anything that you could have done to stop the situation, that doesn’t really matter, you still have that overwhelming feeling of guilt. (Brad)

Many leaders felt shame as well, although none labeled the feeling as clearly. Ed, for example, who grew up where the shooting occurred, lamented that the town was well know for a crop that grew there. Though the town and its crop were well known, the location was more obscure. Ed bemoaned, “Now they know exactly where [our town] is and they tell you why they remember.” Similarly, Dan was saddened that his school district would forever be known for the shooting rather than for educational excellence.

Dan described feelings of helplessness, bitterness, and anger:

Someone sitting across from me talking about their child that has just died, and I have teenagers and young adult children and I realize how horrible that would feel, but that didn’t make you able to help the parent.

Dan also expressed feeling isolated and bitter because “people could have done a little more, if they really felt that it was their problem, too. There was great support from peers and other districts, but as far as getting a letter from the President. No national response.”

Dan also described the anger he felt from other directed at him and again echoed feelings of helplessness to personally resolve issues:

People were angry. Employees saying they weren’t really angry but later it appeared they were because lawsuits came out. They were angry and you don’t like to have people angry at you. You try and resolve those things. And you can’t resolve them. First off, it is your position that they are angry at.

The shooting was a life-changing experience: “Everyone is so profoundly changed, and probably the leaders more than anyone” (Ed).

Emotional Labor. Emotional labor, or emotion work, explains that how we feel, to some degree, is socially and culturally constructed. Leaders were engaged in emotion work during and after these incidents of organizational violence. Hochschild describes
two different types of emotion work: surface acting and deep acting. Surface acting refers to “painted on” displays of emotion. Deep acting, on the other hand, requires a person to consciously “work on” his/her inner feelings so as to bring in line one’s inner feelings with the requirements of the situation.

One example of emotion work leaders described was their efforts to set aside the personal: “I had to set aside all things personal. It really wasn’t that hard to do. Because you're in such shock” (Brad). Leaders felt they had to be “good models” for others. Many stated that they “tried to be strong for the kids and the teachers—let them do what they needed to do, but to set an example” (Brad). Another way Brad explained the notion of setting aside his personal experience was what he called “going completely into the professional mode.”

I was in professional mode and there was no personal. Just pushed that aside completely. Just pushed everything aside that was personal completely. In other words, it is just all business.

Brad’s way explaining how he managed his public and private emotions was echoed by other leaders. A principal from Dan’s district lost his wife in the shooting. Dan described how before the principal knew whether his wife was okay or not, the principal had to manage his emotions:

He had to separate his immediate emotions—“my wife is mortally wounded and may be dying but I’ve been told I can’t go in to her classroom because there is a gunman in there”—from “I’ve got kids to evacuate.”

Dan explained the how this principal “was torn between the personal push of wanting to see his wife and being forced to step back into his professional role.”
Conclusion

The examples of four leaders at four different school shooting sites have implications for leaders in other settings. People who experience significant loss and/or trauma must be able to make sense of the experience in order to recover from it. Sense-making involves being able to "stand outside" an experience in order to re integrate it and to move on to a “new normal.” Sense-making,\textsuperscript{xix} therefore, qualifies as a Resource, in the Margin\textsuperscript{xx} equation. Each leader’s experience offers insights into crisis response for leaders in any organizational situation.

Ed

Ed came through his experience in a healthy way. Key to his experience was his the ability to make sense of the experience, to integrate it, and to move forward.

I know that I have to live with the reality of what happened. I don’t care if you’re a quarterback or a superintendent, Monday morning you’re wondering what could I have done differently or should have done differently, whether you won the game or lost it. I do that. Still do. Leaders should be introspective and so you do replay a few things from time to time to see if you can learn. How can I still be an effective leader, be positive, optimistic, forward thinking, plan it strategically, create a vision, motivate people, all this in spite of what has happened? How can I take an organization that has been dealt this kind of a blow and help them to recover from that blow? That is what I focus on. That is what I have to focus on.

Ed’s crisis team leader was well versed in family systems therapy and trauma from his professional practice. One of the victim’s parents was instrumental in helping Ed’s school district deal with the shooting in a way that helped everyone in the community move forward. Both these factors underscore the importance of counseling support for leaders. Whether or not they realize they are processing their experience, leaders need to do so. Without adequate opportunities to make sense of the experience, recovery from trauma is difficult.
Brad

Brad had difficulty making sense of the experience:

You don’t make any sense out of it. Doesn’t make sense, so I don’t even try to make sense of it. You try to deal with the situation. [Play] the cards that have been dealt to you. Go from there.

Brad felt a deep, personal sense of responsibility for shooting:

The hardest part is getting over the guilt feeling that it happened on your watch. That is the hardest part. The hardest part to get over is that you were in charge, and it happened. You were the person in charge. That is the hardest part to get off. That you didn’t stop it. That even though you know that rationally there was no way you could have known.

Brad’s sense of responsibility framed his need to “restore order” as soon as possible. A way he thought he could accomplish this was by giving interviews and getting the media to leave the school—at great personal cost. His strategy suggests that Brad’s ideal of “leader” was the heroic model. His actions probably contributed greatly to his goals of helping others, but in the end, his personal needs were sacrificed.

I am more in tune with other people’s feelings, but I am a worst principal, because it’s taken away my vision of the future. I have a real hard time focusing on the future. I tend to look back at the past too much and judge everything according to the past. So, if you're dwelling in the past, you're making a mistake. In this business, you need to be looking in the future. So in a way, all my judgments are tied to the past. I’m a better person, but not as good a principal. Brad’s seeming inability to look forward led to his leaving education before he qualified for retirement.

John

When asked if he would “do over again, what would you do?” John said,

I would get out there and see what I had and I would turn around and I would go home. But it was rewarding, it really was rewarding. “Man, we sure did a lot out here…. Emotionally I am fine. Because I've had some coping skills instilled in me from the past experiences [wartime experiences in Viet Nam] like this that others haven’t. So they've had some problems. I've done fairly well on this.”
John reported that he could not bear to look at the trophy case when he entered the school where the shooting occurred, but he was at a loss to explain why this was so. John was the lead for the counseling response. He helped organize post-crisis counseling for children and for staff. He described how his team debriefed nightly. John’s self-assessment was somewhat contradictory. He stated, “That was the worst three weeks of my life” however he called it “rewarding. John’s ambiguity about how he faired suggests that leaders who deal with extreme crises are not receiving the kind of support they need.

Contracts for school leaders contain sick leave and bereavement leave provisions, but not crisis leave. Whether or not they are contractually guaranteed, organizations must consider the human costs involved in crisis management by providing Resources to leaders that have had to cope with extraordinary Load. John’s “I’m fine” directly contradicted some of his other post-crisis self-assessment. Such an outcome suggests that a structured process of sense-making might have help John reconcile the contradictions he expressed. Unfortunately, after a crisis subsides, most organizations want to “move on.” Looking back is often seen as weakness.

Dan

Like the other men and women who led in the aftermath of a school shooting, Dan wanted to take care of people and not take any action that might cause further harm. But even the seemingly simplest decisions were challenging.

Candles and ribbons and flowers. Who makes the decision to do away with those? They can’t stay there forever. When are you taking them away? What process? There is no book to look that up in. When do you get rid of the candles in the doorway? (Dan).

Dan was acutely aware that the “candles and ribbons and flowers” carried meaning to those who brought them. His school housed children from any cultures. Dan wanted to be
sensitive to the sensitivities of his community, yet pragmatically, “They can’t stay there forever.” Multiplied many times, the ambiguity created by the crisis took a heavy toll on leaders.

Dan realized that the experience of crisis responding took a toll on him: “There are people who say I am never going to get on with life. I am always going to be affected in a different way. I will never be completely over that.” Dan recognized that his experience of crisis responding made a significant “impact…on your personal health and mental state. I know in my case, you get on with life. That's sort of the way I've handled it. Dan reported that severe cold temperatures took him “back into that trauma of how fearful you are.” In stating that a traumatic event can have a significant impact “on your personal health and mental state,” Dan has articulated what other leaders suspected, but may not have understood, and rarely articulated as clearly as Dan did: A crisis as intense as a school shooting take a toll on leaders. And a school shooting is on the extreme end of a continuum of crises that leaders might face. Certainly, “lesser” crises might impact leaders similarly.

**Recommendations**

Probably none of these leaders will ever be “completely over” (Dan) their experience. According to the Margin concept\textsuperscript{xxi}, these leaders experienced negative Margin. The only way to prevent collapse is to add Resources or decrease Load. Because the nature of the crisis adds Load that cannot be decreased, I recommend that organizations find ways to provide Resources both during and after a crisis, particularly debriefings, counseling, and some sort of crisis management leave, so that they and their leaders come through the crisis intact. The self-report of these four leaders suggests that
they saw themselves as heroic. Such notions do serve leaders, but may also be unrealistic and counter-productive. Leaders, particularly those who lead during times of crisis, can benefit from standing back and reflecting, or as Ed put it, consider “what could [they] have done differently or should have done differently, whether [they] won the game or lost it.”

---

7 Swenson (1992) uses the term power, not Resources. Because power has connotations related to influence, politics, and authority, we have opted to substitute the term Resources.
8 The same Margin equation can be applied to any living system (families, work teams, entire organizations, religious congregations, etc.). Daryl Connor (1992), for example, describes an organization’s Resources as “capacities” and its Load as “demands,” and makes the same points as does Swenson.
11 Subsequent to the original study, I have also interviewed 12 individuals from two school shooting sites.

Promoting STEM Achievement for African American Male Success

Mathematics Education

Paper Session

Abstract: Too many of our students are falling short in the STEM field. We will provide results of a study that will show achievement factors including engagement, capacity, continuity, and guided functions that can improve the classroom ethics of care and social-emotional well-being of student success towards STEM fields. Education Professionals will learn how to implement these achievement factors to increase responsiveness for higher academic achievement in STEM subjects.

The number of African American males entering college to pursue STEM fields is small and dwindling. While African American males comprise 15.4% of the US population they only receive 5% of STEM bachelor degrees awarded (NCES, 2009). The success of our nation’s economy is dependent on having a racially and ethnically diverse workforce trained in quantitative and technical fields. Identifying and evaluating the school related factors connected to math and science achievement so that African American males in high school can be directed towards success in STEM subjects in the classroom are needed.

The model discussed is the Four Factor Hybrid Model that consists of four achievement factors, engagement, capacity, continuity, and guiding functions (Boykin & Noguera, 2011). Each factor described focuses on the achievement levels specifically for Black males in the classroom to excel in STEM subjects (Jolly, Campbell, & Perlman, 2004). Each factor embodies certain achievement functions such as determining the interest level of math and science, rigor of the subject, and various institutional opportunities afforded to the students (ECC Trilogy Model & Boykin/Noguera model). This paper will discuss an empirical research project designed to evaluate the effectiveness of the Four-Factor Hybrid Model for high school students in the classroom. By evaluating the success of these four factors through the literature and an empirical study, a better understanding of how to incorporate these four factors in classroom instruction will become essential to the increase of more African American males to receive higher achievement in STEM subjects.
Overview of the Four-Factor Hybrid Model

In an effort to account for creating a theoretical framework that included African Americans Males and STEM achievement, a combination of the Engagement, Capacity, Continuity (ECC) Trilogy (Jolly, Campbell, Perlman, 2004) and the Research-based Scheme for Promoting Enhanced Teaching and Learning (Boykin & Noguera, 2011) were used to create the Four Factor Hybrid Model. The Four Factor Hybrid Model includes achievement factors of engagement, continuity, capacity, and guided functions. The engagement factor is the student’s active participation towards an academic task (Boykin & Noguera, 2011). Also included is capacity, which is the student’s acquired knowledge and skills to advance to rigorous quantitative content (Jolly, Campbell, Perlman, 2004). Continuity is the institutional and programmatic opportunities, resources and guidance that support advancement to rigorous content in science and other quantitative disciplines (i.e., teacher practices, what is the school doing) (Jolly, Campbell, Perlman, 2004). Lastly, guiding functions are the student’s adaptive learning postures such as self-efficacy, self-regulated learning and incremental ability beliefs (students beliefs) (Boykin & Noguera, 2011). All four of the factors are used to guide the research in determining how to improve the success of student achievement in STEM subjects.

Project Design

Participants included (N=517) undergraduate students (Female= 346, Males=170) in math category courses at Howard University in Washington, DC. Undergraduate
students were given a 47-item questionnaire on a 4-point Likert-scale entitled the Conditions for Black Male Success in STEM Survey (CBMSSS). Each question corresponded to one of the four factors of engagement, capacity, continuity or guiding functions. The students were asked to reflect back on their high school experience in responding to each question on the CBMSSS questionnaire. The data was collected and organized for quantitative analysis.

Results

The predicted hypothesis is to evaluate the interaction of factors proposed in the Four Factor Hybrid Model and determine what combination of factors best work together (Appleton, et.al, 2006). An ANOVA analysis will be used to determine an interaction among the four factors and a multiple regression (hierarchical method) will be performed to determine which combination of the four factors predicts the highest achievement using GPA as an achievement indicator. Based on the literature, the engagement factor is proven to be an effective indicator for achievement in the classroom. Therefore, evaluating the additional factors, capacity, continuity and guided functions, in predicting achievement is also necessary for improved classroom instruction. The expected outcome is engagement will yield the highest interaction result of the four factors and engagement and capacity combination will yield the highest predicted achievement outcome (Boykin & Noguera, 2011).

Objectives/Learning Outcomes

Education professionals can utilize the CBMSSS as an academic instructional
support tool to evaluate how to increase these four factors in classroom instruction and various assessments and interventions. In doing so, participants can use this tool as a formative assessment for preventative of low achievement. Also, using these questionnaire items as a guide can help improve the classroom ethics of care of the teacher-student relationship and build upon the increasing these achievement factors for higher social-emotional health for students. Educators will gain an understanding as to how to be more intentional and transparent about the value of assignments given to students, so that students find more meaning behind it and are encouraged to complete it (Conner and Pope, 2013).

Journey Through the Leaky Bucket: Canadian Millennial Teachers

Lena Shulyakovskaya
Werklund School of Education, University of Calgary
Calgary, AB, Canada
lena.shulya@gmail.com

Teacher turnover is a growing problem in North America. Numerous research studies have estimated that half of the teachers leave the profession within their first 5 years on the job. The topic of teacher attrition in North America has been widely discussed in the education field, with such scholars as Linda Darling-Hammond (2003, 2005) and Linda Duxbury (2013) arguing that work overload, inadequate support from colleagues and administrators, irrelevant professional development, and constantly changing policies pressure teachers to leave the profession. While there is a breath of research on teacher turnover in general, those works do not adequately address generational differences among the teachers in regards to turnover. My paper addresses the issue of Canadian teacher turnover with a focus on the Millennial generation of teachers. According to the most widely used definition, Millennials are a generational cohort that was born roughly between 1977 and 1995. It is the youngest generation of professionals entering the workforce at this time and the generation that has proven to be the most difficult to retain in any workplace, making retaining teachers from that generation an even more difficult task. Furthermore, previous works have focused on teachers who were still teaching at the time the studies were conducted, while my research focuses on individuals who have already left the teaching profession. My research aims to investigate two questions: (a) why do Canadian Millennial teachers leave teaching? And (b) what would be needed to
retain Canadian Millennial teachers? Using a case study approach, I conducted in-depth interviews and follow-up questions with three groups of participants: (1) former Canadian teachers from the Millennial generation, (2) current Canadian teachers from the Millennial generation, (3) former immigrant teachers from all generations. Based on the lived experiences of my participants, I discuss what conditions influence Millennial teachers to leave and what is needed to help them want to stay in the profession. My study may open up new areas of interest in regards to being a teacher in the 21st Century, such as having a foreign accent, having the freedom to work overseas, ability to teach online, and reaching out to opportunities in Education outside of the K-12 sector. There is an urgency to find appropriate employment practices that will help retain Millennial teachers at K-12 schools because that generation will soon comprise the majority of the North American workforce. My research study is one of the first to focus on Millennial teachers in Canada.
Title of Submission: Learning to Live with HIV/AIDS in the Rural United States: Research-in Progress

Learning to Live with HIV/AIDS in the United States: Research-In-Progress

Lisa M. Baumgartner
Texas A&M University

Abstract: The purpose of this presentation is to discuss my research-in-progress concerning the learning journeys of People Living with HIV/AIDS (PLWHAs) in rural areas. The research questions include: (1) How do PLWHAs learn about HIV/AIDS? (2) How do various contexts (e.g. sociocultural, interpersonal, and situational) affect the learning process? (3) What learning resources are most beneficial? Tentative findings show learning is self-directed, affected by various contexts, and learning from other PLWHAs is most beneficial.

Although much of the literature concerning PLWHAs in the United States centers on populations in metropolitan areas (Galindo, 2013; Marshall et al., 2012), individuals living in rural areas must also cope with the disease. Approximately 67,000 individuals age 13 or older who live in rural areas have been diagnosed with HIV or AIDS since the beginning of the epidemic (Centers for Disease Control (CDC), 2013). In 2011, almost 2,300 individuals 13 years or older were diagnosed with HIV/AIDS (CDC, 2013).

Rural PLWHAs may have different experiences from those living in larger cities. The concerns of rural PLWHAs include barriers to care such as lack of transportation and lack of health care professionals adequately trained in HIV care (Pellowski, 2013; Sarnquist et al., 2011). Research that included rural PLWHAs has focused on coping strategies (Johansen & Kohli, 2012), disclosure, social support and depression (Vyavaharkar et al., 2011), and resilience amongst African Americans (Bletzer, 2007).

In addition to these areas of inquiry, learning to live with a chronic disease is also important. Learning about HIV/AIDS has helped individuals better cope with the disease and integrate HIV/AIDS into their respective identities (Baumgartner, 2007). Few chronic illness researchers have framed their investigations in terms of learning theories and even fewer have discussed the learning of PLWHAs. Further, how various contexts including the sociocultural (race, gender, culture), interpersonal (support and stigma), and situational (e.g. living in a rural area) influence the learning process has not been studied in a rural population (Ickovics, Thayraypan, & Ethier, 2001).

Researchers that have examined learning as it relates to chronic illness have looked at participants’ informal and transformative learning. Informal learning happens without “externally imposed curricular criteria” (Livingstone, 2001, p. 4) and includes self-directed, incidental, and tacit learning. Self-directed learning occurs when individuals consciously decide what to learn, how to learn it and how to evaluate the learning experience (Knowles, 1975). Incidental learning is the “unintended outcome of a learning experience” (Keeping & English, 2001, p. 313). A person attends a seminar to learn more about HIV/AIDS medications and incidentally learns that PLWHAs can live long healthy lives. Tacit learning occurs at an unconscious level and awareness of this type of learning occurs later (Marsick & Watkins, 1990). Upon reflection, a participant who has been attending AIDS Service Organization (ASO) meetings might realize that a goal of the ASO is to empower clients to become HIV/AIDS activists. Transformative learning occurs when an individual’s worldview changes as the result of critical reflection on previously held assumptions (Mezirow, 2009).
Studies that examined informal learning include the informal learning of multiple sclerosis (MS) educational support group attendees (Preissner, 2013) and patients with continuous ambulatory peritoneal dialysis (CAPD) (Keeping & English, 2001). The self-directed learning of men with prostate cancer and women with breast cancer was explored (Rager, 2004, 2006). Holland (1992) and Francabandera (1992) spoke with individuals living with MS and their family members and uncovered the kinds of information sought. Participants in these studies were from metropolitan areas.

Regarding transformative learning and chronic illness, investigators delineated a meaning-making process of PLWHAs from a major Midwestern metropolitan area that resulted in a perspective transformation (Courtenay, Merriam, & Reeves, 1998). Two years later, they returned to determine whether the perspective transformation remained (Courtenay, Merriam, Reeves & Baumgartner, 2000).

Persons Living with HIV/AIDS (PLWHAs) need to learn about the disease to emerge from the shock of diagnosis and effectively integrate that identity into their larger self, and live more productive lives (Baumgartner, 2007; 2012). PLWHAs living in rural areas face unique challenges. The voices of PLWHAs living in rural areas have been largely absent from the literature on learning and chronic illness and their learning journeys need exploration in order to more effectively serve them.

Most of the existing research on PLWHAs in rural areas concerns access to care, coping strategies, and relationships between social support and depression (Johansen & Kohli, 2012; Pellowski, 2013; Sarnquist et al., 2011; Vyavaharkar et al., 2011; Zukowski & Thornburn, 2009). Few studies discuss the learning journeys of PLWHAs living in rural areas. The purpose of this study is to examine, describe and analyze the learning journeys of PLWHAs who reside in rural areas. The research questions include: (1) How do PLWHAs living in rural areas learn about HIV/AIDS? (2) How do various contexts (e.g. sociocultural, interpersonal, and situational) affect the learning process? (3) What learning resources are most and least beneficial? Answer to these questions will show how, where, what, when and why rural PLWHAs learn about HIV/AIDS and what prevents and enhances their learning processes and will help health educators provide client-centered education and inform administrators how best to spend HIV/AIDS education funds.

**Method**

Qualitative research is concerned with how people make sense of processes (Bogdan & Biklen, 1998). Since I want to understand the learning journeys of PLWHAs living in rural areas, I am conducting a basic qualitative study.

Participants that are being recruited for the study are: (1) at least 18 years old; (2) reside in a rural area of the United States (3) are diagnosed with HIV or AIDS for a minimum of a year. Based on my previous research, it takes a minimum of a year for individuals to start making sense of living with HIV/AIDS. For the purposes of this study, I used the Centers for Disease Control definition of rural which is “an area with a population of less than 50,000” (CDC, 2008, p. 4).

I have contacted numerous rural health agencies throughout the United States and have worked with contacts at my institution to recruit participants. For a number of reasons, recruitment has been slow. However, I am persisting and trust I will eventually be able to secure enough participants to achieve saturation.
After receiving IRB approval, I have conducted one (1) usable in-depth interview with a participant which was tape-recorded and transcribed. To ensure credibility of the findings I plan to conduct interviews until saturation. This means the same information is heard repeatedly and no new information is forthcoming (Merriam, 2009). To ensure adequate engagement in the field, I plan to interview at least 20 participants. I will also conduct member checks by providing tentative findings to participants to obtain their feedback, and keep and audit trail which details data collection and analysis decisions (Lincoln & Guba, 1985). Pseudonyms are assigned to participants to protect anonymity.

Data is being analyzed using the constant comparative method (Glaser & Strauss, 1967). I am coding transcripts and looking for themes across and within them. First, I perform initial coding which involves categorizing short segments of data (Charmaz, 2006) and then I conduct focused coding which involves sifting through the initial codes to derive more conceptual codes that result in larger themes (Charmaz, 2006).

Results of a Study-In-Progress

Because there is only one participant thus far, I will write the findings in a more narrative format. As more participants are interviewed, a thematic presentation of data will occur in future publications.

Jeremy is a 25-year-old, employed, White male who is a high school graduate. Much to his surprise, he was diagnosed HIV-positive five years ago when he took a physical. Prior to diagnosis, Jeremy learned what HIV was when a friend’s relative was diagnosed and the information was also presented to him in high school.

Although he knew individuals lived with HIV/AIDS when he was diagnosed, and that there were medications available, Jeremy said, “I was still in shock about it because it was still kind of like, ‘Is this really happening?’” This period of shock lasted “about six months” during which time he “made a lot of stupid choices” and “drank, drank, drank.” The turning point to this behavior came when started crying in front of a friend. After that emotional outburst, he went back to the doctor and started telling friends he was HIV-positive. He received support and information from friends, doctors, and “reliable sources on the internet like Web MD and Wikipedia because for the most part, people don’t mess with Wikipedia. They don’t put false information on Wikipedia.”

Jeremy tried support groups but found his friends were more helpful to him when he wanted to talk about or learn more about HIV. He did not join a support group because he “didn’t want to sit around feeling sorry for [himself] every day or every week.” His favorite way to learn about HIV is from his friends,

Because you get to hear their stories and everybody has a different story to tell about how they got it and how they found out and that’s kind of the biggest support that you have is your friends. The internet is going to be there and you can view the internet all day long but the internet’s not going to be saying, ‘Hey, I’m here for you.’

Jeremy appreciated his doctors’ knowledge and has found medical professionals helpful. However, he cautioned that doctors can sometimes be condescending. He remarked,

Sometimes the doctors just like to assume that I don’t know what they are talking about and so when they start talking. . . and I’m like ‘I know what you are talking about.’ And
they are like, ‘No you don’t.’ I’m like Mhmm [yes] I do.’ . . . I have never liked it when people talk down to me and act like I don’t know what they are talking about. I love the doctors and they give me really good information but 90% of the time it’s something I already knew because someone told me or I looked it up.

Jeremy believed that besides his own shock at diagnosis, nothing has affected his learning about HIV/AIDS. However, he said that being HIV-positive has affected his social life somewhat. He stated, “People don’t send me messages all the time anymore.” He has to travel some distance to see friends and have more of a social life.

When asked what ideas he had to help rural individuals learn about HIV/AIDS he encouraged individuals to “ask questions” “go to the library” and “look up stuff on the internet.” He remarked, “The only thing that is preventing somebody from finding out information is themselves [sic].” Another way that he thought individuals would be receptive to information about HIV/AIDS is through general public health conferences where a variety of subjects were discussed including HIV/AIDS. Privacy and anonymity are important in small towns, he noted.

Jeremy cautioned newly diagnosed PLWHAs saying, “I guess my biggest advice is ‘Don’t let AIDS define you’ . . . People let HIV control their identity rather than being part of their identity. . . I don’t let HIV control my identity.” He also said that he would tell newly diagnosed individuals “Don’t be scared and…move to a larger city [if you feel you are in danger]. He stated that being gay and having HIV might put people in danger in small towns in some cases.

In summary, Jeremy knew about HIV/AIDS prior to diagnosis through information presented in high school and knowing a friend’s relative contracted the disease. After diagnosis, he sought information from his doctor, the internet and friends who were HIV-positive. He found the information from his peers most helpful. He did not think there were any other factors that influenced his learning about HIV/AIDS other than the initial shock he experienced after diagnosis. He did not experience stigma when looking up information at the library. He considered his friends the best resource for learning and although he appreciated his doctors, he warned that doctors should refrain from being condescending to their patients.

Discussion

Jeremy’s learning appears to be largely self-directed (Rager, 2004). He used a variety of sources to learn more about HIV/AIDS. His story confirmed the importance of peers in the learning process although he found his support outside of a formal support group at a community-based organization (CBO) (Coursaris & Liu, 2009). His portrayal of HIV/AIDS support groups as a place where individuals felt sorry for themselves is something that could be investigated further. Was this experience situational? He noted that the support group contained people of all ages which were not bothersome. He also had peers he could talk to once he revealed his diagnosis. It would be interesting to investigate how PLWHAs in more isolated areas than use support groups for learning.

Second, Jeremy considered WebMD and Wikipedia reliable sources of information for HIV/AIDS. Further investigation of how PLWHAs decide which internet resources are reliable is an area of inquiry I might pursue in future interviews. How does education level factor into these decisions? What other factors influence which internet sites individuals investigate regarding HIV/AIDS?

Third, PLWHAs contend with various challenges regarding healthcare including access,
stigma, and healthcare professionals’ attitudes (Grodensky et al., 2015; Jin et al., 2015; Kempf et al, 2010). Emotions and learning are intertwined. Although health care professionals might be unaware that they are being perceived as condescending to patients in some cases, this attitude comes across and can be detrimental to the patient/doctor relationship and to patients’ ability to learn from health care professionals.

Last, although Jeremy eschewed any contextual influences on his ability to learn about HIV/AIDS, I suspect more effective questioning in this area might uncover how various contexts influence learning about HIV/AIDS. Assuming individuals can access the internet, has the internet leveled the information playing field? Are others as internet savvy as Jeremy? How did Jeremy’s relatively close proximity to a larger city affect his access to information? What differences, if any, will be found for PLWHAs in more isolated areas? These and other answers await as I continue to pursue my investigation into the learning journeys of PLWHAs living in rural areas in the United States.

Abstract

Introduction

The utilization of cohort models is not a recent concept in educator preparation programs; universities have been using cohorts, in various forms and constructs, for decades. Goodlad (1990) described a cohort as a group of pre-service teachers working and sharing experiences together throughout their time in an educational program. While there was a time in the educational system when cohort models were less formally planned and much less strategically structured, due to current redesigns in the extensive training of pre-service teachers, institutions of higher education have realized the need for effective cohorts. Having high-quality teacher education programs in EPPs has never been more critical, and cohorts are an important component of the preparation of teachers.

While the cohort model has become a very common practice (Mandzuk, Hasinoff, & Seifert, 2005), the concept must be thoroughly examined to allow teacher candidates to “acquire the values, attitudes, norms, knowledge, skills, and behaviors of the teaching profession…” (Staton, 2008, p. 1). While Maher (2005) believes that cohorts can seem attractive to EPPs because of consistency and coordination of course sequencing and course completion, cohort models are only successful if they produce effective teachers who add value to the lives of the students with whom they work. Cohorts in which members develop a strong sense of community most enhance the educational experience of pre-service teachers (Dinsmore & Wenger, 2006).

The purpose of this study was to evaluate teacher candidates’ attitudes toward the effectiveness and potential problems and difficulties associated with being a part of a cohort.
Teacher candidates were surveyed, and analysis of the surveys was used to inform policy and practice; learning how the teacher candidates feel about being in a cohort, and the positives and negatives associated with the cohort model, were key in informing the EPP in decision-making going forward. The discussion of this study may be relevant for individuals from other EPPs who hope to strengthen their own cohort models and policies. The impact of this could be far-reaching for teacher preparation programs globally, as the field of education is ever-changing and EPPs must know how best to prepare candidates for the increasingly diverse landscape of education.

The results of this study may be instrumental in determining implications for program policy. The use of such qualitative evidence helps to inform decision-making and adjust practices with those currently being used.

**Research Objectives**

The main purpose of this study was to evaluate preservice teachers’ attitudes toward the effectiveness of the cohort model and to assess potential problems and difficulties associated with being a part of a cohort. Many education preparation providers utilize a cohort model. In the Middle Georgia State University Early Childhood Special Education program (Pre-kindergarten through fifth grade certification), the term “cohort” consists of a group of teacher candidates taking all education courses with one another during their last two years in the program. This is consistent with Dinsmore and Wenger’s definition of the cohort model, who characterize cohorts as “having four or more classes together in a given semester” (2006, p. 59).

The hope was that in learning about the candidates’ feelings toward the positive and negative attributes of the cohort model, the teacher education program can be strengthened, cohort models
can become more effective, and teacher candidates will be better supported as they go through their coursework and prepare to teach in their own classrooms.

**Methodology**

As the focus of this study concerns teacher candidates’ attitudes toward the effectiveness of cohort models used in teacher preparation programs, the principal investigator wanted to determine the candidates’ perspectives of the positive and negative attributes associated with being in a cohort while in the EPP. Therefore, it was vital to use surveys to ask the candidates for their opinions. The use of this qualitative method yielded important information that can help improve the structure of cohorts for future preservice teachers preparing for the field.

The survey was given to two cohorts of teacher candidates at the end of the spring semester of their junior year (April 2014). This timeframe was important, because at this time, the teacher candidates had been together as a cohort for two complete semesters (one full year in the program).

Prior to giving out the surveys, the principal investigator wrote identification numbers in the heading of each copy of the survey. In order to differentiate between the two cohorts and the contributors of the study, the investigator assigned numbers beginning with a “1” for “Cohort A” and a numbers beginning with a “2” for “Cohort B.” Participants were not identified by any other means on the surveys to preserve anonymity. Participation for this study was voluntary, and the participants had the right to decline responding to any question that they did not feel comfortable in answering. Participants were asked to participate in this research by filling out a survey regarding their thoughts and attitudes concerning the effectiveness and potential limitations of being in a cohort setting. Two questions were “open-ended” responses while the
other questions asked for “Likert scale” responses. For these questions, the participants circled the response that most closely resembled their experiences, feelings, and attitudes toward the subject.

The principal investigator then gave the same survey to the same candidates at the end of their senior year in the program (April 2015). The investigator wanted to see if any changes in attitudes and perceptions occurred within a year’s time of the first survey. Participation was once again voluntary. The same procedures for data collection were used. All surveys had an identification number; for the senior year, the investigator assigned numbers beginning with a “4” for “Cohort A” and a “5” for “Cohort B.” The surveys took approximately 10-15 minutes for volunteers to complete.

Once the investigator had information for both years of surveys, the process of looking at the data began. At this time, the investigator compared the answers given by cohort members to see if individual candidates had changed their opinion and perspective concerning the positive and negative attributes of being in a cohort. As well, the principal investigator looked for similarities and differences between the two cohorts.

**Overview of Results**

The responses from the candidates showed that overall, the cohort model being used is working for both cohorts. Although there was some change in attitudes on the Likert scale questions, the changes were rather minimal. Overall, the candidates answered the Likert questions quite positively.

However, there was a huge change in the results of the open-ended question. The participants were given the opportunity to answer these two questions after their junior year and senior year:
In your opinion, what are the greatest positive attributes of being in a cohort? In your opinion, what are the biggest negatives of being in a cohort? During the junior year, there were far more responses for the first question than the second question. When completing the survey during the senior year, the responses for the second question were much more detailed and showcased more negative thoughts and feelings toward others in the cohort and the cohort in general.

The seniors talked more about bullying in the cohorts; some even mentioned that there were cohort members who tried to sabotage potential job opportunities. The subject of cliques was discussed by both cohorts in both the junior and senior years, but the candidates talked even more about cliques and feelings of being left out in the senior year survey. As well, the seniors had more to say about faculty members and how they felt that future cohort members would benefit from better faculty support. This echoes the work of Dinsmore and Wenger (2006).

Teacher candidates were also very honest and forthright in stating that they were never “taught” how to work in a cohort; rather, they were “thrown together” and told to work together for two years. This information is pivotal; research shows that collaboration and teamwork are essential for positive cohort models (Koeppen, Huey, & Connor, 2000). In order for candidates to gain the optimal benefit of cohorts, a conscious effort must be made to teach pre-service teachers how best to work in communities.
Likert Scale Questions:

Being in a cohort is a rewarding experience.

Strongly Agree    Agree    Neutral    Disagree    Strongly Disagree

Being in a cohort helps prepare me for working with others in the field of education.

Strongly Agree    Agree    Neutral    Disagree    Strongly Disagree

Being a member of a cohort system allows me the opportunity to learn from others.

Strongly Agree    Agree    Neutral    Disagree    Strongly Disagree

I spend time with cohort members who are of varying ages, who have different life experiences, or/and who have different personalities than I do.

Strongly Agree    Agree    Neutral    Disagree    Strongly Disagree

I feel that all or most of my cohort members are supportive of me and want me to succeed in the program.

Strongly Agree    Agree    Neutral    Disagree    Strongly Disagree

Being in classes with the same individuals each semester gives me a feeling of security.

Strongly Agree    Agree    Neutral    Disagree    Strongly Disagree

“Bullying” is not, and has never been, a problem in my cohort.

Strongly Agree    Agree    Neutral    Disagree    Strongly Disagree

In my cohort, I rarely, if ever, see the forming of “cliques” that exclude others.

Strongly Agree    Agree    Neutral    Disagree    Strongly Disagree

I consider my colleagues in the cohort to be very caring and respectful of me and my feelings and ideas.
Strongly Agree  Agree  Neutral  Disagree  Strongly Disagree

I consider the cohort that I am in to be a very close-knit group.

Strongly Agree  Agree  Neutral  Disagree  Strongly Disagree

I believe that I will stay in touch with members of my cohort after graduation.

Strong Agree  Agree  Neutral  Disagree  Strongly Disagree

References

The overarching goal of this project was to involve teachers directly in sea turtle research, rehabilitation, and education through the Georgia Sea Turtle Center (GSTC) on Jekyll Island, Georgia. The project was conducted through the summer course, ESED 7090: Using the Georgia Sea Turtle to Build Teachers Understanding of Sea Turtle & Rehabilitation offered through Georgia Southern University. Twelve Georgia state teachers enrolled in this course were working on their Master of Education in Science Education.

The twelve teachers first participated in a full day pre-residency workshop on campus. The purpose was to introduce the participants to barrier island geology and ecology and to build the students’ background knowledge on sea turtle anatomy and nesting habits prior to their time on Jekyll Island. During the pre-residency workshop, the twelve teachers received content-specific texts to read and hand-outs on the five different types of sea turtles to increase comprehension that would be needed to complete the course. The twelve teachers were assigned a homework lesson that required them to build a power point or chart to illustrate the following facts for the five species of sea turtles: general characteristics, adaptations, habitats, common nesting range, endangered level, life cycle, and fun facts.

During their residency on Jekyll Island, the twelve teachers participated in activities designed to study sea turtles’ life cycle, anatomy, food chains, and threats to survival. Such duties included shadowing a rehabilitation technician to perform daily duties, such as feeding, cleaning the tanks, and assisting the staff during turtle releases back to the sea, and to monitor sea turtles with nighttime beach patrols that included protecting female turtles during the egg laying process. In addition, the twelve participants served as hosts at the Georgia Sea Turtle Center to talk to the
public, answer questions about sea turtles, lead beach walks on nightly turtle patrols, and provide power point lessons on sea turtles and the interconnectedness of ecosystems.

A follow-up learning activity took place on St.Catherine’s Island to engage the twelve participants in a concluding field-based experience. On this day, the twelve teachers participated in the care and treatment of sea turtle nests and hatchlings. The twelve teachers put into practice their field science skills that included observing, sketching, measuring, and recording each nest to predict the location of the egg chamber within the greater nest structure. Each nest was then documented, sketched and/or photographed, and monitored. When sea turtle nests were found that were not in located in safe areas, the clutch of eggs was moved under the guidance of two resident professors who are certified to perform this function.

Throughout the course, the twelve teachers were required to utilize the following literacy skills: observing, predicting, inferring, comparing & contrasting, communicating, classifying, collecting and organizing data, interpreting data, linking cause and effect, and formulating conclusions. Because the twelve participants were all classroom science teachers, it was important for them to understand that developing literacy through science concepts is essential for effective science teaching and learning. It supports clarity of thought, description, discussion, and argument. Students make meaning by writing, talking, and reading about science, especially when accompanied by direct investigation of scientific phenomena.

As a culminating activity, the twelve teachers met at Georgia Southern University at the beginning of the fall semester. The purpose was to share the instructional lessons they had created for their own classroom students that targeted scientific content on sea turtles and the nature of the scientific process.

6. Abstract and/or full paper

Abstract

In 2012, the Office of Student Academic Services (OSAS) began admitting freshmen students to the College of Education (COE) at the University of Hawai‘i at Mānoa for the first time. Previously, students were admitted in their junior year under stringent admission criteria, including a fairly high grade point average (GPA) standard. Generally COE students were academically strong from admission through graduation and GPA issues were not a major concern. However, with the admission of freshman students, OSAS noticed an increase in students who struggled to maintain minimum GPA requirements.

As a result, OSAS focused on expanding current retention and persistence efforts by developing a series of strategies aimed at assisting students placed on academic warning, probation, suspension, and dismissal. Via an assessment survey, OSAS engaged students in self-reflection to identify reasons why they experienced academic difficulty. Data collected by the retention assessment survey were analyzed to guide and inform OSAS advising practices that help and support academically at-risk students. New interventions now include: student notification letters every semester after grades are posted, mandatory advising appointments, student self-reflection assessment surveys, resource handouts, an academic progress contract, collection of retention and persistence data for reporting purposes, and annual reviews of program effectiveness for improvement.

6. Abstract and/or full paper

Abstract

The U.S. Census predicts that the Asian Americans and Pacific Islander (AAPI) population is increasing at a faster rate than any other racial group (Museus, Maramba, & Teranishi, 2013). However, historically, AAPIs are often invisible, which results from constant marginalization and, in many cases, entirely excluded on the basis of race within higher education research and policy (Museus, 2009b; Museus & Chang, 2009; Museus & Kiang, 2009; Museus et al., 2013; Osajima, 1995; Suzuki, 2002; Teranishi, Ceja, Antonio, Allen, & McDonough, 2004).

Often times, people from various geographical areas are grouped into the AAPI racial category, which creates numerous issues. As stated by Museus et al. (2013):

In constructing the AAPI racial category, forcing a wide range of ethnic groups into it, and attaching misleading overgeneralizations and misconceptions of its members as universally successful, dominant political and social forces have helped render the diversity and unique realities of communities and individuals within this population invisible. (p. 8)

One such issue is the mythical fallacy of the AAPI group being the “model minority,” which broadly assumes that AAPI students are academically successful, attend highly selective four-year institutions, and are scholastically strong in science, technology, engineering, and mathematics (Agbayani & Ching, 2012, p. xxvi). Data from the U.S. Census and the National Commission on AAPI Research in Education (CARE) challenges this misconstruction (CARE, 2008, 2010; U.S. Census Bureau, 2012), as it demonstrates that almost half of AAPI students attend community colleges, not Ivy League schools.

When the AAPI student population is disaggregated, there are great disparities among specific groups regarding the rates of college degree attainment in the U.S. (CARE 2008, 2010). On one hand, the number of Southeast Asian Americans, which includes Cambodian, Hmong, Lao, and Vietnamese people, earn a bachelor’s degree or higher at rates disproportionately lower (Cambodian, 9.2%; Lao, 7.7%; Hmong, 7.5%; and Vietnamese, 19.4%) than the national average of 25.9% (Maramba, 2011). On the other hand, there are other populations within the AAPI grouping that earn a bachelor’s degree, like Koreans at 35% and Filipinos at 40%, at significantly higher rates than the national average (U.S. Census Bureau, 2012). Despite the increasing number of AAPIs entering college, there are only a small number of studies pertaining to the experiences of these students (e.g. Buenavista, Jayakumar, & Misa-Escalante, 2009; Lee,
For this presentation, the co-presenters will discuss two recent studies utilizing quantitative and qualitative methods to learn more about the disparities among and within specific AAPI. The results of these studies informs higher education research, theory, policy, and practice. Generating more knowledge about AAPIs will help postsecondary administrators, faculty, staff, and advisors be better-prepared and able to support AAPI students. People who work with these students could use the results of this study to determine what strategies and approaches to employ when working with this population to help increase academic success. With the AAPI population being the fastest growing racial group in America, the results of these studies are important to postsecondary institutions to help ensure the academic success of AAPI students.

As a result of this presentation, participants will be able to:
1) Define the AAPI population
2) Understand the model minority myth and its related issues
3) Comprehend two studies that address the model minority myth
4) Discuss the ways in which higher education institutions can further understand and support AAPI students

The presentation outline is as follows:

1) First, a brief literature review defining the AAPI population and the model minority myth will be provided.
2) The issues related to the model minority myth will be discussed.
3) A quantitative study focusing on the status of Filipino students in Hawaii public higher education will be described.
4) Next, a qualitative study examining the academic motivation of AAPI students will be presented.
5) Then, participants and co-presenters will discuss specific recommendations and strategies to better support AAPI students in higher education based on the findings of the studies.
6) Small group activities along with debriefing will be interspersed throughout the session.
7) The presentation will close with a question and answer session.
The Impact that the Environment and Materials have on a Child’s Health
and Overall Development

Introduction

The early years are a critical period for all aspects of a young child’s development and set a foundation for future growth (Fernald, Gertler, & Neufeld, 2008). Thus, young children need a world that is safe to explore, one where they are encouraged to venture and discover. The experiences young children have with their environment impact their development in a multitude of ways (Berris & Miller, 2011). This article explores ways to optimize the environment that surrounds the young child. Variations in the quality of the environment provided to young children can facilitate or harm development. We will discuss the various materials that are commonly found in the young child’s environment. Research findings that delineate the impact that many of these materials have on a child’s health, the environment and overall development will be reviewed. We will address the following questions 1) What materials should be avoided? And 2) What is the selection criteria?

Environment

The quality of a young child’s environment has been correlated with child IQ at 3-4 years of age (Blair, Gamson, Thorne, & Baker, 2005). The deleterious effects of inadequate environments on development have been well established (Evans, 2006). An environment that does not provide developmentally appropriate materials for young children to explore (Santos et al., 2008) may result in physical and intellectual delays. While an ideal and effective caregiving environment should provide opportunities for learning (Curtis & Carter, 2014), it is essential that a young child’s environment, which includes the materials in it, provides for the child’s overall
health. The health of the young child lays the biological foundation so that learning and development can take place.

The age and developmental stages of the children sharing the environment. When two or more infants who bang and throw toys are present, soft toys (e.g., soft blocks or balls) are less likely to result in injury than solid toys (e.g., wooden blocks and hammers). That is not to say that infant should not be provided the opportunity to utilize hard or heavy object but in those instances close direction and supervision would be recommended. In the circumstances where there is a mixed-age environment, caregivers need to consider how to provide for the needs of all the age groups in a safe manner. Providing a separate semi-enclosed area (could be defined by shelves) creates a natural boundary for non-mobile infants from older toddlers that need space to be more active.

Materials

Toys and play materials are a salient part of the young child’s environment. The availability, variety, and number of play materials accessible to an infant has been correlated with IQ at 3-8 years of age (Blair et al., 2005). They provide opportunities for young children to develop skills, learn and interact with others (Wachs, 1987). For example, a manipulative helps children develop their fine motor skills, build on their understanding about spatial relationships or encourage collaborative work with a peer.

The main consideration in selecting play materials and setting up a young child’s environment should be safety. Caregivers should be cautious of materials that have sharp edges, may chip or splinter (toys should be made of durable and resilient materials), have small holes (leading to entrapment of fingers), have easily removable parts (choking hazard), or toxins (Langley, 1985). Many products found in young children’s environments, including toys,
household item, and feeding materials, are made from plastics, which may be particularly harmful to young children (Wargo et al., 2006). Two harmful chemicals found in plastics are bisphenol A (BPA) and the phthalate DEHP. Both compounds cross the blood-brain barrier, which may negatively affect brain formation—particularly in infants’ developing brains and other organs. Phthalates are chemical compounds used in poly-vinyl chloride, PVC found in vinyl flooring, shampoo, air fresheners, soft plastic items, food packaging and wraps, textiles, paints, cleaning products and detergents. The effects of phthalates on newborns, infants and toddlers have been extensively researched. Multiple studies examined associations between phthalate exposure and physiological, cognitive and behavioral development of subjects.

To limit exposure to these toxins, caregivers can select BPA-free plastics and alternatives, such as materials made from bamboo, stainless steel, wood or cloth. However, for younger infants whose primary mode of material exploration is through mouthing, it is important for adults to select materials that can be easily cleaned. In addition to preventing additional exposure to these harmful toxins, young children can learn a lot by exploring natural materials (Curtis & Carter, 2014). Bark and shells provide wonderful textures for young children to explore, while instilling a connection with nature. It is important, however, to be always mindful of choking hazards for younger infants whose primary mode of material exploration is through mouthing. Also, caregivers may wish to consider the durability of natural materials. Thicker, larger shells are more suitable than small, delicate ones. Conversely, not all manufactured materials are poor choices. Plastics tend to be easier to clean and disinfect than natural materials, and for materials in large volumes, such as Duplos, this may be crucial for appropriate sanitation. Choose fabric items such as cloth teethers or cloth dolls for toys that are frequently mouthed so that they can be laundered.
Another commonly found toxin that young children are often exposed to are chemical flame-retardants, Polybrominated diphenyl ethers (PBDE) which are used in a variety of products to prevent the spread and occurrence of fire. They are found in carpeting, pajamas, crib bedding, wallpaper, toys, cell phones and other electronic devices. PBDEs are extremely toxic, do not break down, and build up over time in our bodies as well as the environment. PBDEs have been found to negatively impact attention, learning, memory and behavior in animals. The have also been found to be harmful to the brain, reproductive system, liver and thyroid. To avoid PBDES, caregivers should use alternative natural flame retardant materials like wool.

**Conclusion**

The focus of this paper has been the assessment and selection of the environment and materials in a young child’s environment. The arrangement of the caregiving environment provides the foundation upon which the well-being and development of the child depends on. The materials in the environment can promote developmental growth in a young child or have deleterious health and safety effects on a child. This article provides the research so that caregivers can make informed decisions when designing a young child’s environment and selecting materials for a young child.

The Goals of this Report

The Bachelor of Integrative Studies (BIS) program on the Miami Regional Campuses was developed in 2008 and, with 350+ enrolled students per semester, is currently one of the largest academic majors in the College of Professional Studies and Applied Sciences (CSPAS). The BIS program has many possible foci, and students can even design their own degrees in order to enter the work force in myriad career tracks. In this report we will review the BIS program and determine how it is preparing students to interact in an increasingly globalized world. We are specifically looking to see if, over time, the BIS program’s influences students’ Intercultural Competence (ICC) development. To assess students’ perceived intercultural knowledge, attitudes, and skill, we will utilize BIS students’ scores on the six primary scales of the Global Perspectives Inventory (GPI; Braskamp, Braskamp, Merrill, & Engberg, 2012): Knowing and Knowledge (Cognitive), Identity and Affect (Intrapersonal), Social Interactions and Social Responsibility (Interpersonal), as well as the supplementary scale, Experiences (Curriculum, Co-Curriculum, and Community). The BIS faculty and Miami administrators can use this report to see the strengths of the program and to identify gaps in its influence on student development. We will also provide literature reviews of best practices for increasing ICC, with particular emphasis on strategies that can benefit a more non-traditional population (National Center for Education Statistics, n.d.) such as ours.

The BIS Program and the Importance of Service-Learning

The Bachelors of Integrative Studies (BIS) degree is a 4-year degree offered at Miami University Regional campuses (Middletown, Hamilton, and the Voice of American Learning Center). In the BIS program students are able to select from a variety of concentrations or design their own Bachelor’s degree to fit better their personal and professional needs. Students pick two concentrations upon which to focus their degree and are required to take three BIS core courses to synthesize their course work. Students can chose from 14 concentrations, including:

1. Applied Kinesiology
2. Applied Sociology
3. Child Development
4. Contemporary American Experience
5. Cross Cultural Leadership
6. Environmental Studies
7. Family, Gender & Society
8. Geographic Information Science
9. Health Care Administration
10. Information Technology Strategy for Organizations
11. Organizational Leadership
12. Personal and Community Health Perspectives
In addition to their two concentrations, BIS students are required to take three core seminar courses. BIS 201 is the introductory course where students learn important concepts of the BIS program as well as develop their educational goals and plan for their degree. BIS 201 has a focus on the “self.” In BIS 301 there is a focus on “others.” Students participate in a Service-Learning project and are paired up with a local business or organization. In their senior capstone, BIS 401, students have to create a “product” that demonstrates what they learned from the program.

Required Service-Learning is one of the unique highlights of the BIS program. Much more than volunteerism, Service-Learning involves students meeting an identified community need while applying what they are learning in credit-bearing classes and then reflecting on their experiences in order to deepen their knowledge about, attitudes toward, and skill when working with others (Bringle & Hatcher, 1996). Designed to be mutually beneficial for both the students and the community, this type of experiential learning (Kolb, 1984) has myriad benefits for students, including reduced apprehension toward out-group members, increased awareness of stereotypes and biases, increased social responsibility and civic engagement, greater cultural and self-awareness, and improved academic performance (e.g., Bringle & Hatcher, 2002; Dolynui, 2002; Eyler, Giles & Braxton, 1997; Feen-Calligan, 2008; Kretchmar, 2001; McKenna & Rizzo, 1999; Miller & Yen, 2005; Peterson, 2009; Reeb, Sammon & Ibersom, 1999; Reed, Jernstedt, Hawley, Rebe, & DuBois, 2005).

A 2015 post-graduation follow-up project report of the CPSAS Bachelor’s Degree recipients for the year 2013-2014 indicates that BIS students have a 93% placement rate in jobs or graduate school within six months of graduation. The department graduates a higher percentage of enrolled students than any other CPSAS department.

**BIS Core Competencies**

The BIS program is built around six core competencies that are used to frame each course in the major and to assess student development upon graduation (Integrative Studies Core Seminar/Degree Competencies, 2015; please see Appendix A for assessment rubric). The BIS program expects and prepares students to be:

1. **Reflective Thinkers** – Reflects on own learning, values, beliefs, and experiences to articulate why they think what they think and consider other ways of making meaning.
2. **Critical/Creative Thinkers** – Identifies and explores ideas and perspectives in diverse contexts. Designs and responds to relevant questions and approaches.
3. **Self-Directed Problem Solvers** – Identifies components of a given problem and possible responses in a structured framework and enacts a problem-solving strategy.
4. **Communicators** – Communicates a concept or position orally or in writing, demonstrating awareness of audience and purpose.
5. **Collaborators** – Employs active listening and articulates appreciation of diverse contributions of self and others in groups or partnerships. Takes on roles and responsibilities as instructed.

6. **Integrators** – Connects ideas, texts, experience and learning across two or more contexts in personally relevant ways.

While the BIS program does not specifically target ICC development in its students, its focus on experiential learning (Kolb, 1984), including the Service-Learning requirement, is extremely relevant and synchronous with many ICC constructs, as explained below.

### Intercultural Competence (ICC)

ICC definitions vary among different institutions, but most scholars in the field agree that ICC can be defined by the attitudes, knowledge, and skills necessary for individuals to have an understanding of others and themselves from a cultural context in a way that leads to effective and appropriate behavior during intercultural interactions (AAC&U, n.d.; Deardorff, 2006). One method that many if not most schools rely on to boost intercultural skills is study abroad programs. Many times, depending on the structure of the program, these programs have been effective in increasing ICC (Salisbury, 2011). However, on-campus programs can also be beneficial (Anderson & Lawton, 2011). Although study abroad programs are growing and are indeed be a learning opportunity for many students, other students are unable and/or unwilling to dedicate the money and time required to learn abroad, even in short-term programs, which is especially true for more non-traditional students. What becomes challenging for institutions is to provide resources and opportunities for intercultural growth for both traditional and non-traditional students at home and abroad. Soria and Troisi (2014) encourage institutions to offer at home solutions that will encourage all students to participate in events and activities that will increase overall ICC.

### ICC and Non-Traditional Students

Developing intercultural skills, attitudes, and knowledge is important for all students—whether they are more traditional or more non-traditional. All students should be provided with the opportunities and resources that are needed to foster ICC in order for programs to graduate students who are global citizens. The BIS program is a regionally based degree, meaning that many students in the program are non-traditional at some level (Horn & Carroll, 1996; National Center for Education Statistics, n.d.). For example, our sample of students tends to be older, have a lower family income, and have more work and family commitments than do more traditional students. As these students are preparing for the workforce, they will greatly benefit from having a global perspective and the ability to work well with culturally different others, even if they never leave the United States.

Literature reviews reveal the challenges of internationalizing both community and two-year colleges. Small campuses, limited funding, lack of interest, and poor administrative support can often be barriers to providing an environment rich in opportunities for ICC growth (Green, 2007). Community or two-year colleges may find it difficult to get both students and faculty to
be interested in learning about other cultures and developing intercultural skills. This overall deficiency of interest can result in reduced funds and resources that are allocated to internationalize the campus. Even if a school is interested in fostering a global and culturally welcome environment, they may not have the financial means. Despite these challenges, different ways exist for schools to be local but push students to think and act global (which we will describe later in the best practices review).

**Miami Global 2020 Goals**

The Miami Global 2020 plan is a set of global goals of the university, with the ambition of “promot[ing] a vibrant learning and discovery environment that produces extraordinary student and scholarly outcomes” (Miami University 2020 Plan, 2013). To accomplish this unifying goal of overall excellence, there are three foundational goals—Foundation Goal 1: Transformational Work Environment, Foundational Goal 2: Inclusive Culture and Global Engagement, and Foundation Goal 3: Effective Partnerships and Outreach. These goals have measurable matrixes of institutional outcomes to be fulfilled by the year 2020.

Specifically relevant to this report and initiative is **Foundation Goal 2: Inclusive Culture and Global Engagement**. Our report focuses on Foundation Goal 2 because we are assessing the BIS program’s effectiveness for increasing students’ ICC. We will address whether or not the BIS program helps students develop the needed skills to interact with others from different cultures. If the BIS program is effectively increasing ICC, then the program will be meeting both components of the foundation goal. In some sense, we are determining if this Regional degree is offering students similar (or perhaps enhanced) resources and opportunities as those offered by the main campus (Oxford). This contributes to an inclusive culture throughout the university because students from diverse backgrounds will have the same chances for success in the work force. Being able to communicate and work well with people from different cultures is a vital component of professional success (Lloyd & Härtel, 2010; Stone, 2006). We are also assessing whether the BIS program helps students over time develop and mature in their ICC to have better understanding of the world and other viewpoints.

Students in the BIS program can take courses and tailor student projects that have a global/cultural focus, and they can take a BIS 201 course that has a global theme. They can also partner with an organization in their BIS 301 program that offers interactions with diverse others. In BIS 401, students can create any product of their choice. As a result, students in the past have sometimes created culture-focused projects or worked with diverse people groups as part of their projects. The Service-Learning projects and self-designed projects put learning into the students’ hands. The 301 and 401 courses also meet the requirements of the Miami 2020 Foundation Goal 3: Effective Partnerships and Outreach. These opportunities foster student growth as well as benefiting the communities that they affect.

**Regional Campus & BIS Programmatic Responses to 2020**

The Miami Regional campuses, which fall under the College of Professional Studies and Applied Sciences (CPSAS), have drafted their own metrics in response to the objectives in accordance of
The Miami Global 2020 plan (CSPAS Goals, Objectives and Metrics, n.d.). The BIS program has additionally articulated strategies toward achieving these metrics, as well as the opportunities and challenges in doing so (2020 Metrics Integrative Studies, 2014; please see Appendix B). This section will highlight objectives that are most relevant to this project.

In response to the Miami 2020 unifying goal, the regionals have included goals of higher graduation rates, increased employment rates after graduation, increased opportunities for student creativity and research, higher levels of students who intern before graduating, more student co-curricular involvement, and more degrees and pathways for success at the campuses. The BIS program bachelor’s degree, started in 2008, offers students a flexible program that can fit their career goals best. This should increase graduation rates, offer students better opportunities in finding employment, demonstrate student creativity and research, and encourage involvement in more co-curricular activities.

**Foundation Goal 2: Promote a diverse culture of inclusion, integrity, and collaboration that deepens understanding and embraces intercultural and global experiences.** Of specific relevance to this report, the Regionals are dedicated to the objectives of 1) increasing diversity on the campus in both staff and students, 2) fostering a warm and inviting environment for all members, 3) increasing the amount of students who study abroad and participate in curricular and co-curricular cultural learning experiences, and 4) broadening Miami Regionals overall global involvement. While over 50% of Miami students tend to study abroad, regional campus estimates of students studying abroad are less than 5% (hence, the Regionals’ goal for Metric 20 of increasing students studying abroad or away to 5%; CPSAS, n.d.). However, ICC must then be achieved in more “local” options. In the current sample, only 2% of students had studied abroad or away, and only 15% of students indicated that they intended to study off campus. Therefore, local strategies that address Metric 21, *All Miami students will have a curricular or co-curricular cultural learning experience (e.g., intensive community engagement, service-learning experience, intercultural or global learning requirement) by the time they graduate*, become all the more important as a way for Regional students to develop further ICC.

**Foundation Goal 3: Cultivate mutually beneficial partnerships and applied and service-oriented projects that strengthen our local, state, national, and world communities.** The objectives in Foundation Goal 3 outline the regional campuses’ commitment to developing partnerships that strengthen both the local and global communities. To achieve these goals, the campuses strives to 1) partnering with more private and public institutions, 2) offering life-learning services and support from alumni and parents, 3) increase research and internship partnerships, 4) and supporting the community by providing the expert services from the university. BIS students have the opportunity to partner and work with organizations to foster both student growth and aid for the community.
Introducing the Global Perspectives Inventory (GPI)

We chose the AAC&U *Intercultural Knowledge and Competence VALUE Rubric* (n.d.) as our guide for ICC goals for the BIS program. From this we found alignment with the Global Perspectives Inventory (GPI) tool to serve as our method to assess ICC (see [http://gpi.central.edu](http://gpi.central.edu)).

Developed by Larry Braskamp, David Braskamp, Kelly Carter Merrill, and Mark Engberg (2012), the Global Perspectives Inventory measures global perspective under the theory that all students, faculty, and staff are on a life journey in which they continuously ask three key questions:

- **Who am I?** Reflects the Intrapersonal dimensions. This area of development focuses on becoming aware of and integrating personal values and self-identity.
- **How do I relate to others?** Reflects the Interpersonal dimension centered on willingness to interact with others with different cultural backgrounds and social norms, acceptance of others, and being comfortable relating to others.
- **How do I know?** Reflects the Cognitive dimension and is centered on our knowledge and understanding of what is true and important to know, including knowing with greater complexity and not relying on external authorities to have absolute truth.

The GPI measures the three dimensions of global learning and development, each of which can be broken down into two subscales. The three dimensions align with the Knowledge, Skills, and Attitudes components found in the AAC&U *Intercultural Knowledge and Competence VALUE Rubric* (n.d.).

These skills and attitudes can be broken down into six core scales of the GPI, with one supplementary scale that addresses campus-community belongingness. Cronbach’s coefficient alphas (α), a measure of internal consistency, for the current sample are reported below. (NOTE: Some scholars suggest α > .70 is ideal for measures used in research, e.g., Cho, 2015)

**KNOWING:** Complexity in understanding cultural contexts (α = .65)

**KNOWLEDGE:** Degree of cultural understanding (α = .65)

**IDENTITY:** Awareness and acceptance of ethnicity, race, and gender (α = .72)

**AFFECT:** Respect for and acceptance of cultural differences (α = .71)

**SOCIAL INTERACTIONS:** Degree of engagement with cultural different others (α = .74)

**SOCIAL RESPONSIBILITY:** Level of interdependence and social concern for others (α = .65)

**COMMUNITY:** Degree of connection and belongingness to one’s university (α = .84)
Results

Demographic Information
There are currently over 320 students enrolled and involved in the BIS program. This report summarizes data from a sample of 321 students in the BIS 201, 301 and 401 courses who were assessed from fall 2013 to spring 2015, suggesting we captured a strong percentage of the BIS majors (the exact number will fluctuate from semester to semester) and therefore have a fairly representative sample. A sub-sample of students (n = 52) took the survey at least twice, and we were able to match their responses. For raw data, please see Appendix C.

The sample was largely female, including 207 women (65%) and 111 men (35%), with 3 students (<1%) not reporting gender. The average age was 26.9 years (Males = 25.8, Females = 27.3), which is noticeably older than more traditional college student samples. By ethnicity the group included: 280 Caucasian Americans (87%), 12 students of multiple ethnicities (4%), 15 African Americans (5%), 3 Asian (1%), 2 Hispanic/Latino(a) (1%), and 6 people (2%) who did not report ethnicity. The majority of students were lower- to middle class, with an average household income of $71,942.75 (median = $50,000, range $4,000 to $750,000). In terms of mothers’ and fathers’ education level, the most common response for both mothers and fathers was high school graduate (32%). Mothers’ highest level of education were <1% elementary school, 6% some high school, 15% some college, 17% Associate’s degree, 17% Bachelor’s degree, and 11% Doctorate degree. Fathers’ highest level of education were 2% elementary school, 6% some high school, 19% some college, 12% Associate’s degree, 19% Bachelor’s degree, 6% Master’s degree, <1% professional degree, and 3% Doctorate degree.

Geographically, only 25 (8%) of students grew up primarily in an urban area, while 138 (43%) grew up in suburbs, 103 (32%) grew up in small or mid-sized towns, and 47 (15%) grew up in rural areas. Most students (n = 311 or 98%) had not studied abroad, only a small group (n = 23 or 7%) had lived abroad, and roughly 1/3 of them (n = 112 or 35%) had previously traveled abroad, suggesting relatively little international experience for this sample as a whole. Altogether, about 2/3 of them (n = 206 or 65%) had no experience in a foreign country, and the vast majority (n = 274 or 85%) said they do not intend to study abroad. Thus, if global perspectives are what the BIS program and Regional campuses want for their students, the onus is on Miami to either find ways to encourage and support students in seeing study abroad as a feasible option, or we need to develop more effective ways for students to achieve global learning experiences locally.

ICC: The GPI & Personal Background Factors
Before we began more targeted analyses, we explored potential impacts of personal and cultural factors on GPI subscales.

• Gender. Many differences in the GPI factors could be found between males and females. Females made up 65% of the sample (n = 214), and 35% were male (n = 113). Men reported having higher Knowledge, t(265.17) = 5.21, p < .00, Identity, t(316) = 2.77, p < .01, and Social
Interactions with individuals outside of their cultural group, $t(316) = 2.23, p = .03$, than women. Women reported having higher Social Responsibility, $t(316) = -3.59, p < .00$, and greater Community Belonging, $t(316) = -2.88, p < .01$, than men.

- According to Braskamp and Engberg (2011), females report having higher scores in the GPI factors of Social Responsibility, Knowing, Social Interaction, and Affect than males in national norms. Males reported higher scores in Knowledge than females. Males and females did not significantly differ in the GPI factor of Identity.
- In comparison with national gendered norms of the GPI using one-sample $t$-tests (Braskamp, Braskamp, & Engberg, 2014), females in our sample reported significantly lower scores in the GPI subscales of Knowing, $t(206) = -3.93, p < .00$, Affect, $t(206) = -2.04, p = .04$, Social Interaction, $t(206) = -4.32, p < .00$. Male students in our sample reported higher scores of Knowledge, $t(110) = 2.91, p < .01$, Identity, $t(110) = 3.56, p < .01$, and Affect, $t(110) = 2.95, p < .01$, than the national norms.
- While we did not collect data on military history of the participants, we suspect that veteran status is more likely in males on our Regional campuses than in traditional undergraduates, which may be influencing their GPI scores more than it does for women, and we speculate that this might explain why our pattern of gender differences differs from the national norms. Regardless of the source of the gender differences, which is outside the scope of the current report, the impacts were great enough that we controlled for gender in our primary analyses described below.

- **Ethnicity.** We could not realistically compare students across various ethnic groups given that the sample was 87% White (which is fairly representative of our campus). However, there were generally no significant differences when we compared White to non-White students except, as might be expected, that minority students were more likely to have social interactions with individuals outside their ethnic group, $t(328) = -3.86, p = .00$.

- **Socioeconomic Status Variables.** There was only one significant correlation between family income and the GPI factor of Knowing, $r(260) = -.23, p = .00$. Students who had a higher annual family income reported less complex thinking in cultural contexts. A small positive correlation, $p(318) = .11, p = .05$ existed between the GPI factor of Knowledge and students’ mothers’ years of education, when mothers had more years of higher education, students reported higher levels of cultural knowledge. There were also two small negative correlations between the GPI factors of Social Responsibility with students’ fathers’ years of education, $p(315) = -.13, p = .02$, and Community with students’ fathers’ years of education, $p(315) = -.14, p = .01$. When fathers had more years of education, students reported having lower levels of social responsibility and belongingness with community.

- **International Experience.** We used a 2 (traveled abroad vs. not) x 7 (GPI factors) MANCOVA (multiple analysis of covariance), controlling for gender, to see if there were any differences between students who have traveled abroad ($n = 112$) than students who had not been out of the USA ($n = 206$), with follow-up separate ANCOVAs for each GPI factor when
differences across factors were observed. The omnibus $F$ was significant, $F(7, 306) = 523.69, p < .001$. There was also significant main effect of having traveled abroad before with the GPI factors of Knowing, $F(1, 312) = 19.13, p < .00$, Affect, $F(1, 312) = 7.98, p < .00$, and Social Interactions, $F(1, 312) = 17.04, p < .00$. These results suggest that students who had traveled outside of the country previously reported more complex thinking, had a better respect and acceptance for other cultures, and had also interacted with others outside of their cultural group more often.

- **Study Abroad: Historical or Prospective.** We combined students who have intention to study abroad as an undergraduate ($n = 37$), with students who have studied abroad ($n = 7$) and compared them with students that have no intent to study abroad ($n = 274$). Utilizing 2 (abroad vs. not) $\times$ 7 (GPI factors) MANCOVA (multiple analysis of covariance), controlling for gender, the omnibus $F$ was significant, $F(7, 309) = 503.17, p < .001$. There was a significant main effect of intent to study abroad on Knowledge, $F(1, 315) = 4.55, p = .03$. Students who had an intention to study abroad or who had studied abroad reported that they had more cultural knowledge than students who had no intent to study abroad. There was also a significant main effect of intent to study abroad on Social Interaction, $F(1, 315) = 13.73, p = .00$, as well as Social Responsibility, $F(1, 315) = 5.52, p = .02$. Taken together, students who had studied abroad in the past or had an intention to study abroad reported higher levels of interaction with others outside of their cultural group and felt a greater level of concern for others than those who were not planning to go abroad.

GPI “OVER TIME” – MEASURED BY CLASS YEAR, BIS CLASS, AND AGE

- **Year in School.** Selecting out the few first year ($n = 6$) and sophomores ($n = 23$) in the data set because of small sample size, we compared junior ($n = 143$) and senior students ($n = 144$) on GPI scores. Utilizing 2 (year in school) $\times$ 7 (GPI factors) MANCOVA (multiple analysis of covariance), controlling for gender, the omnibus $F$ was significant, $F(7, 278) = 493.07, p < .001$. There was a significant main effect of class year on Identity, $F(1, 284) = 5.45, p = .02$: Senior students reported more solid identities than junior students. Another significant main effect, $F(1, 284) = 8.20, p < .01$, indicated that senior students also reported a higher Social Responsibility than did junior students.

- **BIS CLASS.** (201, 301, 401) BIS students were sorted into before Service-Learning ($n = 259$) and after Service-Learning ($n = 59$) based on whether they had completed Service-Learning in BIS 301 at the time of data collection. Utilizing 2 (Before SL vs. After SL) $\times$ 7 (GPI factors) MANCOVA (multiple analysis of covariance), controlling for gender, the omnibus $F$ was significant, $F(7, 309) = 509.89, p < .001$. There was a significant main effect of Service-Learning on GPI factors of Knowledge, $F(1, 315) = 5.94, p = .02$, Identity, $F(1, 315) = 4.58, p = .03$, and Social Responsibility, $F(1, 315) = 5.03, p = .03$. Students who had completed the Service-Learning during their 301 semester reported having higher levels of cultural knowledge, had a greater developed sense of self, and felt a greater concern and responsibility for the well-being of others than students who had not yet completed this programmatic requirement.
• **Age.** Because “non-traditional” most often refers to older students, in this sample age was split between students age 23 and below (younger) \( n = 152 \), and students 24 and older (older group) \( n = 162 \). Older students were more likely to report higher scores in Knowing, \( t(325) = -2.65, p = .01 \), Affect, \( t(325) = -3.15, p = .00 \), and Social Interactions, \( t(325) = -3.26, p = .00 \), than younger students. There was also a significant linear relationship between age and Knowing \( r(316) = .14, p = .01 \) and Knowledge, \( r(316) = -.22, p = .00 \), indicating that students who are older (as opposed to younger) reported greater complexity in thinking in regards to cultural contexts, but alternatively reported less cultural knowledge.

• **Paired Samples Analyses.** We ran a 7 (GPI factors) x 2 (time: Time 1 or Time 2) repeated measures MANCOVA, controlling for gender, with a sub-sample of 51 students who had filled out the GPI at least two times (e.g., at the beginning and end of semester, or in BIS 201 and 401, etc.). If students had filled out the GPI three times, we selected their two sets of GPI scores with the most time in between for analyses. There was a significant main effect for GPI score, \( F(6,44) = 3.78, p = .004 \), but not for time, \( F(1,49) = 0.59, p > .05 \), yet there was also a 3-way interaction between GPI factors, time, and gender, \( F(6,44) = 3.36, p = .008 \). In essence we did see differences in GPI factors from the first to second self-report, and we did see impacts of gender on GPI factors, but the influences were not always the same. Therefore, we ran a series of one-way repeated measures ANCOVAs, controlling for gender and looking for differences in GPI factors from Time 1 to Time 2. Only the Social Responsibility factor showed significant effects, with a significant interaction between time and gender, \( F(1,49) = 6.90, p = .01 \). Men significantly gained in social responsibility from Time 1 to Time 2, while women scores remained the same. Therefore the BIS program may be influencing men’s sense of social responsibility more than women’s (remembering that women’s were higher to begin with). Please see Figure 1 below.
GPI Outcomes by BIS Concentration (Culture Focused vs. Not)

The BIS program allows students to pick two concentrations to focus on in their major. From the descriptions of the BIS concentrations, both authors concurred to label the concentrations as culturally focused or not. In using this strategy, we recognize that we may have had some bias in selecting which courses we “counted” as culturally focused. The concentrations were broken down as such:

1. **Culturally focused**: Applied Sociology, Contemporary American Experience, Cross Cultural Leadership, Family, Gender & Society, Personal and Community Health Perspectives, Understanding Media and Visual Culture and Self-Designed Concentrations that were culturally relevant (i.e., included culture in their title).
2. **Not culturally focused**: Applied Kinesiology, Child Development, Environmental Studies, Geographic Information Science, Health Care Administration, Information Technology Strategy for Organizations, Organizational Leadership and Self-Designed Concentrations that had no cultural aspects.

We ran a 2 (time: before or after Service-Learning) x 2 (culture: culture-focus or no culture focus) MANOVA, $F(7, 275) = 302.73, p < .001, \eta^2_p=.89$. In the GPI factor of Knowing there was a significant main effect for culture, $F(1, 275) = 6.77, p =.01, \eta^2_p=.02$. There were no significant effects for Affect, Social Interaction, and Community. Students who had a culture-focused concentration reported more complex knowing than students without, whether they were assessed before or after their Service-Learning in BIS 301. There was a significant main effect of
time for Knowledge, \( F(1, 275) = 4.51, p = .03, \eta^2_p = .02 \), for Identity, \( F(1, 275) = 4.65, p = .03, \eta^2_p = .02 \), such that students reported stronger senses of identity and more knowledge after Service-Learning than before, regardless of whether they had culture-focused concentration. For Social Responsibility there was a significant main effect for time, \( F(1, 275) = 4.81, p = .03, \eta^2_p = .02 \), a significant main effect for culture, \( F(1, 275) = 5.75, p = .02, \eta^2_p = .02 \), as well as a significant interaction, \( F(1, 275) = 6.40, p = .01, \eta^2_p = .02 \). In other words, while both groups saw increases in Social Responsibility from before Service-Learning to after, and the culture-focused group always reported higher Social Responsibility than the group not focused on culture, the impact of Service-Learning was even more pronounced in the “no culture focus” group. See Figure 2.

**Figure 2. Global Perspectives Inventory (GPI) Scores Before and After Service-Learning (S-L) by BIS (Bachelor of Integrated Studies) Concentration Focus**

GPI Outcomes, Co-Curricular, and Extra-Curricular Activities

A large number of significant correlations existed between GPI subscales and students’ co-curricular and extracurricular activities that had a global or cultural element (please contact authors if interested in the complete correlation matrix). The most significant factors are included in Table 1.

Notes. Spearman correlations ($\rho$) were conducted. Students in all courses of BIS. n > 307. KNOW = Knowing, KNWL = Knowledge, IDEN = Identity, AFCT = Affect, INT = Social Interaction, RESP = Social Responsibility, COM= Community. *p < .07. **p < .01.

This correlation matrix demonstrates that there are many co-curricular and extra-curricular activities in which students can participate that positively relate to ICC. These relationships are important to address because college, as a holistic experience, offers students a multitude of...
opportunities to increase ICC. Knowledge of these effective activities can also be beneficial for the BIS program because it can be a helpful framework for instructors who might wish to incorporate best practices when developing their courses.

**Best Practices in ICC: What Works with College Students?**

In this section we review the literature on best practices for increasing campus internationalization and student ICC for both traditional and non-traditional students. Studying abroad is a traditional method that universities will use to increase student ICC. Again, because 85% percent of the Miami regional students sampled reported that they do not intend to study abroad, it is important for Miami’s regional campuses to discover additional other methods that universities utilize effectively to increase ICC.

First, as demonstrated by our data and other studies Service-Learning programs can have an effect on students’ ICC, including their ability to advocate for marginalized social groups (e.g., Bringle & Hatcher, 1999; Etheridge, 2006; Marchel, 2004; Wickline, 2012). Our data suggests that the impacts on cognitive, affective, and behavioral aspects of ICC can happen even when each Service-Learning placement does not directly focus on cultural diversity. Rather, through the variety of experiences that students have out in the community, where they are encountering others from different walks of life, social classes, and ethnic groups, they are gathering experiences that are challenging them to increase their global perspectives.

Second, Choi et al. (2014) suggests that universities can internationalize their campus as well as increase students’ ICC by having a group of international students study at their school. Currently many opportunities exist for regional students to work and get to know international students. The English Language Center (ELC) has been growing rapidly since its creation in 2008, such that there are now several hundred international students on Miami’s Middletown campuses. Host students can learn about the international students’ home cultures, as well as increasing many important ICC skills—such as communication skills during intercultural interactions, attitudes and openness toward international students, and knowing more about their own and other cultures (Wickline, 2012). From our analyses, it appears that BIS program does contribute to growth in many ICC domains, but social interactions with and empathy for culturally different others appear to be gaps in student growth that are not currently addressed through BIS classes. Perhaps the BIS program can utilize and partner up with the ELC to better prepare students to interact with culturally different others.

Third, courses with a global or international focus also can improve ICC skills (Soria & Troisi, 2014). Students who are a part of the BIS program are required to take the Global Miami Plan as a part of their Bachelor of Arts degree, which requires classes that focus on global issues and perspectives. From students’ self-reports in our data (see correlation matrix), taking more of these classes appears to be helping students in all ICC scales. What is unclear from our largely cross-sectional data review is whether it is the BIS core courses (201, 301, 401) and/or their Miami plan courses that are contributing more to ICC development. Alternatively, perhaps there is also a selection bias in play, whereby students who are already more developed in ICC are drawn to culturally-focused concentrations.
Fourth, another effective method of increasing student ICC is by providing students with many opportunities to attend cultural events (Anderson & Lawton, 2011). The Miami regional campuses have global/intercultural courses that allow students to participate and practice ICC skills, and they host diversity-focused extra-curricular and co-curricular events that are open to all students. Students in the BIS program may choose to host a multicultural event as their capstone project, increasing both their own ICC as well as overall internationalization of Miami University. Additionally, the BIS program could encourage or require their students to attend a certain number of diversity-focused events each semester.

**Authors’ Summary & Primary Suggestions**

- In general, the data sample is large and representative enough to draw reasonable conclusions about the impact of the BIS Program on Miami students’ ICC growth.
- From our findings we can conclude that at least some regional campus BIS students are increasing in Knowing, Knowledge, Identity, and Social Responsibility from the pre-test (before Service-Learning in BIS 301) to post-test (after Service-Learning), which demonstrates tangible impact of the BIS program on holistic student development.
- We did not observe differences in the Social Interaction and Personal Affect subscales, which one could perceive as “gaps” the BIS program might want to address with future curriculum changes. Alternatively, we recognize that changes in some aspects of ICC may not happen in a short amount of time. Perhaps longer-term assessment (e.g., graduation surveys, alumni surveys) would better demonstrate the impact of the BIS program on ICC development. From the data and literature reviews we suggest that the BIS program could better foster structured and semi-structured interactions between students of different cultural backgrounds to increase engagement (Social Interactions) and help students with respect for cultural differences (Personal Affect).
- We found gender to overall be a significant predictor variable, as we observed many gender differences between males and females on the GPI subscales. Our sample also differed from national gender norms. We speculate that this may result from age differences between our sample and the national norms, as well as Miami’s regional campuses having a higher number of student veterans, which could increase their global exposure. Further understanding of the reasons behind these gender differences would need to be pursued in future studies.
- This sample of this study included more non-traditional students (especially older students) than samples used for national norms. While the GPI appeared to be a relatively reliable and valid assessment instrument in this population, future studies utilizing the GPI with more non-traditional students can help schools that have a majority of non-traditional students learn more about their ICC trends, as well as the best methods for fostering ICC.
- In regional campus students, studying abroad is not their primary expectation or intention, and many BIS students did not have a culturally-focused concentration. How specifically and intentionally we reach these “no culture focus” students to convince them of the importance of ICC development remains a crucial and critical goal with
which Miami needs to wrestle in the near future if it is to prepare global-ready graduates and meet Miami 2020 metrics.

- Specifically, our suggestion for Miami – if it really does value global-ready graduates – is to invest more financial resources in the programs, people, and events that support ICC development in students: Intercultural events need food and supplies, the professors that teach Service-Learning or experiential learning classes need time (in the form of course releases) and professional development funds, and the diversity- and globally-focused offices need larger budgets.

Next Steps

Developing global perspectives and intercultural competency is a primary goal for Miami University graduates, as highlighted in the Miami 2020 goals. The intent of this report and study was to assess and evaluate the global competencies of current BIS students. BIS faculty and administrators can use these findings to identify program strengths and gaps in student ICC growth.

This report has been shared with BIS administrators and faculty who can use the results 1) in supporting curriculum development and interventions to increase intercultural knowledge, skills, and attitudes and 2) for addressing metrics for Miami 2020 plan. This report could also be shared with other administrators who are interested in using the BIS assessment as a model for other departments or in order to compare Regional and Oxford students on ICC development.

For complete statistics or more information, please contact: Dr. Louise Davis (davishl3@miamioh.edu or 513-785-3055) or her consultants, Dr. Virginia Wickline (wicklivb@miamioh.edu or 513-217-4180) and Dr. Chen Ferguson (fergusc@miamioh.edu or 513-785-7703). The Assessment Project team also acknowledges the hard work, statistical support, and project contributions of Sarah Matthews, Miami University Undergraduate Summer Scholar (USS), matthes2@miamioh.edu, which were funded in part by the USS program.

Appendix B: Miami 2020 Plan

Integrative Studies Department Contributions

UNIFYING GOAL: LEARNING AND DISCOVERY - Promote a vibrant learning and discovery environment that produces extraordinary student and scholarly outcomes.

Objective 1: Prepare students for success at Miami and beyond through a liberal and applied education emphasizing inquiry-based experiential learning that integrates many disciplines.

Metric 1: Miami will achieve a 6-year graduation rate of 85% (4-year graduation rate of 75%).
Enhanced Regional Metric: CPSAS will achieve six-year graduation rate of 30%.

Strategies:
- Offer hybrid offerings of Integrative Studies core seminars and online, upper level, IS electives
- Expand the curriculum to appeal to a broader base of students and provide more MPF and/or elective courses in Integrative Studies that would serve majors and non-majors alike
- Develop a 100 level foundation course to recruit majors and help prepare non-majors and majors for their academic careers
- Develop new faculty advising systems (including workshops) that offer clear information to students about learning expectations, resources, and curricular pathways to graduation
- Continue collecting data using new assessment plan

Challenges & Opportunities:
- Obtaining reliable data to track student success
- Maintaining standards of academic rigor while increasing retention
- Reconciling and prioritizing the competing and increasing demands on faculty and staff

Metric 2: Within one year after graduation, 100% of graduates (excluding those enrolled in graduate or professional school) will be employed.
Enhanced Regional Metric: CPSAS will increase by 5 percentage points the number of graduates who, one year after graduation, have sought employment and are employed.

Strategies:
- Enhance partnerships with Career Services and major employers
- Institute and enhance career mentoring and advising through foundation course and new curriculum
- Develop systems to provide support for students’ internship placement
- Continue to build and enhance connections with alumni who may provide networking opportunities to CPSAS graduates

Challenges & Opportunities:
• Challenge: Too few faculty to build strong curriculum, advise, develop and test assessment strategies, AND develop relationships outside the university
• Challenge: Current career services and internship systems on the regionals

**Metric 3:**  Upon graduation, 80% of students who apply to graduate or professional school will receive at least one offer of admission.

**Strategies:**
- Support the development office in offering workshops for current students and recent graduates on preparing for graduate school
- Provide student support with applications and offer interview preparation in the BIS capstone and through faculty advising workshops
- Encourage graduates to gain work/volunteer experience prior to going to graduate/professional school

**Challenges & Opportunities:**
- Too few faculty. Faculty are already stretched providing academic advising for BIS majors AS WELL AS majors in their original disciplines (i.e. Communications, Psychology, American Studies, English). More faculty are needed to support career advising initiatives

**Objective 2:**  **Immerse faculty, undergraduate and graduate students in research and creative scholarship that forms a vital part of the learning experience.**

**Metric 4:**  Continue to increase the quality and impact of scholarship and creative performance.

**Strategies:**
- Improve the annual review process to provide enhanced feedback to faculty and to encourage more goal setting and professional development.
- Encourage faculty to take advantage of university programs that support faculty research such as CFR grants.
- Leverage faculty workload assignments strategically to enable research-active faculty adequate time for scholarship

**Challenges & Opportunities:**
- Recognizing that many regional campus faculty have service as their second criteria for tenure and promotion, rather than scholarship and that many of the strategies for increasing scholarship can be deployed to increase the quality and impact of service activities
- Addressing the high number of university initiatives which may distract faculty from research activities
- Balancing the demand for increased faculty time devoted to diverse Miami 2020 goals such as retention and student success, development of online courses, and increasing community partnerships, with the need for increased scholarly productivity
- Providing increased financial support for faculty research in times of decreasing state support for higher education
• Advancing scholarship when standard faculty teaching loads on the regional campuses are 24 contact hours an academic year

**Metric 5:** Upon graduation, all Miami students will have participated in a research (40%) or a similar experiential learning activity (100%), e.g., fieldwork, field or clinical placement, service-learning, public or private sector engagement, performances, and other applied learning activities.

**Strategies:**
- Increase efforts to make students aware of opportunities available to them and the benefits of participation
- Create courses that either require experiential learning and internship experiences OR provide information on and encourage such learning experiences

**Challenges & Opportunities:**
- Provide opportunities for faculty to mentor promising students
- Too few faculty: Managing the logistics of and securing the faculty time needed for mentoring experiential learning projects
- Recognizing that regional campus students often have employment and family obligations which prevent them from spending additional time on campus to participate in research or similar experiential learning activities
- Lack of resources

**Objective 3:** Engage students with substantive co-curricular and internship opportunities that augment their learning and establish a strong foundation for lifelong success, growth, and adaptability.

**Metric 6:** 70% of Miami students will have completed an internship before they graduate. Enhanced Regional Metric: We will increase the percentage of CPSAS students who complete a co-op or internship before they graduate to 25%.

**Strategies:**
- Increase communication between faculty and OCCIS to make sure we are utilizing contacts that faculty already have in business, industry, and government to help increase the numbers of internship options available to our students
- Improve communication with students about the availability of co-ops and internships.
- Designate scholarship funds specifically for students who choose to do a co-op or internship.

**Challenges & Opportunities:**
- Securing the faculty time and the OCCIS resources required to maximize the educational benefits of internships.
- Finding ways for the many working students on the regional campuses to be able to participate in experiential learning opportunities, including internships related to their major and future career path

**Metric 7:** 95% of Miami students will have two or more co-curricular experiences before they graduate.
Enhanced Regional Metric: 75% of Miami students will have two or more co-curricular experiences before they graduate.

Strategies:

- Create an IS Week in which students and faculty promote and participate in events (e.g. panel discussions, poster board sessions, inviting guest speakers)
- Work with IS students and alumni already involved in community outreach to (a) work out the needs of the community, and (b) how the IS department can support those needs in traditional ways (through providing labor) and less traditional ways (e.g. running events that build community and provide material support)
- Support CPSAS and Regional Campus Veteran’s Group by providing IS veterans with information and support AND supporting veteran events on campus and in the community
- Start an IS student group

Challenges & Opportunities:

- Meeting this metric given that recent changes in advising and new demands that result from satisfying other metrics increase faculty workload
- Challenge: having only a half-time staff member to coordinate all IS departmental needs
- Challenge: Lack of IS faculty that do not have multiple responsibilities in other departments
- Recruiting dedicated faculty volunteers to serve as advisers to student organizations
- Addressing the fact that regional campus students have many family and work obligations that prevent them from participating in co-curricular experiences.

Objective 4: Offer flexible pathways to and through the university, including interdisciplinary, e-learning and multiple degree options, to help students achieve timely and cost-effective completion.

Metric 8: 20% of our students will graduate with multiple degrees, majors, or co-majors, and 4% will graduate with a combination bachelor and master’s degree.

This metric is not applicable to the regional campuses because the regional campuses currently offer no master’s degrees.

Metric 9: 60% of degree programs can be completed in 3 years or less through curriculum revision and by using different pedagogical approaches and modes of delivery.

Strategies:

- Identify paths that can be taken to complete a degree in three years
- Carefully schedule course offerings to assure that three-year paths can be completed
- Offer highly demanded classes in the summer and winter terms when pedagogically appropriate.
- Work with students so that they can effectively utilize the multi-year schedule to plan their degree paths

Challenges & Opportunities:
• Developing degree completion strategies that take into account that regional students frequently change majors which can increase credit hours and the time needed for degree completion
• Noting that students on the regional campuses have many competing priorities including family and work obligations

**Metric 10:** Increase the online and hybrid credit hours to 10% of the total credit hours.

*Enhanced Regional Metric: Increase the online and hybrid credit hours on the regional campuses to 15% of the total credit hours.*

**Strategies:**
• All new IS courses be offered in either hybrid or online format within 1 year of their creation

**Challenges & Opportunities:**
• Faculty workload
• Securing the appropriate approvals for online and hybrid courses that carry subject codes of an Oxford-based department or division

**FOUNDATION GOAL 1: TRANSFORMATIONAL WORK ENVIRONMENT -** Ensure vitality and sustainability by building a forward-looking, efficient, and caring culture that stimulates, recognizes, and rewards creativity, entrepreneurial thinking, and exemplary performance.

**Objective 1:** Promote a work environment built upon continuous improvement and evaluation that empowers employees through ongoing professional development and career growth opportunities.

**Metric 11:** All employees will have an annual evaluation that aligns with the overall university objectives and a measurable professional development plan.

**Strategies:**
• Incorporate goal setting into the annual evaluation process
• Provide incentives for achieving goals

**Challenges & Opportunities:**
• Finding a way to recognize professional accomplishments that are difficult to measure
• Addressing the fact that some faculty may view this as an encroachment on their traditional autonomy

**Objective 2:** Recognize and reward Miami employees for increasing effectiveness and productivity by utilizing their expertise, creativity, and collaboration to constantly improve accountability, productivity, and efficient utilization of resources.

**Metric 12:** At least 25% of the merit salary improvement pool for faculty and unclassified staff will be allocated to recognize and reward exemplary performance that contributes to university and unit goals and objectives.

This metric will be advanced at the divisional and University levels.
Objective 3: Implement flexible and accountable governance structures that increase the university’s responsiveness and ability to make timely decisions.

Metric 13: The time line for the process of soliciting input and recommendations for governance purposes should not exceed one semester as appropriate.

**Strategies:**
- Revise newly create governance document in response to Miami’s new guidelines for governance documents
- Continue to hold core faculty meetings on a monthly basis

**Challenges & Opportunities:**
- Governance document has yet to be approved because the guidelines mentioned have not yet been distributed

Objective 4: Minimize tuition increases through a transparent, strategic financial and budgetary system that incentivizes new revenue streams, reallocates resources, and promotes team-oriented solutions to fiscal challenges.

Metric 14: An average of 1% of Oxford campus total revenues annually will come from new or expanded revenue initiatives other than tuition rate increases.

This metric will be advanced at the divisional and University levels.

Metric 15: Divisional deans will annually realign 1% of their divisional University budgeted funds by phasing out low priority organizational structures, programs, and activities. These funds will be set aside to support new, or expanding successful, programs and collaborations with an emphasis on inter- and multi-disciplinary activities.

This metric will be advanced at the divisional and University levels.

Metric 16: 0.5% per year of permanent budgetary funds will be captured from divisions, and these funds will be collected centrally and redistributed.

*Enhanced Regional Metric: 0.5% per year of permanent budgetary funds will be captured from improvements in regional campus productivity, and these funds will be collected centrally and redistributed.*

This metric will be advanced at the University level.

Metric 17: Implement, and annually update, a transparent, flexible and dynamic 10-year budget plan that will ensure a sustainable and financially viable foundation.

This metric will be advanced at the University level.
**FOUNDATION GOAL 2: INCLUSIVE CULTURE AND GLOBAL ENGAGEMENT** - Promote a diverse culture of inclusion, integrity, and collaboration that deepens understanding and embraces intercultural and global experiences.

**Objective 1:** Attract and retain a diverse community of students, faculty, staff, and administrators.

**Metric 18:** Grow the diversity of our students, faculty, and staff.

**Strategies:**
- Continue to build our already diverse faculty base by hiring more IS tenure line faculty
- Support the veterans group (see metric # 7)
- Implement new advertising and marketing strategies, and combine them with student centered community outreach strategies (see metric # 7), in order to target communities of youths and adults that do not yet see college as part of their future
- Support students already working with underprivileged youths (either through service-learning projects or self-directed community outreach) to help them encourage young people to consider attending college
- Hold IS town and gown events

**Challenges & Opportunities:**
- Faculty workload
- Student obligations
- Safety

**Objective 2:** Create an environment where our people live, learn, and work cooperatively with those of widely varied backgrounds, beliefs, abilities, and lifestyles, moving beyond boundaries to welcome, seek, and understand diverse peoples and perspectives.

**Metric 19:** 90% of Miami students will report that they feel welcome and have had significant and meaningful interactions with diverse groups.
- **Enhanced Regional Metric:** The regional campuses will increase by 10 percentage points the number of students that report that they feel welcome and have had significant and meaningful interactions with diverse groups.

**Strategies:**
- Create a culturally relevant curriculum
- Develop student organizations
- Create or participate in multicultural student, faculty, and alumni events
- Create an IS film series that includes diverse guest speakers and foreign film
- Provide opportunities for community engagement
- Forge partnerships with other departments and community organizations
- Continue to support Professors Ginny Wickline and Chen Ferguson on their GPI project which tests the cultural competencies of IS students. Discuss findings with faculty and students using feedback loops.

**Challenges & Opportunities:**
Objective 3: Achieve cultural competency among members of the Miami community by immersing them in domestically and globally relevant learning experiences.

Metric 20: By the time of graduation, 60% of Miami students will study abroad or study away. 
Enhanced Regional Metric: Miami Regionals will increase the percentage of students who will study abroad or study away to 5%.

Strategies:
- Create a working group of faculty and students to brainstorm the possibilities for study away and virtual study abroad initiatives

Challenges & Opportunities:
- Oxford tuition rates for study abroad
- Students gaining sufficient ‘global’ credit for shorter study abroad and study away experiences
- Raising sufficient funding for study abroad and study away learning for regional students with financial need
- Creating exciting study abroad and study away opportunities for nontraditional regional students who may not be able to leave their jobs or families for long periods of time

Metric 21: All Miami students will have a curricular or co-curricular cultural learning experience (e.g., intensive community engagement, service learning experience, intercultural or global learning requirement) by the time they graduate.

Strategies:
- Develop an Applied Global Studies concentration for Integrative Studies students
- Strengthen our current Cross-Cultural Leadership concentration
- Develop ‘global’ courses in Integrative Studies that include study away, virtual study abroad, or global service-learning experiences

Challenges & Opportunities:
- Faculty workload (time needed to create contacts, develop and implement programs, develop assessment plans for cultural learning experiences)
- Financial resources

Objective 4: Expand, virtually and physically, Miami’s global involvement.

Metric 22: All faculty and staff will engage in meaningful, globally diverse cultural activities (e.g., volunteer or community engagement; course or workshops on global and intercultural topics, professional training on diversity issues).

Strategies:
- Engage in research collaborations with international colleagues
- Give presentations at an international conferences
- Attend and create programming related to global diversity issues
• Interact with global colleagues on teaching and learning projects
• Support faculty working to develop study abroad, study away, and virtual study abroad initiatives by reducing workload or providing financial incentives

**Challenges & Opportunities:**
• Faculty workload
• Financial resources

**Metric 23:** Miami will expand, virtually and physically, by 25%, its international partnerships and activities to increase its impact on the global stage.

**Strategies:**
• Offer globally related courses, programs, centers or institutes
• Design an Applied Global Studies concentration
• Hire TT faculty members with applied global experience and a research/teaching background in global interdisciplinary studies
• Develop core assignments in new courses that encourage students to participate in global activities and interact with diverse global communities
• Develop partnerships with peer and international institutions to teach combined online courses in which students can interact with diverse populations

**Challenges & Opportunities:**
• Identifying partner institutions and building mutually beneficial relationships
• Funding international travel and experiences for faculty, staff, and students
• Faculty workload

**FOUNDATION GOAL 3: EFFECTIVE PARTNERSHIPS AND OUTREACH - Cultivate mutually beneficial partnerships and applied and service-oriented projects that strengthen our local, state, national and world communities.**

**Objective 1:** Partner with educational and other public-and private-sector institutions to co-design academic and outreach programs that enhance access to and support of quality higher education.

**Metric 24:** Miami will increase the number of transfer students to 400 students on both the Oxford and regional campuses.

**Strategies:**
• As each new concentration is added to the IS major, develop at new articulation agreements with either Sinclair or Cincinnati State which will support enrollment in that bachelor’s degree

**Challenges & Opportunities:**
• Training faculty how to advise transfer students, process transfer credits, etc
• Faculty workload (we already advise over 400 majors. Increasing this number with additional transfer students will require more faculty advisors and tenure line faculty devoted to IS)

Metric 25: Miami will double the number of partnerships with high schools, community-based organizations, foundations, and other entities to expand the recruitment of talented, diverse college-bound students.

Strategies:
• Promoting the IS major as a four-year degree that can appeal to freshman and high school graduates by advertising the degree in area high schools

Challenges & Opportunities:
• Staffing

Objective 2: Increase lifelong learning opportunities, engagement, and giving from alumni, parents, and friends.

Metric 26: Miami will provide educational opportunities and career support to at least 10% of our alumni and to other external stakeholders.

Strategies:
• Providing webinars
• Providing social/continuing educational events (already under way)
• Offering hybrid, on-line, and evening courses
• Providing study abroad activities
• Flexible offerings for full time workers

Challenges & Opportunities:
• Faculty workload

Metric 27: Increase the total dollar amount raised annually from alumni, parents and friends by 10% per year.

This metric will be advanced at the University level.

Objective 3: Grow Miami’s sponsored research, grants, intellectual property, internships, and co-curricular learning opportunities by helping corporate, governmental, and non-profit entities thrive through solutions-oriented partnerships.

Metric 28: Increase the total dollars of external funding (contracts and grants) to $30 million. Enhanced Regional Metric: Increase by approximately 20% the regional campuses’ total dollars of external funding, to an average of approximately $3 million annually.

We do not have the expertise or resources currently to support such a metric.

Metric 29: Increase by 25% the number of mutually beneficial educational, governmental, corporate and non-profit partnerships.
We do not have the expertise or resources currently to support such a metric.

**Objective 4:** Advance Ohio’s economic development and prosperity by providing talent and expertise that helps shape policy and improves quality of life.

**Metric 30:** By 2020, 65% of the Miami University community will be engaged in providing expertise and advancing the success of public and private entities.

**Strategies:**
- Revising or creating websites
- Networking with community organizations
- Working with the Corporate and Community Institute & the Cincinnati Chamber to develop talent pipelines and develop awareness of community needs, especially in terms of IT

**Challenges & Opportunities:**
- Developing the expertise or finding the resources to support such a metric
- Faculty workload

This poster presentation outlines my ongoing master’s research thesis project studying the relationship between Attention Deficit/Hyperactivity Disorder (ADHD) and possible deficits in reasoning performance. This project has been approved by the ethics board of the University of Saskatchewan and is funded by the Tri-Council Agency of Canada through a Social Sciences and Humanities Research Council grant. The project is supervised by Dr. Laurie-Ann Hellsten, Associate Dean Graduate Studies and Research and Associate Professor, University of Saskatchewan, Canada.

Summary of Research Our research investigates whether ADHD might affect the reasoning performance of students diagnosed with this disorder. Differences in analytic reasoning are compared between students with ADHD and those without. Our study may offer insight into why ADHD students require accommodations for learning, which can assist with how to help students with ADHD learn more effectively. Results could inform teaching approaches for students with ADHD aimed at improving hypothetical reasoning skills.

Word Count = 70

See following page for Abstract
Abstract
ADHD is widely associated with deficits in frontal lobe executive function (EF). Exactly how deficits in EF impair the ability to learn in the classroom is an on-going topic of research. One area of focus is the executive inhibition mechanism required to suppress erroneous belief responses to engage in deeper analytic thinking. The capacity to reason independently of beliefs is considered a core ability of formal reasoning that is highly dependent on executive processes. University students both with (64) and without (64) ADHD (N = 124) will solve base-rate (BR) problems, in which inhibition of belief mediates normative reasoning performance. BR problems feature salient stereotypes (e.g., “Paul lives in a beautiful home in a posh suburb”) that either conflict or match with presented base-rate probabilities (e.g. “Paul was randomly selected from a sample of 5 doctors and 995 nurses for conflict; 995 doctors and 5 nurses for non-conflict”) and asks for group membership (e.g. “What is the likelihood Paul is a doctor?”). Unless specifically instructed to respond using statistics, people generally neglect base-rates in favor of compelling descriptions due to differing processing demands that BR problems entail. Representativeness cues autonomous, intuitive responses that are difficult to inhibit, whereas base-rate processing requires effortful analytic reasoning. Resisting erroneous belief responses in favor of normative responses is linked to inhibitory control; thus, we expect ADHD participants to exhibit diminished reasoning performance when asked to respond ‘statistically’ to conflict problems. This study may offer insight into why ADHD students require modifications in learning, which has the potential to inform how to help students with ADHD learn more effectively.

Establishing an Effective Teaching Assistant Program for Computer Science Undergraduate Education

Kathryn Cunningham, Anand Seetharam, Sathya Narayanan, Bude Su
School of Computing and Design, California State University Monterey Bay
{k cunningham, aseetharam, snarayanan, bsu}@csumb.edu

Abstract—Academic support services (e.g., teaching assistantship services, enrichment activities) can be beneficial and at times crucial, for the success of low income, first generation, underrepresented, motivated students with gaps in their academic preparation. In this paper, we describe the establishment and growth of a teaching assistantship (TA) program in the Computer Science and Information Technology (CSIT) program at California State University Monterey Bay (CSUMB), a primarily undergraduate institution and evaluate its effectiveness. Developing a strong TA program in the CSIT program is challenging. Firstly, being an undergraduate only program, our teaching assistants have to be selected from undergraduate students. Compounding this issue is the fact that significant portion of our students are underprepared for the rigors of college education. Therefore, to create a successful TA program we recruit top-of-the-class junior and senior students (TA scholars). To ensure good quality of the TA program, we organize weekly workshops on effective tutoring and mentoring techniques for TA scholars. The TA program is currently in the third semester of its implementation. Data collected during the Fall 2014 semester suggests that nearly 60% of surveyed students availed TA services. Additionally, approximately 85% of students who availed TA services rate the TA program highly.

I. INTRODUCTION

Computer Science and Information Technology (CSIT) program at California State University Monterey Bay (CSUMB) is committed to providing high quality computing education and opportunities to low income, first generation, underrepresented students in the state of California [1]. Noticing that introductory computer science courses are becoming filter classes that are keeping out motivated students with gaps in their academic preparation from pursuing a computer science major, the CSIT program has invested significant effort in developing strong academic support services for students such as teaching assistantship services, mandatory study hours, professional development and internship/job preparation.

In this paper, we describe the establishment and growth of our TA program and evaluate its effectiveness. Prior research has demonstrated the benefits of undergraduate TA programs for introductory computer science courses [2], [3], [4]. While TA programs provide students additional academic support, it also helps teaching assistants improve their technical and communication skills. While there are multiple TA programs currently associated with large research institutions (e.g., Stanford University, University of Arizona) we explore the benefits of such programs for students at CSUMB, a teaching-focused Hispanic Serving Institution.

Developing a strong TA program in a primarily undergraduate institution has its share of challenges. Firstly, being an undergraduate only program, we do not have the luxury of selecting graduate students as teaching assistants; our teaching assistants have to be selected from undergraduate students. Compounding this issue is the fact that significant portion of our students are underprepared for the rigors of college education. Secondly, aligning teaching assistants’ objectives that have traditionally been focused on reducing the instructors workload to a student centric model focused on improving academic outcomes requires significant effort for training. Lastly, the biggest challenge lies in creating a self sustaining TA program that requires minimal faculty or staff intervention for its operations.

The TA program at CSUMB (modeled after the section leader programs at the University of Arizona [2]) and Stanford [3], [4]) consists of specially trained tutors, providing necessary tutoring and mentoring support to CSIT students. Our TA program provides support for introductory programming and upper division computer science courses. To create a successful and sustainable TA program we recruit ‘top-of-the-class’ junior and senior students (TA scholars). Weekly workshops on effective tutoring and mentoring techniques are organized for TA scholars. TA scholars also share their experiences about the program (e.g., office hours, review sessions, workload) during this workshop. Program continuity is being ensured by having existing TA scholars share their experiences and provide guidance to new TA scholars.

The TA program is currently in the third semester of its implementation. To assess the success of our TA program we performed extensive data collection during the Fall 2014 semester. Our data suggests that nearly 60% of surveyed students availed TA services during the fall semester. We also observe that approximately 85% of students who availed TA services rate the TA program highly. Additionally, the program has been beneficial to TA scholars; many of them note that the program has helped improve their communication and presentation skills.

The rest of the paper is organized as follows. We provide a brief description of the ongoing projects and cohort programs in the CSIT program at CSUMB in Section II. We describe the growth and development of the TA program in the CSIT program in Section III and evaluate the effectiveness of the program in Section IV. We conclude the paper with a discussion of our current and future work in Section V.

II. BACKGROUND

Since its inception in 2007, the CSIT program at CSUMB has been committed to providing high quality computing
education and opportunities to students identified in CSUMB’s vision statement. Over the past seven years this commitment has resulted in significant efforts to develop learning communities to support student success through cohort-based programs.

In 2013, the CSIT program in partnership with Hartnell College launched a cohort-based, three-year bachelors degree program called CSIT-In-3 [5] as a way to improve learning outcomes and increase student retention. The first and second cohorts of CSIT-In-3 began in Fall 2013 and Fall 2014 respectively, each with 32 students. Cohort-based learning communities have been proven to be effective in both short term success and long-term retention [6]; learning communities also increase the success of underrepresented and first generation students in STEM majors [7].

Inspired by the initial success of the CSIT-In-3 program (e.g., high retention rate experienced so far), starting in Fall 2014, computer science faculty from CSUMB launched a cohort-based, 4-year bachelors degree program called CSIT++ [8]. The objective of the CSIT++ program is to create a rigorous, competitive curriculum and to provide additional student services so as to enable students to graduate with their CSIT degree in 4 years.

These cohort-based programs have provided CSIT faculty a launchpad for starting a number of initiatives such as TA programs, enrichment workshops, professional development and job preparation workshops. We have leveraged this opportunity to provide academic support services to all our students - the CSIT-In-3 students, CSIT++ students and our traditional non-cohort students. In this paper, we describe the development of our TA program and its positive impact on our students.

III. TA Program

As mentioned earlier, the CSIT program caters mainly to first generation, low income students. Many of these students are motivated, but fail to cope with the rigorous requirement of a computer science degree due to gaps in their academic preparation. Additionally, a large fraction of our students have to work part-time to support themselves financially, thereby leaving them with limited opportunity to attend instructor office hours. CSIT faculty thus realized that our students will greatly benefit from a strong TA program primarily aimed at providing tutoring and outside classroom assistance.

Establishing a strong and sustainable teaching assistantship program at CSUMB comes with its fair share of challenges. Firstly, the CSIT program being an undergraduate only degree program, our teaching assistants have to be selected from a pool of undergraduate students. Secondly, aligning the teaching assistants’ objectives from decreasing instructor workload to a more student-oriented model requires considerable training. Compounding the difficulty of the task is the fact that currently the CSIT program has only four tenure track faculty and two academic support staff. We entrusted one of the academic support staff members with the role of being a TA coordinator. Table I provides an overview of the activities of the TA scholars. We note that TA scholars receive remuneration at the hourly student rate.

Recruiting TA scholars: The first batch of TA scholars was selected from the ‘top-of-the-class’ juniors and seniors. Care was taken to ensure that TA scholars themselves had secured an ‘A’ grade in the courses they were selected as teaching assistants. TA scholars provide academic support in the form of tutoring and mentoring for all our students (CSIT-In-3, CSIT++ and traditional CSIT students). The interest in the TA program has increased over time and for the Spring 2015 semester, we had a large pool of applicants. The recruited TA scholars not only had good grades but were also screened via an interview process.

Training TA scholars: The primary task of the TA scholars is to hold office hours and to conduct review sessions and discussions. At the beginning of each semester, TA scholars receive training on effective tutoring and mentoring practices. The TA scholars meet weekly with the TA program coordinator and discuss their experiences over the past week. During the weekly workshop TA scholars are provided relevant material for the coming week; they are also given guidelines and tips related to improving overall student experience.

Program continuity: We plan to create a sustainable model for the TA program by having older TA scholars share their experiences and provide mentoring support to new TA scholars. Having older TA scholars guide new TA scholars will increase program scalability by utilizing older scholars as resources for training newer scholars. As the TA program is still at an early implementation phase, we are in the process of implementing the above mentioned program continuity model.

Tutoring in Study Hours: To improve student outcomes, CSIT faculty aim to reinforce good academic practices such as regular attendance, mandatory study hours and good note taking in our students. We note that certain activities such as attending study hours is mandatory for cohort students, but our traditional students are also given equal opportunity to participate. Apart from holding office hours, TA scholars provide additional assistance to students during study hours, thus helping them to be on top of their courses.

IV. Evaluation

To evaluate the benefit of the TA program for our students as well as the TA scholars, we conducted extensive data collection during the Fall 2014 semester. We collected data by having students fill out a questionnaire; the survey consisted mainly of quantitative questions, where the respondents had to select from a few options. We also included some qualitative questions to seek the students’ and TA scholars’ opinion on the effectiveness of the TA program and to explore avenues for future improvement.

Our main objective behind this evaluation is to answer the following two questions - i) Do CSIT students perceive the TA program as being an useful academic support service? ii) Do TA scholars perceive the TA program as having helped them improve their teaching and communication skills? Our analysis in the section answers both these questions in the affirmative.

A. Benefit to CSIT students

We made the survey available to all our students and obtained responses from 101 students. Among the 101 respondents there are 32 CSIT-In-3 cohort students, 33 CSIT++ students and 36 traditional CSIT students. We observe from
the data that we obtained larger number of responses from the cohort students than the traditional CSIT students. This skewed distribution can be attributed to the fact that filling the questionnaire is voluntary; cohort students were allocated time during their weekly enrichment workshops to fill in the questionnaire. We are aware of the biases introduced by data collection via voluntary filling of surveys, but we believe that our initial data collection provides us valuable insight about the impact of our TA program.

Table II shows the distribution of the number of times a student availed teaching assistantship services. It is evident from the table that nearly 60% students availed TA services, with some students attending office hours almost regularly. Table III provides an overview of the types of assistance sought during the TA office hours. We observe form the data that while some students used the TA scholars office hours to clarify points of confusion, a majority of them used the office hours as tutoring services and to seek assistance on specific projects and assignments.

We offered TA services for most lower and upper division computer science courses in the department. Table IV shows the number of respondents who sought help for the various courses. One can observe that a large number of students availed TA services for the Physics of Computing course; the primary reason is that the course is mainly project based and all CSIT++ cohort students were enrolled in that course. We also observe from the data that TA services for most other courses were availed equally. We would like to note that though we observed a large number of students availing TA services for CS1 and CS2, the lower number of responses is due to the fact that all students enrolled in these courses were traditional CSIT students.

Table V shows the overall satisfaction of the students with the teaching assistantship services. From the table, we observe that most students (approximately 85%) found the TA office hours helpful. Table VI provides examples of some qualitative questions and sample responses. Evaluating the responses to both qualitative and quantitative questions, we observe that students found the TA office hours helpful. We also observe that the TA program has helped build a sense of learning community for CSIT students; it has provided a platform for students to get together, exchange ideas and to help each other.

B. Benefit to TA scholars

In this section, our goal is to understand the benefits of the TA program for the TA scholars. Table VII provides an overview of some of the questions and sample responses. Most TA scholars identified the TA program as helping them improve their communication skills. The TA scholars also appreciated the opportunity to be able to work with other students and to help them solve their problems. We also believe that being a TA scholar helps students revise prior material and retain information.

Through our TA program we hope to create role models for our freshman and sophomores. We believe that we have partially succeeded in the endeavor by providing an avenue for freshman and sophomores to interact with ‘top-of-the-class’ juniors and seniors. We have already noticed an increasing popularity of the TA program. In Spring 2015, we obtained applications from a large number of students for becoming TA scholars and selected the TA scholars after personal interviews.

V. DISCUSSION AND CONCLUSION

Encouraged by the initial success of the program, CSIT faculty have been incrementally increasing the responsibilities
We observed that approximately 85% of students who availed TA services rate the TA program highly. The program has been beneficial to TA scholars as well; many of them noted that the program has helped improve their communication and presentation skills.

VI. ACKNOWLEDGMENT

This research was supported in part, under National Science Foundation grant NSF STEP award 1317649. We would also like to acknowledge the effort of Julie Shattuck who helped us in designing the survey questions and in data collection.

Summary: A 16 year-old young man with no known academic, behavioral, or attentional issues who uncharacteristically refused to attend school from the age of 14. This presentation details the psycho-educational testing process used to tease out an underlying hidden learning disability of dyscalculia. A lack of awareness of this disability coupled with increasing frustration with concepts of numeracy led the student to disengage from education, emphasizing the importance of psycho-educational testing for students with atypical conduct.

Word count = 75
Abstract

“John” is a 16 year-old young man with no known academic, behavioral, or attentional issues who refused to attend school from age 14. The behavior was uncharacteristic given John’s average school grades, stable family support, good peer relations, lack of attentional or behavioral issues, and model social behavior. Norm referenced tests were used to evaluate John’s cognitive abilities and academic achievement at 16 years, two years after disengagement from school began. Despite placing in the above average range on the General Ability Index, WISC subtests of cognitive ability revealed significantly divergent scores. In particular, any subtest involving numerals greatly skewed scores downward. To tease out the suspected learning disability of dyscalculia, domain specific subtests incorporating only numerals were administered and compared to same-domain subtest scores utilizing only language. Thus, “number only” subtests could be separated out to positively identify a LD of dyscalculia, whereas “language only” subtests revealed a more accurate representation of John’s true cognitive ability beyond his disability. Results demonstrated that testing material entailing numerical retention, manipulation, or numerical retrieval resulted in scores as low as the 1st percentile. What distinguishes dyscalculia from a “lack of opportunity” for learning basic math facts is exceptionally poor performance in subitizing tasks and retention/recall for numerals, both of which do not entail mental manipulation or operation of numerals. The segregated method of cognitive testing uncovered extensive difficulties in mastering a sense of numbers, grasping and understanding the size or quantity of numbers, learning number facts, and performing calculations, all characteristic of developmental dyscalculia.

Abstract

Parents of children with autism spectrum disorder and intellectual and developmental disability play a major role as advocates to facilitate the access of their children to higher educational institutions. Therefore, this study investigated American, Saudi and Arab-American parents’ of young adult with ASD and ID perspectives toward post-secondary education programs to explore whether cultural background or the availability of post-secondary education programs had any influence on shaping their attitudes. The researcher conducted 24 semi-structured interviews with six different American parents and their young adult with autism and intellectual and developmental disability, in addition to three American parents and their young adult with autism and three Arab-American parents and their young adult with intellectual and developmental disability to analyze their perspectives. Using an inductive approach researchers thematically analyzed the data. These findings were presented under four main headings or themes: 1) cultural and religious conflicts, 2) availability of programs, 3) students’ needs and 4) social advocacy. Parents’ reflections highlighted the lack of post-secondary education programs for individuals with autism and intellectual disability in the Middle-East and the impact of that lack on the whole family. These findings reveal the importance of providing post-secondary education programs in the Middle East

In education we often focus on evaluative feedback. We as educators place a high value on end products rather than the learning destination and the process for the learner along the way. As we assess and value quizzes, tests, and learning area content descriptors we put ourselves at educational risk if we do not include the process of learning, the learning destination and often ignore moments where students are given the forum to articulate their learning with proof of their learning. I commenced as Principal in July 2014 at Dardanup PS after returning from a yearlong exchange stint in Ontario, Canada. During that time I was fortunate enough to attend a series of workshops titled ‘Advancing Student Engagement and Learning in the 21st Century through distributed Instructional Leadership.’ One area of the workshops was facilitated by Canadian presenter Sandra Herbst, and detailed primarily on how assessment is a journey, not necessarily the end product.

At Dardanup PS this was most definitely the case and the only data collected was post evaluative data in the forms of testing and online testing. This data was proving to be almost ‘too late’ in terms of data driven analysis used as an impetus to drive teaching in the school. Staff examined their own practice in terms of classroom content, engagement of students, depth of work, and the presence of thinking in students. The following tool, ‘Looking at Opportunities’ (Ritchhart, 2003), from the Project Zero group at Harvard was the beginning of a whole school process to see how classroom practice can be enhanced and ultimately of greater benefit to students.

As part of an action research project the staff were then exposed to a School Development Day focussed on assessment-based learning. We identified collectively what was already in place and evaluated this against some fundamental principles of student-based assessment and the use of high quality descriptive feedback to improve student learning. As a staff we looked at how we give feedback to students in our school. When we mark a test, a quiz or a project we are giving feedback, but it is usually post data. There is far more powerful learning attributed to unpacking curriculum requirements or expectations and the sharing of what these expectations look like in concrete examples provided to students and with students acting as co-constructors of what success looks like.

Qualitative research was undertaken and centred largely on discussions around the concepts and ideas of knowing what counts in classrooms and our results from examination of individual practice. A series of questions was discussed to elicit evidence of when and how we set criteria for learning in our school. We embedded a whole school data cycle and formed a professional learning community to moderate student responses, and to create visible learning goals and success criteria.

Our first question during professional learning meetings was ‘How do we ask students to show proof of learning at our school?’ As a staff we examined deconstruction of curriculum expectations and looked at what groups of expectations made sense to plan and teach together. Alongside this was an identification of the success criteria used to evaluate learning. Teachers must be clear on the success criteria they will use to verify learning before they can bring students into the role of co-constructing criteria.
It is important therefore to not only know what curriculum expectations are being taught but be clear in what success will look like. Teachers at this school often give rubrics as a prelude to the learning activity but we found as a staff that we rarely did was provide examples of what success looked like matched against the criteria. We also discussed the pitfalls that can happen with student learning with the child that receives rubric but aims for the middle ground as this will be safer.

As a whole school example we looked at an oral report in a year 5/6 classroom as the discussion point for our action learning research. When working on this particular aspect of the curriculum students need to be very clear what is expected in an oral report. Students were also given opportunities to moderate samples of student oral reports as well as visual representations of this and identify what makes a good oral report or fits a grade descriptor. Students at Dardanup PS were also part of the identification and posting of the success criteria against the grade descriptors.

This was also displayed in the classroom for future reference during the learning pathway. As a group, students identified the learning destination that was being 'looked' for in the grade but also what that meant in terms of what the assessor was looking for. What became very evident to us a learning group was that this process of success criteria identification must be carried out in the beginning and is not effective if this is attempted half way through or at the end of the learning trajectory.

Criteria were revisited by students and teachers throughout the process and the result of this was that students gained a greater understanding of what high quality work looks like. As teachers we also got better at the process along the way. Results from our findings indicated that when teachers were able to clearly communicate to students what they were looking for, a process of high quality feedback commenced with the process becoming one of elimination. Learning destinations became clear and concise as missing criteria was listed and students knew exactly what they had to change about their presentations to select the most important element they had to improve on.

As a group we scheduled continued professional learning meetings to further our understandings of learning pathways in our particular grade levels. Time is always a factor for teachers and it was agreed that set meetings to talk about construction of criteria and actively examining samples of what success criteria looks like was the only way to proceed to co teach and lead professional opportunities at the school and district.

The second shift in our school was that in order for assessment to become student based as well as teacher based only comes from teachers understanding that they are not the only ones who have to assign marks. When we talk about skills that 21st century learners need for the future we need to be clear about what those skills are and how they are taught. Students as 21st century learners need to develop skills of reflective thinking but must be taught to do so. Learners need to be able to determine next steps in their own learning and our reporting in schools must also convey this message. We developed our own motto where students learning must be on the ‘cusp’ of their learning.

As educators we often remind a student to get ‘back on track’ with their learning but we always assume they know what they are learning in the first place. How often do we ever give kids a second chance at learning? The oral report example was examined as a group and feedback that could be given was determined. We examined powerful prompts that make thinking visible derived from the LNS, Ontario Ministry of Education SIM Session II, Fall 2010 and applied to this particular learning trajectory.
Prompts included providing reminders, but specific reminders linked to context. Providing scaffolding where specific feedback was explained alongside what the student must do to attain success. As a group we examined how many times we say to a student ‘You are doing a great job’, or ‘Wow that looks good!’

What were we actually talking about here? Asking direct questions, asking for clarification of connections, and giving students thoughts they must be the ones to complete. Students were also provided with three examples of an oral report and were asked to identify elements of those presentations they felt addressed criteria. The terms ‘Learning Destination’ and ‘Proof of Learning’ were to be used at the beginning of each clarification of success criteria.

From this beginning with an oral report we have found as a staff that when students are engaged in the process of constructing and moderating their own work they are were deeply successful. Students began to set their own learning targets and rate their performance on a continuum. We also provided opportunities for students to be able to give feedback to each other. Students were asked to collate feedback and determine leaning targets.

As a school we have found this process very powerful as well as a shift in pedagogy. After trialling this in the initial lesson in the production of an oral report we were able to apply to other areas of the school. This is a continued focus and point of need in our school. Our professional learning community continues to discuss best practice in this area of student learning. Staff surveys demonstrated that 98% of staff felt that they had improved the quality of set tasks and reported greater depth in student attainment of curriculum an understanding.

More importantly from our action learning we found as a staff from collated student responses that students found great value in co construction of criteria with responses indicating they felt successful and knew what was expected of them. As teachers we reported that there were gains in student engagement and the resultant learning. Staff felt the concept of giving high quality and descriptive feedback led to in depth and rich task evidence. Students were also able to pinpoint learning proof and use statements such as, ‘I used to do this but now I know how to do this.’

Using surveys, video reflections and classroom observations, pre and post work samples improvement in student learning and perception of tasks was clear and insightful. Students were able to clearly see themselves on a continuum of learning. Increase in engagement and use of direct feedback was evidenced in oral and written work samples. Purposeful and specific feedback given to students was addressed in final work samples. Students reported they felt the teacher ‘knew’ what they needed help with.

Collaborative data focussed discussions have now become the norm at DPS. Student data is tracked and continued building of teacher capacity remains a factor at this school. Research findings from this action-learning project showed that 96% of teachers surveyed felt that the quality of their classroom delivery and depth of learning tasks increased substantially. Student data showed improvements in literacy gain and quality of work samples. Teachers are focussed on next steps for this school where high quality conversations to improve student learning are the norm and the process followed forms the basis for further building of teacher capacity through active learning and whole school improvement agendas. The journey continues.

Abstract: The purpose of this study was to investigate the implications of the use of the flipped teaching strategy on preservice teachers’ learning outcomes, self-efficacy and perception. The investigators employed a within-subject design with an independent variable: the teaching method (flipped-based (FB) or lecture-based (LB) and two dependent variables: (1) learning outcome (2) students’ perception of self-efficacy. The first group of participants were 60 preservice teachers (39 undergraduates, 21 graduates, average age 22-25 years). The second group of participants were approximately 70 pre-service teachers enrolled in two sections of an adolescent development course. The results of the first group showed that there were differences between students’ mean test scores and the differences were statistically significant (higher in FB). The results also showed that students’ self-efficacy mean scores were higher after using FB compared to LB and the differences were statistically significant. The results of the second group which only addressed learning outcome indicated that there was no significant difference in the mean test scores in the FB compared to the LB. Finally, the investigators collected the results of 12 questions from the students to assess their perception on the FB teaching strategy and found that preservice teachers favor the use of FB strategy in both the technology integration course and the adolescent development course. These results suggest that FB teaching strategy can have a positive effect on preservice teachers’ test scores, self-efficacy and the majority of them are in favor of its use in a technology integration course. Furthermore, the majority of students who prefer the FB indicated that a reason for favoring this strategy is that it promotes collaboration and hands-on activities during the class time. Other students found that the FB strategy had less lecture time, they can work at their own pace, they are able to interact more with the teacher and ask questions, and that they do not have to sit and listen to an hour long lecture that “goes in one ear and out the other one”.

2
1. Objective

Although the lecture-based teaching strategy (LB) has been used for decades as an effective way to help students acquire new knowledge (e.g., Hattie, 2009; Schwerdt, 2009), many educators argue that this teaching model is mostly static, passive and not suitable for teacher candidates preparing for extended field experience and careers in teaching. Students reported also that the information delivered during lectures may come too slowly or cover what they already know; other students have trouble taking in information so rapidly, or they may lack the prior knowledge needed to understand the presented content (Goodwin & Miller, 2013).

A growing number of teachers started recently using a different teaching strategy through creating flipped or inverted classrooms. This teaching strategy involves moving the lecture content before class and working on homework and hands-on activities during class time. For example, the data from the Flipped Learning Network (2012) indicated that membership on its social media site rose from 2,500 teachers in 2011 to 9,000 teachers in 2012. In the flipped teaching strategy (FB), educators can employ online asynchronous educational videos, recorded lectures or readings and spend time in class working on problems or exercises through active, group-based problem solving activities. The learning materials can incorporate multimedia visual representations, such as interactive graphs, photos or animation. While watching the video, lectures or reading the text, students have the chance to control the pace of the multimedia streaming to match their own learning preferences. Students can also watch or listen to recordings of class lectures on their computers, tablets, smart phones, or personal media players outside of class, leaving class time to engage in learning activities that might otherwise be assigned as homework (Frydenberg, 2013).

Reports of student perceptions of the FB have been found to be somewhat mixed, but are generally positive overall. For example, some prior research found that students tend to prefer in-person lectures to video lectures, but prefer interactive classroom activities to lectures (Bishop & Verleger, 2013). Although there is steady increase in the number of teachers who adopt the FB in classrooms, there is little research on the effect of this teaching strategy on preservice teachers. Therefore, the purpose of this study is to examine the implications of the use of the flipped classroom teaching strategy on preservice teachers’ learning outcomes, self-efficacy and perception in a technology integration course.

2. Theoretical Framework

Cognitive Theory of Multimedia Learning:

Since the introduction of television, a large body of empirical studies on the use of multimedia in education have demonstrated that students not only prefer it over text, but are also more likely to gain deeper learning from multimedia than from words alone (Baggett, 1984; Mayer, 2002, 2003, 2005; Mayer & Moreno, 2002; Salomon, 1984; Shepard, 1967; Wetzel, Radtke, & Stern, 1994). Researchers suggested that because multimedia contain two representations, visual that conveys information about objects and its relation to other objects, and verbal that communicates abstract meaning and special attributes of this information, a combination of both representations should increase the learning effect (e.g., Guttormsen Schar, Kaiser, Krueger, & th, 1999; Lowe, 1999). A major assumption underlying this empirical work is that humans can construct a mental representation of the semantic meaning from either auditory
Implications of Flipped Instruction

or visual information alone, but when instruction is presented in both formats, each source provides complementary information that is relevant to learning (Baggett, 1984).

Cognitive theory of multimedia learning (CTML) (Mayer, 2001), proposed several assumptions regarding the relationship between cognition and learning from dual representation information formats. Four of these assumptions are particularly relevant to learning from multimedia learning materials. First, the cognitive architecture assumption postulates that the human mind consists of an unlimited, long-term memory (LTM) in which all prior knowledge is stored and a limited working memory (WM) in which new information is processed. Second, the dual-channel assumption proposes that WM has two channels for visual/pictorial and auditory/verbal processing and that the two channels are structurally and functionally distinct (Clark & Paivio, 1991). Third, the limited capacity assumption states that each cognitive channel has limited capacity for information that can be processed at one time (Baddeley, 1986; Baddeley & Logie, 1999). Fourth, the active processing assumption explains that humans actively engage in the cognitive processes to select relevant verbal and non-verbal information from the learning materials, organize the selected information into cognitive structures, and integrate these cognitive structures with the existing knowledge to construct a new (or update an old) mental representation (Mayer, 1996).

Flipped Classroom:

Researchers on the flipped classroom do not agree on the type of activity that constitutes the flipped teaching model. For example, some researchers tend to delineate the flipped classroom in a broad definition and suggest that assigning video or reading outside of class and having discussions in class constitutes the flipped classroom. Bishop & Verleger (2013) reject this definition and describe the flipped classroom as an educational technique that consists of two parts: interactive group learning activities inside the classroom, and direct computer-based individual instruction outside the classroom. According to this definition, the flipped teaching strategy may use videos or readings as an outside of the classroom activity. For example, Demetry (2010) provides lecture notes for students to read at home prior to the class session, rather than providing video lectures to help meet the goal of increasing “time on task” to complete course-related activities. Other researchers identified flipped classroom as “events that have traditionally taken place inside the classroom, now take place outside the classroom and vice versa” (p.32) (Lage, 2000). Therefore, the flipped classroom is based on the idea that students are engaged in group interactive learning activities inside the classroom. To make sure that students watched the videos or completed the reading at home, students can respond to “clicker questions” to report their progress as they work on the exercises (Houston, 2012). Finally, the learning activities as well as the assigned homework in the flipped teaching model vary widely between studies. For example, some activities are made up of asynchronous web-based video lectures and closed-ended problems or quizzes, while others consider that the flipped classroom actually represents an expansion of the curriculum, rather than a mere re-arrangement of activities (Bishop & Verleger, 2013).

Self-efficacy and Learning

According to social cognitive theory (Bandura, 1997) self-efficacy is a form of self-judgment that influences decisions about what behaviors to undertake, the amount of effort and
Implications of Flipped Instruction

persistence put forth when faced with obstacles, and finally, the mastery of the behavior. According to Bandura, self-efficacy is not a measure of skill; rather, it reflects what individuals believe they can do with the skills they possess. For example, in discussing self-efficacy in computer use, Compeau and Higgins (1995) distinguished between component skills such as formatting disks and booting up the computer and behaviors individuals can accomplish with such skills, such as using software to analyze data. Thus, preservice teachers’ perception of their self-efficacy focuses on what they believe they can accomplish with the knowledge they master during their learning. It does not refer to a person's skill at performing specific learning related tasks (e.g. class management, integrate technology in their teaching and mastering a content area). Instead, it assesses a person's judgment of his or her ability to apply knowledge and skills in a broader context.

Preservice teachers participating in a technology integration course learn skills and knowledge of teaching with technology in an actual classroom. Self-efficacy beliefs are a key component for preservice teachers’ success in overcoming the fear they may experience in this new area. For example, Compeau and Higgins (1995) empirically show that there is a relationship between computer self-efficacy and computer use. Staples (1999) found that those with high levels of self-efficacy in remote computing situations were more productive and satisfied, and better able to cope when working remotely. Consequently, novice teachers enrolled in a technology integration course are required to develop a set of skills to perform successfully a distinct set of behaviors required to establish, maintain and utilize effectively teaching with technology beyond basic personal Internet and computer skills.

Research questions

The focus of this study was to investigate the implications of the use of the flipped teaching strategy on preservice teachers’ learning outcomes and self-efficacy in a technology integration course. Based on previous studies of CTML and self-efficacy, this study will be guided by the following questions:

1. Will the flipped teaching strategy improve preservice teachers’ learning outcomes compared to the lecture-based teaching strategy in a technology integration course and adolescent development courses?
2. Will the flipped teaching strategy improve preservice teachers’ self-efficacy in a technology integration course?
3. What is the perception of preservice teachers regarding the use of the flipped teaching strategy in a technology integration course?

The first question: Will the flipped teaching strategy improve preservice teachers’ learning outcomes compared to lectures-based teaching strategy in a technology integration course and adolescent development courses? This primary research question was at the heart of the study, as the answer to this question will inform instructors and trainers about the effect of the use of flipped teaching strategy on preservice teachers’ learning outcomes. In general, prior research found that the flipped teaching strategy resulted in improvement of students’ learning outcomes. Other studies, however, found that overall class testing scores do not support that flipping the classroom improved the entire class (Sparks, 2013). Therefore, the result of this
study will examine the effect of the flipped teaching strategy on students’ learning outcomes in the context of a technology integration course and an adolescent development course.

The second question: Will the flipped teaching strategy improve preservice teachers’ self-efficacy in a technology integration course? According to Bandura’s social cognitive theory, it is important to assess students beliefs and ability to apply the knowledge and skills they acquire during a lesson as indication of understanding the learning content (Compeau, 1995). The answer to this question will help instructors and trainers to evaluate the effect of the flipped teaching strategy to improve preservice teachers’ self-efficacy in applying the knowledge they acquire in the context of the technology integration course.

The third question: What is the perception of preservice teachers regarding the use of the flipped teaching strategy in a technology integration course? The answer to this question attempts to recognize the perception of preservice teachers’ toward the use of flipped teaching strategy in the technology integration course. The answer will help instructors and trainers to use the appropriate teaching strategies for students with different learning preferences. Particularly, the question focuses on whether learners will perceive the flipped teaching method positively or not.

Research Hypotheses:

In this study, the investigators hypothesize that:

- The flipped teaching strategy will improve preservice teachers’ learning outcomes in a technology integration course and adolescent development courses.
- The flipped teaching strategy improves preservice teachers’ self-efficacy in a technology integration course.
- The majority of preservice teachers will prefer the use of flipped teaching strategy in a technology integration course.

3. Methods

This study employed a within-subject design to assess the effect of using the flipped teaching method on preservice teachers’ learning outcome and self-efficacy in technology integration courses. The study has one independent variable: the teaching method (lecture-based or flipped-based method) and two dependent variables: (1) learning outcomes (2) students’ perception of self-efficacy to integrate technology in teaching.

The participants in the first group were sixty preservice teachers (39 undergraduates, 21 graduates), enrolled in technology integration courses at a Midwestern university. Participants were non-science majors and attending three sections: section one: 19 undergraduate students, section 2: 20 undergraduate students and section three: 21 graduate students (10 male, 50 female). Students were from four different majors: 32 in early childhood education, 2 in elementary education, 14 in middle-level education, 9 in high school education and 3 other education major such as physical education or speech/theater. English was reported as the native language of all participants. The average reported age of the participants was 22-25 years (SD = 1.415 years). Participants were 53 White, 4 African American, 1 Hispanic and 1 Asian, among them 4 freshmen, 11 sophomores, 23 juniors, and 22 seniors.
Participants in the second group which only addressed learning outcomes were 55 undergraduates enrolled in an adolescent development course at the same Midwestern university. Participants were preservice teachers attending two sections: section one 25 undergraduate students (15 males, 10 female), section 2: 30 undergraduate students (18 male, 12 female). Students were from 3 different majors: 29 secondary, 25 other, and 1 elementary education. The average reported age of the participants was 18-21, among them 13 sophomores, 27 juniors and 15 seniors.

The lessons and activities used in the first experimental group of participants were adapted from the textbook “Integrating Educational Technology into Teaching” by Roblyer and Doering, Sixth Edition (2012). Participants were taught with two different teaching methods: the traditional lecture-based method to teach one topic: learning with technology in special education and the flipped-based method used to teach four topics: Technology tools for 21st century teaching, hypermedia tools for 21st century teaching, distance teaching and learning and the role of the internet and developing and using web-based learning activities and teaching.

The lessons and activities used in the second experimental group(s) of participants were adopted from the textbook “Adolescence” by Santrock Fourteenth Edition (2012). Both groups of students covered the same material over the same period of time. The first group (control group) was taught utilizing a standard lecture followed by an activities format. The second group was taught utilizing a flipped classroom strategy.

4. Materials

All learning materials used in the flipped teaching method, including videos, post-tests and surveys were online as part of the Blackboard course content and released to students every week based on the topic covered in that week. The instrumentations consisted of the following items in the first group of participants: demographic survey, 10-question multiple-choice post-test for each of the five learning topics, 10-question 11-level Likert scale to assess students’ perceived self-efficacy based on Bandura’ measure (Bandura, 2006). All learning measures were selected or developed by the course instructor and were used regularly with students attending the technology integration courses and adolescent development courses.

Pre-test

Demographic survey: This questionnaire was designed to collect information about the participants’ makeup, such as students’ gender, years in college, area of specialization and age.

Students’ self-efficacy survey (pre and post): This questionnaire was designed with 11-point scale ranges from "Cannot do at all" at zero to “Highly certain can do" at 100. Students were asked to answer how confident are they in their belief that they have this ability". For example, in question number three, students were asked the following question: “How certain are you that you can identify and use technology tools and information resources in your content area to increase productivity, promote creativity, and facilitate academic learning. Rate your degree of confidence by recording a number from zero to 100 using the scale given below”.
Implications of Flipped Instruction

Participants could rate their confidence by selecting a number starting from zero "Cannot do at all" to 100 “Highly certain can do”.

The investigators developed the self-efficacy measure based on Bandura’s “Guide to the construction of self-efficacy scales” in (Pajares, 2006). The measure was tailored to assess students’ ability to integrate technology into their teaching. The initial ratings of the measure indicated that all items adequately reflect and assess the topics covered in all conditions and the scores averaged across the 10 items. Mean for the total sample $M = 83.00$, $SD = 11.30$, range $= 8.38$. The investigators calculated the inter-rater reliability of the measure by intra-class correlation coefficients to evaluate the consistency of the ratings. The reliability for the measure Cronbach’s alpha (an estimated of internal consistency) was .92 (across all sections). Further, the investigators used this measure as self-efficacy assessments in other classes related to teaching technology for preservice teachers (face and construct validity). Finally, the investigators examined the measure’s scale results and scale results of other concepts in the technology integration courses such as computer-assisted instruction, virtual classroom and course management system, and found that the results of this measure significantly correlated with the results in other concepts and Cronbach’s alpha was .88 (criterion-related validity).

The second group, adolescent development courses, were given pre- and post-tests over material covered within the indicated time span. Students in both sections covered the same material. Their demographics was also recorded to be included in the analysis and interpretation. Data was analyzed using ANCOVA and Correlation Coefficient Analysis.

Post-test

The learning outcome test measure consisted of five quizzes covering five different learning topics to elicit participants’ retention and transfer of knowledge of these topics. The five topics were: learning with technology in special education (lecture teaching method), technology tools for 21st century teaching, hypermedia tools for 21st century teaching, distance teaching and learning and the role of the internet, developing and using web-based learning activities and teaching (flipped teaching method). The questions about these measures were based on the topics covered in this experiment. An example of the multiple-choice questions in the topic “learning with technology in special education” is: “Technology offers potential to help address this characteristic, which arises when an individual is unable to fulfill a role due to a limiting condition:” Participants could choose from the following responses: “Impairment, handicap, disability, or deficit”. Another example of a multiple-choice question in the topic “hypermedia tools for 21st century teaching”: “In this system, as originally conceptualized by Ted Nelson, items of information from all over the world could be logically connected with links”. Participants could choose from the following responses: multimedia, hypertext, hypercard, linkway. Each correct answer yields 1 point, for a total of 10 points and scores ranged from zero (no correct responses) to 10 (all correct responses) for every quiz.

The retention and knowledge transfer measurements developed by the textbook’s author, were selected, and reviewed by the course instructor to assess participants’ understanding and application of the five topics. The initial ratings of the measures indicated that all quizzes adequately reflected and assessed the five topics covered in this study.
Materials

The learning materials used in the present study were five topics to help preservice teachers integrate technology in teaching. The materials were identical in all sections and released every week with the related activities. There were two different teaching methods: traditional (lecture-based) and flipped. Traditional method was based on lectures and direct teachings conducted by the instructor and the information was delivered during the meeting, while students listened to lectures and learned from them. In this method, the lesson's content and delivery was the most important aspect of instruction and students learned knowledge through the assignments completed at home. For example, to teach the topic “learning with technology in special education”, the instructor lectured about the topic and used a power point presentation during the class time and covered the following points: Introduction to special education, current issues in the use of technology in special education, effective ways for technology to be integrated into special education and the Tech-PACK needs and challenges in special education. Students in all sections attended the class in a computer lab and worked and submitted their work through computers.

The assignment of this teaching strategy was based on lecture notes and the textbook. The assignment was in the form of essay questions and students had to complete all work at home with no help except from their notes. For example, an assignment asked students to review the teaching notes and textbook (pages, 398 -400) regarding impairment, disability and handicap. Students were asked to “explain in no less than 600 words the difference between Impairment, Disability and Handicap with examples for each definition.

In the flipped teaching strategy, the instructor did the following: Students read the chapter or online materials before class (at home). For the difficult points, students were asked to watch a video or screencast. To insure that students completed the assigned readings or videos, the instructor conducted a Q & A in the first five minutes of the class and then the assigned topic was introduced in another five minutes. The instructor dedicated the class time for hands-on activities. Students worked through activities related to the assigned topic with the guidance of the instructor and the support of their peers. In this method, the instructor emphasized collaborative learning and students had the opportunity to ask questions to the instructor and their peers as well. For example, in the flipped teaching strategy, the instructor started the topic “Distance teaching and learning and the role of the Internet”, by asking students questions based on the home reading such as why teachers should develop rationale to use internet or what are some of the internet’s problem areas teachers have to address before using the internet for teaching and learning. Students’ answers included, accessing sites with inappropriate materials, safety and privacy issues for students, fraud, computer viruses and hacking, and copyright and plagiarism issues. After the Q & A, instructor introduced the topic using a short power point presentation and covered the following points: Distance education: an evolving use of the internet, developing an internet use rationale, using and implementing the internet effectively: navigation, searching and storing, communicating and social networking. After the Q & A and the topic introduction, students were guided to complete hands-on activities related to the week’s topic. For example, student were asked to develop a WebQuest including: deciding the lesson to be taught through the WebQuest, using Google to collect the information web links, images and
Implications of Flipped Instruction

videos and finally creating a free website for the WebQuest that includes these pages: Introduction, Task, Process, Resource, Evaluation, Conclusion and Teacher Page. During the activity, students were free to ask for help or ask questions of their peers or instructor.

Procedure

First, students in all sections completed demographic and self-efficacy surveys. Second, the instructor used the flipped-based method to teach four topics in four consecutive weeks to all sections. In the fifth week, instructor used the traditional lecture-based method to teach one topic to all sections. At the end of every week students completed a quiz related to the week’s topic and at the end of the fifth week, students completed self-efficacy survey (post). All surveys and learning activities were presented and submitted through Blackboard.

The students in the adolescent development courses also completed the demographic survey and were given a pre-test over the material to be covered during a three week time period. This included three chapters from the text. To insure that students completed the assigned readings or videos, the instructor administered a quiz the first five minutes of the class and then the assigned topic was introduced in another five minutes. One group then followed the lecture-based teaching strategy, while the other group was exposed to the flipped learning strategy. At the end of the three week time period students were given the post-test (identical to the pre-test).

5. Results

Prior to the main analyses, the data was screened for normality, out-of-range responses and systematic patterns of missing values. It was found that the data is normally distributed with no apparent patterns or clusters emerging.

First question: To answer the first question: Will the flipped teaching strategy improve preservice teachers’ learning outcomes compared to lectures-based teaching strategy in a technology integration course?”

To answer this question, the investigators conducted a paired-samples t-test to compare students mean test scores in the two conditions flipped and lecture-based. The analysis show that there were significant differences in the students’ mean test scores in all flipped teaching method test scores: Test 1 (M=6.61, SD=1.62), test 2 (M=11.48, SD=4.44), test 3 (M=5.56, SD=1.42), test 4 (M=6.79, SD=1.76) compared to lecture-based mean test scores (M=9.4, SD=1.14) conditions; \( t(30)=8.399, p = 0.001 \), \( t(30)= 9.017, p = 0.001 \), \( t(26)= 5.498, p = 0.001 \), \( t(28)= 8.681, p = 0.001 \). These results suggest that the flipped teaching strategy does have positive effect on preservice teachers’ test scores in a technology integration course. Specifically, our results suggest that when students engage in class activities using the flipped teaching strategy, the test scores improved. Table 1 summarizes the paired-samples t-test results.

10
The results from the adolescent development groups suggest that the flipped teaching strategy does not have a significant positive effect compared to lecture-based mean test scores.

Second question: Will the flipped teaching strategy improve preservice teachers’ self-efficacy in a technology integration course?

To answer the second question, the investigators conducted a paired-samples t-test to compare students’ self-efficacy mean scores before and after using the flipped teaching strategy. The analysis show that there were significant differences in the students’ self-efficacy mean scores after flipped teaching strategy (M=830.00, SD=113.014) compared to before the use of the flipped teaching strategy (M=737.30, SD=170.516); \( t(36) = -4.652, p = 0.001 \). These results suggest that the flipped teaching strategy has a positive effect on preservice teachers’ self-efficacy in a technology integration course. Specifically, our results suggest that when students engage in class activities using the flipped teaching strategy, their confidence to apply what they learn improved. Table 2 summarizes the paired-samples t-test results.

Note: Significant at \( p < 0.001 \) level

Third question: What is the perception of preservice teachers regarding the use of the flipped teaching strategy in a technology integration course?
To answer this question, the investigators collected data from 60 students through answering 12 questions to assess their perception on the flipped teaching strategy. The results were reduced to three answers regarding favoring the flipped teaching model (Agree, Disagree or Neither agree or disagree). The number of responses from the 12 questions were 452 (62.9%), disagree 104 (14.5%) and neither agree or disagree were 163 (22.7%). Figures 1 summarizes statistics of students’ responses.

6. Scientific or scholarly significance of the study or work:

The main finding of this study is that the use of the flipped teaching strategy indeed has the potential to help preservice teachers to improve their learning outcomes in the technology integration course. This benefit demonstrated by the statistically significant differences in learning outcomes between students taught by flipped and lecture-based teaching strategies, with the highest scores achieved by students in the flipped condition and the least was in the lecture-based condition. The results of the present study support previous findings produced in the context of other content areas and with different population and provide empirical evidence that validates the flipped teaching strategy ability to improve students’ learning outcomes (Sadaghiani, 2012; Sparks, 2013; Walker, 2011). Specifically, the preservice teachers' test scores improved in all tests after they engaged in flipped teaching activities compared to their test scores after lecture-based activities. A possible interpretation of this result is that students during the flipped classroom had the opportunity to work together and engage in hands-on learning activities, which allowed them to participate in an authentic and collaborative learning environment. According to prior studies, the effectiveness of the flipped classroom on student learning is due to the additional opportunities for students to collaborate and work on problem solving together (Demetry, 2010; Strayer, 2007).

Furthermore, assigning multimedia learning materials for students to review outside the classroom allows them to learn content at their own pace and permits them to view and listen again to those sections that present important or complex concepts (Gibbons Jf, 1977). This interpretation is consistent with prior cognitive research, which noted the positive effect of allowing students to control the pace or stream of learning content. If students lack control over the pace of the learning content, this might burden their limited cognitive resources, especially learning from multimedia materials. According to cognitive theory of multimedia learning
Implications of Flipped Instruction

(CTML), the human cognitive system can process only small portions of the large amounts of visual and auditory stimuli received. Unlike processing printed text, learners in formal educational contexts typically do not have the opportunity to stop the multimedia presentation and reflect on what they are learning and identify potential gaps in their knowledge. Thus, information processing in this situation frequently requires longer and more intense periods of cognitive and metacognitive activity. Regardless of the amount of information presented in each sensory channel, the learner’s working memory (WM) will accept, process, and send to long-term memory (LTM) only a limited number of information units (Attneave, 1954; Jacobson, 1950, 1951). Thus, working memory requires pauses or direct prompting to accept, process, and send to the long-term storage only the most crucial information (Clark, Nguyen, & Sweller, 2006).

Another significant finding of this study is that students’ self-efficacy perception was significantly improved after engaging in flipped teaching strategy compared to their self-efficacy perception after lecture-based. This benefit demonstrated by the statistically significant differences in the reported self-efficacy scores after the flipped activities compared to lecture-based, with the highest scores reported by students after the flipped activities and the least was in the lecture-based.

A possible interpretation for this result is that the flipped teaching activities promote students’ cognitive engagement and help them to interact more efficiently with learning content than in the lecture-based teaching activities (as reflected by the higher test scores in all tests after flipped teaching strategy) and consequently improved and promoted their self-efficacy perception. This interpretation is consistent with prior self-efficacy research. According to this theory, self-efficacy reflects what individuals believe they can do with the skills they possess and they can accomplish.

Finally, this study found that preservice teachers favor the use of the flipped teaching strategy in a technology integration course compared to the lecture-based teaching strategy and this was demonstrated by the statistically significant differences in the number of students who were in favor of the flipped strategy compared to lecture-based, with the highest numbers for the flipped strategy and the least was for the lecture-based (452 vs. 104) or (62.90% vs.14.50%).

A possible interpretation for this result could be found in students’ rationalizations in the perception survey. Although the majority of students who preferred the flipped classroom indicated that it promotes collaboration and hands-on activities during the class time, other students have different reasons such as: “had less lecture time”, “work at my own pace”, “using technology”, “being able to interact more with the teacher and being able to ask questions as I worked” and “we do not have to sit and listen to an hour long lecture that goes in one ear and out the other one”.

Although opinions tended to be positive, there were invariably a few students who strongly disliked the change. One very interesting case was a student reported that she dislike the flipped teaching model because “Everyone asking questions. I wasn't able to concentrate and do my work in the classroom. I am a very ADD person. I have to be somewhere without distractions to do well”. Although this student reported her dislike of the flipped teaching model, she received higher grades in all the quizzes completed after flipped classes were compared to her quiz grades after the lecture-based class.

Abstract

The aim of this paper is to empirically examine whether different listening speeds have any effects on different levels of Japanese EFL listeners in filling the recognition gap between content and function words in English. English is a stress-timed language and its prosodic structure is featured by the alternation of weak and strong syllables. This means speech length or duration time in spoken English differs greatly from that in written English since weak syllables are pronounced short or occasionally omitted. Function words usually consist of these weak syllables so that Japanese EFL learners, who have a syllable-timed language as their native tongue, presumably find it harder to recognize them in connected speech. The logic is that Japanese EFL learners expect those weak syllables to be pronounced the same length as they are in written forms or in their native language. To confirm this, an experiment was conducted and the results show that function words are significantly more difficult to recognize than content words across all listening comprehension levels and listening speeds. However, they also show that slower listening speed has a role to play in closing top-level listeners’ recognition gap between content and function words.

Introduction

The aim of this paper is to empirically examine, if there is a recognition gap in listening by Japanese EFL learners between content and function words and how different listening speeds affect listeners’ word recognition, especially the gap in lexical recognition between content and function words, depending on their listening comprehension levels. The definitions of content and function words are first discussed, followed by general look at the literature concerning why word recognition in listening
matters. After the brief look at the literature pertaining to the differences in listening processes between content and function words and to the prosodic features of English, research questions are raised and experiments conducted. Finally, following discussion, conclusions are drawn and pedagogical implications referred to.

**Content and Function Words**

English words fall into a number of grammatical classes and grammarians have long found it useful to identify two categories of lexical unit: content words and function words. The former group includes nouns, adjectives, adverbs, and verbs, which have context-independent meaningful content, whereas the latter includes prepositions, pronouns, determiners, conjunctions, modal auxiliary verbs, and primary verbs, which principally exercise syntactic functions (Cutler, 1993; Quirk, Greenbaum, Leech, & Svartvik, 1985).

**Importance of Word Recognition in Listening**

L1 speakers of English is said to identify word boundaries by relying on such cues as prosodic and phonotactic patterns of the language (Saffran, Newport, & Aslin, 1996). However, lexical segmentation in L2 listening from connected speech is no easy matter. Field (2003) argues that finding where the word boundary falls is a greater problem for L2 listeners than is generally recognized. In addition, Rost (2002) mentions that, in listening to continuous speech, there is no auditory equivalent to the white spaces between words found in continuous written text and no reliable cues marking word boundaries whatsoever. Word recognition is, therefore, an approximating process marked by continual uncertainty. He also insists that recognizing words in connected speech is a very basis of spoken language comprehension and that the development of automaticity of word recognition is a critical aspect of language acquisition.

Rost (2002) further insists that exposure to speech during childhood alters neural organization so that individuals, born capable of listening and speaking any language, develop perceptual and cognitive processes specialized only for their native language. This means that adult L2 learners may find it difficult to segment L2 speech into words and that different phonemes in L2 can sound as if they are the same. Rost (2002) also refers, as one of the intriguing aspects of auditory decoding, to allophonic variations (e.g. *gonna*), which are alternate pronunciations of citation forms; that is, pure forms uttered in isolation (e.g. *going to*). These allophonic variations occur due to context and efficiency principles in production. They are brought about through co-articulation processes of assimilation, vowel reduction, and elision, which shorten both production and reception time. These simplifications make continuous speech more efficient in both
production and perception, but this only holds true for native speakers of the language. L2 listeners often find these co-articulation processes difficult to process, particularly if they have learned the written forms of the language and citation forms of the pronunciations of words in the language before they have begun to engage in natural spoken discourse, just as Japanese EFL learners do.

Vandergrift and Goh (2012) also claim that the major challenge in listening for L2 learners is segmentation of sound stream into words. Listeners do not have any cues, like the spaces in reading, which would help them recognize word boundaries. They assert that phonological features in English, stress patterns, elisions, schwas, and other reduced forms make it all the more difficult for L2 listeners to recognize words. Even if they recognize individual words, when spoken in isolation or presented in written forms, L2 listeners may not be able to recognize the same word in connected speech. Moreover, in order for the listener to be successful in word recognition, they need to activate prior knowledge such as related schema and grammatical knowledge and to make use of top-down processing such as inferencing strategies. However, a certain threshold of accurate linguistic recognition, information from bottom-up processing, needs to be attained before listeners successfully use top-down processing to compensate for gaps in understanding. This threshold of information from bottom-up processing that enables listeners to utilize top-down processing remains to be explored.

When content and function words are recognized, different subparts of the brain are activated, depending on whether the tasks are semantic or syntactic (Friederici, Opitz, & Cramon, 2000). Field (2008) also says that children learn to recognize function words rather early but only later can they fully utilize them despite their frequent appearance in everyday discourse, because content and function words are dealt with differently in the brain.

Concerning this, Vandergrift and Goh (2012) state that it is not surprising for content words to be more easily recognized in listening by L2 listeners, since content words have meanings and listeners have to be selective in paying attention because of their limited working memory and because content words are often identifiable by stressed syllables.

Takanashi (1982) concludes that recognition of weak syllables correlate positively with listening comprehension scores and that recognition of weak syllables and reduced forms is essential for successful word recognition. Yonezaki (2014) also suggests that Japanese EFL learners, even though they are excellent readers, perform badly in listening because of their poor recognition of function words.
Recognition of Content and Function Words and English Prosodic Structure

The phonemic system of English is quite different from that of Japanese. In addition, most of the Japanese words are made up of open syllables and almost every consonant is followed by a vowel, while in English closed syllables are the norm and many basic words end with a consonant. Therefore, consonant clusters, which are not uncommon in English, rarely appear in Japanese. On top of that, English, a stress-timed language, in which strong and weak syllables alternate, has a very different prosodic structure from that of Japanese, a syllable-timed language, in which each syllable has the same length and strength.

Ur (1984) holds that L2 listeners have difficulty with the sequences and juxtapositions of sounds typical of English words, particularly with consonant clusters. He also claims that L2 listeners are not used to the stress and rhythmic patterns of English, that is alternation of strong and weak syllables, and also confused by unfamiliar English phonemes that are nonexistent in their L1 or by the fact that some allophones in their L1 are found in English as two different phonemes. In particular, Ur (1984) cites the following speech as an example of stress-timed rhythm; it takes roughly the same to say ‘the CAT is INTERested in proTECTing its KITTens’ as it does to say ‘LARGE CARS WASTE GAS’ (p. 13), since they both have 4 strong syllables, even though the number of total syllables each sentence contains, 14 and 4, is very different. This is the characteristic of the English rhythm, which makes listening to and understanding English oral discourse difficult. In another language, it takes twice as long to pronounce a phrase that has twice the number of syllables.

Grosjean and Gee (1987) conducted gating experiments. The results and the conclusions they drew can be summarized in the following four arguments.

1. Lexical search in the speech stream does not follow the process of written dictionary units getting recognized sequentially, left to right, one word at a time but the lexical access is based on a tightly bound phonological unit, or a phonological word that is made up of one stressed syllable and a number of weak (unstressed) syllables that are phonologically linked to it. The boundaries of phonological words are not always the same as those of syntactic structure.

2. The weak syllables in the phonological word may be the unstressed syllables of a content word, affixes attached to a stem, clitics attached to a content word, reduced function words lexically attached to a content word, or function words phonologically linked to content words. In segmenting the speech stream into a string of words, the knowledge of phonotactic and morphophonemic rules is used, and, based on the information retrieved from the knowledge, a content word,
which contains a strong syllable, is searched first and then a number of function words on either side of the content word are recognized.

3. Lexical access, in parsing the speech stream into words, is done through two types of analyses. On the one hand, the processing system searches for stressed syllables and uses these to initiate a lexical search. On the other hand, the system identifies the weak syllables on either side of the stressed syllable by subjecting them to a pattern-recognition-like analysis. These two types of analyses constantly interact with one another and the speech stream is segmented into a string of words with constant help from other sources of information and listeners’ linguistic and situational knowledge including that of grammar, syntax, and schema.

4. Of the two types of analyses, the one initiated by the search for stressed syllables is the more complex than the other type, in which weak syllables, function words, and other affixes are searched for, because in the former analysis the mental lexicon that has to be searched for is larger and there are many more possible candidates. On the other hand, mental lexicon to be searched for function words is smaller. In addition, the system often refers directly to a separate lexicon specifically stored for such function phrases as ‘might’ve been’ and ‘out of the’, which is located apart from general lexicon, independent of the other lexical search for content words. This separate lexicon allows more direct recognition so that the search for function words is faster.

Eastman (1993) further claims that the two-way lexical search model based on prosodic structure, which was presented by Grosjean and Gee (1987), shows difficulties that syllable-timed language speakers have in listening to English and also pedagogical clues. His arguments are as follows.

1. Of the two systems stress-timed language speakers use in parsing the speech stream into a string of words, the one shared by syllable-timed language speakers is the system in which lexical access is initiated by a search for a content word that contains a stressed syllable. The other high-speed and pattern-recognition-like search system for weak syllables on either side of a strong syllable does not exist. Therefore, L2 listeners whose L1 is syllable-timed depend more on content words in parsing the speech stream. In order for them to recognize function words, the high-speed and pattern-recognition-like search system must be developed.

2. In a stress-timed language, function words are reduced to weak forms and often with phonetic changes including assimilations and elisions. Vowels are reduced to schwas or occasionally totally eliminated, which is a difference not only between speech and written language in English but also between speech in English and spoken language in a syllable-timed language. L2 learners of English whose L1 is syllable-timed pronounce every word literally, reproducing every phoneme and
syllable, and stressing all syllables or avoiding distressing them while speaking. This in turn illustrates how these L2 learners listen, attempting to reconstitute unstressed syllables to their full salient form. They attempt to listen to unstressed syllables and weak forms just the way they do to content words which contains a stressed syllable. Especially, schwas, which appear frequently in English, are most challenging. All these are due to the fact that they lack the high-speed and pattern-recognition-like search system for unstressed syllables. As a consequence, this reconstituting process occupies their mental energy and diverts attention away from recognizing even content words, thereby reducing the amount of words they can identify, which leads to unsatisfactory comprehension.

**Literature Review on the Difference in Lexical Recognition Between Content and Function Words**

From the discussion above, it can be assumed that, for L1 speakers of a syllable-timed language, recognition of English function words, which mostly consist of unstressed syllables, are more challenging than that of content words. Voss (1984) and Pemberton (2004) carried out the research on the recognition gap between content and function words. In Voss’ study, participants’ L1 was German while Pemberton’s study was conducted in Hong Kong. In Voss (1984), the number of errors involving function words is greater than that of content words and Pemberton (2004) reported very little difference between recognition rates for function and content words. However, in these two studies, participants’ L1 was not syllable-timed and they were allowed to rewind and listen to the text as often as they wished. This opportunity for recursion means the levels of accuracy and types of errors might have been different from those that could be obtained in real life.

On the other hand, Field (2008) examined, under a more real-life circumstance, whether there was any significant difference in recognition rates between content and function words. Those who participated in the Field’s study had various languages as their L1.² Field claims that the two-way lexical search model, in which recognition of content words takes a different route from that of function words, is beneficial for L1 speakers of English. In search of content words in the sound stream, a wide range of lexical candidates must be accessed before one that accords with the context is chosen, while a simple pattern match is all that is required in order to identify function words. Function words appear quite frequently and potential candidates are not more than 300. Therefore, listeners do not need to give any consideration to their senses. On the other hand, in speech, vowels of function words are often elided and consonants not very clearly pronounced, making recognition of these weak syllables challenging. Thanks to
this alternation of stressed and unstressed syllables, however, L1 speakers find it easy to understand the connected speech. Given this seemingly contradictory traits of function words, Field (2008) conducted experiments, using both L1 and L2 speakers as participants, examining which of these two traits shared by function words, high frequency vs. weak perceptibility, has more profound effects on L2 listeners.

In Field’s study, pauses were inserted into the recording at irregular intervals and whenever a pause occurs, participants were asked to transcribe the last few words. In addition, participants were allowed to listen to the recording only once, without the possibility of rewinding, just as they do in real life. The non-native and native participants were divided into two groups respectively according to their English proficiency levels so that there were four groups altogether.

The results of the study found no significant difference in recognition between content and function words for both native groups, but for L2 listeners, recognition of function words were significantly more difficult than that of content words regardless of their English proficiency levels. In the study, correlation between English proficiency levels of L2 listeners and their accuracy in recognition of content and function words were also examined. Correlation of accuracy in word recognition with English proficiency was significant for both content and function words, which means that the higher their English proficiency level, the more accurately they can recognize both content and function words. However, the recognition gap between content and function words did not become smaller as their English proficiency level went up. Furthermore, the correlation of accuracy in recognition of function words with English proficiency was less strong than that of content words. In other words, as L2 learners of English became more proficient in the language, their recognition of content words in listening became more accurate. This was also the case with function words, but the relationship was not so linear as in the case of content words. This indicates that there would be another factor involved in the process of function word recognition. Field (2008) says that as L2 learners’ listening vocabulary becomes larger, recognition of content words improves, but that this is not the case with function words. He concludes that recognition of function words in listening is more challenging than that of content words regardless of learners’ English proficiency.

**Hypotheses Drawn From the Discussion Above**

Based on the discussion above, the following hypotheses have been drawn concerning the recognition of content and function words by Japanese EFL listeners.

1. As Eastman (1993) claims, of the two lexical search systems shared by L1 speakers
of stress-timed languages including English, Japanese EFL listeners, whose mother tongue, Japanese, is syllable-timed, lack the high-speed and pattern-recognition-like search system for function words. Therefore, it is challenging for Japanese EFL listeners to recognize function words in the speech stream.

2. Since the process of recognizing function words in the connected speech thus involves a different system than the one used in recognizing content words, in case of Japanese EFL learners, recognition of content words in listening may become more accurate with the improvement of their English proficiency, but as for function words, accuracy does not improve so much as it does for content words. This means that the gap in lexical recognition in the speech stream between content and function words is near constant and does not get closer as the listener’s English proficiency improves.

3. What is a factor or factors that might influence word recognition, especially recognition of function words, in listening? One plausible approach would be to add listening speeds (speech rates) as a variable in order to increase the amount of information that listeners can pick up through the bottom-up processing from the sound stream. A slower listening speed might have an influence on lexical access by the listeners.

4. If a slower listening speed leads to a better lexical recognition, the increased amount of information through the bottom-up processing might initiate the top-down processing that would have otherwise never happened. Thanks to this activation of top-down processing, there is a possibility for Japanese EFL listeners to improve word recognition in the speech stream, especially the recognition of function words that they have found very challenging.

Given the hypotheses above, an experiment was conducted in the present study to address the following three research questions.

Research Questions

1. Is recognition of function words more challenging than that of content words for Japanese EFL listeners?

2. Is there any relationship between English proficiency, especially listening comprehension, and accurate recognition rates of content and function words in the connected speech? Is the gap in lexical recognition in the speech stream between content and function words near constant across all listening comprehension levels and do even advanced-level listeners find recognition of function words challenging?

3. How does the difference in listening speeds affect the respective accuracy in lexical
recognition of both content and function words? Are listeners belonging to a different listening comprehension level affected differently?

**Research Design**

**Participants**

158 third-year and fourth-year technical college students in Japan, majoring in engineering, participated in the study. Of them, 39 were third-year students and the remaining 119 were fourth-year with 126 male and 32 female students. Data from the participants who were absent either from the listening comprehension test or from the test of paused transcription and those of exchange students were removed and the data from the remaining 142 participants were analyzed. They speak Japanese as their first language. Their proficiency levels of English were estimated using the reported Test of English for International Communication (TOEIC, developed by Educational Testing Service) score, $M = 395.71$, $SD = 119.97$.

**Materials**

For the preliminary test of listening comprehension aimed to divide the participants into 3 groups according to their listening proficiency, the second and pre-second grade STEP (Society for Testing English Proficiency, 2004) listening tests consisted of 60 questions, 30 questions for each grade, were adopted.

For listening material of the transcription test to measure the participants’ lexical recognition, one dialogue and an expository text recorded by English native speakers, adopted from ‘Kyukyoku-no-eigo-listening (Ultimate English listening)’ series level 1 (published by ALC Press), the texts of which are written, using the 1000 most commonly used words in the graded vocabulary list of Standard Vocabulary List 12000 (SVL 12000), developed by ALC Press Inc, were used. The listening speed or the speech rate of the material (standard speed) was 157 w.p.m. on average, 178 w.p.m. for the dialogue and 141 w.p.m. for the expository text.³

On adopting the above-mentioned materials, participants’ level of English proficiency, their average score of a little less than 400 in a TOEIC test and the fact that about half of the participants had passed the pre-second grade STEP test, was taken into consideration. Especially, as for the transcription test, the listening texts made up only of the most basic 1000 words on the SVL list of 12000, the first level on the list’s scale of 1 to 12, was used to ensure that the participants of the above-mentioned level could
recognize every word in the texts if given the written version of the test. All the words in the texts were so commonly used that the students in Japan should learn while in junior high school or in the first year of senior high school. Therefore, if given the written scripts of the listening tests and asked to recognize the words, the participants would have had no trouble recognizing and understanding them.

Method

The transcription method used in the present study was paused transcription, as was the case in Field (2008).

The participants listened to the recordings only once without any possibility of rewinding and were told beforehand that there would be pauses inserted at irregular intervals. They were asked to write down the last four to five words they thought they heard before the pause, every time the pauses occurred. Each pause lasted about 10 seconds. Short sections of four to five words were targeted with a view to limiting possible working memory effects. The length of the pauses, 10 seconds, was designed to ensure that it would give enough time for the participants to write down five and not six or more words at average writing speed. The aim was to prevent them from attempting to recall larger sections of the text and in the process reducing the accuracy of their responses. This expedient also ensured that the participants did not have time to review their answers once they had written them down. Furthermore, the general specification of four to five words was used so as not to create unnecessary cognitive demands by encouraging participants to count the number of words to be transcribed.

As a means of testing word recognition in listening, cloze tests, which are more common, were not adopted to ensure that the participants not be given any additional cues such as word boundaries and the context. There is also psycholinguistic evidence (Jarvella, 1971) that we briefly retain a verbatim record of the words we hear until the onset of the next clause. The method in the present study was adopted to ensure that the participants should be listening the way they would in real life and it was judged to be a suitable one to test word recognition in the natural sound stream.

Quirk et al. (1985) was referred to as it was in Field (2008) to distinguish content words from function words. Content words include nouns, adjectives, adverbs, and verbs, and function words are prepositions, pronouns, determiners, conjunctions, modal auxiliary verbs, and primary verbs (such as be, have, do).
Procedures

The 142 participants were grouped into two, according to the listening speed, the standard-speed group \((n = 73)\) and the slower-speed group \((n = 69)\), who listened to the recording made mechanically slower, at 0.7 times the rate of the normal speed. Following this grouping, the preliminary listening comprehension test was given to divide the participants into different groups, depending on their respective proficiency in listening comprehension.

The participants were grouped into three, with their proficiency in listening rated as high, medium, and low, on the basis of the deviation values \((DV)\) of the listening comprehension test. As a result, 42 participants belonged to the high-proficiency group \((DV \geq 55)\), 56 to the medium-proficiency group \((55 > DV \geq 45)\), and 44 to the low-proficiency group \((45 > DV)\). Therefore, the participants were grouped into six in total, according to the listening speeds and their proficiency in listening. Table 1 shows the respective number of participants in each group and the listening speeds (w.p.m.).

Function words are in italics.

No. 1 to 8 are the sections from the dialogue and 9 to 16 from the expository text.

Pauses were inserted in the same place in the same text across all these six groups and participants transcribed the last four to five words they heard before each pause. They were also asked not to use *katakana* when they were unsure of the spellings, but to use alphabets they thought they had heard. Pauses were inserted 16 times, 8 each for the
dialogue and the expository text. Judgment of whether the participants’ handwritten responses were accurate or otherwise was limited to the last four words before each pause. Therefore, 64 items, four each for every pause (16 times), were the maximum accurate responses possible. Of the 64, 28 were content words and the remaining 36 were function words. Sections of recordings targeted for transcription are shown in Table 2.

In the present study, content and function words were classified based on Quirk et al. (1985). Due to the contextual and syntactical functions, however, No. 2 ‘all’ and No. 5 ‘here’ were judged to have meaningful content and to be stressed, so that they were classified as content words, whereas No. 13 ‘there’ and No. 15 ‘none’ were judged to be functional and so unstressed, getting classified as function words.

In the judgment of accuracy for participants’ transcription of acoustic information, the following were considered.

1. Each target item in the written responses was recorded as either accurate or inaccurate and if there were wrong lexical segmentations, that is, if word boundaries were incorrect, they were recorded as incorrect across all the word items involved (e.g. the river → for ever, were tents for camping → wonst on care, none of → nana).

2. If they segmented a particular item correctly and phonemes were recognized and distinguished accurately (e.g. l/r, b/v), that target item was regarded as accurate transcription of the speech and orthographic variants were recorded as correct (e.g. beautiful → beutiful, basket → bascket, camping → kamping).

3. As to the conjugal suffixes of content words, these suffixes are quite functional so that, from the perspective of accurate or inaccurate recognition of content words or stressed syllables in the present study, the attitude to inflection should not be prescriptive so that lexical words which were identified accurately but wrongly inflected were treated as correct answers.

4. Of the four words which should be transcribed in a particular targeted section, when a blank in the first item, in the last item, or in the middle of the section was found, the remaining transcribed item or items, if they were accurately identified, were treated as correct answers.

5. If the respondent had written words which fell outside the targeted string in question, that is the fifth or farther words from the pause, or if an unnecessary word or words had been added between items in a particular targeted section (e.g. by car → by a car), then those words were counted out.45

All the data were computed into the percentage of accurate word recognition, with the
number of items (content and function words) correctly identified being the numerator and the total number of items in all the sections targeted for transcription (28 content and 36 function words) the denominator.

Descriptive statistics of the preliminary listening comprehension test (Cronbach’s $\alpha = .82$) is shown in Table 3. Means of the six groups are shown in the graph (Figure 1). Based on these data, a two-way (proficiency in listening / listening speeds) between-subjects-design ANOVA was conducted (Table 4).  

![Figure 1](image)

*Figure 1. Comparisons in means of the six groups in the preliminary listening comprehension test.*

The results of the ANOVA demonstrated that the interaction ($F(2, 136) = 1.184, \ p = .309, \ ns, \ partial \ \eta^2 = .003$) and the main effect in listening speeds ($F(1, 136) = 1.062, \ p = .305,$
ns, partial $\eta^2 = .001$) were not significant and that only the main effect in proficiency in listening ($F(2, 136) = 305.722, p = .000 < .001$, partial $\eta^2 = .806$) was significant. The results of multiple comparisons in proficiency in listening (Tukey-Kramer Method) are summarized in Table 5.

***: p < .001, *: p < .05

The results of the ANOVA demonstrated that a significant second-order interaction was found ($F(2, 136) = 4.102, p = .019 < .05$, partial $\eta^2 = .004$) so that simple interaction effects at each level of the three factors were examined. The simple interaction effect of listening speeds and percentage in accurate word recognition at high proficiency in
listening ($F(1, 136) = 6.174, \ p = .014 < .05$, partial $\eta^2 = .043$) was all that was significant (Table 8).

The fact that no other simple interaction effect but the one of listening speeds and percentage in accurate word recognition at high proficiency in listening was significant implies that only in the high proficiency group was the gap in correct recognition percentage closer between content and function words because of the slower listening speed, which can also be seen from the graph in Figure 2. This was not the case with the other two listening proficiency groups, medium and low.

***: p < .001, **: p < .01, *: p < .05

First, as for the percentage in accurate word recognition, recognition of content words is significantly better than that of function words at all levels of proficiency in listening and listening speeds (p < .001). Next, as for difference in word recognition by different proficiency groups, there was a significant difference across both the listening speeds and both content and function words between high and medium proficiency groups (standard speed & content words t = 3.897, p < .001, standard speed & function words t = 2.055, p < .05, slower speed & content words t = 2.186, p < .05, slower speed & function words t = 4.199, p < .001). However, difference at standard speed and function words as well as at slower speed and content words was smaller than that at standard speed and content words and slower speed and function words. On the other hand, between medium and low proficiency groups, difference was significant only at the combination of slower listening speed and recognition of content words (standard speed & content words t = 0.388, p = .698, ns, standard speed & function words t = 1.443, p = .150, ns, slower speed & content words t = 2.608, p < .01, slower speed & function words t = 1.821, p = .070, ns).

Finally, as to an influence of different listening speeds on word recognition, recognition of function words by high proficiency groups (F(1, 272) = 13.476, p < .001) and that of content words by medium proficiency groups (F(1, 272) = 9.752, p < .01) were significantly better at slower listening speed than at standard listening speed. However,
no significant influence was found for all the other combinations except that recognition of function words by medium proficiency groups was only marginally significantly better at slower listening speed than at standard listening speed (high proficiency & content words $F(1, 272) = 1.838$, $p = .176$, ns, medium proficiency & function words $F(1, 272) = 2.774$, $p = .097$, ns, low proficiency & content words $F(1, 272) = 0.725$, $p = .395$, ns, low proficiency & function words $F(1, 272) = 1.395$, $p = .239$, ns).

### Analysis of the Gap in Lexical Recognition

The results of three-way mixed ANOVA showed that there was a significant second-order interaction and that, of all the simple interaction effects, only the one of listening speeds and percentage in accurate word recognition at high proficiency in listening was significant. This means, as has been mentioned above, that only in the high proficiency group was the recognition gap between content and function words significantly closer at the slower listening speed. In this section, this was reexamined through an analysis of the recognition gap between content and function words. The following are results of a two-way (proficiency in listening / listening speeds) between-subjects' design ANOVA conducted on the recognition gap between content and function words (Table 11). A graph is shown in Figure 3 on the means of lexical recognition gaps at a different listening speed for three levels of proficiency groups.

*: $p < .05$
A significant interaction was found so that simple main effects of proficiency in listening and of listening speeds at each level of the other factor were examined (Table 12). The results of ANOVA demonstrated that no other simple main effect than that of listening speeds at the high proficiency group was significant ($F(1, 136) = 5.641$, $p = .019 < .05$, partial $\eta^2 = .039$). This signifies that the slower listening speed enabled only the high proficiency group listeners to close the recognition gap significantly between content and function words. This was not the case with the other two proficiency groups (medium and low).

**Correlation Between Listening Comprehension and Lexical Recognition**

Finally, correlations between listening comprehension (the results of the preliminary listening comprehension test) and lexical recognition (percentage in respective recognition of content and function words and the gap between the two) were analyzed.
both for the standard and slower listening speeds, using Pearson product-moment correlation coefficients (Table 13).  

First, Pearson product-moment correlation coefficients suggested moderate positive relationships between listening comprehension and both content and function word recognition across all the listening speeds. Relationships between listening comprehension and recognition of function words were slightly stronger than those between listening comprehension and recognition of content words and, as for a comparison between two different listening speeds, the relationships were slightly stronger for the slower listening speed group.

Second, positive relationships were found between content word recognition and the recognition gap across all the listening speeds. This means that, as percentage in accurate recognition of content words becomes higher, the recognition gap between content and function words grows wider: that is, recognition of function words does not get better as that of content words does. On the other hand, as for relationships between function word recognition and the recognition gap, no significant relationships were found for the standard listening speed group, but there were moderate negative relationships for the slower listening speed group. This implies that, if the listening speed is fast enough, the recognition gap between content and function words stays near constant with the growth in accurate recognition of function words, but that, at slower listening speeds, the recognition gap gets closer as percentage in accurate recognition of function words rises; that is, recognition of function words becomes far better than that of content words does.

Third, as for the relationships between listening comprehension and the lexical recognition gap, no significant relationships were found for the standard listening speed group. This means that even highly proficient listeners cannot close the recognition gap between content and function words, which corroborates the study by Field (2008). However, for the slower listening speed group, weak but significant negative relationships were found between listening comprehension and the recognition gap, which implies that the recognition gap between content and function words closes as listening proficiency rises. This demonstrates that the slower listening speed has an influence on recognition gap between content and function words, especially if learners’ listening proficiency is higher.

Discussion

First, three research questions (RQs) will be discussed. As for the first RQ, Is
recognition of function words more challenging than that of content words for Japanese EFL listeners?, the results of the present study demonstrated that the percentage in accurate recognition of function words was significantly lower than that of content words across all the levels of listening proficiency and listening speeds. This means that recognition of function words is more challenging than that of content words for Japanese EFL listeners regardless of the listener’s proficiency or the speaker’s speech rate. This corroborates Field’s (2008) study and is also consistent with the discussion before the RQs were raised.

Second, the second RQ, Is there any relationship between English proficiency, especially listening comprehension, and accurate recognition rates of content and function words in the connected speech? Is the gap in lexical recognition in the speech stream between content and function words near constant across all listening comprehension levels and do even advanced-level listeners find recognition of function words challenging?, will be discussed. As far as the relationship between English proficiency and accurate recognition rates of content and function words is concerned, listening comprehension has positive correlations with recognition of content and function words. On the other hand, the gap in lexical recognition between content and function words at standard listening speed was 36.15% for the high listening proficiency group, 29.95% for the medium listening proficiency group, and 33.30% for the low listening proficiency group respectively. As the result of ANOVA on the lexical recognition gap showed, the simple main effect of proficiency in listening at standard listening speed was not significant ($F(2, 136) = 1.978, p = .142, ns$), and the Pearson product-moment correlation coefficient for the standard listening speed group suggested no relationship between listening comprehension and the lexical recognition gap. These results demonstrate that the gap in lexical recognition between content and function words is constant across all listening comprehension levels and that even advanced-level listeners find recognition of function words challenging, if the speaker’s speech rate is around 150 to 160 w.p.m. This is also consistent with Field (2008) and supports the discussion before the RQs were raised, implying that, in recognition of function words, there are some other factors involved than in recognition of content words.

Finally, intriguing results were obtained as for the third RQ. How does the difference in listening speeds affect the respective accuracy in lexical recognition of both content and function words? Are listeners belonging to a different listening comprehension level affected differently? The data obtained in the present study reveal that different listening speeds have different influences on lexical recognition by Japanese EFL listeners of different proficiency groups. According to the results in the present study, when the participants listened to the recordings at a slower listening speed (about 110 w.p.m.), 0.7 times the standard speed, percentage in their accurate recognition of
function words for the high listening proficiency group and that of content words for the medium listening proficiency group were significantly higher. In addition, only for the high proficiency group did the recognition gap between content and function words become significantly smaller. This is discussed in the following paragraphs.

For the high listening proficiency groups, the participants in the slower listening speed group identified function words significantly more accurately than those in the standard listening speed group, but no significant difference was found across both the listening speeds in the recognition of content words. As a result, the lexical recognition gap between content and function words became significantly smaller due to the difference in listening speeds.

One possibility is that the slower listening speed enabled the participants to identify word boundaries and words themselves more easily so that the recognition of both content and function words slightly improved through bottom-up processing. This increased amount of information retrieved from bottom-up processing was large enough to trigger, in turn, top-down processing. In other words, the amount of information that listeners gathered through bottom-up approaches went past the threshold (O’Malley, Chamot, & Kupper, 1989; Eastman 1993; Vandergrift & Goh, 2012), which enabled listeners to make use of top-down approaches and the participants were able to infer missed function words after turning to top-down processing such as schema and grammatical knowledge. Thus, their recognition of function words improved significantly better than that of content words.

Another possibility is that the slowness of the listening speed itself had some influence on participants’ lexical recognition. Many function words are not spoken independently or isolated from other words in a connected speech, but are usually spoken in a group of content and other function words. These groups of words, or phonological words (Grosjean & Gee, 1987), in the speech stream were supposedly recognized over a slightly longer time span, by a split second, which affected recognizing process positively and helped the participants identify more accurately the words they heard, even the unstressed syllables. This was presumably impossible when they were listening to the recordings at the standard speed. Quite possibly, there may also have been some cues from top-down processing. On the other hand, content words can be searched from stressed syllables so that they were identified easily enough at a faster speed, the standard listening speed. Therefore, recognition of content words was not affected even if the listening speed was slower.

For the medium listening proficiency group, however, participants’ recognition of content words were significantly better at the slower listening speed than at the
standard listening speed, whereas their recognition of function words were only marginally better at the slower speed. These results imply that top-down processing, which became available to high proficiency listeners, was still not in use by medium proficiency listeners, or that the threshold itself to initiate top-down processing may be higher than in the case of high proficiency listeners. One possibility is that medium proficiency listeners need more information retrieved from bottom-up processing in order to activate higher-order knowledge. Another is that, even with the increased amount of information from the bottom-up, they still cannot successfully identify function words because of insufficient syntactic and idiomatic knowledge.

However, the participants in the slower listening speed group recognized content words significantly better than those in the standard listening speed group. This implies that recognition threshold of content words, which divides recognition of content words in spoken English and that in written English, falls somewhere between these speed ranges for medium proficiency listeners, a threshold that did not affect in any way high proficiency listeners because of the difference in listening speeds. Simply put, the participants of this proficiency group recognized at the slower speed what they could have recognized in the transcribed version of the recordings. Due to the slower listening speed, participants were able to identify content words, made up of stressed syllables, which would have been impossible to identify at the standard listening speed. Nevertheless, this difference in listening speeds never affected their recognition of function words, which in the speech stream can be heard and recognized only in a phonological word, a string of words including a content word. This is probably because the slower listening speed was still too fast for medium proficiency listeners to identify function words, made up only of unstressed syllables, exclusively from the information they gathered from bottom-up processing. Furthermore, the increased information on content words from the bottom up due to the slower listening speed did not trigger top-down processing, which would otherwise have led to successful identification of more function words. Consequently, the lexical recognition gap between content and function words, though not significantly, widened. Insufficient grammatical knowledge may have played a part as well.

Lastly, for the low listening proficiency groups, neither influence was observed over the speed ranges in the present study. Possibly, there might be some changes measured, if the listening speed was to be made further down, or there might not be, however slow the listening speed becomes. Their vocabulary size may be too small to make a difference or identify words in the speech stream.

One possibility drawn from the discussion above is that the threshold enabling listeners to make use of top-down approaches may fall between the percentages in accurate
lexical recognition at the standard listening speed and the slower listening speed for the high proficiency group; that is, around 65% for content words and a little above 30% for function words. Granted that only the high proficiency listeners improved their recognition of function words significantly better than that of content words due to top-down processing triggered by the slower listening speed, the medium proficiency listeners did not reach this probable threshold, with 61% for content and 26% for function words even at the slower listening speed, leading to the failure to close the recognition gap between content and function words. There are other possibilities as well. The level of threshold itself may depend on listeners' proficiency and there must be other listening sub-skills closely involved including grammatical knowledge and the size of vocabulary, which necessitates further studies.

The present study did not verify what Grosjean and Gee (1987) and Eastman (1993) claimed. It did not directly validate whether there are two systems in parsing the speech stream into a string of words and whether a system used in recognizing function words is different from the one used in recognizing content words. Neither did it verify whether, of the two parsing systems, syllable-timed language speakers lack the high-speed and pattern-recognition-like search system for weak syllables so that even high proficiency learners of English find it difficult to recognize function words in the connected speech. In addition, it remains to be seen whether, in recognizing function words, the speech parsing system refers directly to a separate lexicon specifically stored for function words and located apart from general lexicon. However, the present study showed that the listening speed or speech rate is a variable that should be taken into consideration in syllable-timed language speakers' recognition of words in spoken English, which has a stress-timed prosodic structure featured by the alternation of weak and strong syllables.

**Conclusion and Pedagogical Implications**

The three major findings concerning the RQs in this study were:

1. Recognition of function words is more challenging than that of content words for Japanese EFL listeners.
2. There is a positive relationship between English listening comprehension and accurate recognition rates of content and function words in the connected speech, but at a standard listening speed, the gap in lexical recognition between content and function words remains near constant across all listening comprehension levels and even advanced-level listeners find recognition of function words challenging.
3. The difference in listening speeds affects the accuracy in lexical recognition of content and function words differently. When the listening speed is made slower, listeners in the high proficiency group not only improved their recognition of function words, but also the gap in their lexical recognition between content and function words significantly closed. Listeners in the medium proficiency group improved their recognition of content words at the slower listening speed, but there was no influence on the lexical recognition by listeners in the low proficiency group.

Finally, we would like to remark on some of the pedagogical implications derived from the present study:

1. If listening speeds affect lexical recognition, it may be effective to use high-speed listening in order to improve L2 learners’ lexical recognition in listening. By having the learners exposed to constant higher-than-standard-speed listening, and thereby having them get used to it, it may be plausible for the learners to improve lexical recognition, especially recognition of function words, at the standard speed. However, this would require further research.

2. If what Eastman (1993) claimed is true, that is, if English stress-timed prosodic feature is the gap that divides written and spoken English or a spoken syllable-timed language and spoken English, and if Japanese EFL learners attempt to recognize every syllable, stressed or unstressed, as a stressed one, then there certainly is an excessive cognitive load on them by listening to every single unstressed syllable as if they were stressed just the way they do when they deal with written English or a syllable-timed language. It is also highly probable that they read aloud or speak English without distressing any syllable. If so, as Rost (2002) claims, Japanese EFL learners should not learn and practice citation forms of the pronunciation from written English, but engage in natural spoken discourse and continue to practice pronouncing each syllable and word just as they hear in the speech stream, stressing and distressing each syllable distinctly, copying and tracing English prosodic feature including schwas in weak syllables, vowel reductions and elisions or consonant elisions, and other phonetic changes. This can be an effective way of improving their lexical recognition in listening. This may also be an effective method to develop in Japanese EFL learners’ mind a system of recognizing strings of unstressed function words accurately in the fleeting speech stream, claimed by Eastman (1993) and Grosjean and Gee (1987): the high-speed and pattern-recognition-like search system for function words and a separate lexicon specifically stored for direct search of function words. For this purpose, it may be important not to let English phonological knowledge of written words or isolated pronunciation of each word get into English listening practices. In
addition, it is also necessary to stick to the same measures in oral reading or shadowing practices so that the gap between Japanese EFL learners’ oral reading and English L1 speakers’ natural speech will be closed.

3. In second language acquisition (SLA), the input through listening is a prerequisite and in order for the oral input to work effectively in SLA, it must be taken into the interlanguage system as efficient intake (Ellis, 1993). However, if L2 learners cannot get hold of words, especially function words, sufficiently in listening, which is the essential input in SLA, then does the input work as an efficient intake to be taken into the interlanguage system? Content-words-centered listening may be all right in understanding speech passively, but it is not an efficient intake and will not lead to reconstitution of the interlanguage system and to the acquisition of a language. In order for Japanese EFL learners’ listening to work as an effective input in SLA, it is necessary for them to improve recognition of function words, thereby closing the gap that exists between their actual recognition in listening and the one that plays a role as an efficient intake in SLA. At least from the perspective of listening for SLA, content-words-centered listening for passive understanding of the speech is not sufficient and percentage in accurate lexical recognition, including that of function words, must be brought up to near 100%. If so, in making use of listening as the effective input in SLA, it is useful, depending on the learners’ listening proficiency, to slow down the listening speed to the one which will raise the percentage in accurate lexical recognition, especially that of function words, in English classes.

With these being the future research orientation and tasks to be tackled, we would like to conclude this study.

Notes

1. Gating is a research technique in which participants hear successively longer pieces of a word in increments of 0.03 to 0.05 seconds, where a syllable lasts 0.2 seconds on average, and the participants are asked to say, after each presentation of accumulated increments, what they believe that the word is. According to Grosjean and Gee (1987), using this gating technique, they carried out an experiment on sentences of the sort ‘I saw the bun in the store’, gated from the beginning of the word ‘bun’ and measured how accurately participants recognized the word ‘bun’ after each presentation. The results showed that 45% of the participants accurately recognized the word before the syllable ‘bun’ ended, but that the remaining 55% did not recognize ‘bun’ until ‘in’ or ‘the’ ended or some even until ‘store’ ended. This demonstrates that words are not necessarily recognized sequentially from left to right.
right and that the beginning of a word is not necessarily crucial to its recognition or to initiation of lexical access.

2. L1 of 46 non-native participants in the Field’s study were as follows: Spanish 12, German 8, Portuguese 5, Korean 4, Italian 4, Japanese 3, Arabic, Czech, and Mandarin Chinese 2 respectively, and French, Russian, Albanian, and Hebrew 1 respectively.

3. Materials used for paused transcription, testing accuracy in lexical recognition, were a dialogue of 342 words and an expository text of 382 words, which make 724 words in total. On the other hand, the recording time was 115 seconds for the dialogue and 162 seconds for the expository text, which make 277 seconds in total. In terms of words per minute, there seems to be some difference in speeds between the dialogue and the expository text, but both were materials of ‘Speed Range 3’, the fastest in ‘Kyukyoku-no-eigo-listening (Ultimate English listening)’ series level 1. Materials were used to test participants’ accuracy in lexical recognition so that the ones with simple vocabulary but high speech rates were adopted. Readability of the script in Flesch-Kincaid Grade Level was 1.6 for the dialogue and 5.8 for the expository text.

4. All these counted-out words were excluded from the denominator, thus from the computation of percentage in accurate word recognition. Therefore, [percentage in accurate recognition of content words] = [the number of content words correctly identified] × 100/28, and [percentage in accurate recognition of function words] = [the number of function words correctly identified] × 100/36.

5. In Field (2008), content words that possessed three syllables or more were excluded from the results, but in the present study, three-syllable words, hospital and beautiful, were included. Both items have a strong syllable, hos and beau, respectively, and the other two syllables are pronounced weak in stress-timed English, featured by the prosodic structure of the language. Therefore, these longer items, even if they have three syllables, are pronounced short, roughly the length of a one-strong-syllable word in the speech stream, according to the stress and rhythmic patterns of English. Accordingly, listeners must initiate the search for and identify these content words from the strong syllable and that is the system of lexical access for content words. For the reasons stated above, it must be thought that these longer items are recognized just the same way the other shorter (at least in written English) content words are and that no advantage of length is to be found.

6. As far as analyses of the data are concerned, an online software, ANOVA 4, was used for the three-way ANOVA and a Microsoft add-in software for Excel was used for the two-way ANOVA and for the analysis of Pearson product-moment correlation coefficients.

First Semester College in High School™ Program
Addressing Rising Tuition and Soaring Student Debt

Lawrence A. Tomei
Francis E. Perry

By the time Madyson graduates from high school in 2017, she will have completed an entire semester of courses at Robert Morris University (RMU), allowing her to earn a college degree in less time and for less money than many freshmen. Mady is very happy in the program, certainly her parents are happy, and perhaps most important for Robert Morris University, it is making their board of trustees happy.

A Question That Affects Us All

At the Robert Morris University Board of Trustees annual retreat in June 2013, its members discussed two issues drawing recent national attention to higher education; specifically, the soaring cost of tuition and the rising amount of debt for college graduates (Bakersfield, 2010; NCES, 2013). The heated debate focuses on asking the really tough question: What can colleges and universities do to reduce the harbinger of debt hovering over college seniors as they make their way across the commencement ceremony stage?

Madyson is among the first group of students at one nearby high school to participate in the RMU First Semester College in High School Program, a cohort-based curriculum in which participants join a select cohort of 12-15 students during their rising junior year of high school for a series of five undergraduate courses. Each of the target courses was selected because (a) they are freshman-level courses; (b) require no prerequisites; and (c) have a history of unproblematic transfer to colleges and universities. Every course in the program must meet these criteria.

Target Courses

Research has found that most colleges and universities accept transfer credits into their general education curriculum. English composition, public speaking, history, sociology, philosophy, psychology, mathematics, and science are among the most common offerings in a core curriculum (MacDonald, 2013). The RMU program embraced this trend by offering a select number of common core courses to its high school participants, including: Reading and Writing Strategies (English Composition); College Math (Algebra); General Psychology; Principles of Sociology; and, Environmental Science.

Participating high schools make their choices based on the preference of the students (and parents); some offer the program in the evenings, others on Saturday mornings. Courses are
taught by regular RMU faculty on the high school campus. The program begins in the cohort’s rising junior year: one course per semester starting in fall and another course during the spring semester. The third course is offered in the summer term and may be hosted either at the high school, on the University’s main campus, or online. The senior year repeats the pattern with courses four and five in students’ senior year. The result: participants graduate with their high school diploma in one hand and a full 15-credit semester transcript in the other. Sure, Robert Morris University would like those students to attend RMU when they graduate, but the courses are equally transferrable to nearby or national institutions of higher learning.

**Let’s Save Parents Some Big Bucks**

The five courses in the FSCHS program are offered at 30 percent of the published University traditional undergraduate tuition at the start of the cohort’ first academic year. And, these rates remain in effect for both years of the program. As an example, students who began the program in Fall 2013 saved over $8,000 compared with those students who enter as first semester freshmen. (See Table 1).

Students pay for books. And, since cohort students are treated as on-campus students, they are eligible to purchase new or used texts or rent their books from the campus bookstore. Other students find their texts in online textbook outlets (e.g., Amazon.com) and save even more. Still others will pass along their texts to a succeeding cohort.

**Table 1. Example of FSCHS Savings (Based on 2013-14 tuition rate of $775/credit)**

Participating high schools decide on minimum requirements for entry into the program. Some require their students to have at least a 3.0 grade point average to apply for the program and most demand that their student maintain that GPA to remain in the program. If their secondary schoolwork is negatively impacted in any way, students may be removed from the program.
“The First Semester College in High School program allows a number of our eligible students a valuable head start on their post-graduate educational career. With the tuition discount, it’s a win-win financially for our parents,” said one high school principal.

**Formal Agreements**
The University invites a limited number of schools to participate in the First Semester College in High School program; it’s a question of available resources. In the first year of the FSCHS program, two schools participated. By Fall 2015, there were 5 schools (10 cohorts) running simultaneously.

A formal agreement document spells out a number of important conditions, such as: a clearly stated purpose and background of the program; administrative responsibilities; courses, tuition and fees; withdrawal and refund policies; student conduct and parental involvement; and, program outcomes. Roles and duties for both the university and the high school are fully explained. As an example, the school district is responsible for determining student eligibility and selecting the members of each cohort; hosting the courses on their high school campus; and, closely monitoring satisfactory student progress. The university maintains student transcripts and appropriate records.

The design of the FSCHS program calls for a new cohort to be selected during the early summer months (no later than June) prior to the junior year. Student invitations go out in January and parent information sessions are offered before the students leave school for the summer. Cohorts are typically filled well before the start of the fall semesters. A timeline for Fall 2015 program start is shown below.

*Figure 1. Timeline for Implementation of FSCHS ™ Program (Academic Year)*
Students may withdraw or be removed from the program without penalty and retain their college transcripts showing credits earned to that point in their program. However, students may not return to the cohort once they leave and no new students may join the cohort after the start of the initial FSCHS semester. In other words, students and their parents have one opportunity to select the FSCHS program as rising juniors.

The University provides official transcripts each semester and upon requests by parents. In addition, at RMU, the University Registrar serves as the single point of contact for each of the schools and advises each of the participating students. It is important to remember that students participating in the FSCHS program are almost exclusively minors. University contacts outside the classroom are made with the school and parents unlike the FERPA-governed environment of colleges and universities.

“If this past admission year taught us anything,” related the RMU Registrar, “it’s that high school students are coming to meet their freshman admissions counselors with three, six, nine, sometimes as many as twelve to fifteen college credits already on their transcripts. The First Semester College in High School places these applicants well ahead of their peers, both academically as well as financially.”

Cohort members participating in the FSCHS program are considered RMU students and receive the usual student identification card for admission to the University library, bookstore, campus activities and even sports events. They are also given the same access as traditional students to online resources. They receive instruction for accessing library materials when working on research papers – a convenient alternative for those who may lack the time or transportation to conduct on-site research. Materials are posted to a standard online learning platform for students who might miss a class meeting or wish to review a previous lesson. During a typical semester, there are a sufficient number of weeks to accommodate special high school activities such as SAT exams, prom night, and sports banquets. The same minimum number of instructional hours applies to FSCHS as it does to any on-campus course. The hours are the same, the syllabus is the same, the text books are identical – it’s the same course.

**Students and Parent – and the Instructor – are Unanimous in Their Praise**

“Mrs. V makes the class so much fun. I think I can speak for the whole class in saying that it is amazing, interesting, and so different from high school. I am thoroughly enjoying the class and am so glad that I'm involved in this program,” said Madyson.

While there is no “typical” FSCHS student, two traits are common to cohort members: an extremely strong work ethic and the desire to succeed. Students who are willing to
come back to school in the evenings or early on a Saturday morning do not take their studies lightly. Their commitment to academic success in the program is apparent. One student in the Saturday cohort is a member of the football team. He spends Friday nights under the lights, but he is in class at 8:30 the next morning prepared for extensive class discussions. Another student in an evening cohort has given up her place on a traveling softball team so that she can take these courses.

Courses taught in the FSCHS program mirror those offered on-campus. Table 2 displays the most popular courses chosen by the currently participating cohorts.

The Reading and Writing Strategies instructor for FSCHS also teaches the course on campus and has made no modifications to course work or expectations. FSCHS students have had little difficulty in meeting, and in some cases exceeding, expectations of the courses. The start and end term dates may vary, but all other aspects of the course are identical. The only perceivable difference is that, while students in the Tuesday/Thursday sections have the opportunity to meet with the instructor more often throughout their writing process, the Saturday students have only one opportunity per week to interact with their instructor. They have not only shown the discipline to read large chunks of material between meetings, but also email the instructor often throughout the week rather than holding questions for class meetings.

Students have expressed their surprise and enjoyment at meeting collegiate expectations while still in secondary school. They were somewhat surprised at the amount of class time devoted to discussion and the instructor’s decree of “no wrong answers, just poorly supported arguments,” and have embraced the opportunity to explore different interpretations and present their perspectives to their peers. As students were leaving their first class session, some were heard stating “That was an awesome class” and “I think I’m gonna like college.”

Cohort members have also been excited to break away from the conventions of high school writing. The idea of presenting an argument outside of a given formula has, for
the most part, been warmly embraced. Surprisingly, students have been especially engaged in discussions of grammar and mechanics, often taking copious notes during lessons focused on agreement, structure, word choice, and punctuation. They have shown a willingness to work through examples of both strong and weak writing and ask detailed questions when working to improve their own drafts.

FCSHS students have shown exceptional maturity in their approach to learning – some have gone so far as meeting in study groups on their own time or organizing their own “field trips” to the campus library.

Who Wouldn’t Want to Do This?

Examining recent statistics, approximately 51% of our freshmen applicants are bringing in between 3 and 18 credits through high schools sponsored dual enrollment programs, College to High School programs, or advanced placement programs. All credits are transferable; however, they may not all be applicable to a particular major. Like the First Semester College in High School, these programs provide the student an opportunity to graduate early and reduce their debt upon graduation. Unlike the other programs, the FSCHS is a cohort-based program, held on the students’ high school campus, with faculty hand-picked to work with high school juniors and seniors.

As one principal explained it to her parents at an evening information session,

“A full semester of college, taught right here on our campus, with a university faculty member, and a 70 percent discount – who wouldn’t want this for their child?”

Yet, both the University and the high school realize that the First Semester College in High School program is not for everyone. Cohorts are targeted for 12-15 participants. At one invited school, the initial cohort was started with only nine students. At a second school, a cohort of 17 was permitted based on the overwhelming response from parents. Too, high school students often are forced to make a choice. Sports, band, advanced placement courses, a host of intra- and intermural activities. Everyone recognizes that students have many competing choices in their high school years.

The First Semester College in High School Program grew out of two other dual-enrollment programs that allow high school students to take a solitary university course. The idea to expand those programs was a logical progression from what is already working at his campus. The thinking was that, if our dual-enrollment programs work for one course, why not do it for the entire first semester of college?
Our Success Rate

After two complete years of the FSCHS program, our experience so far has produced some startling statistics. Nearly all of the cohort students completed all five courses; only three students dropped out before their graduation. The grade distributions have told us another remarkable story: 85 percent of our FSCHS students received either an “A” or “A–” in their coursework while maintaining at least a 3.0 or higher (most much higher!) in their high school curriculum.

Impact on the University – Share the FSCHS Model!

The FSCHS program is a trademarked academic program; however, Robert Morris University is more than happy to share the program with other institutions of higher learning.

More than enough schools for everyone. Limited resources allow RMU to offer the cohort-based model to 5-7 school districts at most. Remember, by the second year, each of those schools is hosting two separate cohorts. There are nearly 500 districts in Pennsylvania alone; over 13,500 throughout the United States. So, there is no real competition for FSCSH schools. We are more than happy to talk with you about sharing the model and how to make it work.

Faculty union issues. Early and recurrent discussions with local school district unions are always a good idea to solicit their buy-in on the program. They need to be assured that the FSCHS will not intrude upon their student’s available study time, their own AP course offerings, or the school’s honors program. FSCHS classes are held outside the class day and the precedence of dual enrollment, college to high school, and other similar college prep courses have, most likely, already been established.

School board issues. School board members can be excellent advocates for the FSCHS program. Emphasize to your board members that a partnership with a local college or university is in their students’ best interests. Plus, parents are responsible for all costs, including books. District in-kind contributions call only for classrooms and facility expenses (e.g., light, heat, security, etc.). School and parent organizations often look at college-to-high school initiatives as indicators of truly innovative schools.

Parent issues. Unlike the college environment (and the application of Federal guidelines), the FSCHS program deals with the student, the school, and also the parents. A Parent Information Night (to which students are heartily invited) is highly recommended. The agenda highlights the program and its academic and financial benefits. High schools principals can share the application process while college officials can discuss the courses, grades, financial, and program objectives.
**Student issues.** High school students (like their college counterparts) have numerous choices when it comes to extra-curricular activities. It is imperative to everyone involved that students remain committed to the program – and that includes staying part of the cohort for all five courses. Students (or their parents) will invariably ask if they can “sit out” a semester to play football or head up the school play. Can my child come back next semester? The answer should be “no.” Certainly, students have been compelled to drop from the program because of personal reasons. Any credits they completed earn a transcripted grade. However, we hardly ever allow them to return to the cohort once they miss a course.

**Finding faculty.** Actually, this was the easiest task for FSCHS program administrators. College faculty that enjoy working with first-year undergraduates will also enjoy working with these high school students. Schools typically select from among many applicants those who already know they want to attend college and have, therefore, already developed the learning tools to be successful.

**Want to Learn More?**

One university is helping to answer the question, “What can we do to reduce the impact of rising tuition and student debt?” Mady and her parents know the answer: take your first semester of college while you are still in high school. Enroll in the First Semester College in High School™ program. If your institution would like to learn more about the program, please contact Dr. Larry Tomei (tomei@rmu.edu) or Mr. Frank Perry (perry@rmu.edu). We do webinars explaining the program!

The popularity of transformative learning theory in the adult education literature over the last several decades speaks to the interest in understanding highly impactful learning experiences. However, in our zeal to grab ahold of a theoretical lens that would allow us to understand and convey some of the far-reaching affects of learning in people’s lives, the field has taken the well-theorized grounding that Mezirow provided and diffused it to accommodate almost any kind of learning outcome. The term transformative learning has now been used to refer to such a wide variety of phenomena that it has lost any distinctive meaning.

Building on social constructivist premises, Mezirow carefully articulated the learning outcomes he was describing. He used the terms transformative learning and perspective transformation to refer to the process of “becoming aware of one’s own tacit assumptions and expectations and those of other and assessing their relevance for making an interpretation” (Mezirow, 2000, p.4). Further clarifying, he said:

Transformative learning refers to the process by which we transform our taken-for-granted frames of reference (meaning perspectives, habits of mind, mind-sets) to make them more inclusive, discriminating, open, emotionally capable of change, and reflective so that they may generate beliefs and opinions that will prove more true or justified to guide action. … (Its) focus is on how we learn to negotiate and act on our own purposes, values, feelings, and meanings rather than those we have uncritically assimilated from others—to gain greater control over our lives as socially responsible, clear-thinking decision makers. (p. 7-8)

As the theory grew in popularity, scholars approached the study of TL from a variety of disciplinary perspectives. During the first 25 years of the theory, there were four primary approaches that scholars used to inform their approach to TL: the psychocritical approach of Mezirow, as well as the psychodevelopmental, psychoanalytic, and social emancipatory approaches (Taylor, 2008). More recently, other approaches have evolved, including the neurobiological, cultural-spiritual, race-centric, and planetary (Taylor, 2008). Every approach stems from different literature bases with their respective premises and foci, which result in widely differing descriptions of the learning outcomes that are transformative.

For there to be value in the theory, we need clarity about the terms we use. I believe there are indeed learning experiences that are so deep and profound that they can justifiably be considered transformative. Further, Mezirow’s formulation of transformative learning, although groundbreaking, has proven to be not quite sufficient to encompass the varieties of transformative learning outcomes that researchers have observed. What we need to do as a field is to delineate the variety of phenomena that can be understood as transformative so that we can articulate clearly the learning experiences we are trying to describe.

A Preliminary Typology of Transformative Outcomes
In 2014, a team of researchers performed an analysis of all the articles using transformative learning theory published in 1) Adult Education Quarterly; 2) Journal of Transformative Education; and 3) Adult Learning from January 2003 through October 2014. This search yielded 240 articles. After filtering out articles that made no inference to outcomes, our study examined 206 articles. For each article, we looked for the implicit and explicit ways that the authors defined transformative outcomes. Often, because of Mezirow’s influence on the theory, scholars described transformational outcomes simply as a change in one’s frame of reference. However, we felt that this term was too broad; it is frequently used to describe multiple ways in which a person makes meaning differently. Therefore, we sought for finer articulations of learning outcomes. As this form of analysis is unique, an example may be illustrative. The “planetary” perspective offered by O’Sullivan, Morrel, and O’Connor (2002) offers the following partial definition of transformational outcomes:

Transformative learning involves experiencing a deep, structural shift in the basic premises of thought, feelings and actions. It is a shift of consciousness that dramatically and permanently alters our ways of being in the world. (p. xvii)

As this a particularly comprehensive definition, it offers insight into the approach to the coding of articles in this study. If an article used this exact definition, then we looked for specific outcomes that the article used to define the overall learning experience. In this case, we extrapolated each of the following:

- Shift in basic premises of thought, understanding of relations of power
- Shift in feelings
- Shift in actions
- Shift in consciousness
- Altered ways of being in the world

We then evaluated the excerpts and assigned codes, splitting or merging coding categories as seemed best to capture the intent of the authors. Almost every article had at least two distinct codes, and most of them had three or four. When an article had multiple excerpts with the same assigned code, we combined them so that multiple descriptions in the same article did not skew the overall results of the analysis. Among the 206 articles, there were a combined 1,023 coded excerpts, therefore averaging 5 codes per article. The excerpts resulted in 28 different codes, which we eventually coalesced into six broad categories.

This process yielded the following general categories of transformative learning outcomes.

- Worldview
- Epistemology – Ways of Knowing
- Self
- Behavior – Action
- Development – Increased Capacity
- Ontology – Ways of Being

The following descriptions provide more information about each category of transformative learning outcomes along with the number of articles in which each subtheme was found.
A Typology of Transformative Learning Outcomes

**Worldview** refers to changes in underlying worldview assumptions or conceptualizations. The subthemes from which it was derived were:
- Changes in Assumptions, Beliefs, Values, Expectations
- Ways of Interpreting Experience
- More Comprehensive or Complex Worldview
- New Awareness / New Understandings

**Self**
Outcomes related to Self refer to changes in one’s sense of identity, relatedness to others, self-efficacy, empowerment, and so forth. Subthemes were:
- Self-in-Relation
- Identity or View of Self
- Self-Knowledge
- Empowerment or Responsibility
- Change in Personal Narrative
- Change in Meaning or Purpose in One’s Life
- Change in Personality

**Epistemology – Ways of Knowing**
These outcomes refer to changes in epistemic habits, including more autonomous, systemic, authentic or embodied ways of knowing. Subthemes were:
- More Open
- More Discriminating
- Utilizing Extra-Rational Ways of Knowing

**Ontology - Ways of Being**
These outcomes refer to changes in deeply established dispositions and tendencies that affect the way a person affectively experiences life and how they physically and emotionally react to experiences.
- Affective Experience of Life
- Ways of Being
- Attributes

**Behavior – Action**
Behavioral or Action outcomes refer to changes in observable behavior.
- Actions Consistent with New Perspective
- Social Action
- New Professional Practices
- New Skills

**Capacity**
These outcomes refer to development of cognitive abilities in one or more domains.
- Cognitive Development
- Change in Consciousness
- Increased Spirituality
A Typology of Transformative Learning Outcomes

A Problem with Definitions
These learning outcomes demonstrate that Mezirow’s definition of transformative learning is too limited; although it describes one way in which a person’s frame of reference can be transformed, it does not encompass many other ways. The same critique can be leveled at the planetary definition offered as an example above. The research literature has demonstrated that there are a wide variety of learning outcomes that can justifiably be considered transformative. We should define transformative learning broadly in order to accommodate these outcomes. A suitably broad definition is: Transformative learning refers to processes that result in significant and irreversible changes in the way a person experiences, conceptualizes, and interacts with the world.

Our meta-analysis revealed that many scholars used the term transformative learning to refer to relatively minor changes – changes that are almost certainly not transformative for the learner. To be considered transformative, learning outcomes must present both depth, breadth, and relative stability of change. Depth refers to the impact of a change, or the degree to which it affects any particular component listed above. Breadth refers to the variety of contexts in which a change is manifest. Relative Stability means that the change is not temporary.

Implications for Future Research and Theory
Researchers should reserve the use of the term transformative learning for use only with learning experiences that result in significant and irreversible changes in the way a person experiences, conceptualizes, and interacts with the world. They should specify the ways that learning outcomes impact the way a person experiences, conceptualizes and interacts with the world, and ensure that such changes are indeed dramatic by providing evidence of depth and breadth of change. Following is a tool that researchers can use that incorporates a typology of transformative outcomes and focuses attention on clarifying the impact of each component.

<table>
<thead>
<tr>
<th>Transformational Outcome</th>
<th>Depth / Evidence of Deep Impact</th>
<th>Breadth / Evidence of Impact on Multiple Life Contexts</th>
</tr>
</thead>
<tbody>
<tr>
<td>Worldview</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Self</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Epistemology – Ways of Knowing</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Ontology – Ways of Being</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Behavior</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Development – Increased Capacity</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This typology aids scholars to articulate changes to the way that learners experience, conceptualize and interact with the world. For each type of outcome, scholars should articulate one or more specific ways that learners have changed in the way they experience, conceptualize, and/or interact with the world, possibly using the subthemes described above as a framework. Any particular transformative experience will likely include several of the learning outcomes in this typology, and scholars should be comprehensive and explicit about the types of learning outcomes they are describing.
A Typology of Transformative Learning Outcomes

Abstract

An important and often overlooked component of American history is the accounts of the enslaved Africans that fought for their freedom. Isolated and unacknowledged for years due to location, the descendants of these enslaved Africans live culturally intact on coastal Carolinas, Georgia, and Florida and are known as the Gullah and Geechees. The Gullah-Geechee culture is vital to the completeness of American history and knowledge of the culture can provide African-Americans with self-identity and pride by providing them with a connection to their African heritage. Despite numerous research studies and federal legislations, the Gullah-Geechee culture is now in jeopardy of extinction. The purpose of this paper is to explore social science in the area of preservation and sustainability efforts of indigenous cultures to understand the best methods to foster survival of an indigenous population.

Keywords: Gullah, Geechee, sustainability, preservation, culture
Exploring Cultural Education And Preservation Of An Indigenous Population

Most Americans were taught that the Civil War was the only war fought on American soil that involved slavery. However, the years from 1739 to 1858 were marked by ongoing revolts by enslaved Africans and battles with American colonists along the southeast continental coast (Goodwine, 1998). Margaret Goodwine (1998) argues, based on extensive reviews of contemporary documents and other artifacts, that these battles were purposefully undocumented and unacknowledged since the success of the enslaved Africans and the development of alliances with Native Americans threatened the enslavement system and global misconceptions that the slaves were content. Unlike the mainland slaves that adapted to Euro-American cultures, the isolated resistant slaves formed their communities along the marshlands of coastal Carolinas, Georgia and Florida (National Park Service, 2005).

Today, the descendants of these enslaved Africans are known as Gullahs and Geechees. They remain isolated beyond the Spanish moss and sand gnats of the Low Country and surrounding regions unscathed by Western civilization. Unbeknownst to most Americans, including African-Americans, the Gullah-Geechee community offers African Americans a direct connection to their African heritage (Cross, 2012). “Gullahs” are African slave descendants that reside in the Carolinas while “Geechees” are descendants of the Georgia and Florida region (National Park Service, 2005). Although Native Americans were the first population in the region, the Gullahs-Geechees are considered “indigenous” to the coast because of their affinity for the land and the distinctive Gullah-Geechee culture was developed in North America (National Park Service, 2005).
The Gullah-Geechee population’s affinity for the land is based on an ancestral connection to the Rice Coast of Africa, known today as the region that extends from Senegal to Liberia (Opala, n.d.). According to Opala (n.d.) these slaves were imported to the coastal region mainly for their expertise in rice cultivation and irrigation systems. In addition to the Gullah-Geechee community’s indigenous ecological knowledge, the culture’s uniqueness and resiliency has been recognized globally for its ability to sustain its African heritage for over 400 years, across two continents, despite slavery, wars, tropical diseases, oppression, major hurricanes and most recently tourist development (National Park Service, 2005).

**Background**

The recording of Gullah-Geechee history and culture was challenging for slaves since they were not afforded the opportunity to properly document their history, and the purposeful manipulation of written American history to favor the colonists (Goodwine, 1998). With only an oral means of historic preservation, the Gullah-Geechee culture is often a missing component in America’s published or understood heritage. In addition to the challenges of recording Gullah-Geechee history, the mass diaspora of African-Americans to other regions created a disconnection from African heritage maintained along the coast (National Park Service, 2005).

Du Bois (1903) noted the earliest account of the Gullah-Geechee culture. Du Bois (1903) detailed the accounts of the Port Royal experiment where the white Northerners met the Southern slaves for the first time. The slaves of this region were described as primitive and untouched by the world around them. The Northerners met with the Gullah-Geechee community with the intention to change the community by
adopting Western standards. Freire (2012) argued that the theory of anti-dialogical action leads to cultural invasion due to a disrespect of the invader’s belief in the invaded culture’s potential that eventually leads to cultural conquest and inauthenticity. Smalls (2012) concurred that during 1862-1954, schools for Gullah-Geechee students known as the Penn School and Avery School demoted Gullah selfhood and oral communication by their teaching strategies and educational philosophies. The Penn School was founded by two Northern missionaries to provide a formal education for the Gullah community (Pollitzer, 2005). Freire (2012) would describe the formal education at these schools as a cultural invasion and “camouflaged with the invader assuming the role of a helping hand” (Freire, 2012, p. 153).

Conversely, others described the same period at the Penn School (later named Penn Center) as “successful, [The Penn School] helped serve to preserve their culture and left a continuing legacy, nowhere more enduring” (Pollitzer, 2005, p. 67). Smalls (2012) later described the Gullah Schools as defining the culture by educating the public with a different set of ideologies. However, as established by Cross (2013), without a written language the passing of knowledge from an oral culture could not be upheld with only a school; furthermore, a culture can quickly disappear when there is a gap in passing along traditions primarily because younger generations become ashamed of the traditions and seek a more accepted culture.

During the late 1950’s and early 1960’s the family-oriented Gullah-Geechee community was self-sufficient as well as interdependent (Goodwine, 1998). The community was able to maintain their lifestyle with the fishing, timber, and farming industries (National Park Service, 2005). The availability of air-conditioning, newly
constructed bridges and beachfronts made coastal properties more appealing to tourists (Cross, 2012). The once undesired marshland and coastal properties would also become ideal properties for commercial fisherman and high-class resort communities; therefore, causing a population explosion and increased property values and taxes to the residents of the region (National Park Service, 2005). New resorts, golf courses and gated communities created fences and gates that inhibited the Gullah-Geechee community from natural resources for hunting and fishing (Cross, 2012). To add insult to injury, the high-class resorts to many Gullah-Geechee community leaders were considered to be a reincarnation of the slavery system, since most of the resorts had “plantation” as part of their names and the Gullah-Geechee community was forced to work in the resort industry for little pay, losing self-sufficiency and autonomy (National Park Service, 2005).

To further add to the challenges in the preservation of this community, the Gullah-Geechee people speak a creole-based language called “Geechee,” which has also been the subject of debate by Americans (National Park Service, 2005). Du Bois (1903) noted his fascination with the oral language used by the Gullahs-Geechees because of the use of accents and cadences from Africa. Green (2013) argued that the Gullah-Geechee language was viewed negatively not only by Europeans but also by African Americans and the Gullahs themselves. To illustrate, Supreme Court Justice Clarence Thomas (as cited in Weimel, 2002) was raised in a Gullah community southeast of Savannah and stated:

"But I’m going to give you a more personal reason, and I think this is probably the first time I ever even told anybody about it...When I was 16, I was sitting as the only black kid in my class, and I had grown up speaking with a kind of
dialect. It’s called Geechee. Some people call it Gullah now, and people praise it now. But they use to make fun of us back then. I was self-conscious…I was trying to speak Standard English. I was thinking in Standard English but speaking another language…I just started developing the habit of listening…I didn’t ask questions in college or law school. And I found that I could learn better just listening (p. 318)

Some members of the Gullah community have negative feelings toward Judge Thomas because he was initially ashamed of his heritage (National Park Service, 2005). Green (2013) described African-Americans, like Justice Clarence Thomas, as being brainwashed into believing that any deviation from the European culture is inferior. Public schools in the region discouraged the use of the Gullah language and taught the community to move toward “progression” rather than a balance and appreciation of the heritage (Pollitzer, 2005). Historically, members of an invaded culture are separated from their culture and want to pattern themselves after the invaders and lose their true identity, like seen in the African American experience (Freire, 2012).

**Importance of Cultural Education**

The African American experience can be incorporated into common humanity by cherishing individual differences and taking pride in the distinct heritage of African descendants (Pollitzer, 2005). According to Racism No Way (n.d.), cultural identity starts at birth and is shaped by values and attitudes expressed in the home and community. On the other hand, Schiele (2005) concurs that most social problems experienced by African Americans are linked to lack of cultural identity or cultural oppression. Furthermore,
mass media and popular culture can create new cultures and cause cultural estrangement and override the cultural values prevalent at home and in the community if there is not a strong appreciation of one’s culture heritage (http://www.racismnoway.com.au/index.html). Another social theorist states,

Cultural estrangement may prelude many African Americans from recognizing the presence and importance of their human particularity. This acknowledgement is critical, some say, to a group’s ability and willingness to truly express its positive potentiality, to educate others about its contribution to human history, and to form institutions that infuse its interpretive frameworks and that protect its political and economic interests. (Schiele, 2005, p. 807)

African American and other minorities must be free to express and learn the uniqueness of their culture and any denial of culture can negatively impact how minorities view themselves. For example, in the movie *A Soldier’s Story*, Sergeant Vernon Waters told the character CJ,

See, the Black race can't afford you no more. There used to be a time, we'd see someone like you singin', clownin', yassuh-bossin'... and we wouldn't do anything. Folks liked that. You were good. Homey kind of nigger. When they needed somebody to mistreat, call a name or two, they paraded you. Reminded them of the good old days. Not no more. The day of the Geechee is gone, boy. And you're going with it (Jewison & Schwary, 1984).

Furthermore, in the movie *Inkwell*, one character describes the unattractive, less-desired girl as “Geechee.” Moviegoers accepted the screenwriters’ descriptions of a
“Geechee” as someone with a stereotypical buffoonery behavior or unattractive person not as the highly esteemed carrier of the African American culture. Unfortunately, African Americans were “robbed” of an allegiance to the Gullah-Geechee culture. In addition, understanding one’s cultural heritage leads to an understanding and valuing of other cultures and most importantly overcomes racism (http://www.racismnoway.com.au/index.html).

**Preservation and Education**

Africans were known for their storytelling abilities to preserve their traditions and to pass on communal wisdom. The official storyteller of the African tribe was known as the griot, and this esteemed member was also the historian, advisor, spokesperson, musician, poet and teacher (Hale, 1997). Along with storytelling, enslaved Africans shared with plantation owners their ecological knowledge of how to cultivate rice and rice growing techniques orally, which is called the “diffusion of an indigenous knowledge system” (Carney & Porcher, 1993, p. 130). Other scholars studied the importance of the Gullah-Geechee oral communication and its direct connection to Africa.

The first scholar to study the Gullah language and oral communication intensively and made it a legitimate language was Lorenzo Turner, who published his findings in 1949 (Campbell, 2011). His pioneering work promoted the unique history and folklore of the Gullah-Geechee culture in a positive light by dismissing the idea that the people were using poor English (Campbell, 2011). The Gullah-Geechee culture was shown by Turner’s research to be a product of merging diverse cultural experiences and
communication to retain African roots and is the only African American creole language in the United States (National Park Service, 2005). Turner’s finding led to a sense of pride and respect for the culture that had been previously described as inferior (National Park Service, 2005). Turner sparked a desire for African-American to discover their ancestral roots; however, many researchers credited the Civil Rights Movement for inspiring African Americans (Campbell, 2011). Regardless of the origin, this sense of pride was vividly expressed in the works of Gullah resident and historian, Cornelia Bailey.

Bailey (2003) detailed in her book the oral traditions of her Gullah community called Hog Hammock. In this book, themes of pride and self-identity emerged to the reader. Bailey recalls the stories told by her father that would hold the children spellbound. As established by Bailey and Crook (2003), paralinguistic features found only in the Gullah language included tones, pauses and inflections brought poetic elements to the folklore. Bailey stated that the oral history of the Gullah culture “connects the living with the dead”. Bailey’s work focused on the oral histories and traditions of the Gullah-Geechee culture including the Creole language and farming skills. Bailey’s work has been used to study African-American history, anthropology, and linguistics, and she won the 2004 Governor’s Award for her preservation efforts (National Park Service, 2005).

Along similar lines, Patricia Jackson identified the link of oral traditions in the Gullah-Geechee community to West Africa. Jackson (1987) detailed the singing and storytelling abilities of the Gullah-Geechees. The *Brer Rabbit* and *Uncle Remus* tales originated in the Gullah-Geechee community and common with other African folklores.
by the use of metaphors and proverbs (Jackson, 1987). Jackson (1987) studied the traditional worship services especially unique ring shout with traces back to Africa. The ring shout is a call and response spiritual singing with hand clapping and rhythmic movements to complement the spiritual songs. After the Gullahs became Christians they still maintained their African roots with ring shouts, and some non-Gullah observers described the ring shout as savage without knowledge of its cultural significance and ties to Africa (Pollitzer, 2005). Turner linked the ring shout to Mecca, and many singing groups have passed on shouting traditions to present-day shouters (National Parks Service, 2005) Jackson (1987) concluded that effective oral storytelling is more memorable than written literature. For example, in oral communications the storyteller must be able to create images in the audience’s mind by mesmerizing them with the kinesics including gestures and hand movements not seen in literature (Jackson, 1987).

Other verbal techniques used in storytelling of the Gullah-Geechee community with African origins are mimicry, repetition and rhetorical questions (Jackson, 1987). Pollizer (2005) noted that improvisation and intonation add to the appeal of storytelling and folklore of the Sea Islands. The literature from both Jackson (1987) and Bailey (2003) showed how preserving an oral culture was more intense and involve more than content alone; good folklores and songs included proxemics, body languages, atmosphere and audience participation, all found in the Gullah-Geechee and West African cultures. In order to preserve a culture holistically, the literature suggests that with changes in society, preservation efforts must also change. Dervine & Mitsch (2007) establishes:

The important societal changes that have overwhelmed almost every part of Africa do not in any case allow us to maintain a mode of transmission of oral
literature such as existed in the middle of the twentieth century. Moreover, there is nothing surprising in that. It is the common lot of any cultural manifestation to always be subject to the laws of social evolution. The question is whether to allow this manifestation to disappear (which is in large measure what is happening) or in any case to only collect it in a form and with a goal that is museographer, where it will only exist as a testimonial of memory inscribed in the Universal (p. 160).

Yenika-Agbaw (2011) suggests how storytelling can evolve to print and still preserve the oral uniqueness of African tales that include the use of graphic novels, YouTube videos, bilingual picture storybooks, and picture books with illustrations from African art. Current thinking indicates that a measure of the pride in one’s heritage can be seen by the increasing efforts to preserve and publish oral histories (Yenika-Agbaw, 2011). For example, the Anansi African tales are featured on YouTube with three different perspectives: traditional read aloud; theatrical performance in village setting accompanied by drumbeats, and bilingual read aloud with traditional music (Yenika-Agbaw, 2011). This authentic and innovative medium for cultural transmission provides visual and verbal narratives with the ability to capture the attention of twenty-first-century children and adults proving that cultural preservation can be adaptive to societal changes.

Global research showed a paradigm shift in cultural preservation by the actions to add oral and intangible cultures, which includes language, literature, dance and other forms of communication and information to the World Heritage List that previously only contained archaeological sites and landscapes (Nas, 2002). This initiative to include oral
traditions gave value to the collective memories of a people of culture in order to create a self-identity. According to social theorists Petrilli, and Ponzio (2001), the tradition of oral communications creates a new form of humanism of otherness or a polyconic identity.

Preservation efforts have been ongoing throughout the Gullah-Geechee region. For example, the Gullah-Geechee community banded together to create legislation to make it illegal to develop private properties with gated communities on St. Helena Island (Green, 2013). In addition, Sapelo Island, off the coast of Georgia, is protected by the Georgia Department of Natural Resources as a natural wilderness and ecosystem (Cross, 2012). Cross’s (2012) research examined the seventy-residents of Sapelo Island and the fact that they have successfully maintained their Gullah-Geechee heritage. Visitors of Sapelo Island experience the richness of the Gullah-Geechee culture and lifestyle with tours and festivals on the secluded island. Even with preservation efforts and cultural awareness with festivals and federal legislations, the Gullah-Geechee culture was named one of the Most Endangered Historic Sites. Therefore, the National Parks Services performed a special report to research and preserve the Gullah-Geechee culture, which lead to the development of the Gullah-Geechee Heritage Corridor Commission (National Parks Service, 2005).

**The Gullah-Geechee Heritage Corridor Commission**

The Gullah-Geechee community remained intact culturally for two primary reasons: most slaves brought to the region were from the same regions in West and Central Africa and the community was considered diseased with malaria (Cross, 2012).
Today, without a substantial land base and economic means to maintain cultural lifestyles, preservation efforts have often been viewed as ineffective especially with the diminishing Gullah-Geechee population, land ownership, and cultural lifestyles of the region. Therefore, in 2007 federal legislations under the leadership of Congressman James E. Clyburn established the Gullah Geechee Heritage Commission (GGHC) to develop strategies to provide cultural education and public awareness of the Gullah-Geechee culture. The GGHC is also a resource for the Gullah-Geechee communities to preserve their culture through empowerment and economic development (Campbell, 2011). According to Wolfe (1994), locals within the Gullah-Geechee community have always used governmental agencies, like the GGHC, to construct their purpose in relation to power and domination. However, even with government assistance, most of the land and culture have been lost due to what close observers conclude is excessive property taxes and encroachments and the community has limited economic resources and employment opportunities to continue their cultural lifestyles. Yunus (2007) concurs that governmental programs are not sufficient to address serious social problems since governmental initiatives are historically proven to favor the interests of powerful groups. Another social theorist concluded:

There is hardly a study of an ethnic group now that does not describe how the locals use ‘agency’ to “construct themselves’ in relations to power or interest. It transcends the bland, power irrelevant relativism of much of the talk about ‘culture’ (Wolfe, 1994, p. 6).

However, the locals in the Gullah-Geechee community have come to together to sponsor many activities in the region despite the fact that the community must “grapple with the
increasing forces of modernization, urbanization, and globalization that endanger their collective cultural memory and their traditional social identities” (National Parks Service, 2005, p. 93).

Current Preservation and Educational Activities

There are many festivals in the Gullah-Geechee region that are organized by community leaders and some leaders have partnered with national sponsors. For example, the Original Gullah Festival is held annually in Beaufort, SC. The festival includes consumer and educational workshops, along with art exhibits, music, and traditional Gullah-Geechee cuisine. Furthermore, the Gullah-Geechee Nation hosts many cultural activities throughout the year including The International Music and Movement Festival. The International Music and Movement Festival provides quilt and sweet-grass basket-making classes and workshops for cast netting and crab trapping. Another event held the entire month of February is the Gullah Celebration on Hilton Head Island. The organizers of this event have established partnerships with national sponsors like Coca-Cola and the Westin and regional organizations like the Chamber of Commerce and the Arts Center of South Carolina. Activities include the Taste of Gullah, Arts, Craft, and Food Expo, storytelling, African dance and gospel music. In fact several cultural-based non-profits were developed in the region including the St. Simons African Heritage Coalition (SSAAHC) and the Daufuskie Island Historical Foundation (DIHF) to provide cultural learning and preservation of the Gullah-Geechee culture (National Parks Service, 2005).
Community leaders have also endorsed educational programs in the Gullah-
Geechee region to provide a deeper understanding of the culture. For example, the
Gullah Studies Summer Institute at the Penn Center is a two-week program providing
students an overview of the history, language, music and heritage of the Gullah-Geechee
culture (Cross, 2012). Cross (2012) notes the other educational programs on regional
college campuses including a course at the University of South Carolina that provides an
introduction to Gullah culture covering the key components of the Gullah-Geechee
lifestyle.

The Need for Technology Implementation

The World Summit on the Information Society (WSIS) noted that with advances
in information technology, our society must pay attention to the special needs of
indigenous people especially with the preservation of their heritage and cultural legacy
information technology should be used to preserve and promote the language, distinct
identities, and exchange of knowledge of indigenous populations. Further research shows
that e-commerce through technology implementation integrates the poor in the process of
globalization by providing job opportunities, broadening the marketplace, accessing the
government and accessing other useful information (Yunus, 2007).

By integrating information technology, the indigenous community can decrease
the digital divide between the “have and the have-nots” which exacerbates the social
disadvantage of poor communities due to limited broadband connection and Wi-Fi, which
in some cases is due to the remote geographical location (Dukes, 2015). Freire (2012)
concurs with the need for information technology and adds that information technology
removes the dichotomies of the oppressor-oppressed and leads to open constructive dialogs for the emergence of vision sharing and aspirations. Srinivasan (2006) outlined several technology-driven projects within indigenous communities worldwide and discovered from his research that local communities were able to utilize information technology to advance political and cultural agendas and develop community-created information and media.

According to Borreo (n.d), indigenous community access to information technology presents many challenges. Indigenous communities have low computer ownership, literacy, connectivity, and access while digital technology is expensive especially in remote regions because of Internet connections and repair services (Borrero, n.d). Government IT initiatives have not been successful in rural areas. Pigato (2001) researched long-term success of government-sponsored programs in the rural areas of South Asia. The drawback from governmental programs include:

- Competence and motivation of the initial pilot without the ability to sustain the momentum
- Lack of improvement mechanisms for administration
- Inadequate financial resources to maintain program
- Lack of governmental agencies to develop suitable applications (Pigato, 2001).

**Conclusion**

In sum, with an ever-changing society, the Gullah-Geechee community, like other indigenous populations, must also change their traditional lifestyles and views without
sacrificing the richness of their heritage for ownership in the efforts to revitalize and educe others of their culture. Social theorists have researched methods to better equip an economically challenged population in order to sustain their lifestyles and preserve their cultural uniqueness. Most theorists would agree that government intervention alone is not enough to sustain an indigenous community. Furthermore, sustainability and preservation efforts can be successful with community involvement and the integration of information technology. By sharing the success of other sociocultural projects like the Grameen Bank, future sustainability and preservation efforts of indigenous cultures and populations can be improved in other communities globally like Russia, Canada, the Philippines, Australia, Cambodia, Mongolia, the Amazon, all over Latin America and Papua New Guinea to name a few.

1. TITLE PAGE

A. Title of Submission:  
*An Exploration on the Experiences of the Alangan Mangyan’s Consciousness in relation to their Ancestral Domain*

B. Topic area: Indigenous Education

C. Presentation format: Paper Session

D. The Alangan tribe of Mangyan Indigenous people in Occidental Mindoro, Philippines has struggled and fought for 17 years to claim legal rights for ancestral domain. 
This paper attempted to explore the experiences of Mangyans using phenomenological research to look into their consciousness, life and worldview about their ancestral land. 
From first thematic reflections to second thematic reflections, the theory of “Trinitarian Consciousness of Alangan- Mangyan” as an eidetic insight has been drawn to conclude it. 
Video presentation will highlight the summary of this paper.

2. ABSTRACT

AN EXPLORATION ON THE EXPERIENCES OF THE ALANGAN MANGYAN’S CONSCIOUSNESS IN ANCESTRAL DOMAIN

Researchers: Gladiolus M. Gatdula, Phd
Atty. Genesis M. Gatdula

The ancestral domain is the core content of this study. Since, it is a phenomenological research, the researchers explored on the meaningful experiences of the Alangan Mangyan and looked at their personal life, worldview and consciousness in the land of this tribe in Sitio Siapo Baclaran, Barangay Pinagturilan Sta. Cruz, Occidental Mindoro Philippines. It is also a context of a human – land relationship. Their struggles to own Certificate of the Ancestral Domain Title (CADT) are also highlighted.

The ancestral domain is a very relevant issue in the world and in the Philippines. The research tackles its significance in the social and government sector, in the mission of the Church, for future researches and the educational discipline. That’s why, theories and comprehensive review of literatures and related studies in relation to ancestral domain here and abroad are well documented.

It is a qualitative research with phenomenology as a specific method. The steps are done through: immersion, choose of co-researcher, Indigenous style of FGD (focus group discussion), strategy in recording the experiences, use of necessary documents about ancestral domain and presentation of these meaningful experiences.

The description of the indigenous people in Mindoro, the lived – experience of the co-researchers, thematic phenomenological reflections are freely written.

The eidetic insight as a fruit of the first and second thematic reflections is summed up in a particular personal theory of the researcher, though an open-ended. This is called “Trinitarian Consciousness” of the Alangan Mangyan in relation to their ancestral domain. This specific Trinitarian consciousness which is a meaningful consciousness of the Alangan tribe is a interconnectedness of Amang Sa ugbos (God), Life and Land. The land is life from God, this land as life has become holy through a meaningful act of burying the placenta in the land considered as the extension of their life. In Philosophy “Cognatus ergo sum,” or I am related, therefore I am. (Phoebee). God-Life-Land (which connects in all aspects of life) deepens and enriches the experiences of the Alangan in Trinitarian consciousness.

The last chapter tackles the theoretical implications, creative summary, creative symbol and the suggestions.
Introduction

School represents the most critical context outside the family for the development of self-concept. An analysis of student/teacher perceptions of self-esteem related to students with and without disabilities reveals discrepancies between both groups. Three distinct areas of self-esteem underscore the development and impact on self-concept—academic competence, peer popularity and personal security.

Rationale

Recently a renewed focus has drawn researchers and educator alike to consider the influence of one’s self-concept as it pertains to a students’ personal experience of success. Hattie (2013) conducted a meta analysis of the influences in student achievement highlighting factors related to self esteem and perception of others. Historically and classically, Purkey (1988) states, “There is a growing awareness that all the perceptions we experience in the course of living, none has more profound significance than the perceptions we hold regarding our own personal existence—our concept of who we are and how we fit into the world”. It is one’s self-concept that helps to define the complicated and dynamic system of individual views, values and thoughts, which the individual cleaves to for their own existence. Purkey encourages educators to address the concerns of a positive self-concept in order to do away with the “negative self-talk” which leads to irrational views of oneself. The effects of self-concept reach educator’s area of concern, including academic competence, peer acceptance and general sense of self.

A large body of research has shown that children without disabilities have a higher self-concept globally and academically than their peers with disabilities however, studies suggest that students with disabilities compare themselves to non-disabled peers. Further, teacher perceptions of a student’s self-concept tend to be higher for average achievers and lower for students who struggle with academics. Teachers also tend to view higher achieving students as putting forth a higher degree of effort to situations and being harder workers. (Metzer, Katzir-Cohen, Miller, Roditi 2001).
Methodology

The Self-Esteem Inventory (SEI) developed by Brown and Alexander (1991) was adapted for the purpose of this study. The subcomponents selected for the comparative study were 1) academic competence, 2) peer popularity and 3) personal security. The student population consisted of a total 154 students in general education and in special education classes. Disability categories included behavior disorders, learning disabilities, mild mental retardation, other health impairments and autism/Asperger. The majority of students were receiving special education services in a resource room for grade level K-8th grades.

Overall Results

Teachers consistently reported typical students having the highest self-esteem in all subcomponents and students with behavior disorders as having the lowest self-esteem. Student reports paralleled the teacher reports.

Test-Based Accountability: A Civil Rights Issue?

Abstract

The controversy over test-based accountability began with the passage of No Child Left Behind (NCLB) during the Bush Administration and has continued throughout the Obama Administration. NCLB holds schools accountable for student scores on standardized tests and sets goals for annual yearly progress, with sanctions for schools that do not meet the goals. The Obama Administration has given incentives to states to hold individual teachers, as well as schools, accountable by establishing the Race to the Top Fund, a competitive grants program, and also offering waivers on some of the requirements of NCLB for states meeting the Administration’s criteria.

When NCLB was originally passed, in 2001, it was supported by the majority of mainstream Republicans and Democrats in Congress. An unlikely coalition opposed it: conservative Republicans, who were concerned about federal control of education and liberal Democrats, who felt that the education of low-income and minority children would suffer as a result of the requirements.

The controversy (which is now about both testing and Common Core) has become more heated on both sides of the issue and is reflected in the current attempt to reauthorize the legislation. For conservative Republicans, test-based accountability is a cause célèbre and a symbol of federal intrusion in local decisions. Many others, both Republicans and Democrats, also oppose the emphasis on testing because of a concern that it weakens education; some parents have joined the “opt-out” movement and do not permit their children to be tested.
The Obama Administration and many mainstream Democrats and Republicans, however, continue to support testing requirements. Civil Rights organizations have also been particularly strong advocates of the testing requirements, which they view as essential to ensuring equality of educational opportunity for low-income and minority students. They make two main arguments: first, testing is essential to ensure that the achievement gap based on poverty is visible and, therefore, not ignored by policymakers and educators and, second, holding educators accountable for student test scores will strengthen education in high-poverty communities. The preponderance of research evidence, however, shows that both assumptions are questionable. Test-based accountability is having precisely the opposite effect from that hoped for by its advocates.

The presentation will examine the assumption that testing is required to ensure that policymakers and educators are aware of the achievement gap. It will draw on the vast research literature that shows the link between poverty and low achievement. A milestone of this literature is “the Coleman Report,” published almost 50 years ago, which shows the overwhelming impact of poverty on academic achievement. The presentation will also discuss the laws that were enacted 50 years ago in an attempt to alleviate the problem, most notably the Elementary and Secondary Education Act and the Higher Education Act. NCLB is not needed to demonstrate the link between poverty and low achievement; that link is all too apparent.

The main point of the presentation is to describe the ways that test-based accountability has exacerbated the already significant gap in opportunities available in high-poverty schools as compared to schools serving more affluent populations. The discussion will focus on the following findings:

1. The opportunities for a broad-based education have been diminished in high-poverty schools in order to free up time to cram for reading and mathematics tests. Especially in elementary school, the time spent on other subjects or activities has been reduced; in some cases, untested subjects—social studies, science, art, music—as well as in-depth projects have been completely eliminated.

2. The opportunities for the top students in high-poverty schools have also been diminished, both because they are denied access to a broad-based education and because teachers under extreme pressure to raise test scores have little time left for the students who they know will do well on the tests.
3. The opportunities for students in high-poverty schools have been weakened because the focus on test scores has added to the existing problems in recruiting and retaining teachers. Many teachers are concerned about the sanctions and negative image that might result from teaching in a low-performing school or prefer not to teach in an environment that is focused on test scores.

4. Perhaps the most serious outcome for high-poverty students is the increased segregation that has resulted from policies implemented in response to low test scores. Charter schools, the most visible of these, have exacerbated the already severe segregation in high-poverty schools. Recovery school districts, a more recent “fix,” create separate, non-geographical school districts composed only of low-achieving schools in a state, thereby segregating the high-poverty, typically minority students from other students. Brown v. Board of Education (1954) concluded that “separate educational facilities are inherently unequal.” The evidence of the past 50 years has continued to demonstrate the wisdom of that conclusion. The recent Supreme Court case, Texas Department of Housing and Community Affairs v. Inclusive Communities Project, Inc. (2015) might also be relevant to school segregation resulting as an unintended consequence of government policy. The Court found that “disparate-impact claims are cognizable under the Fair Housing Act”—“a shift in emphasis from an actor’s intent to the consequences of his actions.”

5. In addition to weakening education in high-poverty schools, the preoccupation with test scores has detracted attention from the underlying problem of poverty, the major correlate of low academic achievement.

Standardized test scores do not demonstrate meaningful academic benefits of test-based accountability. Although research findings for some programs do show small gains on high-stakes tests—the tests for which students have crammed--these gains are not sustained over the years. And when students are tested on the same material (typically reading and mathematics) using a different test, any advantage shown on the high-stakes test is no longer apparent. Moreover, the losses that have inevitably occurred from narrowing the learning experience are not accounted for in these studies.

Yes, testing is a civil rights issue. But test-based accountability, rather than strengthening equality of educational opportunity, may in fact be weakening it.
Title Submission: Teacher effectiveness in Trinidad and Tobago: The perceptions of the major stakeholders

ABSTRACT

Research has shown that it matters who the teacher is. This study aims to contribute to the discussion on teacher effectiveness, but in relation to teacher effectiveness in Trinidad and Tobago, based on the perceptions of the major stakeholders in education. Findings have confirmed that strong pedagogy, commitment and dedication to the profession, caring, patience and good communication skills are traits which are valued in effective teachers. The study revealed that what the teacher does, positive or negative, can impact students; e.g., ineffective teaching can contribute to student indiscipline and disaffection with school. Stakeholders longed to see more ongoing professional development in schools, better teacher preparation which focuses on pedagogical skills; and the provision of adequate resources and facilities for teachers to aid their effectiveness.

Keywords: Perceptions, major stakeholders, effective teacher, teacher effectiveness
Introduction:

Albert Ramdin (2013) p. 1, the then Assistant Secretary General of the Organization of American States (OAS), speaking about education in Trinidad and Tobago said:

We must re-examine our priorities and our subsequent investments in our people. We are interacting and competing with counterparts from around the world, and the question we must ask ourselves is, are we on equal footing to compete in this age of advancing technology?

Steinbach (2012) p.75 laments the deteriorating standards of performance in both primary and secondary schools as reported by various newspapers in Trinidad and Tobago. There are increases in repetition rates, especially at the primary level; the low level of achievement of a significant number of children at the Secondary Entrance Assessment (SEA) examination (formerly the Common Entrance and 11+); and consequently a large cohort of children are entering secondary school totally unprepared. Other issues are the level of and the increase in school violence which continue to worry all citizens. This has raised questions about the commitment and competency of teachers and also about their preparation. (Ministry of Education, 2005, p. 42).

Bernard (2015) p. 13 supports the above concerns when he states the following with respect to education in Trinidad and Tobago:

Despite our annual commendation on the performance of our students at our high stakes tests – SEA, CSEC and CAPE, we are not getting value for money in education. With an annual budget of $10 billion representing about six per cent of GDP, there are too many schools under-performing, especially at the public secondary level.

There are dropouts unaccounted for at the primary and secondary levels and wastage of money on students who register for courses, courtesy GATE, but do not attend the classes or sit the exams. There is also a continuing reduction of functional literacy, even at the tertiary level and a prison population that is increasing exponentially.
Matthews (2013) p. 5, writing for the World Bank found that despite the high level of investment, quality of education in the Caribbean remains low. Pass rates for standardized tests in core subjects like English and Mathematics are less than 50%; many students lack basic skills in information and communication technology and other disciplines deemed critical for success in the workplace. What is even more worrisome are the reports of poor student Caribbean Secondary Education Certificate (CSEC) examination performance on test items that require critical thinking, analysis or communication. Despite eleven (11) years of formal education school leavers struggle to find employment. This situation begs the question, what is happening in classrooms in the Caribbean, including Trinidad and Tobago?

The implication of this challenge for Trinidad and Tobago is that teachers, the backbone of the education system, need to be effective in the classroom and facilitate students’ academic and life preparation.

Unfortunately in Trinidad and Tobago the violence in society has infiltrated many schools. According to the United Nations and World Health Organization’s Global Status Report (2014), Trinidad and Tobago is listed as number ten of the most homicidal countries in the world. In Trinidad and Tobago 77% of persons are killed by firearms and there are 35.3 murders per 100,000. The message that this may be sending to the youths is that life has no value and there is little purpose in working hard to achieve academically when you could be killed at any time.

This researcher feels that it is necessary to explore the concept of teacher effectiveness from the perspective of the main stakeholders in education, i.e., the students at all levels, teachers, parents, school and business leaders. The rationale for this is that if qualified teachers, graduates of the University of Trinidad and Tobago (UTT), the University of the West Indies (UWI), the Catholic Religious Education Development Institute (CREDI), the University of the Southern Caribbean (USC) and other teacher preparation institutions are in classrooms in Trinidad and Tobago, then effective teaching should become the norm. It is possible that the perceptions of teacher effectiveness as seen by the stakeholders are not in sync with what the teacher preparation institutions deem to be effective teachers. If this study yields relevant results, then the teacher preparation institutions can better align their programmes to accommodate the expectations of
the stakeholders and actually produce effective teachers who can positively impact student learning in all spheres of the education system.

Pretorius (2012) p. 310 contends that if teacher effectiveness in this complex era is the single most important school-based factor in student achievement, education reform movements should look anew at teacher effectiveness in all school phases and the factors contributing to effective teaching. The training that teachers receive is most surely one of the critical factors contributing to whether they would be effective or not. Teacher success is inevitably linked to good and effective teacher training.

Hunt (2009) p. 7 admitted that there is relatively little in the current literature about students’ views of teacher effectiveness. This study should fill this void and go a step further by soliciting the perceptions of other key stakeholders in education, apart from students, about teacher effectiveness in Trinidad and Tobago. This study looks at what an individual needs to do and to possess to become an effective teacher. The focus is not on teacher quality, but teacher effectiveness.

Research has shown that effective teachers (also referred to as outstanding, excellent, exemplary, good, competent, and highly skilled and master teachers) are vital to the improvement of the quality of education, school improvement and improving the chances for success for all students. (Darling-Hammond, 2009; McArdle, 2010; Arnove, 2010; and Christenburg, 2011). The teacher and the effectiveness of instruction are important variables which contribute to student success. Kelchtermans (2009) p. 258 puts it this way: Teaching is an act done by someone and it matters who the teacher is. The teacher is held to be the centre of, not only the classroom, but also the educational process.

**Research Aims and Questions:**

The research objectives are to determine:

1. The perceptions, and qualities of effective teachers;
2. how effective teaching impacts students at all levels of the education system;
3. some activities that teachers engage in which cause them to be ineffective
4. how exposure to ineffective teachers impacts students
5. suggestions to ensure teacher effectiveness in Trinidad and Tobago classrooms

Based on the findings the qualities and competencies that constitute teacher effectiveness in the Trinidad and Tobago context should be revealed. In addition the teacher preparation institutions should be able to align their programmes with the competencies and qualities which are valued by the main stakeholders. Ultimately, the society should benefit as students will be taught by effective teachers who possess the competencies valued by the society and necessary to prepare students for 21st century living.

Methodology:

This study is a qualitative descriptive research. Descriptive research is also referred to as survey research and it determines and describes the way things are. (Gay, Mills and Airasian, 2006, p. 159). The researchers state that: Typically descriptive studies are concerned with assessing attitudes, opinions, preferences, demographics, practices and procedures. Qualitative descriptive research focuses on the participants' views of a situation; whereas with quantitative, the researcher’s view is presented. The data for this study were collected through a self-report survey approach which required participants to respond to a series of statements or questions about themselves. (Gay and ors., 2006, p. 161).

The population used in this study comprised business leaders and parents from the society; school leaders, teachers and students from ten primary and ten secondary schools in Trinidad and Tobago; and tertiary students from the University of Trinidad and Tobago, the University of the West Indies, St. Augustine and the University of the Southern Caribbean. Both male and female participants were selected and they ranged from 10-50 plus in age.

While the ideal would have been to have a balance of male and female participants, this was not possible. For example, in coeducational schools this researcher had no control over the gender mix in the classroom. For the non-school participants, e.g., parents and business leaders, this researcher made an effort to strike some gender balance, but females were more inclined than males to complete the questionnaires. This was not seen as a major problem because this researcher is of the view that to plan in advance for gender equity is somewhat artificial; in real life there is no gender equity in institutions or in societies. Overall female respondents (67%) completed the questionnaires and males (33%).
In this study purposive sampling was used so as to determine who would be best able to provide the information required. In purposeful sampling researchers intentionally select individuals and sites to learn or understand the central phenomenon. Gay and ors. (2006) p. 114 observed that because many potential participants are unwilling to undergo the lengthy demands of participation, sampling in qualitative research is almost always purposive. This observation by the researchers was borne out in this research as a few students and some teachers started to complete the questionnaires but did not finish. This is because the questionnaire required time spent in providing thoughtful responses.

The sample comprised seven hundred and eighteen (718) participants (business leaders – 13; parents – 45; school leaders – 20; primary and secondary teachers – 200; and students (primary, secondary and tertiary – 440).

Prior to the data collection process, this researcher sought and received the necessary Ministry of Education approval for the study and the use of the schools which were selected.

Primary data collection was undertaken through the use of seven (7) questionnaires comprising open-ended questions which were structured to suit the developmental ages of the participants. These questionnaires were used as the main data collection tool so as to give the participants the opportunity to respond in their own time. However, Fraenkel et al (2006) p. 126 note that when questionnaires are used for data collection, unclear or seemingly ambiguous questions cannot be clarified and the researcher has no chance to expand or react verbally to a question of particular interest or importance. This was borne out by this researcher when the questionnaires were personally administered at one of the school. The students asked questions and the researcher was able to clarify. It is unfortunate that the students from the other schools surveyed did not have this opportunity.

Woods (2006) p. 79 admits that questionnaires are not among the most prominent methods in qualitative research because they commonly require subjects to respond to a stimulus and thus they are not acting naturally. However, they have their uses, especially as a means of collecting information from a wider sample than can be reached by personal interview. The questionnaires used in this research presented the participants with limited stimulus as the responses required
them to articulate their own words in response to the open-ended questions asked. There were no prompts and the items used in all of the questionnaires required thought on the part of the participants so that meaningful responses could be given.

The questionnaires used in this study were piloted during the months of November, 2013 and February 2014. After this process the questionnaires were modified and finalized for use during the data-collection phase of the study with effect from May to July 2014. The return rate of the questionnaires overall was 57%.

This researcher distributed the questionnaires to all schools personally except for the Tobago schools; these questionnaires were sent by TT Post. This researcher also met with the principals, vice-principals, or dean of the schools in Trinidad. The researcher was in constant telephone contact with the principals of the schools in Tobago. Most of the principals recognized the value of the research being conducted by this researcher and the questionnaires were administered within the shortest space of time – at one primary school the questionnaires were administered immediately and were ready for collection in the afternoon. In other schools the questionnaires were administered within one day, one week and at most two weeks.

The completed questionnaires were collected from the various schools as they became available and collection was arranged by this researcher to coincide with the distribution of some of the packages to the other schools. It is to be noted that this researcher in no way coerced the participants and the exercise was totally voluntary.

The questionnaires were administered by school personnel except in the case of one school where the Vice Principal invited this researcher to come in at a scheduled time to administer the instrument. School leaders and teachers completed the questionnaires on their own time. In order to facilitate data collection in the Tobago schools, this researcher hired a temporary research assistant who administered the questionnaires at one of the schools and collected the completed questionnaires from the other school and posted them to this researcher.

This researcher wanted to reward the students who participate in this research and to this end
Packages were prepared for the school leader or teacher assigned to assist with the research; and for the students who participated. Items bearing the logo of the University of Trinidad and Tobago (UTT) where the researcher works (items such as bags, note pads, pens, key rings were given to the school leaders and the students were given folders, and UTT pencils purchased by this researcher. In one unsponsored primary school this researcher donated a set of reading books and reference books for the library. The appreciation packages for the Tobago schools were sent by TT Post courier mail.

Secondary data collection was done by the examination of archival documents and records where necessary; and an overview of the relevant literature.

**Theoretical Framework:**

Researchers are discovering what parents have always known, it matters who the teacher is. Haycock (1998) p. 4 said that parents have always known that it matters a lot which teachers their children get. That is why those with the time and skills work so hard to assure that, by hook or by crook, their children are assigned the “best” teachers.

Witcher, Jiao, Onwegbuzie, Collins, James and Minor (2008) p. 281 offered this definition of effective teachers: effective teachers are described as those who have strong cognitive skills, are subject specialists, and are able to vary their teaching strategies to meet the needs of their students.

Acheson and Gall (2003) p. 18 define the concept of effective teaching in this way:

> Effective teaching involves the ability to provide instruction that helps students to develop the knowledge, skills, and understandings intended by curriculum objectives, create an instructional climate that causes students to develop attitudes toward school and self, adjust instruction so that all students learn, irrespective of their ability, ethnicity, or other characteristics, manage the classroom so that students are engaged in learning all or most of the time, make sound decisions and plans that maximize
students’ opportunity to learn, and respond to initiatives for curriculum change so that the new curriculum’s intents are fully realized.

Williams, Sullivan and Kohn (2012) p. 107 admit that effectiveness is an elusive concept. The word seems to characterize a teacher’s worth and ties directly with being successful in the classroom. Effective and successful are synonymous in that they indicate achieving desired results.

It is important at this juncture to point out that this researcher is not suggesting that teacher effectiveness is the only contributor to student academic and life achievement. Rather, teacher effectiveness is the focus of this research but there are many other factors involved in this process.

Stumbo and McWalters (2011) p.10 explain that over the years there has been a shift in focus – there is now an emphasis on teacher “effectiveness” rather than on teacher “quality”. Teacher quality largely refers to how well teachers know their content as measured by the post-secondary courses they have taken. The shift towards effectiveness focuses on how well teachers perform with students. Rather than measuring inputs (such as how many academic degrees the teacher has or how long he/she has been on the job), the outcomes of a teacher’s work should be measured to see how effective the teacher is (the extent to which the educator has met crucial student needs, such as an increase in student achievement). Stumbo et al (2011) p. 10 contend that this is analogous to the shift from paying attention to student inputs (how many courses a student has taken, or seat time) to looking at outcomes (how much the student knows and can do, or performance).

Kennedy (2008) p. 59 defined teacher effectiveness but, like Stumbo et al (2011) placed it as a component of teacher quality. Teacher quality has different meanings depending on the context and the user. It can mean to some a teacher’s test scores; a teacher’s credentials; their classroom practice and student achievement; or teachers’ beliefs and values. However, Kennedy (2008) p. 60 suggested that the term should be “teacher qualities” and not “teacher quality” given that
there are various dimensions of the concept teacher quality. The researcher therefore proposed three (3) broad groupings of teacher qualities:

- Personal resources (attitudes and personality traits)
- Performance (what teachers actually do on a daily basis)
- Effectiveness (how good teachers are at raising students’ scores on achievement tests)

Kennedy (2008) p. 61 went on to explain that even if reliance were to be placed on a very narrow definition of effectiveness there are still to be found multiple qualities within the term. Teachers might be more effective in some subjects than in others, or they might be more effective with some types of students than with others. Darling-Hammond (2009) p. 2 also recognizes that a high quality teacher in one circumstance may not be a high-quality teacher for another. An example of this would be subject-specialists teacher who are only effective in their area of expertise.

Pretorius (2013) p. 238 asserts that the term “teacher quality” subsumes teacher effectiveness, qualifications, professional capacity, performance, et cetera. The definition is brought down to specifics by delineating teachers’ contributions to student outcomes as final criteria.

Darling-Hammond (2009) p. 1 believes that standards have been rising for teachers. The average teacher today is in the top half of his/her college class. Some states are choosing from the top third. This researcher takes issue with this type of view on the selection of teachers. A high academic achiever may not be a “good” or “effective” teacher. Even with the best of preparation the passion and enthusiasm may not be present, and that person may not be effective in the classroom. Teacher selection should not be based solely on academic scores. Credence for the above view is found in Goldhaber (2007) pp. 766 who observed that despite the testing, many teachers whom we might wish were not in the teacher workforce based on their contribution toward student achievement are nevertheless eligible because they score well on their licensure test. Conversely, many individuals who would be effective teachers are ineligible due to their poor test performance.
Added to the above, Goodwin (2011) p. 80 warns that being credentialed, being experienced or holding an advanced degree is no guarantee of effectiveness. Rather, leaders must look more deeply, in other words, they should look below the surface at the intangibles. Support for this approach is found in Wong and Wong (2009) p. 5 who agree that a “highly qualified teacher” may not be an effective teacher. Effective teachers are the ones who produce student learning and achievement, not highly qualified teachers. Therefore, you hire for qualification then train for effectiveness.

It is this researcher’s position that it is important for all students to be exposed to high quality education and effective teaching. Clifford (2010) p. 64 agrees and referred to the UNICEF (2002) p. 5 statement that access to education of a poor quality is tantamount to no access at all; the quality of education children receive is critical to genuine learning and human development; and quality is influenced by what goes on in the classroom and beyond.

Goodwin (2011) p. 79-80 said that while good teachers possess a few quantifiable attributes (such as verbal and cognitive ability; adequate knowledge of their content area and of how to teach their subject areas). Great teachers also possess many intangible attitudes which are sometimes overlooked. Some of these intangibles are: the belief that all students can learn, belief in their own abilities/sense of efficacy and an ability to connect with students. A study by Cornelius-White (2007) found that teachers warmth, empathy and “non-directivity (student initiated and student regulated activities), strongly correlated to higher levels of student participation, motivation and achievement. Therefore, the softer or intangible qualities of teachers do matter and should be addressed in teacher preparation programmes.

O’Brien (2010) p. 114 advises educators to let students know that they care about them. The idea is not new, but still teachers have a problem with how to care and show that they care. The researcher states: they (students) would not care to learn until they learn that you (the teacher) care.
Lumpkin (2007) p. 159 believes that:

Caring teachers nurture relationships with students through affirming students’ efforts and talents. These teachers realize that learning is much more likely to occur when positive, reinforcing comments outnumber critical comments. While teachers will, at times, provide constructive critiques of the performance of students, caring teachers persistently reward the efforts of students, their learning from mistakes, and their not giving up even though they sometimes struggle to learn. Caring teachers’ expectations contribute to students’ feeling that their efforts will be rewarded as learning outcomes become more meaningful.

Dozier (2009) p. 8 stated that when students see that teachers care about them personally and are willing to spend time helping them succeed, teachers build trust between themselves and their students; and the students are willing to work harder to succeed, if for no other reason than to please the teacher who wants them to succeed. Believing in students’ abilities to achieve is the theory of the Pygmalion effect or self-fulfilling prophecy and when applied to education posits that if teachers continuously show that they believe in students’ abilities, almost all students will respond with greater effort.

A study by Ribie-Davies (2007) compared the classroom practices of teachers categorized as having high expectations with teachers categorized as having low expectations. It was reported that the teachers with high expectations spent more time providing a framework for their pupils’ learning, provided their pupils with more feedback, questioned their pupils using more higher-order questions, and managed their pupils’ behavior more positively. In effect, it appears that teachers with high expectations are purposively more committed through their teaching to creating a classroom climate within which pupils must make greater progress.

Hayes (2006) p. 47 recognized that effective teaching is not a paper and pencil exercise or a
vehicle for governments to flaunt policy achievements. It profoundly affects the lives and welfare of teachers, assistants and pupils. He says:

The role of teacher encompasses more than the act of teaching (significant though it is). It also involves relating to and influencing a large number of people, particularly the children and young people with whom teachers have daily contact. Every word spoken, decision taken and action witnessed makes a difference to their lives and welfare. Over succeeding years, when much of school life is forgotten, men and women will not only continue to benefit from the good teaching they receive, but also from the moral and ethical example they received from teachers.

It is to be noted that students are well able to determine if their teachers are effective or not. They know when the teacher is making an effort to teach well, whether the teacher has planned for instruction and whether they care. When students are given “busy work” they recognize that their time is being wasted and can lose the zeal to learn. This is why many students in Trinidad and Tobago are placed in private lesson classes and that culture of private lessons, a costly venture for parents, has become endemic in the education system in Trinidad and Tobago.

Goa (2014) p. 104 has stated: Children naturally love to learn, but might not like to be taught in certain ways. Teachers’ improper ways of teaching might make a child shut down his or her willingness to learn, which is called not-learning. Not-learning does not refer to an incapability to learn, but is rather a choice a child intentionally or unintentionally makes to resist learning.

Clifford (2010) p. 70 recognized that the views of teachers and students are essential in making decisions pertaining to education. The reality is that not only students and teachers’ views of effective teaching are needed, but the perceptions of all major stakeholders; and it is
this deficiency which this study hopes to address, and therefore profile an effective teacher in the Trinidad and Tobago context.

Delaney (2008) p. 1 has observed that traditionally high school students have not been given many opportunities to offer their insights and comments on education and schooling. In fact, there appears to be a dearth of information regarding high school students’ perceptions of effective teachers. Delaney (2008) p. 1 describes these views or perceptions as “authentic sources” as students personally experiences classrooms firsthand. Soo Hoo (1993) p. 388 is of this view also and states that:

Somewhere educators have forgotten the important connection between teachers and students. We listen to outside experts to inform us, and consequently, we overlook the treasure in our own backyards: our students. Students’ perceptions are valuable to our practice because they are authentic sources; they personally experience our classroom firsthand.

Wang, Gibson and Slate (2007) p. 293 found that students can blossom or wither because of the affects, behaviours and methods of a particular teacher. A teacher can positively or negatively impact students both in and outside the classroom. How one teacher treats or teaches a child has rippling effects that permeate and continue throughout the individual’s educational journey. There is no denying that it matters who the teacher is.

Chetty, Friedman and Rockoff (2013) p. 4 revealed that a good teacher not only improves a child’s test scores in the classroom but also enhances his/her chances to attend college, earn more money, live in a better neighborhood, avoid teenage pregnancy and save more for retirement. Furthermore, effective teaching tended to be effective with all types of students from all types of backgrounds; likewise, ineffective teaching tended to be ineffective with all types on students from all types of backgrounds.

Schacter and Thum (2004) p. 411 have observed that in the last decade a series of studies have confirmed that access to an effective teacher is the single most important school-related
factor responsible for increased learning. The quality of the teacher, then, is the most important school-related factor and can be more powerful than many out-of-school factors. Phillips (2011) p. 18 lends support to this when she says that great teachers are the most important school-based ingredient for student success.

Findings:

Perceptions of an effective teacher

The main stakeholders in education gave their perceptions of an effective teacher (Figure 1). Male (63%) and female (72%) stakeholders perceive an effective teacher as one who possesses strong pedagogical skills. This encompasses the following:

- Engaging in advance planning
- Make learning fun and enjoyable
- the ability to explain content clearly
- Being able to complete the syllabus
- Using a variety of instructional strategies
- Using relevant teaching and learning aids during one’s lesson

![Figure 1 Stakeholders’ perceptions of an effective teacher](image-url)
Another perception of male (42%) and female (40%) stakeholders is that effective teachers should be committed or dedicated to the profession and be willing to go the extra mile in the exercise of his/her duties. It was felt that teachers should be willing to help children after school at no charge.

Male (25%) and female (35%) stakeholders perceive an effective teacher as one who cares about his/her students and who is able to develop the student holistically. In addition it was felt that caring teachers should be able to reach their students emotionally and touch students’ hearts.

**Qualities of effective teachers:**

Stakeholders went on to identify qualities which they perceive an effective teacher should possess. (Figure 2).

![Figure 2 - Stakeholders’ perceptions of the qualities of an effective teacher](image-url)

**Figure 2**  Stakeholders’ perceptions of the qualities of an effective teacher
Male and female stakeholders (58% and 49%) believe that teachers should be committed to the profession; possess strong pedagogical skills (53% and 49%); be caring (54% and 44%); have patience (44% and 33%); and possess good communication skills (39% and 44%).

**How students benefit when they are taught by effective teachers:**

Stakeholders next examined how students benefit by being taught by effective (Figure 3). Stakeholders (male, 69% and female, 71%) recognized that children taught by effective teachers develop a love for learning, experience improved academic performance, learn taught material and achieve excellence. They understand the material which is taught, their general academic performance would improve and they will go on to get good grades and have examination success.

![Figure 3 Stakeholders’ perceptions of how students benefit from being taught by effective teachers](image)

Stakeholders next examined how students benefit by being taught by effective (Figure 3). Stakeholders (male, 69% and female, 71%) recognized that children taught by effective teachers develop a love for learning, experience improved academic performance, learn taught material and achieve excellence. They understand the material which is taught, their general academic performance would improve and they will go on to get good grades and have examination success.

![Figure 3 Stakeholders’ perceptions of how students benefit from being taught by effective teachers](image)
Male (55%) and female (48%) were of the view that students’ behavior would improve considerably if they were to be taught by effective teachers. There would be less indiscipline in schools and in society.

Male (40%) and female (41%) of stakeholders feel that children exposed to effective teachers are motivated and would want to come to school thereby reducing the dropout rate, thereby improving their life chances. Students would develop into well-rounded citizens who would be productive in the work force and become law-abiding, patriotic citizens.

Activities that cause teachers to be ineffective:

Stakeholders acknowledged that some teachers engage in activities which cause them to be ineffective (Figure 4).

![Stakeholders' perceptions of activities that cause teacher ineffectiveness](image)

**Figure 4  Stakeholders’ perceptions of activities that cause teacher ineffectiveness**

The major activities identified were teacher indiscipline (male 53% and female 66%); tardiness (male 58% and female 55%); and poor pedagogy (male 23% and female 27%). Teacher indiscipline includes the following activities/behaviours:
Teacher absenteeism was identified as the most serious form of indiscipline which teachers engage in. The students explained that while some of the teachers do not come to school or to class, others are present at school but do not show up for their classes as timetabled. In addition, if some of the teachers come to class, albeit late, there is an absence of instruction, so it is better if they are not there.

Stakeholders recognized that teachers tend to engage in tardiness (male 58% and female 55%). Teachers come to work late, and go to their classes late; they are late marking and returning scripts, and they do not meet deadlines for the submission of marks. The students said that some teachers are too lazy to come to class and even to school; they are tardy coming to class and they much prefer to “lime” (socialize) in the staffroom.

Stakeholders identified poor pedagogy (male 23% and female 27%) as an activity which causes teachers to be ineffective. The reality is that some teachers just do not teach for understanding/comprehension they just do not have the skills to break down material and explain properly. Teachers are accused of spending whole periods calling out notes from textbooks in a monotonous tone; they do nothing to make lessons fun; they rush through the syllabus and move on without ensuring that all students understand the concepts being taught. Students revealed that teachers gloat that even if they do not work they still get paid. They assign students busy work and retreat to the staffroom, thus leaving students unsupervised. Some teachers have been accused of teaching the wrong information.

Instead of teaching when they go to their respective classes some teachers engage in several time-wasting activities some of which are:

- Showing favouritism
- Teacher absenteeism
- Being abusive to students
- Engaging in time wasting activities
- Using students to run their personal errands
- Frequent quarreling with students and embarrassing them
• Reading books in class
• On social media in class
• Eating during class time
• Playing games on phones
• Talking about their life experiences
• Answering cell phones and texting during class

When some teachers come to class they sit and do nothing and at times engage in small talk with students and this causes non-productivity and some of the talk is “vicey” talk, which is inappropriate to have with students. When some teachers go to their classes they appear to be under the influence of alcohol.

*How students are affected when taught by ineffective teachers:*

It was recognized by stakeholders that when students are exposed to ineffective teachers they are impacted negatively. (Figure 5).

Male and female stakeholders identified several negative consequences for students: delinquency (43% and 38%); academic failure 50% and 55%); illiteracy (56% and 64%); students are demotivated (38% and 49%’ and some students may become dropouts (32% and 38%).

![Figure 5 How teacher ineffectiveness impacts students](chart.png)
Suggestions to ensure that most teachers are effective:

Stakeholders next expressed their perceptions of what can be done to ensure that most teachers are effective (Figure 6).

Retraining (male 46% and female 45%); provide teachers with the necessary resources (male 41% and female 20%) monitor constantly (male 34% and female 30%) and change the recruitment system (male 42% and female 33%).

It was felt that all teachers in the system should participate in mandatory in-service training which could be held as part of professional development activities. It was suggested that the initial training process for teachers should be properly done and that adequate resources be provided for teachers and facilities improved.

Another suggestion was that the recruitment system should be changed and all teachers entering the system needed to have a teaching qualification such as the Diploma in Education (Dip. Ed.) which is offered by the University of the West Indies, St. Augustine, School of Education.

Figure 6  Stakeholders’ suggestions to ensure that teachers are effective
Discussion and conclusion

The essence of this study is to identify, from the perspective of the major stakeholders, what an effective teacher looks like in the Trinidad and Tobago context.

The capacity to engage in good pedagogical practice was the most frequently identified expectation associated with an effective teacher. The teacher who stands in front of the class must be someone who knows how to teach, explain content properly and help children to learn. One can question the purpose of a teacher being in the classroom if no learning is taking place.

Therefore, an effective teacher is someone who can really teach. A study of seventeen (17) schools in four states in the United States of America examined the effects of longer school days giving teachers more time in class as not being as effective as the improvement of the quality of instruction. Ferguson (2015) from the Centre on Education Policy said: any effort to expand learning time should go hand in hand with a plan for improving the quality of instruction.

The importance of good teaching is supported by Ferriter (2011) p.84 who said that even with the presence of various digital tools that can be used in the classroom, they are useless without teachers who are armed with good instructional skills. Good teaching trumps good tools every time.

Ferriter (2011) p. 84 cited Nussbaum-Beach (no year given) who said that students sitting in high-tech classrooms armed with interactive white boards, iPods, and handheld video cameras, but staffed by teachers who can’t craft lessons that integrate the skills needed for success aren’t any better off than their counterparts in unplugged classrooms.

Good pedagogical practice involves knowing how to teach one’s subject area, how to teach for understanding, how to prepare one’s lessons to meet the needs of the various learners in one’s class and how to assess the different learners in one’s class. It is not only about instructional practice. It also needs to be stressed that having higher qualifications in a subject do not necessarily transfer into a person’s capacity to teach that subject for understanding.
The stakeholders identified several qualities that effective teachers should possess. The most frequently cited qualities were: commitment, strong pedagogical skills, caring, patience and good communication skills.

Commitment refers to the level of dedication which one has towards one’s job or according to the stakeholders, one’s willingness to go the extra mile. Too many teachers in the school system in Trinidad and Tobago view teaching as only a job or a pay cheque and they lack passion for the job. Given this mindset, these teachers do not care about their charges and do not care if their students learn.

Johnson (2011) believes that student commitment depends on teacher commitment – the researcher suggests that:

When the teacher says, I am the one that makes learning possible in the classroom and I am committed to make it happen. And the student says, I will do everything that I can to learn. I am ready to learn. That is when the magic of learning really happens.

An important quality identified by stakeholders is a teacher’s capacity to care. Caring will ensure that a teacher exercises patience, and that teacher will display integrity by being fair to his/her students. A caring teacher is committed to the welfare of his/her students, will want them to learn and therefore will exercise good pedagogical skills. In addition caring will permit the teacher to be able to exercise good communication skills, in speaking and listening, to his/her students. A caring teacher will generally have a student-centred orientation.

A teacher who does not care about his/her students will not have the patience to teach them well and this spells a lack of commitment. This researcher views an uncaring attitude being linked to a lack of integrity. A teacher’s main responsibility is to ensure that their students learn and even if the job as a teacher is to be used as a stepping stone to other things, then at least that job should be done well. This is not happening in many schools in Trinidad and Tobago.

Lumpkin (2007) p. 2 explains this about caring:
Teacher-learner relationships are founded on the fundamental human need of knowing that another person genuinely cares. Students know when they are recognized, understood, and respected for their unique abilities and interests by their teachers. Teachers are effective when they deeply care about the learning of each student.

Lumpkin (2007) elaborates by saying that when teachers care they believe in their students’ abilities and teachers demonstrate that they care by placing the learners at the centre of the educational process. Thus teachers are able to engage students actively in the learning process and learning becomes fun, meaningful and enduring for the students.

Teachers need to have good communication skills so that they can positively interact with their students, the students’ parents, colleagues and management. In addition having good communication skills would indicate to the students that this teacher is approachable and is one who can listen. Students have to know that they are able to go to their teacher for clarity or advice, and that they (the students are welcomed by the teacher).

The stakeholders recognized that when students are taught by effective teachers they benefit in several ways:

♣ Learning occurs
♣ Students are motivated to achieve
♣ Students cultivate a love for learning
♣ Students tend not to engage in delinquent behavior
♣ The country benefits as students turn out to be good citizens

It was recognized that when teachers are ineffective students are disadvantaged in many ways. Students experience academic failure; they become disaffected with school and eventually drop out; and they tend to engage in delinquent behavior. What is really happening is that the educational institution is not achieving its goal, as student learning is not taking place. This researcher sees this as a failed system.
Stakeholders identified several activities which teachers engage in that cause them to be ineffective, e.g., teacher indiscipline (e.g., absenteeism, showing favouritism, being abusive to students, engaging in time wasting activities).

Teacher absenteeism simply means that the provider of education in an institution of learning is not around to do his or her job. This is a serious problem and the Education for All Global Monitoring Report (2015), p. 205, says that: teacher absenteeism takes a toll on student learning by reducing the number of hours that children are actually taught.

In Trinidad and Tobago teacher absenteeism is not only about a teacher taking legitimate leave available to him/her under the terms and conditions of service, e.g., sick leave, casual/business days. Rather, it extends to teachers being present in the school but absent from classes. Some teachers simply stay in the staff room and do not go to their classes. This researcher would like to extend teacher absenteeism to the practice where teachers may be forced to go to class but they do not teach. There is an absence of instruction as teachers engage in a lot of time-wasting activities, as identified by the students in this study. The teachers are busy on social media, communicating on their cell phones, marking assignments or are outside of the class chit-chatting. This means that there is an absence of supervision and an absence of teaching. This practice is not unique to Trinidad and Tobago but is a problem being faced in many developing countries such as Ecuador, Kenya, India, Pakistan, Papua New Guinea, Zambia and South Asia (World Bank, 2004).

Because of poor administrative planning some teachers are absent as they have to attend to official duties, e.g., workshops, seminars and meetings. However, one questions the rationale for scheduling meetings and workshops during the term and during class hours. Workshops should be conducted during the school vacation periods and meetings can be held after school is dismissed. Given the school culture in Trinidad and Tobago having meetings after school would be a problem as many teachers leave the school compound when the students are dismissed or at the end of their last teaching period for the day. However, there should be specific hours of work for teachers; and it should be specified that they need to stay on the compound.
In terms of the vacation periods: Easter, August and Christmas, teachers tend to forget that they are on paid vacation and should be attending to school business. Rather, many of them view these vacation periods as sacrosanct and their own by right, and the teachers’ union tends to facilitate this belief. The Ministry of Education in Trinidad and Tobago should take the lead in amending the Education Act to explicitly state that teachers are on duty during the vacation periods and if they do not wish to be they should apply for vacation leave. Teachers’ vacation leave days need to be clarified just as their sick leave and casual days are, and in the way in which vacation leave for public servants is specified. So based on a teacher’s years of service s/he may be entitled to 21 days (1-10 years’ service); 28 working days (10+ years of service) or 35 working days based on one’s salary range. These vacation days should not be approved during term time, except in emergencies.

If the above method were to be utilized then the authorities would be better able to monitor their teachers and get replacements or substitute teachers.

Students are the biggest losers when their teachers choose to be indisciplined. Children need to be supervised at school. When teachers are tardy going to class or are frequently absent, children are idle and they get themselves involved in many deviant acts of mischief, which can graduate into outright indiscipline and even violence. Added to the fact that students have become indisciplined, they are also not engaging in formal learning, they are doing badly in tests and examinations and they may be illiterate. This causes them to have a feeling of a sense of failure; in addition they feel less worthy because their teachers are not coming to class; then their self-esteem and sense of motivation will be diminished. These students will eventually become angry and lash out at society; in the school they become bullies, disruptive in class and eventually drop out voluntarily or forced out through frequent suspensions. Without an education and lack of training in any skill some of these dropouts may become menaces to the society as they turn to a life of crime. Those who are able to secure employment can expect only minimum wage and many will not be productive workers as the one thing they would have learnt from their teachers is an unhealthy work ethic.

Shaw, Conti and Shaw (2013) p. 34 explain that the students who become disaffected with school and drop out become at-risk because of various societal factors, such as chemical dependency, teenage pregnancy and poverty.
Kassam (1989) p. 531 explains that literacy empowers and to be illiterate is to be disempowered and marginalized. Pedriana (2010) p. 78 supports this and listed several factors which he calls the “inestimable costs of illiteracy”. These include: the inability to attain higher levels of education; the risk of imprisonment; the cost to a country when it cannot produce a workforce capable of addressing the increased demands of a society that must compete globally. In addition people with low or marginal literacy are more likely to be unemployed and therefore less likely to be covered by health insurance, thus becoming a burden on the State and taxpayers. Illiteracy even impacts the effective functioning of democratic principles as an illiterate electorate cannot sort through printed material and make judgments based on deep knowledge. Even the act of voting itself requires the ability to read and follow procedures necessary to make a vote count. So there may be many “spoil votes” in various polling stations. Illiteracy causes its victims to follow a path of violence and aggression as they engage in high-risk behaviours that often land them on the wrong side of the criminal justice system. It can be seen that lack of a proper education and illiteracy have crippling, lifelong effects.

It is important for teachers to undertake mandatory professional development activities during the vacation periods; and for principals to monitor their teachers closely in terms of their performance in their classrooms, and their punctuality and regularity. Principals can assume the role of instructional coaches and help their teachers to improve their pedagogical skills by visiting them in their classrooms, unannounced, and assess their pedagogical skills. In addition, the provision of necessary resources is vital and there should be proper facilities for teachers and students at schools.

The provision of resources and improvement of physical facilities are imperatives and cannot be over-emphasized. For example, it is interesting that secondary students are given laptops, but class teachers are not; a laptop for every department is not adequate. If teachers want to guide students on the proper use of laptops for learning they too must have access to laptops at the school. Granted, there may be a teachers’/staff’s computer lab in schools, are there sufficient computers for every teacher? This researcher feels that all teachers should be given laptops/tablets for use in the school, they should not be taken home. With this arrangement if a substitute teacher comes to work on any given day, that person will have access to the laptop/tablet and material relevant to the lesson including student assessment records. In addition
there would need to be Internet access in all classrooms so that the use of laptops can be integrated into lessons.

In terms of other resources all classes should have a proper chalk board, notice board for displaying students’ work and a white board; chalk and markers should be readily available. Teachers should have access to all of the various materials which they would need to make teaching and learning aids. In many instances this is not happening and some teachers have to purchase their own materials.

In some schools teachers have no access to educational journals. The school library is equipped to cater for the needs of the students, but the school is a learning community and academic staff should be able to access online journals, research databases and other materials. In addition as a learning community teachers should be encouraged to collaborate and engage in action research at the classroom and school levels.

Stakeholders were of the view that principals and other Ministry of Education officials should monitor and discipline delinquent teachers. No more should teachers be tardy in regularity and punctuality, not attend their classes, fail to mark scripts and meet deadlines. Yet, these same teachers successfully obtain part-time employment to mark the National Test for primary students and the Caribbean Examination Council (CXC) examinations for secondary students. Principals need to identify delinquent teachers and help them to reform their practice and attitudes and recommit to the profession, or recommend disciplinary action and/or dismissal if necessary. The lives of children are at stake.

Stakeholders want to see a change in the recruitment system used for teachers. It was suggested that all teachers should enter the profession armed with a Diploma in Education as offered by the University of the West Indies. No longer should teachers be sent to schools without having formal teacher training, with emphasis on strong pedagogical skills.

What would be useful is if the teacher preparation institutions can adjust the programmes to focus more on pedagogy (practical instruction) than on theory. Trainee teachers need more practice in pedagogy in a real-world situation and not simulated. Less attention needs to be placed on reflective practices and more on developing the softer skills in teachers, caring, good communication, patience and empathy; and on introspection more than reflection.
Trainee teachers should be sent to schools from the first year of their training. In year one they should go to private/independent schools in Trinidad and Tobago and observe how that system is structured. This can be for a period of one month. In years 2 and 3 they should be sent to government schools for a full term; and in year 4 for two terms.

Trainee teachers should have maximum exposure to hands-on teaching and be given the opportunity to apply their theoretical learning in real world/authentic situations.

**Conclusion:**

This research has attempted to profile an effective teacher based on the perceptions of the major stakeholders. It was expected that an effective teacher should possess strong pedagogical skills, which would include the teacher having strong content knowledge, being able to explain work for clarity, be willing to reteach if students do not understand and have the capacity to engage in relevant assessment methods. However, commitment and dedication overshadowed good pedagogy as a necessary quality. In addition an effective teacher should be kind, caring, possess good communication skills and be able to motivate students to learn, develop a love for learning, have high expectations for his/her students and also possess good pedagogical skills. Added to this the teacher should not engage in indiscipline and must be punctual and regular for work.

Teacher preparation programmes tend to focus on the theory of teaching and trainees are not given sufficient hands-on exposure in the classroom. Yes, they do have classroom encounters, but not enough and they seem to lack the capacity to transfer the theory taught into practice. While there is focus on producing a reflective practitioner, trainee teachers need to be guided in the art of introspection. Teachers should look at their attitude to their jobs, contribution to student learning and their attitude to their students. If as a teacher your students are not learning and are dissatisfied with your performance, then there is definitely a problem and that teacher should rethink his/her continued presence in that classroom.

A teacher must model to students positive practices such as efficiency, integrity, diligence and passion for one’s job or subject area. Students should want to come to class. No action on a teacher’s part should cause students to become so demotivated that they want to drop out of school.
A teacher needs to always remember that he/she is preparing the next generation and that teacher would be living in that world. Children should be given a fair chance to achieve their fullest potential and not be stymied by a negative academic experience. Some children are facing many challenges at home due to socio-economic and other factors, school is their escape and they should not be subjected to negative experiences there also. To ensure that this happens principals need to accept the challenge and become genuine guardians of students by ensuring that teachers attend their classes and teach the students properly so that learning can occur.

It is hoped that the perceptions of the stakeholders in education have provided an opening as to what is valued in teachers and the creation of an effective teacher in Trinidad and Tobago.

Abstract:

The Japanese English language education system and its policies have often been the center of much debate and discussion between administrators and teachers. Those with vested interests in the system often decry the many "lip-service" changes in curriculum and this, coupled with comparatively low scores on international standardized tests, leads many to conclude that something is simply not working. Furthermore, despite the fact that the subject of English language in Japan is compulsory from junior high school, the low communicative abilities of young Japanese English language students should be cause for serious examination and reconsideration. The Ministry of Science and Education (MEXT) has set guidelines and goals for the communicative ability (MEXT, 2011) for students from junior high school through university and this poster session will focus on the actual amount of communicative learning and teaching which takes place, in English, within the junior high school English classroom by surveying both
students and teachers concerning their usage of English in the classroom. Data from a questionnaire given in 2000 will be compared to a current 2015 questionnaire with matching inquiries concerning the amount of English first-year university students felt was used in their junior high school classrooms. These results will be discussed alongside the results from a separate survey for Japanese teachers of English and foreign assistant language teachers (ALTs) in the context of the current guidelines put forth by the Japanese Ministry.
Say What?

A Survey on the Use of Jargon by Academic Librarians at San Jose State University

Cross-disciplinary Areas of Education

Paper Session: Work-in-Progress

This first stage of an extended research project will, via the use of a survey, provide insight into the jargon used by the academic librarians at San Jose State University. The results will inform future research on the impact of jargon use on students’ success in conducting research, aid with the redesign of information literacy instruction sessions and instructional materials, and help facilitate day-to-day interaction with students.

Abstract

This work-in-progress will, via the use of a survey, provide insight into the jargon used by the academic librarians at San Jose State University. Knowing more about what type of jargon is frequently used, and in what context, can reveal the extent to which librarians use language that has the potential to be uninformative, confusing, or incomprehensible to those the librarians interact with in-person and virtually.

The results of the survey will inform future research on the impact of jargon use on students’ success in conducting research, aid with the redesign of information literacy instruction sessions and instructional materials, and help facilitate day-to-day interaction with students.

Introduction

Academic success at the university level is achieved by a combination of many skills, not the least of which is the ability to conduct individual research in the student’s chosen field of study. Usually, the library is the primary place for such research, and librarians offer a wide variety of in-person and online services in order to help students navigate the increasingly complex information landscape. All too often, however, librarians employ specific library jargon, something most students are unlikely to be familiar with, and especially those who are English Second Language (ESL) speakers. Amsberry (2008) writes that jargon has been described as a “third language” in the library literature, requiring students to add multiple meanings to words they might still be struggling with in the first place, or assign entirely new meanings to words that exist in their native language but have different (yet related) meanings where jargon is concerned. A prominent example for the latter is the word “journal,” which in French means newspaper but in English-language library jargon refers to academic, peer-
reviewed publications that contain research articles (Amsberry, 2008). Amsberry summarizes a number of studies which have shown that native English speakers and ESL students alike struggle with library jargon and are oftentimes unable to correctly define even the more commonly used jargon terms. Additionally, these studies have revealed that there is a “significant disparity between what students reported to understand and what they actually understood,” a finding that suggests that “students may be afraid or embarrassed to admit that they lack understanding of some of the library-related terminology” (Amsberry, 2008, p. 355).

**Background**

*Definition of Jargon*

“ALA,” “call number,” “ILL,” and “weeding.” What do these words have in common? They are all examples of jargon. The term jargon (also known as argot) is defined in a number of ways, as exemplified by dictionary.com’s entry, which states that jargon generally is “the language, especially the vocabulary, peculiar to a particular trade, profession, or group” but also “any talk or writing that one does not understand,” and even “language that is characterized by uncommon or pretentious vocabulary and convoluted syntax and is often vague in meaning” (dictionary.com, n.d.b). Looking at the example words above, one can understand how these definitions came to pass.

*Distinguishing Jargon from Dialect or Slang*

Jargon is quite often confused with dialect or slang, or considered to be one and the same. Dialect is defined as “a variety of a language that is distinguished from other varieties of the same language by features of phonology, grammar, and vocabulary, and by its use by a group of speakers who are set off from others geographically or socially” (dictionary.com, n.d.a). As such,

Slang is the “very informal usage in vocabulary and idiom that is characteristically more metaphorical, playful, elliptical, vivid, and ephemeral than ordinary language” (dictionary.com, n.d.c). Contrary to this upbeat and positive definition, slang is by many perceived to be the type of speech and writing that is “characterized by the use of vulgar and socially taboo vocabulary and idiomatic expressions” (dictionary.com, n.d.c).

Distinguishing jargon from slang can be difficult: “Both introduce new words into a language by recombining old words into new meanings;” “introduce entirely new words;” and “ascribe entirely new meanings to old words” (Fromkin, Rodman, & Hyams, 2014, p. 319). To further complicate matters, just as jargon has its communities of practice, so does slang. San Jose State University linguist Dr. Manjari Ohala sees no real difference between jargon and slang but points out that persons tend to ascribe one or the other based on the prestige of the speaker (personal communication, November 20, 2014).

**Development and Use of Jargon**

Jargon is primarily formed within communities of practice. The term *communities of practice* is defined as an “aggregate of people who come together around some enterprise [...]” however, “unlike a speech community, a community of practice is not defined by region, race or ethnicity” (Curzan & Adams, 2009, p. 76). Rather, speakers within communities of practice “simultaneously fashion their own identities and contribute to the group’s identity. Speech is not isolated but embedded in other social practice surrounding the common enterprise” (Curzan & Adams, 2009, p. 76).
Within communities of practice, word formation processes are common occurrences. Generally, jargon words are formed in three major ways: By inventing a new word, changing or altering existing words, or borrowing extant words from other languages (K. Glover, personal communication, September 15, 2014). In addition, word formation processes include alterations such as abbreviations and acronyms; words that have been clipped, blended, or compounded; were formed because of conversion, functional shift, or branding; were derived from proper names (eponyms); or were modified over time due to changes in language and/or social identity (Jannedy, Poletto, & Weldon, 1994).

It is with one or more of these processes that words are formed which are unique to the specific community of practice. These words build common ground, serve as identifiers for a community of practice, and facilitate communication between its members, but also create an environment that may be perceived as exclusionary to those on the outside. In many instances, words that have been created by means of word formation processes are described as “jargon” (K. Glover, personal communication, September 15, 2014).

Methodology

*Chosen Community of Practice*

To investigate the jargon used by academic librarians, the library faculty of San Jose State University’s Dr. Martin Luther King, Jr. Library has been chosen as the community of practice. Currently, twenty-one library faculty assist students, teaching faculty and staff with their research; teach information literacy sessions; build and maintain the library’s extensive book, eBook and electronic journal database collections; devise and complete projects related to information science; and conduct research and subsequently publish their findings. While each librarian’s general position description is that of an academic liaison librarian, individuals tend
to, over time, specialize in certain fields, e.g. special collections and archives, digital initiatives, information literacy and unbounded learning, reference, or collection development.

Survey instrument and parameters

To collect academic librarian jargon, each librarian is provided with a survey and asked to provide the following information (see Appendix A for the survey instrument):

- Degrees earned
- Years of experience in librarianship
- Short-answer question on the usefulness of library jargon
- Short-answer question on the drawbacks, if any, to the use of library jargon
- Picking of 10 library jargon words, providing definitions and stating usage

Analysis of Survey Results

Upon completion of the survey phase the results will be analyzed for the following:

- Communalities and differences in jargon use by the various librarians
- Frequency of use of jargon terms
- Correlation between specialized positions and types of jargon used
- Correlation between years of experience and types of jargon used
- Benefits and drawback of jargon as stated in the short answer questions

The results of the survey will determine the authors’ future direction of research, but the overarching goal is to find and implement practical ways to limit the use of jargon wherever possible and feasible. Experience has shown that the expectation of being able to affect immediate and lasting change across the board with a single research project is unrealistic; as a result, the authors have chosen to take a grassroots route that seeks to devise, implement, and
practice change on a small-scale level and to subsequently spread what has been learned and observed with colleagues and the larger community in a persistent and consistent manner.

**Conclusion**

The authors hope that this study will be the first step in raising awareness among fellow librarians of their word choices when working with students. Is the use of jargon really necessary or desirable when instructing or otherwise interacting with students? If so, what ways can be found to familiarize the students with the necessary terminology? If not, what are lasting and efficient ways of limiting, as much as possible, the unnecessary jargon that builds walls and hinders communication? Based on the findings of this survey and subsequent research in the scope of an extended, multi-phase project, the authors seek to replace theory with practical ways to bring lasting change in the amount and frequency of jargon use in their own institution and beyond.

High Impact Task-based Learning Strategies for your Classroom

Topic area of submission: Higher Education

Format of presentation: Workshop

Description of presentation:
This workshop will discuss how to build meaningful interactive individual and collaborative learning strategies for your teaching/classroom. The workshop will focus on four key components to incorporating these strategies into your classroom: creative design, thoughtful preparation, fearless execution and tactical debrief and reflection. Examples of high impact active task based learning strategies from practice will be integrated throughout the workshop.

**High Impact Task-based Learning Strategies for your Classroom**

Do your students like coming to class and listening to you lecture? Is there a way to deepen your student’s learning while increasing student engagement? Have your student’s learned how to play school and take the role of the passive recipient? If you are asking yourself these questions then this workshop is for you! Come learn about active task-based learning and accompanying strategies that will make your classroom come alive.

Task-based or activity based learning is an innovative pedagogical approach that not all teachers understand or are comfortable utilizing. By incorporating task-based /activity-based learning instructors are able to step out of the traditional lecture focused class and become learning designers and facilitators. Student’s experience deeper learning and have increased opportunities for engagement with their instructor and peers.

This workshop will discuss how to build meaningful interactive individual and collaborative learning strategies for your teaching/classroom. Included will be things to consider such as what you want your students to know, level of interaction, personal choice, level of comfort and level of student experience.

The workshop will focus on four key components to incorporating these strategies into your classroom: creative design, thoughtful preparation, fearless execution and debrief and reflection. Examples of high impact active task based learning strategies from practice will be integrated throughout the workshop.
Title of the submission: Exploring the Student Experience of Learning in a Flipped Classroom

Topic area of submission: Higher Education

Format of presentation: Workshop

Description of presentation: In this session the results of a research project exploring the student experience of learning in a flipped classroom model of instruction in higher education will be presented. After a brief overview of the flipped classroom the author will present data gathered through focus groups, online survey and classroom assessment techniques to demonstrate how the flipped classroom increased student engagement and supported learning.

Exploring the Student Experience of Learning in a “Flipped Classroom”

In this session the results of a research project exploring the student experience of learning in a flipped classroom model of instruction in higher education will be presented.

The flipped classroom model was applied to an introductory health research course in a nursing degree program. This is a required course that is content heavy with a lot of new concepts and terminology. Students have difficulty linking the theoretical concepts to evidenced based practice. As well, as student populations and their expectations of the learning environment become increasingly diverse, maintaining their engagement during class and meeting different learning styles has become increasingly challenging. It was believed that a flipped learning model would allow this to happen more readily.

The flipped classroom is emerging as an area of interest for researchers exploring teaching and learning. Flipped classrooms use digital technologies to shift direct instruction outside of the classroom. In this instructional model students explore concepts before coming to class through video/audio lectures, content-rich websites and/or podcasts. Taking advantage of the student’s preparation, the teacher devotes more time to opportunities for integrating and applying their knowledge, via a variety of student-centered, active learning strategies. Through the flipped classroom model, time becomes available for students to collaborate with the professor and peers, engage more deeply with content, practice skills and receive feedback on their progress.

The following research question was explored through a mixed methods approach: What happens with student learning and engagement when the flipped classroom is used to teach students Health Research? Three data sources were gathered to explore the research question. Focus group interviews were conducted at the end of the semester to more deeply explore student reactions, perceptions, and/or feelings about experiencing the flipped classroom model of instruction and how it impacted their engagement and learning. Classroom Assessment Techniques were gathered to assess student’s understanding of concepts covered in pre class and in class learning activities. Students responded to questions about the most important thing they had learned, what helped their learning and questions they still had about the material in the online lecture or classroom application of that material. Lastly, an anonymous on-line survey allowed students to evaluate functional aspects related to the flipped classroom along with advantages and disadvantages of learning in this approach. The findings from these three data sources will be presented to demonstrate how the flipped classroom increased student engagement and supported learning.
This session would be of interest to individuals considering moving away from a traditional lecture-centered instructional model and interested in devoting more time to opportunities for integrating and applying knowledge, via a variety of student-centered, active learning strategies.
Sandtray Interventions in Counselor Supervision

Marta Garrett

University of Mary Hardin-Baylor

Author Note

Marta Garrett, is an Associate Professor and Director of the Graduate Counseling Program. Correspondence concerning this article should be addressed to Marta Garrett, Director of the Graduate Counseling Program, University of Mary Hardin-Baylor, 900 College Street, Box 8006A, Belton, TX 76513 (e-mail: martamgarrett@gmail.com).
Abstract

This article examines the use of sandtray interventions as a tool in the clinical supervision of counselors and counselors in training. General knowledge of the therapeutic use of sandtray or similar expressive arts intervention in clinical work is assumed. A description of how the sandtray can be used to build supervisee-supervisor alliance and aid in supervisee insight and reflection is discussed. Case illustrations and suggested prompts to use in integrating sandtray interventions into clinical supervision are provided.

*Keywords:* Counseling, Sandtray, Supervision
Sandray Interventions in Counselor Supervision

Introduction

For many counselors and therapists whose training and experience is predominantly rooted in talk-therapies, sandtray (ST) interventions represent a significant shift in processes and required skills within counseling or counselor supervision. The term sandtray work is used here to describe the therapeutic use of a sandtray within the counseling and counselor training or supervision settings and can include a wide range of theoretical orientations or interventions (Boik & Godwin, 2000). Therapeutic sandtrays are generally smaller than traditional children’s sandboxes (roughly 30 inches by 20 inches and approximately 4 inches deep) and are primarily offered at waist height or on a table top when working with adults (Boik & Godwin, 2000).

When used as an expressive arts or play-based intervention, sandtrays are partially filled with wet or dry sand and presented to the client or supervisee with an assortment of small figures or items selected to represent people, places, and concepts from the client’s world (e.g., people, real or imagined animals, plants, buildings, etc.). The client or supervisee then creates or builds a world or scene in the sand and this experience is assessed or processed within the counseling or supervision session (e.g., Homeyer & Sweeney, 2011). With adults, the level of direction given to clients regarding what to build or create in the sand is determined by the theoretical orientation of the therapist and the type of work being done in therapy (Garrett, 2013). Small children more typically play in the sandtray without direction from the therapist rather than creating a static scene prompted by the therapist (Weinrib, 1983). Within many theoretical orientations, processing the sandtray can be done verbally, but as ST is largely an experiential intervention, the potential therapeutic gain in using ST not always heavily based on the verbal intervention (Boik & Godwin, 2000; Amatruda & Helms-Simpson, 1997). Within clinical supervision, the
focus of sandtray work may be experiential, or more emphasis can be placed on the completed sandtray scene. Depending on the theoretical stance of the supervision and the goal(s) of the supervision work there may be more or less emphasis placed on verbally processing the sandtray in the supervision session. Because of this, additional counseling or supervision skills in play or expressive-arts therapies may be required when working with ST interventions in supervision.

According to nationally recognized ethics and standards of practice within the counseling profession, before engaging in any new specialty areas, counselors should receive adequate education, training, and supervised experience (American Counseling Association [ACA], 2014). As a form of play-based intervention or an expressive arts intervention, ST would require additional and specialized training for many counselors and therapists who are most often trained primarily in verbal interventions (e.g., Association for Play Therapy [A4PT], 2014). When sandtray is used as an expressive-arts or play-based intervention it is recommended that ST counselors have adequate training and supervision specifically in the use of ST in addition to play therapy training, expressive arts training, and generalized counselor education coursework (e.g., A4PT, 2014; Turner, 2005; Zoja, 2011; Vernon, 2011). DeDomenico (1995) suggested that counselors and therapists who use ST in their clinical work should also have created and processed a minimum of 30 to 50 trays in their own clinical work before using ST with clients.

In clinical supervision, ST can provide a creative outlet with concrete, touchable examples in the tray allow supervisees to increase their reflection skills, develop awareness and insight, or conceptualize challenging cases. Ishiyama (1988) described a Visual Case Processing Method for clinical supervision of art therapists that relied heavily on supervisees generating visual imagery and metaphors to process clinical cases in supervision. ST work in counselor supervision can be considered an extension of this type of expressive arts supervision process -
asking supervisees to create a ST scene (vice a drawing) to be used in supervision. Recent work in this area has shown that the sandtray can be used within the counselor supervision session to better understand client processes or to further develop supervisee skills (e.g., Anekstein, Hoskins, Astramovich, Garner & Terry, 2014; Cunningham, 2013).

Before practicing clinical supervision of counselors or counselors in training, supervisors are required to have adequate clinical experience including and appropriate training in supervision and supervision theory (ACA, 2014; Bernard & Goodyear, 2009). Furthermore, many state laws also set standards for clinical supervisor training and legal parameters for supervision practice. For example, Texas State law (§681.93) specifies supervisors have a number of years of practice and specific training in supervision methods and theory (see Texas State Board of Examiners of Professional Counselors [TSBEPc], 2015). Texas State law also sets additional regulations for conduct of clinical supervisors (TSBEPc, 2015). In order to ensure competent and ethical practice, counselor supervisors who use ST interventions in their supervision work should not only meet the minimum training and practice requirements for clinical supervision, but they should also have supervised experience specifically in ST work (Warr-Williams, 2012).

*Is ST supervision a good fit for your supervisee?*

Before considering introducing the ST into clinical supervision, the supervisor should consider the current skill level of the supervisee, the relationship between the supervisor and the supervisee, and specifically how ST may help or hinder the specific supervision process. For example, novice or beginning supervisees who are new to the practice of counseling often experience high anxiety and fear of evaluation (e.g., Smith, 2009). Beginning supervisees who may still lack core counseling skills and are highly anxious or fearful in supervision may not be
appropriate candidates for ST supervision interventions as adding new supervision interventions might increase supervisee anxiety and/or shift the focus of the supervision work to resolving supervisee issues at the possible expense of client safety (Bernard & Goodyear, 2009). New or different supervision interventions may be best suited for more experienced and secure supervisees working on developing specific skills in supervision (Falender & Shafranske, 2004). Once the supervisor has determined that a specific supervisee might benefit from ST supervision, many of the fundamental aspects of therapeutic ST use in counseling transfer to the use of ST interventions in the supervisory relationship.

What are the benefits of integrating ST into clinical supervision?

While there are many potential benefits to integrating ST into clinical supervision, the most obvious benefits of including ST work in supervision are related to the kinesthetic qualities of working in the sand, the potential for symbolic work with miniatures in the sand, and the potential for exploring and encouraging expressiveness within the supervision relationship. ST work allows for the movement from one modality of processing to another (e.g., seeing your feelings or touching your feelings). This is referred to as synesthesia (Homeyer & Sweeney, 2011) which has been demonstrated to increases insight, awareness, and reflection skills (Deaver & Shiftlet, 2011). ST offers a unique kinesthetic opportunity within counselor supervision and can provide a break from traditional verbal feedback that can often be perceived as negative by the supervisee (Rae, 2013; Bernard & Goodyear, 2009). Focusing on activity-based learning in clinical supervision may be more appealing to those supervisors and supervisees who have less-developed or limited verbal language skills or who don’t share the same first language or culture (Homeyer & Sweeney, 2011) and can help develop the supervisor-supervisee relationship by facilitating rapport building and alliance building with the supervisor (Lahad, 2000). Because
ST is action-based and doesn’t necessarily need to rely as heavily on verbal responses, ST can be used to help the supervisee maintain a less-defensive position in supervision. ST can be used to help visualize power differentials; to emphasize symbolic relationships or themes; or to play out a scene allowing different solutions to emerge (Homeyer & Sweeney, 2011).

**Introducing ST into Clinical Supervision**

The following guidelines for introducing ST into counseling sessions help inform how ST can be introduced into the clinical supervision environment while maintaining a safe and growth-conducive environment for the supervisee (Homeyer & Sweeney, 2011; Boik & Godwin, 2000). First, the supervisor should set a positive expectation and manage the supervisee’s possible anxieties by providing a brief orientation to the tray and miniatures and explaining how ST will be used in supervision. This is especially critical if the supervisee has little or no training in the use of ST or other expressive arts-based interventions within the supervision relationship. The supervisor should be clear in helping the supervisee to understand the focus of the ST work in supervision and what will be required on the part of the supervisee. Additionally, when using the ST in supervision, the supervisee should be provided with the same level of concern and respect afforded to counseling clients when they build or create sandtrays. Supervisors should be mindful of the supervisee’s personal space when the supervisee is creating and processing trays; supervisors should never touch or move items in a supervisee’s tray without permission, and supervisors should avoid labeling any miniatures or scenes until the supervisee has named them (Homeyer & Sweeney, 2011; Boik & Godwin, 2000). Finally, any photos taken of ST creations in supervision should be treated with same level of privacy as client-created art or play products.

*Ideas for integrating ST into counselor supervision*

ST work in clinical supervision can be used to address issues related to the supervisee-
supervisor alliance and aid in reaching supervision goals. Images in the sand provide a three-dimensional, touchable, action-based intervention which can provide a hands-on method of making meaning (Zoja, 2011). ST work has been described as useful in working with clients who are therapeutically “stuck” or struggling with progress in addressing their issues (e.g., Homeyer & Sweeney, 2011). Because STs can be photographed and compared over time, ST can be used to show small or vague changes in the therapy or supervision process. For example, the supervisee can be prompted to “create a tray that shows where you are in your professional goals” and this tray can be compared to similar prompts given over time as the supervisee progresses through clinical experiences and works towards professional goals. While trays may be similar in appearance when built with the same prompt, it may be helpful for the supervisee to see and explore small changes over time – especially if the supervisee is frustrated by the realities of working at lower pay while under supervision for licensure.

Some suggested ST prompts to aid in building rapport within the supervisory relationship, to help build the alliance between the supervisor and the supervisee, or to explore supervision goals include:

“Create a tray to help me understand your theory of change.”

“Create a tray showing your path to becoming a therapist.”

“Create a tray that shows the kind of therapist you want to be.”

“Create a tray that showcases 3 things you want to get out of this supervision.”

“Create a tray with 5-10 items that will help me to get to know you on a professional level.”

“Create a tray to show how you think your client sees you.”

“Create a tray to show how you would like your client to see you.”

“Create a tray to show how you see our supervisory relationship.”
“Create a tray about how your life would be different if you already had your license.”

“Create a tray about how I can help you in this supervision process.”

“Create a tray about the qualities you think will make you a better counselor/therapist.”

When addressing the supervisee’s counseling skills and his or her work with clients, ST may be helpful to demonstrate where changes can be made to help the client move forward in therapy. For example, the supervisor can ask the supervisee to “create a tray with your understanding of where the client is right now.” This tray is then verbally processed with the supervisee with the hope of gaining insight and understanding of the client’s current situation and status. The supervisor can then take a photo of the tray. This photo will allow future discussion if the scenarios is too complex to fully process in one supervision session, or can be printed if only one tray is available. Next, the supervisor can ask the supervisee to “create a tray of what it would look like when this client’s situation is resolved.” This sandtray prompt can be considered a supervisory equivalent to the miracle question (e.g., Wetchler, 1990). The supervisor and supervisee can then verbally and emotionally process the differences between the two sandtrays - the client’s current situation and what the client’s world would look like without the presenting problem. Again, it may be necessary to take a photo of this second, solution tray, if time does not permit further work or if only one sandtray is available. Setting the two trays side-by-side on the table allows the supervisor to physically move the two trays (or photos) apart and prompt the supervisee to create a link or bridge from the first to the second, “create a tray that shows how you see the client getting from here (the current situation tray) to here (the solution tray).”
Kielo (1991) used post-session work such as this in art therapy supervision to help build supervisees reflection skills. Additional post-session ST prompts that might help supervisees develop a deeper understanding of their clients’ motivations and feelings include:

“Create a tray of the emotion that was behind what the client was describing in this session.”

“Recreate what the client talked about in this session in the ST and bring this to life by dialoging within the tray” (give voice to various components or parties involved in the therapy).

Assigning specific or directed STs outside of the supervision session to encourage supervisee in-depth thought about a case or professional growth or development is referred to as “response” work and is a common in art therapy supervision (Fish, 2008). Supervisee growth can be encouraged by outside ST work or other similar journaling assignments (Bykofsky, 1990). Examples of how this type of response work could in ST include:

“Recreate a ST about a specific moment or turning-point in your session.”

“Create a tray about your wish for this client.”

“Create a scene about who this client reminds you of.”

It is often useful in clinical supervision to have supervisees explore and address relational issues in order to gain insight, increase awareness, and build reflection skills about relational issues in their clients’ lives (Smith, 2009). Based on the work of Gil (1994) it may be helpful for supervisors to direct supervisees to:

“Create a genogram, sociogram, or family map for your client in the tray.”

“Use miniatures to describe the relationship between the key players in the client’s family.”

“Create a family map using only one category of miniatures” (e.g., addictive behavior-related miniatures for clients who have a strong family history of addictive behaviors; foods may be used to address eating disorder issues, etc.).
Creating a three-dimensional work in the sand may also help supervisees visualize complex transference and countertransference issues more clearly. Expressive-based interventions like ST work in supervision may be helpful in: developing empathy with the client; seeing clients as more than their problems; clarifying therapists feelings; exploring the preconscious and unconscious issues in the client, or in the client-counselor or supervisee-supervisor relationships; differentiating between the therapists feelings and the client’s feelings - building separate trays from these different perspectives; and exploring the therapeutic or supervisory relationship - having the supervisee and supervisor build similarly-themed trays for comparison (Kielo, 1991).

Some suggested ST prompts to help the supervisee focus on client issues include:

“Create a tray about how you are helping your client.”

“Select 3 to 5 items that demonstrate the progress you have already made with this client.”

“Create a tray about how you are not able to help your client.”

“Create a tray about a specific intervention you used with your client.”

“Create a tray about how that intervention was received by your client.”

“Create a scene that shows how you anticipate this client will push your boundaries.”

“Create a tray about your goal(s) for your work with this client.”

“Create a tray about the potential obstacles you see in working with this client.”

“Create a scene showing other ways you might get to this same therapeutic goal.”

“Select 3 to 5 items to demonstrate the strengths you have as a therapist so far.”

“Create a scene of your client’s world.” then “add a character or miniature to show how you fit into this world.”
Because of the potential calming effect of sandtray work (e.g., Bradway, Signell, Spare, Stewart, Stewart, & Thompson, 1990), including ST in the supervision process can offer an opportunity for a mini-break or respite when the supervisory process becomes intense or overwhelming to the supervisee (Deaver & McAuliffe, 2009, as cited in Deaver & Shiftlett, 2011). The following prompts can be used to facilitate mini-breaks within the supervisory work:

“Take five minutes to create a mini-scene or just play in the tray before we get started today.”

“This was a challenging supervision session – why don’t you take the last ten minutes of our time today to create a tray that will help you to relax before you head back to work.” or

“Pick approximately 5 items that show what you would do if you had a totally free hour today with no deadlines hanging over your head.”

Lahad (2000) suggested expressive work in supervision to help new counselors build brainstorming skills and to rely more on imagination and intuition in their counseling work. In the ST, this could include prompts such as:

“Create a tray showing the client’s issue or presenting problem.” In a separate tray, “create as many solutions to this issue as you can.”

“Create a tray about what is holding this client back” (or what is holding you back as his/her therapist); and

“Create a tray that shows the various emotions this client has been experiencing.”

The power of symbolism and metaphors in ST

Perhaps the greatest potential benefit of incorporating ST interventions into clinical supervision is that ST offers a unique emphasis on symbolism and metaphor and the ability to highlight cultural aspects within the client or supervisory relationship (Siegelman, 1990). Discussion of what is included or excluded from a miniature collection can be used to spark
discussion of cultural differences between the client and counselor or the supervisee and supervisor. Specific miniatures can be explored for their potential and differing symbolic or cultural meanings or value (to the supervisee or client or both). Laminated photos can be included in the tray to allow for connection to specific concrete images. Supervisees can bring in a specific miniature or item to represent themselves in their supervision trays. Some ST prompts to address cultural issues or symbolism could include:

“Create a tray about the underlying symbolism or cultural aspects from your client’s tray.”

“On this side of the tray, create a scene about what this miniature might mean to you; on this side, create a scene about what this might mean to your client.”

“Select 3 to 5 items that speak the unique family culture of your client.”

“Select 3 to 5 items that speak to your client’s cultural background and 3 to 5 items that speak to your cultural background. Create a tray that shows how these worlds interact.”

Summary

Supervisors who have expressive-arts or ST training can expand the level of creativity they use in their supervisor work by including ST in the supervision process. ST is a flexible medium that can be used in most if not all of the same ways that other play or art prompts can be used (Lahad, 2000). ST has unique strengths that can add to almost any supervision experience. Supervisors should always work within their areas of training and expertise, but also be creative and not be afraid to integrate skills they have used in counseling.

Sandtray interventions in Counselor Supervision: Play-based Interventions

Dr. Marta Garrett, LPC-S, LMFT-S, RPT-S
APT Approved Provider #14-377
University of Mary Hardin-Baylor

Objectives for today’s training:

1. Develop an understanding of how the sandtray can be used as an expressive arts or play-based intervention within the counseling supervision setting;

2. Understand the value of the sandtray in helping to build the supervisor-supervisee alliance; and

3. Understand the unique benefits of the sandtray in addressing cultural issues in supervision, and building supervisee insight and reflection skills.
Knowledge I am assuming you already have:

1. General training and experience in the use of sandtray (ST) as an expressive arts or play-based counseling intervention with adults;
2. Training and experience in counselor supervision;
3. General understanding of legal regulations and ethical codes that apply to counseling and clinical supervision.

Reminder of essentials of therapeutic ST use:

1. Manage expectations; set the environment with positive expectations; orient the user to the tray and miniatures; point out the blue sides and bottom; reassure the user as needed; explain your role; address the issue of time.
2. Be mindful of your physical presence when the user is creating or processing the tray.
3. Never touch the users ST items without permission.
4. Avoid labeling or naming items until the user has named them.
Overall Benefits of using ST in Supervision (that we will cover today):

1. ST is a touchable, action-based intervention which breaks from the traditional oral supervisor feedback process.
2. ST has been shown to increase reflection, awareness, and insight skills for trainees.
3. ST can provide the opportunity to tap into cultural or symbolic dimensions of clinical and/or supervisory work.

Benefits of using ST in Supervision:

- ST can provide a three-dimensional, touchable, action-based intervention.
  - ST can be used to facilitate rapport building and alliance building with the supervisor or as a form of respite in the supervisory process (mini-break).
  - ST provides a hands-on method of making meaning:
    - Appeals to those supervisors and supervisees who have less-developed or limited verbal language skills or who don't share the same first language.
    - Appeals to learners who prefer activity-based learning;
    - Can be used to demonstrate counseling or supervisory goals and relationships.
  - ST can be used to visualize transference and countertransference issues.
  - ST can provide a break from traditional talk-therapy basis of providing feedback that is often perceived as negative by focusing on action or play-based activities to develop the supervisor-supervisee relationship.
Example: Mini-break/respite with ST in supervision

Creative process breaks as stress reduction for internship students (Deaver & McAuliffe, 2009, as cited in Deaver & Shiftlett, 2011).

- “Take five minutes to create a mini-scene or just play in the tray before we get started today.”
- “This was a challenging supervision session—why don’t you take the last ten minutes of our time to create a tray that will help you to relax before you head back to work.”
- “Pick approximately 5 items that show what you would do if you had a totally free hour today with no deadlines hanging over your head.”

Example: Goal work with the ST in supervision

- “Create a tray with your understanding of where the client is now.”
- Process this tray with the supervisee.
- Take a picture of the tray for later (or to use as a reference if you only have one tray, or if the counseling situation is so complex that this process may take several supervision sessions).
- “Now create a tray of what it would look like when this client’s situation is resolved.”
- Processes the noticeable differences between the two trays.

“How do you see the client getting from this tray (now) to this tray (solution)?”
Example: Addressing Countertransference with ST in Supervision

ST can be helpful in:

- Developing empathy with the client - seeing clients as more than their problems;
- Clarifying therapists feelings;
- Exploring the preconscious and unconscious issues in the client, or in the client-counselor or supervisee-supervisor relationships;
- Differentiating between the therapists feelings and the client’s feelings (building separate trays from these different perspectives);
- Exploring the therapeutic or supervisory relationship (having the supervisee and supervisor build similarly-themed trays and comparing).

Based on the work of Kielo (1991) who worked with art therapists.

Example: Providing feedback with ST in Supervision

Because ST is action-based and doesn’t necessarily need to rely as heavily on verbal responses, ST can be used to help the supervisee maintain a less-defensive position in supervision.

- ST can help visualize power differentials.
- ST can help emphasize symbolic relationships or themes.
- Playing out a scene can allow different solutions to emerge.

Note the size differential in this scene (very small fox) and the two-headed dragon.

Based on the work of Homeyer and Sweeney (2011).
Example: Processing growth with ST in Supervision

Prompt: “Create a tray that shows where you are in reaching your professional goals.”

Using pictures to document STs from the supervision process allows these pictures to be viewed in comparison to earlier creations.

Example of two trays covering similar themes completed several months apart. Notice the use of similar items, but less fencing and more openness.

Prompt ideas to help build rapport or supervisory alliance with supervisees or goals for supervision:

“Create a tray to help me understand your theory of change.”
“Create a tray showing your path to becoming a therapist.”
“Create a tray that shows the kind of therapist you want to be.”
“Create a tray that showcases 3 things you want to get out of this supervision.”
“Create a tray with 5-10 items that will help me to get to know you on a professional level.”
“Create a tray to show how you think your client sees you.” or
“Create a tray to show how you would like your client to see you.”
“Create a tray to show how you see our supervisory relationship.”
“Create a tray about how your life would be different if you already had your license.”
“Create a tray about how I can help you in this supervision process.”
“Create a tray about the qualities you think will make you a better counselor/therapist.”
Additional ST prompt ideas focused on supervisee’s client sessions (vice supervision or supervisory relationship):

“Create a tray about how you are helping your client.” or
“Select three to five items that demonstrate the progress you have already made with this client.”
“Create a tray about how you are not able to help your client.”
“Create a tray about a specific intervention you used with your client and how it was received by your client.”
“Create a scene that shows how you anticipate this client will push your boundaries.”
“Create a tray about your goal(s) for your work with this client and the potential obstacles you see in this process.”
“Create a scene showing other ways you might get to this same therapeutic goal.”
“Select 3 to 5 items to demonstrate the strengths you have as a therapist so far.”
“Create a scene of your client’s world.” then “Add a character or miniature to show how you fit into this world.”

Benefits of using ST in Supervision:

ST can provide a creative outlet or concrete, touchable examples allowing for supervisees to increase reflection skills, develop awareness and insight, or conceptualize challenging cases.

- Visual Case Processing Method (based on the work of Ishiyama, 1988): (1) Reflecting on a case and responding with words to a series of verbal prompts. (2) Generating imagery and metaphors. (3) Drawing the case or creating a ST scene. (4) Presenting the case in individual or group supervision.

- Synesthesia (Homeyer & Sweeney, 2011): ST allows for the movement from one modality of processing to another (e.g., seeing your feelings or touching your feelings). Deaver & Shiftlet (2011) describe several studies demonstrate this increases insight, awareness, and reflection skills.
Example: Building counselor imagination and intuition with ST in Supervision (brainstorming)

To help supervisees rely more on imagination and intuition in their counseling work:

- “Create a tray showing the client’s issue or presenting problem.” In a separate tray, “create as many solutions to this issue as you can.”
- “Create a tray about what is holding this client back” (or what is holding you back as his/her therapist).
- “Create a tray that shows the various emotions this client has been experiencing.”

Based on the work of Lahad, 2000.

Example: Developing insight with ST in Supervision

To help supervisees gain insight, increase awareness, or build reflection skills:

- “Create a genogram, sociogram, or family map for your client.”
- “Create a family map using only one category of miniatures” (e.g., addictive behavior-related miniatures for clients who have a strong family history of addictive behaviors).
- “Use miniatures to describe the relationship between the key players in the client’s family.”

Based on the work of Gil (1994).
Example: Developing insight with ST in Supervision

Develop a deeper understanding of client motivations or feelings: “Create a tray of the emotion that was behind what the client was describing in this session.”

“Recreate what the client talked about in this session in the ST and bring this to life by dialoging within the tray” (give voice to various components or parties involved in the therapy).

Example: Encouraging growth outside of the supervision session using ST

Ideas to help supervisees gain insight, increase awareness, or build reflection skills (post-session work as suggested by Kielo, 1991):

- Assign specific or directed STs outside of the supervision session to encourage in-depth thought about a case or professional growth or development. This is referred to as “response” work and is a common in the art therapy world (Fish, 2008).
  - “Recreate a ST about a specific moment or turning-point in your session.”
  - “Create a tray about your wish for this client.”
  - “Create a scene about who this client reminds you of.”

- Assign journaling (written or visual based [including photos of other STs]) to follow up on client STs or STs created in supervision (or about supervision-related topics).
### Benefits of using ST in Supervision:

Because of the unique use of intact symbols, ST can be used to visually highlight cultural aspects of the client or supervisory relationship (or experiential backgrounds).

- Discussion of what is included or excluded from a miniature collection can be used to spark discussion of cultural differences between the client and counselor or the supervisee and supervisor.
- Specific miniatures can be explored for their potential and differing symbolic or cultural meanings or value (to the supervisee or client or both).
- Laminated photos can be included in the tray to allow for connection to specific concrete images (see earlier slide for example of photo genogram).
- Supervisees can bring in a specific miniature or item to represent themselves in their supervision trays.

### Example: Exploring cultural boundaries and underlying symbolism with ST in Supervision

- “Create a tray about the underlying symbolism or cultural aspects from your client’s tray.”
- “On this side of the tray, create a scene about what this miniature might mean to you; on this side, create a scene about what this might mean to your client.”
- “Select 3 to 5 items that speak the unique family culture of your client.”
- “Select 3 to 5 items that speak to your client’s cultural background and 3 to 5 items that speak to your cultural background. Create a tray that shows how these worlds interact.”
Summary: Using ST in Supervision

- ST is a flexible medium that can be used in most if not all of the same ways that other play or art prompts can be used.
- ST has unique strengths that can add to almost any supervision experience.
- Work within your areas of training and expertise, but also be creative as to how you can use the skills you already know from clinical work in your supervision work.
- Ensure you guard the privacy of all ST supervision creations with the same level of concern that you afford to client-created art or play creations.

Abstract

Given a choice of going to a mall or to a science museum, which will your students choose? How do we make students not only aware of the possibilities that a science background will open for them, but also of its relevance in their daily lives? The introduction of the Next Generation of Science Standards makes it even more imperative that we seek ways to show how science is done in the real world. Many groups of professionals are exploring ways to motivate young generations, especially women and minorities, to pursue STEM careers. This presentation describes one such initiative. During this session, participants will be actively involved in learning about teaching science in a department store venue. The opening presentation will review research on the importance of contextual learning, will provide the history of the project, and will share science lessons developed for the Macy’s in Philadelphia. During the second half of the session, we will demonstrate with participants one or more activities and explore how these can be adapted for any shopping venue.
Abstract

This session will address the creative diversity inherent in learning by using sports as the context through which scientific principles can be explored. Through the vehicle of sports not only are students learning the underlying principles of science embedded in the mechanics of performing a sport; but also, they are learning the scientific principles in an atmosphere that embraces the psycho-social-creative-emotional connection to learning. For instance, everyday students learn how to ride a bike, throw a ball, and/or jump rope. They learn these activities in an environment that is non-competitive and non-threatening academically. What they are not aware of is the scientific and mathematics principles laden in performing these activities. In the classroom students learn these scientific and mathematical principles in a context that is foreign to their everyday experiences. They learn about the trajectory of a golf ball without connecting this principle with the actual practice of hitting a golf ball.

What is unique about the concept of this program is that the academic and the everyday experiences of students can be bridged through the creative process of using sports as a mechanism to learning science and mathematics. By using sports as a creative vehicle for learning scientific and mathematical principles, the program is responding to the call for creating innovative and creative programs that provide access to the latest strategies in promoting science literacy. The following objective is pursued: To increase science and mathematics achievement of middle school students through the creative use of sports.
Abstract

We are proposing to discuss an article series called “Engaging the Scientist Within”. The presentation will feature discussing the article series which will include seven articles for parents and teachers on how to practically and easily develop in young children skills required by future scientists and engineers. The article series draws from the Next Generation Science Standards. The feeling is that it is never too early to begin to “engaging the scientist within”.

We are proposing to discuss the following strategy. Using a logical framework we discuss the questions parents and teachers already ask children to show that early positive questions about science are significant in molding children’s attitudes about science. We will also demonstrate that everyday conversations with our children contain questions that support the development of scientific and engineering practices outlined in the Next Generation Science Standards.

The strategies that we will discuss are the importance of questions’ parents and teachers ask children and the awareness of those questions on the impact of children. We will focus on how parents and teachers can stimulate curiosity in children through the impact, intent, and awareness of the questions.

The seven strategies we will discuss are:
1. Asking questions (for science) and defining problems (for engineering)
2. Developing and using models through questions
3. Planning and carrying out investigations through questions
4. Analyzing and interpreting data through questions
5. Using mathematical and computational thinking through questions
6. Construction explanations (for science) and designing solutions (for engineering) through questions
7. Engaging, obtaining, evaluating, and communicating information through questions.

We will explain through the discussion how empowering parents and teachers is the first step toward engaging a child’s appreciation and wonder of science.
Title: Reflective and Transformative Critical Thinking Skills in Two Online Graduate Nursing Research Courses

Topic Area: Distance Education or Higher Education

Paper author(s): Patricia A. Riccio, Ph.D., R.N.; Karyn Holt, Ph.D., CNM

Affiliation and Address: College of Nursing and Health Professions, Drexel University, 9th floor, 1601 Cherry Street, Philadelphia, Pennsylvania, 19102

Email: par48@drexel.edu; keh36@drexel.edu

Abstract:

The objective of this paper is to identify reflective and transformative critical thinking skills in two online graduate nursing research courses in the College of Nursing and Health Professions at Drexel University. Three abilities: analysis, evaluation and inference (Profetto-McGrath, Smith, Hugo, Patel, & Dussault, 2009) appear to be important issues in critical thinking used for learning strategies. These abilities are described as: 1) examination of information, 2) consideration, and 3) linking data for problem solution.
Reflective and Transformative Critical Thinking Skills in Two Online Graduate Nursing Research Courses

Abstract

The objective of this paper is to identify reflective and transformative critical thinking skills in two online graduate nursing research courses in the College of Nursing and Health Professions at Drexel University. Three abilities: analysis, evaluation and inference (Profetto-McGrath, Smith, Hugo, Patel, & Dussault, 2009) appear to be an important issue in critical thinking which are used for learning strategies for graduate research students at Drexel University in the two research courses. These three abilities are described as: 1) being able to examine information and context, 2) then considering all aspects, and 3) understanding and discriminating data so as to link information together in order to solve problems (Chan, 2013). The hope is that the students in these two graduate research courses will take their problem solutions and apply to their practice setting.

Background

Critical thinking has been one educational outcome to learning in all Nursing programs and has been found to be paramount (Hunter, Pitt, Croce & Roche, 2014; Kong, Qin, Zhou, Mou & Gao, 2013). Nurses need to make critical judgments about many patient care issues. There also is agreement by credentialing bodies that universities need to initiate learning experiences to improve critical thinking skills (American Association of Colleges of Nursing, 2008).

Definitions vary but most agree critical thinking is a cognitive skill which requires logical thinking (Hunter, Pitt, Croce & Roche, 2014). Two graduate research courses at Drexel University take this approach to critical thinking as others have defined this term in a more traditional sense – identifying models for basic Nursing courses where the goal is the acquisition of clinical skills (Morrall & Goodman, 2013). Students in the graduate research courses at Drexel University are to think in a transformative manner (Sterling, 2001) which means that instead of acquisitions of skills which is first order thinking in critical thinking, focus is on second order thinking or “reflective thinking” and third order thinking which is “thinking about thinking.” In
other words, students need to engage more in the “new” (transformative thinking) rather than in more of the “same” thinking (adaptive thinking). This moves Nursing students at Drexel University out of the realm of vocational thinking into the realm of intellectual thinking which can move our profession into a more positive direction. Additionally, students in the research courses are increasingly called upon for increased use of research utilization in the practice setting in order to facilitate evidence based practice.

Three abilities - **analysis, evaluation and inference** (Profetto-McGrath, Smith, Hugo, Patel, & Dussault, 2009) appear to be an important issue in critical thinking which are used for learning strategies for graduate research students at Drexel University in the two research courses. These three abilities are described as: 1) being able to examine information and context, 2) then considering all aspects, and 3) understanding and discriminating data so as to link information together in order to solve problems (Chan, 2013). The hope is that the students will then take their problem solutions and apply to their practice setting.

**Objective**

The objective of this paper is to identify reflective and transformative critical thinking skills in **two** online graduate Nursing research courses in the College of Nursing and Health Professions at Drexel University.

**Application of Research Course Learning Strategies**

In an effort to apply these three abilities of analysis, evaluation and inference, the first course used for illustration is the graduate research course at Drexel University titled *Research Methods and Biostatistics*. This course uses a paper titled a “Nursing Problem Analysis Paper.”

The purpose of this paper is to provide students with the opportunity to analyze concepts or variables of interest within the context of a problem, in **Nursing**, using published research studies from peer-reviewed journals.

The following guidelines are used within the paper to accomplish this goal:

1. Select **two concepts or variables pertaining to a problem**. This could be a problem encountered in one’s practice setting, one heard about or one interested in, or, a problem based on Healthy People 2020, World Health Organization, or other National/International Health Agendas. Choose a problem in **Nursing**. Choose a problem which best fits under **one** of the following themes from the National Institute of Nursing Research. The National Institute of Nursing Research has 4 major themes and 2 cross-over ones for priorities in Nursing Research so choose a problem which fits under **one** of them. They include: 1. **Symptom Science**: Promoting personalized health strategies (some examples are: chronic illness and adverse symptoms such as symptoms resulting in pain, fatigue, disordered
sleep or strategies to treat and prevent symptoms of illness across diverse populations and settings; 2. Health: **promoting health and preventing illness** (such as physical, behavioral and environmental causes of illness, behaviors that lead to a healthy lifestyle and choices to develop evidenced-based interventions to promote illness); 3. **Self-Management**: Improving quality of life for individuals with chronic illness (some examples are: strategies to help individuals with chronic conditions and their caregivers to create a better understanding of these strategies for management of their illness); 4. **End of Life and Palliative Care**: The science of compassion (some examples are: science to manage the symptoms of life limiting conditions and planning for end-of-life decisions); 5. **Promoting Innovation**: Technology to improve health (some examples are: science in promoting innovations) and, 6. **Innovative Strategies for Research Careers**.

2. Search the literature by using either key words or concepts (depending on the search engine used) from the problem and locate 10 research, peer-reviewed studies (less than 10 years old-preferably 5 years or less) which address these two concepts or variables.

3. Using **5 quantitative, peer-reviewed research** articles (out of the 10 selected from the literature search) in Nursing, identify and describe elements of the research process within each of these articles. Include: a. **research problem and purpose, or hypotheses if any**, b. **literature review**, c. **design**, d. **sampling strategies**, e. **descriptive and/or inferential statistical analyses for the major study concepts or variables**, f. **summary, conclusions and limitations to the study**

4. Explain the statistical results (descriptive or inferential) in your own words.

5. Provide a summary of the **Research-based interventions** from all of your research studies related to your **identified Practice-based Nursing Problem**.

The second graduate research course in the College of Nursing and Health Professions at Drexel University, *Evidenced Based Approaches to Practice*, uses an end of term paper titled, “Final PICOT Paper”. The purpose of this assignment is to evaluate evidence based practices researched in the health literature and then to analyze current clinical practice. If there is discordance between the evidence in the literature and the actual clinical practice, an evidence based suggested practice is designed, an implementation of that design is planned, and an evaluation plan of the process is written.

1. Generate a PICOT question using Melnyk’s “how to formulate a PICOT Question”. A well formulated PICOT question is essential to doing a successful literature search and writing a meaningful evidence based practice project. Identify each component of your PICOT question. This question is the foundation of this paper.

2. Now search in multiple databases for the answer to the PICOT question. Students must use at least four databases, and each search is to be demonstrated in a Search Table. There will be as many Search Tables as databases searched in. Prior to your search, identify all synonyms for each component of your PICOT question. All articles must be current (five years or younger in
Articles must be research articles, practice guidelines are not acceptable. Additional narrative explanation to replicate the search should be beneath the appropriate search table.

3. Select five articles from the search that will provide the answer to the PICOT question asked. Use the highest level of evidence possible, the most controlled research design. Review your search to verify your search is exhausted and you have the answer to your PICOT question.

4. After selecting the five articles that answer the question, complete the appropriate Critical Appraisal Tool appraising that article of evidence. Complete an Evidence Table including each of the five articles. The headings for the Evidence Table are: Citation/Sample/Setting, Research Design, Data Analysis, Findings (or Results), Level of Evidence and Comments. Synthesize the evidence gleaned in the five articles noting unique/unusual or inconsistent findings, similarities and dissimilarities in the articles. Compare and contrast the methods and results across all articles.

5. Answer the PICOT question using the evidence. Respond to: Is your practice the same as recommended by the evidence? IF not, develop an implementation plan and an evaluation plan that incorporates the evidence based evidence.

Conclusions

Three abilities -analysis, evaluation and inference- (Profetto-McGrath, Smith, Hugo, Patel, & Dussault, 2009) appear to be an important issue in critical thinking which are used for learning strategies for graduate research students at Drexel University in these two research course assignments. These three abilities are described as: 1) being able to examine information and context, 2) then considering all aspects, and 3) understanding and discriminating data so as to link information together in order to solve problems (Chan, 2013).

In these two graduate nursing courses, examination of information within its context did occur. Within the second research course, the “PICOT Paper”, the PICOT search results analysis and construction of the Evidence Table examination of information within its context did occur. In the “Nursing Problem Analysis Paper” this information examination occurred by searching the literature and identifying ten articles containing two concepts or variables. In both of these assignments, abilities 2 and 3 were seen in the analysis of the literature and the development of an implementation plan using that new knowledge in the second course and in the summary of research based interventions in the first course.

One can conclude that analysis, evaluation and inference is an important issue in critical thinking.

Full Paper:

Early childhood is a growing field, as is distance education. Although online learning has become common within most universities it presents a challenge for areas where field based experience are necessary. The purpose of this paper is to address methods and strategies which have been found effective for early childhood education (ECE) programs to support both the mastery of content knowledge and the field based experience.

According to the National Association for the Education of Young Children (NAEYC) both federal and state legislations have recognized the need for funding for ECE programs (About NAEYC, n.d.). Programs that promote high quality early childhood educators are needed to support the developmental and cognitive growth of these children to ensure that they will be able to be integrated into the school system with the skills sets to be successful. Statistical evidence supports the needs for early childhood education (ECE) programs. Currently the number of children enrolled in programs such as Head Start is an under-represented population with less than four percent of eligible babies and toddlers enrolled (Explore an archive of resources and
press related to the Early Head Start-Child Care (EHS-CC) Partnership initiative. One common limitation found in the ECE field is the lack of quality educators in the field with the necessary educational requirements.

The body of knowledge in relationship to teaching techniques and strategies for the ECE educator have been growing as the realization of the importance of education for this population of learners becomes more evident to those in the field of education. In order to meet the needs of educators in this field, innovative ways to bring this information to educators needs to be implemented. Learning in the online venue is a learning management system that is already in place serving a vast population regardless of location. Utilizing such learning opportunities cannot be overlooked by educators in the field. Obstacles must be overcome in relationship to the acquisition of knowledge for educators to meet the needs of this population of students.

Luckily, early childhood education has gained in popularity as research continues to demonstrate the value of early learning experiences. Working with students who have an age span of birth to age eight requires a specific set of teaching abilities that are especially designed for this population (Noe, 2014). Many early childhood professionals are returning to the classroom to enhance their current knowledge and skills which creates a unique group of learners who are both students and practitioners.

In order to meet the educational needs of these educators, many ECE programs realize that traditional classroom hours and settings are not the ideal solution for those students currently in the field. After working a full day with young children, attending evening courses is often the only option. Programs which offer online degrees in early childhood education help meet the needs of current educational practitioners to update their credentials in addition to offering new educational opportunities for those who wish to enter the field.
Most early childhood programs center on the concept of constructivism, allowing the learner to be actively involved in the learning experience through relevant “hands-on” interactions. In a typical face to face classroom, college instructors in this field often provide many group activities, observations and field experience to create this type of learning environment. In an online setting, these activities must shift to accommodate the virtual classroom. This shift in instruction can be accomplished however online educators must possess the skills to facilitate such learning. Pedagogical expertise in early childhood education alone does not suffice in relationship to the “hands-on” instruction strategies that need to be taught. Attending an online degree program of study that is specially designed for preschool instruction is necessary to ensure that the preschool educators acquire the skills needed for the face to face classroom environment.

Effective online ECE programs often use the following strategies – peer collaboration through discussion boards, videos, observations, and field based assignments. With peer collaboration, students engage in a variety of activities to mirror the dialogue or group interactions found in a traditional classroom setting. Discussion boards are a common method used in online classrooms to promote student interaction. In early childhood education focused courses, students often share their own experiences working in early childhood and gain relevant ideas for others currently in the field (Adler & Iorio, 2013). Creating effective discussion thread in the online venue is a skill that needs to be practiced before implementation. Discussions need to provide the teachers with an opportunity to share about their experiences in addition to being able to interject solutions to problems and concerns that may arise in the face to face classroom setting. The instructor also adds insight into the class discussion, typically incorporating research or relevant examples to extend the learning further. Students often report the discussion
boards as a valuable method to gather insight into topics and gain new ideas to use in the classroom.

The use of videos has become increasingly effective with the use of YouTube to teach about various circumstances that can occur in the face to face classroom environment. By having online students watch videos and then discuss these with one another this activity provides another useful “hands-on” approach to learning in the online environment. The students can also make their own videos in order to demonstrate how they would teach a topic to their students. By watching videos of peers and one’s self a tremendous amount of learning can take place due to having the ability to actually see how what they do in the classroom as a teacher comes across to their students. Nuances such as body language, voice intonation, and hand gestures are all subtle when interacting on a daily basis however these can affect the overall effectiveness of a lesson being taught.

A critical piece of the teaching experience for those who are seeking to update their credentials or enter into education as a career is conducting observations and field based assignments in the classrooms of other teachers. In the online venue this type of learning activity depends upon the learner getting in touch with a school that will cooperate with the university providing the degree program and to mutually agree upon the appropriate protocol in which to make observations. The first step in creating this type of relationship with a school is to contact the administration to seek permission. Documentation regarding policies and procedures for this type of observation need to be clearly defined and well laid out so that all involved have a very clear understanding as to the roles and responsibilities of the student observer.

A unique element of online programs is the diverse make-up of the learners within the classrooms which often comes about through random enrollment. Students who enroll in the
class typically come from a variety of backgrounds and work with a wide range of students in their own personal classrooms. When engaging in the discussions, students often share examples from their own experience which can provide others with knowledge of students and family issues they have yet to encounter. For example, a student working in an early childhood classroom in a small rural community may have limited experience working with second language learners. As a result, the student may be unprepared to provide the support an EL (English Learner) student may need if enrolled in her classroom. However, through the class discussions other students have shared methods and strategies which have been effective to support EL students in their urban classrooms. While the settings in these two situations vary greatly, the knowledge shared assists in creating a supportive classroom experience for the ESL student in the rural area. If the student from a rural area had been enrolled in a local ground classroom, the examples shared by her classmates would very likely be similar to her own, limiting the applicable knowledge she gained in this scenario.

Another common method used in the ECE online programs is to provide students with readings and additional learning material which merges both classic and current theories and practices. Most ECE programs focus on developmental theory and provide instruction on how these concepts translate to real-world settings. In a traditional classroom, it is common for information to come for a course lecture or reading. Online programs follow a similar pattern, providing relevant readings to link the concepts (Garvis & Lemon, 2015). In addition, most online programs include videos or other technology based resources to enhance the examples and information share in the classroom. As the field of education becomes more and more infused with various technologies it is incumbent for everyone in the field of education to use these modalities for instruction to student and further teacher development as well.
As educators across various fields look to the future, the use of technology is a growing trend. For practitioners in the ECE profession, the virtual learning environments provides quality instruction and exposure to more experiences than what they might encounter in a traditional classroom setting. The flexibility also provides a great advantage without reducing the educational experiences. EGE is developing into a field requiring specialization and expertise in order to ensure children receive an education that will prepare them for lifelong learning. In order for educators in this field to remain current they must actively engage in learning about the newest techniques, expanding upon their current knowledge. Online Early Childhood Education programs offer this opportunity in a cost effective manner.

Abstract

Matching Flight Attendants' Educational Needs

Each year, mandatory education courses are provided to flight attendants to develop their personal and work skills. These courses cover topics such as effective customer service skills, crisis coping, and teamwork building. In the present study, we evaluated flight attendants' educational needs and explored ways to reflect these needs in the flight attendant education classes. Upon completion of the education courses, the participants completed course evaluations. Based on their responses, we developed a questionnaire that asks about flight attendants’ needs and goals. A total of 319 participants were included in this study, with the majority being women (89%) and the average years of service ranging from 1 month to 31 years (mean=7 years, 10 months). Preliminary analysis revealed that the flight attendants found the teamwork-promoting classes to be most helpful and that these classes were most effective if all team members participated at the same time. As flight attendants are required and experience pressure to be friendly and patient all the time when working, the flight attendant participants also reported emotional problems which negatively affect their performance. Relatedly, the flight attendants reported a need for more education courses covering well-being and application of psychological principles to strengthen self-help skills. Other ideas and suggestions for improved education courses for flight attendants will also be discussed in the study.
Searching for a Visual Arts Pedagogy in the Digital Age (ID: 320)

Empire State College, State University of New York
113 West Ave. Saratoga Springs, NY 12866 U.S.A.
alice.lai@esc.edu

Introduction

In recent decades, digital technology use in online art classrooms has pervaded art education in the United States (Sweeny, 2010). Art educators now view digital technology not only as a new medium for creating art but also as a new tool for enhancing educational content, contexts, and processes. They have fully participated in the creation of online courses and incorporated social media, Web 2.0 tools, digital games, multimedia, 3D immersive worlds, and online learning management systems into their courses (Black & Browning, 2011; Buffington, 2008, 2010; Engdahl, 2014; Knochel, 2013; Lai, 2010; Liao, 2010; Sweeny, 2010). This trend reflects recent national surveys on the use of digital technology in postsecondary education. For instance, tracking online education in the United States over a 10-year period, the Babson Survey Research Group and Quahog Research Group (Allen & Seaman 2013) observed rapid growth in postsecondary enrollment in online courses, including Web-facilitated, blended, and online courses. Specifically, the survey reported that 32% of postsecondary students took at least one online course in the fall of 2011, a sizable increase from 9.6% in the fall of 2002. Moreover, according to the Babson Survey Research Group and Pearson Learning Solutions (Seaman & Tinti-Kane, 2013), among the different disciplines, the humanities and arts faculty used social media in their teaching at the highest rate.
As a faculty member teaching and developing online arts and art education courses for more than 15 years, I have witnessed growing enthusiasm in integrating digital technology in art classrooms, on or offline. I have also conducted case studies to examine students’ perceptions of and experiences with online learning and online learning technology (Lai, 2010, 2013). My experiences and research have taught me that knowing how to use or employing certain new technologies because of their popularity among students or institutions is not a sufficient pedagogical rationale to implement those technologies and does not necessarily lead to better learning experiences and outcomes. My case studies, along with the National Telecommunications and Information Administration (NTIA, 2013) publication *Exploring the Digital Nation*, have also demonstrated that in spite of nationwide improvement in the access and price of technology, digital inequality continues to exist, disfranchising learners of low socioeconomic status, non-Asian minority groups, and advanced age, learners from rural areas, female learners, learners with disabilities, and adult learners. As Prensky (2010) asserted, the vital challenge for 21st century teachers is not becoming technology competent but finding an effective pedagogy that is responsive to 21st century digital learners’ techno-social realities while also supporting educational equality for all learners.

Concerning technology-related educational issues, I began reviewing the literature and conducting an empirical case study to help identify a techno-socially responsive and empowering visual arts pedagogy for today’s digital learners. In this paper, I summarize my findings. First, through explaining postmodern feminist theories, I discuss the social and educational trends in this postmodern digital era and identify postmodern feminist pedagogy as an empowering and relevant pedagogy for 21st century learners. Then, I present a “student-led discussion” assignment in an online women’s art in history course as an example of a postmodern feminist
learning activity. Lastly, I use the students’ feedback to specify the most effective aspects of the postmodern feminist pedagogy.

**Postmodern Feminist Theories and Pedagogy**

Scholars (Genz & Brabon, 2009; Rosser, 2006) have asserted that postmodern theories defy modernism’s emphases on essentialism, foundationalism, universalism, and dichotomous thinking, which privilege an androcentric structure and grand narratives; challenge “the idea of the autonomous and free agent and articulate a self that is always within power structures and subjected to multiple discursive formations” (Genz & Brabon, 2009, p. 107); and reject the deep-seated notion of a fixed conception or category of gender identity. Postmodernism’s rejection of essentialism and the patriarchal ideal has raised significant concerns about the formation of individual identity, agency, and power structures between and among sexes, races, and socioeconomic classes as well as between teacher and student and canonical knowledge and individual experience. Postmodernism advocates decentered, non-universal, fluid, and deconstructive notions of identity construction. Postmodern ways of knowing, therefore, underscore the contextualization of knowledge, legitimize personal experience, and incorporate a critique of power structures.

Informed by postmodern theories, today’s visual arts curriculum, as Freedman (2003) asserted, “makes imperative a connectedness that undermines knowledge as traditionally taught in school, highlighting the importance of interactions between individuals, cultural groups, forms of representation, and professional disciplines” (p. 108). Freedman urged educators to employ technology in their teaching, as today’s Internet and Web 2.0 digital technology provide connectedness, interaction, and access to multiple professional and disciplinary resources to enhance visual arts learning. Moreover, postmodern visual arts education asks students to
“contextualize their work within a contemporary value system” (Hardy, 2006, p. 13). This approach prompts students to create art that is responsive to their time and sociocultural conditions, through which students may produce new artistic genres or aesthetic stances while challenging the traditional canon of art.

Drawing on postmodern theories and placing women at the heart of the theorization, postmodern feminist theories, as Rosser (2006) pointed out, open up the identity category to women and urge women to reclaim their agency and actively engage in the process of “becoming” women. Considering the different micro experiences of race, class, nationality, creed, bodily ability, and so forth, Rosser specified, “The category of woman can no longer be regarded as smooth, uniform, and homogeneous” (p. 33). Postmodern feminist theories, in this way, recognize and welcome individual differences and experiences, embrace pluralistic and even contradictory ways of knowing, confront the patriarchal hierarchy, and support the kind of feminist agency established through critiquing and overturning social/gender injustice.

Following postmodern and critical theories, Brady and Dentith (2001) proposed six principles of a postmodern feminist pedagogy:

[S]tudents' experiences as central to teaching and learning; provisions for safe spaces in the development of students' voices; the revision of centers and margins to understand power and agency; the recognition of difference as central to the reconfiguration of existing social boundaries; the development of a language of critique and possibility; and the evolution of teachers as intellectuals. (p. 165)

Likewise, applying feminist and critical theories, Chick and Hassel (2009) described feminist pedagogy in the postmodern era as follows:
Feminist pedagogy produces a classroom environment of mutual respect where both teacher and all students take active, responsible, and shared roles in the learning process. This dynamic is achieved through classroom relationships that don’t hide or glow over the differences in experience and perspective within a community of learners. Within this community, students care about others’ learning and well-being as well as their own, and they feel free to use their sites of authority – where they already stand and what they already know – to help contribute to the knowledge of the course. (p. 199)

Today’s digital technologies can be understood from a postmodern feminist standpoint. Based on Castro’s (2014), Prensky’s (2010), and NITA’s (2013) studies, one can argue that the interactivity, networking capacity, assorted (a)synchronous communication tools, easy access to information, and various multimedia features that a dazzling array of digital technology provides have increased opportunities for today’s learners to (de)construct and perform identity, knowledge, and agency in a postmodern feminist manner. Castro argued that the creation and sharing of (personal) images, videos, and texts have become a daily activity for many people today and that they should be considered as a form of online identity (de)construction and performance. Through such performance, young people “navigate, interact, and resist normative cultural and gender stereotypes online” (p. 32).

Digital technology, especially social media, is omnipresent in 21st century learners’ social life and educational experience. In the past decade, several art educators have taken into consideration the techno-social realities of today’s learners and postmodern feminist pedagogical principles when implementing digital technology in their online or technology-enhanced visual arts courses (Castro, 2014; Collingwood, 2012; Keifer-Boyd, 2012; Lai, 2010; Liao, 2010). Castro observed that the asynchronous communication in online courses allows students to
“consider, share, interpret, and critically engage with their own experiences, values, and practices” (p. 36). Lai illustrated that in an art history class, through the posting and ongoing discussion of students’ own texts, images, and media arts, students also contextualized their interpretations of arts, which differed from those of canonical texts. Prolonged online discussion and easy access to virtual museums and information on the Internet allowed students to continue examining personal narratives and canonical knowledge collaboratively. Keifer-Boyd developed a participatory learning and social network online to motivate students to engage in a dialogue about personal cultural experiences and cultural differences; this further facilitated students’ collaborative art making and critique of gender and cultural assumptions. Collingwood and Liao demonstrated that avatar creation projects in 3D virtual learning environments, such as Second Life, can allow students to explore, critically interrogate, and resist gender stereotypes and other normative images of self in popular culture.

In short, postmodern feminist pedagogy would emphasize connected, dialogical, participatory, and engaged learning; employ a situated knowledge construction process; invite women to articulate their ideas and experiences and consider them a central (not supplemental or peripheral) source of knowledge; challenge the teacher or textbook as the sole authority in the classroom; and accept personal narratives and experiences as legitimate knowledge that should be examined in a classroom.

**Online Student-Led Discussion: Instruction and Feedback**

Following postmodern feminist pedagogical principles, I designed a student-led discussion activity aiming at prioritizing the student’s own identity, narratives, and choices of visual arts work; enhancing active, participatory learning; and undoing the “hidden curriculum” or “sage on the stage” teaching style, in which male students or the professor often dominates
class discussion. Rather than having the instructor decide what specific visual arts work to examine, topics or issues to explore, or questions to ponder, in the student-led discussion students took turns assuming the role of online discussion leader and selecting and preparing their own visual arts work, topics or issues, and questions they deemed relevant to their personal context for the class to explore together. The activity framework and the instructor provided guidance for the discussion content and activity. The content of the student-led discussion derived from the individual student’s own choice of visual arts work and topics or issues that he or she selected from the course texts. To ensure that the discussion would be successful and meaningful, the instructor also offered timely and intellectual guidance. Giroux (2004) argued that while postmodernism rejects the teacher as the sole or main knowledge holder, he or she still plays an authoritative role in the classroom, and he or she still has responsibility to guide the students to explore and construct knowledge. Therefore, the instructor in this student-led discussion activity did not simply serve as a silent observer or occasional moderator; rather, the instructor guided the student leaders in preparing their initial discussion posts and helped them to continue developing their own discussion threads by joining the discussion as a participant.

Below is a sample description of the student-led discussion activity all the students received when the semester started. It includes the structure and schedule of the activity; the tasks for the discussion leaders, participants, and instructor; and brief suggestions of how to prepare a leading post and lead online discussion.

<td>During Week 1 of the course, please sign up for the TWO weeks that you wish to lead the online discussion by posting your choices in this leading discussion sign-up area. Your</td>
</tr>
</tbody>
</table>
instructor will confirm your choices via this area as well.

Each week starting from Week 3, there will be an online class discussion led by you or your classmates. This learning activity is implemented to enhance your active learning skills, as you will have the chance, twice in this semester, to choose your discussion themes, design your discussion questions, and lead the class to explore together what you find important and meaningful. Your course instructor will be available to assist you to prepare and lead the discussion.

**As a discussion leader,** you are expected to prepare and initiate a discussion topic and post early, usually a few days before Monday of the week that you sign up to lead a discussion. This will allow your classmates time to read your initial post, begin reviewing the text, and prepare their responses.

Each week, there may be more than three discussion leaders. Before submitting your leading post, please check to see if other discussion leaders have posted a similar topic, issue, or visual arts work. If so, please revise your post to focus on a different topic, issue, or visual arts work.

In your first post, provide a brief analysis of a topic or issue you take from a chapter of the assigned readings for that week; select visual arts work from the readings, your own creation, or other external but reputable visual repositories to illustrate your topic or issue; and raise a few questions to help the class examine the topic with you together.
Please make sure to include a citation or caption for each visual arts work used in your post.

As your classmates begin responding to your leading post, you should continue to follow up with your own discussion thread by asking for clarification (if needed), building on each other’s points to enrich the analysis, identifying conflicting points, challenging the text author’s points, adding further resources to support your or your classmates’ points, sharing personal experience relevant to the topic, and/or offering more questions to explore the topic further. If no one responds to your leading post in 2-3 days, consider revising your leading post or initiating a new topic.

Your role as a discussion leader is not to provide answers or lecture. Nor are you expected to respond to every classmate’s posts. However, to practice a leading/leadership role in an online learning community, you should review the selected readings and your classmates’ posts carefully and use them to facilitate and enrich the discussion. As discussion progresses, you may continue to raise questions, encourage active participation, occasionally summarize recurring points, and/or mediate conflicting points. The discussion leaders are welcome to contact the instructor, if there are any questions.

**For all class members as discussion participants**, you are expected to read the selected readings beforehand in order to respond to the leaders’ questions as well as other class members’ postings. You are expected to offer thoughtful and resourceful responses, challenge the questions, “deconstruct” each other’s points, find more information, add
additional visual arts work, and/or raise other relevant questions. As the discussion unfolds, everyone should try to continue to provide more sophisticated analyses. Your instructor will also participate in discussion by moderating the discussion, offering correct facts or relevant resources, and following the above expectations for the participants.

I implemented the student-led discussion activity via Moodlerooms (a learning management system) twice in an undergraduate women’s art in history course in the fall and spring semesters of the 2014-2015 academic year. At the end of each semester, the college administered an anonymous learning survey to all the students to collect their feedback on the courses. In the anonymous survey, nearly 70% of the students from the spring 2015 course who responded named the student-led discussion “the best aspect of this [course’s] learning experience” (End-of-Term Learning Survey administered by Empire State College, June 2015).

Based on the students’ feedback, I identified the following factors contributing to their positive online discussion experience: The instructor’s active participation in the student-led discussion; the opportunity for the students to not only voice their own ideas but also be seriously heard and responded to by others; a learning experience that was fun and engaging; acceptance of different interpretations and approaches to understanding visual arts; and the student-led discussion as a site of critical thinking and in-depth knowledge construction rather than fleeting exchanges of quick thoughts or social interactions. The feedback also suggested that when the students assumed the discussion leader role, they felt a strong sense of responsibility, not only to facilitate the flow of their discussion threads but also to raise “valid” topics and questions and “quality” visual arts. A few students noted that the student-led discussion allowed
for in-depth engagement with ideas, readings, and the arts. This could be due to the fact that each student was asked only to lead class discussion twice a semester, which resulted in no more than five leading discussion threads each week. This appeared to be a reasonable number of discussion threads per week, enabling the discussion leaders and class members to focus on the selected topics. Both the strong sense of learning responsibility and time for serious engagement contributed to higher order learning and better learning satisfaction.

**Final Thoughts**

When the students chose their own topics and visual arts work for the class to explore, they placed their own curiosity, identity, and sociocultural context over the instructor’s preferences or the disciplinary traditions. Following postmodern feminist pedagogical theory, the student-led online discussion allowed this type of participatory, active, and self-empowering learning process. It resulted in students’ examining a wide range of visual arts, critically and creatively exploring the meaning of each work, uncovering the influence of the patriarchal system in the discipline, and challenging the contemporary bias against certain artists or social groups. Art history textbooks and the art world have been harshly criticized as male dominated and elitist (Chadwick, 2012). I used Chadwick’s book *Women, Art and Society* to counteract androcentric visual arts pedagogy, but the book still largely represented white, heterosexual, and elitist standpoints. Thus, the student-led discussion played a key role for the students to uncover less-explored but personally meaningful artists, artworks, and issues. In fact, many student discussion leaders chose topics and issues reflecting their marginalized identity, such as adult learner, single parent, person with a disability, and member of the LGBTQ community, or those relating to gender stereotypes, underrepresented ethnic groups in the art world, and so forth. The leaders also took the time to search for artists and artworks that were not included in the
textbooks to accompany their topics or issues. Consequently, the students learned about artists and artworks that were rarely introduced in a traditional visual arts curriculum.

While seemingly serving as a neutral or even invisible “landscape” in the student-led discussion activity, digital technology formed an integral part of postmodern feminist visual arts pedagogy. The discussion forum chosen for the student-led online discussion enabled multi-linear threads, dynamic interactions, multiple ways to search texts and organize discussion posts, a convenient copy-and-paste (as opposed to the cumbersome file size-limited attachment) function for visual arts work, the capability to attach large audio-visual files, and HTML capacity to easily insert a hyperlink or manipulate images and page layout. These features made it easy for the instructor and students to search and sort through several dozens of discussion posts each week; then they could quickly and precisely summarize recurring interpretations of an artwork or compare comments on an artist among different students under different threads.

In this women’s art course, while the majority of the students were non-arts majors, the course subject matter, along with the digital technology, spurred the students to consider artistic elements in their discussion posts. As class discussions continued, the students grew more familiar with the technological features, and their posts became more visually oriented or sophisticated. Toward the middle of the semester, many students’ posts looked as if the students had carefully designed them, purposefully intertwining the visual images with texts of different sizes or colors. Some students designed the posts (manipulating the visual images) to allow for easy downloading, easy viewing, or special effects aiming at accentuating the key point in the post. Some students began commenting on the visual quality of their classmates’ posts. The online discussion technology had encouraged and enabled the students to practice art/design that was not feasible or practical in verbal-only discussion. Freedman (2003) noted that this
postmodern digital era is saturated with visual information and images; being able to communicate effectively through visual images is an important goal of visual arts education. The online discussion technological features selected appeared to be techno-socially responsive to the digital learners in the postmodern era.

I cannot stress enough the importance of the dynamic yet user-friendly online discussion technology employed in the student-led discussion. Research (Collingwood, 2012; Lai, 2013; Rosser, 2006) has indicated a digital gender divide in which female students have less confidence in learning to use new technology and more trouble with technology than male students. In order to level the playing field, it is important to implement user-friendly and intuitive technological features. The learning curve involved in the online discussion technology was relatively low. By the time students started leading class discussions in Week 3, none of the students had raised a question about the basic features in the discussion forum. The user-friendly discussion technology reduced female students’ anxiety in learning to use the discussion forum or male students’ superior sense of technological competency. Indeed, by the middle of the semester, none of the students demonstrated or expressed a lack of confidence or frustration or faced problems with technologies.

In searching for a visual arts pedagogy that is responsive to 21st century digital learners, I have identified a postmodern feminist visual arts pedagogy exemplified by a student-led discussion activity. Based on the students’ feedback, I gather that postmodern feminist pedagogy supports today’s digital learners’ preferences in active participation in knowledge construction, the teacher as a co-learner or non-judgmental participant, multiple examples of visual arts, multiple approaches to interpreting art, dynamic yet user-friendly technology, and an emphasis
on following one’s own curiosity and constructing or presenting self-identity through the visual arts.

Faculty of Innovation
Doceô Center - Northwest Nazarene University
623 University Blvd., Nampa, Idaho, 83686
aackley@nnu.edu

The H.A.C.K. Model of Innovative Instruction was developed to serve as a systematic guide for educators faced with integrating technology into teaching practices. The model was designed to transform a classroom to a student-centered, project-based environment where students take ownership and personalize their learning. This session will give a complete overview of the H.A.C.K. Model of Innovative Instruction, practical applications, and share 'lessons learned' on implementing a strong blended learning culture into a classroom, building, or district.
The H.A.C.K. Model of Innovative Instruction:

A Systematic Approach to Technology Integration in Education

The traditional school environment is changing. The established educational system born out of a standardized industrialized America is challenged by not only the needs of today’s society, but also society’s unknown needs of tomorrow (Horn & Staker, 2015). This shift of societal change demands a change in educational instruction. No longer are the ‘stand and deliver’, ‘drill and kill’ old-school approaches to teaching sufficient in equipping our students with the 21st Century Skills needed to be innovative, technology-minded, self-directed, life-long learners (21st Century Skills Definitions, 2015).

Tony Wagner states in his book Creating Innovators (2012), “The world no longer cares how much you know; the world cares about what you can do with what you know.” This statement sparks many questions. How do we facilitate this paradigm in an educational system? How do we ensure purchased technology is used to promote student innovation successfully? Most importantly, how as educators do we change the characteristics of our instructional practices so we are actually meeting the needs of 21st Century learners?

The H.A.C.K. Model of Innovative Instruction was designed to build capacity and boost self-efficacy of educators while systematically integrating technology and student innovation into instruction. Using defined stages of technology integration, the H.A.C.K. Model ensures that student standards and rigor remain at the forefront of the integration process and moves educators forward in the development of a 21st Century, student-centered learning environment.
Literature Review

The 21st Century demands students acquire an innovative skill-set. Students will need the ingenuity to gather information efficiently and effectively, analyze, and creatively construct new information using technology (21st Century Skills Definitions, 2015). The Information Technology and Innovation Foundation determined that the United States has been the least successful of 40 nations or regions studied in showing improvement in international competitiveness and innovation capacity over the last 10 years (Wagner & Compton, 2012). Wagner states "Most policymakers, and many school administrators, have absolutely no idea what kind of instruction is required to produce students who can think critically and creatively, communicate effectively, and collaborate versus merely score well on a test.”

Although many acknowledge the need for change, it can prove to be a challenging task. In 2013, the former Superintendent of Los Angeles Unified Schools, John Deasy, had a vision of creating a 21st Century district by implementing a massive district-wide 1:1 iPad initiative. Unfortunately, this effort fell disparagingly short of expectations (Blume, 2015). Some critics point to a lack of organization, insufficient instructional technology leadership, and an absence of adequate professional development in using devices to achieve education goals as key errors in this massive initiative (Gliksman, 2014). Michael Horn expresses (2015), “Blended learning, at this point in its evolution, is not a walk in the park.” Although difficult, Horn strongly believes it is a blended learning, student-centered environment that will ultimately transfer the ownership of learning to students. “This translates into an ability to become a lifelong learner, which is
necessary in today’s rapidly changing world, in which knowledge and skills become outdated quickly (Horn, 2015).”

Integration of technology into the educational system is one of the most dramatic, costly, and widespread initiatives in modern educational history (Bebell & Kay, 2010). Although Los Angeles Unified was an extreme case, studies indicate a relationship between a teacher’s self-efficacy in regards to technology, the degree of which technology is integrated, and a student’s overall performance (Bebell & Kay, 2010; Waxman & Huang, 1996).

Bebell and Kay (2010) conducted a study with five middle schools in western Massachusetts. This three-year pilot program provided 1:1 technology access to all students and teachers. The pilot program’s objectives were fundamentally to change teaching strategies, curriculum delivery, classroom management, and enhance capabilities among students to conduct independent research and collaborate with peers. Through a series of yearly surveys, interviews, and observations this quantitative study found a dramatic increase in technology use among teachers and pupils. Teachers who reported adoption of new and novel approaches across curriculum also reported an increase of student motivation, engagement, and academic performance. A vast number of teachers also conveyed experiencing a distinct shift in their teaching. As reported in the final survey, over 80% of pilot teachers indicated that instructional practices within their classrooms had transformed as a result of the 1:1 implementation.

Furthermore, a study that included over 2000 middle school math students examined whether classroom interaction, selection of instructional activities, organizational setting of the classroom, and student on-task/off-task behaviors in the
classroom significantly differed according to the degree in which implementation of technology was taking place in mathematics classrooms. Using a classroom observational protocol and trained observers, the findings revealed significant differences in instructional techniques based on the level of technology integration in a given classroom. Waxman and Haung suggest that the more technology was integrated into the classroom setting, the more there was a significant shift from a traditional teacher-directed model of instruction to a more student-centered, student-independent instructional approach of learning (Waxman & Huang, 1996).

A 2011 U.S. study revealed how a teacher’s self-efficacy can affect an educator’s willingness to implement technology into their classrooms. The goal of the research was to pinpoint elements and obstacles that would keep an in-service educator from utilizing, or not utilizing Web 2.0 tools into their instruction. This quantitative, web-based study surveyed 559 in-service K-12 teachers from across the nation. Results from this study revealed that if a teacher self-assessed as having low self-efficacy in the use of Web 2.0 tools, they also reported a low integration of Web 2.0 tools in their classroom instruction. The study also revealed three key indicators they feel can notably predict whether the integration of Web 2.0 tools will occur in the classroom setting: teacher’s self-efficacy, professional development, and school administrative support (Shu Chien & Franklin, 2011). The H.A.C.K. Model of Innovative Instruction accounts for each of these areas.

H.A.C.K. Model Development

Who knew the words ‘start small’ would become words that sparked and inspired a model for instruction? What does ‘start small’ mean when it comes to integrating technology into a classroom environment? This is the challenge Amy Ackley and Gregg
Russell, a fifth grade teacher and principal at Ronald Reagan Elementary school, faced while looking to implement a 1:1 iPad initiative in a single classroom at a public elementary school in Nampa, ID. Even as experienced veteran educators, with vast content and pedagogical knowledge, Ackley and Russell wrestled with initial implementation and how to successfully leverage technology to meet student outcomes. Although, in the end, the implementation would be considered successful, it did not come without struggle and lack of available resources.

Now working for Northwest Nazarene University’s Doceō Center, Ackley and Russell were determined to focus attention on the technology integration process and finding a way to provide support to others who were working to incorporate technology into the educational setting. Ackley and Russell carefully examined and mapped the natural progression of integration that occurred in Ackley's classroom throughout the year. With student pedagogy & learning at its core, the model was infused with Bloom’s Revised Taxonomy (Anderson & Krathwohl, 2001) and Webb’s Depth of Knowledge (Miller & Linn, 2013) to ensure student rigor and complexity of instruction was addressed throughout the implementation of a blended learning environment.

The H.A.C.K. Model of Innovative Instruction was crafted to create a common language, build capacity, and boost self-efficacy of educators while systematically integrating technology and student innovation into instruction. The strategic model allows not only the educator, but also students to build technology skills and achieve device proficiency. At the same time, the H.A.C.K. Model changes instructional practice. Using four defined stages of technology integration, the model moves an educator from
teacher-directed instruction to teaching that focuses on innovative student-centered instructional activities (see Appendix A).

**Essential Elements of the H.A.C.K. Model of Innovative Instruction**

**Learning Platforms**

The H.A.C.K. Model of Innovative Instruction exists to leverage technology as a tool for learning in the classroom. Ackley learned early on in the 1:1 iPad initiative that the student perception of technology, especially when it came to an ‘app’, could present a challenge. Most students referred to an ‘app’ as a toy or game. To combat this perception, Ackley focused on the words ‘Learning Platform’ when referring to applications on the device. This simple change of terminology manifested the mindset and culture shift needed for students to view technology in a new way. No longer games, applications transformed into Learning Platforms, or instruments, in which students can display evidence of their knowledge.

**H. -Highly Structured**

The first stage of the H.A.C.K Model of Innovative Instruction is ‘H’, Highly Structured. This stage guides educators through the ‘start small’ effect, giving them concrete first steps with technology in their classrooms. The Highly Structured stage is about replacement of activities. The model suggests that educators look for tasks they already do ‘traditionally’ in the classroom and replace those tasks with technology-based approaches. For example, if students traditionally filled out a graphic organizer using pencil and paper, the teacher would replace it by having students use a learning platform with a graphic organizer on a device. Although not all, most ‘H’ activities fall on the lower end of rigor when it comes to Bloom’s Taxonomy (Anderson & Krathwohl, 2001)
or Webb’s Depth of Knowledge (D.O.K) (Miller & Linn, 2013). This decision is purposeful. In the beginning, ‘H’ activities should be structured in such a way that rigorous content and heavy device instruction do not occur simultaneously.

This Highly Structured stage of replacement opportunities is important for many reasons. It allows educators the time to see what technology can ‘look like and feel like’ in their classrooms. This new vision allows teachers to incorporate management routines and procedures to use the new devices successfully in the learning space. This replacement process is not a ‘one and done’ practice (see Appendix B), but something that needs to occur over multiple times of use. Although the Highly Structured stage of the model is only the beginning of the integration process, its importance cannot be understated. During this time, the capacity building progression of not only the educator, but also the students begins.

A. -Allowed Choices

Allowed Choices is a very natural ‘next step’ for educators who have taken the time to do ‘H’ well. In Allowed Choices, teachers leverage the capacity built in ‘Highly Structured’ to initiate deeper levels of learning. Repeated replacements in ‘H' have developed the aptitude of students not only on the device, but also on different learning platforms presented. This newfound competence allows opportunities in the classroom that would not have been possible previously: increased rigor and student choice (see Appendix C).

In Allowed Choices, the lesson design begins to promote student choice in how they evidence their learning. With foundational learning platforms and management procedures in place, the capacity building process of ‘A’ shifts to teachers and students

learning to navigate student choice and deeper level independent learning in the
classroom.

Lessons in Allowed Choices begin the ‘ownership shift’ of learning, giving more
choice and responsibility to the students in how they show evidence of their learning.
Once again, ‘starting small’, allows educators and students to transition into this new
culture of learning experiencing only ‘growing brains’, instead of ‘growing pains’.  For
example, during an Allowed Choices activity, a class may study the different structures
of a cell. The student’s objective is to know, name and state the functions of at least five
different cell structures. Through repeated Highly Structured activities, the class has
experience with such learning platforms as Educreations™, Screenchomp™, Explain
Everything™, and Movenote™. Although used individually in the past, in an Allowed
Choices activity, students can now choose which of the given platforms would be best to
evidence their learning (see Appendix D).

Allowed Choices activities force learners far beyond remember/understand,
recall/reproduction levels of understanding. Educators and students alike begin to
experience the power of student-centered instruction that requires students to apply,
analyze, and think strategically through deeper complexities of Revised Bloom’s
Taxonomy and Webb’s Depths of Knowledge.

C. -Consistent Application

The transitional swing that takes place after Allowed Choices and Consistent
Application is perhaps the most significant shift that occurs in the H.A.C.K. Model of
Innovative Instruction. A Consistent Application classroom exhibits four major
characteristics: Change of culture, consistent use of technology, deeper levels of complexity in learning, and student choice.

When observing a ‘C' classroom, the cultural shift that has occurred in this room is evident in a variety of ways. Instruction is student-centered, where the role of a teacher has shifted to that of a facilitator in the student learning process. Students are not only actively engaged in learning, but also providing and receiving feedback and instruction from their peers. In a Consistent Application classroom, the technological capacity of educators and students is no longer an issue or obstacle in instruction.

The built technological aptitude of educator and students leads to another observable trait, consistent use of technology in the classroom setting. Technology is now seen as an aide, or essential tool, in the learning process to access and share information that may not have been possible before.

With devices no longer an issue, the push for deeper levels of complexity in instruction should be the focus of any Consistent Application Classroom. Intentional and purposeful planning of lessons that increase rigor and student understandings is vital. At this point, outcomes should be asking students to analyze, synthesize, create, evaluate, and extend their thinking beyond the given task, or when possible, across content areas.

Perhaps the most prominent and significant attribute of a Consistent Application is student choice. Although Allowed Choices had the beginnings of student choice, the instructor was still prescribing what those choices would be. In a ‘C' classroom, the students are encouraged to choose a learning platform independently to evidence their learning. In fact, at this point students’ technological capacities are such that they may ‘appsmash’ (Kulowiec, 2014), or choose a variety of platforms, to showcase evidence of
their knowledge (see Appendix E). When feasible, students are also encouraged to choose topics or concepts, and personalize aspects of their education. This aspect of student choice boosts student engagement and the likelihood of students' expressing their thoughts and feelings on a given topic or issue due to the sense and meaning that subject holds to a particular pupil (Marzano & Pickering 2011; Sousa, 2006).

**K. Knowledge Centered**

A Knowledge Centered classroom focuses on identifying student outcomes, mentoring, and providing a learning environment that allows your students to take control, personalize, and achieve their targeted educational goals. This student-driven, rubric centered, inquiry/project-based instruction pushes students far beyond the traditional brick and mortar classroom. It contextualizes knowledge to real-world problems/issues facing them globally.

The intent of this type of complex instruction is to develop highly independent learners that think cross-circularly and acquire the experiential learning skills needed to be our innovators of tomorrow. Lesson design should emphasize and require students to interact with real-world sites, experiences or experts. Whether physically or virtually, these concrete experiences are necessary to create tangible and authentic understandings in the brain to deepen student’s learning (Zull, 2002). Instructors should consider employing such learning platforms as Skype™, Facetime™, or other Web 2.0 tools to achieve this process with students.

Other than clearly designed, standards-based student objectives, no other stipulations should be placed on how students choose to show competency or mastery of their learning. The process of analyzing a problem, gathering and synthesizing needed
information and the persistence required for inquiry/project based learning, support the 21st learning skills students’ need for the unknown jobs of tomorrow (see Appendix F).

**H.A.C.K. Wheel with Learning Platforms**

The H.A.C.K. Wheel with Learning Platforms (see Appendix G) was created as a support to educators who are ‘H.A.C.K.ing’ their districts, schools, or classrooms. H.A.C.K. Learning Platform Wheels developed for Apple™, Android™, and Google™/Web 2.0 identify platforms that can facilitate the type of instruction needed in each of the four various stages of the H.A.C.K. Model of Innovative Instruction. The wheels are not an inclusive list, or a list that should limit the use of the various platforms presented. The wheel is a visual aid in understanding the H.A.C.K. Model, and a pre-researched resource to offer platform ideas to assist in a particular level of instruction. In the fast-paced world of technology, the NNU Doceō Center considers the wheels to be fluid, living documents, subject to changes and updating as needed.

**Future Implications**

The Northwest Nazarene University’s Doceō Center believes the H.A.C.K. Model of Innovative Instruction has the potential of becoming a national model for technology integration in education.

**Uses for H.A.C.K. Model in K-12 Education**

The H.A.C.K. Model of Innovative Instruction’s impact on K-12 education is growing. Ackley and Russell, along with the Northwest Nazarene University’s Doceō Center Team, Eric Kellerer and Jesse Buchholz, continue to collaborate and create an effective professional development series (see Appendix H) that incorporates the values and principles of the model. The H.A.C.K. Model’s structure allows an educator to
identify where they currently stand in the technology integration process. It then provides an educator with a systematic process of moving forward towards competency in technology use in the educational setting.

Along with professional development, the H.A.C.K. Model has inspired a monthly program called ‘Platforms LIVE!’ (see Appendix I). ‘Platforms LIVE!’ is a hands-on platform experience building capacity of educators in innovative platform’s that influence instruction. The H.A.C.K. Model has allowed opportunity to work closely with districts, schools, and staffs, creating advocates that can produce the systemic change needed in education.

**Uses for H.A.C.K. Model in Higher Education**

Traditionally higher education pre-service and in-service graduate student programs have included some type of ‘technology’ course for educators. These courses have customarily ended up being ‘how-to’ sessions for teachers. While this kind of class has educated teachers on how to create websites, build documents, and become more technology-minded, it did not address the disconnect that exists for many educators on how to leverage technology to meet student objectives. The H.A.C.K. Model of Innovative Instruction offers an answer to that disconnect.

The H.A.C.K. Model provides guidance in constructing curriculum that incorporates changes in instructional practices while integrating innovative instruction. Influencing pre-service and in-service teachers at this level can begin to transform and support the systemic shift of instructional practices that support 21st Century Skills. The H.A.C.K. Model of Innovative Instruction will be a foundational instrument incorporated
into an undergraduate and graduate course entitled *Innovation in Education* in the fall of 2015 at Northwest Nazarene University.

The H.A.C.K. Model of Innovative Instruction also offers an approach to education that can influence and stimulate innovative practices in higher education. Just as in K-12 education, university level instructors and professors can look to the H.A.C.K. Model as a way to increase innovative instructional strategies and technological capacity into their general education, upper division, and graduate coursework.

<table>
<thead>
<tr>
<th>Students will be able to:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Apply the H.A.C.K. Model of Innovative Instruction into lesson plan designs and educational practices.</td>
</tr>
<tr>
<td>2. Plan and design lessons based on the stages of the H.A.C.K. Model of Innovative Instruction, Bloom’s Taxonomy and Webb’s Depth of Knowledge.</td>
</tr>
<tr>
<td>3. Utilize and be fluent in various technology, platforms/applications and leverage those resources to meet student outcomes in the educational setting.</td>
</tr>
</tbody>
</table>

**Docebo Center Objectives:**

1. Increase teacher candidate knowledge and skill to prepare candidates to integrate technology into effective teaching strategies that support P-12 student outcomes. (Teacher candidates will be supported through their 3rd year in the field.)
2. Increase inservice teacher and administrator knowledge and skill to integrate technology into effective teaching strategies that support P-12 student outcomes.
3. Build an evidence base for effective strategies for integrating technology in the educational process that foster improved student outcomes.

Abstract

THE EFFECT OF MUSIC ON DISRUPTIVE BEHAVIOR IN STUDENTS WITH EMOTIONAL/BEHAVIORAL DISORDERS

ANTHONY ROTHFORK

The purpose of this study was to evaluate the effectiveness of listening to music as an intervention to improve disruptive behavior in middle school age children with emotional/behavioral disabilities. Five middle-school students participated in a single-subject design, which involved a multiple baseline across subjects and settings. Students listened to an eight-minute recording of classical music on an iPod before engaging in an independent math or reading assignment while seated at their desk. The researcher used fixed rate recording to collect data over a five-minute session. No significant differences were found between pre-treatment and post-treatment for the targeted behaviors observed during the study. The small sample size
of the study is cited as the possible reason for the negative results. Limitations as well as directions for future research are also discussed.
Meeting the needs of diverse learners is an ongoing challenge for educators. Students come from different cultures, with different interests, background experience, interests, and with a wide degree of readiness to learn. There is growing evidence that differentiated instruction has positive effects on student learning (Rock, Gregg, Ellis, & Gable, 2008). Some basic principles of differentiated instruction are simple (O’Brien & Guiney, 2001): every child can learn and
every teacher can learn. All children have the right to high quality education. There is a presumption of student competence and progress for all will be expected, recognized, and rewarded. Students have common needs, distinct needs, and individual needs.

Creating lessons that provide motivation, engagement, and appropriate levels of challenge for these diverse learners takes consideration and planning. Research has determined that differentiated instruction within the classroom is one way to meet the needs of diverse learners. Additionally, flipping the classroom is also an effective strategy. The flipped classroom allows the teacher to guide instruction on the side, often through the use of technology, much like mentoring. This presentation will provide participants with hands-on application of differentiated instructional practices.

**Differentiation**

Tomlinson and Imbeau (2010) state, “At the core of the classroom practice of differentiation is the modification of four curriculum-related elements—content, process, product, and affect—which are based on three categories of student need and variance—readiness, interest, and learning profile.” Teachers who differentiate lessons provide students with choice, flexibility, on-going assessment, and creativity in how concepts are learned.

When planning differentiated instruction, it is critical to consider different ways to offer content, engage students in learning, and provide opportunities for varied end products. The first step in planning for differentiated instruction is to know your students. Begin by creating learning profiles. Collect information that includes learning preferences, state assessment scores, academic scores, and other scores related to academic performance, and also collect personal information such as family structure, hobbies and interests (Anderson, 2007). Knowing where a student is in understanding a particular skill, allows the teacher to plan instruction to extend that
understanding. Students need to be challenged, and if tasks are too easy, they become bored and do not learn. Conversely, motivation is lessened when tasks are consistently too difficult. Getting to know students helps teachers provide meaningful and engaging lessons.

Content refers to the materials used for instruction. Differentiating content, the “what” of instruction, allows a teacher to vary the level of complexity of materials. Differentiating process, the “how” of instruction, means that teachers vary the learning activities based on the interests or learning styles identified when creating learning profiles. This can include grouping methods such as whole group, small group, pairs, fixed groups, flexible groups, etc. Differentiating product provides students with a choice in how they demonstrate what they have learned. This can include a variety of ways to express knowledge, degree of difficulty, as well as different types of evaluation (Tomlinson, 2001).

Several concepts have been included in literature about differentiation. One method of differentiating is to use a RAFT activity. The acronym RAFT stands for Role, Audience, Format and Topic. In a RAFT assignment, a choice of Role is presented, such as child, adult, workshop participant, or student. The writer takes on the persona of the person and writes in that voice. Audience describes to whom the person is writing. Format describes how the writing will convey the idea. Topic specifies the content for the writing. If a student is focusing on readiness levels, they can be assigned to a specific RAFT depending on their readiness. Other strategies for differentiated instruction include Tic Tac Toe assignments, where students need to complete three activities in a row, but have choice as to which ones they choose. Teachers can strategically place assignments on Tic Tac Toe boards to ensure that all concepts will be covered. Tiered instruction requires developing assignments with different degrees of complexity. Tiered assignments can be more abstract or concrete, require different amounts of support, different
resources, or different background knowledge and skill. Task cards are little cards that contain some task or activity for students to complete. They can be used for either individual or group learning and can be created to target a wider range of skills while promoting student autonomy (Tomlinson & Imbeau, 2010).

**Flipped Learning**

Flipped learning is a strategy where direct instruction is conducted outside of the traditional learning environment and active, interactive learning occurs during group time. Learners apply concepts and engage in creative activities, problem solving, and collaborative learning to show their content learning (FlippedLearning.org; Roehl, Reddy & Shannon, 2013).

When beginning to use flipped learning it’s important to plan and research the content and the activities used to engage learners. Videos for flipping are key to engaging students and knowing how to make a good video. Making the video, editing, and producing the video can be very basic to complicated, depending on the abilities and hardware/software available. Including the best strategies when producing videos helps to ensure students will complete the homework and be ready to apply the materials when entering the classroom (FlippedLearning.org).

The benefits of flipping include students are more engaged, there is an increase in class flexibility with more time available to answer questions, and students have a clearer understanding of expectations of what is needed for class (Mok, 2014; Roehl, Reddy, & Shannon, 2013; Yeung & O’Malley, 2014). Additionally, students have the opportunity to re-watch more complex videos giving them more opportunities to understand materials and formulate questions prior to class (Mok, 2014). Flipping is not a new concept but is being implemented with greater emphasis as new technology makes it more accessible to instructors.

**Conclusion**
Teachers, who effectively differentiate, employ numerous strategies to meet the needs of diverse learners. This paper has outlined some of the processes for providing differentiated instruction. Teachers who successfully differentiate instruction are consistently reflective of their practice, and stay apprised of effective pedagogy and how students learn (Parsons, Dodman, & Burrowbridge, 2013).

Title: Developing and Implementing an Interprofessional Service-Learning Internship: The Community Health Project (CHP)

Topic Area: Health Education

Presentation Format: Workshop

Description: This workshop will showcase the Community Health Project (CHP) as a model for development of a successful academic-community partnership between public health or social service organizations and an academic medical center. We will share specific developmental processes including funding, student recruitment, agency relationship building, project evaluation methods, and academic course requirements. Case studies will highlight mentor/student experiences. Examples of course projects will demonstrate the scope of student work and the depth of community contribution.

ABSTRACT

The Community Health Project (CHP) is a long-standing and unique academic course at the University of Kansas Medical Center that is made possible by solid academic-community partnerships forged by University faculty, community organizations, and students. Established 22 years ago, the Community Health Project (CHP) provides a unique opportunity for students at an academic medical center to work with community agencies and the populations they serve in order to gain a better understanding of the health needs, health-related challenges, and real-life solutions. Directed by an interprofessional faculty, the mission of the Community Health Project is to provide an interdisciplinary, service learning internship that enhances the educational experience of students in the health professions by immersing them in public health and social service settings. Students enrolled in the course represent a variety of disciplines, including medicine, public health, pharmacy, occupational therapy, dietetics, health information management, health policy, and urban design.

During the eight-week service-learning internship, students are required to keep weekly journals, design and implement a project to be mutually beneficial to their education and to the needs of the agency, submit a comprehensive final report that includes the project and overall internship experience, and present their agency experiences at a campus-wide Showcase event. Partnering agencies are required to provide the organizational structure and mentorship to foster learning about public health issues and service and to support student success. Students participating in CHP were supported in their personal and professional development within three key areas: behavior, cognition, and skills. To facilitate development, six specific learning objectives shaped the intern projects. Students were asked to demonstrate 1) knowledge of the cultural, environmental, and socioeconomic factors that influence health promotion and disease prevention, 2) knowledge of health assessment, maintenance, and promotion within a community setting, 3) clinical and instructional skills as deemed appropriate with his/her agency, 4) project development, program implementation, and communication skills applicable to his/her agency and the population it serves, 5) reliability and dependability in performing his/her responsibilities within the agency, and 6) application of his/her abilities and recognition of his/her limitations with regard to knowledge, experience, and clinical judgment. Through the CHP experience, we aim to extend the prescribed reach of medical model instruction to include a lens into the intersection of public health, clinical best practice, social determinants of health, and real people.

This workshop will present the process of developing a model for successful academic-community partnerships from funding issues, student recruitment strategies, agency mentor development and retention of agencies, to enlisting guest speakers, creating evaluation tools, and engaging students in the work of public health and the social service sector. Case examples will highlight the mutual benefits of agency and student participation in CHP. Further, we will share a variety of projects undertaken by recent CHP students to demonstrate the scope of work and community impact.
Online Skills Training for Reflective Supervision in Nursing

Abstract

Aim
The aim of the project was to develop a distance education course with an online design for skills training in reflective supervision in nursing; the aim was also to evaluate the online design scientifically.

Background
Being a nurse means meeting people in need of care and nursing and becoming a part of their lives, which often means illness, pain and suffering. It is well documented that health care professionals, regardless of what kind of care is given, often are affected by work stress. This work stress can result in prolonged illness for the
individual nurse and negative consequences for the patients; moreover, it means high costs for society. Several studies show that professional supervision in nursing strengthens nurses' professional development, contributes to increased creativity and reduces the risk of burnout and work stress. Professional supervision in nursing is traditionally performed as group sessions where the participants regularly meet face-to-face with their supervisor in a physical room. In practice, it is hard to arrange physical meetings for nurses working in different settings and in rural and remote areas. Therefore, the intention of this project was to enable course participation with only a few campus meetings and online supervision sessions.

**Method and Results**

To evaluate the participants' reflections while participating in the online supervision course, a qualitative approach was used. Focus group interviews were performed with two student groups, six participants in one group and seven in the other group. The interviews were performed before the course started, after the second semester (out of four), and when the course is completed. The course is to run for a duration of two years. The teachers were also interviewed before the course, and there will be another interview session after the course is completed. In addition, the students will answer a validated questionnaire about their experiences with online supervision. Qualitative content analysis will be used for the interviews and descriptive statistics will be used for the questionnaire responses. Preliminary results from the interviews and questionnaires will be presented.

Aim
To develop online virtual patients and virtual emergency room simulations for the examination of master student skills in health assessment and handoff communication in a rural nursing course via distance spanning technology.

Method
This project was part of the pedagogical development of an online course in rural nursing where acute care and health assessment skills were included in the curriculum goals. An immersive emergency room environment was built in the software “Open Sim”. Patient cases for Objective Structured Clinical Examinations (OSCE) were constructed and to each case, a corresponding patient avatar was created. After a teacher-led introduction, the students had free access to the room for additional scenario training. Team communication in the scenario and the students’ abilities to assess Airway, Breathing, Circulation, Disability and Exposure (ABCDE) were scored. Handoff communication according to Situation, Background, Assessment and Recommendation (SBAR) was also assessed. Performances were scored 0 to 10 points for each student and graded as pass or fail. The scenarios were recorded so that they could be reviewed for the final grading and for a second opinion from colleagues.

Results
Students clearly saw the advantages in the possibility of performing skills and team training online in a virtual emergency room. The technique is promising, though there is the potential for improvement when it comes to “game technology” and making the avatars perform more precise, hands-on tasks.

Teacher inter-rater assessments of the recorded scenarios will be presented.

Conclusion
The examination form was deemed fair and useful by both teachers and students. The immersive emergency room environment is an acceptable alternative to use in OSCEs.

Abstract

Poverty, poor sanitation and lack of education attribute to poor health choices and diseases among the underprivileged in India. The World Health Organization’s 2015 statistical profile indicates stroke, heart diseases, tuberculosis, infections, and diarrhea, are common causes of death in India which are mostly preventable. Some underprivileged high school students and teachers in India are receiving health education via interactive webcam calls from Hawaii with videos, discussions and case studies which are considered actions for health promotion on the Nutbeam Outcome Model for Health Promotion. Emphasis is placed on students to share information learned with other students, family and neighbors. Maslow identified physiological integrity and safety as basic needs, which drive the motivational behavior of students to learn about disease prevention as well as share the same with others in the community. Results gathered via webcam discussions with students, teachers and the school principal indicate 90% of students are successfully sharing information. Outcomes such as changes in diet, physical activity, environment, and attitude toward health have been reported. This program has implications for global healthcare educational leaders to improve health literacy among the poor.
Revitalizing English lessons through PowerPoint

Revitalizing English lessons through PowerPoint

Abstract

In this presentation participants will see how one teacher went “chalkless” by using PowerPoint for all his English as a Second Language lessons. The presenter will detail the many benefits he has recognized by no longer using chalk and a chalkboard. Using a projector and PowerPoint is implementing technology in the classroom without needing to be a computer expert, learning a new online management system or asking your school to buy new computers or servers. Making PowerPoint slides for your classes is easy. Through the use of PowerPoint in your classroom, students can check the answers to their homework easily. Teachers are able to give much information, teach new vocabulary in interesting ways and review previous lessons. Using PowerPoint is also an excellent way to manage your class time.

Many ESL teachers already use technology in their classroom, but some have not already embraced this trend. There are many reasons ESL teachers do not use incorporate technology in their teaching such as fear, lack of funds or lack of technological expertise. Using PowerPoint in the ESL classroom is one way to incorporate technology into a teacher’s lessons. In order to use it, a classroom must have a projector and a screen. PowerPoint is one part of Microsoft Office software and is readily available for both Windows and Mac
users. This paper will explain how using PowerPoint is very advantageous for ESL teachers.

Two years ago this author wanted to incorporate technology into the classroom because he heard of its many advantages and saw his colleagues using it. He had used PowerPoint only a few times, but then a sudden change happened in to his classes. Because the author had to teach twice as long (90 minutes instead of 45), he decided to use this change as a reason to go “chalkless” or in other words, use only PowerPoint and a screen instead of chalk and a blackboard or whiteboard. The changes in this teacher’s classes after using PowerPoint were immediate. The amount of time he spent writing on the board was eliminated because that time was now done before class writing PowerPoint slides. In his first class using PowerPoint, he went through all of first class material much faster than he had expected and had time left over. Though writing out the information on the slides before class is time consuming, in the long run it is a time saver in the classroom. Also the slides can be used again in the following semester or year, so writing out the information on the slides is really done only one time. Eliminating the time a teacher takes writing information on the blackboard or whiteboard is important because it makes the teacher more efficient.

Showing drawings and pictures for the whole class to see is not easy unless you are projecting them onto a screen. Getting pictures from a computer to a PowerPoint slide is easy. The only process a person must use is copy and paste. This is another reason why PowerPoint slides are beneficial for the ESL class.

A person with a basic knowledge of computers and the ability to type, cut and paste can start making slides right away.
There are even ready-made slides for teaching certain grammar points such as prepositions. PowerPoint is user friendly.

Recognizing that students have different learning styles and incorporating them into the ESL lesson plan is important. One way to incorporate these different styles into a lesson plan is by using PowerPoint slides. For example, the author uses a listening and speaking activity in his class of Japanese college students. In the past, the author used to write eight past tense verbs on the board, say the 8 sentences several times and have the students repeat the sentences to the person sitting next to them. This exercise requires students to memorize the sentences. The exercise was difficult for students who could not memorize easily without a visual aid. Using PowerPoint, the teacher now shows a sentence on the screen along with a picture that corresponds to the sentence. Students who are more visually motivated can attach the sentence to a picture and can memorize the sentence much more easily.

There are other advantages of using PowerPoint in the classroom. One is that the teacher no longer has to worry about inhaling chalk dust or getting it on his/her clothes. Hints to answers can easily be shown on PowerPoint slides. For example a teacher can prepare a hint such as the first or last letter of an answer in a close exercise.

Even if a teacher has limited technological expertise, the use of copy and paste can go a long way when making PowerPoint slide presentations. These days, college students are often recommended or required to make PowerPoint presentations as part of an end of the semester project. If the teacher is well-versed in using PowerPoint, she/he can help students when they are making their own.

College level students are very accustomed to seeing class material presented through PowerPoint slide presentations.
They have no problem with it as long as the font is large enough for all the students to see. The author recommends using just one or two sentences per slide and that the font should be 48.

PowerPoint presentations help a teacher manage her/his classroom time. For example, a teacher writes on a slide, “Mr. Bozek will hand out rhyme papers.” This is not necessary for the students to see, but it helps the teacher to remember to pass out those papers at a certain time in the class. In addition, teachers can write the answers to homework on PowerPoint slides. The teacher can still ask a student to say the answer and then the rest of the class can check the answer on the screen. Many teachers still spend a great deal of time writing answers on the board. Just think of the minutes that can be saved if the answers are ready to present to the class on PowerPoint slides.

When a teacher has developed slides for a class for a semester, then she/he can start going deeper by adding videos or animation to the slides. This is more difficult than just copying and pasting pictures.

PowerPoint is an excellent tool for ESL teachers. For those educators who do not already use it in their classrooms, there is no better time than the present to begin. Making and using PowerPoint slides will revitalize a class through its power to present pictures, give hints, and present large amounts of information to students while saving time.

Abstract

Improving Course Evaluations through the Use of New Technology: 80% Response plus Innovative Approaches to Improving Faculty Teaching Practice

Since the advent of electronic course evaluations in the 1990s, two choices have existed for those charged with conducting evaluations: 1) Continue using paper evaluations, which results in response rates in the range of 80% or above. However, this process is expensive, time-consuming, and labor intensive. Or 2) use electronic evaluations which are more efficient and less costly, but produce response rates in the range of 30% to 50%. Most administrators, over time, moved to electronic course evaluations.

As the use of electronic course evaluations expanded, instructors and administrators complained – justifiably – about the loss in the quantity of evaluation data (Nowell, Gale, & Handley, 2010). The main purpose of conducting evaluations is to gather data from students about an instructor’s teaching practice. And basically, the more data, the better (Ebel, 1965; Palmer, 2012). In addition, new problems arose. For example, if only half the students completed evaluations, were the responses from this group representative of the class as a whole, or did response and sampling bias cast doubt on the results? Many techniques were tried in order to boost response rates to previous levels, mostly without success.

During the Spring 2015 semester at a large southwestern university, evaluations were conducted in person in four classes. An evaluator entered the classroom during the final week of class and guided students through the process of completing course evaluations via their mobile devices. The process also included a short discussion of several misconceptions about course evaluations that students had (Kuch & Schraw, 2015). The overall response rate for these classes was 78.4% as reported in Table 1.

This process overcomes the low response rates introduced with the advent of electronic course evaluations and restores the status quo of 20 years ago. In addition, this technology opens the door to new possibilities. For example, it would be possible to show students in real time the results of
the evaluation, both individually on their mobile devices and collectively on the screen in a smart classroom. It would be possible to delve more deeply into areas that showed up as special or troublesome by asking the students additional questions. It would even be possible to ask the instructor to re-enter the classroom and participate in a collaborative and reflective discussion, in real time, about potential ways the class could be improved. What this technology provides is a platform that opens myriad new creative possibilities for instructors to improve their practice and for students to participate more fully in the process of education improvement.

The Initial Number of Responses is the number of completed evaluations when the evaluator left the classroom. The Final Number of Responses is the number of completed evaluations when the evaluation period “closed,” usually several days after the evaluator visited the classroom. The Response Rate is calculated from the Final Number of Responses as a percentage of the Number of Students Enrolled in the class. The Previous Response Rate indicates the response rate the last time this class was taught by the same instructor.

Panel Session Paper

Introduction

A Course Redesign Studio was created and offered to the Chaminade University faculty members for the summer of 2015. This panel session will allow each faculty member to describe the individual process, which they used to redesign their course and showcase their scholarly product. The application process was initiated by the following request for applications in May 2015.

“The Faculty Center invites faculty to actively engage in a weeklong Summer Course Redesign (SCR) studio. The purpose of the experience is to provide faculty with the time, resources, information, and collaborative support needed to revise and redesign an existing course in ways that will maximize student engagement and learning.

Faculty selected to participate and who produce a redesigned artifact will receive a stipend. Participants would be required to attend the entire day of all meetings during the week and produce all deliverables to receive the stipend. This faculty development opportunity aligns with the Faculty Handbook section 4.10.5. addressing Faculty Development Summer Funds.

“Each year the university will set aside funds, as the budget permits, to support projects designed by full-time or a team of full-time faculty for the purpose of improving teaching, learning and scholarly research at Chaminade.”

For this funding opportunity, participants will spend time integrating research-driven teaching and learning strategies into their selected course. At the conclusion of the studio, each faculty member will have a formal written course plan, redesigned class meetings, and updated, appropriate, relevant and meaningful course assignments with an associated assessment rubric. Faculty members will include a map of the relationship between learning and program outcomes as well as how each will be assessed, course materials, and course activities.

There will be two Course Redesign studios offered. The first studio will be held June 1-5, 2015 from 9 AM - 5 PM each day. The second studio will be held during the same hours on July 6-10, 2015. Faculty members are eligible to apply and may receive funding for both sessions if they submit an application to redesign different courses for each session.
The Application Process

The Faculty Development Committee and/or the current and prior Faculty Senate President will review the proposals. Preference will be given to applications, which present specific educational outcomes, procedures and time line, a philosophy of assessment, and a method for sharing the results. Ideally, successful proposals will share how they plan to engage students by integrating active learning strategies and appropriate, relevant, meaningful innovative technologies.

We would like to receive the applications by May 18, 2015. To apply, please review this document, answer the items below and complete the Faculty Development Application form to request summer funds. To submit your application, please respond to the prompts below and email to jace.hargis@chaminade.edu. Thank you.

Name: ____________________________
Division: ______________________ Discipline: __________________________
Years teaching at CUH: ____________ Years teaching in higher education: _____
Would you be interested in creating a Scholarship of Teaching and Learning manuscript from the outcomes of this Summer Course Redesign Studio? Yes/No/Maybe

1. What courses do you typically teach?
2. When would you be implementing this redesigned course (semester/year)?
3. How frequently do you teach this course?
4. Provide the title and brief course description that you would like to redesign (as it exists currently)(200 words maximum).
5. Reflect on the course you intend to redesign and identify what you perceive as its current strengths. Please include any data to support this (200 words maximum).
6. Reflect on the course you intend to redesign and identify the weaknesses – again, if you have data, please include (200 words maximum).
7. Describe the specific areas that are most important for you to improve and how you propose to implement these improvements. (200 words maximum).
8. How will you know if the redesign is successful? How will you evaluate the impact of the redesigned aspects of the course? (200 words maximum).
9. Briefly share your experience with instructional design – please share specific models that you may have used (200 words maximum).
10. Will you allow the Faculty Center to showcase your redesigned course as an example to other faculty who are considering redesigning their courses?"

Course Redesign Agenda

Day 1
○ Before Design: Higher Education Learning Theories
○ Wiggins & McTighe Backward Design
○ Results - Teaching Outcomes; Alignment; Course Outcomes

Day 2 - Evidence (Assessment) - Strategies; Matrix; Outcomes Matrix

Day 3 - Experiences - Planning; Interactive Strategies; Teaching Models

Day 4 - Syllabus Design - Guide to Teaching & Learning; Interactive Syllabus; Appropriate, Relevant, Meaningful (ARM) Technology
Day 5 - Share - Pilot, Reflect, Critique, Update

Formative Assessment
Throughout the week, research-based, effective practice learning modules were shared. Faculty members were asked to reflect on the activities and provide their insights to three prompts to encourage their reflection and provide useful formative assessment data to assist the facilitator. The prompts asked them to share

1. a ONE sentence summary (goal was to determine if they had gained a broad sense of the knowledge);
2. ONE idea they would use in their class (goal was to identify if they could apply the skills learned); and
3. ONE word that describes the way they feel right now (goal was to discover their current disposition).

The faculty wrote their responses on Post-It notes, anonymously, which were collected, aggregated and shared through Google Docs for everyone to view. The data was analyzed each day to help plan for subsequent days and at the end of the event, major themes emerged, which are presented below.

DAY 1, PART 1: Before Design: Learning Theories

One Sentence Summary of this Session

- Course backward redesign; Learning how we learn; Information processing theory: The way we help students encode should be how we assess.

“Learning with colleagues from different disciplines is helpful.”
“Truly feel like I am gaining something useful here.”

One Idea That You Might Use in YOUR Teaching & Learning

- Formative assessment; Concept mapping; Poll Everywhere; Backwards design; VARK teaching survey; Google Drive

One Word That Describes How You Feel Right Now

YOUR THOUGHTS – DAY 1, PART 2: Rewriting Student Learning Outcomes

One Sentence Summary of this Session

- Learning Outcomes; Alignment of assessment strategies to outcomes (LOs); Backward design; REEx
“Thank you for waking up my “AHA” moment. I am on the sun now!”
“Learning how to place teaching into more of a measurable framework.”

One Idea That You Might Use in YOUR Teaching & Learning
- Refined LOs; Sharing with my students; Integrating more technology; REEx; KWL; Backwards syllabus construction; Link course, program and institutional outcomes using rubrics; Revisit Program & Course LOs for alignment.

One Word That Describes How You Feel Right Now

YOUR THOUGHTS – DAY 2, PART 1: Alignment of LOs, Assessment & Topics
One Sentence Summary of this Session
- Holistic viewpoint; use assessments to help students improve; giving meaning to assessment; recognizing and understanding key point of the learning:

“I have been de-constructing to build up.”
“Assessment is ongoing.”

One Idea That You Might Use in YOUR Teaching & Learning
- Collaboration with non-division colleagues; Breaking down the class into modules and lining it up with the LOs; Share the information with students; Rubistar rubric creator; Poll Everywhere; Assessment before and after (during class); Formative approaches to assessment.

One Word That Describes How You Feel Right Now
YOUR THOUGHTS – DAY 3: Active Learning Strategies

One Sentence Summary of this Session
- Meta-active learning: If we really want students to learn, they have to be engaged! Active learning helps students move, speak and know others; Diversity of ideas - methods to use in online course

“Extremely practical and useful session.”
“Active learning is not simple but can be done.”

One Idea That You Might Use in YOUR Teaching & Learning
- List of 140 active learning strategies; Group learning self-assessment; Storyboarding; Use of “make a 30 second movie; Facilitating; Fun; Not to be afraid of active learning; Building relationships.

One Word That Describes How You Feel Right Now

YOUR THOUGHTS – DAY 4, PART 2: Appropriate, Relevant, Meaningful Tech

One Sentence Summary of this Session
- Process should promote humanness opportunities; we need to make sure technology is used to transform learning; I need to use the green room for my online classes now; we can get her done; new opportunities in tech.
“Wonderful new opportunities to redesign and be creative.”
“This was the best and most helpful session.”

One Idea That You Might Use in YOUR Teaching & Learning
- Green screen; iStop; Twitter; SAMR model; Interactive, hyperlink syllabi; Blog, Second Life, Google Scholar; Versatility; Explain Everything screencasting app; Wordle; About me.com for student work (eportfolio); Progress you can adopt;
  Need to revise ALL my syllabi.

One Word That Describes How You Feel Right Now

Summative Assessment
We were able to gather multiple types of summative assessment using appropriate, relevant and meaningful (ARM) technology. One method was using Poll Everyone.com open responses to ask faculty their attitudes towards topics before and after we shared information. A Comparison of Visual Pre/Post Dispositions on the topic of Syllabus is presented below.
Formal Evaluation

A formal course survey was provided at the end of the experience to gather data to help build future faculty development. The aggregate items and data are presented below (n=18).

Please rank the following items based from 1 (Highly Disagree) to 5 (Highly Agree).

1. I felt that the facilitator designed & created an authentic, active learning environment, where the main outcomes were well shared and supported.
Response Average: 4.94/5.0

2. I felt that the facilitator provided appropriate resources, well-aligned research & individual attention to help me develop & integrate teaching and learning strategies into my course.
Response Average: 4.94/5.0

3. I felt that the facilitator demonstrated knowledge, comprehension, analysis, application, synthesis and evaluation of the topics.
Response Average: 4.94/5.0

4. I felt that the facilitator was enthusiastic, accessible and involved.
Response Average: 4.94/5.0

5. This faculty development experience exceeded, met or fell below my expectations.
Response Summary: Exceeded 15; Met 2; Unsure (no point of reference) 1

6. In what significant ways did you modify your course teaching and philosophy as a result of this experience?
Summary Narrative: Several themes emerged, most common was the intentional focus on examining and assuring the alignment of Learning Outcomes/Backward Design (REEx) (6); secondarily, the integration of appropriate, relevant and meaningful (ARM) technology (5); and then embedding frequent opportunities for active learning (3); and various forms of formative assessment (3).

Notable Faculty Quotes:

• “[This experience] Significantly changed the way I will modify and refine my course in the organization and types of active learning activities and also the use of more ARM technology.”

• “I am applying the Backward Design model and this has allowed me a different way (& more deliberate) of going through the design of my course. I assumed the means to the goal would ultimately relate in the goal being met by default. Knowing and reflecting on this now, I feel I need to re-examine my courses in general to ensure that alignment is truly there.”

• “I'm willing to be much more creative in the way that I assign material and the ways that I'm going to assess learning. I also saw the value and necessity of linking all experiences to specific LOs and making those links clear to students.”
• “I walk away from this session with more questions rather than all the answers. More possibilities than restrictions. I think we are beginning to scratch the surface of what inspires, connects and engages the generation of students we have today. Redesigning my course gave me the opportunity to think in a broader vision. What can we do that sets the tone for all courses? How can it be an introduction to a new way of learning?”

7. What would have made this faculty development experience better for you?

Summary Narrative: Several themes emerged, which included direct responses noting that “Nothing” would have made the experience better (7); others shared that it was a long week (4); some needed more time to do work (3) and on the topic of technology (3); as well as a better (warmer) room (3). It appears that most were able to connect the substantial amount of empirically-based research into their own design as only one person requested additional research should be added.

Notable Faculty Quotes:
• “This is one of the best courses I have ever attended and I am taking it all in”.
• “I can’t think of anything that would have made this experience any better - the food, the information, the energy, the presentations, the sharing were all very helpful to me.’
• “The best part of the experience was sitting and talking with colleagues. I came up with so many ideas from this type of sharing.”

8. What did you like about this faculty development experience?

Summary Narrative: There were several reoccurring ideas, which faculty noted favorably about the studio, primarily how much they enjoyed the substantial time to work with and get to really know their wonderful and talented colleagues (11). In addition, they indicated that they were able to engage in a highly interactive environment (8); with high quality resources (human, content, food and coffee, 6); gaining new insights and perspectives about teaching and learning (4); while enjoying their time (4) to reinvigorate their passion to redesign learning experiences.

Notable Faculty Quotes:
• “I really liked working with my colleagues as we were all introduced to (new) educational theory and practices so that we might improve what we do. In addition to learning a lot, we had a great time!”
• “It was very interactive, good content, and made me more interested in HOW I teach instead of WHAT I teach.”
• “I enjoyed the energy and enthusiasm. Yes, the course was about redesigning a syllabus, but it was much, much more - it was about bringing a new energy into the classroom, challenging students from a new perspective, taking risks, offering creativity, and being comfortable with what we don’t know. It is what education and a learning environment should be and I feel that with more of these sessions we can begin to really get students excited about learning.”
• “I liked that the facilitator was so attentive and responsive. Our comfort, not just mental, but physical was always considered. You felt as if you were valued!”
• “The sharing of colleagues that added beauty and art to simple pages. Opened up a way of looking at something different. I got a chance to meet my colleagues in a new surrounding. Not committee work, so the time was enjoyable.”

9. Please share any other thoughts or comments that you have about this faculty development experience, which will help us improve.

Summary Narrative: Faculty members were very helpful at identifying ways in which we could enhance this event for the future. The prevailing suggestion was to offer more events such as this and drill down to make some concepts more focused (10) (btw, a special 3 hour session on ARM technology was requested and offered two weeks afterward, resulting in half of the 18 participants attending). Also, faculty suggested that the room could be have better (3); and more time allowed for work (2). Only two people thought that the experience should be shortened, which reinforces previous comments on how they appreciated both time to genuinely get to know each other and work, perhaps finish their course redesign. There were several people who strongly encouraged us to find ways to interest more faculty members to engage in this studio, which we hope to do over the coming year.

Notable Faculty Quotes:

• “This has been a terrific way to rejuvenate during an important time of the year. I do a lot of work during the summer that I cannot get done while teaching, and this week has increased my passion for this work.”
• “This should be a regularly offered workshop for all faculty; it made me realize how badly we need a faculty center for this kind of exchange and interaction.”
• “I would just say help the community of us educators continuously stay fresh (i.e. keep help us to continue to learn and adapt new tools as they continuously come out - given how fast technology and methods change)”
• “A mini version of this week’s session would be really cool.”

10. Please share your thoughts on the logistics for this Studio (e.g., location, food, suggestions for improvement).

Summary Narrative: Only three major themes emerged from this inquiry, which included the room temperature (9) was cold for many, although some liked it cold; many agreed that the food quality was great (7); and overall, the event was very well done (6).

Notable Faculty Quotes:

• “I like the theater as a space for this work. It is too cold in here, but this is often the case around campus. The food was wonderful.”
• “Loved the food, terrific breakfast, lunch, snack options. Good chairs and space with couch was a comfortable option.”
• “Food was 1st class restaurant. Makana was amazing with logistics and providing everything we need. Mahalo.”
• “The location was perfect because it wasn't a classroom, which would have made it seem like too much of a class, but in a location that truly had a design studio or Faculty Center ambiance.”
“I feel embarrassed to be receiving money for this experience as it is something I feel I should be paying big money for, such was the great experience that this week has been.”

**Conclusion**

The final piece of summative assessment evidence is the academic artifacts created by each faculty member at the end of the week. Most faculty members created an updated, redesigned syllabus, indicating which portions of their prior syllabi was updated with the information they learned during the studio. During the course, a substantial amount of information was shared, so to be able to actively listen, engage, interact AND produce an artifact in one week is indicative of exemplary faculty. Everyone created and many presented an artifact on the final day, which will be made available on the new Faculty Center website ([http://www.chaminade.edu/faculty-center/article/faculty-center-hosts-two-summer-course-redesign-studios](http://www.chaminade.edu/faculty-center/article/faculty-center-hosts-two-summer-course-redesign-studios)). One of the most significant results was how faculty translated the course information into their own teaching philosophy, which produced a wide range of products. Faculty showcased their course redesign products as iBooks, Screencasts, graphic visualizations, through the LMS, using track changes on a prior syllabus, spreadsheets, and through using the new syllabus template guide.
Title: Preservice Teachers Project Caring Experienced in the College Classroom Toward Future Elementary Students

Preservice Teachers Project Caring Experienced in the College Classroom Toward Future Elementary Students

Jodi Meyer-Mork
Luther College

Katheryn East
University of Northern Iowa

Abstract

This qualitative pilot study examined preservice teachers’ perceptions of caring behaviors, as experienced in one teacher education course. Some considerations are given to how those same actions may be projected to their future elementary students. Researchers analyzed data using Noddings’ care ethic (2010) and present findings using exemplars (Mishler, 1990), explicitly connecting data to care ethic and relevant literature. Preservice teachers identified natural and aesthetic caring more often than ethical caring in their responses. Implications for teacher education programs are discussed.

Introduction

Since the early 2000s, school personnel in the U.S. have been held accountable for student achievement measured explicitly through standardized tests and adequate yearly progress (AYP) mandated by legislation such as No Child Left Behind (NCLB). This sole focus on academic achievement and sanctions for not performing well sometimes has resulted in school personnel neglecting other important aspects of teaching, such as nurturing social-emotional growth in students or considering the whole child, which can better prepare students for fulfilling adult lives and to contribute in democratic societies. This push for more rigorous accountability, which has become so strong in pre-kindergarten through grade twelve systems, has also become more evident in institutions for higher education, and, specifically, in teacher education programs.

As concerns over whether teachers in pre-kindergarten through grade twelve education adequately prepare students for life beyond high school, similarly teacher preparation programs have been scrutinized for their ability to prepare candidates. The Council for the Accreditation of Educator Preparation (CAEP) charges teacher preparation programs to “produce educators who raise student achievement” (caepnet.org), through candidate preparation in content knowledge, pedagogy, and clinical experiences, as well as to “establish and monitor...dispositions beyond academic ability (CAEP Commission Recommendations to the CAEP Board of Directors, p. 17, bold added). Included in these are “abilities to build trusting, supportive relationships with students and families during preparation” (CAEP ACCREDITATION STANDARDS 2013, p. 42, chart).

This inquiry focused on ideas of caring, at a point in the program when candidates are engaged predominantly in on-campus classes and not in clinical experiences. Noddings’ perspectives on care were used to interpret candidate perspectives. The results provide some indications of how teacher preparation programs may encourage non-academic dispositions within their candidates.
**Literature Review**

Throughout Noddings' writings (1984, 2010, 2012), she describes four approaches to caring. Natural and ethical caring revolve around people and their interactions. Aesthetic caring involves a person’s caring for ideas and things. Finally, in virtue-caring, the carer views her act of caring as a virtue or “morally admirable character trait” (130). For this paper, natural, ethical, and aesthetic caring are of central interest and further described.

Natural or relational caring involves two individuals, the carer and the cared-for, who focus on the caring *relation* and the basic human needs of security and attachment (Noddings, 2010). People engage in natural caring because they want to care and be cared for; they do not engage in it out of a sense of duty or moral principle (Noddings, 2010). A key element in the caring relation is the idea of reciprocity, the “mutual recognition and appreciation of response” (Noddings, 2012, p. 53 italics in original). The carer’s role is to be attentive to the cared-for, to identify, and empathetically respond to the needs she feels the cared-for is expressing. “Caring precedes the identification of needs” (p. 181, italics in the original). When unable to establish natural caring, Noddings suggested one turns to ethical caring.

Ethical caring is ‘a state of being in relation, characterized by receptivity, relatedness and engrossment’ (infed.org). It may result from tensions or other barriers between the carer and cared-for, such as when the carer cannot in good conscience provide what the cared-for wants. The carer uses her own ethical ideal of how to respond to the cared-for instead of relying on externally-imposed principles. Ethical caring is illustrated by the question, “What would I respond if I were at my best caring self?” (Noddings, 2010, p. 68), which is still focused on preserving the relation with the cared-for. The final type of caring, aesthetic does not involve relation with a cared-for or person.

Aesthetic caring is directed toward “things and ideas” (Noddings, 1984), such as when one cares about learning or art appreciation or pets. The current focus on U.S. achievement through standardized testing illustrates aesthetic caring. However, Noddings (2010) suggested that relational care and happiness in life are what students ultimately need to learn in school. Thus, Noddings three types of caring are used to analyze data in this inquiry. The objective for this pilot study is to discern 1) how prospective elementary teachers describe instances of caring experienced in the first author’s teacher education course and 2) how they anticipate extending similar caring to their future elementary students.

**Methodology**

This qualitative pilot study employed a researcher-designed questionnaire and results were analyzed using Noddings’ ethic of care (1984, 2010, 2012) as a framework. The questionnaire contained 10 open-ended items asking preservice teachers to describe instances of caring experienced in the teacher education course taught by one of the authors and that they anticipated extending to their future elementary students. (See Appendix A for list of the questions.) Human subjects review board permission was granted for this study.

The study participants attended a small liberal arts college in the Midwest of the United States and made up the course in two sections of 23 and 11 students. Of the 34 students, 29 were female and 5 were male. These preservice educators (PSTs), participated in the study at the end of the semester-long course, Instructional Strategies. The course content and procedures introduced PSTs to research-based instructional practices and classroom management techniques, including relationships with future students, families, and colleagues. Even though caring was discussed in general terms and candidates...
were asked to define care when they used that word in discussion, the ethics of care, per Noddings, was not directly discussed within the course.

The questionnaire was administered during the final exam period through the electronic course management system, which was set to allow PSTs to respond anonymously. Although answers were anonymous, an individual’s responses can be seen across the 10 questions or all responses for any one question can be seen from all respondents. PSTs were awarded 10 points toward their course grades for answering the questions or typing “decline” to any or all questions they chose not to answer. The same five (5) participants chose this option throughout the questionnaire; three (3) chose to decline to answer all questions, while two (2) selectively answered questions. The remaining 29 PSTs responded to all 10 questions with narrative comments. This particular paper reports responses from question 9: “How might the care you experienced in Instructional Strategies be similar to care you anticipate providing to your future elementary students?”

Researchers read, annotated, and coded responses using Noddings’ three types of care (natural, ethical, and aesthetic), and then further analyzed and interpreted the data using exemplars (Mishler, 1990). Mishler uses Kuhn’s definition based on studies in the sciences: an exemplar involves one learning in a given field of study by being presented with problems and research from that field in order to learn by example (1970, p. 187 as cited in Mishler [1]). Since Mishler claims that knowledge is socially constructed, it is imperative that the researcher make her or his actions visible at each point in the research process. Toward this end, the PSTs’ responses and researchers’ meaning-making of those responses are offered as the exemplars. The PSTs’ narrative responses used as data and in analysis are then made available to readers, with the researchers making explicit the methods “that transformed the texts into findings; and of the direct linkages between data, findings, and interpretations” (p. 429). Readers will then decide whether the researcher’s claims are trustworthy because they are rooted in the social world, discourse, actions, and praxis (p. 420). For this process, we take representative examples from the data and interpret it in terms of the literature on caring and effective teaching practices.

Results and Discussion

PSTs generated 34 responses. Researchers categorized the responses based on the type of caring that appeared most prominent in a response (Table I). However, many responses appeared to address more than one type of caring, which will be illustrated through the following exemplars.

To illustrate the complexity of the PSTs’ responses, three exemplars are discussed below in detail. The first response is coded as ‘natural’ in the above table, yet shows evidence of natural, aesthetic, and ethical categories of Noddings’ ethic of care.

“The care will be similar in the sense that it will be my job to help the students feel comfortable, respected, and welcome in the classroom. I want my students to feel like they have a voice and teach them the appropriate way to share their voice in order to respect others. I will also show an interest in what the students enjoy to show that I care about their interests and personalities. Differentiation can be a way of showing that you care by adjusting things in the classroom to suit the individual needs, learning styles, and interests of each student rather than expecting them all to be on the same page with everything. I would be doing my students a disservice if I did not treat them as individuals and care about them for who they are.” (Response b)

I would be doing my students a disservice if I did not treat them as individuals and care about them for who they are.  
(g) making sure to be attentive to my students and making sure that they all feel welcome and important in my classroom. Whether that be by thanking students who answer questions in class or keeping calm at all times. Using a soothing calm voice when talking to students. I also plan to use lots of the instructional strategies and ideas we talked about in class within my future classroom. |
| Ethical - Focus appears on the teacher responding to student in manner that challenges her natural inclination and also preserves the relationship. | 2                   | (s) I will always try to remember that students can make mistakes, they can forget to complete assignments on time, or misunderstand assignments. Having an open mind while determining consequences or alternatives for the student will be good so that I can still be fair but still care for the student and help them learn from their experiences.                                                                                                         |
| Aesthetic - Focus appears to be on academic achievement, physical elements of the classroom, or the processes of teaching and learning. | 3                   | (d) As an elementary teacher, I will show that I care for my students by communicating to them the purposes for learning and showing that I put thought and care into making daily lesson plans.  
(j) I appreciated that the Professor in ED 222 was conscientious about the lighting in the classroom. I want to provide my students with the best lighting that encourages stimulated and active minds.                                                                                                       |
| Uncategorized - Responses lacked specificity     | 6                   | (n) I want my students to feel welcome and excited because of the care they have in the classroom.  
(cc) Making sure my students are doing alright and that there aren't other outside circumstances that are making their classroom experiences different.                                                                                                                                                                                                  |
| Declined                                        | 6                   |                                                                                                                                                                                                                                                                                                                                                      |
In this statement, the PST shows understanding of caring based in relationship, which falls under the natural or relational category for Nodding. The PST is focused on her relationship with the student. This is clear when she says, "I will also show an interest in what the students enjoy to show that I care about their interests and personalities," and "I would be doing my students a disservice if I did not treat them as individuals and care about them for who they are." Wanting the elementary students to feel comfortable, respected, and welcome is consistent with natural or relational caring in that the PST is addressing psychological and physical security of her students. Helping others be comfortable and welcoming them suggests this PST is thinking of a relationship built on trust and respect. When she ends by reiterating the importance of treating students and caring for them because of who they are she indicates that she is thinking of her future students as individuals and is interested in coming to know each of them as an individual.

She also demonstrates natural or relational care when she expresses concern about students’ relationships among peers. She says, "I want my students to feel like they have a voice and teach them the appropriate way to share their voice in order to respect others." This is especially emphasized when she then suggests that she will actually make an effort to make this happen by teaching them appropriate ways to share their voices. This idea of respecting others is consistent with building community in the classroom and helping students care for one another (Noddings, 2001), and helps make the reciprocal nature of relational caring evident.

As described by the PST, differentiation can be a way to individualize teaching for any given student. Varying instruction in order to support individuals instead of teaching to a generalized middle of the class is also a way of expressing care for students. Differentiation is a way to help students access curriculum and learning (Tomlinson & Imbeau, 2010) and also a way show care. Differentiation may fall into aesthetic caring in that the idea of differentiation is important to student success; therefore, effective teachers should differentiate instruction. However, this PST has a sense of differentiation of supporting individuals through techniques appropriate to them.

Finally, this PST’s statement indicates she has a moral obligation to care. This is evident in “I would be doing my students a disservice if I did not treat them as individuals and care about them for who they are.” This caring as a value or belief is more clearly aligned with Noddings’ relational care but is also evident in the idea of ethical care, in which the carer (PST) acts to support the cared-for (student) even when it may challenge the carer’s natural inclination. The statement also indicates that the PST will care about students as people and not just as students of academic learning. Her statement demonstrates a way of being (Noddings, 2001), which is more significant than an attitude of caring. This PST’s response does not indicate tension in deciding how or whether to care for students but instead suggests that it is her responsibility or belief to treat students as individuals and to care for them. This one response demonstrated several ideas about caring. The following exemplars, while shorter, still demonstrate the challenge in categorizing examples as one type of caring.

The next two exemplars were coded as natural but also demonstrate the idea of ethical caring.

I will similarly be flexible with my students, understanding their individual situations. I will also make sure I always have their best interests at heart when I make any decision. (Response r).

I will always try to remember that students can make mistakes; they can forget to complete assignments on time, or misunderstand assignments. Having an open mind while determining
consequences or alternatives for the student will be good so that I can still be fair but still care for the student and help them learn from their experiences. (Response s)

The statements “understanding individual situations” and “while determining consequences...for the student”, suggest natural caring, with a focus on the relationship between the teacher and student. These indicate that PSTs understand that caring is contextual and may be expressed and viewed differently depending who is involved (Noddings, 2001; Webb, et al., 1993). However, both of these responses also suggest that teachers, while caring about students, may make decisions that are unpopular with the student but can still support the student’s growth. When this thinking is considered, the comment also reflects ethical caring. This makes it difficult to code the response clearly as one type of caring or the other.

Determining the type of caring as articulated in PST responses was not a clear-cut task. While the majority of ideas were consistent with natural caring, many responses appeared to illustrate multiple types of caring or were not specific enough to make a clear determination. The actions of the teacher and how they are perceived by the student is paramount to caring; however, the intent of the teacher and other contextual factors would also help in categorizing the responses.

Results from this pilot inquiry do give insight to what one group of PSTs early in their teacher education program considered to be caring behaviors. Results and analysis also suggest the limitations of the research. Ideas of differentiation, relationships, and context were evident in the responses. The majority of responses demonstrated natural or relational caring. This is consistent with views of preservice teachers who believed that “a really good teacher” was one who has positive interpersonal relationships with students, and emphasized the social and affective domains while de-emphasizing academic preparation (Weinstein, 1989). Not only do PSTs believe that good student and teacher good relationships are important, but favorable student and teacher relationships have been identified as having a positive effect on student learning (Babonea & Munteanu, 2012).

Limitations of the research include the instrument and study design. Survey question 9 did encourage PSTs to describe experiences in one teacher preparation course that they might take forward into their own teaching. The interactions in the college classroom are distinctly different in some ways than the elementary classroom, and this likely limited the PSTs’ ideas. Also, the questionnaire did not allow researchers to return to participants to clarify statements. Had participants been asked to respond to the researchers’ interpretations, they likely would have provided additional information prompting their responses to be categorized differently. However, an explicit focus on caring as a disposition, and perhaps more importantly as a way of being (Noddings, 2001), is necessary in teacher education programs.

While this study is only a pilot with limited number of participants, good student and teacher relationships support increased academic progress for students (Babonea & Munteanu, 2012)

Implications

The increased focus on accountability for academic achievement in pre-kindergarten through grade twelve seems to de-emphasize the need for caring teachers, who will help all youth develop into adults who are not only college and career ready but ready for other aspects of life. Teacher preparation programs have Arnstine (1990) stated “The activities of students in teacher preparation programs are remarkably similar in character to those of their pupils in the public schools” (p. 241). These do not encourage PSTs’ caring or rational but may foster dispositions that are not desirable:
Not only do prospective teachers have few opportunities to be rational and to care in their teaching activities, but their experiences as students in a teacher preparation program continue to foster the dispositions to obey authority and to work alone and care little for others - just the dispositions that characterized their actions as public school students. (241)

This along with the known impact of positive teacher-student relationships on academic success and the results of this study suggest that a reasonable response to the current accountability pressures on teacher education would be to foster caring candidates. To do so, teacher education programs can do the following in the on-campus program:

1. Teacher educators can consciously decide to include caring as part of the curriculum. Many teacher educators model caring behaviors. Fewer explicitly talk about caring, its development, and how it can influence future teachers’ interactions with their prospective students. Directly addressing caring would highlight its significance for teacher candidates, which relates to development and measurement of the non-academic dispositions CAEP demands of teacher preparation programs. This can be accomplished by programs co-constructing ideas of care with candidates; this balances the affective and cognitive aspects of teaching (Rogers & Webb, 1991). Dialogue and listening within the classroom, related directly to care and other issues prompts critical examination of teaching practices and how they can support or hinder growth. Dialogue can also help PSTs be aware of the contextual nature of caring (Noddings, 2001).

2. Teacher education programs foster reflection as part of professional and personal growth. Reflection upon teaching and student learning can be further bolstered by learning about one’s biases, flaws, virtues, etc., which can engender PSTs to further learn about their students (Nieto, 2012). Developing an ally or mentor to help the PST and early career teacher can further this reflection.

3. Within on-campus courses, teacher educators can develop communities in which PSTs work closely together to learn and to care for one another. Geiser (1974) states that communities like these when used with children encourage competence, responsibility, and being responsible for one another; it is reasonable to suppose that similar communities in the college classroom would do the same for PSTs. Support from teacher educators through creating these opportunities, augmenting communication when needed, acknowledging caring acts (Rogers & Webb, 1991), and then reflect on these communities with PSTs can further develop understanding of and attitudes of caring.

In this paper, the authors have shared how one group of preservice teachers early in the program may extend caring to their future students. PSTs’ responses often demonstrated an understanding of care that could not be neatly categorized in one of Noddings’ categories of natural, ethical, or aesthetic.

Appendix

Questionnaire Prompts
Directions: Think about your experiences in ED 222, and then type your answer to each question.

1. How did the teacher demonstrate care for you?
2. Were there times when you felt you needed or expected care and it was *not* demonstrated by the teacher? Explain.
3. How did other preservice teachers demonstrate care for you?
4. Were there times when you felt you needed or expected care and it was *not* demonstrated by other preservice teachers? Explain.
5. Describe instances when you demonstrated care for class members. In each instance, why did you choose to respond as you did?
6. Describe instances when you did *not* demonstrate care for class members. In each instance, why did you choose to respond as you did?
7. What is your responsibility in caring for others in the college classroom? Give some specific examples showing how you carried out that responsibility in ED 222. Why did you choose those actions?
8. Did the professor in ED 222 provide the appropriate amount and type of care for you, as an individual? Please explain.

Now think about teaching your future elementary students.
9. How might the care you experienced in ED 222 be *similar* to care you anticipate providing to your future elementary students?
10. How might the care you experienced in ED 222 be *different* from that you anticipate providing to your future elementary students?
How Native Japanese Speakers Categorize Themselves and Non-Native Speakers in First Encounters

SHIMAHARA, Koichi
Tokyo University of Foreign Studies, JSPS research fellow
3-11-1, Asahi-cho, Fuchu-shi, Tokyo, Japan
skoichi1221@gmail.com
Introduction

The aim of this research is to illustrate how native speakers of Japanese categorize themselves and non-native speakers in conversations of first encounters. With the increasing number of non-native speakers of Japanese in Japan, some researchers have claimed Japanese as a lingua franca (JLF), which is thought to have different norms from Japanese as used by natives. Because it concerns how natives talk with non-natives, the target of teaching JLF includes natives as well.

Previous research has shown that natives often play superior roles in conversations, which could lead to unequal relationships between natives and non-natives. For example, Sugihara (2003) illustrates how natives exclude non-natives from conversations, by categorizing them as “non-natives” who do not have rights to participate equally as natives. Sugihara (2003) uses Membership Categorization Device (MCD), claimed by Sacks (1972), as a tool of analyzing the categorization being employed in conversations. Not only by using the term “non-natives”, but also by evaluating their language or by not giving them a turn during conversations, natives could categorize their interlocutors as non-natives. Moreover, the problem often pointed out is that natives are not intentionally excluding non-natives. On the contrary, it is sometimes the case that what natives do with good intentions could work as MCD and categorize their interlocutors as “non-natives”. However by using JLF, it is expected that
natives and non-natives could build equal relationships in conversations since there is theoretically no “superior” or “inferior“ speaker in conversations of JLF.

Method

This research attempts to how natives categorize non-natives in first encounters between the two. For this research, sixteen conversations were recorded and videotaped. The hypothesis is that the experience of interacting with non-natives influences the way of natives’ categorization. The natives and non-natives were controlled according to their experience. The speakers groups are as below.

Natives A  eight natives with much experience with non-natives
Natives B  eight natives with a little experience with non-natives
Non-Natives  eight non-natives with a little experience with natives

Furthermore, all speakers were female students at a university in Tokyo and in their twenties. Eight non-natives were all native Chinese speakers and international students at the university. Eight first encounter conversations between Native A and Non-Natives and eight between Native B and Non-Natives were recorded and videotaped for the research. Altogether sixteen
conversations were transcribed and analyzed qualitatively focusing on categorizations and MCD.

Result

As a result, many categories were observed in conversations, such as native-non-native, Japanese-Chinese, language specialist-novice, graduate student-postgraduate student, females, and busy students. Native-non-native and Japanese-Chinese categorizations which were thought to be problematic in previous research were foregrounded mostly by asking and explaining sequences. Speakers often asked each other about issues of their interlocutors’ countries, and such asking was thought to work as MCD. Although previous research claimed that such categorizations of native speakers and non-native speakers are problematic, some of them were claimed to function as positive politeness strategies to non-native speakers from the perspective of politeness theory (Brown & Levinson 1987).

At the poster presentation, the result of analysis will be presented with the transcription and some suggestions to JLF teaching will be discussed.

Abstract

Higher education administrators and professionals are confounded with how to promote persistence and graduation attainment for undergraduate African American males. While many studies have examined why students drop out of college, relatively few studies have addressed how African American males are staying in college beyond matriculation. This paper examines how traditional-aged undergraduate African American males were persisting at a predominantly White institution. Through qualitative inquiry, I illustrate how cognitive and non-cognitive factors are central to their African American male persistence. Interactionalist theory (1975) and the conceptual model of black student attrition (Bennett & Bean, 1984) were helpful in framing this study. Policy recommendations for enhancing educational outcomes for undergraduate African American males were also provided.
Background of Study

In recent decades, there has been strong research interest in student persistence (Tinto, 2006-2007). In the higher education community, persistence symbolizes a student’s desire and wherewithal to remain in college from matriculation to degree attainment (Seidman, 2005). The concept of persistence also relates to the personal efforts that students make in their study patterns and other aspects of engaging to their institutions so they are successful (Astin, 1993; Bailey, Jenkins, & Leinback, 2005). Notwithstanding higher education policies and initiatives (i.e., financial aid policies, pre-college interventions, TRIO support services, parental involvement, outreach programs) aimed to promote persistence (Kuh et al., 2006), still slightly more than half of all students enrolled at baccalaureate institutions fail to persist and earn a college degree (Museus & Quaye, 2009).

Ethnic minority students are less likely than non-minority students to complete their degree in a timely manner (Stage & Hossler, 2000; U.S. Department of Education, 2011). African American males in particular have the lowest degree completion rates (Harper, 2012). Kimbrough and Harper (2006) documented that 33.8 percent of enrolled African American males had earned a bachelor’s degree in 2000. In general, this student group lags behind their gender and ethnic counterparts in degree attainment (U.S. Department of Education, 2009). In 2001, for instance, almost 35 percent of matriculated African American males graduated from college within six years. This is compared to 46.2 percent of African American females, and 57.3 percent of Caucasian males who graduated from college during the same period.

Despite the dismal percentage for African American males, there is some indication that colleges and universities are working to improve persistence and graduation outcomes for African American males (DeSousa, 2011). For example, from 1990 to 2007, African American males “have improved their graduation rate from 28 to 37 percent” (“Here is Good News,” 2007/2008, p. 47). This increase suggests that a growing minority of African American males know what it takes to persist in college and earn a bachelor’s degree. It may also indicate the wherewithal of African American males to persist in the face of real or pending obstacles during the midst of their higher education experiences (Simmons, 2013). Despite the modest improvement in graduation, it still remains unclear as to how African American males persist in college. According to Flowers (2004-2005), not much research exists that analyzes and synthesizes the trajectories of African American college students. With limited research, higher
education professionals are unable to glean information that could reveal the knowledge, resources, skills, and attitudes that undergraduate African American males have to persist and earn a bachelor’s degree. This research gap presents an opportunity for inquiries that clarify what researchers already understand about African American male persistence, and what higher education institutions can do to improve the educational experiences of African American males across the postsecondary pipeline (Bean, 2005; Jackson & Moore, 2006).

The fact that many African American males disproportionately fail to persist and earn a bachelor’s degree remains one of the central, yet perplexing problems in undergraduate education (Harper, 2012; Jackson & Moore, 2006; Schwartz & Washington, 2002). Research studies that illuminate how African American males persist in college, particularly at predominantly White institutions, can produce quality information that counters the long-standing discourse on poor academic achievement among undergraduate African American males. Investigations in this area are especially needed since researchers rarely solicit the stories from African American males on how they negotiate their way through college beyond matriculation (Harper, 2012).

**Statement of Purpose and Research Question**

The purpose of this study was to understand how undergraduate African American males persist at a predominantly White institution. The study intrinsically examined how African American males were traversing their way toward earning a bachelor’s degree. The research question framing this study is, “How do undergraduate African American males persist at a predominantly White institution?” This question emanates from the need to uncover strategies used by undergraduate African American males who either know, or are learning what it takes to persist at a predominantly White institution. By asking this question, educators and researchers can learn how these students negotiate their experiences at a predominantly White institution. Perhaps most important, findings from this study should offer practical insights for young African American males who have expressed an interest in pursuing a bachelor’s degree or another formal postsecondary education credential. These insights can empower young men to learn about individuals who are similar to them, while understanding what it takes to persist and be successful in higher education.
Theoretical Frameworks

Despite the limited research on African American male persistence, the extant literature is replete with information related to persistence among the general population of college students (Tinto, 2005). The literature summarizes that the most important influences of persistence are parental education, family background, high school grade point average, standardized test scores, and institutional characteristics (Choy, 2002; D’Augelli & Hershberger, 1993; Lotkowski, Robbins, & Noeth, 2004; Townsend, 1994). These aspects underpin the majority of theories that explain student persistence; including Tinto’s (1975) widely accepted interactionalist theory of student departure. Researchers frequently use this theory in their own studies making it the most often cited theory that informs student persistence (Berger & Lyon, 2005). This groundbreaking framework incorporates “relevant personalogical, psychological, as well as institutional variables” (Flowers, 2004-2005, p. 24) that enable researchers and educators to understand the different trajectories that students take to earn a bachelor’s degree (Nora, Barlow, & Crisp, 2005; Tinto, 1993). More important, the model accounts exclusively for factors related to the background of students, their goals and commitments related to thriving in higher education, and their capacity to engage effectively with the academic and social spaces of the institution. As such, it is the confluence of these underlying constructs which represent the multitude of factors that influence student persistence (Berger & Lyon, 2005; Braxton, Hirschy, & McClendon, 2004).

Interactionalist theory has been regarded for its exemplary strong points, but also criticized by scholars because of the universal application of its findings. Attinasi (1989) in particular argued that interactionalist theory failed to explain persistence for culturally diverse students, students at commuter schools, non-traditional students, and community college students, among others. Others reasoned that the theory does not “acknowledge the influences of financial resources, connection with an external community (such as family and/or work), and classroom experiences on a student’s decision to persist” (Braxton & Hirschy, 2005, p. 68). Braxton et al. (2004) realized the shortcomings of findings generated from the application of interactionalist theory. They asserted that these findings have been generalized through the lenses of affluent, traditional-aged Caucasian students on residential campuses. More or less, these findings have led to erroneous assumptions that the variables which underscore
interactionalist theory aptly explain persistence for African American males and other underserved student populations.

Bennett and Bean’s (1984) conceptual model of Black student attrition compensates for the misapplication of findings from interactionalist theory. This theory draws on variables related to persistence for undergraduate African American students enrolled at predominantly White institutions. The model was first developed and employed at Indiana University-Bloomington to combat high attrition among African American students at that institution. Intrinsic to this model are nine independent variables, with “intent to leave” as the variable being predicted. The core predictor variables are identified as (1) precollege positive interracial contact, (2) precollege academic performance, (3) parent’s education attainment, (4) collegiate positive interracial contact, (5) stage of ethnicity, (6) preparedness, (7) satisfaction, (8) less trauma, and (9) college GPA (Bennett & Bean, 1984). The latter variables (satisfaction, less trauma, and college GPA) were all hypothesized to have positive effects on a student’s intent to remain in school. Noteworthy were findings showing that the predictor variables better accounted for explaining persistence or departure decisions for undergraduate African American students; an important consideration not examined in interactionalist theory.

Findings from Bennett and Bean’s (1984) study, specifically as applied to African American males, suggest that preparedness (ability to do college work), satisfaction (degree to which being a student is viewed positively), and less trauma (level of alienation that students experience when confronted with unfamiliar norms or expectations in a college setting) were significant variables to their persistence. As hypothesized, college grade point average was not significant for these students, and had a negative influence on their intent to persist in college (Bennett & Bean, 1984). Overall findings denote that colleges and universities should develop programs that enhance the academic and social experiences of undergraduate African American males. The findings indicate that policies and practices for promoting African American male persistence should include ways of increasing a student’s ability to perform college work (preparedness), and address ways to facilitate the adjustment for first and second year students into the college setting (less trauma). These findings enabled Bennett and Bean (1984) to recommend these strategies for enhancing African American student persistence at predominantly White institutions: (1) high schools to engage more African American males in college preparatory curricula, (2) colleges to develop or enhance peer and mentoring support
programs on campus, and (3) colleges to develop academic and social programs that encourage positive interracial contact experiences. Most important, Bennett and Bean’s (1984) recommendations inform ways of putting into effect best practices that enable African American males to persist in predominantly White campus environments (Flowers, 2004-2005).

**Methodology**

The study employed a case study design using a qualitative research framework. Participants were recruited from a large, public university in the Southern United States (hereafter referred to as Mid-Southern University). Purposeful sampling was used to select the study’s sample of 11 participants. The participants selected for this study met the following predetermined criteria: (1) currently enrolled student at Mid-Southern University during data collection, (2) traditional male college student (between 18-22) who identifies as Black/African American, (3) have earned at least 30 semester hours prior to their participation in the study, and (4) were willing to talk and share openly their experiences regarding their persistence. I decided on the criterion of 30 semester hours to ensure sufficient student experience, with the expectation that participants will draw on their experiences of persisting at the baccalaureate level.

Each participant completed one face-to-face, semi-structured interview. The semi-structured interview type is an important data collection choice because it offers flexibility for the researcher to probe for details and for the participants to expand upon responses in unique ways (Merriam, 2009). The interview method in general was particularly useful because it allowed the participants to discuss how they were persisting at Mid-Southern University. “How” these students persisted was assessed through questions that elicited responses related to their high school experiences, parental background, educational and career goals, and campus experiences. Follow-up member checking interview sessions served to clarify the accuracy of information provided from the initial interviews. They were scheduled and held 1-2 months after the initial interviews were transcribed and prepared for analysis. The member checking process as a whole gave participants an opportunity to offer a preliminary response to their transcripts prior to the follow-up interviews. The conversations during the follow-up interviews allowed for discussion on emerging data from the transcripts. In essence, member checking sessions allowed for collaboration in constructing some of the initial themes that derived from the participants’ experiences of persisting at Mid-Southern University.
Data Analysis

The initial interviews were digitally recorded and transcribed verbatim. I used an open-coding technique in reviewing and analyzing the transcripts. Comments that were potentially relevant to the research were made in the margins of each transcript. Following Stake’s (1995) recommendation for analyzing case study data, I employed an analytical technique called direct interpretation. Direct interpretation was useful to this study because it relies on the researcher “pulling the data apart and putting them back together in more meaningful ways” (Creswell, 2007, p. 163). Illustrative quotes from the interviews were used to strengthen the participant data, which enhanced the way I made sense of these data. After intensive analysis, I was able to develop natural generalizations and learn about how African American males persist at a predominantly White institution (Creswell, 2007).

Findings

Overall findings point to the complexity of African American male persistence (Braxton et al., 2004). Specific findings indicate mostly that non-cognitive factors are attributed to their persistence. But for some participants, taking advanced placement courses in high school positively impacted their persistence in college. The findings from this cognitive measure signify that exposure to a rigorous curriculum in high school enhanced their ability to perform well in college courses; thus increasing their self-efficacies to persist and succeed in higher education. In theory, students exposed to a rigorous curriculum have relative advantages of being academically prepared for college; especially since preparedness makes a difference in how college students traverse their educational trajectories (Educational Policy Institute, 2003; Strayhorn, 2008; Schwartz & Washington, 2002). As mentioned, the non-cognitive factors were dominant in explaining how the participants persisted at Mid-Southern University (D’Augelli & Hershberger, 1993; Townsend, 1994). For instance, many of the participants were encouraged by members of their family to persist. Some of the participants noted how their parents were their biggest supporters, while others were inspired to persist by witnessing vicariously the educational and professional achievements reaped by respective family members and same-raced peers.

Without saying, the participants possessed a healthy sense of motivation to persist. Their motivations were driven by core beliefs and values they hold for themselves, and by ideas about impacting the life of others. But for the most part, they were motivated to persist because of
better employment opportunities after earning a degree. This comes to no surprise, given the established correlation between earning a bachelor’s degree and stable employment and financial stability (Pascarella & Terenzini, 2005). The participants understood how having aspirations and goals relate to persisting at Mid-Southern University (Pascarella & Terenzini, 2005; Strayhorn, 2008). They each expressed lofty professional goals, and voiced an aspiration to earn at least one educational credential beyond a bachelor’s degree. According to Strayhorn (2008), having graduate school aspirations are critical to African American male college persistence. In fact, the mere ponder of attending graduate school, whether during formative years or in higher education, has some effect on their persisting behaviors. Wayne, for instance, realized early in life that persisting in college will help him make the transition into graduate school, and achieve his long-term goal of becoming an industrial organizational psychologist.

Kuk and Manning (2010) noted that students involved in campus-based organizations are more likely to persist in college. Many of the participants involved in these organizations had opportunities to build their character, enhance their leadership skills, and partake in the campus community in different ways. These opportunities were more common for participants involved in ethnic-based organizations. Mike and Chris’ involvement in an ethnic-based organization was important for them to bridge the cultural gap between their predominantly White campus and their home environments (Padilla, Trevino, Gonzales, & Trevino, 1997). They found comfort with a particular ethnic-based student support organization, which offered specific activities and resources to enhance their persistence. Important to this study was how organizational involvement provided the participants with meaningful opportunities to engage and interact with campus stakeholders. In most instances, these stakeholders functioned as gatekeepers for helping the participants successfully navigate their college experiences; and allowed the participants to gain access to capital (Allen, 2010).

Lastly, many of the participants realized how meaningful their interactions with faculty and staff were to their persistence. A few participants spent time with ethnic minority professors who were willing to support their persistence in college and beyond. These professors provided a sense of comfort and allowed the participants to feel relaxed during formal and informal interactions. Isaac had a momentous encounter with an African American male professor in his major field of study. He found the professor to be an inspiring soul who encouraged him to achieve his goals and to not give up; particularly in the midst of what Isaac perceived as hostility
and hazing from his Caucasian professors. Jordan acknowledged the importance of connecting with faculty, regardless of their racial or ethnic background. He expressed comfort in initiating interactions with a few Caucasian professors in his department, and felt that his connections were mutually beneficial.

**Conclusion and Implications**

Overall findings show that for the participants in this study, persisting at a predominantly White institution is predicated on personal and family background, the degree of academic preparation in high school, levels of support by family and peers, early insights into future education and career goals, and engagement with the academic and social communities that exist at Mid-Southern University. The findings present an opportunity for higher education administrators and professional staff to put into effect policies and practices that could enhance the capacities for African American males to persist toward graduation; inevitably improving their overall college experience. Policies should be geared toward enhancing academic performance prior to college matriculation. Summer Bridge or early intervention programs are common, and can assist students with transitioning from high school to college (Kezar, 2003-2004). Professional staff should be made available to connect African American males with other people or through activities that can nurture their motivations and aspirations. They must also be strategic in involving African American males early in ethnic-based student organizations, since their involvement enhances their persistence. Only a few of the participants had access to ethnic minority faculty. This speaks to the dearth of minority faculty (especially African American faculty) on predominantly White campuses. There is a need for policies aimed at recruiting additional faculty and retaining them. The presence of more minority faculty could allow African American males to have positive role models they can identify with; which can ultimately shape their persistence in college.

Introduction

Few studies of explicit practices for teaching and assessing oral skills in grades 5 and 6 exist (X and Y, 2011; Nolin, 2013), and research data related to teaching and assessing orality in disadvantaged communities are still more rare (Y, X and Z, 2014). To address this, our research team conducted an action-training-research (ATR) project (Guay and Prud’homme, 2011) with the collaboration of four elementary school teachers. The research team focused on collaboration – which is key to changing teaching practice – and the development of students’ oral competence. This paper will outline the research problem and theoretical elements guiding the implementation of our research process, as well as the study’s methodology. It will also discuss preliminary results that led teachers to renew their practice and allowed researchers to determine the impact of participating in this study on students’ oral skills.

1- Research Problem

Although oral skills are practiced in elementary classrooms in Quebec, direct instruction and assessment are still quite limited (Y, 2013; Nolin, 2013). Despite recommendations
from the provincial Ministry of Education, explicit practices used to teach and assess oral skills are not widespread, particularly in the case of grades 5 and 6 teachers (students aged 10-12) (Plessis-Bélair and Cauchon, 2010; X and Y, 2011). Although cooperation is essential for oral learning (Topping, 2005; X, 2008 and 2010), students rarely have the opportunity to cooperate during oral skills instruction (X, 2008 and 2010; Nolin, 2013). Teachers often spend more time speaking than do students who, to their detriment, frequently adopt a passive approach to oral learning (Le Cunff, 2009; Nolin, 2013). Also, because elementary students in general, and those from disadvantaged communities in particular, regularly express themselves through spontaneous and sometimes limited language, it can be even more difficult for teachers to know how to address these limitations (Tréville and Duquette, 1996; Y, 2005). Direct instruction of listening strategies is also rare (Y and Z, 2011). Moreover, there is a lack of explicit educational devices for oral skills instruction in elementary classrooms capable, first, of supporting instructional practice in ways that allow teachers to choose assessment strategies that take these activities into account and, second, of guiding teachers in changing their oral skills teaching and assessment practices, specifically, in grades 5 and 6 in disadvantaged communities (Y, 2005; Plessis-Bélair and Cauchon, 2010). Our action-training-research (ATR) project on orality, in collaboration with four grades 5 and 6 teachers working in disadvantaged communities, seeks to address these limitations and follows a collaborative approach to oral skills teaching and assessment (Y, 2001 and 2011).

2- Theoretical Framework

Studies of oral skills instruction show that orality must be considered an object of instruction (Dolz and Schneuwly, 1998; Y, 2007; Grandaty and Dupont, 2010). As such, researchers suggest that oral skills be practiced according to type. These types consist of popular and literary social practices of public orality, such as debate, literary criticism, and discussion. The use of types makes it possible to teach and assess oral production and comprehension. Furthermore, with types, content for instruction and assessment can be clearly defined, which facilitates evaluation and the development of assessment tools adapted to each type. This conception of orality is entirely consistent with activities proposed in Quebec’s provincial education guidelines. Orality must be taught in class
using formative strategies and specific workshops focused on the teachable dimensions of each type, including language register, structure, listening strategies, and more. (de Pietro and Schneuwly, 2003; Y, 2007).

This research project uses Y’s (2001 and 2011) instructional model of oral production, presented in Figure 1. Formative workshop stages (Figure 1, section 3.3) were developed by X (2011a). This model both facilitates student learning by promoting collaboration (Topping, 2005; X, 2008 and 2010; Li, Liu and Steckelberg, 2010) and encourages cooperation among teachers to stimulate mutual support and the development of oral skills learning and assessment situations (LASs). Using this device (model), we endorse student peer evaluation (X, 2008, 2010 and 2011b; Li, Liu and Steckelberg, 2010). According to X (2008, 2009, and 2011), peer evaluation can be divided into three stages: self-assessment, peer feedback, and teacher evaluation. It is important to note that the model on which this study is based has been adapted and enhanced through the collaboration, knowledge, and practice of the teachers who participated.

Figure 1: Educational device used in the ATR project: Instructional model of oral production in classrooms where French is the language of instruction (Y, 2001, p. 218)

1- Intention to communicate
2- Communication situation: integration of reading, writing, and oral practices; subject types presented to students (significant and insignificant); consideration of student interest; consideration of audience

3- Oral activities (planned and implemented):
   3.1 Initial production
   3.2 Student knowledge
   3.3 Five types of formative workshops on orality: complete modeling by the teacher and sometimes the student, learning roles to play, learning linked to practice types, learning linked to grammar points, learning listening techniques. Formative workshop stages developed by X (2011a): catalyst, knowledge level, instruction, application, large group discussion, meta-cognitive activity.
   3.4 Final production: final evaluation preceded by formative assessments (self-assessment, peer evaluation, observation and evaluation checklists, interviews, logbooks, etc.)

4- Student impact: assuming responsibility for their own oral communication

3- Research Question and Objectives

This study asks the following question: How do grades 5 and 6 teachers in disadvantaged communities adapt and implement an educational device and assessment tools related to oral production and comprehension in order to renew their practice? Our objectives are to: 1) train four teachers in oral instruction, specifically oral production and comprehension; 2) collaboratively adapt an educational device and assessment tools in oral production and comprehension; 3) implement the educational device and assessment tools in the classroom; 4) analyze the implementation of the educational device and assessment tools; and 5) attest to practice renewal in oral skills instruction. Because this research project will continue until June 2016, this article focuses primarily on results from Year 1.

4- Methodology
In this section we will describe our approach, sample, data collection instruments, research process, pre-test and post-test evaluation criteria, and learning and assessment situations (LASs) developed in collaboration with participating teachers.

4.1 Approach

The action-training-research (ATR) approach chosen for this study is well recognized for generating knowledge (Guay and Prud’homme, 2011). This research project seeks to advance knowledge concerning a specific teaching situation – orality – by bringing together researchers and practitioners to develop learning and assessment situations (LASs) related to orality. The ATR approach “is based on the idea that research benefits from a focus on action, being anchored in experience, and adopting a participative perspective in which practitioners and researchers collaborate to solve problems linked to practice development” (Guay and Prud’homme, 2011, p. 190-191, original translation). The methodology proposed is both rigorous and flexible due to an iterative process that encourages continuous reflection on each of its three objectives: action (creating change within the teaching situation), training (contributing to the development of participants within the teaching situation), and research (contributing to knowledge about the teaching situation) (Dolbec and Clément, 2004; Guay and Prud’homme, 2011).

4.2 Sample

Two grade 5 and two grade 6 teachers from two schools in disadvantaged communities were recruited through convenience sampling to participate in our research project. Following ATR principles, we established a research team whose members are most often in the classroom: three researchers, two research assistants, and four teachers. The experimental group consists of two teachers (EG: EG5, EG6¹) and the two others are control groups (CG: CG5, CG6). The latter groups received no training during Year 1 of the study.

¹ EG5 and CG5: grade 5, students aged 10-11 years; EG6 and CG6: grade 6, students aged 11-12 years.
4.3 Data collection instruments

Each meeting was recorded so that every event and comment could be summarized as accurately as possible in a report *in extenso*, a superior tool “to sustain participant actions between meetings” (Guay and Prud’homme, 2011, p. 203, original translation). To collect data outside the classroom, each year, EG and CG teachers were asked to complete questionnaires before and after oral skills instruction and assessment to better understand their perceptions, opinions, knowledge of oral skills instruction, and practices. We also conducted semi-directed interviews with each teacher to collect information, thoughts, emotions, intentions, conceptions, and examples related to the ATR process as well as the CG teachers’ personal processes. To collect data in the classroom, we filmed oral skills lessons given in both the experimental and control groups, collected instructional materials created by the teachers, and used a non-participant observation checklist to analyze teaching. Members of the research team, EGs, and CGs used logbooks to keep track of observations and the evolution of practice. Content analysis was conducted by theme, as proposed by Paillé and Mucchielli (2003).

4.4 Research process

Following the model developed by Dolbec and Clément (2004), this ATR project contains several stages: 1) starting point; 2) clarifying the situation; 3) planning action; 4) action; 5) evaluation; 6) sharing knowledge generated. This research process was formalized in August 2013 with the four participating teachers (ATR model, stage 1). Each class received six laptop computers and all the necessary equipment to film the activities. The research process for each group of participants will be presented next.

4.4.1 Year 1
In the fall of 2013, the research team and participating teachers chose a specific type of orality to work on, nonsense debates\(^2\), and researchers provided training in oral skills instruction and assessment (research objective 1). Pre-tests, in the form of initial nonsense debates that took place before researchers provided training, were filmed in each class (ATR model, stage 2). In the winter of 2014, the educational device and assessment tools were adapted to create LASs (research objective 2; ATR model, stage 3). In the spring of the same year, EG teachers tested the LAS and filmed the post-tests, i.e. nonsense debates conducted with students after teachers had received training and attended workshops on a variety of oral objects of instruction (research objective 3; ATR model, stage 4). CG teachers, who taught orality as they normally did, also filmed pre-tests and post-tests (CG5: advertizing; CG6: information bulletins), which provided comparative data on the educational device’s effect on student learning (research objective 4; ATR model, stage 5).

4.4.2 Year 2

During Year 2, in the fall of 2014, researchers and CG teachers chose to work with a different type of orality, film reviews. Teachers filmed a pre-test, received training in oral skills teaching and assessment, and collaboratively developed an LAS (research objectives 1 and 2; ATR model, stages 2 and 3). The LAS was tested in March 2015 (research objective 3; ATR model, stage 4). EG teachers also developed a new LAS for the same type of orality as in Year 1 to show how to adapt an LAS after testing it the previous year (research objective 4).

4.5 Pre-test and post-test evaluation criteria

For each of the four groups participating in the study, Year 1 pre-test and post-test evaluation criteria for each type of orality are defined in Quebec’s provincial guidelines (Programme de formation de l’école québécoise [MÉQ, 2001], Progression des

\(^2\) In nonsense debates, students debate inconsequential topics that are easily understood (for example, being for or against white socks) in order to develop argumentative strategies.
Researchers identified 19 evaluation criteria relevant to informational types chosen by the CGs in Year 1: “advertizing” (CG5) and “information bulletins” (CG6). For the EGs, 14 criteria applicable to the “nonsense debates” used in both groups were identified. These criteria, presented in Table 1, were chosen because they were observed in a majority of students and sufficient sound and image quality made evaluating them possible from a technical standpoint.

4.6 Learning and assessment situations (LAS)

The desired instructional approach was formalized in an LAS template (Y, 2012) with three phases: preparation (context, calling on students’ previous knowledge, project objectives, expected production), execution (learning activities to be accomplished according to LAS objectives with teacher guidance and assessments during and at the end of the project), and integration (summary of student learning and transfer of student knowledge and acquired skills).

In Year 1, EG teachers developed an LAS on nonsense debates and, in Year 2, researchers and CG teachers collaborated to develop an LAS on film criticism. During the preparation phase, EG and CG teachers asked students to watch to their initial productions to identify their strengths and weaknesses. During the execution phase, teachers gave formative workshops on oral skills based on the weaknesses identified, then teams of four to six students created their final productions. Students used computers to film themselves during these workshops and watched the videos to observe the development of their oral skills, all of which was documented in a portfolio. During the integration phase, students watched the videos again, performed self-assessments, and noted their orality-related challenges.

5- Research Results

Based on results from Year 1 of this research project, we were able to determine whether oral skills instruction given by the four participating teachers improved students’ oral
competence. The study also provided insight into changes in these elementary teachers’ oral skills instruction and assessment practices in the classroom after one year.

5.1 Student results

To determine whether students’ oral competence had improved, all four groups’ Year 1 pre-test and post-test results were compared and students were interviewed to better understand these results.

5.1.1 Evaluating spoken interventions

A professional researcher evaluated students’ spoken interventions in the experimental and control groups before and after oral skills instruction from their teachers. Twenty percent of spoken interventions were counter-coded by a research team member to ensure the validity of the research professional’s evaluation. Spoken interventions were coded 0, 1, or 2.

Overall results

Following the evaluation of all spoken interventions in Year 1 before and after oral skills instruction, the average result of all evaluation criteria for each group was calculated. Figure 2 presents the average of each group before and after oral skills instruction.
This figure indicates a small decrease in the grade 5 control group (CG5). The grade 6 control group (CG6) showed no significant difference. However, an increase in oral competence can be observed in both experimental groups.

Statistical tests show that not all of the differences between pre-test and post-test scores are significant for all groups. In fact, it appears that the differences between pre-test and post-test scores for CG5, CG6, and EG5 are not significant. However, performing a t test\(^3\) revealed that the difference between students’ pre-test and post-test scores in EG6 are significant\(^4\) (p = 0.000031211). The difference between the results of the pre-test and post-test is 0.516, and therefore statistically significant.

Control groups

\(^3\) According to Gaudreau (2011), the t test is a form of parametric statistical analysis used to verify whether there is a difference between the averages of two groups. In this case, the pre- and post-instruction averages of each group were tested.

\(^4\) In quantitative research, a significance threshold of 5% (p = 0.05) is generally accepted (Nolin, 2013). These arbitrary conventions have been established by statisticians over time (Howell, 1998).
In Year 1, CG teachers taught orality in what they believed was the most effective way to encourage students’ oral skills development. Results seem to indicate that these oral skills instruction strategies, i.e. without explicitly teaching oral skills, implementing an instructional model (Y, 2001 and X, 2011a), or performing peer evaluations (X, 2008, 2010 and 2011b), are not conducive to developing students’ oral competence. CG5’s average fell slightly (from 1.556 to 1.512) and CG6’s average remained almost the same (from 1.546 to 1.553).

Experimental groups

Comparison of pre-test (1.406) and post-test (1.621) results from EG5 suggests an improvement of these students’ oral competence. For this group, however, the difference does not appear to be significant. Furthermore, increased scores between the pre-test and post-test were not observed for each of the evaluation criteria, i.e. each of the oral objects of instruction taught and evaluated. In fact, of 14 evaluation criteria, 10 increased and 4 decreased. Of the 10 criteria whose results improved, 8 were oral elements taught during formative workshops (X, 2011a) and 2 concerned elements not explicitly taught (language registers and pronunciation). Criteria whose results fell include volume – which had been explicitly taught – and three criteria (choice of ideas – relevance; choice of ideas – sufficiency [number of ideas]; vocabulary richness) for which no direct instruction was given. In CG6, results for all 14 criteria improved.

Based on these results, we argue that students in both experimental groups demonstrated improvement in oral competence after oral skills instruction. However, improvement goes beyond the elements for which they received instruction, with the exception of volume, which decreased in EG5. It is therefore possible to conclude that teaching oral skills can bring about improvements that go well beyond the specific elements taught. This may be explained by peer evaluations performed throughout the LASs in each of the EGs. Indeed, research has demonstrated that peer evaluation has a positive impact on student learning (Topping, 2005; X, 2008 and 2010; Li, Liu and Steckelberg, 2010). Because peer evaluation requires students to assess their own oral skills and peers to
articulate observations and recommendations concerning their classmates’ competence, it can be beneficial for learning overall. In both EGs, peer and teacher feedback was not limited to the specific oral elements taught. Furthermore, because watching their spoken interventions provided students with multiple opportunities for self-assessment, it is possible that they were able to identify strengths and opportunities for improvement far beyond the elements taught in class. Student reflection on their own spoken interventions (self-assessment) and cooperation among students could therefore explain the improvement of all of the criteria in EG6 and a majority of criteria in EG5.

5.1.2 Student interviews

In order to better understand Year 1 results, interviews were conducted with students in both EGs. Three students were selected from each experimental group: one whose results were generally weak, another with satisfactory results, and a third with results exceeding expectations.

These interviews provided insight into why results for volume decreased between the pre-test and post-test for students in EG5. Students in this group mentioned having had less time to practice this oral element than others and not having made the necessary links to its use in the debate: “Well I never talked loud because our teacher told us that we’d practice but we didn’t practice much. But I didn’t really do it in the activities either, well, in the debates.” and “Well I think it would have been better to practice because we learned it fast and after that didn’t have the chance [to practice]”. The three EG5 students interviewed indicated that they wanted to work on this element again because they felt that it had not been sufficiently taught and practiced. The teacher confirmed the students’ observation that insufficient time was spent on practicing volume and necessary links were not made to the type of orality in question. EG5 students also mentioned experiencing difficulty in finding arguments to present in the debate: “We have trouble finding our arguments”. This corresponds to two evaluation criteria whose results were

---

5 Students’ comments were transcribed as spoken. All quotations presented here are original translations from the French.
lower in the post-test (choice of ideas – relevance; choice of ideas – sufficiency [number of ideas]). Students claim that they did not have sufficient time to prepare and practice. One student expressed a desire to spend more time practicing these elements: “We need more practice”.

More generally, students in both EGs mentioned gaining new knowledge between the first (pre-test) and second (post-test) debates. An EG6 student stated that “[t]he first nonsense debate, it was, it didn’t work. It wasn’t a real debate, not clear like the new debate.” Realizations about several elements were also mentioned during these interviews. For example, an EG5 student brought up the importance of listening in being able to reformulate: “You really have to listen well to be able to reformulate what the person said in your own words”. Students’ perception of orality changed after the LAS was implemented: “I learned oral skills because, at first, I thought they were just, for example, you pick up your paper […] and talk to your teacher, but I didn’t know that there was another kind of oral skill, for me, it’s another kind of oral skill. We present to the teacher and all the students”.

Students also mentioned the importance of cooperation in learning oral skills: “You’re in teams, and you can help each other but individually, if I had filmed myself individually, it would have stressed me a bit more, but I know I have someone to help me”.

5.2 Teacher results: interviews

To better understand the results presented above and, more specifically, account for the fact that teachers renewed their practices, each of the four teachers participated in an individual, semi-directed interview. These interviews were all conducted after they had experimented with oral skills activities in their classrooms in Year 1. These interviews contained three sections: 1) understanding oral skills instruction; 2) understanding the LAS; 3) renewing teaching practice related to orality. Given that teachers in the control group did not receive training from the research team to develop LASs in Year 1,
questions in section 2 and parts of sections 1 and 3 were not included in the interview. Responses were first separated into CGs and EGs, then all four teachers’ comments were summarized.

5.2.1 Control group (CG) teachers

Below are responses to semi-directed interview questions about understanding oral skills instruction and renewing teaching practice during Year 1. These two teachers received no training on oral skills instruction and taught orality as they wished.

Understanding oral skills instruction

Although these teachers’ conception of orality goes somewhat beyond a traditional definition of public speaking, i.e. an individual presentation on a particular topic in front of the class, they stated that involvement in this research project piqued their interest in orality. More care was taken in planning the different steps students would follow in preparing to present their projects to the class. Oral skills were more systematically organized: for one teacher, this meant presenting an advertisement that explains the benefits of country living to urban dwellers; for the other, it meant circus-themed activities to prepare a year-end show for parents and create videos to be posted on the school’s website.

After the first year of the study, one of the teachers still demonstrated discomfort: “I feel like I’m still building on my previous knowledge” (CG5). Although she recognized having presented a more complete orality project, she continued to wonder if she had chosen the right approach. The other teacher stated that she felt more comfortable because she took the time to find the tools she needed and conduct short workshops with her students, reminding them that improvement is always possible.

Both teachers reported a continued sense of discomfort regarding oral skills evaluation. One (CG5) asked whether she was evaluating oral skills or the content of the project
presented to the group: “Can my observations lead to a mark, even though we are not really taught how to look at orality?” For the other teacher (CG6), “evaluation remains subjective”.

Teaching practice renewal

Involvement in this research project led teachers to make modest changes to how they taught oral production, whether in terms of preparing information or clarifying the work to be done during each French class dedicated to oral skills. With regard to oral comprehension, teachers stated that they had not worked on this specific element with students, although watching the videos prompted them to comment on it: “It’s something I’d like to work on more” (CG6). They look forward to being better equipped in this regard. These teachers have expectations for future training sessions with the research team. Their first impression is a feeling of increased confidence in oral skills instruction, as well as in evaluating these skills.

5.2.2 Experimental group (EG) teachers

As stated previously, both teachers in this group received training from the research team and collaboratively developed an LAS for nonsense debates that was tested in the classroom. They taught four specific objects of instruction/learning related to debates: debate structure, rebuttal, reformulation, and voice volume.

Understanding oral skills instruction

This study and the team’s involvement have changed these teachers’ conception of orality. For the EG5 teacher, it is “the act of producing a message and listening to what the other person has to say at the same time”, as well as adapting the communication to the activity in question. For the other teacher (EG6), orality is an “act of communication between two or more people in which the individual must combine verbal communication and understanding others”. These teachers demonstrate an understanding of both the
production and comprehension elements of orality. Although they do not consider themselves experts, they claim to be more comfortable with orality after a year’s participation in this study. This limited degree of comfort may be explained by the fact that they are still in the understanding phase: “I would say that, before, I didn't know where to start… Now, orality is more present in my teaching” (EG5).

Understanding the LAS

These two teachers used Y’s (2001) activity planning template; although they sometimes found the process arduous, this model allows students to work on several types of orality and prepare an improved final production. Students were motivated by a new way of teaching orality. However, the EG6 teacher reported that she and her students were overwhelmed by the number of workshops required. However, none of the students refused to present their final project and all were eager to practice what they had learned. This teacher stated: “I realized that I was teaching oral skills poorly, and rarely, and that it was difficult for them to improve.” The teachers observed that, now, students are gaining confidence and have even exceeded their expectations.

Following their first experience with the LAS, teachers were still uncomfortable because the template was unfamiliar and pushed them outside their comfort zone. Nonetheless, the LAS process created enough interest in both teachers and students that the template was retained. Training in oral skills instruction provided by the research team was helpful in planning the LAS and using it in the classroom. Furthermore, according to the EG5 teacher, because they were in the classroom during each of the filmed activities, “interaction and discussion with the researchers provided immediate answers to our questions”.

Teachers stated that they were surprised by what the students learned. Filming the final debates made it possible to watch them more than once and evaluate them more accurately because the criteria corresponded to specific objects of instruction. The EG6 teacher mentioned the need to film students in order to better evaluate them.
Teaching practice renewal

After the first year of the study, teachers recognize that it is possible to include objects of instruction/learning (such as volume) in all subjects as well as outside of class time. They stated that some students have applied these skills outside the classroom, for example, to clearly argue their point with the lunchtime supervisor, their parents, or even in other subjects (ethics and religion).

These teachers’ practices have evolved: they now teach orality differently. Although things initially moved slowly, all of these changes are considered positive. There were challenges, but the project has been a success. The LAS was an exciting project for both teachers and students, using technology particularly appealed to students, and filming the activities was very effective. Filming the final debates allowed teachers to watch them more than once and use tangible evidence of learning to more appropriately evaluate their students’ oral skills.

The teacher training sessions were a rich source of information: “I went home mentally drained because I had questioned myself” (EG6). On the one hand, teachers appreciated the research groups’ presence in the classroom; they felt reassured and supported. They also found the different elements of orality presented during the researchers’ training sessions useful: initial production, student knowledge, formative workshops, expectations, soundscape, pre-listening, general listening, analytical listening, and listening checklists. On the other hand, it was more difficult to implement elements related to comprehension because the teachers were unused to working on oral comprehension with their students.

5.2.3 Comments summary

After Year 1, teachers in the experimental group have a better understanding of the oral skills LAS and the educational device used (Y’s model, 2001). According to them,
students were motivated and probably learned more with this model (educational device) than with those used previously. The teachers stated that they could reuse what they had learned and considered these to be positive changes.

Teachers in the experimental group feel more comfortable evaluating oral skills because they now teach specific elements of orality and their assessments focus on what has been taught. Control group teachers are somewhat uncomfortable evaluating oral skills, which they believe remains a subjective exercise.

According to teachers in the control group, students are now more comfortable speaking in public and being filmed after having practiced these things in class. They confirm that they have modified their practice, but believe that the way they teach oral comprehension has not changed. They see Year 2 of the study as an opportunity to improve how they teach and evaluate orality and to modify their oral skills teaching plans.

For all four teachers, having to work on oral skills activities led to a concern for more structured preparation. They mentioned that taking the time to reflect on oral skills instruction necessarily brings about change.

6- Conclusion

Given the limited number of teachers and students involved in this research project, generalizations are impossible. However, preliminary results from the first year of the study suggest that coaching teachers, researcher-teacher collaboration, LASs, student instruction, and significant time spent on peer evaluation (which encourages cooperation) can promote the development of students’ oral skills and the renewal of teaching practices. These initial research results will be further clarified as the study continues.

Abstract:
Name writing skill has been proved to be the developmental indicator of early literacy skills across alphabetic writing system. This study aimed to develop a Chinese name writing scale (CNWS) for evaluating the developmental characteristics of Chinese name writing skills across preschool stage. 316 children (aged 3-6) were recruited from local kindergartens. Children who could recognize their name were asked to attempt writing their own name in a designed space. Their name writing skills were then evaluated through the scale pre-designed. It showed that Chinese name writing skill was developing in a transitional process from scribbling and conventional writing that depended on both ages and grades. As formal schooling and instruction on writing are given in the early 1st term of K.2, they play a critical role in the development of Chinese name writing skills even it is not to be taught directly. Although there is limited relationship in learning to write one’s own name and other characters in Chinese, it helps children to transfer and generalize the writing rules as well as the intercorrelation between structure, sound and meaning. It indicated that CNWS could be used to assess how well the children apply literacy-related skills in Chinese handwriting.

Introduction
Name writing skill is recognized as a developmental indicator of early writing competence across different language (Drouin & Harmon, 2009; Haney, 2002). Ability to write one’s own name has its both personal and social significance (Bloodgood, 1999). From very young of
age, children are exposed to their written name on their personal belongings, and encouraged by adults to read and write. According to Hancy (2002), children are motivated to learn to write their names with intense meaning and socio-psychological impact. Their experiences with names provided strategies to understand how literacy works. It is supported by previous studies on the relationships between the development of name writing skills and other literacy skills such as letter naming (Diamond, Gerde & Powell, 2008; Welsch et.al., 2003), letter writing (Puranik, Lonigan & Kim, 2011) and spelling (Levin & Aram, 2004). Nowadays, name writing task is widely used to assess the outcomes of handwriting intervention (Lust & Donica, 2011; Zhang et al., 2014).

Despite of the importance of name writing skills, there is limited number of studies in Chinese name writing. Differed from basic interaction between vowels, consonants and syllables in different alphabetic writing systems, Chinese writing system is dominated by logographic features that are visually complex. Normally, each character composes of both semantic and phonetic radicals (also called stroke patterns) within a square configuration that provide necessary information about the characters. There are a thousand of radicals, at which children have to understand its positional regularity with a great demand of spatial relationship in order to maintain good alignment and spacing in each of the combination.

In addition, Chinese names usually have three characters (one surname and two given names). Instead of starting from first letter, Yin & Treiman (2013) stated that learning to write children’s own Chinese name is related to its visual properties and start with the one with fewer strokes. Study from Chan and Nunes (2001) showed that after children beyond scribbles, writing becomes distinctly Chinese, such as more strokes and radicals with squariness structure. Their development is usually classified by the proportion of correctness and recognisability. However, it is believed that some similar categories from alphabetic writing systems could be applied to classify the level of Chinese name writing from scribbles, presence of strokes and stroke-patterns and correct writing (Chan & Nunes, 2001; Chan, Cheng & Chan, 2008). Therefore, this study aimed at address their issue by examining the developmental progression of Chinese name writing skills among preschool children in Hong Kong.

Methodology
Chinese name writing scale (CNWS) is firstly established by summarizing the name writing scales from the studies published in recent 10 years. The scales selected should be based on the concept of name writing development from scribbling to conventional writing. A 9-point scale was formed, which was further equally subdivided into three categories: (1) Graphic, (2) Writing-like writing and (3) Symbolic (Gerde, et al., 2012; Levin et al., 2005). Then, a
forward translation from English and Chinese, and some modification has been made to suit the need of Chinese name writing.

316 Chinese children from aged 3-6 were recruited by convenience sampling from six kindergartens in Hong Kong. After obtaining informed consent from guidance, two prerequisite tasks were performed. They were asked to speak out and recognize their name from their class list to ensure they know the representation and function of their name. 308 children passed two tasks and were requested to write their Chinese name onto a white paper as much as possible.

**Results**

Except 21 children who were refused to write, name writing products of 295 children were analyzed. The means and standard deviations are presented in Table 1.

The results showed a gradual increase of universal language feature such as directionality at 3- to 4-years-old, followed by the language specific features such as the combination of complex strokes and radicals until all children were able to write correctly between 5.5- and 6-years-old.

**Discussion**
The focus of this study was on the developmental characteristics of Chinese name writing skills across age and grade. Although there were a number of differences between alphabetic and Chinese name writing, they showed similar pattern of development from scribbling to conventional writing. They were started to use language-related features such as turning angles and shapes, or separate units. Instead of writing the first letter of their name, they were started to write the easiest character of their name or part of each character with the radicals/ stroke-pattern they knew.

From the past studies, the performance of name writing skills is accounted by age range but not with grade. It was believed that children were self-initiated to observe their name and other words from the surrounding and practice. They were tried to correlate with the letter and sounds and combine them as much as possible. However, most children in Hong Kong started formal instruction of handwriting no later the first term of second year of preschool education (i.e. Lower Kindergarten, or K.2). The formal instruction on the orthographic rules of Chinese handwriting prepared them to write from simple to complex characters in terms of visual complexity and popularity.

A greater range of improvement was shown in their second year of schooling, at which character-like feature was shown but in pieces or random. However, when writing of their own name was specifically taught at the end of the second term of K.2, they were able to acquire the skills effectively and booster the development. It proved that even though Chinese characters were distinct with each other, the writing rules and regulation are inter-transfer between name writing and the formation of other Chinese characters.

**Conclusion**

Although the formation of Chinese name and other characters is differed from those in alphabetic writing system, similar trend of development has been observed. It is proposed that name writing tasks is useful to assess the development of early writing skills in Chinese, and help to identify children who have handwriting difficulties. A study on the relationship between the development of name writing and other literacy skills in Chinese is recommended.

The evolution of an online English language class site

Abstract

Founded in 2008, Edmodo is a popular online social learning platform originally aimed at K-12 education that is frequently used by educators to disperse information and to establish direct lines of communication with young learners and their parents. While utilizing Edmodo to support classes has been shown to generate higher student initiative (Holland & Muilenburg, 2011), and can encourage student engagement and responsible learning (Sanders, 2012), it still tends to be largely teacher-centered, in terms of the content, set up, and regulations. This paper will explore findings from a case study in a very different context and for a very different purpose from which Edmodo is frequently utilized. The semester long action research study was conducted in a Japanese university English language class, in which the online community was treated as a supplementary activity. Differentiating this study from previous research was the fact that the learners were primarily responsible for the content and development of the online community. The educational objective behind this project was for learners to create an online community, which best served their specific interests and needs. The research objectives of this study included analyzing how this online community evolved, documenting how or if students participated and assumed ownership of the community, and identifying the specific issues and problems that could affect the implementation of a similar program in the future. A qualitative approach was adopted for this case study, to analyze and assess the data. All the entries made on the class page were thematically coded, and then sub-coded. Grounded-theorization
then revealed several salient themes, which form the basis of the findings to be discussed. These include noting how the class instructor was initially required to foster the shift from a teacher-centered to a more learner-centered community, and that this shift was a relatively gradual process. The analysis of the posts revealed distinct patterns, with learners preferring to make more humorous and visually oriented posts, often supplemented with advice and suggestions for how fellow learners could be more successful on demanding tasks such as delivering oral presentations and improving English language proficiency test scores. In contrast, the instructor’s posts were initially almost exclusively informative and dealt primarily with class administrative matters. As the semester progressed, the instructor began to adapt and to follow the style and content of the posts the learners were making. Problematic issues regarding the use of Edmodo were a lack of participation by some learners and a tendency for other learners to dominate proceedings. It is also still unclear whether or not Edmodo was actually beneficial for enhancing the English ability of the participants. In conclusion, this pilot project to develop a learner-centered community was partially successful. It revealed that through the evolution of such a community, a wider range of activities, learning experiences, and discussions developed, in a more natural and potentially beneficial way. Future goals include utilizing Edmodo in a more effective way and instituting an online community that can be enhanced through collaboration and intercultural interactions (as defined by O’Dowd, 2011) with other online communities. This would enable further learning opportunities for students and would serve to make the online community a more integral part of the course and less of a periphery project.

1. Background
The “rapid evolution of communication technologies has changed language pedagogy and language use, enabling new forms of discourse, new forms of authorship, and new ways to create and participate in communities” (Kern, 2006, p.183). These changes have led directly to an increase in research attempting to measure and analyze the effects of this technology on all forms of education. As Kern
(2006, p.200) noted, “most research to date has focused on communicative task-based, project-based, and focus-on-form approaches...but the literature has begun to address uses of corpora in data-driven learning.” Research has also begun to focus on the use of online communities. As Miller (2011) explained, the benefit of online communities is that they compensate for the lack of community in the real world. Amongst these online communities, the most widely used learning platform in the K-12 context is Edmodo, which has been found to encourage both student engagement and responsible learning in high school students in the US (Sanders, 2012), as well as in university settings where English is not the first language (Balasubramanian et al., 2014).

When assessing the use of technology or online sites such as Edmodo for language learning, Kern (2006) posed a series of important questions to consider. Firstly, do computers assist language learning? In addition, he also asked if multimedia authoring improves learner’s language use in terms of accuracy, fluency, and appropriateness in offline contexts? Definitive answers to these questions are obviously difficult to obtain, and are very much context dependent. Kern then put it rather succinctly when he said that technology-based language teaching is not a method, but an integrated and varied pedagogical approach. It is important to note here that assisting language learning was not the main purpose behind incorporating Edmodo into the course, but rather a potential secondary benefit.

Despite the difficulties in addressing the questions posed by Kern, research on the use of technology and online sites to support language learning and to foster telecollaboration (online intercultural exchange) has been a popular venture in recent years (O’Dowd, 2011). However, most of the research to date has been restricted to documenting learner perceptions of the sites utilized, or to analyze how the sites are used, without attempting to measure language improvements. Dizon (2015) found that Japanese university students had moderately positive views of using Facebook to support classroom learning, based on the ease of use, convenience and the relatively low-stress environment it provided. Kongchan
(2012) investigated the use of Edmodo for her English language classes in Thailand and found students had a favorable view of it. She also noted that Edmodo enabled what she referred to as a non-digital-native teacher to take charge of and explore her own online classes in a better way. She then added that the website resembles Facebook but is a safer and more private learning environment. Kongchan primarily used Edmodo in a teacher-centered manner, to post information/give feedback/disperse assignments/solicit peer reviews and even for collecting assignments. Afterwards, she took her findings and taught a workshop for other teachers at the same institution, who also responded positively to Edmodo because of its user-friendly nature. Balasubramanian et al. (2014) found learners had a favorable view of Edmodo as well, and that they saw it primarily as a resource where they could obtain the information they were seeking, where they could get support, and where they could have online discussions. These favorable findings are in contrast to a study by Ali (2015) who concluded that participants were undecided about whether Edmodo was advantageous or not for learning English. This study found some learners viewed Edmodo's main function as being to disperse instructions and announcements from the teacher, and that it could not assist them in learning English skills, particularly the presentation skills they wanted to learn. The students also overwhelmingly rejected the idea of using Edmodo to supplement face-to-face discussions in English class.

Another area of related research has been to explore the benefits and difficulties of incorporating telecollaboration (intercultural interactions through the use of technology) into curriculum and courses (O'Dowd, 2011). There are numerous pedagogical and institutional impediments to implementing and using technological activities and O'Dowd (2011) provides a good overview of intercultural exchanges and the research conducted so far (p.369-375). Essentially, authenticity is a key feature of this and a positive point in favor of its implementation. Despite this, telecollaboration is still usually seen as an add-on to most curriculums and courses, and success depends largely on motivated students and teachers. O'Dowd (2011) then stressed that telecollaboration needs to be ‘normalized’ and to be made more
integral. Various reasons found that frequently prevent this include a lack of digital expertise, a lack of time, concerns over control of the technology or site, a lack of overseas connections, and various other context-specific issues. Incorporating intercultural exchanges into the use of Edmodo was an initial goal of this project, but proved logistically impossible to achieve in this pilot study. It will however, be implemented in the future, through Edmodo.

Before discussing the research design and findings from the current study, it is first necessary to provide some background on Edmodo. Edmodo is a free social learning platform designed specifically for K-12 contexts that was founded in Chicago in 2008, but is now based out of California. By 2012 it had over 12.5 million users worldwide in an estimated 210 countries and was growing rapidly (Edmodo.com, 2015). “Edmodo was custom-built for the classroom and designed to provide a single access point for teachers to safely and securely discover and share content that could be used to deliver personalized instruction at scale” (Edmodo.com, 2015). In addition, “Edmodo is used to share educational content, manage projects and assignments, conduct quizzes and facilitate highly engaging learning experiences among students and teachers” (Edmodo.com, 2015). One of the strengths of Edmodo is that all the stakeholders (teachers, and parents) in the learner’s life can be a part of the learning process. Furthermore, Edmodo can facilitate individualized classroom instruction, professional development, parental involvement, and it is easy to use for administrative metrics and planning. While Edmodo is largely utilized in K-12 teaching contexts, it is not necessarily limited to this. As we have already seen, instructors in other countries are now making use of it for a wider range of purposes.

2. Methodology
This study was conducted at a Japanese private university, with English majors. The course for which Edmodo was utilized was a compulsory Oral Communication course for sophomore students, in which there were two groups of students, with 25 in one class and 24 in the other (N=49, although three participants dropped out of
the course during the semester). The class met three times a week for 45 minutes. The participants were all Japanese, approximately 80% of them were female, and the participants’ average TOEIC score is estimated at 750.

The use of Edmodo for the course was experimental, as the instructor (researcher) was interested in learning how to use the site, and exploring possible uses for the future. Reasons for choosing the site included the reputation it had garnered and the similarity in design and layout to Facebook – a site almost all the participants were familiar with. Using Edmodo was not part of the assessment for course work, but all the students were encouraged to register for the class site. Several students did not do so, and later in the year two students who had forgotten their passwords asked to be able to re-register. Instructions given regarding use of the site were based on two core principles. Firstly, any posts or comments by the students had to be done in English. Secondly, posts must not be offensive to other students (or the teacher). Apart from these regulations, students were free to post, comment or ‘like’ anything on the site. They were also free not to post (or even not to log in) if they did not wish to do so. The purpose for using this site – as it was explained to the students – was to create an online community, where students could enjoy reading and writing, discussing issues or topics that interested them, and where they could also communicate and interact more freely with each other.

A qualitative approach was adopted for this study as this provided the best opportunity to compile a description of the posts students were making, and to analyze the evolution of the online class site. The data collection period spanned the duration of a semester (15 weeks). All the posts, comments, ‘likes’ and shared links on the class site represented the raw data collected. Firstly, all the data was coded thematically – as defined by Saldana (2013) and then organized into sub-categories, based on similar properties and usages. Grounded theorization was then utilized to provide a description of how the site evolved throughout the year. In addition to this, the participants were canvassed at the end of the semester regarding their views of Edmodo.
3. Findings

Overall, the findings reflect a positive view of Edmodo by a majority of the students, and also demonstrate interesting trends in the evolution of how the site was utilized. The first important finding was drawn from informal discussions with the participants at the end of the semester. Almost all of them were of the opinion that the use of Edmodo as an extra source of learning was beneficial and interesting. Further support for this opinion can be seen in the fact that a large majority of the students posted, commented or replied to other’s posts throughout the year. When questioned further by the instructor, the students also indicated that they wanted to keep utilizing it in the second semester. The primary reason given by many students when queried about why it was useful was that it helped generate a more cohesive atmosphere between learners. During class activities learners are typically limited to either one or two partners for conversation tasks (the students they are sitting next to). While these partners change every class, learners have no freedom in deciding with whom they can communicate each time – something they could control with Edmodo.

After thematically coding the posts made on the site, an interesting – if not unexpected - distinction was noted regarding the type of posts the instructor made, compared with those made by learners. Almost exclusively, posts made by the instructor were administrative. These included posts dispersing course information, uploading documents and handouts, providing links to videos and test preparation sites that supplemented course content. In contrast to this, learners frequently posted on matters completely unrelated to the course. This included posting pictures of various activities they had recently done or links to videos they had found online that were particularly interesting. Some learners posted information about upcoming local events, or even limited-time sales in nearby shops. From this it could be surmised that learners viewed the online community as extraneous to course content, while the instructor tended to use the site as a means of supplementing and supporting coursework.
A further distinction in the types of posts learners and the instructor made was that many of the posts made by learners were of a multisensory nature. Learner posts tended to be predominantly visual or audio oriented. This included uploading pictures, or links to videos and songs (often to sites such as YouTube.com or ted.com). Typically these were indicative of something the learner liked or a message that was being presented, that expressed the learner’s viewpoint in a more eloquent manner than they could. In contrast, the instructor’s posts were more oriented towards written text. Learning through multisensory experiences has been shown to further stimulate the learning experience (Gallo, 2014) but these kinds of posts were probably more indicative of the learners’ age, than of an in-depth understanding of learning conditions.

Perhaps the most significant finding – and one that was especially pleasing for the instructor – was the apparent gradual shift from a teacher-centered and dominated online community, to one that was more learner-centered, in terms of the content and frequency of posts. This evolution had been hoped for at the outset by the instructor, but in reality, took time to eventuate. In the first month of the course, only one learner started a post, while the instructor started 13. On many such posts by the instructor, typically only one or two learners replied or commented. Contrast this with the last month of the semester when the instructor started five posts (all of which received at least four responses), and the learners started eight posts, generating at least five responses for each one. It was gratifying to see learners showing more initiative and taking more ownership of the online community.

One problematic finding – and also not entirely unexpected – was that there was a lack of participation on the part of some students. 12 students never posted or commented on anything during the semester. Edmodo does not provide statistics that keep track of who logged in and for how long, but it is likely that these students rarely if ever logged in to the site after initially registering. Perhaps this was due to a lack of interest, or perhaps it was awareness by the students that their grade would
not be affected by their lack of participation. It could also have been that they simply forgot about the site or forgot their password and were not interested enough or too embarrassed to ask the instructor for help logging back in.

As an indirect result of some learners not participating, there was also a tendency for several others to dominate proceedings. Five students made 85% of the posts started by learners. This was not necessarily problematic, but their frequent posting and commenting might have indirectly discouraged others from posting or replying. From the instructor’s point of view, these students were simply keen to build up the community and were generally constructive in all their posts.

Problems between inter-classmates (two groups of students took part in this study and some did not necessarily know each other) were a source of concern. Although no such issues were raised with the instructor, it is considered highly likely that there were such issues at play. These were most likely issues such as shyness, and reluctance to post or comment on another learner’s post, when not familiar with that person.

4. Implications
The biggest implication drawn from this small case study is that Edmodo is suitable for second language university courses outside the K-12 context in the United States. The other significant finding was that online communities could be shaped and led by the learners themselves. How beneficial this online community is for the learners, is a question that needs to be examined further though. Significantly for the researcher, was that a majority of the students responded positively to the opportunity to make use of this online community, and also expressed their support for using Edmodo in future courses. This favorable feedback – combined with the positive findings and implications discussed previously – means the researcher will utilize Edmodo again in the future.
An obvious strength of Edmodo (in all educational contexts) is the relative ease with which information can be dispersed digitally, in a more environmentally friendly and convenient way. Through Edmodo both learners and instructors are exposed to and can access a wider range of mediums and digital materials. Another advantage that Edmodo has over similar sites such as Facebook (which has been used for educational purposes) is that Edmodo is private and learners and instructors do not need to worry about breaches of privacy or that their private use of social networking sites will be exposed or connected to the class site. Edmodo does not require interaction with other forms of SNS, meaning there are far fewer ethical issues (particularly if students are minors) for instructors to worry about.

In addition to this more encompassing learning experience, the autonomous approach that learners took toward building the community meant that the language used in posts and comments was authentic and used in a natural environment. In the end of semester informal discussion, participants frequently indicated that they enjoyed the chance to write freely, without the constraints of having to follow academic formatting and genre styles. What would have increased this authentic use of English for ‘real world’ communication would have been if an intercultural exchange had been incorporated into the community. As this study was essentially a pilot study, logistics prohibited this intercultural exchange, but it will be strongly considered for future projects involving Edmodo, and was something the participants also expressed an interest in setting up.

One issue that does need to be examined further is the future of the class online community after the course has finished. Typically the duration of a course in K-12 contexts is for one academic year, and this was the same for the university course in this study (the second semester was not included in the study due to time constraints). If learners are to be encouraged to invest time and effort into constructing an online community and to participate actively in it for almost a full calendar year, then the issue of whether or not to delete the community after the course has finished needs to be addressed. Continuing the community in an
unsupervised manner for an indefinite period of time is a contentious issue, fraught with potential problems, but also with potential benefits. While the general consensus was that many students would have liked to continue the page, many also admitted that they would likely gradually forget about it and stop using it. With this in mind, and considering privacy and ethical issues related to this research, it was decided to terminate the site after the academic year had been completed, and use of the site had declined to a certain level.

5. Future goals
This study was essentially a pilot study and a form of action research. One of the main purposes was to assess how students and the instructor utilized Edmodo, so that better use could be made of any future implementations of the learning platform. For the past year only limited use was made of Edmodo, but due to the relatively successful nature of the project, a broader implementation of it will likely be adopted in the coming years. Ideally this would include collaboration at the institutional level where this project was carried out. As there are three other streams of students at a similar level, attending coordinated classes, largely using the same materials already, this would be a potential starting point to implement online community building as part of course requirements. A potential stumbling block would be obtaining consent from the three fellow instructors teaching the same courses. Differing ages (and technological abilities) and differing perspectives on the use of technology in the classroom, means that it might not be possible to develop a course wide program.

A further goal – that may be harder to reach – is to develop and incorporate some form of cultural exchange into the online community. Ideally this would mean sharing the community with a class from another country (with either native English speakers or non-native English speakers), whereby a cultural and language exchange would could be fostered. Precedents for this exist (see Bonn, 2015) so it is not beyond the realm of possibility. Potential problems to be aware of would include monitoring the page, establishing guidelines for both classes that were acceptable,
and – most importantly – establishing whether the medium of exchange would be English only or perhaps a form of language exchange (Japanese and English) whereby guidelines would have to be set up and adhered to.

A more realistic and easily obtainable goal is to implement a similar program in the same instructor’s course next year, but with suitable adjustments, based on the findings from this study. Firstly, there is a need for more specific tasks in the beginning of the academic year, so that all students are initially active and participating. Once they have all had a chance to be a part of the community it is more likely that more of them will continue to participate throughout the year. By being absent from the early proceedings, some participants this year felt hesitant to get involved later on. By being involved in the early stages, learners would also experience the ‘workings’ of the site and would be able to get assistance with technical difficulties. To assist with this more structured approach to using Edmodo, more concrete guidelines could also be provided at the outset.

The purpose for this study was to examine if an online community would develop with minimal guidance from the instructor. While this was largely successful, it might be more useful to provide more structure at the beginning of the semester, so that learners can make better use of the site, even at the possible expense of a degree of learner autonomy. As the course in question is primarily an English language class, it will also be beneficial if the online community can assist in developing language skills in the future.

6. Concluding comments

In conclusion, this pilot project can be considered a moderate success in that the learners involved reacted favorably to the opportunity to build an online community through Edmodo, and were able to develop this community in a semi-autonomous manner. With further work and fine-tuning the use of an online community could be developed in the future and utilized to provide learners with greater opportunities, including the opportunity to develop their language skills. This study also revealed
that Edmodo is not limited to use in the K-12 context, but that it can be used for second language university courses as well. The study also demonstrated distinctions between what the instructor and the learners focused on. Future research in the area of online community building will benefit by expanding the scope or field of investigation and by collaborating further with other researchers and instructors.

Teacher Empowerment

Abstract

The extent to which Master Teacher designation empowered teachers who attained the recognition was investigated. The study also investigated how the sense of empowerment, where it existed, was manifested in Master Teachers’ practice. Teacher empowerment is assumed to be embedded in various efforts to retain effective teachers in the classroom such as teacher recognition, tiered certification and innovative compensation systems. Two hundred and forty seven Georgia Master Teachers participated in the study by completing an electronic survey. It was found that most Master Teachers did not consider themselves empowered by the recognition (only 2% did), rather they reported a sense of accomplishment (39.4%), and affirmation (24.4%). Master Teachers on their own assumed teacher leadership roles such as mentoring (60.6%), coaching (42.4%), data analysis and interpretation (43.4%), participation in school improvement committees (37.9%) and organizing professional development workshops (31.3%). It was concluded that, as Terry (n.d.) contends, empowerment entails some shared decision-making which is only possible if the administration is willing to share or delegate authority and responsibility to Master Teachers.
Does teacher recognition necessarily lead to teacher empowerment?

Purpose

The purpose of this study is to investigate first, to what extent Georgia Master Teachers feel empowered by the recognition and designation; secondly what impact they report that they have on other teachers and in school improvement efforts.

Perspective/Theoretical framework

In recent years, concerted efforts are being made to keep effective teachers in the classroom by providing alternatives to promotion into administration as a means of advancement. The Teacher Advancement Program (TAP) funded by the Milken Foundation (National Institute for Excellence in Teaching (NIET), 2015) was designed to foster multiple career path and innovative compensation systems, not based on mere experience all in the attempt to keep effective teachers in the classroom. The TAP program integrates value-added model of assessment into teacher evaluation. Margolis (2008) found that teachers with 4-6 years of experience “are searching for roles/activities that are regenerative (keeping them learning and excited about their teaching); and also generative (widening their sphere of influence, sharing their gifts with others in the profession).” He contended that mentoring other teachers may be best suited to provide those regenerative and generative experiences.

Other efforts and alternative routes for teacher advancement have included career ladder, tiered certification, teacher leader endorsements/certificates, state and national certifications and recognitions, etc. (Riggs, 2013). Embedded in these options
is teacher empowerment. According to Terry (n.d.), empowerment entails some shared decision-making, is essential to school improvement and often facilitated by the principal. Researchers agree that teacher empowerment results in informal teacher leadership (Terry, n.d.; Berry, Daughtrey & Wieder, 2010; Behera, n.d.). These authors presume that the empowerment is generated from within the school and essentially originates from, or with the blessing of, the principal. When teachers are empowered this way, they function more autonomously, exhibit professional confidence and personal efficacy. Berry, Daughtrey and Montgomery (2009) reported that “teacher empowerment was the most important school-level factor to student learning.” Teachers selected and recognized using various criteria are supposedly empowered to build a critical mass of effective teachers in their schools and help administrators to plan and implement school improvement initiatives aimed at improving student learning. Unfortunately, often teachers are not consulted to find out if they truly feel empowered or to engage them in the discussion on how they can participate in or facilitate school improvement initiatives. Thus, the questions explored in this study are: Can teachers feel empowered if that sense of empowerment emanates from outside of the school, for example from becoming a Master Teacher, an honor bestowed by the state? A subsidiary question is: If Master Teachers feel empowered by the recognition, how have they demonstrated this empowerment in their practice or in the workplace?

The Georgia Master Teacher program was established by Georgia Legislature (GA Code 20-2-205) in 2005 to recognize teachers who positively impacted their students' achievement and progress. It was proposed that teachers who achieve Master Teacher status and serve as coaches or mentors for other teachers would be
remunerated. Because of economic downturn, that promise of financial remuneration was eliminated but the recognition remained. At the state level, Master Teachers received non-monetary privileges such as free conferences, teacher leadership institutes, membership in state taskforces and committees. The certificate is valid for seven years and could be used to renew a Georgia Teaching certificate. Various school districts provided some benefits and recognized their Master Teachers in local newspapers, and by providing them with special parking space, monetary gifts, etc. Though not initiated from inside the school, principals were involved in the application and selection process. They were required to show their approval and support by signing off on a teacher’s application. Nevertheless, Nweke & Elliott (2011) found that Master Teachers were not always able to implement new strategies and principles in their classrooms due to impediments in the workplace. Given that there were no monetary incentives, the researchers sought to find out to what extent Master Teachers felt empowered by this recognition and how the empowerment was manifested in their practice and workplace. Though the Master Teacher program ended with the 2013-2014 awards, bringing the total to close to 800, the last of the Master Teacher Certificates will expire in 2021, as they are valid for seven years.

Also, Georgia has since instituted a tiered certification system comprising four tiers: Pre-Service certificate, Induction certificate, Professional Certificate and Advanced Professional and Lead Professional certificates (Georgia PSC, 2014). The advanced and lead professional are two paths at the same tier for teachers interested in leadership (lead professional) and those interested in teaching (advanced professional). Like the Master Teacher certificate, the tiered system is not aligned to any pay scale
and teachers holding the professional certificate who aspire to reach the highest tier
either teaching or assuming leadership roles, must be motivated by a sense of
accomplishment, empowerment, or anything other than monetary remuneration. Thus,
this study is relevant and may inform the implementation and an understanding of
teacher motivations and practice as they make career choices.

Method

Participants

Participants comprised the 247 Master Teachers who were still employed in
Georgia public school systems as of the 2013-2014 school year who responded to the
online survey. See Table 1 for a distribution of respondents according to the year of
award. The highest number of responses were from 2010 cohort (20.7%) and 2006
(19.4%).

Table 1.

Master Teachers Distributed By Year of Application

Most respondents held master’s degree (39%) or specialist degree (45.9%). The number of years of teaching in Georgia ranged from 6 to 39 years, with an average of 16.8 years. The participants comprised of 11% males, 89% females, 80.3% Whites, 15.2% Blacks, 2% Asian, etc.

**Data Collection and Procedure**

A 26-item online survey was administered through Survey Monkey. The questionnaire was emailed to 696 MTs, 122 bounced back, leaving a total of 584 that were presumably delivered. Two hundred and forty-seven (247) MTs responded, for a response rate of 42%. The survey was designed to elicit whether or not Master Teachers felt empowered by the recognition. The survey was also to elicit the formal and informal roles they had played in their schools, district or state, to enhance student
learning, and other teacher professional development or school improvement activities they had engaged in.

**Result**

Descriptive statistics were used to analyze the quantitative data collected. The results are presented according to the research questions. The first research question was whether Master Teachers felt empowered by receiving the Master Teacher designation/recognition from the state. Though 188 or 76.1% of the respondents report that their school or school district recognized them, Table 2 shows that very few Master Teachers (2%) felt empowered by attaining the certificate and being recognized by their principals, school systems and the governor. However, the same table shows that 97 or 39.4% of respondents felt a sense of accomplishment and affirmation (24.4%) similar to a sense of validation reported by Brantley (2014) for National Board certification experience.

Note. Percentages are based on total N=247 responses

One hundred and sixty-three (66%) of the respondents indicated that they had been assigned additional responsibilities in their school, county or the state. The most frequently assigned roles in descending order of frequency were: mentoring of other teachers, coaching, participation in school improvement committees, conducting professional development workshops, and analyzing and interpreting data for grade level or subject teams, organizing professional learning communities, participating in county or state-level tasks forces, and conducting action research on issues of interest to the school or grade level teams.

Another important finding was that even though most Master Teachers (98%) would not describe themselves as empowered, motivated by their sense of accomplishment, affirmation, credibility and competence, they took the initiative to engage in the types of leadership activities that, it was hoped, the principals and schools would use them for. Specifically, while only 89 of the respondents listed roles
assigned to them, as many as 198 (%) personally assumed, without being asked, mentoring roles (60.6%), coaching (42.4%), analyzing and interpreting data (43.4%), participating in school improvement committees (37.9%) and organizing professional development workshops (31.3%).

**Discussion and Conclusion**

The results support Wall’s finding on teacher empowerment (2012) that “most teachers perceive themselves as operating from self-efficacy empowerment subscale, while their principals were using the legitimate power base. In addition, teachers determined that the power base of referent was related to the empowerment subscale of professional growth.” This might explain why teachers sought the Master Teacher designation that gave them a sense of accomplishment and affirmation and opportunities for professional development.

Though many Master Teachers (76.1%) reported that school districts and principals recognized them at board meetings, special name tags, in local newspapers, on district websites, at faculty meetings, with plaques, flowers, letters from politicians and superintendents, checks from school foundations, etc., they did not feel empowered. A critical element of empowerment is sharing decision making authority. Apparently, the administrators were not willing to relinquish or share any power or authority with Master Teachers.

Teacher recognition programs are often surprised that many teachers they have carefully selected and recognized do not seem to have the impact they expect on their colleagues and in their schools (Governor’s Office of Student Achievement, 2009). Given that the recognition is coming from outside of the school, some principals may
feel threatened and seek to entrench their power and authority, rather than share them with and, thus, empower teachers, to facilitate the principals’ task of running their schools more effectively. The recognized teachers need to understand that while they may be recognized by the state or national organizations, it is up to their principals to willingly share power, authority and responsibility. The principals need to understand that empowering teachers and sharing their authority would lighten their administrative load and make teachers more invested in the school reform goals. Finally, the researcher needs to understand that it is not enough to publish findings that they think would impact teaching and learning positively. They also have to help sell the findings to the policy makers and administrators who control the work conditions in which the findings can be implemented.

This study makes teacher recognition programs, teachers who are recognized, educational researchers and the administrators aware that teacher empowerment may not be automatic or welcomed by some administrators, even though the administrators could use it to facilitate the achievement of their goals. The study, it is hoped, makes all the stakeholders more aware of their responsibilities in encouraging and harnessing teacher empowerment. Luckily, teacher recognition engenders the sense of accomplishment, competence, affirmation and credibility that liberates teachers to take leadership initiatives to facilitate student learning by creating and nurturing a critical mass of knowledgeable and collaborative colleagues that enhance effective professional practice.

As the usage of online services such as Internet shopping and online banking have grown over time, there has been an increase in cybercrime. This is not only a problem for consumers and enterprises, but can also impact the world economy negatively because we all rely on web services on the Internet. McAfee & CSIS (2014) reported that the global financial loss by cybercrime amounts to 445 billion dollars per year. In order to reduce the damage caused by cybercrime, it is necessary to better educate consumers and to build security systems to protect our society.

There are many researches on the topic of cybercrime prevention and building security system that target enterprises and government organization, but there is a lack of research targeting consumers. Cybercrime uses very clever social engineering techniques to fool individual consumers (Akiyama 2013, Shibata et al. 2007). However, there is very little research about cyber security education for consumers based on a psychological point of view. In order to reduce cybercrime, we must also better educate and raise awareness about cyber security to consumers.

In this research, we started by exploring the mindset of Japanese consumers on cyber security. We learned that the majority of individual consumers had concerns about cyber security because they do not know how to deal with the problem and are interested in obtaining correct knowledge about it.

Secondly, we performed experiments based on the psychological theory of fear arousing communication to determine effectiveness of different types of cybercrime warning messages on web sites. We created cybercrime warning messages based on various topics, such as data on financial loss caused by cybercrime incidents, frequency of such incidents and different fraud techniques employed by attackers. We also tried mimicking human faces, which is the method we think is most effective. Then we examined how well these different messages draw the consumers' attention, their willingness to input their private information such as usernames and passwords, and their measured levels of perceived risk.

Classroom Practices of Technology Education using 3D-CAD and 3D-Printer in Japanese Junior High Schools

Koichi MIYASHITA
Department of Technology and Information Education, Naruto University of Education
748, Nakashima, Takashima, Naruto-cho, Naruto-shi, 772-8502 Japan
miyasita@naruto-u.ac.jp

1. Introduction

The past few years, 3D-Printers are expected to be utilized as teaching materials because the price became down. Therefore in this report, at first some examples using the 3D-printers for technology education in progressive junior high schools in Japan will be introduced. Then, as a case study of the classroom practice at Kamiyama-Higashi Junior High School, contents of teaching, understanding of the students and 3D-Printed products of the students will be reported in detail. In case of Kamiyama-Higashi Junior High School, the students had interest in 3D-CAD very much and almost understood a basic operation method by only two times of classes. As a homework for summer vacation, they try to design flowerpot covers. At last, the covers will be printed using 3D-printer.

2. Consideration of 3D-CAD software

In order to design the original products, use of 3D-CAD is necessary. The following conditions are required in 3D-CAD to introduce into a junior high school.

(1) Easy to use for teachers and students
   - A manual and a help of how to use are substantial.
   - Japanese notation is accomplished.

(2) An introduction cost is cheap or free.

(3) Output in stl format is provided.

(4) Light operational characteristics on PC

On April 2015, candidate 3D-CAD was 6 models. Of these, it is thought that “Design Spark Mechanical” and “123D Design” are most suitable.

3. Classroom practice

The experimental class using 3D-CAD and 3D printer were carried out at Kamiyama-Higashi Junior High School. The class is consisted by third year 14 students (5 boys and 9 girls). In order to support the class, Naruto University of Education performed an induction course about 3D-CAD of three hours for the teacher, sent a graduate student who have mastered operation of 3D-CAD and provided 3D printer (3D Systems, cube3). The class plans are as follows.

- Let's know the technique of the 3D printer (one hour)
- Let's learn basic operation of 3D-CAD (two hours)
- Thinking about the design of an original flowerpot cover (Homework of the summer vacation)
- Let's design the original flowerpot cover (two hours)
- Let's print out a flowerpot cover (one hour)
- Let's evaluate techniques of various manufacturing methods (two hours)

4. Conclusion

As a result of having taught using 3D-CAD, the students understood an operation of 3D-CAD at short time. With the computer system of the school, there is a problem about installation of the free software. The shapes that the output with the 3D printer had difficult were included in the designs of the students.
Title: Academic Advising in an Online Degree Program

Topic Area: Academic Advising and Counseling

Presentation Format: Paper Session

Description: “Students in a school leadership online graduate degree program were surveyed and asked to assess an online resource created by their faculty academic adviser. This advising resource was made with online adult learners in mind and with the goal of keeping students informed and on track for program completion. The findings are presented in context as part of a quality online program and also pay heed to the goals and parameters of academic advising.”

marci1sp@cmich.edu
Quality academic advising is critical in university graduate programs. Students who receive what they perceive as good advising are more likely to be satisfied with their program (Chun-Mei, Golde, & McCormick, A. 2007; Pargett, 2011; Schlosser, Knox, Moskovitz, & Hill, 2003; Soria, 2012; van Emmerick, 2004) and graduate on time (Henderson & Stassen, 2007; Lovitts & Nelson, 2000; Metzner, 1989; Nutt, 2003; Tinto, 1987; Tinto, 1993; Tinto, 2002). Advisers are sometimes specialists employed by a university to cover a range of programs or may be faculty members in an academic department who advise students in the faculty member’s discipline or specialty.

As more students take classes and programs online (Allen & Seaman, 2010; Bates, 2011; Green & Wagner, 2011; U.S. News & World Report, 2015) the challenges for advisers to keep timely and open communication with students becomes more problematic. Students are no longer tied to a physical campus and may be scattered across time zones around the world. The traditional “office hours” for academic advisers no longer make sense.

This project queried students in an online master's degree program in school leadership about what constitutes effective advising. The adviser's general duties can be described as getting students into the program (admission), getting them through the program (coursework), and getting them out (graduated). The author quickly learned that the best way to perform these advising duties was a web-based shell using the university’s course management system, Blackboard. Therefore, the adviser (who is also a faculty member in the department) cobbled together a shell that consolidated the various resources, forms, and other relevant materials that students would need throughout the program.

The shell was successful and well received from the beginning. The department noticed fewer students “falling through the cracks” and important deadlines in admissions, course registration, capstones and internships, and graduation were more closely adhered to. Not only were students receptive but also faculty appreciated this as it gave a bit more certainty and confidence to students.
that they were on the right track and thus they (the students) were able to devote more attention and effort to the classes at hand.

This effort is now in its third year and it seemed appropriate to try and get some feedback beyond anecdotal from students. Were there gaps in the shell, topics that were missing? What existing information could be improved, updated, or otherwise altered? Are there students who do not find the shell helpful but simply have not spoken up about it? A review of extant literature on this subject of direct student feedback on online academic advising systems turned up barren. Therefore, using Qualtrics, a detailed survey was sent to 150 students in the program.

One of the primary jobs of the academic adviser is to increase the level of student engagement. Summarizing the current literature on the subject, Trowler (2010) offered the following definition:

Student engagement is concerned with the interaction between the time, effort and other relevant resources invested by both students and their institutions intended to optimise [sic] the student experience and enhance the learning outcomes and development of students and the performance, and reputation of the institution. (p. 3)

This definition encompasses the idea of the student and adviser enjoining in collaborative learning, co-participating in academic events, engaging in ongoing communication with staff, immersing themselves in educational experiences, and benefiting from the support of the learning community (Coates, 2007). But as worthy and common sense as these endeavors may appear, achieving them is a complicated proposition given the rise of global education, the diffuse nature of higher education institutions, and the proliferation of distance education. In order to satisfy the current needs of the students engaged in online learning, advisers must understand the underlying theory of student involvement, the characteristics of graduate program adult learners, the challenges that these learners face, and the tools that online programs offer.

A framework of practices based on data gathered by The National Survey of Student Engagement (NSSE) have led to increased student engagement (Kahn,
Nonetheless, the concept of student engagement remains undertheorized. For example, while collaboration, student participation, and communication are accepted as important factors, how these factors work together is not fully described. The same is the case with regard to an explanation of the role that students play in influencing their engagement, especially as it relates to diverse student populations (Harper & Quaye, 2009). This study is informed by Astin’s (1984) Student Involvement Theory and by the work of Archer (2008) in explaining student agency.

Astin (1984) defined student involvement as “the investment of physical and psychological energy in various objects” (p. 519); these objects may be specific or general. Astin (1984) further proposed that: this involvement takes place in a continuum in which different students are involved to different degrees with one object at a time, or many objects over the course of time; involvement is quantitatively and qualitatively measurable; student learning and progress is proportionate to the quality and duration of the educational program; and, the success of the educational policy or practice is directly associated with the quality of the educational policy or practice. It is the job of the academic adviser to work with students to maintain a high level of involvement. This involves the recognition that “the psychic and physical time and energy of students are finite” (Astin, 1984, p. 523), with many forces competing for the students’ attention. It also involves working directly with students to monitor and increase student involvement and, in the case of online instruction, ensure that adequate resources exist.

Archer (2008) contributed to the understanding of student engagement by underscoring the role that reflexive thinking, defined as a process of mental deliberation, and co-reflexivity, defined as deliberation with others, play in influencing the structure on agency. The process of deliberation involves “planning, prioritising [sic], imagining, rehearsing, [and] monitoring” (Kahn, 2014, p. 1007). Reflexivity manifests itself in several ways. For example, students working in online programs may deliberate in private, communicate with others with whom they have established trust, prioritize or self-sensor their value-based ideas when
these ideas confront with those of others, and manifest stress rather than action (Archer, 2008). The role of the academic adviser is to monitor and communicate with students, and to assist students in developing strategies to remain positively reflective and reflexive.

Academic advisors that work with students enrolled in online graduate programs also benefit from research-based frameworks that serve as a lens to help them thinking about graduate online learners. One such framework is Knowles’ Andragogy Framework (1973). Knowles made four assertions about adults’ ability to learn:

1. Adults have a psychological need to be self-directing. 2. Adults bring an expansive reservoir of experience that can and should be tapped in the learning situation. 3. Adults’ readiness to learn is influenced by a need to solve real-life problems often related to adult development tasks. 4. Adults are performance centered in their orientation to learning – wanting to make immediate application of knowledge. (Cited in Glickman, Gordon, & Ross-Gordon, 2007, p. 53)

Another framework that is helpful in understanding graduate learners is Mezirow’s Transformative Learning framework (1990). According to Mezirow (1990), transformative learning is a process in which adults’ core frames of reference, or world views, are challenged by new and often disorienting dilemmas. Adults learn by critically reflecting on previously held assumptions. Academic advisors assist graduate students in achieving transformative learning by assisting in providing a supportive online environment and by fostering critical thinking.

Adult students enrolled in both undergraduate and graduate online programs share many common characteristics, and academic advisers must demonstrate an awareness of these. These students are often employed full-time, support families or dependents, are active members of their communities, and the majority enrolled in graduate programs following a period of being in the workforce (Choy, 2002; Rinck, 2006). The majority of these students decide to pursue a graduate degree in order to advance their careers, while others are influenced by economic conditions. According to Kuh (2003), several groups of students historically tend to be more
engaged in learning, including: “full-time students who live on campus; female students; native students (those who start at and graduate from the same school); learning community students; international students, and student with diversity experience” (p. 27). And while all students clearly deserve attention, the aforementioned list underscores the need for advisors to devote more attention to those students who are not listed in the groups, especially in the case of students enrolled in graduate programs where instructors have been found to offer less feedback. (NSSE, 2014).

Academic advisers play a vital role in keeping students informed and on track for program completion. DeSousa (2005) described six guiding principles that inform academic advisors in their work. These principals for advising have been adopted by the National Survey of Student Engagement (NSSE) and The American Association for Higher Education (AAHE). The first of these is that advisers should seek to develop the unique talents of each student. The second is that advisers should include a wide range of people, resources, and services in the academic process. The third principle is that of helping students to develop a plan to achieve their goals. The fourth is that advisers should maintain frequent and purposeful interactions with students. The fifth principle is that of helping students connect to co-curricular learning opportunities both inside and outside the boundaries of the online course. And sixth, advisers should encourage students to seek out learning opportunities that invite diverse perspectives.

In addition to subscribing to the aforementioned principles, academic advisors must be familiar with online tools, how they are used, and how students access and relate to these tools. They also be familiar with the students themselves, understand the students’ career goals, and appreciate the challenges that they face. In addition, advisors should adopt a global institution approach in dealing with students as a way of avoiding program fragmentation (Kuh, 2003; Kuh, Cruce, Shoup, Kinzie, & Gonyea, 2008). They also adopt an approach to student engagement that takes into account issues of learning diversity (Harper & Quaye,
By effectively performing their jobs, academic advisors benefit both the graduate students and the online programs.

At this time the results are still coming in and will be analyzed over the next several months. This proposed presentation will have the findings completed by conference time and also will put the issue of academic advising into the context of: What constitutes a quality online graduate degree program? and, how do the professional ethics (including security and confidentiality, which present their own challenges online) of advising fit into the picture?

*If any of the reviewers of this proposal would like to see the online academic advising Blackboard shell as it now stands, the authors would be happy to provide a guest link.*

A Grade-4 Teacher’s Mathematics: The Case of Annie’s Understanding of Decimal Fractions

Ron Tzur, Nicola M. Hodkowski, Maria Uribe
University of Colorado Denver

Abstract

The purpose of this case study, conducted within a constructivist framework, was to examine and promote a teacher’s (Annie, pseudonym) own understanding of the mathematics she was teaching to her 4th graders. Annie expressed dissatisfaction with her ability to teach decimals—largely due to considering her understanding of these numbers as inadequate. This paper focuses on data collected from one lesson Annie had taught and a reflective, post-lesson, video-recorded coaching session with her. Our qualitative analysis of Annie’s mathematics indicated initial, procedural understanding that would constrain her ability to promote students’ conceptual understanding of decimal fractions. Our analysis is compatible with Annie’s own sense of low self-efficacy in teaching this topic. Further work to promote Annie’s conceptualization of decimal fractions, fully supported by the school’s principal (the third co-author) and done by the first author during the post-lesson coaching session, seemed to promote Annie’s construction of a different meaning needed for effectively teaching this topic.

Introduction

In this case study of a fourth-grade teacher we addressed a twofold problem: What understanding of fractions and decimals may upper-elementary teachers have, and how may mathematics teacher educators use knowledge from research on children’s understanding to inform coaching of these teachers. Addressing this problem can contribute to the growing body of knowledge about teachers’ mathematical knowledge for teaching (MKT), which Hill, Rowan, & Ball (2005) found to be a critical factor in promoting students’ mathematics achievement. MKT involves not only the teacher’s understanding of the mathematical concepts at hand but also being able to analyze students’ reasoning to inform instruction (e.g., providing examples and explanations) can support making sense of and reviewing multiple ways to solve different problems. Simply put, enhanced MKT is critical for fostering changes in teachers’ instructional practices (Ball, 2000; Hill, Ball, & Schilling, 2008).

Our case study with Annie (pseudonym), a fourth grade teacher who asked for help in enhancing her MKT, focused on the hard-to-grasp (and teach) mathematical understanding of fractions (Carpenter, Fennema, & Romberg, 1993; Davis, Hunting, & Pearn, 1993). Specifically, in this paper we focus on the meaning she seemed to have for fractional symbols, both common and decimal fractions. This focus was guided by our conceptual framework (see next section), which highlights the importance of learning (and teaching) to reason about/with fractional quantities as multiplicative relations (Norton & Wilkins, 2009; Tzur, 1999; Ulrich, 2014). Annie’s work in class indicated a rather typical focus of elementary teachers on procedural aspects of equivalence between different fractions, while lacking a deeper understanding of
fractions as quantities (Tirosh, 1989, 2000). For example, to show the equivalence between 9/10 and 90/100 during the lesson she literally covered a zero in the numerator and a 0 in the denominator. Later, during the coaching session, Annie was unable to provide a mathematical justification for that procedural ‘cancelation’.

From a constructivist perspective, teaching is seen as a continual effort to build on what learners already know (Hodkowski, Tzur, Johnson, & McClintock, 2014; Steffe, 1990; Tzur et al., 2013). Accordingly, in this study we aimed at gaining further insights about a teacher’s knowledge about unit fractions, non-unit fractions, and equivalence among them—in both common and decimal forms, as well as to how professional development may advance this knowledge. In particular, this paper addresses three questions:

(a) How might elementary teachers go about teaching ordering and equivalence of decimal fractions?

(b) What knowledge of common and decimal fractions might underlie this way of teaching, and to what extent it relies on understanding of partitioning a unit fraction (e.g., 1/10 of 1/10)?

(c) How might coaching sessions with a teacher who is interested in improving her mathematics be guided by knowledge from research on children’s learning?

A Constructivist Conceptual Framework

This study is rooted in a constructivist perspective on knowing and learning (Dewey, 1933; Piaget, 1985). In this framework, one’s transition from not knowing to knowing a particular mathematical idea is considered as a mental transformation of available into new knowledge through the dual process of assimilation and accommodation. Accordingly, a learner’s observable behaviors (actions, language) can, at best, provide indications for inferring the learner’s mathematics by an observer. Specifically, we drew on von Glasersfeld’s (1995) three-part construct of a scheme, which he postulated to be the essential unit of analysis for the mental realm. The first part of a scheme is the recognition template of a certain situation. Here, a learner uses assimilation (Piaget, 1971) to “recognize” the situation based on previously recorded (like) experiences. This recognition triggers a goal that brings forth the second part of the scheme, namely the mental activity for accomplishing the goal. The third part of a scheme is the result the learner expects, possibly predicts, to ensue from the scheme’s activity.

Using this notion of scheme, Simon et al. (2004) explained the transformation, mental process of available into new schemes through reflection on the relationship between the scheme’s second (activity) and third (effect) parts. This explanation, termed Reflection on
Activity-Effect Relationship (Ref*AER), elaborated on Piaget’s (1985) core construct of reflective abstraction. They postulated that this process of transformation commences when a learner experiences a perturbation, for example when unable to arrive at his/her predicted outcome or when a constraint is placed on the learner’s activity. Another kind of perturbation may occur when the effect of the learner’s activity is different (in her view) than the result predicted by her recognition template. Such a perturbation opens the possibility for the learner to identify, and construct, a novel relationship between the activity and its effects (Simon et al., 2004)—a process they emphasized may not be conscious to the learner. This reflective process, which yields a new linkage between the activity and its effect, underlies the reorganization of existing assimilatory schemes into a new scheme.

Tzur & Simon (2004) further postulated that the transforming available into novel schemes via this mechanism of reflection on activity-effect relationship typically occurs in two stages. They stressed that, whereas in both stages the learner’s anticipation of activity-effect relationship is essentially the same, the stages differ markedly in the accessibility of the novel relationship to the learner. In the **first stage**, called *participatory*, a learner can only access a novel activity-effect relationship she began constructing if somehow being prompted for the activity and its newly noticed effects. That is, the notion of a participatory stage pertains to a conceptualization in which a learner may only be able to solve a task after s/he has been given a prompt that proves helpful in one’s solution. Tzur and Lambert (2011), pointed to this prompt-dependent stage as a cognitive correlate of Vygotsky’s (1978) core notion of Zone of Proximal Development (ZPD). The prompt can be provided either from another individual or from within the learner’s own mental system (the latter indicated by, say, the learner’s “oops” experience). Eventually, at the **second, anticipatory stage**, a learner cements the anticipation of the link between the novel goal-directed activity and its effects. Thus, she can independently and spontaneously solve a task without any prompting and transfer the newly conceptualized idea to novel situations.

Because no research could be found that analyzes teachers’ schemes of decimals and/or fractions, for the content-specific part of our framework we drew on research of how children construct fractional schemes, specifically schemes containing the foundational activity of partitioning unit fractions further, termed recursive partitioning (Steffe, 2010; Steffe, Liss, & Lee, 2014). In these research studies, a fraction is conceived of as a multiplicative relation between two units—a fractional unit and the whole to which it is being related. Specifically, a unit fraction \((1/n)\) gains its meaning from the learner’s anticipation that it fits precisely \(n\) times into
the whole—and hence the whole is exactly \( n \) times as much of that unit fraction. For example, 
1/10 is a unit that the whole is ten times as much of it, and 1/100 is a unit that the whole is 100 times as much of it. Consequently, a recursive partitioning operation can be carried out, actually and/or mentally, to make parts of parts of the whole. To further illustrate this, a learner may form an anticipation of the relationship between partitioning 1/10 into 10 equal parts and the effect of a new unit fraction that the whole is precisely 100 times as much of it (while the 1/10 is also conceived of as 10 times as much as 1/100). Critically, the learner should also be able to anticipate, and explain, why each such unit is 1/10 of 1/10 (or 1/10 times 1/10), by abstracting the two-step partitioning ‘history’ that occurred to arrive at 1/100. Steffe (2004) refers to this as a scheme involving units-of-units-of-units, as 1/100 is 1/10-of-1/10-of-One (whole).

Method

This study used a qualitative case-study methodology (Merriam, 1988; Stake, 1995) to figure out how an upper-elementary teacher may reason about and make conceptual advances in the domain of decimal fractions. Annie (pseudonym) served as a case within a larger teacher development experiment (Simon, 2000) conducted by the first author of this paper. The goal of this methodology was to promote teacher development as a cyclical process - similar to constructivist teaching experiments (Cobb & Steffe, 1983; Steffe, Thompson, & von Glasersfeld, 2000) conducted with children. Annie serves as a case in a threefold sense. First, she represents teachers interested in their own development while recognizing it must include improvement in one’s own mathematics. Indeed, Annie approached her principal, and the researcher, to ask for help in improving her own mathematics. Second, our preliminary analysis of data indicated, prior to the intervention, that Annie’s available knowledge was typical of many elementary teachers (Simon & Blume, 1994; Tirosh, 2000). Third, Annie’s participation in the school’s Professional Development (PD) intervention, instigated by the third author (principal at the time), included a focus on understanding children’s thinking and learning of fractional schemes through activities and tasks (including a computer software) that could also be used to promote Annie’s understanding. We note that, within this PD context, Annie participated as a teacher assigned to teach a grade-4 class in which a large proportion of students were identified as English Language Learners, because Spanish was a language in which she could communicate.

Data collected for the study reported in this paper include video recording of one observed lesson and the post-lesson coaching session conducted by the first author, and
transcribed and annotated by the second author. Our data analysis consisted of three iterations. First, we focused on identifying sections in the data that pertained to the meaning Annie seemed to have for common fractions, for decimals, and for the relationships between those numbers. Second, we focused on making inferences into cognitive structures and operations that could explain what made sense for her by linking the actions and language she used in both the lesson and the coaching session. Third, we interweaved main themes we identified in her reasoning and learning into what, to us, seemed a coherent ‘story’ that unfolded through the teaching-learning interactions. This story is told in the next section.

Analysis

In this section, we analyze data from (a) the first lesson on comparing and ordering decimals that Annie taught to her 4th graders and (b) a post-lesson coaching session conducted by the researcher at the end of the same school day. We first describe the 3-part, observed lesson, which we consider data for addressing the first research question because it provides a ‘window’ onto Annie’s mathematical understanding. We then proceed to presenting and analyzing data from the coaching session, which focuses on the third and most telling part of Annie’s lesson, to address the second research question while substantiating claims about what she did seem to know (or not) about decimal fractions. This leads to addressing the third research question by examining the researcher’s use of knowledge on children’s fractional reasoning to foster Annie’s construction of a recursive partitioning operation with tenths (e.g., why 1/10 of 1/10 of a given whole is equivalent to 1/100 of that whole). We provide evidence for how this research-based knowledge about children enabled diagnosing conceptual understandings Annie needed to construct, so that comparing and ordering decimal fractions would make sense to her.

Annie’s Three-Part Lesson on Comparing Decimals. Annie’s main goal for her students’ learning during the three-part lesson she had requested the researcher to observe seemed to be that her students would be able to use the tenth-digit as ‘first-in-line’ for comparing decimals. Besides being rooted in the curriculum, this goal seemed to reflect her perturbation about student incorrect answers on the previous day’s test, such as comparing 0.45 and 0.9. Toward the end of the lesson we observed (about 40 minutes into it), she returned to that problem (see Figure 1), talking about and underlying the tenth digit in each decimal fraction, then asking students to say out loud (in unison), “nine tenths is greater than four tenths.” Earlier during the lesson, she used a pair of numbers (8.9 and 8.87), under which she drew arrows to underscore the tenth digit, and engaged students in saying out loud in unison, “nine tenths is greater than eight tenths.”
To accomplish her goal, in the first part of her lesson (~14 minutes) Annie introduced a handout titled “My Place Value Tool.” It included 9 empty-spaces for considering (inserting) numbers that have a decimal point with tenths and hundredths places (see Figure 2-a). She reminded the students how, in 2nd grade, they used base ten blocks for whole numbers. Then, while drawing diagrams on the board, she said that, for decimals, they would use a ‘column’ of squares for each tenth and a square (‘small cube’) for each hundredth. She also linked a tenth and a hundredth in the place value expression to the proper fractions of 1/10 and 1/100 – and to their monetary values of a dime and a penny, respectively (all written on the board, see Figure 2-b).

The second part of this lesson consisted of students working in pairs, and then of a whole class discussion, on solutions to a few problems of Comparing and Ordering Decimals. These problems were cast in the realistic context of music types found in the market. Five music types with the following percentages were included: Pop – 8.9, Country – 10.4, Rock – 25.3, Rap/Hip Hop – 13.3, and R&B – 10.6. Annie moved about the pairs, making sure each had documented the comparisons in correct mathematical ‘sentences’ (e.g., 13.3 > 8.9). In the whole class then, Annie and the students read these comparisons out loud in unison (e.g., “Thirteen and three-tenths is greater than eight and nine-tenths”).

Finally, in the third part of the lesson (~15 minutes), Annie addressed the comparison between 8.9 and 8.87 – the latter being the percentages she supplied to a different type of music contributed by a student (Orquesta – the Spanish word for Orchestra). To address this
comparison, Annie delved into the equivalence between .9, 9/10, and 90/100, by first adding a dotted ‘0’ to the right of 8.9 (so it then could be read as 8.90). Students seemed unclear about the equivalence of 9/10 and 90/100. Thus, she attempted to show it by covering the right-most zeros in the numerator and denominator of 90/100 (see Figure 3). She followed this by telling them that .9 is the way to write 9/10 in a place value system. Finally, she returned to the comparison of ‘9’ and ‘8’ in 8.9 and 8.87 (respectively), and to ‘4’ and ‘9’ in .45 and .9 from the previous day’s test. In that last comparison, she explicitly told the students that their reasoning (“.45 has more digits”) was incorrect, and they should focus on the digit in the tenths place.

Figure 3. Annie’s explanation of equivalence between 9/10 and 90/100

Throughout Annie’s lesson, and particularly during the third part, she seemed to us to lack a scheme for reasoning about recursive partitioning of unit fractions—a scheme found in research about children (Hackenberg, 2007; Steffe et al., 2014). Specifically, she did not seem to consider 1/100 as the potential, mentally anticipated outcome of partitioning 1/10 of the whole into its tenths. The researcher thus decided to focus much of the post-lesson debrief on (a) figuring out how Annie thought about the equivalence of, say, 1/10 and 10/100, and (b) fostering her construction of a recursive partitioning scheme. The next section elaborates on both issues.

Annie’s Thinking about Decimal Fractions. Before delving into what Annie needed to construct to make sense of equivalence among 9/10 and 90/100, we propose what we infer she did know about decimal fractions. Our inferences are gleaned from data collected during the first 9 minutes of the post-lesson coaching session, which began with asking Annie to explain why she thought 0.1 is larger than 0.09. Her response focused on the location of the digits in the place value system:

Excerpt 1: Annie’s Initial Explanation of Her Comparison of Decimals

Annie: I think it matters totally on the place value where the digit is. So it's, I mean, I...I, my knowledge is (places hand on heart) that wherever the digit is (holds up right hand, forefinger and thumb extended as if pinching a number and moves hand in hopping movement in air from left to right) in the place val.., in the correct place value then you have to first realize what the place value is and then you see the digit to know if it's bigger or smaller than a different digit.
Annie (a little later): Umm, yeah, it’s the, it’s the (puts both hands together and then opens them into a V shape with arms) opposite way of the spectrum of place value so, or the base ten system I mean. So, going to the left (holds left hand in air and moves it in hopping movement towards left), the place value is always multiplied, exponentially gets bigger by ten; going to the right of the decimal (moves left hand back to middle and then towards right in smooth movement, two times) it's doing that, but it's going smaller so it's being divided.

Annie’s initial, independent responses in Excerpt 1 indicate her rather procedural focus on the way a decimal fraction is written in the place value system. On one hand, she seemed to recognize the linkage between a position of a digit in a number and the value of that position. On the other hand, we use ‘procedural’ to emphasize the fractional quantity symbolized by each digit in the system did not seem to be prominent in Annie’s reasoning. The researcher thus pursued further by asking Annie if she could explain this in a different way that does not use the place value aspect. She responded: “Ummm, well, like what we were talking about [points to the white board] about equivalent, umm … fractions, so a hundredth is, is a, well a hundredth is divided … a tenth divided again by ten.” Following her response, the researcher went to the white board Annie herself used in the lesson, pointed to the fractions written on it (.9, 9/10, and 90/100), and again asked her to explain—not in place value terms—in what way these three numbers are related. Annie responded: “They’re all, umm, ‘cause if you were looking at some, … at a, at a model, if you were to color in, … shade in, … they would all have the same portions.”

Annie’s responses (e.g., notion of shading, or coloring) indicated she has been operating from the prevalent conceptualization of fractions as parts of wholes. Most importantly, in both explanations she gave (place value for decimals, proper fractions as shading the same portion) there seemed to be a lack of explicit meaning for the quantities for which each symbol stands. To us, and to the researcher at the time, a hundredth (1/100) did not appear to serve a ‘connecting role’ in her thinking, not even in the sense of ‘common denominator’. The researcher thus conjectured this could indicate the absence of understanding of 1/100 as a quantity resulting from a recursive partitioning operation (i.e., 1/10 of 1/10).

To further pursue this conjecture, the researcher turned to the computer and used the JavaBars software (Biddlecomb, 1994) to draw a long bar (red), partition it into 10 equal parts, and color (“shade”) every other tenth in another color (yellow, see Figure 4). He then asked Annie to point on the screen where she saw the 9/10. She responded by pointing to and simultaneously counting each of the colored tenths (red and yellow) from 1/10 through 9/10, accordingly. Sensing this knowledge of hers is also what she tried to teach he asked: “So [the idea that] each one is 1/10 and you have nine of them is [also] what you tried to show on the board?” – to which Annie nodded, “Yes.” Accepting this, he then pursued further: “How is this [pointing to the 9th tenth on the computer screen] related to .9? Why is this .9?” Simply re-stating
her previous assertion, Annie responded: “.9, when you say it, is also 9/10.” To the follow-up question, “So they are just the same quantity?” she replied, “Yeah.”

Figure 4. A JavaBars screen showing a whole partitioned into 10 equal parts

The above exchanges indicated to us that, within an equally partitioned whole, Annie could identify 9/10 as the equivalence of 9 pieces, each of size 1/10 of the whole. Her understanding of each unit fraction seemed to be rooted in it being one of 10 equal parts (to which she pointed on the screen), nine of which she counted one-by-one. This was supported by her initial response to the researcher’s request in the following task, namely, in what way the 9/10 on the screen is equivalent to 90/100 (see next section). We note that these exchanges did not pursue the extent to which Annie considered any single 1/10 as a multiplicative relation to the whole in and of itself. However, suspecting that such a multiplicative notion might not be part of her reasoning led the researcher to proceed to what he considered as a core of the teaching-learning process for Annie, namely, the multiplicative, recursive operation involved in creating 1/100 as a unit fraction of a unit fraction (1/10 of 1/10).

Annie’s Initial Construction of Recursive Partitioning. The researcher set out to further diagnose Annie’s thinking about equivalent fractions (9/10 and 90/100) as a basis for promoting her thinking of this equivalence. Excerpt 2 presents data pertaining to these exchanges.

Excerpt 2: Annie’s Thinking of the Equivalence 9/10 = 90/100

R: I am a child; I am looking at this, first you wrote the ‘point nine’ [.9]; it was related to eight; so I would probably need to understand that you dropped it and then you wrote nine tenths; and I only had nine. [Then] suddenly it's nine over ten, and it’s the same. Do you see, from a child’s point of view …

Annie: (Smiles, nods her head up and down for yes) A lot, uhhh-huh.”

R: (After a few seconds wait time, relating to her action in class of hiding the zeros) As a child in your class, not understanding why you can hide this [the zeros], or take it away [the zeros]; umm … I don’t get it. So, where in the quantities this must be the same?

Annie: (seems to be thinking, silently, how to respond to this question for about 20 more seconds.)

R: (Rephrases the question) So what I am trying to push at, is how do you understand ninety hundredths in this picture (pointing to the ninth-tenth on the screen)? What would you do to get ninety hundredths?

Annie: I would count these and make sure there was ten, (points with the mouse to the shaded parts on the screen), five; ten.
Excerpt 2 indicates Annie’s thinking about fractions as equal parts of a given whole through her attempt to show, to a ‘mock child’ played by the researcher, that each part is 1/10 of the whole. The key point we emphasize in this excerpt of data is that, on one hand, she recognized the question and possible difficulties students in her classroom might have experienced when she tried to convey the equivalence at issue. On the other hand, she reverted to explaining why each colored piece was 1/10 of the whole – not why the 9/10 she had just counted was equivalent to 90/100. Her responses did not include any indication of the potential to recursively partition one or all nine of the tenths shown on the 10-part whole.

Considering difficulties found in research on children’s construction of recursive partitioning schemes, the researcher then turned to providing Annie with a prompt for such a possibility as a means to explain the equivalence between 9/10 and 90/100. He pulled another 1/10 from the 10-part whole, demonstrated for Annie how it could (recursively) partitioned into 10 equal parts, and asked:

**Excerpt 3: Annie’s Initial Explanation of why 9/10-90/100**

R: How would you tell me that this [points to 9/10] is just like 90/100? Why would I believe you? Ninety [90] and hundred [100] are so much larger [then than nine and ten]; as a child, they are like “whooooaa …” You see the point but I am trying understand how you think, you know that it is the same and I am trying to understand why, for you?

A: Umm (short pause); I think the, I think what I was saying [in class], with the zeros, so in my mind (puts hand up and touches her head); if I can do the same thing to [the] top, and cover up one of the zeros (puts hand in the air as if covering the numerator), and to the bottom cover up (moves hand lower as if covering the denominator), [then] it is visually the same, (holds both hands in air on top of one another as if to cover numerator and denominator together). I think that is how I best understand it, but I think when I look at a model I …

The data in Excerpt 3 indicate that, at this point, the researcher’s prompt did not impact Annie’s reasoning. She seemed engaged in trying to figure out how 1/10 of 1/10 may be related to explaining the equivalence at hand. After being asked the question in two, slightly different ways, however, she returned to her available way of reasoning of covering the zeros, as she demonstrated in class (see Figure 3). We infer from Annie’s response that her understanding of 9/10, and hence 1/10, was not as quantities on which she could operate with further partitioning. Rather, her mathematics at the time reflected a ‘canceling-out’ procedure she likely learned previously, during her schooling and/or teacher preparation. We refer to her understanding of the equivalence as working with/from empty symbols, that is, she had a way of using the symbols to appear like the equivalent fraction, but seemed to lack a meaningful quantity these symbols would signify (e.g., 1/10 of 1/10 as a multiplicative relation between the resulting unit fraction and the whole).
With this inference, and having realized his rather explicit prompt of partitioning the 1/10 further did not ‘ring a bell’ for Annie, the researcher turned to first fostering a perturbation in her own (procedural) thinking about the equivalence by alluding to the actions she had used. Using the mock child context again, he went to the whiteboard, wrote on it 91/101, and said: “I am a child; I just saw what you did; so [similarly] 91/101 (covers the ‘1s’ in the numerator and denominator) is like 9/10?” Excerpt 4 below provides data of exchanges that this perturbation-seeking question transpired.

**Excerpt 4: Fostering Recursive Partitioning through A Perturbation**

A: Ohhhhh; No.
R: Is it [9/10]? Is it not [9/10]?
A: Ummm, ohhh … (A little later) No.
R: Why not? Can you use any of the quantities here (looking at the computer screen) to explain to me why ninety-hundredth is like these … and why ninety-one over one-o-one [91/101] is not?
A: (Takes the mouse, points to each tenth on the 10-part whole while saying accordingly) So this, so if this, so this is ten here, so if I had to say how is this like ninety-hundredths, I would say well if it is already in tenths then this represents ten-hundredths, this is twenty-hundredths, thirty-hundredths, forty-hundredths, fifty-hundredths, so I …
R: (Points to the first tenth, which is NOT partitioned into 10/100) How would you tell me, how would I know these are ten hundredths? What would you do to, … [you can] ask me to do something on the computer to show that this one-tenth is also ten-hundredth.
A: Ummm, could you make this one-tenth into tenths?
R: (Shows Annie how to re-partition 1/10 into 10 equal parts, then teaches her how to pull out one of these little parts, each 1/100 of the whole.) So help me understand, we put ten of these, one thing that as a child, or as an adult, I now know this thing still stayed the same quantity, and it is one-tenth of that whole. I understand that. Help me understand why it is ten-hundredth? Why not ten-tenth, or ten-millionth? How do I know that this is ten-hundredth?
A: Umm, because, … So if this is already separated into ten then all of these (points to the 10-part whole) could be separated into ten as well. So then ten, ten times ten is a hundred; so then if one of those sections is there it would be ten-hundredths.
R: So, let’s first make sure that we see what you are saying. This is one one-hundredth (points to the small piece on the 10/100 bar)?
A: Mmm-hmm (nods yes).
R: That is what you are saying, that this one … and the reason; now you gave me a reason; I will just try to extend it a little bit. You gave me a reason … so you just said to me this little piece, that [was] pulled out, this is one-tenth of one-tenth?
A: Yeah.
R: And it is also one-hundredth?
A: Yeah. (Then, a bit later and after they used JavaBars to show and measure that the 1/100 is 1/10 of the 1/10 piece) But even that, but even that much word, like even that much language for me is hard. So I think that’s why, ‘cause you bring up a good point …

Excerpt 4 provides evidence of Annie’s initial construction of recursive partitioning for unit fractions (tenths). We claim that, at best, she has constructed a participatory stage of a scheme by which she could think of (anticipate) 1/100 as the effect of the activity of re-partitioning 1/10 of the whole into 10 equal parts. Let us first address the nature of her new construction, which was brought forth by first fostering her own questioning of the procedural method she had used (covering the same digit in the numerator and denominator). This perturbation, created as a counter example in which a pseudo-similar operation on different
numbers (91/101) leads to the same effect (9/10 like in her covering of 90/100), seemed to help Annie realize her own reasoning was fault (“Ohhhhh; No”). With her “No” as the starting point, she then responded to the researcher’s question to explain the equivalence, with what, for the first time in our work with Annie, indicated an anticipation of the potential (not executed) action of partitioning each 1/10 into 10 parts, which would result in a 100-part whole. Accordingly, it seemed also the first time for her to realize that each 1/10 could be ‘skip-counted’ in 10s of hundredths (“This is 10/100, 20/100, 30/100, 40/100, … [etc.]”). We do not claim here that Annie’s understanding has been anchored in an explicit multiplicative operation; only that she realized the equivalence involved in the number of parts by which such an equivalence could be explained. This is consistent with her seeming consideration of the number of parts in the whole and in each tenth (“So, then all of these (points to the 10-part whole) could also be separated into 10, too … Ten times ten is a hundred and then one of those sections would be 10/100”).

Having articulated the nature of Annie’s newly found conceptualization, we now return to the claim it was constructed at the participatory stage. Such a claim is key to understanding that Annie’s new way of reasoning, while an important advancement in a teacher’s thinking about fractions and decimals, is not yet expected to change her practice so it promotes students’ conceptual powers in this domain. Our claim for a participatory stage rests on three main aspects of the history of exchanges leading to Annie’s new realization. First, as seen in Excerpt 1, Annie did not initially “act upon” the prompt given by the researcher, in which he literally (in action on the screen) partitioned the 1/10 into 10 equal parts. Rather, she reverted to her digit-covering method. Second, a noticeable time gap took place between her experience of the intended perturbation (i.e., 91/101 for her was not equivalent to 9/10) and the point of starting to explain how each 1/10 in the 10-part whole could be considered as if it was partitioned, too. We postulate that during that time gap Annie’s mind was searching for a way to show the researcher why the equivalence worked, a goal toward which she could have brought forth and use her activity of multiplying whole numbers (“Ten times ten”). In turn, this whole-number scheme triggered activation of her partitioning activity, at which point she could finally apply such partitioning to a unit fraction (1/10). In turn, she could also mentally apply the same activity to all unit fractions in the whole (10/10=100/100) and in the non-unit fractions (9 of those tenths = 90/100 of the whole). Third, we point out to Annie’s genuine statement that the language about 1/10 of 1/10 is hard for her. We contend that this language was hard because she has just began constructing a recursive partitioning operation, in which one symbol (1/10), used recursively, would present a hurdle until such a multi-step activity is both cemented into a single activity and
linked back to the whole as a multiplicative operation on units of units (Hackenberg & Tillema, 2009).

Discussion

In this paper, we presented a case study of a 4th-grade teacher (Annie), which focused on her mathematical understanding in the domain of decimal fractions. Our analysis indicates that, at the study’s outset, her understanding was rather procedural. During the post-lesson coaching session, however, she began constructing a more robust way of reasoning—a scheme marked by anticipating the effect of recursively partitioning a unit fraction, such as 1/10. In this final section of the paper, we propose three key contributions of this study: (a) explicating an elementary teacher’s mathematical knowledge of decimal fractions, (b) applying knowledge from research with children to the coaching of teachers, and (c) pointing out the potential such teacher learning may hold for informing her practice. Below, we expound on each of these.

An Elementary Teacher’s Knowledge of Decimal Fractions (Research Question 1). Our study contributes to the articulation of ways of reasoning about decimal fractions that elementary teachers may typically have and use. Specifically, Annie presents a common case of a threefold way of thinking. First, her thinking about unit fractions seemed driven by a limiting, one-of-n-equal-parts-of-a-whole model (Van De Walle, Karp, & Bay-Williams, 2010). Such a model is limiting, for example, when one is trying to determine the fractional size of a part within an unequally partitioned whole, or when shifting from proper to improper fractions, because a part cannot be larger than the whole of which it is a part whereas a fraction can be larger than that whole (Figure 5).

![Figure 5](image-url)

Figure 5. One-fourth of an unequally partitioned whole (two $\frac{1}{4}$ths, one $\frac{1}{2}$) and $\frac{5}{4}$ of it (bottom)
Second, Annie’s notion of ordering decimals seemed superficial in the sense of left-right, (place value) position determination. During class (see students’ unison statements), she seemed focused on starting a comparison of the digits from the 10ths; if those digits are equal - move one position to the right (100ths) and compare those, etc. As our data showed, Annie followed a method for which she did not seem to have a sound explanation of the magnitude of each unit in the place value system—let alone of the relationships among those units.

Third, Annie seemed to also operate procedurally on the numerator and denominator of fractions in the sense of lacking a meaning for the unit fraction of 1/100, apparently reflecting no multiplicative coordination of its origin (1/10 of 1/10, or 1/10 times 1/10). Both during the observed lesson and the coaching session, she explained the equivalence between 9/10 and 90/100 via a bodily gesture of ‘cancelling out’ a zero in the numerator and the denominator. While mathematically correct for that particular fraction, Annie’s method cannot be generalized, and she seemed to have no way of explaining why it would be justified in this case.

Coaching Teachers Based on Research with Children (Research Question 3). Annie’s case study demonstrates how a teacher’s understanding could be advanced while using knowledge from research on children’s learning of fractions. A key scheme she needed to construct, in which units produced through a previous partitioning are partitioned further, was investigated in several constructivist teaching experiments (Confrey, 1994; Norton & Wilkins, 2009; Olive & Steffe, 2010b; Steffe, 2010). Our scrutiny of the literature indicates that the construction of such a recursive partitioning scheme (a) has never been studied in teachers and (b) seems crucial for their ability to operate on/with fractions as multiplicative quantities. Specifically, our study showed how such a scheme may underlie a teacher’s conceptualization of 1/100 as the effect of (recursively) partitioning 1/10 of a whole into 10 equal parts. Moreover, rooted in our conceptual framework, we demonstrated that such a scheme could be constructed as reorganization in the schemes available to the teacher.

To initiate our case study’s construction of this scheme, the researcher commenced the teaching-learning process by cultivating a perturbation in Annie based on her way of explaining the equivalence between 9/10 and 90/100 (covering to ‘cancel out’ the zeros). Capitalizing on what she actually did in class, the researcher used the same bodily gesture for a counter-example she would possibly dismiss (91/101 ≠ 9/10, although it is possible to cover the ‘1s’ like she did with the ‘0s’). Determining that Annie experienced the intended perturbation, he then turned to promoting reorganization in her scheme of the link between 1/10 and 10/100. To this end, he re-oriented her attention to a recursive partitioning action being presented on a computer screen.
He anticipated that she could anticipate the effects of recursive partitioning (1/100, 10/100, and other multiples of 10/100) by bringing forth her scheme for multiplying whole numbers (Steffe & Cobb, 1998). Thus, this teaching-learning process provides an example of how teacher educators can inform coaching sessions geared to advance willing teachers’ mathematical understandings by using analytical lenses gained through research on children’s construction of compatible schemes.

Potential for A Teacher’s Newly Constructed Math to Inform Her Practice (Research Question 2). In the past two decades, research has repeatedly demonstrated the key role that teachers’ mathematical content knowledge (MKT) serves in affording, or constraining, their practice (Hill et al., 2008; Hill et al., 2005). Our study lends rather unique support to this commonsense standpoint, by highlighting how absence of a recursive-partitioning scheme may hamper a teacher’s capacity to promote her students’ meaningful operations when ordering decimals. Indeed, Annie’s choice to work with the researcher on decimal fractions was due to her self-perceived weakness in this area. Going into the lesson presented in this paper, she explicitly conveyed how her students did not understand what she tried to teach largely because of her own insufficient understanding (e.g., many of them failed to ‘see’ what, for her, was painfully obvious—0.45 must be smaller than 0.9). We were thus in a unique position to not only witness how a teacher’s own mathematics serves as an “upper-limit” to what her students can learn but also to examine this stance with a teacher who volunteered to do so in a difficult-to-grasp (and teach) domain. In this sense, Annie is a twofold case of a teacher who self-recognizes her own lack of understanding decimal fractions and the limitation it places on the teacher’s ability to foster students’ learning with understanding.

It should be noted that, while clearly seeing Annie’s progression during the post-lesson coaching session as necessary for a change in her teaching practice, we do not consider it as nearly sufficient for being fully, meaningfully, and independently implemented. We do contend, however, that her early construction of a recursive partitioning scheme has a twofold, vital potential. First, this new scheme can ‘open the door’ to further development along a continuum of schemes that constitute fractional reasoning (Steffe et al., 2014; Tzur, 2014). Such schemes are needed, for example, to meaningfully solve problems involving equivalent fractions, addition/subtraction of unlike denominator fractions, and of course multiplication/division of fractions. Second, once her recursive partitioning scheme would be constructed at a solid, anticipatory stage (which our data are inadequate to determine), it will serve as a basis for both setting similar understandings as goals for her students’ learning and for selecting and/or creating
tasks to promote such learning (Simon & Tzur, 2004; Tzur et al., 2013). We anchor this claim in the example that perturbed Annie to recognize the inadequacy of her own mathematics. As seen in Figure 6, to compare .45 and .9 she would anticipate and justify the quantities each symbol stands for, and thus why .45 is smaller than .9 even though it has more digits.

![Figure 6. Recursive partitioning of tenths into hundredths to compare .45 and .9](image)

The reasoning to make sense of this comparison will include seeing .9 as equivalent to .90 (and 9/10 to 90/100) in spite of the fact that the wholes are partitioned into 64 and 55 unequal parts, respectively. Note that on each whole bar one would have to anticipate, without actually executing, the partitioning of each 1/10 into 10 equal parts that, together, amount to 100 parts (not all are visible!). To Annie, and her students, 100 can thus become a common measure (Olive, 2003; Olive & Steffe, 2010a) of both .45 and .9, because the whole is 10 times 10 as much of each small piece, and hence 100 times as much of it. Similarly, they will also anticipate and explain why, after the recursive partitioning, each 1/10 must necessarily also be 10/100 of the whole (10 times 1/100). Coordinating these two anticipations could then underlie a meaningful ordering of any two decimal fractions (e.g., .45 < .9) because, when considered for the equivalent quantity, it entails to compare the number of same-size units (e.g., 45 units of 1/100 each against 90 units of 100 each). We see this potential for changing upper-elementary teachers’ practice through changing their knowledge of decimal fractions on the basis of research on children’s fractional schemes as a strategic site for future research.

Abstract

The process for digital figure modeling has dramatically shifted from a low to high polygon workflow to its current incarnation of high to low polygon workflow. Developments in 3D animation have also allowed animators to refine their work to a much higher level. In this paper, we break down the classroom process being used to create high-fidelity digital figure sculpture and high-fidelity animations using traditional art based teaching techniques. Class and lecture time is primarily dedicated to teaching concepts that lay outside of the software and are key to understanding how and why things look and move the way they do in the real world. The modeling section focuses on human anatomy and traditional drawing techniques being applied to a digital media class while the animation section focuses on the physics of the motion and the importance of clear timing and posing.
**Introduction:**

Breaking down the process being used to create high-fidelity digital figure sculpture and high-fidelity animations using traditional art based teaching techniques. Evolving software for the movie and video game industries has changed the character production pipeline over the last few years. The process for modeling has dramatically shifted from a low to high polygon workflow to its current incarnation of high to low polygon workflow. Developments in 3D animation have also allowed animators to refine their work to a much higher level. A more traditional art style approach to teaching for the current development pipeline appears to be needed. This is how a modeling class and an animation class at East Tennessee State University are adapting to meet these demands.

Teaching someone which end of a paintbrush or chisel to use in at a university level class would be simplistic if not insulting. However, digital artists have been introduced to the computer as a creative tool in this same overly simplistic manner. As more and more students are born into a world with high-speed internet and constant exposure to the digital world, the need for remedial computer training at the university level is outdated and possibly insulting to the students. In conjunction with this new generation of learners comes many advances in the software that is used to create the digital images we see every day.

In the first section, we will discuss the idea of digital sculpture. What is its current form as well as the technology that makes learning how to do it less about button pushing and geometry and
more about form and aesthetic? In the second section, we will explore teaching 3d character animation. We will discuss how it can be broken down into the most fundamental elements in order to build critical thinking skills to solve future animation challenges.

The idea that the learner needs to be a technology wizard to create beautiful 3d models and animations is coming to an end. Now, more often than not, the youngest of the people we encounter are often the most technologically sophisticated in the room. They are not bothered by operating systems, graphical interfaces, or high-tech peripherals. These learners are able to jump into digital media at a high level. Over time, the technology we have taught at our highest level class has trickled down to our freshman classes. This has met with resistance, but the free flow of technology has pushed forward. Now students are able to look past the complicated interfaces and more quickly start using the software as a tool for artistic creation.

Embracing this trend, many of ETSU’s Digital Media faculty have moved from the idea of focusing on hard skills, like where button A is or how to create object C using method Y, to a more lifelong learning approach. Emphasizing research, self-guided learning, and understanding rather than regurgitation, ETSU’s Digital Media program is establishing itself as a leading program in the Southeastern United States.

**Class 1 – Digital Figure Sculpture:**

What does all this mean and how is it being applied in the classroom? Here we will look at the Digital Figure Sculpture class and how it used these ideas to improve student success. Digital Figure Sculpture used the latest in high polygon modeling software while emphasizing
anatomical drawing and traditional sculpting techniques. This class implemented Zbrush, the latest high-end software being used by industry professionals in movies and video games. However, emphasis was placed on the aesthetic result rather than the tool. In past iterations of digital media classes, knowledge of the software was often enough to pass a class. The emphasis on the aesthetic result changed that fundamentally.

The Class:
The class was designed around a shortened summer schedule as a rigorous three-week workshop. The class implemented traditional drawing and sculpting techniques inside Photoshop and Zbrush to create digital figure studies and sculptures. Learners created high-fidelity anatomically correct figure models using digital sculpting software while learning and applying traditional painting, sculpting, and drawing techniques.

Prerequisite for the Class:
Designing this class with the intention of limiting the technology while teaching cutting edge software, the prerequisites were kept extremely light. The prerequisite included knowledge of Photoshop and basic computer skills. The class focused on new modeling techniques, artistic ability, and anatomical understanding.

Drawing and Anatomy, “I thought this was digital media”:
Understanding anatomy is a critical part of figure modeling. The technical aspects of figure anatomy from works including An Atlas of Anatomy for Artists by Fritz Schider as well as other sources were the cornerstone of the class. Application of drawing technique and line diversity are
APPLYING TRADITIONAL ART TECHNIQUES

essential for describing what the learner is portraying. Both of these ideas come into play as learners began sculpting.

The class began by scanning thirty anatomy drawings, ten drawings of the bones, ten drawings of the muscles, five drawings of the skin, and five drawings of the veins and arteries. These scans were then brought into Photoshop and the students were required to create three new layers for each of the drawings, one for line art, one for shading and one for naming the structures. During this part of the class, line quality, style, and technical accuracy for the shapes and name of the anatomical structures of the human body were the focus. This taught the students to “draw what is really there” and not what their preconceptions were.

The software:

For this project, the faculty focused on “limiting technology.” What does limiting the tool set mean? Here it is defined as picking the smallest amount of tools the learners can use to achieve the desired result. There were many different or even slightly duplicated tools that could be used to achieve most of the results the class was working toward. The faculty leading the class optimized a minimized toolset allowing the learners to focus on the aesthetic rather than the technology. Knowing the end project, the faculty carefully selected a set of tools that minimizes duplication while giving the learners all the tools needed to complete the project.

Traditional techniques appear through the learning process:

The heads system of measuring is a traditional art method for judging the scale and size of a character. The heads method says that every feature of the body is X “heads” tall or long. To use
this method, the learners created a sphere equal to the size of a head. The sphere was placed on a separate layer and duplicated to measure. This required some software knowledge of layers and duplication in Photoshop. Also, a system of efficiently using reference was incredibly important. The reference that was created by the students and how to effectively use it was emphasized as a tool. Traditional drawing techniques emphasize drawing from life. Here that tradition is repeated using a combination of techniques to implement the reference images.

**Breaking down the human figure, torso, arms, legs and hands:**

As with limiting the tool set, limiting the scale of the project leading to the final allowed the students to focus with a laser-tight precision on very specific aspects of the figure. Breaking the sculpts into five parts, the muscles of the torso, arms, legs, hand, and feet, the class painstakingly developed the shapes under the skin that make up what we see when we view a figure.

For learning purposes, the artists broke anatomy into smaller parts to limit visual errors. If you can break an item down into its base shapes, it allows the artist to focus on the scale rather than complex lines. The arm is two cylinders of roughly the same length with a gradual taper. Breaking that down further, above the elbow and after the shoulder, the upper arm is little more than a tube. By breaking the arm into two separate components visually, learners were able to focus on the scale first and then go back and apply the underlying anatomy in a measured process. The learners repeated this type of breakdown for each of the five parts of the body the faculty isolated.

**A self-portrait, “can I wear clothes”:**
The final project was an anatomically correct self-portrait model. Why a self-portrait? It is the quintessential traditional figure project, and it allowed for unlimited access to reference. The project: Wearing a bathing suit or similar form-fitting outfit, take sixty to ninety photographs focusing on three hundred and sixty degrees of all parts of the learner's body.

The learners were then guided through the project the same way the class is structured, gather reference, set scale, and build up landmarks. Then they went back over and built the underlying anatomical structure.

Presentation of the final project was a T-posed model in a three sixty round table. Formal critique for a self-portrait can be extremely difficult for students. Going back to the basics for the critique was important to communicate feedback. Correct scale, landmark locations, and overall accuracy was a key focus of comments. Identifying landmarks early and ending the critique with a positive note was also important.

**Improvements for next time:**

With the limited time constraints, the class was not able to delve into head and bust sculpting. The head and face being an important aspect of the character with so many small details, it was impossible to cover all of the elements in depth in a single class. Moving forward, pushing through the drawing sections of the class a little faster and freeing up time in the middle for more work on the face would improve the overall aesthetic of the project.

Looking to the past masters of sculpture, the pose of the character is essential. Current industry concept artists and modelers are asked to create assets in T-pose, and animators are tasked with
bringing the model to life. Balancing time, aesthetic, and portfolio needs of the learners, adding a more natural pose to the final would increase the aesthetic of the work but is not an essential modeling skill.

**Class 2 - Fundamentals of Character Animation:**

In the Fundamentals of Character Animation class, the instructor worked with the students to help them develop a full range of character animations for both games and film. No two animations are ever the same. And even with a repeating animation such as a walk or run cycle, the character’s physical and emotional attributes have a way of showing in the physical motion. Because of this, teaching animation as a process that the students can repeat through rote memorization does them a significant disservice. Each animation is a unique challenge, a complicated problem to be solved. To solve those problems, the students needed a strong understanding of physics, timing, and staging.

Technical complications such as constraints, FK/IK switching, and gimbal lock are difficult challenges that the student will face. But dedicating large portions of class time on methods to solve every technical issue that might arise would result in a student that is good at using the program, not a student that is good at making strong animations. These technical issues were addressed on a case by case basis and supplemental material was provided to help the students work through the issues if they arose. But class and lecture time was primarily dedicated to teaching concepts that lay outside of the program and were key to understanding how and why things move the way they do in the real world and how to replicate that motion.
Physics for Artists:

The students in the Digital Media department at ETSU often complain about having to take a physics class as their core science. So they groan when they see the words “Physics” in their Fundamentals of Character Animation syllabus as well. To soften the blow, the lectures and principles are reiterated as “Physics for Artists,” promising absolutely no math, formulas, or calculations, only concepts.

Human beings see motion happening every day of their lives. A person walking, tree leaves blowing in the wind, cars driving on coarse pavement, all of these motions and actions are intrinsically linked to the laws of physics that affect the natural world. The patterns and subtle elements of the motions become ingrained in our mind. So when a person views a poorly created animation that does not accurately adhere to the laws of physics, even if it is off by a tiny margin, it seems unbelievable. This is true for all animations, particularly of humans since we see other people moving every day.

For a character walk animation, students often fall into the trap of thinking that they can simply make the feet slide back and forward under the character and pendulum the arms front to back and that is all that is necessary to make a character look like it is walking. In fact, that is often what many of their early animations resemble. Some teaching methods rely on detailed memorization of the key poses that make up a walk cycle, and although the key poses were still covered in the Fundamentals of Character Animation class, the instructor focused primarily on the physics behind the motions instead.
A lecture on a walk cycle animation would explain that the feet are applying force to the ground which applies an equal and opposite force back preventing the body from collapsing to the floor. The force is being applied at an angle and encountering the force of friction. Without friction, the person’s feet would slide out from under them. The raising of the foot requires the core weight of the person to shift over the opposing planted foot in order to stay in balance and not tip over. All of these elements of a simple walk are driven by the laws of physics. The Law of Conservation of Energy, kinetic and potential energy, the many different kinds of forces, and Newton’s Three Laws of Motion were covered extensively, focusing on what the concepts meant in a practical sense and not the detailed calculations behind them.

The language of these physics concepts was used as often as possible when critiquing the students’ work. If a student were doing an animation of a character pushing a box, the instructor would say something like, “Notice how it doesn’t feel like the character is applying force to the ground. If they were, the hips would be pushed upward as a reaction to that force.” As time progressed, the students also started using similar language to describe what they saw in their own work and during peer critique.

The understanding of the core physics involved in the motion meant the student always had a place to start when trying to create a new animation or troubleshoot a problematic animation. If a jump animation felt incorrect, then they always knew that the problem had to be one of physics. No matter what the animation problem the student faced, they had a foundational physics based tool that could be used to address it.
This method differs from many traditional technique based systems because it focuses on problem-solving and critical thinking that is required to solve any animation problem rather than only giving the students a set of do/do-not rules to follow when creating an animation. The particularly helped the students later in class when they were asked to solve more complicated physical acting animations that were more nuanced and detailed.

**Breaking up the 12 Principles:**

One would be hard pressed to find an animation program or class that did not rely heavily on the 12 Principles of Animation. The 12 Principles were first published in *Disney Animation: The Illusion of Life* by Frank Thomas and Ollie Johnston in 1981. The book summarized all the techniques, tips, and tricks that the early animators at Disney Animation Studio learned in order to create believable motion. The book is seen by many as the Bible of animation. Thomas and Johnston summarized all they had learned in a handful of short concepts they called the 12 Principles of Animation (Thomas and Johnston, 1981, p. 47).

As listed by Thomas and Johnston (1981), the 12 principles are:

1. Squash and stretch
2. Anticipation
3. Staging
4. Straight Ahead Action and Pose to Pose
5. Follow Through and Overlapping Action
6. Slow In and Slow Out
7. Arcs

8. Secondary Action

9. Timing

10. Exaggeration

11. Solid drawing

12. Appeal

These principles are undeniably crucial to any animation education, but rather than build each exercise and project around the 12 principles, the instructor decided to use the 12 principles as a layer on top of the physics and body mechanics concepts. In short, no matter how perfect the arcs are in a character’s arm motion, the animation will still look bad if the character is defying the laws of gravity.

Some principles refer to elements of polish in the final animation that are necessary to the fidelity and aesthetic, such as Follow Through and Overlapping Action, Secondary Action, and Arcs. Others are simply descriptions of different workflows like Straight Ahead Action and Pose to Pose. But some of the 12 Principles are crucial core concepts to the way animation communicates as motion or action. For that reason, the instructor focused a very heavy amount of the lecture and critique time to two specific principles: Timing and Staging. All of the other principles were addressed and covered thoroughly as well. But timing and staging were seen as core elements that were required for the media to communicate as the artist intended.
**Timing:**

Timing is simply how much time it takes for an action to happen. A character may sprint across the room, implying they are in a hurry, or they may slowly drag themselves across the room implying they are depressed or sad. But since animation deals in the media of moving images, this is intrinsically linked to another concept called spacing.

Spacing is the distance that an object appears to travel over a single frame of animation. It is the changing of this spacing over time that makes an object seem to accelerate or decelerate. It is the inherent link between timing and spacing that allows an animator to emphasize weight, impact, level of urgency, trepidation, fear, and even thought.

The students were encouraged to consider spacing when creating key poses in their animation, building a foundation for strong spacing. If the animation was of a character raising their arm nervously, the spacing of the hand may accelerate more slowly. The student could build that spacing into key poses and breakdowns of the animation.

Spacing became even more evident in the final phase of the animation process as the student polished the animation of each limb using a graph editor. A very subtle change in the graph could make a large impact on the final spacing of the movement, so the students were given as much time as possible in this phase and encouraged to seek feedback more frequently in this phase. It was also emphasized by the instructor that this level of detail in the spacing was one of the primary things that separated professional quality work from mediocre work which could often cost a prospective employee a job.
Timing is one of the principles that often falls through the cracks for early animators. They are impressed that the character is moving at all, and so it is difficult to see the subtle issues with timing. To combat this, an extra step was inserted into the animation process in which the students were forced to stop and evaluate the timing of the shot and nothing else. This may sound obvious, but after working on an animation for a long time, the timing issues start to seem correct; you can’t see the forest for the trees. Working in a manner that forces the students to focus only on timing periodically throughout the process means that timing alone is given the attention it deserves.

**Staging:**

Staging is simply how the shot is presented to the audience. It comprises camera angle, composition, and pose. In the Fundamentals of Character Animation class, animation was compared to other types of communication, such as writing. Every frame of the animation has to communicate the artist’s intention to the audience, similarly to how every sentence must communicate in a paragraph. A single poorly composed sentence can cause an entire paragraph to become confusing and unclear. Staging is just as important to the way animation communicates to the audience.

One method of working with this was to have the students create all their keyframe poses on consecutive frame with no frames in between. This helped them to focus on the poses and staging without being distracted by the transition between those poses. This also forced them to go back later and focus on the timing.
For each pose in the animation, the student focused on the silhouette, line of action, contrapposto, and contributing anatomical factors. This allowed them to craft a single image that communicated the essence of what they wanted to communicate at that point in the animation. If their character was surprised, the viewer should be able to tell that from a single image of that pose. The first pass of feedback for each animation focused on improving the poses as single images before moving on to the transitions from pose to pose.

Once the poses were solid, the student could focus on timing. By solidifying these two elements of the animation, it made the splining and polishing process significantly easier and faster.

**Improvements for next time:**

Timing for animation is difficult, and students often assume the timing of their shot is fine. It is hard to make them address something they see as “good enough” when they are on a time constraint and facing assignments from other classes. The faculty of the Fundamentals of Character Animation class is currently testing new exercises that would help the student focus on timing in their animations and develop good timing workflow habits in future versions of the class.

Many students address an interest in working with motion capture data. Seeing that motion capture cleanup often deals with the adjustment of pose, weight, and timing, a motion capture exercise is being strongly considered, though it may require other exercises to be cut.
Conclusion:

While knowledge of the software is essential to the creation process, it should not be the acceptable outcome of the class. By changing the class focus from the technology to the aesthetic outcome, we are no longer accepting that the knowledge of the tool is enough. We are challenging our students to become strong digital artists and animators by creating aesthetically appropriate work instead of simply memorizing all of the buttons and shortcuts of the tools. This is only becoming possible now thanks to a generation of learners who have never lived without computers and software that is able to handle complex high polygon characters. This presents challenges to the teachers of these mediums, forcing them to use tradition art teaching methodologies rather than computer literacy teaching methodologies. But facing these challenges will increase the competency level of students and help empower them to enter an increasingly competitive workforce.

Abstract:
Project-based learning improves students understanding of the digital media pipeline and how learners fit into that process. The authors discuss in detail how they have applied PBL, project-based learning styled projects into the two classes one a sophomore-based class creates a mobile game for the Android platform integrating lectures and smaller projects; while, the other is a senior-based class, consisting of only a single assignment, building and publishing a digital magazine for use by the University. Both projects employ PBL but do it in two different styles and both styles of have proven to be effective. Here the authors discuss the class and the projects.

What is project-based learning or PBL?
We will be discussing two project-based learning projects in this paper. The first is “creating a game for mobile deployment”; the second is “creating a cross-platform digital magazine“. These are taught by two separate professors and in different classes but they exemplify a real-world problem solving style of teaching that is being offered to our learners.

An interpretation of project-based learning can be seen as a project that includes at least the following six areas of study, “1) the project presents an authentic, real-world challenge; 2) the project is academically rigorous, demanding breadth and depth; 3) learners apply learning by using high performance skills such as working in teams, communicating ideas, and organizing and analyzing information; 4) learners engage in active exploration by gathering information from various resources; 5) learners interact and make adult connections; and 6) various formal and informal assessment practices are embedded within the unit.” (Lee, Jean et al. "Taking A Leap Of Faith: Redefining Teaching And Learning In Higher Education Through Project-Based Learning").
Traditional projects are often given to teach a specific skill set. An example of a traditional project for a digital media student might be to create a raster image using layers or to create a 3d model using a polygon modeling technique. This type of skill-based project is excellent for introducing students to new ideas, however; problem solving projects can incorporate this type of learning while including many other soft skills as well as core techniques. Therefore we sought to employ project-based learning as defined by researchers as a “student-driven, teacher-facilitated approach to learning. Learners pursue knowledge by asking questions that have piqued their natural curiosity” (Bell, Stephanie “Project Based Learning for the 21 Century: Skills for the Future).

What is an example of a project-based learning assignment in digital media? We’re focusing on solving a real-world problem while applying lessons learned in the classroom— creating a game or creating a magazine, our processes reflect authentic, real-world pipelines. We will demonstrate how our classroom approach aligns with the concept that project-based learning “reflects a learner-centered environment that concentrates on students’ use of disciplinary concepts, tools, experiences, and technologies to answer questions and solve real-world problems” (Lee, et al. 2014).

A way faculty members do this is to begin the semester by assigning the final project, and then give lectures and critiques that help the students reach their goal. Every meeting with the students for that block focuses on something that will help the learner answer the initial question. By working the lectures and/or critiques around a central question the class can see how the smaller pieces fit together to solve a larger problem.

Project 1

The first project we will be discussing is the creation of a game for mobile deployment. This is an eight-week project that works the learner from what a game engine is through using an XDK for mobile optimization and uploading html5 files. How does this fit in with PBL? Looking at the six ideas defined previously we will discuss how this project meets each of the criteria.

PBL Area 1: Real world problem: create a game for mobile publication.

First what is the real-world problem the learner will be solving? The learner will create a game that is playable, aesthetically appropriate for the genre and optimized for mobile play.

PBL Area2: Academically challenging: demands basic knowledge of coding and strong understanding of design.

Is this project academically challenging? What types of learning will occur while solving the problem? The learner will need to be able to learn and demonstrate; a basic knowledge of scripting, a strong understanding of design and a strong understanding of optimizing assets for mobile.

PBL Area 3: Team-based challenge: the project is too big for one person to complete and requires a team to for success.

The final project is team-based and is too large for one person to complete. Learning the individual parts that can be used to make up the final game can be accomplished by individuals allowing for learners to
focus in areas of the project they are interested in. While the final project will require several different skill sets.

PBL Area 4: **Active exploration: active exploration is achieved by answering specific problems based on the basic information given in class.**

Active exploration is worked into the project from the beginning in that the students are tasked with creating a playable game. We do this by not defining what type of game or setting bounds on the game the students are expected to create—just something they are “interested” in. The topics covered in class lectures are a sufficient overview of creating a basic game but not enough to create “every game”. The students are expected to use active exploration “research” to understand how to modify the basic ideas presented in class to solve the problem.

PBL Area 5: **Learners must interact with each other and the outside world: Comments from the in-class critiques and live feedback from online users.**

The process of iterative design builds in the idea of feedback from the class. However, often in education there is very little input from “the real world.” Online and mobile developments change that in real time. Posting a game to Google or any of the other game hosting sites allows the world to have access to what the students are creating and give feedback. User comments, while not always positive in nature, often create a reality check on the student’s work that would not be there if the work was only seen in the classroom.

PBL Area 6: **Formal assessment class critique: informal assessment feedback on the site the game is published to and formal assessment through classroom critique and grading.**

The idea of formal assessment or in our case, final critique and grading happens inside the classroom while looking at the entire process from the initial steps of learning the mechanics, to group participation and finally feedback from the users online. This holistic approach to critique encourages the students to be active in the entire process while creating a breadcrumb trail for official assessment.

**Breaking down Project 1**

**Assigning the project**

The first day of the semester the class is given the problem, teams consisting of three members will create a game for mobile deployment. The project is due in eight weeks. There will be three weeks of lessons which will be done individually, two weeks of building a web version of a game individually and then three weeks to build the team based game.

During the first three weeks of the class the learners are guided through small assignments that develop the individual pieces for the games. An example of this is to design a heads up display “hud” for the game.

The learners are given a list of topics they would be interested in learning after the first three introductory lessons are presented and asked to pick which ones they would like to work on. These lessons do two things. Firstly, student buy-in is created when they select the areas they are interested in
learning. Therefore, they are more motivated in the class. Secondly, they can demonstrate to the class their areas of expertise during the small critiques, thus building towards the final project.

The first complete small game that is due allows the student to experience the entire building process. The first game is designed to be small and simple. By allowing the students one small complete game they can show off their area of expertise while applying the KIS (keep is simple) principle.

Choosing partners – past performance matters

Why all the small projects if this is a project-based learning model? This is a late freshman and early sophomore class. These learners are still learning the fundamental building blocks they will need to solve the problem.

That being said, this is an important part of the problem. Past performance matters. By explaining the final project at the beginning of the semester the class is very aware of what is going on with other people’s work. Each of the final groups will have a total of three artists; a designer, an animator and a scripter. Knowing this at the beginning of the class the students are presented with the opportunity to “impress” other potential group members with the small critiques along the way.

One real-world problem faced by entry-level artists is how to manage the distribution of work in a team setting. Students realize that the project is too large to be completed by a single person. However, they still may face the problem of selecting appropriate team members. Students learn how to overcome this challenge through observations along the way of how their class mates have been performing on the small projects that lead up to the bigger team project.

Creating a timeline – learn to identify and define time

With the ramp up of the product cycle, the final three weeks of the team project asks students to create a timeline and information management system. “Google Calendar”, “Google Dropbox” and “Facebook” have emerged over time to be the students preferred method of producing these. The students are asked to elect a “project lead” from their team. This person is tasked with creating the deadlines, assembling the work from all the artists and presenting the work at “checkpoints”. Often students work alone and “cram” at the last second not allowing for “iteration” or feedback. This model does not work for this project. The animator cannot animate until the designer builds an asset to animate, the coder cannot build functions without a design document telling them what to build. With each member of the team working at the same time meeting the deadlines created by the team the students become very involved in the process. The timeline with the breadcrumb trail of notes left on face book also plays into the formal assessment of the project later.

Creating the concept – planning code and graphics and how they work together

Creating the idea for a game becomes more challenging as the class is asked to create a proof of practice and game design concept that work together. How to design the game, while working with coder to create fun and interesting gameplay in a realistic time frame is a real world challenge. The idea here is to present the class with the challenge of creating a game that they can produce. The teams initially start out with complex and deep games which are whittled down to a more realistic concept through the idea of proof of practice. In other words they are allowed to design anything, then asked to produce a block out of the game with the base code in place. If they are unable to achieve this, the second iteration of
design is started. This process continues until the group has achieved something that they feel is producible and interesting.

**Optimizing the game – game works, but test and optimize**

Once the teams have created a game that works on the local PC and looks aesthetically complete, they can begin testing locally and optimizing for deployment. Here the designers learn what people around them see. Each of the groups is asked to have at least ten people test their games and the designers make iterative changes along the way to improve understandability and playability.

**Deploying the game – deploy to Google Play**

It’s now time to get the game out to the players. It’s not a game until people are playing it. The designers are asked to upload and test their games on Google Play. If any technical issues arise with the building of the art assets, this is where they will come out. A real world problem faced by all game designers is the size of their art assets. Some common problems are “Have the sprite sheets been converted to the correct color system? Have the sounds been compressed properly?” These real problems get ironed out while the deployment of the game is being set up. Learning the ever-changing rules of the host, in this case Google Play is a challenge in itself. Reading the directions becomes essential and can save huge amounts of wasted time. This external challenge is often glazed over by the groups and comes back to haunt them later in the form of rejected games or missing assets.

**Feedback from the world – take both feedback from world and class – make iterations?**

The students get a cold dose of reality when they take their game from the classroom to the public. Real world feedback can be difficult for students, taking it in stride and improving the game is essential. If you have ever read a forum or looked at comments from real people you know this is true. The students are forced to take critique through a non-emotional lens. This learning opportunity is very important in their development as designers. Real-world feedback can help to spot real problems and give them a chance to see their designs as others do. However, this does get balanced with academic review. The academic review helps the students to make improvements to the game and allows for a wider interpretation of success.

**Project 2**

EVOXE Magazine is an image-rich, interactive publication designed, developed, photographed and written by students as a major group project in a senior-level class called “Digital Media Production” taught each year in the spring semester. This project was a partnership between two departments. Digital Media students designed and developed the magazine and Mass Communication students functioned as the magazine writers, providing the articles for the publication’s premiere issue in the spring of 2014 and the second issue in the spring of 2015.

The production of each issue took 8 weeks of their respective semesters. Each issue involved student teams working on: articles; photography; page layout; and publication structure. For the premier issue, the heavy lifting of the project involved the establishing of the publication’s brand from the ground up: magazine title; masthead design; and style sheets for typography and graphic ornaments. A school year later, the second issue was developed by a team whose major contribution incorporated: new
interactive methods and styles; and a new format suitable for delivery to mobile phones while keeping true to the style guide of the tablet version. As each of these two different teams solved these two unique problems, the core pipeline of the magazine remained very similar: gathering content, developing layouts and creating imagery.

PBL Area 1: An authentic, real world challenge: a published university magazine available to a wide audience on the mobile marketplace.

The EVOXE magazine is published to the Apple App Store and to the Google Play Store. Electronic publication to the mobile marketplace makes the distribution of the magazine available to a wide audience. As a university publication, the students have a client’s oversight above the scrutiny of the professor.

In their phenomenological inquiry approach, Lee and her fellow researchers studied eight faculty members who use PBL and how they dealt with the definitions, successes and challenges in doing so. Several faculty members in the study discovered the same result we found in the EVOXE project. Using client-based projects “helped motivate students to perform in ways that traditional assignments could not, because students were required to be open their work to public scrutiny.” They attested that students were engaged because project based learning mimics the work environment and prepare them for career. Real clients elicit more effort and commitment from students than a standard college paper or project might require. Projects without an authentic audience can also feel contrived (2014)

The influential student motivator on each issue of EVOXE is the reality that their work will be available to the public while the university uses the publication to promote the arts at ETSU. Our goal was to teach the students professional practices in an authentic environment while providing a quality service to the university.

PBL Area 2: Academically rigorous: senior-level class producing content for an emerging standard in media consumption.

Students on the production team for each issue of EVOXE are required to participate at the professional edge where client expectations, public scrutiny and industry recognition meet together. Students are often surprised how much work goes into the whole publication in order to have it ready for output.

An industry pioneer in the digital magazine medium, Adobe developed the Digital Publishing Suite (DPS)—tools for design, development and publication of digital magazines inside of Adobe InDesign. In 2010, GQ and Wired magazines were among the first magazines available as a digital edition. Through adoption by major publishers like Condé Nast, this new form of editorial content has taken root as a standard platform.

In response to the emergence of this platform, the Digital Media program at ETSU began teaching the Adobe DPS tools in the fall of 2011 at the sophomore level. The premier issue of EVOXE, first published in 2014, is the result of the senior level class mentioned earlier.

Indeed, ETSU is not the only higher learning institution using the DPS for university publications. Quite a number of schools use it promote their academic and athletic programs (digital viewbooks, catalogs, apps, alumni magazines, gameday magazines). However, according to Sue Leff, a member of Adobe’s EDU Apps marketing team, ETSU is just one of a relatively small group of universities teaching the DPS
platform in the classroom and not all of these schools teach it by actually publishing the student work like ETSU. The result is a class that asks students to meet deadlines with rich content in a non-traditional classroom environment that challenges students to use high level thinking skills to navigate the pipeline.

To create a DPS publication worthy to publish, a great deal of development and testing is required to meet the potential of the interactive features on top of the rigor of creating attractive and organized editorial content across many pages. Digital magazines are not limited in the number of pages and spreads like print publications. The scope of the project is broad when you take into account that any one of the many pages can have several layers of interactive structure. The depth of the writing and the production of photography and of video need to support such interactive potential.

**PBL Area 3: Applying learning: working in teams and communicating in an agency atmosphere with self-directed analysis of project development.**

In keeping with the approach of an authentic, real-world experience in the EVOXE project, the professor sought to establish a “mini agency atmosphere.” This agency was “staffed” by a creative director, art directors, copywriters, photographers and layout designers. Based upon their expertise and intended career paths, the students fulfilled these roles. These job descriptions are indicative of the industry we were trying to reflect. The pipeline from start to finish also reflected industry practices: brainstorming sessions; sketches on the masthead; group discussions; and managing project flow.

Among the Digital Media students, three distinct team units were formed: layout designers, interactive developers and photographers. Student leads in these teams were referred to as art-directors. This structure was to give a real-life relevance to the work at hand and to enable all of the students to have ownership of the magazine in parts and as a whole.

To solidify this atmosphere, the students as a whole were referred to as the “creative team.” The contact hours for the class were referred to as “creative team meetings.” Each of these meetings transpires more like an office workflow as opposed to a class that might incorporate traditional lecture and note taking. Each “creative team meeting” for the EVOXE project reviews student progress and establishes a production direction for the next phase. This is generally followed by a class breakout session where relevant production work ensues. As the “creative team” solves problems at their own workstations, they communicate and exchange ideas and help each other through technical, conceptual and aesthetic decisions. The professor helps facilitate these things and governs the direction to maintain quality, but ultimately it is the students who are creating the work through self-directed and collaborative learning as they prepare in and outside of class for the next “creative team meeting.”

**EVOXE Student Team Subdivisions**

Layout Team—each member of the team is responsible for using the established style guide to design their article’s screens. The goal for the individual students was to learn how a cohesive design is implemented, how to work as a team, and how to exercise their own creative layout decisions while adhering to the brand style of EVOXE magazine. Each layout student was challenged to get the appropriate photography from the photography team or request new photography etc.

New revelations emerged and design decisions were made during the creative process. These revelations were shared with the group and other layout artists picked up these new
elements. Therefore each “creative team” meeting’s collaborative communication was crucial. It allowed for the magazine to evolve while still maintaining a coherent graphic style from page to page.

Interactive Development Team—Professional examples were shown by the professor such as those from publishers like Condé Nast as well as other university view books, catalogues and athletic magazines who have been using the Adobe DPS technology. By examining these examples the EVOXE interactive developers worked to create touch button galleries, sequence animations, and other hidden content revealed with a tap or a slide on the tablet screen. Adobe DPS technology and its InDesign software made this design process fluid and manageable as our students worked to create an interactive product with the nuances of print publication design.

Photography Team—The photography team managed location scouting, hiring of talent, and execution of the shots. The team was charged with the task to bring in a curated collection of final shots for us to review at the creative team meetings.

Some students actively participated in more than one of these categories. Some multi-talented students also fulfilled extra supporting roles. One student doubled as a stylist for the photography team. She organized talent, determined locations, and established a wardrobe for the photography shoots. Other students were identified to create custom spot illustrations for the feature articles. All of these teams were governing themselves and outside of class, students were expected to govern the flow of the work that they would bring to the “creative team meetings.”

PBL Area 4: Engaging in active exploration: gathering all the pieces

Each of the student teams was required to understand their article subject matter. This took investigation and exploration. Student writers sought out stories and interviewed artists for our spotlight features. EVOXE photographers had to be intuitive as they sought to make meaningful portraits of the artists in their creative environments. EVOXE has a particular photography style that they had to follow. Layout designers and interactive developers were busy with problem solving and exploration into how to bring all the sources together and create engaging interactive features.

Indeed, with each issue the individual subdivisions and the team as a whole were seeking out content and weaving it together from pieces. But, there were some differences between the first and second issue of EVOXE with explorations and innovations unique to that stage in the evolution of the magazine.

EVOXE Premiere Issue: Explorations and Innovations

Magazine Title—In the case of the premier, the student team in the spring of 2014 had a clean slate. There wasn’t even a name for the magazine. On day one, students were challenged to create a memorable title that competes with other arts publications at other universities that were similar to what we wanted to pioneer. The creative team worked collectively on various ideas before arriving at the title, EVOXE which incorporates the Latin root word *vox*—linking the concept of voice as defined by the essence of the arts.

Masthead—With the title established, subsequent class periods were devoted to breakout sessions and individual work time was used for the design of the magazine’s masthead. The team members who had the most viable solution were challenged to perfect sketches and vector files. Ultimately one design was chosen based upon its simple and modern look.
Magazine Style Guide—Next, the creative team was to establish a consistent style across the publication for: typefaces, photographic aesthetic, graphic ornaments, interactive prompts and functionality, and for a recurring grid structure. Professional examples were examined and students were challenged to work individually to bring ideas back to the next creative team meeting. Once contributions were presented and discussed as a group, the final style guide of EVOXE magazine became a hybrid of the best solutions.

EVOXE Second Issue: Explorations and Innovations

Smartphone Edition—The “creative team” for the second issue in the spring of 2015 was challenged to branch out the publication to the smartphone platform. As a learning objective to interaction design, the students were discouraged from merely formatting a tiny version of what appears on the tablet platform. Instead, the new smartphone edition would require: a new flow of interactivity; different density ratios of graphics versus text; format and composition changes with the screen ratio; and a reevaluation of size relationships. Research into different smartphone platforms and industry examples was crucial.

As in the premier issue, the class was subdivided into applicable teams. It was the layout team’s responsibility to design each article for the tablet and for the smartphone. As individual students managed their layouts, new interactive challenges were discovered and students worked together to ensure that any new interactive approaches fit into the overall essence of the EVOXE user experience. This involved trial and error and above all, communication between the team members.

All in all, exploration and the gathering of resources took up precious time during the semester weeks devoted to the project. In hindsight, the professor on the EVOXE project identifies room for improvement in securing a list of articles, spotlight and photo shoots much earlier to decrease stress on the digital production team.

PBL Area 5: Interacting and making adult connections: trusting the students with ownership of a university publication.

The goal of the EVOXE project class structure was to further engage the students and connect them to all aspects of the editorial design process as they merged into ownership of the magazine through a student-centered decision making process.

Students appreciated the real world atmosphere created in this class through the relevant team definitions. Students indicated that this “mini agency atmosphere” was at the top of the list when asked to rank their favorite part of the project.

PBL Area 6: Formal and informal assessment practices: challenges and successes

In their extensive meta-analysis of the research on project-based learning, Lee and her fellow researchers cite one study suggesting that “students can exhibit significant frustration if the teacher—now a facilitator—does not provide deliberate scaffolding of their learning” in this type of environment. Other studies the researchers analyzed indicate that students struggle to discern their roles and responsibilities in a project-based learning classroom, especially when it came to accepting responsibility for their learning (2014).
The EVOXE project didn’t necessarily suffer in regards to assessment practices, but from an academic perspective, more formal assessment and intermittent benchmarks may have given students a better structure that was more familiar to them. Students didn’t get a grade until the end of the semester. This may have resulted in some ambiguity to students who were not self-motivated or those who metered their effort based on whether or not they were meeting expectations. The final grade involved a direct peer evaluation through two blind survey on participation and commitment (halfway and final) and a final subjective grade from the professor on the quality of the work that students delivered.

However, to curb any floundering by the students, the professor was always on point, in a sense, acting more than just a facilitator, but as a creative director helping students whether individually or from a “bird’s eye view” of the project. Constructive criticism was often given that challenged them to use creative thinking, solid design principles, and interactivity excellence. This may take on the form of a group critique if the whole team was working together to develop one element, or individual critiques as students worked individually on their layouts. This served as a good structure for a group project and allowed for accountability.

This “indirect peer review” existed as students found their classmates looking over their shoulder or offering suggestions in open critiques. Sometimes a competitive moment sharpened their efforts such as in the early stages of the EVOXE branding when students competed to have the winning design for the masthead, or best solution to the style sheet, or even the final name of the publication. One student puts this into perspective:

The competitive assignments pushed me to go above and beyond the simple assignment and I found new creativity in myself as I strived to stand out from my classmates.
— “Tim,” student, EVOXE project

The majority of the students in the EVOXE project were seniors. The team members were already versed in various teaching styles at the university. Even though the class involved very little lecture, much of their design training and foundation came from lower-level classes. Therefore, for the students in the EVOXE project, this class was the testing ground where they applied their learning to a real-world challenge. They seemed to understand non-objective grading on performance surrounding work ethic, collaboration or creative excellence and the aesthetics of design.

Furthermore, the EVOXE project students seemed to be satisfied that the final litmus test for success would be the public opinion of the publication, the satisfaction of those featured in it and whether or not they met the expectations of the University as a client.

Conclusions

Project based learning improves students’ understanding of the digital media pipeline and how they fit into it. While working to improve students’ idea of how they can grow as artists and producers of content we came to a few conclusions.

Authentic, real-world experiences in class projects create a level of motivation and investment from the students that is not found in traditional digital media class projects at our university. Our project-based learning methods allowed the students to work in a technological and commercial space that is concurrent with today’s mobile marketplace. This allowed the students to make adult connections. For
example, in the EVOXE project, as the students fulfilled “agency” roles, they were able to manipulate the process as if they were a self-governing team of creative professionals. For a good portion of the participants, this increased the applicability of the class to relevant job experience. Students ranked the “real life” project as a close second in their list of favorite active learning techniques. “app technology” and “editorial design” were among their favorite aspects but not as high. This leads us to believe that the atmosphere and teaching methods of the class struck a chord with the students.

Here are a few student comments on each project’s real-world atmosphere:

I think that this is probably one of the only classes I was in during my time at ETSU that helped me get a ‘taste’ of real business.
— "Becca," student, EVOXE project

The student-centered decision-making is what set this class apart from the others I took in the Digital Media program. It absolutely empowered the learning experience and myself personally as a designer; it was the first time I felt like an adult trusted with my own skills and helped to bolster my confidence in following professional projects.
— "Kathryn," student, EVOXE project

The two most valuable aspects of this class have been the high frequencies of critiques/check ins, and building tutorials instead of doing them to no real end.
— "anonymous," student, The Mobile Game project

We found that our students tend to succeed in a project pipeline that reflects industry process where real-world accountability isn’t about grades, but about the success of the project deliverables under public scrutiny. Our assessment methods proposed a few challenges as far as academic definitions go. However, assessment and investment in each project involved professor, student and the target audience. In a group project, students are not motivated only by their specific grade in the class. We discovered that in the EVOXE student team, for example, expectation from peers had a big influence. This is nothing out of the ordinary. It has been noted that accountability to peers often has greater consequences and provides more motivation for students than if they were only responsible to the teacher (Bell, 2010).

I feel like I actually learned things in this class. This the only class I have actually pushed myself past what I thought I was capable of.
— "anonymous," student, The Mobile Game project

In a similar way to the cited research on faculty roles in PBL, the professors for these two projects acted more as facilitators but we employed discipline-specific instruction such as lectures and critiques. Indeed, faculty members at colleges and universities may not always adhere strictly to these six areas of PBL. Some faculty members in the studies we cite did not wholly adopt a universal PBL model nor implement any specific model with fidelity. Instead, they may embrace the PBL approach as a guiding framework and incorporated some PBL instructional techniques alongside traditional and discipline-specific methods. This results in a hybrid of PBL and traditional academic methods (Lee et al., 2014).

A study of teachers’ application of Information and Communication Technology (ICT) in classrooms
Su Iong Kio, University of Saint Joseph

Abstract

This paper uses data from 176 teachers in a quantitative study to identify the important elements in teachers’ utilization of Information and Communication Technology (ICT) in their classroom teaching, such as videos, presentation software, Learning Management Systems and Social Networking. The regression analysis and factor analysis identify Proficiency, Expected Outcome, Support and Training as prominent elements in this study.

Introduction

Computer technologies and network technologies have been growing at an exponential rate since the early 80s in the last century. From the bulky microcomputers that almost span a whole room to the slim tablets that fit on the palm of a person, the size of the central processing unit (CPU), and generally any integrated computer chip, has been shrinking due to the advance of IC fabrication techniques. This allows the computing power of individual computers to expand ever more powerful. In addition, network technologies have been growing at the same speed as the computers themselves. The connections between computers and hubs and switches allow not only the addition of computing powers, but more importantly the sharing of data, and eventually, information. As a result, we are truly living in the Information Era where knowledge and facts are just within the click of a mouse button.

The use of Information and Communication Technology (ICT) in classrooms has been advocated and integrated in many modern teaching methodologies (Chun, Chin-Chung, and Di, 2015, Goodwin et al., 2015). Policies and strategies have been devised by government agencies and educational institutes to emphasize the impact of ICT in classrooms (Charbonneau-Gowdy, 2015) incorporating digital techniques and enhancing the efficiency of
teachers’ performance. However, the actual utilization of ICT by teachers still varies across schools and even across classes within the same school (Moore and Chae, 2007; McMartin et al., 2008). This study attempts to identify the important elements that drive teachers towards using ICT in classrooms and thus provides direction for schools and institutes to address these elements.

Review of current practices

Traditional teaching has relied on textbooks and classroom lecturing. Authors and publishers put together facts and data according to their disciplines and schools adopt whichever textbooks they deem suitable and necessary for their students. Even though during actual lecturing, some teachers may add in additional information on top of that in the textbooks, the main source of knowledge still comes from what is written in those textbooks. The emergence of the World Wide Web (WWW) has gradually, but certainly, changed this practice. To a greater or lesser degree, teachers search and research for additional and complementary material on the internet to enhance sections and chapters in the textbooks. No matter what is the subject, be it language, science or mathematics, there is abundant information available on the internet to help teachers make their lectures more lively and interesting. As a result, students are able to focus more on the lectures and absorb what is taught in class with more efficiency.

Day (2013) reports the findings of a survey regarding ICT use in Primary Math teaching in Western Australia. Although principals and school teachers have different views on the ICT utilization, both report more than 70% of teachers do at least occasionally use ICT resources to enhance Math teaching in the primary schools. Voogt (2010) conducts a secondary analysis with the data from the Second Information Technology in Education Study (SITES) 2006, which reports pedagogical practices of Science teachers across 22 countries. The analysis indicates that science teachers who extensively use ICT in classrooms are more confident about their ICT competencies and feel more professionally engaged than their counterparts who do not use ICT extensively. The confidence and engagement factors have been shown to lead to more lifelong learning orientation in teachers.
In terms of language teaching, the use of ICT tools and resources also had abundant examples. Union, Union and Green (2015) compare the performance results in public language exams from two groups of students, one using an innovative eReader tool and the other without the tool. The results suggest the use of the eReader tool contributes to improved student performance through strengthened student responsibility and technology durability. Gonzalez-Aller (2015) looks at the impact of ICT use in English language classes in Sweden and finds that students from digital classrooms have boosted performance and more positive attitudes than those from traditional classrooms. Researchers have even used mobile phones (Twiss, 2009) and video games (Mifsud, Vella and Camilleri, 2013) to enhance the teaching of languages.

However, although the benefits and rewards of ICT use is obvious, there are still challenges and obstacles in its utilization. Just because teachers know that using ICT helps their teaching does not mean they are naturally able to utilize it. The skill set to use ICT in classroom is not an easy one. It takes a deep understanding of the hardware and software tools that are available to teachers either in house or on the web. They have to know the efficiency and the limitation of these tools to maximize the advantage of using them. If not used properly, including ICT in their teaching may actually hurt themselves and the students.

Hu and McGrath (2011) discuss ICT-related teacher development amid the national reform in college English teaching in China. They report that English teachers still feel that there is a lack of ICT skills to effectively apply ICT pedagogy in classrooms. In addition, the lack of training also contributes to this insufficiency. Tallvid (2014) follows the “1 laptop per student” initiative and attempts to measure teachers’ ICT use with this initiative. Surprisingly, the reported use of ICT is actually quite low and the reasons include insufficient content and lack of time.

The current research takes both the advantages and obstacles of ICT use into consideration and attempts to generate a list of factors that contributes or hinders teachers’ ICT use, and subsequently attempts to find a relationship
between these factors and the actual ICT utilization by teachers.

**Methods and instruments**

A quantitative study was conducted for this research in which perceptions and opinions were collected from teachers in secondary schools in Macao, a Special Administrative Region (SAR) in China. The questionnaire used for the study combined items from several literature instruments that are related to ICT perceptions and utilizations. The final instrument covered items spanning attitude, expectation, professional training, confidence, efficacy and community, etc. A pilot study was conducted among 9 teachers who filled out the questionnaire and gave input on the relevancy of the question items. A reliability test was checked from the pilot data and the result gave consistency over the data.

Survey data were collected from 176 teachers across 18 schools. Consent was first obtained from the schools participating in the research. The teachers were also briefed before the survey about the purposes of the research and ensured about their anonymity. The questionnaire asks the teachers to assess the importance of items that are crucial towards their ICT usage. A Likert Scale of 1 to 5 was used with 1 being total disagreement and 5 being total agreement.

An Exploratory Factor Analysis (EFA) was first performed to identify hidden constructs behind these items. Four constructs were identified by the EFA. They are “Proficiency of ICT literacy”, “Expect Outcome of ICT usage”, “Institutional Support on ICT resources” and “Practical Training of ICT techniques”. A multiple regression analysis was subsequently conducted to establish relationships between the identified constructs and the actual usage of ICT in classrooms. The SPSS (Statistical Package for Social Science) software was used for the data analysis of this paper.

**Data Analysis**

*Demographic Data*
The demographic data of the participating teachers are summarized in Table 1. Out of the 176 teachers, 64 are male and 112 are female giving a gender ratio around 1:2. Most of the teachers are in their 20s, giving this segment of teachers a dominant percentage of 60.2%.

The Exploratory Factor Analysis (EFA)

There are many question items in this survey that teachers give their rating to. In order to identify hidden constructs out of these items, exploratory factor analysis (EFA) is usually employed to consolidate close items into groups (Yang and Cheung, 2014). This consolidation technique have been utilize in many research methodologies (Fontenot, Mathisen, Carley and Stuart, 2015) to generate meaningful factors out of small question items so that generalization of phenomena can be explained in more expressive terms than sporadic pieces.

In addition, for the eventual task of finding relationships between behaviors and their underlying reasons, multiple regression technique is usually used. However, the regression process should not handle too many independent variables as there will be violations to the independence assumption in the regression analysis. As a result, this research used an EFA run to reduce the number of factors first.

The EFA process generated 4 constructs (or factors) out of the question items in the survey. They are “Proficiency of ICT literacy”, “Expected Outcome of
ICT usage”, “Institutional Support on ICT resources” and “Practical Training of ICT techniques”. The retention criteria for the factors is for their Eigenvalues to be greater than 1. All 4 factors achieve internal consistency by having their Cronbach values all greater than 0.7. The total variance explained by the EFA is 62%.

**Multiple Regression Analysis**

After the factors driving teachers' ICT usage have been identified, the ultimate goal is to quantify a relationship between these factors and the teachers' actual ICT utilization in class. A multiple regression analysis was performed between these factors and the utilization factor. The regression used least square method as the prediction model. Residue was first examined with a P-P plot and a near straight line in the plot confirmed the normality requirement. Scatter plot of the residues was also examined and the variance of the residues did not show pattern, indicating homoscedasticity of the residue variance.

Collinearity issues were evaluated with the correlation matrix, shown in Table 2.

</tbody>
</table>

The Utilization factor is the dependent variable in the regression analysis and refers to the level of utilization of ICT tools by teachers. The independent variables are the 4 identified factors from the EFA. As such, Expectation, Support, Proficiency and Training correspond to “Expected Outcome of ICT usage”, “Institutional Support on ICT resources”, “Proficiency of ICT literacy” and “Practical Training of ICT techniques”, respectively. From the correlation matrix, we observe that besides the self-correlation of 1.000, all cross correlations are less than 0.6, indicating that there is no strong correlations between the independent variables. In addition, the Variance Inflation Factor
(VIF) for each independent variable is less than 2, further reducing interdependency between the independent variables. The result of the regression analysis is summarized in Table 3.

Adjusted $r^2$ value: .421  
$F$-test significance .000

As shown in Table 3, besides the constant term in the regression analysis, all coefficients of the independent variables yield good significances as indicated by the last column. The $F$-test of the regression further confirms that coefficients of the variables are not all zero. The variance explained by the regression analysis is 42% of the total variance as indicated by the adjusted $r^2$ value. As a result, the analysis gives the following relationship between the dependent variable of ICT utilization by teachers, to the factors affecting this utilization.

$$ICT \ Usage \sim (.455) \times \text{Expectation} + (.309) \times \text{Support} + (.287) \times \text{Proficiency} + (.48) \times \text{Training}$$

**Discussion**

From the equation, the factor Training receives the largest coefficient, suggesting that this factor is the dominant factor driving teachers' utilization. Most teachers feel that the role of practical training of ICT techniques is critical, and sufficient training enables the teachers to utilize ICT more. As Raboca and Carbunarean (2014) point out, low level of ICT training is one of the main obstacles hindering teachers' use of ICT tools in their classes. There are so many ICT resources out there and each one may have different features and functionalities that it would be quite difficult for teachers new to the field to
handle these resources. It is then the institutions’ responsibility to invite experts in the field or experienced teachers to take the initiative of training programs so that their experience can be properly disseminated to others.

The Expectation factor follows Training as the second dominant factor. Teachers have to have a reasonable expected outcome of ICT usage in order for them to actually use it. Behavioral science dictates that people are more likely to adopt new behavior if they have high expectation of their action and believe that their action will likely lead to positive results. As such, examples of successful utilization of ICT in classroom have to be identified and encouraged. With the perception that ICT utilization being gradually adopted as a norm, the expected outcome will be more positive for teachers when they include ICT as part of their teaching approaches.

The next factor is Support, which says that institutions have to give sufficient support, either technical support in hardware or software enhancement, or administrative support in teachers’ workload reduction. The development of ICT technology is ever-evolving. New and powerful products emerge in the market with rapid pace. Schools and even government departments have to setup funds and resources to cope with the increasing cost and the learning curve associated with new products. In addition, time is also a precious element that teachers hardly afford. In order to synchronize with new technologies, schools should appropriately balance teachers’ workload so that they can effectively carry out their teaching duty and keep up with necessary ICT development at the same time. Smaller class size and less variation in workload subjects can also help in that regard.

Although the Proficiency factor receives the least coefficient, it is still a significant factor. Naturally, the more proficient a teacher is with ICT tools, the more likely he or she is going to utilize it in class. However, the Training factor actually will ensure that teachers will have the proficiency in ICT literacy to help their teaching. The proficiency includes the use of Office applications, communication software, specialized Learning Management Systems (LMS) such as Moodle and Blackboard. Skillsets also include experience in knowing where to find appropriate content in various subjects and where to get exercise
question sets and illustration images. A deeper knowledge of free online resources is also helpful, such as Google products, various calculators, function plotters and video depositories, etc.

Conclusion

In this paper, a relationship model is established between teachers’ ICT usage and its driving factors. Positive relationship has been identified for 4 factors, namely “Expected Outcome of ICT usage”, “Institutional Support on ICT resources”, “Proficiency of ICT literacy” and “Practical Training of ICT techniques”. The results of the analysis call for strengthening of ICT training among teaching professionals that should aim at practical proficiency in using ICT techniques. Institutional support such as network hardware and media software should be established within the capability of schools to create a favorable environment for teachers to utilize ICT products with relative ease. Demonstration of successful cases of ICT usage in classrooms should be promoted and advertised among teachers to raise awareness of the better learning outcomes among students with the assistance of ICT products.

Research is nothing new in a variety of settings, be it graduate, undergraduate or even high school. However, the most common model for involving students is to recruit one student to assist the researcher, providing an invaluable experience for learning the critical thinking skills that comes with research. As a professor of an Exercise Science program with 1,000 undergraduate students, the single-student model just does not provide the number of opportunities for students interested. This year I intentionally chose a research question and study design that may provide opportunity for as many as 30-40 undergraduate students!

The study: I was contacted by an entrepreneur to study a water-filled strength training device. The device is designed to create an unstable load as the individual lifts, forcing core muscles to compensate. Most of us have used an unstable device we stand on (BoSu ball, wobble board), but this was a novel instability device that you actually lifted. In addition, the device could vary the amount of water “slosh” so the instability could be varied. I designed a study using surface electrodes to examine the degree of muscle activation of 4 muscles during exercise. Due to the number of muscles studied and the number of lift variations, I created three, separate studies that examined 1. The bicep curl and core muscles, 2. The leg extension and core, and the overhead squat.

Involvement: Before the study began (but after research approvals), I had interested students volunteer to be a part of two months of pilot testing, where they were introduced to the technologies of electromyography and the procedures of the study. When their proficiency was at the standards I needed, we began to recruit subjects. While the study is not complex, there was need for a variety of individuals to assist with a number of duties: 1. Spotting the lifts to ensure safety 2. Preparing the subjects’ skin and applying the electrodes 3. Performing initial screenings and health evaluation as well as strength testing, 4. Recording the EMG data and marking the movements (lift and lower transitions) 5. Data processing (signal filtering, rectification and integration). Since subjects are scheduled close together, student researchers need to be prepared for all of the tasks, so that work can be distributed. Currently I have 12-15 students assisting with the first study, as well as a research intern preparing for graduate school. This fall the second study starts, and another group of researchers will be recruited to assist. Most are doing this for no college credit, but rather their desire for involvement in research. To promote the team aspect
of the research group, I am purchasing shirts the students will wear on data collection days. The students design them.

Dissemination: Our initial group will not have anything beyond preliminary data to present, but they will present 3 posters at our University “Student Scholars Day”. One group will present the techniques for EMG sampling (skin prep, and data acquisition). Another will present on the data signal processing techniques used. The research intern will present any preliminary data available at the time of the research day. In subsequent semesters I will have an expanding group of students and data to present at a variety of local, regional and national meetings. I will pursue peer reviewed publication in major exercise science journals for my own dissemination work.

In summary, this is a research project that could be completed with a dedicated group of 4, but by using a large group, I was able to involve students in the same range of experiences, while creating a more empowered group of researchers that have worked very well together. I hope to continue the model as I gain approval of additional research projects.
MEASURING THIRD YEAR UNDERGRADUATE NURSING STUDENTS’ REFLECTIVE THINKING SKILLS AND CRITICAL REFLECTION SELF-EFFICACY FOLLOWING HIGH FIDELITY SIMULATION.

**Topic area:** Health Education

**Presentation format:** Paper sessions – work in progress report

**Description of presentation:** An innovative approach to the facilitation of debrief after a high fidelity nursing simulation and its impact on reflective thinking will be presented. Reflective thinking is a key metacognitive skill for an undergraduate nurse to develop, however it is difficult to measure and the role of students as peers facilitating debrief is relatively unknown. This research hopes to identify effective teaching and learning strategies to promote the development of reflective thinking after simulation.

**WORK IN PROGRESS REPORT**

*Background:* Critical reflection is a key skill in the transference of knowledge and skill. It is essential that an undergraduate nurse develops this metacognitive skill to enable learning whilst studying and the eventual transition to the workplace. It is this high level reflective capability which assists in the process of critical thinking which allows for effective problem solving by the undergraduate nurse. Despite the importance of reflection and reflective practice as both a skill and approach to professional nursing education, it is rarely measured directly and appears not to be articulated as an outcome of experiential learning, even for example, in the setting of High Fidelity Simulation (HFS).

*Method:* The overall purpose of this randomised controlled trial is to explore the role of critical reflection and its development within the context of HFS and nursing curricula. A pilot study found that the Reflective Thinking and Simulation Survey was reliable. The main study used this survey in a non-equivalent control design to determine if students as facilitators, academics as facilitators or student and academics as joint facilitators of HFS debrief alter students level of reflective thinking within a HFS simulation debrief.

The study is guided by the Social Cognitive Theory – Self Efficacy conceptual framework which recognises the importance of self-belief in the execution of skill. For undergraduate nurses to improve both reflective competence and confidence it is necessary to consider this perspective when collecting data and during analyses.

*Results:* Data analysis will involve measuring internal consistency of scales used in the ‘Reflective Thinking and Simulation Survey’, confirmatory factor analysis for a modified scale incorporated into the survey and comparison of mean scores from the survey with the control and intervention groups.

*Discussion:* The research is significant on two levels. Firstly the individual student nurse will benefit directly from receiving objective information and feedback about their reflective capacity and secondly, it is anticipated that the results of this study will also further inform teaching and learning methods associated with HFS, to improve the students’ ability to reflect on action at a critical level.
1. **Title of the submission:** Home is Where You Speak Your Mother Tongue: Heritage Language Maintenance among Ukrainian Immigrant Families in Canada

2. **Name of the author:** Nataliya Kharchenko, PhD Candidate

3. **Affiliation of the author:** Faculty of Education (Department of Curriculum, Teaching, and Learning) University of Manitoba, Winnipeg

4. **Address of the author:** 12 Birchbark Bay, Winnipeg, Manitoba, Canada, R2V 4P1

5. **E-mail address of the author:** Nataliya.Kharchenko@umanitoba.ca

6. **Abstract:**

   The interplay of various political, economic, personal and societal factors causes more people to search for a better and safer place to raise their families. With the increasing deterritorialization of people all over the world (Appadurai, 1997), it becomes obvious that the established values and linguistic beliefs in host countries may undergo inevitable revisions and reconsiderations; the priority for newcomers should be their linguistic repertoire expansion by acquiring an additional language, but not replacement of their native language by the language of the mainstream society (Edwards, 2005). The specific objectives of this project are: to document, analyze and report participants’ narratives regarding their home language and parenting between two or more languages in Canada; to find out specific successful strategies in terms of positive encouragement and maintenance of a heritage language; to address the possible connections between ongoing events in Ukraine and immigrants’ perception of their cultural and linguistic heritage because our life biographies are inseparable from the socio-political circumstances in the countries we were born or reside (Andrews, 2007); to review research literature on heritage language maintenance; to expand scarce research data on
recent immigrants from Ukraine. The project is informed by the theoretical framework of postcolonialism; the data will be collected through narrative inquiry and interviews and analyzed by applying critical discourse analysis. Because the purpose of this project is to portrait personal life experiences of immigrant parents, critical discourse analysis may facilitate in exploring how dominant discourse may indirectly influence both individual and socially shared ideologies and beliefs (Fairclough, 2001; Van Dijk, 1993) regarding the status, dominance and legitimacy of speakers of different languages (Bourdieu, 1991).
Abstract:
Classroom research can improve reflectivity and subsequently improve various aspects of teaching and learning in the classroom (Falk & Blumenreich, 2005; Mills, 2003). However, research has revealed that inservice and preservice teachers are often reluctant to participate in action research due to fear, an inability to recognize the ways in which research can enhance their work, and a lack of knowledge and training related to the connections between research and classroom practice (Bondy, 2001; Glanz, 2003). Involving preservice teachers in classroom-based research provides early support, comfort, and opportunities for participation in evidence-based practices (Evans, Lomax & Morgan, 2000; O’Sullivan, 2002). This study examined elementary preservice teachers’ understanding of inquiry-based science pedagogy within the context of an international research experience. Eleven elementary preservice teachers provided information in the form of interviews and comparative essays during a twelve-week field experience that occurred in the United States and Australia. Analysis of the qualitative data revealed that the preservice teachers expressed enhanced understanding of (a) inquiry-based science, (b) distinctions between science instruction in the United States and Australia, (c) distinctions between pedagogical and classroom management approaches in the United States and Australia, and (d) the role of research in the classroom. Findings also indicated that participation in the research experience affected the university faculty members and classroom teachers involved in the study. Implications and suggestions allow teacher educators to utilize action research to support preservice teachers’ understanding and utilization of pedagogical approaches as well as their understanding and utilization of classroom-based research.

ABSTRACT

The Catholic Church has constantly shown her important concern for providing its children an education by virtue of which their whole lives may be inspired by the spirit of Christ. (Vatican Council II on Christian Education, 1965) It should be stated that education does not only inculcate theories of knowledge or concepts in the minds of people; neither does it merely teach or nurture their minds. Education is not limited to learning the basic academic skills to succeed in life, but also an avenue in which every student is given an equal opportunity to excel in life by receiving a well-rounded education. Education has always been considered as a process that begins in the family, where some values and theories are initially learned and understood. The learning process continues to involve the whole civil society in the form of the right and duty of the state to provide equal educational opportunities.

Nevertheless, Catholic education is distinguished by the integration of religious truths and values with life. Whatever theories or concepts taught in the school should be applied in the day to day situations. The researcher is firmly convinced that true education is directed towards the formation of the human person, and such an education not only develops the maturity of the human person. Hence, Catholic education continues its influence in forging leaders and in shaping cultures according to the highest values and ideals.

A significant number of faithful stakeholders are affiliated with and have chosen Catholic education for the youngsters. Much more, parents, who are devout Catholics, send their children
and family members to Catholic schools. These schools through its Catholic principles and educational system provide not only the secular training, but also the spiritual training which their religious lives necessitate.

In the manual of the Catholic schools, in its general objectives it is mentioned that these schools exist “to gradually help the students open their eyes to the realities and problems of life in the contemporary world, to look at the world with Christian eyes, to master and ready themselves for the challenging mission which they as Christian have to fulfil in society and in the service to the Kingdom of God.”

Moreover, the establishment of Catholic schools has produced a significant effect in the people, particularly the educators, those who have been educated or those who play a special role in the educational arena, the stakeholders. Schools are important in terms of the future of the Church.

This has been the advocacy of the Church; it is dedicated to the education of young people and on the holistic formation and promotion of values based on the principle of Catholic doctrine.

Finally, as objectives of this research, the study mainly focuses on how faithful stakeholders understand Catholic Education. In like manner, in this study the researcher would like to determine the nature and goals of Catholic education. From the experiences of the faithful stakeholders, the researcher would explore the reasons and factors why they choose and have affiliations with Catholic education.

**Methodology**

The justification for using the Classical Grounded Theory of Barney G. Glaser methodology in this research study is the substantive and empirical evidence found on the topic.
This method lends itself to the emergence and discovery of concepts that potentially lead to a theory.

There are a number of stages that the researcher would go through to complete the grounded theory process, namely, choosing initial participants, choosing data collection methods, enhancing theoretical sensitivity, conducting sampling, data collection, data analysis, writing up theory, and research evaluation. Each time a new participant is interviewed, the follow-up questions are changed by the researcher, as appropriate, in order to achieve saturation of a particular concept. Once saturation is achieved, the researcher will review the data to be collected to better understand the emergence of other concepts.

Role of the Researcher

The researcher is a Roman Catholic priest and presently the School Director of 2 Catholic schools. Through his own lens and interaction with others, he will interpret meaning based on participants’ understanding and experiences of the phenomenon. Likewise, he is also a reflective observer, allowing patterns to emerge as indicated by the data (Glaser, 1992). The researcher will intend to guard against personal bias through critically reflective self-examination and fidelity to the grounded theory methodology.

Participants

The participants for this study are the faithful stakeholders, by considering three generations: parents, grandparents, and grand grandparents of loyal students.

Discussion of expected outcomes

Through interviews and by following faithfully the Classical Grounded Theory of Barney G. Glaser would interpret and analyse based on the faithful stakeholders’ and experiences of Catholic Education.
Most of the faithful stakeholders would emphasize various factors in sending their children to Catholic Education.

These faithful stakeholders primarily send their children to Catholic Education because of its Catholic ideals. Students or learners are introduced to the Catholic faith. Knowledge about their faith leads students to appreciate and understand the core of their religion. This knowledge about the faith leads them to that knowledge about God.

As a result these faithful stakeholders would like their children and loved ones enrolled in Catholic Education to imbibe whatever values enshrined in the ideals and objectives of the schools. These values reflect what the school inculcates in their students or learners. In the process, students, starting from their grand grandparents they have observed how Catholic Education has influenced in their professional life, their personality and attitudes, particularly their dealings with people. In short, they try to put into practice whatever values learned in the schools.

Moreover, faithful stakeholders would underline the importance of discipline in the growth, formation, development and education of their children. With discipline, partnered between the school and the home, especially the parents, there is a sense of direction and purpose in their lives. Students become more focused on their studies and on their goals in life. Discipline is basically a foundation for a successful life.

Finally, faithful stakeholders have been convinced with the quality education which Catholic education continues to offer. Catholic education tries to update itself so as their products, meaning their students and learners, become globally competitive, critical thinkers, communicators and creative.
TITLE: The cultural, social and academic challenges affecting girls who leave the Torres Strait Islands for boarding schools in Queensland, Australia.

Author/Presenter: Dr. Francis Bobongie
Affiliation: Griffith Institute for Educational Research, Griffith University
Address: Indigenous Research Unit
170 Kessels Road, Nathan, QLD 4011
Australia
Email: f.bobongie@griffith.edu.au

Abstract: When indigenous girls from the Torres Strait Islands, Australia, leave the comfort and familiarity of their communities for the ‘unknown’ of boarding schools, there are many cultural, social and academic challenges that confront them.

Through the methodology of Ethnography this paper will give a first hand account of current challenges of the transition process through the stories and experiences expressed by a group of girls from the Torres Strait Islands. These girls come from a diverse range of Torres Strait Island communities and boarding school environments in regional Queensland.
Title: Strategies to engage students in social studies through visual and performing arts

Topic Area: Cross-disciplinary areas of education

Session Type: Workshop

Description: It’s a fact: too many students think social studies class is boring. Join our workshop and experience hands-on, arts-based strategies to transform the social studies curriculum. By the end of the workshop, all participants will have experienced a handful of visual and performing arts strategies that are adaptable to a wide range of topics and grade levels. Additionally, participants will have conceptualized and shared a lesson idea to implement in their own classrooms.

Presenters/Authors:
Dr. Desiree Friedmann
Director of Performing Arts at Westside Neighborhood School (K-8) Adjunct Professor at Pepperdine University
5401 Beethoven Street, Los Angeles, CA 90066 desiree.friedmann@pepperdine.edu

Mr. Josiah Cameron
Humanities Teacher at Vistamar School (9-12)
737 Hawaii Street, El Segundo, CA 90245 josiahcameron@vistamarschool.org

Abstract:
Many students dread going to social studies class, perceiving it as an hour dedicated solely to the rote memorization of names, dates, and places that have nothing to do with their everyday lives. Sadly, these disaffected students are at times correct. Though educators who teach social studies may be passionate about their subject, they often experience difficulty translating this to the students, especially via long lectures, textbooks, and maps. Students naturally disengage from this kind of instruction, especially when learning about what they perceive to be the irrelevant past, and simply shut down. It’s time to switch things up! Arts-based teaching methods have the ability to spark curiosity, imagination, and creative problem solving. They allow for a deeper and more meaningful connection to the social studies curriculum. The facilitators of this workshop present a unique perspective as one is a social studies teacher who often utilizes the visual and performing arts as an entry point into the content, while the other is a performing arts teacher who chooses to infuse social studies content into her theatre courses. Since they both worked in a collaborative independent school, they decided to team up and see what strategies they used that were successful across a wide range of students. They found many similarities in the methods that seemed to engage students the most, especially when students connected on an emotional level to their learning experiences. This workshop outlines their pedagogical methodologies across disciplines and the learning transformations of their students.
Elementary School Students and their Knowledge about ‘Variable’

The term variable is quite elusive and often difficult to define, especially for elementary school students. A common exercise used to understand the complexity of the term involves trying to define variable with only one word (Schoenfeld & Arcavi, 1988). Because “the meaning of variable is variable,” the wide variety of different acceptable meanings can make the term difficult for students to understand (Schoenfeld & Arcavi, 1988, p. 425). Researchers have long agreed that understanding variables is an extremely important topic in middle and high schools, especially when making the leap to algebra, but the knowledge requirements are confusing and appear to change over time (Usiskin, 1988).

Kuchemann (1978; 1981) developed a framework of what he considered the six different student interpretations of variables:
1. Letter evaluated (i.e., the letter is a specific number, for example $a+3=5$),

2. Letter ignored (i.e., the letter itself is not given meaning, for example $a+b=43$ so $a+b+2=?$),

3. Letter as object (i.e., the letter stands for an object, for example $s$ stands for students),

4. Letter as a specific unknown (i.e., the letter is a specific yet unknown number, for example add 4 onto $n+5$),

5. Letter as generalized number (i.e., the letter can represent several numerical values), and

6. Letter as variable (i.e., the letter can represent a large range of unknown numerical values).

Although historically reserved for students in official algebra courses in middle and high schools, the importance of teaching these meanings of variable earlier is becoming more widespread. The new Common Core State Standards (CCSS; 2011), for example, recommends that “students in Grade 3 begin the step to formal algebraic language by using a letter for the unknown quantity in expressions or equations” (p. 27). When meeting this standard, students’ first introduction to variables would often therefore involve adding in literal symbols (i.e., $x$ or $y$) into simple open number sentences or equivalence problems instead of blanks or boxes (i.e., $x+8=23$ instead of __+8=23) (Fujii & Stephens, 2008). This Grade 3 CCSS definition of variable may be one of the more rudimentary definitions, because it does not represent varying quantities, (Fujii & Stephens, 2008) however it may be the appropriate starting point for elementary school students. Despite variable use being stressed in the CCSS starting in Grade 3, there is very little research surrounding the conceptions held by elementary school students in this area. The
purpose of this study is therefore to investigate this further – what knowledge do elementary school students possess about variable and what misconceptions are occurring?

**Common Variable Misconceptions**

A review of the research reveals that students often experience misconceptions surrounding variables that appear to persist with age. MacGregor and Stacey (1997) found that common misinterpretations of variables for students ages 11-15 included believing the letter to stand for 1, for an abbreviated word, for an alphabetical value, for a particular numerical value, or for a label for an object. Further, when presented with the task ‘2n+3, what does the symbol stand for?’, the percentage of 6th, 7th, and 8th grade students who understood was 46%, 63%, and 76%, respectively (Asquith et al., 2007; Knuth et al., 2005). The majority of students who answered incorrectly either did not know the answer, or believed it to stand for an object, word, or a specific digit. These results indicate that middle school students may still be interpreting letters as letters (or specific corresponding numbers) instead of understanding their purpose in representing numbers or a range of numbers.

One of the most popular misconceptions held by middle and high school students appears to be misunderstanding literal symbols as labels (i.e., $c$ stands for cat, so $4c$ might mean 4 cats) (Booth, 1984; MacGregor & Stacey, 1997). McNeil, Weinberg, and colleagues (2010) investigated how these misconceptions manifest when utilizing variables using mnemonic letters (i.e., $c$ for price of a cake), non-mnemonic letters (i.e., $x$ or $y$), or Greek letters (i.e., $\Phi$ or $\Psi$). They presented 322 middle school students with a commonly used problem adapted from Kuchemann (1978, 1981) using these three different types of variables as conditions: ‘Cakes cost $c$ dollars each and brownies cost $b$ dollars each. Suppose I buy 4 cakes and 3 brownies. What does $4c + 3b$ stand for?’ Students in the mnemonic letters condition misinterpreted the
expressions the most often, and often considered the labels as standing for objects.

Approximately 37% of students in the mnemonic (i.e., c and b) condition interpreted the variables correctly while approximately 56% of students in the non-mnemonic conditions interpreted the variables correctly. There was no difference between the non-mnemonic letters and the Greek letters groups (McNeil, Weinberg et al., 2010). It seems clear that students experience misconceptions around variables that could be remedied through additional experience with variables and through teacher preciseness in choosing which variables to use (i.e., choosing non-mnemonic letters as variables).

**Importance of Variable Knowledge**

Mastering an understanding of variables and work with variables is significant because, if not remedied early, misconceptions appear to persist into high school and even into adulthood. A seminal study utilizing the notoriously famous ‘Student-Professor Problem’ (Kaput & Clement, 1979) demonstrated that even mathematically-proficient adults (i.e., college students pursuing traditionally mathematically based majors) often seriously struggle with representing mathematical relationships with variables. The most common misconception exhibited by the adults involved committing ‘reversal errors,’ which occur when the variables are reversed in formulas and has been found to be highly prevalent in both high school and college students (MacGregor & Stacey, 1993; Fisher, Borchert, & Bassok, 2010). This reversal error was demonstrated when between 40% and 60% of adults solved the following problem incorrectly: “Write an equation using the variables $S$ and $P$ to represent the following statement: ‘There are six times as many students as professors at this university.’ Use $S$ for the number of students and $P$ for the number of professors” (p. 288). The most common error made involved reversing the solution: ‘$6S=P$’. A follow-up study revealed that a large proportion (i.e., 40-43%) of college
students could not identify the $P$ to mean number of professors or the $S$ to mean number of students, revealing the common misconception that occurs when students misunderstand the $S$ to mean students (instead of number of students) and therefore reading $S=6P$ as “one student for every six professors” (Rosnick, 1981, p. 419). Because of these misconceptions that even adults appear to possess, it is crucial that students gain experience working with variables at an early age.

**Purpose of this Study**

Because of the significance and the accompanied research gap, this research sought to investigate the knowledge elementary school students possess surrounding variables.

**Methods**

This investigation of student variable knowledge was pursued using a two-pronged, mixed-methods research design. The first, quantitative prong, investigated student knowledge through paper pencil assessments while the second, qualitative prong, investigated student knowledge through think-aloud student interviews.

**Student Assessments**

Student assessments were conducted to investigate student knowledge surrounding variable across a large number of students in each elementary grade, Grades 1-5. No research found in the area had used random samples of students; therefore a random sample was utilized to reduce bias and increase generalizability of the results.

**Student demographics.** A stratified cluster random sample was used in this study, with schools stratified by mathematics achievement (i.e., high achievement, medium, and low) and students clustered by school. Of the 397 elementary schools in two urban counties of Washington State, six elementary schools from six different school districts were randomly
selected to participate: two high achieving schools, two medium achieving schools, and two low achieving schools. Schools were stratified by 3rd grade mathematics achievement: percent passing the 3rd grade state standardized test by school ranged from 37% to 83% with a mean of 65% \((SD = 17\%\)). Percent free or reduced price meals also varied widely, ranging from 30% to 77% with a mean of 45% \((SD = 18\%\)).

A total of 1,745 students participated by completing the assessment. The students were relatively equally distributed across the grade levels: 351 (20\%) first grade students, 309 (18\%) second grade students, 336 (19\%) third grade students, 384 (22\%) fourth grade students, and 365 (21\%) fifth grade students. Approximately 51\% of students were male, the average age of students was 8.96 \((SD = 1.49)\), and approximately 22\% of students were English Language Learners (ELL).

**Assessment.** All participating students were administered a newly developed and validated diagnostic assessment of algebraic thinking skills. Reliability and validation efforts of the instrument are currently underway; however internal reliability coefficients (i.e., Cronbach’s Alpha) for all versions of the assessment are at or above 0.80 and evidence of validity has been collected. Each assessment included at least three items investigating variable knowledge, primarily in the rudimentary first level of ‘variable stands for a specific number.’ Eight different variable items were used across the different grade levels. The items varied on the letter used as the variable (i.e., g, b, a, etc.), whether one or two of the same variables appeared, whether one or two different variables appeared, whether there was an ‘equivalence context’ (i.e., \(7+4+5=7+e\)) or not (i.e., \(6+b=9\)), and the type of operation (i.e., addition, subtraction, multiplication, or division).
**Analysis.** Classical Test Theory statistics (i.e., descriptive statistics, frequency counts, difficulty or p-values, etc.) were used to analyze the student responses. Response process analysis using coding and frequency counts was further used to provide common answers to each of the items. Further, analysis of variance (ANOVA) was used to investigate the differences in knowledge levels across grade levels.

**Think-Aloud Interviews**

A think-aloud protocol study was conducted to further investigate student knowledge surrounding variable and better understand student thinking and any misconceptions students are experiencing.

**Student demographics.** Seventy-three students of varying abilities from two different elementary schools in King County of Washington State were selected to participate in the think-aloud interview protocol. Grade level participants included 18 1st grade students (25%), 12 2nd grade students (16%), 11 3rd grade students (15%), 10 4th grade students (14%), and 22 5th grade students (30%).

**Interviews.** In the think-aloud protocol interview, students were asked to verbalize their cognitive processes when answering each of the assessment questions (described above). Using a think-aloud protocol can provide an in-depth view of how students perceive the assessment items (Ericsson & Simon, 1984; Ginsburg, 1997). In this think-aloud protocol, interview students were asked to verbalize their cognitive processes when answering each of the questions. By asking the students what they were thinking when answering the assessment items or why they answered in the way they did, “the experimenter seeks to learn directly from them [the students] the underlying cognitive structure that produced the overt behavior” (Ericsson & Simon, 1984, p. 42).
**Analysis.** The think-aloud data was analyzed using a four-step process. First, all think-aloud interviews were audiotaped and transcribed. Second, several readings of the interview transcriptions were conducted to gather first pass “codes,” or common thought processes and conceptions. Third, qualitative codes or themes were finalized and all interview transcriptions were coded to discover a pattern of themes or codes (Miles & Huberman, 1994). Fourth and finally, these themes were analyzed in conjunction with the results of the response processes analysis discovered in the large assessment sample described above to look for themes across a larger range of data.

**Results and Discussion**

The difficulty (p-values) for all items are displayed in Table 1.

Although students often initially struggled to solve one variable items like 6+b=9 in 1<sup>st</sup> and 2<sup>nd</sup> grades (i.e., with p values of 0.38 and 0.51), they were fairly proficient by 3<sup>rd</sup> grade (i.e., with p values of 0.81). By 5<sup>th</sup> grade, students were also fairly proficient (i.e., with p values of 0.80 and above) with both two variable items (i.e., 4+a+a=10) and variables used in an
equivalence context (i.e., $7+4+5=7+e$). Older students were also asked to solve more complex items involving two different variables (i.e., if $x+y+y=10$ and $x+y=6$ what is $x$ and $y$?). Students surprisingly mastered these problems fairly well (i.e., with $p$ values of 0.55 to 0.62), but continued to struggle throughout the grade levels (i.e., with $p$ values of 0.20 to 0.28) when the variables occurred on both sides of the equal sign (i.e., $n+n+n=n+12$).

There was a statistically significant difference by grade for the three items measured across all five grade levels: for $4+a+a=10$ ($F(4, 872) = 116.821, p < .001$), for $c+c+3=15$ ($F(4, 847) = 72.880, p < .001$), and for $7+4+5=7+e$ ($F(4, 856) = 73.106, p < .001$). Post-hoc Tukey analyses for $4+a+a=10$ and $7+4+5=7+e$ revealed that 1st and 2nd grade students significantly underperformed all other grades, while 3rd grade students significantly underperformed 5th grade students. Similarly, analyses for $c+c+3=15$ revealed that 1st and 2nd grade students significantly underperformed all other grades; however there were no other differences.

**Conception Analysis**

It appears that students faced a variety of different misconceptions when solving problems involving variables, with younger students more likely to be confused. The conception analysis and interview results of three specific items are highlighted below.

**6+b=9.** For the item $6+b=9$, some students understood immediately: for example a 2nd grader said, “Oh, that’s kind of like algebra where there’s like an $x$ and you try and figure out what it is!” Others students were not familiar with the use of the variable and left it blank or just listed numbers in the problem such as 6 or 9: “9? Because it’s [written] right there.” However, certain students who were unfamiliar with problems such as these were able to work them out on their own. One 1st grade student, for example, said, “I’ll skip it. Wait, I think I know how to do
this one. 6 plus what number equals 9… b must be 3!” The most common conceptions for the item $6+b=9$ are displayed below in Table 2.

</table>

10-g=2. Similar conceptions occurred in the item $10-g=2$ (see Table 3 below). Several students had not experienced these types of items. One 1<sup>st</sup> grade student said, “I can’t figure these out. The letter ones I can’t do.” Other students thought that the ‘g’ in $10-g=2$ was actually a 9: “9? Because they kind of look like 9s.” Another student thought ‘g’ was a 6 because “if you turn the g upside down it’s going to be a 6.” Others simply replaced the answer with numbers from the problem like 2 or 10. Others still thought that the letter stood for a specific word, like ‘b’ for box or ‘g’ for Grady (i.e., the student’s name). Like before, some students who were not sure about the problem were still able to talk themselves through it successfully. One 3<sup>rd</sup> grade student, for example, said: “What? Okay, that’s kind of weird. I’m going to skip it. Wait, I think I know. You have to find out what the g is. 10 minus what would equal 2… so it is 8.” It is clear that students held a wide variety of different conceptions about what the variable could stand for, especially in cases where they had not previously been exposed to such problems.

Table 3

Common Answers to $10-g=2$
**c+c+3=15.** Students appeared to continue to experience misconceptions as the variable items became more difficult. When students were asked to solve items with two identical variables such as c+c+3=15, many of the younger students skipped this item: one 1\textsuperscript{st} grader, for example, commented: “I don’t know. Can I just skip this one?” A 2\textsuperscript{nd} grader said, “But I don’t know what these [points to ‘c’s] stand for.” A 3\textsuperscript{rd} grader said, “This one’s a little too hard for me,” and a 4\textsuperscript{th} grader said, “I’m going to skip that.” Other students were a little confused about having two variables in one problem. Many students put 12, which is what c+c equals. One 3\textsuperscript{rd} grade student said, “Wait, for both ‘c’s or for only one c?” while a 5\textsuperscript{th} grade student said, “15 minus 3 is 12.”

**Conclusion**
These findings supported the findings of previous researchers (MacGregor & Stacey, 1997), in that it does appear that students might benefit from more opportunities to experience variables. Students exhibited misconceptions when solving items with variables and appeared to struggle more when a variable was used in an open number sentence instead of a box or blank. Figure 1 below compares their results with the open number sentence $8+\_\_ = 15$, a similar arithmetic problem that differs only in the use of the blank versus the use of a variable.

![Figure 1](image.png)

*Proportion of Students Solving Open Number Sentence and Variable Items Correctly*

When solving these variable items, many students simply reused numbers from the problem in the answer or even utilized the numeric / alphabetic code students sometimes learn (i.e., $a=1$, $b=2$, $c=3$, etc.). When problems became more complex and two identical variables were seen (i.e., $c+c+3=15$), students did not seem to understand that when the variable is the
same and used more than once the same number will replace both letters. Although this analysis measured one of the first, most rudimentary meanings of the word variable, it is important this meaning becomes familiar and is mastered before progressing to more complex meanings. It is imperative this knowledge is fostered early, as misconceptions surrounding variable can persist throughout middle and high schools and even college and beyond. This issue is best summed up by MacGregor and Stacey (1997): “Students frequently base their interpretations of letters and algebraic expressions on intuition and guessing, on analogies with other symbol systems they know, or on a false foundation created by misleading teaching materials… Their misinterpretations lead to difficulties in making sense of algebra and may persist for several years if not recognized and corrected” (p. 15).

The Internet as a Disruptive Technology

Jacqueline Gilovoy¹ and Robert Roggio¹ and James R. Comer²
¹School of Computing, University of North Florida, Jacksonville, FL 32224
²James R. Comer, Department of Computer Science, Texas Christian University, Fort Worth, TX 76129

Abstract Technology is always changing. A new idea is called an innovation. A subclass of this new idea is a disruption. Coined by Clayton Christensen and expanded by Caroline Howard, disruptive technology “displaces an existing market, industry, or technology and produces something new and more efficient and worthwhile. It is at once destructive and creative.” But what really is disruptive technology and how does it displace existing technology? Many feel that when customers’ needs change, new products may emerge that accommodate existing and updated attributes; thus, creating competition with the pre-existing technology and this new innovation. If the pre-existing product cannot keep up with the customers’ changing needs, the new technology takes over the industry and is classified as disruptive. With these definitions in mind, let us examine a specific technology – the Internet – and discuss how it fits the model.

I. What Is Disruptive Technology?

Technology is always changing. A new idea is called an innovation. A subclass of this new idea is a disruption. This concept is “literally uprooting and changing how we think, behave, do business, learn and go about our day-to-day.” [1] Coined by Clayton Christensen, disruptive technology “displaces an existing market, industry, or technology and produces something new and more efficient and worthwhile. It is at once destructive and creative.” [1]

This is a good definition, but what exactly does it mean? How does disruptive technology displace existing technology? What characteristics are necessary to fit this classification? Erwin Danneels provides a more specific description: It is a “technology that changes the bases of competition by changing the performance metrics along which firms compete.” [2] What this implies is that when customers’ needs change, new products may emerge that accommodate existing and updated attributes; thus, creating competition with the pre-existing technology and this new innovation. If the pre-existing product cannot keep up with the customers’ changing needs, this new technology takes over the industry and is classified as disruptive.

With these definitions in mind, this paper will examine a specific technology – the Internet – and discuss how it fits the model.

A. Internet Is Disruptive

Is the Internet a disruptive technology? Merriam-Webster defines the Internet as “an electronic communications network that connects computer networks and organizational computer facilities around the world.” [3] According to Christensen, “the Internet is disruptive to some but sustaining to other firms, depending on whether it is consistent with their business model.” [2] This idea can be confusing and requires an examination of the previously discussed definitions in relation to a specific industry.
When looking at the Internet in the realm of communication, the authors believe that it can be concluded that the Internet is, indeed, a disruptive technology. It is both destructive and creative. It displaces the older means of human interaction and creates possibilities of communicating with different people all over the world. Before the Internet, the only means of doing this was by traveling or writing via physical mail and waiting days, weeks, or even months for a response. Today, if communicators are online at the same moment, they may interact instantly; however long it takes for the Internet connection to send and receive data.

In the following pages, the authors will discuss how the Internet has disrupted the way people communicate, by focusing on the concept of social media and how it has impacted the way businesses interact with employees and customers and how language has evolved.

B. What Is Communication?

In order to say that the Internet disrupts communication, one must first define what communication is. According to Merriam-Webster, communication is “the act or process of using words, sounds, signs, or behaviors to express or exchange information or to express your ideas, thoughts, feelings, etc., to someone else.” [4] There are two subsets of communication: oral (e.g. spoken face-to-face or over the telephone) and written (e.g. letters, emails, text messages or online forums).

But the Internet helps communication! Doesn’t that make it an innovation? Yes, but a disruptive innovation. This technology has made it easier to communicate with people, but at what cost?

II. Social Media

A. What Is Social Media?

Social media is “electronic communication (as Web sites for social networking and microblogging) through which users create online communities to share information, ideas, personal messages, and other content (as videos).” [5] Another definition is, “a group of Internet-based applications that build on the ideological and technological foundations of Web 2.0, and that allow the creation and exchange of User Generated Content.” [6]

Breaking this down a little further, Web 2.0 is a term used to describe a new way of using the World Wide Web, “a platform whereby content and applications are no longer created and published by individuals, but instead are continuously modified by all users in a participatory and collaborative fashion.” [6] User Generated Content (UGC) is a term describing content that is created by end-users. It also needs to fit these three requirements:

First, it needs to be published either on a publicly accessible website or on a social networking site accessible to a selected group of people; second, it needs to show a certain amount of creative effort; and finally, it needs to have been created outside of professional routines and practices. [6]
So, is social media just interacting with other people online? There would not be in-depth definitions if it were that simple. Emails, instant message chats, and browsing the web do not fit the above requirements. Next, consider what types of software do fit the definition.

B. Types of Social Media

One of the earliest forms of social media is the blog. Its basic definition is a type of website that displays “date-stamped entries in reverse chronological order … [anything] from personal diaries describing the author’s life to summaries of all relevant information in one specific content area.” [6] Examples of this type of entity include WordPress, Blogger, LiveJournal, and Tumblr.

Other categories of social media are described as follows by Daniel Nations:

**Social Bookmarking.** (Delicio.us, Blinklist, Simpy) Interact by tagging websites and searching through websites bookmarked by other people.

**Social News.** (Digg, Propeller, Reddit) Interact by voting for articles and commenting on them.

**Social Networking.** (Facebook, Twitter, LinkedIn, MySpace, LiveJournal) Interact by adding friends, commenting on profiles, joining groups and having discussions.

**Social Photo and Video Sharing.** (YouTube, Flickr, Instagram, Snapchat) Interact by sharing photos or videos and commenting on user submissions.

**Wikis.** (Wikipedia, Wikia) Interact by adding articles and editing existing articles. [7]

That’s great, but how does social media support the hypothesis that Internet is disruptive to communication? As described above, the main purpose of social media is communication and interaction with other people.

Communication, check. Innovation, check. Disruption – “literally uprooting and changing how we think, behave, do business, learn and go about our day-to-day” [1] – check. With the current generation, there is nothing that “literally” changes our thinking, behavior, business, learning, and our life more than social media. Facebook, Twitter, Instagram, YouTube – people are constantly on their computers, smartphones, and tablets, checking up on their friends and their favorite celebrities, posting and sharing things others want to know and more things people do not want to know. Checking one’s social networks can be as addictive as taking a cigarette break.

We can take a look at another, smaller example of how social media is disruptive by looking at Wikipedia.

C. Wikipedia

Wikipedia is “the free, non-profit, community-edited online encyclopedia.” [8] This new innovation is disruptive because it has completely changed the encyclopedia industry. In 2012, Encyclopedia Britannica, the “oldest continuously published encyclopedia in the English language,” [9] ended print production after 244 years. In the 1950s, owning a Britannica was “a
possession coveted for its usefulness and as a goalpost for an aspirational middle class.” [9] The price tag of one of these encyclopedias was $1,395. But, with technology changes and the Internet providing instant updated material, and for free, the printed encyclopedia could not compete. Instead, Britannica now focuses on its online collection and educational curriculum for schools. [4] Another reason Wikipedia is at an advantage, besides instant updates and price, is the types of entries it contains versus Britannica. Pretty much anything a person can think of can be included on Wikipedia, especially since that person can create an entry, whereas Encyclopedia Britannica has higher standards on what gets included in its editions. [9]

D. Social Media and Business

Journalism is an example of business that has been impacted by social media. Communication between audience and journalist is rapidly becoming a more used and useful means to express ideas and gain feedback. Emails and story comments have been around for decades, helping to get an understanding of what the audience has to say. But these tools are not as powerful as social networking sites. Facebook and Twitter users share news faster than ever. The way people, especially adolescents and young adults, find out information is not through standard media outlets but through what their friends post and share. Especially with mobile devices, the way news spreads is instantaneous. One’s phone can provide an alert before one has a chance to read the morning paper or check a publication’s website.

There are two sides to this phenomenon: a) people no longer need to read news stories; thus, dropping the readership audience for journalism, and b) journalists can tease future stories and get breaking news information out rapidly as it happens instead of possibly hours later when they can type out an article. It is instantaneous and short, which fits well for the fast-paced audience of today. With Twitter, make your point in 140 characters or fewer.

Okay, so journalism is the quintessential example of communication being effected by the Internet. Let’s broaden the business sphere. Pick a business - any business. Seriously, any business. Social media has changed how businesses interact with their employees and customers. Businesses can communicate with their stakeholders (customers, employees, investors) immediately and in new ways to share information. [10] But, beware: social media can be a Pandora’s Box.

In opening the virtual box of social media, company or employee posts that seem beneficial, or at worst harmless, can unleash a firestorm of unforeseen consequences. As organizations use various forms of social media to improve their bottom line and maximize profits, individuals tend to share details of work and private life on social networks that broadcast information to thousands. [10] (Jennings, Blount, and Weatherly 96-113)

Most people don’t think what their posts about work means much, especially a low-level employee who rants about his boss to his Facebook friends. But, the simplicity and constant use of social media “creates the potential for purposeful or accidental release of information that could be damaging to other people or organizations.” [10] Because of this, more and more companies are developing social media policies for their employees, providing guidance on social media in the workplace and what can be said about work. A problem that has arisen is the limited formal training on how to use this new media, especially in relation to the workplace.
“This potential for widespread, untrained utilization brings new challenges for employers,” including in the financial, legal, and ethical settings. “It only takes one ill-worded or ill-timed post to create a company nightmare.” [10]

Usually, there is one person or a team that handles the social media accounts for an organization. But be aware: based on the principle of respondeat superior, “a company will generally be liable for any torts – civil wrongs for which there are legal remedies – committed by its employees in the course of managing these social efforts on behalf of the company.” [10] Make sure the social media team is aware of potential legal issues and is trained on how to run the company’s media to avoid any future problems.

Individual employees need to be careful, too. When endorsing or reviewing a product or service provided by an organization, one should always disclose one’s connection with the company. This allows potential customers to make an informed judgment since credibility of endorsement is affected. If connection is not disclosed but gets uncovered, customers may feel duped and betrayed, aside from any potential legal ramifications.

Legal liability should not be the only consideration; one should watch out for marketing and public relations nightmares. Bad press is still press, right? While it may get your organization more attention, just remember, once it’s on the Internet, it’s always on the Internet. And the rapid spread of information can also gain boycott momentum. For example, if the company says something offensive, all it takes is one person with thousands of followers or friends, and the damage is done.

Another aspect of business and employment that is disrupted is free speech. Legal action can be used against employers if they attempt to restrict employees from posting online. People tend to vent and complain to their friends, but what happens when the people you vent to are on a public forum? Employers get nervous and try to limit what you can say, but this can lead to legal liability for violations of federal labor laws. [10]

To avoid any of these legal and PR nightmares, it is best if companies have a social media policy in place, but it “must be specific enough that they advise employees of what conduct is restricted without restricting conduct that could reasonably be construed as protected concerted action between employees.” [10] And make sure employees are aware a policy exists and where to find it.

The authors have just finished discussing social media in business; now consider it via language – how the Internet, including social media, has changed the language use to communicate.

III. Language Evolution

When considering the definitions of disruptive technology, the “literal uprooting and changing how we think, behave … and go about our day-to-day,” [1] this concept gives rise to another point. The Internet has disrupted communication via language. As Christensen said, disruptiveness is destructive and creative. And in no other way is it both than by the concept of “chatspeak.” [11]

Urban Dictionary is a “crowdsourced online dictionary of slang words and phrases that was founded in 1999 as a parody of Dictionary.com.” [12] And as such, you can find an array of
new words and terms that are used in everyday English language. Urban Dictionary lets users edit and add entries, similar to Wikipedia. Consider how people define *chatspeak*: “A disgrace to grammar;” “Chatspeak is pretty much the Language of the Idiots. It is used by those too stupid/lazy to type properly;” “When people think it’s cool to shorten words when they type things on IM, message boards, etc;” and

Also known as webspeak, chatspeak, and weblish is basically an illiterate way of typing, and a way to massacre a language. Shortening words (such as you to u), insisting on ignoring captials[sic], making words numbers, (such as 2 or 4) and not using endmarks are all parts of chatspeak. [11]

This term is a destructive phenomenon because as people, especially adolescents, continue to speak like this (“lyke omgwtfbbq typing wit corect spelng is overrated LoL!!1” or “yo r u goin down 2 the club 2day” [11]), it can start seeping into offline life. You would fail an English exam if you wrote like these examples.

While it appears grammar and the grasp of the English language has declined with chatspeak, the grammar police are everywhere. Someone is bound to call you out on your Facebook post if you incorrectly use “there, their, they’re” or “your, you’re.” According to the Facebook news feeds and Internet memes (See Fig 1), people are more likely to reread their Facebook and Twitter posts, to not make a fool of themselves on the Internet, than they are to reread essays and papers for school.

Fig 1. Examples of chatspeak

Aside from chatspeak and grammar nazis, language is evolving with the addition of new words added to the dictionary. Merriam-Webster and Oxford Dictionaries have both added the word “selfie” to their official list of real words. A selfie is “an image of oneself taken by oneself using a digital camera especially for posting on social networks.” [13] According to M-W, words get added to the dictionary simply from the amount of times it is used. [14] and with the Internet, words are used more often than ever. With social media, new terms pop up left and right (YOLO,
anyone?), but the power of the Internet can impact language; it can help add words to
dictionaries. Some other examples of words added in 2014 are crowdfunding, big data, catfish,
gamification, poutine, and steampunk. [15]

While human interaction is disrupted by the Internet, the way we communicate with our
own technology – phones, cars, card chips, etc. – is also changing.

IV. Internet of Things (IoT)

Recently, there has been much interest in what is called The Internet of Things (IoT, sometimes Internet of Everything). The IoT may be defined as a network of physical objects or "things" embedded with electronics, software, sensors, and connectivity to enable these objects
to exchange data with the manufacturer, operator and/or other connected devices.

A number of recent white papers and independent research address the potential world-
wide linking of sensible objects that may be remotely controlled across existing network
infrastructure. [16] Such “connectivity and access” may create unheard of opportunities for much
more direct integration between objects in the real world and computing systems that may result
in vastly improved efficiency, accuracy and economic benefit. [17][18][19][20][21] It is asserted that
each thing is uniquely identifiable through its embedded computing system but is able to
interoperate within the existing Internet infrastructure. In his very recent paper, Philip Howard
estimates that the IoT will consist of almost 50 billion objects by 2020. [22]

J. Höller [23] et al offer that the IoT may offer advanced connectivity of devices, systems,
and services that goes beyond machine-to-machine communication and cover a variety of
protocols, domains, and applications. O. Monnier states that the interconnection of these
embedded devices (including smart objects) is expected to usher in automation in nearly all
fields, while also enabling advanced applications like a Smart Grid. [24] Others expand these
areas into even further domains.

In addition to the wide range of (in many cases) entirely new application areas involved
in Internet-connected application areas, Bob Violino and Mochael Hogan assert that the IoT will
generate huge amounts of data from many different locations that can be put together very
quickly. This will necessitate the need for improved indexing, storage, and improved processing
of data. [25][26]

The impact on our lives via Internet of Things is as yet uncertain, but for sure, it will be
“disruptive.”

V. Conclusion

The Internet is a disruptive innovation. It is both destructive and creative. And it has
forever changed how humans communicate and interact with one another. This incredible
technology is something we all take for granted nowadays. Most of us wouldn’t survive without
Internet access – at least, we say that, but we’re too addicted to try and stop and remember life
before our lives revolved the online sphere of emails, social networking, message boards, and
surfing the web.

But if we stop and think about the way the Internet has impacted communication, we can
see how much it has helped us connect with others throughout the world, people we would most
likely never meet otherwise. So what makes this disruptive?
Disruptive technology means “literally uprooting and changing how we think, behave, do business, learn and go about our day-to-day.” [1] In this paper, several subjects were discussed including social media, language, and the Internet of Things. The creation of social media has most definitely changed our behavior and day-to-day lives. Businesses are learning how to take advantage of reaching more and new customers, yet struggling with how to stop new legal issues that have evolved. Even the English language has been impacted. New words are added to the dictionary because of usage; words that would not exist without the Internet.

As wonderful and powerful as the Internet is, it is an innovation we’re still learning to cope with. In this process, communication is trying to catch up, but it’s been disrupted enough that it may never fully catch up in some areas.

Abstract

This report is a literature review on methods for measuring the efficacy of Professional Learning Communities (PLCs) used in schools as a form of teacher professional development. Research-based characteristics of successful PLCs are identified, and several studies are cited that indicated student achievement gains as a result of PLC implementation. This research contributes to the literature on evaluating effective PLC professional development.

Professional Development through PLCs: Methods for Measuring PLC Efficacy

Certain characteristics are often found in the most effective Professional Learning Communities (PLCs). First, a shared vision for a school and collective responsibility for results by a community are vital to success (Vescio, Ross, & Adams, 2008; DuFour, 2014). A second key component of PLC work is reflective dialogue and inquiry among members of a PLC, which allows for frequent examination and discussion of teacher practice (Darling-Hammond & Richardson, 2009). A third recurring theme in the literature is the importance of teachers using classroom data, both formatively and
summatively, to inform their collaborative work and professional discussions about classroom practice (Strahan, 2003; Vescio et al., 2008; Williams, 2012). Characteristics of successful PLCs include:

- Make connections between adults collaborating and students learning;
- Establish a clear purpose/shared focus that is compelling to the group members;
- Draw on exemplary outside resources relevant to the PLC focus;
- Use a cycle of planning, acting, and reviewing the results tied directly to the PLC focus;
- Provide adequate time to do the work;
- Provide support from building and district administration (Smith, Corbett, & Wilson, 2010, pp. 116-17).

Whitford and Wood (2010) found that PLCs allowed teachers to have collaborative conversations that “spawned possibility, inventiveness, and hope” in the way teachers think about student learning (p. 18). Additionally, PLCs reduced isolation, created better informed and more committed teachers, and increased academic gains for students (Hord, 2004).

One key component to successful PLC implementation that is often overlooked includes measuring both outcomes and fidelity of implementation. The purpose of this research is to investigate: How can a district or school measure the efficacy of PLCs? What tools are tried, tested, and garner information and results? What rubrics can be used to evaluate the efficacy of PLCs?

**Defining Professional Learning Communities**
Professional Learning Communities (PLCs) can be defined as “small groups of educators meeting regularly to engage in systematic peer critique and support by sharing their own professional practices as well as artifacts of student learning” (Whitford & Smith, 2010, p. 22). Furthermore, PLCs focus on educators’ shared commitment to student learning through collaborative practice and decision-making (Yendol-Hoppey, 2010). PLCs promote reflective practice and help to “cultivat[e] working relationships with other teachers, being responsive to student needs and interests, and investigating the strengths and weaknesses of one’s own practice” (Jones, 2010, p. 151). PLCs often exist within grade or content level teams, but they do not have to be limited to one school; Smith, Corbett, and Wilson (2010) researched a cross-district PLC that included superintendents, curriculum directors, and project coordinators who “shared ideas and strategies, and explored the implications of developing more collaborative cultures in organizations that have long been largely hierarchical” (Smith, Corbett, & Wilson, 2010, p. 111). PLCs may provide benefits at many levels, most notably to improve student achievement.

**PLCs Increase Student Achievement**

The goals of PLCs vary based on specific school and district needs but broadly focus on improving student learning by focusing on teaching. Dufour (2004) identifies the three main questions PLCs strive to answer:

1. What do we want each student to learn?
2. How will we know when each student has learned it?
3. How will we respond when a student experiences difficulty in learning?
PLCs provide teachers opportunities to collaborate, focus on teaching across the curriculum, plan balanced assessments, and use data to track progress and make adjustments.

Several studies have shown that PLCs can increase student achievement. Strahan (2003), for example, sought to examine how three schools with a large percentage of low income and minority students had made great gains on standardized test scores, and found the answer led back to PLCs. These three schools started with less than 50% student proficiency in reading and math, and grew to over 75% proficiency over the course of five years. To determine how these schools had reached this level of success, researchers collected qualitative data in the form of interviews, lesson observations, and school-wide meetings. The analysis of the results determined that “the central dynamic…was data-driven dialogue, purposeful conversations guided by formal assessment and informal observation” (Strahan, 2003, p. 143). These conversations were part of a supportive school culture that fostered PLCs with a focus on classroom changes to improve instruction.

Another study examined the impact of a five-year, district-wide implementation of PLCs at the elementary, middle, and high school levels (Williams, 2012). Teacher interviews revealed that teachers at all levels “…believed that PLCs provided avenues for them to learn and positively impacted their classroom practices” (p. 35). Analysis of district-wide data on student achievement in reading after the third year of implementation showed statistically significant ($p < .05$) improvements at all levels, with the largest gains at the middle and high school levels. Williams (2012) asserts that the
results of this study give solid evidence that implementation of the collaborative culture provided by PLCs plays an important role in student learning and achievement.

In 2014, DuFour published a study outlining the important elements of PLC implementation, then provided quantitative data from schools using on-going training on the use of the collaborative PLC process. DuFour described a school district with 27 schools with all schools at 75% or less of the students meeting proficiency standards in reading and math. At the end of the five-year initiative, 19 of the schools had reached the goal of 90% proficiency, with several schools at 95% or more. These studies illustrate the potential academic benefits of successful PLC implementation and practice.

Successful PLC implementation is challenging, however. Smith, Corbett, and Wilson (2010) studied PLCs within three large school districts. They found several barriers that inhibited the success of the communities, including: competing demands on time, administrative support, lack of clarity regarding goals, high turnover, extended time between meetings, and difficulty in maintaining a focus on student achievement.

**Measuring the Effectiveness of PLCs**

Measuring the efficacy of PLCs should occur at various leadership levels within a school district. PLCs can be a valuable practice for schools when there are clear PLC goals that align with school and district goals. A review of the literature indicates five main characteristics of effective PLCs that should be measured, including:

1. Shared values and vision: The PLC community has a continued focus on student learning as its main goal.

2. Collective responsibility: All members of the PLC community advocate for student learning.
3. Reflective professional inquiry: PLC members partake in reflective dialogue to discuss problems of educational practice.

5. Collective learning: teachers learn from each other and improve teaching practices, also increasing student learning (Stoll, Bolam, McMahon, Wallace, & Thomas, 2006).

There are various methods that can be utilized to measure PLC efficacy. Lujan and Day (2009) conducted a study on efficacy using surveys, interviews, and field-based observations. Their research focused on how PLCs impacted collaboration among teachers, and if the roadblocks to collaboration were addressed, was collaboration impacted as well. Their main findings were that time constraints, isolation, divergent views, and lack of conflict resolution were the main roadblocks to collaboration. Utilizing Lujan and Day’s interview questions to guide research can help clarify PLC strengths and weaknesses.

**Methods of Measuring PLC Efficacy**

The literature suggests five different options for measuring the efficacy of PLCs. The options are detailed below:

1. **Demographic Informational Survey**

   The schools’ administrative teams could complete a demographic informational survey about the school, including student attendance and discipline data, student achievement data, and student demographic information.
2. **PLC Participant Survey**

PLC effectiveness can also be measured by PLC participants’ surveys. All PLC participants could be surveyed via an online survey to discover such things as their views regarding PLC participation, familiarity with the district’s mission and vision statements, collaboration with colleagues, and the impact of PLCs on teaching and learning. This survey could be used as a pre-assessment of PLC members and used again at the end of the year to help measure effectiveness based on member perceptions and participation. Data could guide PLC leadership and planning to help garner collective responsibility needed for efficacy. Data could also guide future next steps for this work (i.e., whether the district should proceed with options 3-5 below).

3. **Interviews**

Outside researchers could conduct in-person interviews to measure the effectiveness of the PLCs. Interviews offer data that cannot be gathered in a written survey, such as insights into PLC participant perspectives through direct quotations from PLC members (Forman, Creswell, Damschroder, Kowalski, & Krein, 2008). For example, questions similar to the written survey could be asked, focusing on views about PLC collaboration, participation, and efficacy. Conversely, questions could focus on elaborating on answers in participant surveys. Suggestions for improvement could also be collected. Data gathered through interviews would remain confidential. Conducting interviews in addition to a written survey will help provide a well-rounded picture of PLC function and practice.
4. **Data Analysis**

Researchers and/or PLC members could analyze student test scores to compare data results from the year prior to PLC implementation to data results post PLC implementation. Data analysis could also be compared between other schools utilizing PLCs and/or schools not using PLCs. Data could be disaggregated by grade level and by school.

5. **Observations / Self-Assessment**

Researchers and school personnel could conduct observations of PLCs, using the targeted PLC goals identified by the school. Utilizing multiple forms of research can help triangulate the data to provide a broader picture of PLC efficacy.

**Summary**

A multiple measures approach that includes surveys, interviews, data analysis of existing data and of data produced by PLC protocols, observations, and self-assessments would give a well-rounded picture of PLC efficacy within a school or district. Completing the feedback loop by examining student achievement data can help clarify teacher success in relation to their collaborative work. Research indicates that PLCs that utilize best practices of implementation increase student achievement (e.g. Strahan, 2003; Williams, 2012; Dufour, 2014), so it is crucial that schools measure their own PLC efficacy to ensure success.

Smith, D., Corbett, D., & Wilson, B. (2010). Context and collaboration: Growing the

Newspaper in Education, often called by its initials `NIE,’ in simple terms does exactly what its name says: It is newspapers taking an active role in the education of students. NIE’s main avenue to reach student has been the school classroom. The philosophy of NIE is based on the regular use of the newspaper in the classroom. NIE has various roles in advancing students’ thinking ability such as comprehensive thinking, analyzing, data interpreting, and critical thinking. In this research, I expected to understand how newspaper articles can contribute students’ subject matter knowledge. To draw educational implications of NIE, I collected 92 articles related to Korea in New York Times website from April to October, 2015.

Eighty articles out of 92 were written by one reporter with Korean name, and other 12 reporters wrote Korea-related articles. Twenty-nine articles were about domestic politics, 28 were about domestic social issues, 5 were about culture/technology, and 1 was about sports. It is noteworthy that 28 articles were about North Korean news: Politics of North Korea covered 22 articles and social issues of North Korea covered 6 articles. The keywords of total articles were not various, which means that a few news from Korea did attract international issue. Half of total articles did not exceed 10 paragraphs and 22 articled exceeded 20 paragraphs, which contained a profound content.

The most valuable articles for use of education in Korea were about North Korea. Compared with domestic newspaper articles, they had more neutral and international viewpoint. With this articles, students in South Korea are expected to understand North Korea more objectively and keep an open mind to North Korea, which would help two Korea’s reunification.

6) **Abstract:** Promoting Student Success through Cohort-based Models

   The workshop on *Promoting Student Success through Cohort-based Models* will illustrate the importance of providing targeted and cohort-based academic, social, professional and cultural support services to pre and college students to ensure their academic success. The research objectives are to explore 1) how underprepared students navigate the educational system as compared to those students who do not participate in cohort programs; 2) how specific program initiatives are designed, reviewed and revised to meet the needs of specific program cohorts, and 3) to provide comparison data related to retention and degree completion between program participants and non-participants. The study will use a quasi-experimental design grounded in an action research framework. It is expected that students in cohort programs will have better retention and degree completion rates as compared to similar students who do not participate in cohort programs.

   The following programs at Medgar Evers College of The City University of New York will be highlighted to illustrate how student needs and program outcomes drive the
development of initiatives in cohort programs: The Percy E. Sutton SEEK Program – an opportunity program for pre-freshman through completion of a college degree, and the Upward Bound and Talent Search Programs for pre-college students. The workshop will provide strategies for improving students’ college readiness and address barriers that may prevent students from achieving their goals. The workshop will concentrate on how cohort programs prepare students for college through structured tutoring, counseling, and cultural enrichment opportunities as well as the provision of information about financial aid programs and benefits. The presentation will include a description of a longstanding peer mentor program that pairs new freshman with upper classmen to smooth the transition from high school to college and provides a means for students to identify and address barriers to their success, a description of a summer bridge program developed to meet the needs of underprepared college students, and the benefit of collaborative learning communities. Lastly, we will explore the positive impact academic support programs have on students’ ability to enroll in college, persist, and complete their degrees in a timely fashion. Workshop participants will have the opportunity to discuss issues on their campuses and to work in small groups to develop strategies that can be utilized to serve the needs of specific student cohorts. Some of the highlighted activities provided by these programs help to address and support life-long learning to enrich students’ personal, professional and academic growth. The emphasis on these challenges and addressing them with support services serves to enhance students’ ability to focus on their academic goals and performance and ultimately graduate from high school as well as college.

(Bio)
Dr. Simone Rodriguez-Dorestant serves as the Dean of the School of Professional and Community Development. She has more than 15 years of professional experience in academic and administrative management working with young people and adults. Dr. Rodriguez-Dorestant’s portfolio primarily focuses on student services and success for high school and college students, enrollment management and student affairs, and program and curriculum development.

Dr. Janice Zummo is Chair of the Department of Special Programs and Director of the Percy E. Sutton SEEK Program at Medgar Evers College of the City University of New York. Under Dr. Zummo’s leadership, SEEK students who enter the college less prepared than non-SEEK students achieve higher retention and graduation rates. Dr. Zummo has 14 years of experience in higher education leadership working in an urban environment where she strategically evaluates program outcomes and student preparedness levels to develop academic programs that support continued enrollment and degree completion through the utilization of academic support services.
Breaking Workplace Bullying Behaviors

by

Pamela R. Rockwood, Ph.D.

prockwoo@kidsroe.org
prockw00@gmail.com
ABSTRACT

Bullying is not just for kids anymore and it is indeed the “elephant” in today’s adult workplace setting. While bullying is an individual’s repeated offensive behavior towards another through vindictive, cruel or malicious attempts to humiliate, disrespect, or undermine, mobbing is group bullying with similar goals in mind. There are many reasons that adults choose to bully or mob that include: 1) Having value differences; 2) lacking respect for diversity; 3) seeking attention; and 4) wanting power. It has been shown that targets are bullied or mobbed because they: 1) Refused to be controlled by someone else; 2) appeared to be an “easy” target; 3) exhibited some type of ethical, “whistle-blower” type of behavior; or 4) was envied by the bully for their superior competence or overachievement. Recent research has demonstrated that bullies (the perpetrators) may bully because they could be “wired” differently (Barnes, 2012), demonstrating psychopathic and/or narcissistic, and/or Machiavellian traits. Research has also shown that there are at least 45 different mobbing behaviors that can be grouped into five different categories, as well as three major degrees. While there are seven basic strategies that can be used to deal with any adult bully, there are five specific types of bullies. Thus, with each specific type of bully, there are distinct techniques that should be used. Bullying is expensive for both the target and the organization. It results in the loss of time, health, productivity, and money for both. Therefore, management must take all reports of bullying or mobbing quite seriously. There are many steps that an organization can take to prevent, deal with, and stop adult bullying or mobbing, with the first step being to assess their current workplace culture, then create a plan for improvement and follow that plan with fidelity.
Breaking Workplace Bullying Behaviors

Introduction to the Problem

Bullying is not just for kids anymore indeed being the “elephant” in today’s adult workplace setting, and it appears to make no difference as to the type of setting as illustrated by the data provided from the following studies. In 2012, Hollis surveyed faculty and administrators in 175 four-year American colleges and universities that included liberal arts colleges, Research I institutions, Ivy League universities, historically black colleges, state universities and large private universities, asking about adult bullying in their setting. Out of 3200 potential respondents, she had 401 that completed the survey and of that group 62% confirmed that they had been bullied or had witnessed bullying in their higher education positions. In a study done by the Workplace Bullying Institute, Namie (2014) found that 27% of its respondents had either seen or experienced adult bullying in their workplace setting that included various business locations. Rockwood (2015) then conducted a survey on workplace bullying in a non-profit organization. With a 41% return rate (61 out of 148 participants responded), she found that 47.5% of the respondents had either seen or experienced adult bullying in their workplace. With studies such as these providing evidence, it is safe to say that adult bullying can be found in all types of settings. Workplace bullying legal expert David Yamada (2010) maintains that it is the most neglected form of serious worker mistreatment in American employment law. It is not discriminatory as to where it occurs and by whom. Wherever it takes place and for whatever reason that it occurs, one thing is certain, it contributes to the creation or continuance of a toxic workplace culture, thus making any improvement within that organization next to nearly impossible.
With the pervasiveness of adult bullying being found in so many workplace settings and its potential costs (personal, financial, and organizational), it is imperative that organizations and those who are being bullied (the targets) be able to recognize what is happening, as well as have a repertoire of strategies, based on best practices, so as to be able to deal with it.

Purpose of the Review

The purpose of this review of the current literature is to aid organizations and bullied targets to be able to recognize and deal with adult bullying and mobbing in order to prevent or stop it. Its secondary purpose is to help them realize the potential costs (personal, financial, and organizational) if it is not prevented or stopped.

Conceptual Framework

The conceptual framework for this study was derived from the research literature describing adult bullying, workplace bullying, mobbing, values, and organizational culture.

Review of Related Literature

What is Adult Bullying and Mobbing

Is it Harassment, Bullying, or Mobbing?

The workplace of today is awash with the most age and value diverse workforce this country has known since the field and farm were abandoned for the office and factory (Zemke, Raines, & Filipczak, 2000). With these varying values present in the workplace, it is important to remember that people are guided by their values (Drazin, Hess, & Mihoubi, 2006; English, 2008). It is one’s core values that determine how one
responds, performs, and acts in any given situation (Begley, 1999) and as such, some people may choose to harass or bully or mob others in the workplace.

There is a distinct difference among all three of these behaviors. As per federal law, harassment is abusive conduct that is based on an individual’s race, religion, national origin, sex, sexual orientation, age, citizenship status, disability, or other protected status as outlined in federal law. Bullying, on the other hand, is an individual’s repeated offensive behavior towards another through vindictive, cruel or malicious attempts to humiliate, disrespect, or undermine an individual and it includes, but is not limited to psychological pressure, harassment, intimidation, threats, conspiracies, manipulation, extortion, coercion and hostile behavior which could impact the worth, dignity, and well-being of the individual (www.worktrauma.org). Mobbing then is group bullying with similar goals in mind and it is often done through rumor, innuendo, discrediting, isolating, and intimidation (Elliott, 2003).

Bullying and mobbing are forms of aggression against anyone, rather than specific discrimination or harassment against someone based on age, gender, race, creed, nationality, or disability. It is a malicious attempt to force someone out of the workplace. It comprises negative behaviors that rob individuals of their reputation, professional integrity, and competence (Davenport, Schwartz, & Elliott, 2005). The bully or bullies are called “the perpetrator(s)” and the victim is called “the target”. For any negative behavior to be deemed bullying or mobbing, the behavior must be persistent, repeated, enduring, and escalating and can take place in-person or on-line. There is a deliberate intent and power disparity, and it may or may not be against any law.
Research has indicated that there are at least 45 different mobbing behaviors that can be grouped into five different categories. These five categories include: 1) Impacting one’s self-expression and the way communication happens; 2) attacking one’s social relations; 3) attacking one’s reputation; 4) attacking the quality of one’s professional and life situation; and 5) directly attacking a person’s health (Davenport et al., 2005).

Research has also shown that there are three major degrees of mobbing: First, second, and third. In the first degree the target manages to resist it or he escapes the workplace at an early stage. In the second degree the target cannot resist or escape immediately and he suffers temporary or prolonged mental and/physical disability. In the third degree, the physical and mental injuries are such that the target is unable to reenter or return to work (Davenport et al., 2005).

**Why Bullies Bully and Mobbers Mob**

No matter if it is bullying or mobbing, the reasons for it taking place are many. Bullies bully and mobbers mob not only because of values differences, but they also do it because they can, they are allowed to do it. For some perpetrators it can be due to a lack of respect for diversity and for others it is simply a power play or an attention seeking and getting behavior.

Research has also recently shown that perpetrators may bully because they may be “wired” differently (Barnes, 2012), demonstrating psychopathic and/or narcissistic, and/or Machiavellian traits. The psychopathic bully scares, confuses, and disorients others to help achieve his or her goals. The narcissistic bully is the self-centered person whose ego is frail and who possesses the need to put others down, preferring to use
indirect tactics. Finally, those who are Machiavellian bullies manipulate and exploit others to advance their perceived personal agendas.

People who bully may: 1) Appear to be outgoing, funny, and charming so as to gain private and personal information that they then can use for threatening and manipulating their targets; 2) be sarcastic, putting others down with negative humor, then saying they were only kidding; 3) brag and convince others that they are smarter, know the right people, and have more knowledge and experience; 4) sabotage the work performance of others by giving incomplete or no information about a work assignment; 5) use “divide and conquer” techniques; and 6) give supervisors false information about their targets (Middelton-Moz & Zawadski, 2014).

The Perpetrator’s Toolkit and Tactics

Perpetrators have many tactics and tools that they use in order to attack their target. The World Health Organization (2003) has identified some of the more common tactics that are used that include: Exclusion, slander, humiliation, turning co-workers against the victim, intrusions into one’s private life, isolation, provocation, ridicule (especially in the presence of others), taking away key areas of a target’s responsibilities, threats of violence, verbal abuse, repeated criticism and blame, physical abuse, assignment of meaningless tasks, assignment of new duties without training, excessive monitoring of the person, forced inactivity, unjustified evaluation ratings, unjustified transfers or disciplinary actions, intentionally underrating or ignoring a target’s proposals, and work overload with impossible deadlines.

Barnes (2012) identifies additional behaviors in the “bully’s toolkit” that consist of: Glaring, staring, showing hostility, flaunting status, ignoring the target or his/her
contributions, failing to respond to calls or memos, giving the “silent treatment”,
shouting, throwing tantrums, starting or spreading gossip or rumors, consistently stealing
credit for the target’s work, blaming the target for mistakes made by others, excluding the
target from important activities and/or meetings, swearing, making obscene or offensive
gestures, playing mean pranks, and moving a target’s desk or office to a remote area to
humiliate him.

How to Deal With an Adult Bully or Mobber

Basic Strategies for Dealing With One

There are seven basic strategies that can be used to deal with any in-person
bullying or mobbing (Middelton-Moz & Zawadski, 2014). They include: 1) Looking the
bully straight in the eye; 2) using confident body language; 3) choosing carefully whether
to confront the bully alone or with others present so as to have witnesses; 4) focusing on
the behavior that you wish to have stopped without using labels; 5) saying things simply;
6) avoiding absolutes, sarcasm, and attacks; and 7) being direct.

Specific Adult Bully Types and Specific Techniques for Dealing With Each One

All adult bullies most likely fit into one of five basic bully types and besides using
the above mentioned basic seven principles, there are specific techniques that can also be
used with each of the different types (Middelton-Moz & Zawadski, 2014). The first type
of adult bully is known as the “head-on” collision. This is the person who comes out of
nowhere with no warning. With this type of bully, you must be assertive, using calm firm
statements and addressing the bully by name without arguing. If the bully is standing, you
should ask him to sit down and he should not be allowed to interrupt. If he refuses to sit
down, you should stand up, so as to be on “equal footing”.

The second type of bully is the “rear-end” collision. This bully delivers his verbal abuse from behind, screened in humor or sarcasm, then claims that the you have no sense or humor or you are just being “too sensitive”. With this type, you must not laugh at the jokes that he is making and you must stand up for yourself, again without arguing. You must confront rear-end attacks every time by calmly and simply stating the facts and asking if the bully really meant what he said when he made the cruel joke (Middelton-Moz & Zawadski, 2014).

The “speed up, slow down” type of adult bully is a controller and this is the bully who is righteous and slashes your self-esteem to shreds. He has a distorted view of reality and he is unpredictable, being loving one minute to you, then shredding your ego the next minute. Control for this bully is ego survival. You should not try to make sense out of the controlling bully’s behavior or analyze his intentions. It is what it is. You also need to remember that your self-esteem depends upon you, not someone else (Middelton-Moz & Zawadski, 2014).

The fourth type of adult bully is the one known as “slippery road ahead”. This bully’s behavior can appear out of nowhere and it is very hard to recognize at first. This is the person who is warm and charming and who wants to be your best friend. He believes that “all is fair in love and business” and he will do anything to get ahead or get what he wants. The only strategy to use with this type of bully is to not trust him and to exercise caution around him (Middelton-Moz & Zawadski, 2014).

A final bully type is the one who “sideswipes”. A sideswiper will share things with you that are being said about you “for your own good”. Then you find out that is is really the sideswiper who is saying many of these things “behind your back”. Sideswipers
attempt to destroy you through vicious gossip and rumors in an attempt to get back at you for some perceived attack. When dealing with a sideswiper, you must get the facts about the rumors or gossip that is being spread and then speak in private to the person who is allegedly spreading it. Relate the information directly and simply to this person and then ask if this was in fact what was said. The person will usually deny saying it and he will usually blame the misunderstanding on whoever told you about it. You may also find out that it was the sideswiper who was doing the gossiping. If so, state that you will then speak with the person who supposedly said it. Always look any bully in the eye and let him know that in the future you expect to have any concerns regarding you or your life brought directly to you first (Middelton-Moz & Zawadski, 2014).

**What Research Says About Workplace Targets and Bystanders**

**Who May Become a Target**

Research has demonstrated that there are certain reasons that people become workplace targets of adult bullying or mobbing. Individuals who lack self-confidence or sufficient conflict management skills are most likely to be targets of workplace bullying. People who are characterized as overachievers also have more potential to fall prey to a workplace bully because the bully feels threatened by the target’s competence. Bullying may occur due to the bully’s need to boost his own worth and to undermine another as a result feeling envious of the target’s talents or work ethic (Georgakopoulos, Wilkin, & Kent, 2011).

Other reasons that certain people may become workplace targets include the facts that he may refuse to be controlled by someone else, he may appear to be an “easy”
target, he may have exhibited some type of ethical “whistle-blower” type of behavior, or the bully envies the superior competence or overachievement of that individual.

**The Toll of Workplace Bullying on the Target**

Through their national survey, the Workplace Bullying Institute (Namie, 2014) had found that adult bullying behavior is more prevalent in the workplace than harassment. Victims of workplace bullying and mobbing suffer both emotionally and physically. They experience varying symptoms that include: 1) Increasing distress; 2) physical and/or mental illness; 3) problems sleeping and fatigue; 4) lack of concentration; 5) weight gain or loss; 6) drug/alcohol abuse; 7) isolation and social misery; 8) avoidance of the workplace; 9) uncharacteristic fearfulness; 10) crying for no apparent reason; and 11) panic attacks. Many victims suffer from post-traumatic stress disorder, an injury that results from an overwhelming assault on the mind and emotions, and with some targets, death may occur through failing health or suicide (Davenport et al., 2005).

**What Targets Can Do**

As the target of adult bullying or mobbing, you may feel helpless and you will experience a gamut of emotions and symptoms that range from feeling anger, depression, stress, worry and anxiety while asking yourself “Why me? and “What did I do to deserve this?” When you feel anxious or worried, you must recognize that only you can control your thoughts and perceptions (Reinecke, 2010). To allow others to do so is providing them with the ability to control you.

If you are a target, do a reality check as to the insults that are being hurled at you from a bully. For example, if you are being told how stupid you are, ask questions of
yourself and respond. Below is an example exercise demonstrating this idea (Middelton-Moz & Zawadski, 2014).

<table>
<thead>
<tr>
<th>Question</th>
<th>Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Did I make a mistake on a report?”</td>
<td>“Yes.”</td>
</tr>
<tr>
<td>“Am I stupid?”</td>
<td>“No.”</td>
</tr>
<tr>
<td>“Are you always making mistakes?”</td>
<td>“No.”</td>
</tr>
<tr>
<td>“Am I an airhead?”</td>
<td>“No.”</td>
</tr>
</tbody>
</table>

Going through an exercise such as this empowers you and reaffirms your self-esteem, which in turn helps you to be able to not personalize a bully’s bad behavior.

As an individual who is being mobbed or bullied, you should seek professional help early. Normal stress management techniques, pursuit of a hobby, having a pet, meditating, keeping a journal, and regular exercise may help temporarily. However, as the emotional abuse escalates, it is necessary to seek medical and therapeutic help. You may want to work with your physician to see if you qualify for a “Family and Medical Leave Act” leave. You must put your health before anything else.

People who have survived persistent bullying or mobbing situations are those who have responded to the attacks with confidence, not assigning self-blame or participating in the game, but rather confronting the bully. They have refused to be a victim and they did not isolate themselves. They also displayed a great deal of spiritual and mental strength, trusting that things would change, while consciously taking steps to leave the organization. They learned to distance themselves from the workplace and to feel and practice indifference and emotional detachment. Bullied survivors found people to be
with who served as pockets of safety and support. In addition, they did whatever they could do to limit their exposure to the perpetrator.

They also did many things that built their self-esteem, such as volunteering or learning a new skill. They kept their sense of humor and surrounded themselves with the things they loved. The ability to perceive that you have the power to shape even small aspects of your fate can have a huge impact on your well-being.

If you are being mobbed, bullied, or harassed, Namie and Namie (2003) suggest that you must report it to your superiors and make a business case as to how the bullying is affecting your productivity and driving up your absenteeism. You also need to equip yourself with any available employer policies and procedures and you must document what is happening to you. Your documentation needs to include the date, the time, the place, who is involved, witnesses to the event, and a detailed description of what happened. You will also want to solicit witness statements as this will provide a record of bullying and mobbing actions so that you can avoid being put in the position of having your word alone against the word of the bully.

Ultimately if you are being bullied or mobbed you have four options (given in no particular order). Your first option is to stay and hold on, involving union representation (if available) and filing an internal complaint. The second option is to maintain union representation (if available) and resign yourself to staying, but direct your emotional energies outside of your job. The third option is to resign and your fourth option being to bring forth legal action (Namie & Namie, 2003).

During any bullying or mobbing experience, as a target, you must also try your best to practice resilience and positivity. Resilience is the capacity to deal with the
complexities of life, including the ability to positively handle adversity. “Resilience depends on our ability to recognize pain, acknowledge its purpose, tolerate it for a reasonable time until things begin to take shape, and resolve our conflicts constructively” (Flach, 1988, p. 50). Positivity is having positive emotions. These positive emotions “fuel” psychological resilience (Fredrickson, 2009). Hopefulness, optimism, and coping are all forerunners of resiliency (Siebert, 2005). “By finding positive benefits in adversity, you regain control over your destiny.” (Siebert, 2005, p. 175)

You must remember that if for some reason you can’t escape your source of stress, you can change your mind-set about what is happening to you and you can reframe so as to reduce the damage being done to you. Some reframing strategies include avoiding self-blame, hoping for the best but expecting the worst, and developing indifference and detachment.

**What a Bystander Can Do**

Often there are bystanders who witness bullying incidents and who turn their heads because they don’t know what to do. Being a friend is one of the most important things that you can do for a victim of mobbing or bullying. Just by knowing that there is a person who cares and accepts the individual the way they are can make all the difference. As a bystander, you should address any noted changed behaviors of the target or concerns that you may have with your supervisors. Often those who are being bullied or mobbed feel helpless. They might be afraid to bring the actions to the attention of their supervisors. They may fear greater retaliation for addressing the situation. You, as an outsider, can bring the bullying to the attention of those in charge in an effort to stop this behavior. As a friend you can also show empathy and provide support to the person being
bullied. You may be the person to provide the support they need in order for them to leave an abusive workplace.

**What an Organization Can Do**

**Assess your Workplace Culture**

It’s important to assess the workplace culture and to determine whether or not it is positive or negative (toxic). In order to make this assessment, there are many strategies available for use. The first strategy is rather obvious—it’s that of observation. In a positive culture, people are comfortable taking risks that often initiate positive changes. They have integrity and they are honest, supportive, and helpful. There is cooperation, rather than competition. A toxic culture is much the opposite. In this type of culture, people are focused on negative values and they are pessimistic. There is constant sniping, complaining, and attacking of each other. Threats, intimidation, and personal insults abound.

There are many signals that an organization is toxic and it is experiencing a bullying or mobbing problem. Some signals to watch for include: 1) A sudden loss of key individuals; 2) an increased use of sick leave; 3) an unusually high staff turnover; 4) a loss of credibility; and 5) unexplainable low morale.

Another technique for assessing the organization is to hold regular quarterly interviews with different groups of employees. You will also want to hold exit interviews with employees who are leaving. When using these strategies, you will want to ask open-ended questions and simply listen and take notes. Should you choose to use a conversation-based technique, you will also want to consider whether you will get better
data by bringing in an outside facilitator or not, as well as if those costs are worth the return on investment that your organization will receive.

A third technique is that of using a paper/pencil/online survey or a culture audit that asks questions pertaining to how much employees value certain beliefs, behaviors, group norms, goals, etc. and then ask them how often they see them being enacted. The data is then compiled and analyzed looking to determine if a particular item is valued more than it is being seen enacted. Wherever there are the largest gaps between the value level and the enactment level, these are the areas that should be targeted first for organizational improvement. Select those top 3-5 areas for the creation of an action plan. Your action plan should include SMART goals (those that are specific, measurable, achievable, relevant, and time-bound), strategies for achieving your goals, a timeline, assigned responsibilities, and a statement of what it will look like when the desired level of functioning is attained. Creating a positive, collaborative and continuous improvement action plan in this manner and holding people accountable for its completion is one of the best steps that any organization can take to improve its culture. Again, you need to determine if it may be worth the money to bring in an outside consultant to lead the process.

Other Strategies for Improving Organizational Culture

There are some simple common sense steps that can be taken immediately when seeking to transform an organizational culture into one that is positive. Negative behaviors such as glaring, swearing, yelling, shouting, spreading rumors and gossip, sexist/racist remarks, giving someone the “silent” treatment, and throwing temper tantrums must be confronted immediately. Should they continue, management must take
steps to change the offender’s negative behavior(s), and inform them that they may be subject to discipline up to and including dismissal.

Other common sense steps for reshaping organizational culture include strengthening the positive elements that already exist. Positive established values, traditions, and celebrations, should be maintained, while new ones can be added. The recruitment and hiring process is also very important in reshaping organizational culture. In an interview, ask some types of bully/victim-related situational questions, and if there is any doubt, the candidate should not be hired (on the basis that they do not have the desired qualifications that will “fit” into your organization. Any new hires should be those who share the positive values of the organizational culture and who will add new insights to it.

Professional development should be required for all employees of the organization on the following topics: 1) Bullying behaviors and its effects/costs, 2) harassment laws; 3) awareness of potential violence in the workplace; 4) professional ethics; 5) appreciating diversity; 6) teamwork; 7) communication skills; and 8) conflict resolution skills.

An organization must also have a well-defined organizational chart and clear job descriptions that describe duties and responsibilities. Likewise, it must also have a clear anti-bullying policy in place that addresses adult bullying and mobbing behaviors. It must be a comprehensive, legal, and simple policy that can be enforced with fidelity. The components of the policy need to include a description of bullying or mobbing behaviors, clear reporting procedures, prohibition of retaliation in any form against complainants,
and clearly written consequences for bullying/mobbing behaviors, outlining progressive discipline (Barnes, 2012).

In any organization a manager or supervisor has three basic rights that can and should help in managing those who display bullying or mobbing behaviors. These three basic rights are: 1) Requiring that employees comply with directives; 2) changing employee assignments and standards; and 3) requiring excellence from employees.

When requiring compliance with directives, as long as you are not asking your employee to do something that is illegal, immoral, or unethical, he must do what you ask, or it may be viewed as insubordination. Employees must understand that they have responsibilities and that one of them is that they must learn to work well with others. As a supervisor you can issue this directive and if an employee does not know how to do this, send him or her to a class and/or buy books, or bring in an expert facilitator to provide professional development. The bottom line is that the employee must work well with others and while you, as a supervisor, should coach, counsel, and warn a difficult employee, if his behavior does not improve, you can place him on a performance improvement plan and ultimately recommend termination if needed.

Any performance improvement plan should include: 1) A clear statement of the deficient behavior or work performance issues; 2) the reasons why the improvements are needed; 3) the specific behaviors or replacement strategies that the employee needs to implement to improve; 4) the timeline according to which the improvements should be started and fully implemented; and 5) a schedule stating not only when you and the employee will meet again to talk about progress made in relation to the required criteria,
but also when you will gather data or observe to assess the growth accomplished by the employee.

**The Costs of Adult Bullying to Organizations**

**Overall Costs**

Bullying is costly to organizations both directly and indirectly. Therefore, management must take all reports of bullying or mobbing quite seriously. The costs of not taking these reports seriously are great in terms of time lost due to extensive use of sick leave, workman’s compensation insurance claims and the Americans with Disabilities Act. Potential penalty payments for Occupational Safety and Health Administration violations, increased health insurance premiums, lost productivity, turnover, and bad publicity for the organization are also costs that will be paid.

Hollis (2012) shares that the replacement cost of turnover is enormous, being about 150% of the departed employee’s salary. This cost encompasses background checks, advertisements, any search process fees, rehiring and retraining procedures. She (Hollis, 2012) also found that the average worker was spending 3.9 hours per week trying to avoid a bully at work. This, then calculated out to be $6869.50 per person that is lost annually (Hollis, 2012).

**Legal costs**

Organizations that fail to aggressively discipline and weed out those who engage in the behaviors of bullying or mobbing may find themselves vulnerable to expensive settlement costs, dispute resolution fees, severance package costs, employer liability charges, tort claims, legal fees, and/or difficult lawsuits. Charges such as defamation of character, aggravated stalking (a 3rd degree felony), assault, assault and battery, criminal
charges, hate crimes, and civil rights violations form the basis for most legal actions taken. “Estimates for the cost of bullying to American employers range from $64 billion to more than $300 billion.” (Barnes, 2012, p. 9)

Addressing Adult Bullying and Mobbing in the Workplace on the National Level

While some European countries have had workplace bullying/mobbing legislation in place for years, the campaign to enact “healthy workplace” legislation in the United States is fairly recent. In the 2010 Workplace Bullying Institute survey (Namie, 2010), 64% of the respondents supported workplace bullying legislation to protect workers from “abusive conduct”. By 2014, that same survey showed that support for the legislation had grown to 93% (Namie, 2014). As of April 9, 2015, 25 states had introduced legislation to this effect, with three states passing some form of it. Tennessee was the first to pass the law in May of 2014; however, it only applied to public-sector employers (Rubenfire, 2014). Also, only personal liability was included in that law. Then on September 4, 2014, California passed its “healthy workplace” legislation, with Utah following suit, making their law effective on July 1, 2015.

Conclusion

This review of the literature concerning adult bullying and mobbing in the workplace provides current research and best practices to targets and organizations on how to recognize it and deal with it. While much information is provided, the limitation of this review is that not every book or article ever written on this topic was perused. However, using the information provided, any organization and any target should now be able to recognize an adult bully, their tactics and they should be able to use proven techniques to prevent or stop it. In addition, this review provides many strategies that
organizations can use to determine what is really going on in their culture, as well as steps to take to improve it.

Adult bullying and mobbing behaviors can only persist in an organization as long as it is allowed to exist. It is up to management to set high expectations, role model expected behavior, consistently and fairly apply policies and procedures, and to confront organizational negativity and toxicity head-on.

John Maxwell (2003) maintains that one simple rule, the Golden Rule (to treat others as you would ask to be treated), is the only rule that organizations need. He believes that it is what builds organizational morale, increases productivity, encourages teamwork, lowers employee turnover, and keeps clients coming back. If an organization could accomplish all of that by following one simple rule, wouldn’t you follow it? Certainly, enacting this rule on a daily basis would be a good start in the elimination adult bullying and mobbing in the workplace. As Elliot (2003, p. 57) so succinctly states, “Treating each other with dignity and respect, or not doing so seriously impacts the future—for all of us.”

Abstract:

Although universities across North America are training more teachers now than ever before, teacher attrition remains high in the first five years after certification. In 2004, the turnover of new teachers in Canada within five years of completing a Bachelor of Education was 30%, with some specialized fields – like French Immersion – being much higher than others. Reasons cited by early career teachers for their decisions to leave teaching range from high stress and lack of support to dissatisfaction with workload or salary. These figures are also complicated by the current difficulty new teachers experience in finding full time work in a city where they have a support network, forcing many to choose between remaining Teachers Teaching on Call for an extended period or moving to more rural areas where there may be more vacancies or less competition. Despite a robust literature on the challenges of new teacher induction and retention, surprisingly little historical scholarship has contributed to the discussion. This poster examines the initiative known as “Future Teachers Clubs” (FTCs), from both historical and contemporary perspectives. In particular, we explain FTCs and their origins; discuss how they evolved in British Columbia and why they diminished. Finally, we outline where and why FTCs have remained an important part of teacher training programs that may help to stem the tide of early career teacher attrition.

Abstract

Subtitled video materials have been developed for a College Algebra course. The course is a part of a program offering dual-enrollment, blended learning opportunities to high school students. Since 2000, approximately 7,500 high school students have enrolled in College-level outreach courses of Algebra, Trigonometry and Calculus. The first set of newly developed video materials will be used in approximately 40 high schools and also will be made available as a supplemental resource to on-campus students. This paper describes the motivation for the development of the video materials and the session will present technical information for those interested in pursuing similar undertakings.
Making Videos Accessible for College Level Math

The WvEB program includes a collaborative offering of college-level courses to high school students. Higher Education instructors of record work with high school teacher facilitators in the teaching of the courses. Measures are taken to assure that the level of rigor in the high school courses is the same as that in the corresponding courses taught at the partner post-secondary institution. The WvEB program courses are offered in a blended learning environment such that lectures, assignments, and assessments, are completed both on-line and face-to-face. Information about the development of the project can be found in earlier publications (Pyzdrowski & Pyzdrowski, 2002, 2003; Pyzdrowski et al., 2009, 2011). Since Fall 2000, approximately 7,500 students have completed WvEB courses in Algebra, Trigonometry, and Calculus. Typically the DFW rate for the dual-credit courses in the project is less than 10%. The DFW rate is the percentage of students earning a “D”, “F” or Withdrawing from a course. Students also have been found to do well in subsequent courses (Pyzdrowski et al., 2013, 2014, 2015).

The first course developed in 1999 for the WvEB Math project was College Algebra. Rather than focus efforts on the development of one primary course component, such as video lectures, course developers intended to provide a variety of course components to help students learn. As such, once the initial set of course videos (of a University instructor) were completed, laboratories with computer animations, online homework quizzes, and a study guide were systematically developed and implemented to facilitate students’ learning. Though videos have been redone periodically, recently it was decided to revisit the development of a complete set of course videos. Closed-captioned, or subtitled, video materials have been developed for College Algebra. They were developed to complement the Study Guide used in the course which has been consistently chosen as a helpful course
component by on-campus students, but not so much by those students enrolled in the dual-credit sections. It is the intent to explore this finding in more depth once the subtitled videos have been implemented.

The first set of newly developed video materials will be used in approximately 40 high schools in West Virginia and will be made available as a supplemental resource to on-campus students enrolled in College Algebra.

**Motivation for the Development of New Videos**

*Universal Design for Learning*

A few years ago, a blind student was enrolled in a high school section of the College Algebra Course. The course developer/instructor was able to make accommodations to provide for the successful completion of the course by the student. This experience caused an interest to learn more about the characteristics and needs of special populations and the accommodations that can be made in the content and classroom that can help all students learn Algebra. A workshop was attended on Universal Design for Learning (UDL). Universal design is defined as "the design of products and environments to be usable by all people, to the greatest extent possible, without the need for adaptation or specialized design" (Center for Universal Design, 1997, para. 3). Universal design focuses on removing barriers through initial designs that consider the needs of diverse people, rather than overcoming barriers later through individual adaption (Rose et al., 2006). As such, UDL focuses on removing barriers to learning for all types of learners rather than just students with disabilities. As a result, students from other historically under-represented populations are likely to experience a more welcoming learning environment. UDL offers a blueprint for designing flexible curriculum methods, materials, and assessments that meet the needs of diverse learners with diverse experiences (Rose, Meyer & Hitchcock,
Subtitling and Students with Disabilities

Brady-Myerov (2015) reports that same-language subtitling (SLS) has been referred to as an “undervalued language-learning strategy” and has been found to support literacy. It has also been found that SLS of film songs leads to reading skill improvement (Brijkothari, Ashok & Avinash, 2002). Most importantly for the purposes of this project, it has been found that “the processing of subtitled films is cognitively effective: It leads to a good understanding of film content without requiring a significant tradeoff between image processing and text processing” (Perego, Del Missier, Porta, & Mosconi, 2010).

In February 2015, it was reported by the New York Times that federal lawsuits were filed against Harvard and M.I.T, for violations of anti-discrimination laws by failing to provide closed captioning in educational materials including their online lectures and courses. It is reported that the universities have “largely denied access to this content to the approximately 48 million — nearly one out of five — Americans who are deaf or hard of hearing.”

McCrea (2015) reports through interviews of university leaders that though many may not think about providing accommodations for deaf students, it is both a legal and ethical obligation to provide educational access to students with disabilities. She also reports that improvements have taken place on university campuses in the US. It is the intent for the subtitled videos, developed to complement the College Algebra study guide material, to provide a valuable resource not only for those students who are deaf, or hearing impaired, but also for other diverse learners in the course.

Fundamentals of Video Development

Overarching Considerations for the Subtitled Videos

It was decided to minimize the use of instructor "body" images while redoing the videos. The
undertaking requires a large investment in time and money and having instructor body images in the videos can quickly "date" them. The new videos contain a mixture of PowerPoint slides, written work via a document camera, and instructional audio. This choice was made based on feedback from participants and facilitators who used several versions of the videos throughout the years. The videos will be made available through online delivery as well as DVD due to connectivity issues throughout the state.

**Video/Audio Recording and Editing**

While making the new subtitled videos, the switching between the document camera and the PowerPoint slides on the computer is accomplished through the document camera. The video from the document camera along with the audio are simultaneously recorded by a digital tape recorder. This allows for the initial recordings to be of high quality; and once completed, they are transferred to a computer running a video editing software. Appropriate edits are then made to the video including fade-in and fade-out. In addition to editing the video, the audio is cleaned and normalized. Removing noise makes for a quiet background and normalizing the audio makes all videos end up at approximately the same audio level. The audio tracks are needed for the text transcription. The audio can be extracted from the video by exporting the audio as an MPEG file. Throughout the process a high level of quality is kept in both the video and audio because the size and quality can be decreased at the end of the production.

**Text Transcription and Subtitling**

After the audio has been cleaned, normalized, and exported, a speech recognition program is used to transcribe the speech to text. The text document is edited, corrected and formatted. This is a very time consuming process due to the mathematical nature of these videos. It was decided to adjust the text document so that each line has a short sentence or idea segments no longer than two lines of the final
Making Videos Accessible

subtitling in length. Once the text document is formatted, the document is saved as an ASCII Text file. Using a movie captioning program, load the video file and import the ASCII Text file. Each line of the text file will appear as one line for the subtitling. It is necessary to synchronize each line of text with the appropriate time in the video. Upon completion of the synchronisation of the text lines with the video, it is necessary to preview the subtitled video in order to make appropriate timing adjustments. The subtitled video can then be exported for final production.

Final Production of the Subtitled Video

Using a video editing package, the subtitled video is rendered into an appropriate format for web delivery or DVD viewing. At this time the final size and quality of the video can be adjusted. It was decided to use an MPEG-4 video format for these videos because it has a high level of data compression and is played by most video players.

Two Techniques to use for the Differentiation

of Teaching Students with Challenging Learning Behaviors

Dr. Francie R. Murry
University of Northern Colorado
Office 33 McKee Hall
Greeley, CO 80634
francie.murry@unco.edu
Abstract

This study investigated the impact of two techniques on the social and academic behaviors of middle school level students whose general curriculum teachers described as disruptive to the learning environment for themselves and other students, assignment incompleters, although seemingly bright enough to complete work. These students were or at risk for failing all of their classes in the first semester and were being considered for the second tier of the Response to Intervention model. Four research questions were identified to explore the use of the 9-grid technique as a tool for teachers’ use in the identification of needed assignment adaptations and the RAFT technique to implement identified adaptations for assignment differentiation in the content areas of music, mathematics, history, science, and physical education. Results indicated that students increased in positive social and academic behaviors when the two techniques were implemented by teachers.
Two Techniques to use for the Differentiation of Teaching Students with Challenging Learning Behaviors

Students with challenging behaviors have a long history of academic deficits (Levendoski & Cartledge, 2000; O’Shaughnessy, Lane, Gresham, & Beebe-Frankenberger, 2002), whether it be because of lack of skills, organic origins, and/or cognitive errors. When students are engaged in and able to function within the curriculum, misbehavior is typically less likely to occur (Kauffman, 2010; Witt, VanDerHeyden, & Gibertson, 2004); however, many of these students also have learning problems that keep them from being able to participate effectively in grade level assignments (Sabornie, Cullinan, Osborne, & Brock, 2005). Their disabilities are found across the content areas (Reid et al., 2004); within their wide range of abilities there are many gaps in their academic skills, which often leave teachers at a loss as to how to support them. Finding ways to engage struggling students with techniques that allow access to the teachers’ content area of expertise is a successful solution for both teacher and students. When material is presented initially through approaches that allow students to feel competent, teachers can then support students to further accept and attempt more sophisticated deliveries. It is beneficial to have students begin work in their areas of strength, bypassing the discouragement that is often presented when they are introduced to an unfamiliar or challenging assignment. Teachers need ways of allowing students to work within their strengths, using connections within subject areas of interest and/or authentic life activities or events as motivators. This may require that they elicit performances from students that demonstrate output of learning beyond formats that are traditionally accepted.

The RAFT (Holston & Santa, 1985) is a very versatile technique because it embeds differentiated instruction within a format that can be used for all curricular areas; it has
traditionally been used to enhance written assignments in English. A common definition of a RAFT is that it is a strategy that includes information provided about a topic from a perspective other than the students’, and can be seen applied to an exploration of the topic. Using the acronym of RAFT students are guided to identify their role, their audience, the output format of their work, and the expected content topic covered. Students will take a different role rather than simply being a student reporter of information to teacher demonstrating learning about a particular topic. They will demonstrate their learning to a hypothetical audience in varying delivery formats. The RAFT technique allows students with challenging behaviors and academic deficits to make gains and be engaged in an instructional challenge and thus, less likely to exacerbate misbehaviors. RAFTs provide teachers with a vehicle to differentiate assignments within the content they teach, how they will teach, and how the students will demonstrate what knowledge they have gained using an output preference for that demonstration.

Grant and Gradwell (2010) used the RAFT as a motivational tool by directing students to become a fictional figure. This imaginary enabled students to address big ideas and meet English state core content standards. It is reported that adolescents enjoy the format (Lenski & Lewis, 2008) and teachers report that they believe students benefit if the RAFT technique is used as a method of writing across the content areas (Holston & Santa, 1985). Having another way of approaching teaching and thinking about how learning occurs helps teachers not only identify the differences in diverse groups but also provides a framework in which they can respond with differentiation (Tomlinson, 2014). As teachers prepare lessons they consider student learning, recognizing it as a highly personal process, which is also individualized for absorbing and retaining information (Williamson & Watson, 2006). It is essential for teachers to personalize learning for students who appear unmotivated due to social and academic difficulties; however,
many teachers need a tool that will allow them to support these individual student needs within their lessons.

The RAFT development requires that the teacher use their understanding of readiness levels at which their students are functioning, what student interests are, and student preferences for demonstration of learning. The teacher aligns the topical concepts with the content standards that they want to emphasize as their students’ outcome knowledge. Each line on a RAFT can be matched with specific content and with the assessment standards.

Often students may find challenging or are not interested in the particular subject or the way in which the assignment product is expected to be completed. RAFTs can not only be used to promote thematic teaching across content areas, but also expand traditionally-based student output. For instance, a RAFT can incorporate movement, literacy, and mathematical components to address several content standards, and include at least one area of which may be more appealing to student interest than another. Mathematics instruction is expanded and strengthened when areas such as sense making, reasoning and proof, problem-solving, and communicating are combined. Communication in mathematics should involve talking, reading, and/or writing. Talking with others about mathematical concepts and ideas not only broadens the students’ ability to articulate their understanding, but, also allows them to explore multiple perspectives. The RAFT may be developed to capitalize on a student’s high potential for communication while simultaneously incorporating mathematical concepts that they may otherwise not see as viable due to previous or current mathematical difficulty.

This study was conducted in order to investigate the use of the RAFT as a tertiary strategy to strengthen students with deficits primarily displayed as challenging behaviors and lacking assignment completion. A secondary tool, the 9-grid (DeSchenes, Ebeling, & Sprague,
1994), was used to strengthen teachers’ differentiation understanding while developing the RAFTs.

Method

Participants

Five 6th grade middle school teachers teaching in the content areas of physical education, music, history, science, and mathematics agreed to use RAFTs for 5 weeks. The current grading period had five weeks remaining. The 5 teachers collectively shared 20 students who were being considered for referral to a Tier 2 Response to Intervention plan due to failing grades. Each of the students were described by their teachers as “disruptive, assignment incompleters, to have a generalized uncaring attitude toward school, and were seemingly intelligent enough to do the work assigned.” It was hypothesized by the teachers that both the students’ social and academic misbehaviors were used to avoid what was perceived as boring and/or difficult assignments.

The teachers examined their use of the 9-grid (DeSchenes, Ebeling, & Sprague, 1994) to align adaptation needs with specific RAFT assignment differentiation for the students. Based on initial conversations with each of the teachers, four research questions were composed.

1. Would students’ positive social and academic behaviors increase if they had more choice in how they demonstrated what they learned?

2. Would students’ positive social and academic behaviors increase if the teachers supported work completion with variation of input?

3. Would students’ social and academic misbehaviors decrease if the teachers used instructional methods that allowed more student choice, interaction, and/or physical movement than they currently allowed?
4. Would students’ social and academic misbehaviors decrease if assignments were integrated with items of interest to their daily lives?

Instruments

Each student completed an interest survey. The survey identified students’ hobbies, favorite outings, school subjects, sports, foods, books, movies, likes/dislikes, best self-identified learning modalities, talents, and skills. This information was used to identify the various ways teachers could connect their content areas lesson formats and to the ways in which students could demonstrate learning from lesson information.

The teachers created RAFTs as outlined by Holston and Santa (1985) for assignments that they perceived needed differentiated based on student needs and strengths. Each RAFT followed the sequence of the acronym format; the R identified the role from which the student delivered information, the A identified the audience to whom the student was addressing, F identified output of the product the student produced, and T identified the topic that would be addressed in the assignment. RAFTs were often used for the entire class, sometimes students were assigned a specific line, were given the choice of line, or across a unit were to complete all lines on the RAFT. As can be seen on the example RAFTs some assignment lines were written for individualized student work while other lines were directed at small group completion.

Before the RAFTs technique could be aligned with students’ need, the teacher had to identify areas that they needed to adapt in order to provide tailored differentiation. A tool titled, 9-grid (DeSchenes, Ebeling, & Sprague, 1994) identified student needs by considering adaptations in nine areas, of which seven were targeted as essential for students with learning disabilities. The two additional areas were for students with more severe adaptations needs. Keeping the interest survey information in mind, teachers used the 7 areas of the 9-grid to
identify the most beneficial and/or effective adaptations for the students. This was done individually and then shared as a group, providing brainstorming across content areas and encouraging ideas for thematic content use. After identifying student need, each teacher aligned the next 5 weeks of assignments with the students’ adaptive needs as identified on the 9-grid and created RAFTs for assignments where adaptive differentiations were needed.

Results

Teacher Qualitative Reports

Teachers reported that the most difficult aspect of the study was to find the time when five teachers could meet at once for an extended amount of time, although they found the brainstorming session was valuable for developing thematic assignments across content areas.

9-Grid Development and Use

The teachers reported that completing the 9-Grid was initially difficult because they realized they did not know some of the students’ needs; they only saw the outward display of challenging behaviors that they found to be disruptive to the teaching and learning process. As they examined the 7 areas for need of adaptation they reported a greater ability to add supports to the lessons developed. They also reported as they completed the 9-grid for these students they saw how the same adaptations could be used for many students in their classes. See an example of a completed 9-grid from mathematics in Figure 1 for a student with high anxiety, a preference for verbal modality of expression, difficulty with fine motor skills in handwriting, and slow processing of information read or delivered auditorily.

RAFT Creation and Implementation

The music teacher found that over the 5 week period it was necessary to create 7 different RAFTs. Her example of a RAFT for student identification of vocabulary and musical forms,
with an emphasis on Rondo is found in Figure 2. The English and History teacher collaborated on many assignments during the 5 week period. Figure 3 depicts an example of their collaborative RAFT; in English where types of writing were being reviewed (e.g., informational, persuasive, informal, and editorial) and in History where the reasons and impact of the Civil War were being studied. The English and History teachers developed and used 12 RAFTS in 5 weeks. Figure 4 is an example of one of the 8 RAFTs developed by the Physical Education teacher; this one was for a unit on teaching Tennis. The mathematics teacher created 5 RAFTs across 5 weeks. Figure 5 is a RAFT created for a review prior to the quiz on lines. The Science teacher created 13 RAFTs across 5 weeks and the RAFT example displayed in Figure 6 is for the organization, function, and roles of cells.

Student Perceived Change

Teachers reported that all students, actively participated in the lessons when using RAFTs. Teachers said it was obvious to them what student weaknesses were in academic skill areas when the students demonstrated their learning even through preferred modalities (e.g., spelling was a deficit skill when students were writing a script for a play when acting was their skill strength and learning preference used for the RAFT). This gave the teachers greater insight into what kinds of supports to provide during assignments that required the weaker skill. For instance, they began using Word Walls for vocabulary, word banks for independent worksheets and quizzes; thus, ensuring spelling did not detour or hamper student work completion. All teachers reported positive changes in all students’ social and academic behaviors. Seven of the students did not have failing grades at the end of the grading period and were no longer considered for Tier 2 of the RtI model.

Research Question Results
In response to Research Question 1 (i.e., Would students’ positive social and academic behaviors increase if they had more choice in how they demonstrated what they learned?) all student positive social and academic behaviors increased in a positive direction according to teacher report. Teachers also recognized that they provided a greater degrees of choice in students’ demonstration of learning that now fit how the students viewed their own understanding and learning. For Research Questions 2 and 3 (i.e., Would students’ positive social and academic behaviors increase if the teachers supported work completion with variation of input? and Would students’ social and academic misbehaviors decrease if the teachers used instructional methods that allowed more student choice, interaction, and/or physical movement than they currently allowed?), teachers reported the use of the 9-grid allowed them to examine how they provided initial instruction and to explore if they could expand the modalities they used. The more variation a teacher reported the greater amount of student work was completed in that course. Teachers in this study who had difficulty articulating how they would divert from their standard input of instruction saw less positive gain by students in academic behaviors. Teachers reported that all students increased in positive social behaviors during assignments when teachers used the RAFTs.

For Research Question 4 (i.e., Would students’ social and academic misbehaviors decrease if assignments were integrated with items of interest to their daily lives?) both teachers and students were asked how they viewed social and academic behaviors when assignments included students’ indicated interests. Teachers said the target students participated at least twice as much as they had previously, that the quality of academic work included a great degree of care and quality of completion, and a decrease in the number of misspellings and grammatical errors on written work and syntax during verbal presentations. Students reported that they enjoyed the
assignments more because they felt capable of doing what was asked of them from the start. They said that they felt that they didn’t have to work as hard to integrate their knowledge into the assignment.

**Conclusion**

Teachers can use students’ strengths and interests to promote attempting difficult tasks through various modalities of teacher input and the student learning output. Adaptations can support students in the development of attempting alternative approaches to difficult or new learning tasks. Teachers can understand the diverse nature of the classroom of students while simultaneously expanding their own abilities through the incorporation of student interest and preferences. Students’ new learning can help eliminate avoidance of perceived difficult assignments and disruptive behaviors.

In this study, the use of the 9-grid to identify specific student’s social and academic need in combination with a RAFT that integrated student interest and preferences led to greater assignment completion and student positive participation in classes. Transitioning students back into content areas from which they have been or are being considered for removal due to academic or social behavioral reasons is the goal; whether a tier program for interventions is used or another model. We must ensure teachers are able to differentiated instructional interventions to meet behavioral as well as academic needs. In these cases as identified previously by Kauffman (2010) and Witt, VanDerHeyden, and Gibertson (2004), when the students were enabled to engage in and function within the curriculum, not only did their misbehavior occurred less often, but their academic participation and grades increased in a positive direction.

Abstract:
Higher education professionals are challenged to increase and retain students of color within the STEM field and prepare such students for graduate education and the workforce. Over the last 23 years, the Multicultural Academic Opportunities Program (MAOP) Summer Research Internship (SRI) at Virginia Tech has provided over 600 students the opportunity to partner with a faculty member in a mentor/protégé relationship. This summer, 37 undergraduate interns from 18 different higher education institutions spent 10 weeks designing, conducting, and then presenting their scholarly research. The purpose of this evaluation study was to examine students’ experience while participating in the internship. Pre-and post-surveys were used to collect data. The surveys focused on understanding reasons why students selected the program, what they hoped to receive from the internship and their experiences while in the internship. Additional questions centered on the students’ experience with the learning process. Preliminary results suggest the learning experience was enhanced when interns understood the expectations of faculty mentors, confirmed the feasibility of attending graduate school, and strengthened research skills.
Infusing Demographic-Specific Applications into a Digital Logic Adaptive Learning System

Abstract  

This paper describes the development of a novel web-based adaptive learning system to improve student mastery of digital logic concepts while considering the demographics of the individual student. Adaptive learning is a pedagogical approach that dynamically alters the difficulty of content based on an ongoing assessment of the student’s capability. This technique is becoming more popular with the advancement of web-based learning solutions and increased student enrollment. Using this type of e-learning environment has the potential to address background deficiencies of students that lack the necessary prerequisite skills coming out of high school. This type of system also has the potential to challenge top performing students and free up instructor time during class for active learning exercises. This paper also presents the novel concept of broadening the impact of an adaptive learning system by tailoring the material to the demographics of the students. This can be as simple as the wording used in the problem or posing the problem as a relevant example of interest to a particular student group. This approach has the potential to enhance a student’s perception of the value of the content. This leads to increased content retention and improves student motivation to excel in the course. This paper will discuss the work being conducted at Montana State University in developing and deploying adaptive learning modules at a diverse set of universities to collect data on how different student groups use and are impacted by the materials.

Introduction

With the recent increase in college enrollments, instructors are struggling with how to effectively teach large introductory-level engineering courses. What makes this problem even more complex is that entering college freshman typically have a wide-range of background preparedness in science and math, which increasingly requires individual
instruction. In most cases, reducing the instructor-to-student ratio to solve this problem is impossible due to constrained university budgets. While supplementary instruction techniques such as tutoring, peer advising, and student success coordinators have shown promise, they still rely on human personnel. This limits their ability to effectively scale with the enrollments being seen nationwide in universities.

Using e-learning environments to supplement face-to-face instruction has received great interest of late due to the promise of a scalable, low-cost, method to personalize instruction and address background deficiencies of incoming freshman. An adaptive e-learning system is an exciting pedagogical tool that can provide individual instruction to students by dynamically altering the difficulty of content based on an ongoing assessment of the students’ capability. In its simplest form, an adaptive learning system is a bank of online quiz questions on a particular subject, each with an associated difficulty level. As students answer questions, the difficulty of the next question either increases or decreases based on the students’ response. In a more comprehensive form, supplemental instruction can be provided as students answer questions incorrectly. This provides individual instruction to address background deficiencies. Additionally, more thought-provoking material can be presented to students that consistently answer questions correctly. This provides a technique to challenge the top students and prevent boredom in the course. Individualized, computer-based, adaptive learning has been shown to be nearly as effective as a live instructor guiding the student through the material when implemented carefully [1,2]. Most course management systems (i.e., Desire2Learn, Moodle, Blackboard) support question banks that are dynamically assigned based on difficulty and continual student assessment. Additionally, textbook publishers are beginning to offer learning systems that can provide multi-media rich instruction materials based on student performance on assessment quizzes. Thus, the infrastructure to exploit adaptive learning systems for personalized instruction is becoming a reality.

One of the more exciting aspects of personalized adaptive learning systems is that additional knowledge about the material can be stressed beyond the technical theory. This allows the material to be put into context with a broader view of how it is used. This can be used to stress the application of the material, which has been shown to improve student understanding and increase interest in the subject. When students see how the material is relevant to their own lives, their motivation to study the material increases [3,4]. While stressing the application of the material has been a technique employed in STEM education for the past decade, the challenge is that the application stressed may not be relevant to every student in the class. An adaptive learning system provides the opportunity to have a broad range of application-based examples that can be dynamically used depending on questions posed about student interests. Furthermore, the type of examples used can stress characteristics about the content not typically addressed by existing quiz banks. Highlighting items such as how the material contributes to the overall public welfare of society, or how the field that uses this material serves others, can change the perception that a student may have about an entire profession. This is especially important when trying to increase diversity in a field such as engineering as it has been shown that women and first generation college students tend to choose careers that are more other-oriented [5]. While engineering is a field that certainly does
contribute to public welfare and help others, it is commonly not perceived as so. As such, adaptive learning has the potential to have a much broader impact on education and professional development than just technical training.

Motivation

In our work, we are developing a comprehensive, adaptive learning framework for digital logic content taught at the freshman and sophomore levels. Our unique contribution is that once the baseline system is created, we will augment it with learning content that provides applications of the material relevant to specific student demographics. It is our hypothesis that providing demographic-specific examples of the material will improve student understanding. One of the overarching goals of this work is to simultaneously increase the motivation of underrepresented minorities to persist in a STEM degree program. This will have a direct impact on the number of STEM degrees granted in the U.S. Increasing the number of STEM degrees has become a national priority over the past decade. Numerous reports by agencies such as the National Academy of Engineering [6] and The National Science Board [7] highlight how the U.S. is being outpaced in the production of engineering degrees relative to emerging countries. Part of the issue is retention. Indeed, only 60% of all students in the U.S. entering an engineering degree program are able to achieve graduation in 6 years [8] and at our university, Montana State, a similar pattern emerges with only 52% of engineering students able to achieve graduation in 6 years [9]. Furthermore, not all students are equally likely to pursue or persist in engineering. For example, in 2011, 83,000 engineering bachelor's degrees were awarded in the U.S.; however, only 18.4% of these degrees were awarded to women [10]. At MSU, again, a similar pattern emerges with only 14.2% of engineering degrees going to women [9]. Currently, women represent 50.8% of the U.S. population [11]; thus women are the largest underrepresented group in engineering. Broadening the participation of all students, especially women, will have the largest positive impact on the number of engineering degrees being produced in the U.S.

One of the most key predictors of persistence is a student’s experience of interest [12] as even highly competent students drop out of science and engineering majors citing “lack of interest” in the field [13]. One technique to increase interest is to use examples that the students are familiar with. This approach has shown great success in the Everyday Examples in Engineering (E³s) program [14,15], in which problems are simply posed using material that the student body is familiar with as opposed to classical examples that don’t relate to today’s students. This approach doesn’t change the content, or difficulty of the problem, it simply uses different examples that are more relevant to the students. As an example, consider the following example of how to calculate how long a battery will last.

<table>
<thead>
<tr>
<th>Concept</th>
<th>Problem Statement</th>
</tr>
</thead>
<tbody>
<tr>
<td>DC Power Consumption</td>
<td>A 9v battery is has a capacity of 500 mAh. If you are driving a circuit that consumes 20mW of power, how long will the battery last?</td>
</tr>
</tbody>
</table>
This problem is stated in the typical manner, but has little relevance to the student. A better way to pose the same problem is to use an application that the student is familiar with, such as a smart phone.

**Example 2. Calculating How Long a Battery Will Last (2)**

<table>
<thead>
<tr>
<th>Concept</th>
<th>DC Power Consumption</th>
</tr>
</thead>
<tbody>
<tr>
<td>Problem Statement</td>
<td>Your smart phone consumes 1W of power. Its rechargeable battery has a capacity of 1000 mAh. If you charge your phone overnight and then disconnect it at 8am when you go to class, at what time will you run out of power?</td>
</tr>
</tbody>
</table>

Posing the problem in this way uses an example that each student is familiar with. Furthermore, this example is relevant to the students since each of them as had their phone run out of power at some point. Wording of the problem can also be used to stress other aspects of engineering, such as its contribution to public welfare and how it helps others. Consider the following example.

**Example 3. Calculating How Long a Battery Will Last (3)**

<table>
<thead>
<tr>
<th>Concept</th>
<th>DC Power Consumption</th>
</tr>
</thead>
<tbody>
<tr>
<td>Problem Statement</td>
<td>A pacemaker consumes 1nW of power. Its battery has a capacity of 100mAh. How long will the pacemaker operate before it needs to be replaced?</td>
</tr>
</tbody>
</table>

This example may not be directly relevant to each student in the class, but it illustrates how the content can be presented as one that helps others and contributes to public welfare. This stresses the communal value of engineering, which has been shown to be an important factor in the motivation of underrepresented groups, particularly women, to persist to graduation.

Notice that each of these three examples ask questions about the same concept. The only difference is the application that is used. The practicality of simultaneously using different forms of the same content is made possible by an adaptive e-learning system and is the novel contribution of our work.

**Our Adaptive Learning System**

The adaptive learning course materials being developed at Montana State University are for a sequence of digital logic courses found in every accredited computer engineering program in the U.S. Since the materials are deployed most broadly in this project using the existing courses at MSU-Bozeman, the MSU course names and numbers are used to describe the content for the remainder of this paper. The two courses that are impacted by this project are EELE 261 – Introduction to Logic Circuits and EELE 367 – Logic Design [16].

The adaptive learning system being developed in our work fall into three primary categories: skill development tasks, formative assessment, and summative assessment. For the skill development tasks and formative assessment, four levels of competency are
defined: deficient, beginner, competent and advanced. Learning activities exist (both tasks and formative assessment) that correspond to these levels in order to facilitate the adaptive learning approach.

**Skill development tasks** are items that are assigned to the students in order to increase their level of understanding of a topic. Skill development tasks consist of reading assignments in HTML format and/or print textbook, instructional videos using the Camtasia Relay Screen Capture tool [17], working practice problems with solutions provided, and performing laboratory exercises. Videos and reading assignment tasks are used to develop cognitive skills. Practice problems are used to develop affective skills. Laboratory exercises are used to develop both affective and psychomotor skills. Each task corresponds to one of the four levels of competency defined above.

**Formative assessment** is accomplished using automatically scored quizzes within the course management system. For each level of competency, a statistically large number of quiz questions is created. When a student is assessed, the tools are pulled from the large pool in a randomized fashion. This addresses academic dishonesty, which is a significant concern for web-based courses. Quiz questions are created for each of the learning modules that assess multiple knowledge domains at each of the four levels of competency. Cognitive skills are assessed using auto-graded multiple choice questions. Affective skill assessment are measured using a combination of auto-graded multiple-choice questions, auto-graded circuit analysis questions with numerical entry fields and uploaded circuit design files. The automatically graded questions are implemented in a generic text-based file format, which can be imported into any course management system. The questions are developed based on widely accepted concept inventories for computer engineering courses [18-21].

**Summative assessment** is performed at the end of each learning module through an automatically graded exam administered in the course management system. Students are notified of their score on each module exam.

The adaptive learning algorithm is shown in the following flow chart. For each learning outcome, an initial set of tasks is assigned (e.g., videos, reading assignments, practice problems, lab exercise). These tasks represent the traditional items that are assigned in a course without adaptive learning. An initial assessment quiz is given to measure the level of student understanding. The performance on this assessment will determine the current level of understanding and put the student into one of the four levels of competency (e.g., deficient, beginner, competent and advanced). Students categorized as deficient are given a series of additional tasks to build their background information. An interim quiz will then be given to determine if they are ready to move into the beginner category. If they are, they then must complete a set of tasks at the beginner level. If they are not deemed ready, they are given additional deficient level tasks. This iterative process continues until the student passes the interim quiz and moves into the beginner category. The same process is used for students in the beginner category with the exception that the tasks are at the beginner level and the interim quiz assesses whether they are ready to move into the competent category. Students deemed...
competent by the initial quiz (or reaching competence by working through deficient and/or beginner level tasks) are qualified to take the module exam. Students may optionally choose to receive more training at the competent level. Students deemed advanced by the initial quiz (or reaching advanced by working through competence level tasks) will also be qualified to take the module exam or do optional training at the advanced level. This process provides inherent formative assessment and tracks the progression of each student as they learn the content matter. All interim quizzes used for formative assessment are ungraded and exist to dynamically adapt the difficulty of the material and track student progression. It is at the discretion of the instructor if the module exams count toward the students’ course grade.

Figure 1. Adaptive Learning Algorithm.

Current Project Status

During 2015, our team has developed all of the baseline (i.e., traditional) content for both courses covered in this work. This includes a new textbook, associated lecture videos, and over 600 quiz questions. During the fall semester of 2015, the material is being used to collect a baseline of student performance across all of the learning
outcomes being measured. In 2016, the material delivery will be changed to an adaptive learning format and outcome data will be collected. This will measure how effective the adaptive learning format is in improving mastery of the topics. In 2017, demographic-specific examples will be integrated into the system. The material is being used at Montana State University in 2015 and will be pushed out to three other colleges in Montana (MSU-Billings, Flathead Valley Community College, and Salish Kootenai Tribal College) to collect data on a more diverse population of students. Data is only collected on students who sign a voluntary consent form that allows their demographic information to be pulled from university records and correlated to their performance on the learning modules. All data is coded for anonymity.

Conclusion

This paper presented work underway at Montana State University on building an adaptive learning framework to facilitate mastery of digital logic concepts while simultaneously personalizing the instruction for the students based on their demographics. An overarching goal of this work is to increase diversity in engineering. Research has shown that underrepresented minorities, especially women and first generation college students tend to choose and persist in fields that have communal value (i.e., helping others and contributing to public welfare). The way in which the material is presented and the type of examples used have a direct impact on how important a student perceives the information. Thus in this work, we aim to present demographic-specific content and examples for each student that makes the material relevant to the individual.

ABSTRACT
Visual synchronization tasks are difficult. We need intensive brain activity for completing visual synchronization tasks. Recently, we can measure the precise movement of a human with cheap and easy to use sensors. We proposed a method to estimate the smoothness of the visual synchronization task and implement the measuring system. Using the proposed method and the implemented measuring system, we measure the developments of motor skill of pupils in a primary school. This paper shows the results of the measurements and discusses the development of girls from 6 to 12 years-old.

Introduction

There are many motor tasks that measure the abilities of motor functions of a human. They are the Purdue pegboard task, a seal affixation task, a tray carrying task, and etc. [1] [2] [3]. These tasks estimate the ability of a motor function of a human with the results of the tasks. There is no observation of the process of the tasks.

There are also some synchronization tasks used to measure human abilities. For example, they are synchronization of finger taps with periodically flashing visual stimuli and
synchronization with an auditory metronome. In these tasks, the timing between the stimuli and the action is measured. There is no observation of the process of the tapping [4] [5] [6] [7] [8] [9] [10].

Recently, many cheap and easy measurement methods for the movements of a human body have been developed. For instance, some of these sensors are a Kinect sensor, and a Leap motion sensor [11] [12]. There are many applications that use those sensors for controlling computers. For instance, there are many video games that use those sensors for controlling an avatar in the games [13].

The human hands are the parts of a body that can make the most complex movements. This paper proposes the method that measures the precise movements of hands synchronizing the movements of hands on a display. The synchronization needs visual perception of the displayed hands’ images and precise control of the arm muscles. The process includes the perception of motion about a hands’ image presented on a display, the perception of motion about subject’s hands, motor recognition with muscular sensation, and recognition of processing delay in a subject’s brain.

We proposed the new synchronization task and the evaluation method. The resulting measure is very sensitive. With this measure, we can observe the developments of the motor function.

First, we discuss the new visual synchronization task with visual presentation. Then, non-smoothness measure is proposed. Next, this paper shows the non-smoothness measure experiments in a primary school in Japan. Then, we discuss the experimental results. And last, we conclude this work.

New visual synchronization task

Our new synchronization task requests subjects to synchronize the movements of both hands with the displayed movie. Of course, there many alternatives to hands. However, we make many hands’ movements without dangers. A hand is an organ that is able to make most complex movement in a human body. The performance evaluation system estimates the difference between the displayed hands’ movement and the measured hands’ movement of the subject.

The displayed movie shows the hands’ rotation. The angle of the rotation is controlled as a sine curve. A finger tapping task requests a subject to tap a finger synchronizing to an impulsive stimuli such as flash of a light or ticktack sound of a metronome, and measures the difference between the time of the stimuli and the time of tapping. Our proposed motor function performance evaluation system measures the movements of subject’s hands and evaluates the difference between the displayed hands’ movements and the hands’ movements of a subject.

To complete the visual synchronization task, a subject looks at the displayed hand, recognizes movements on the display, generates motions, feels and looks his hands’ movements, recognizes movements of his hands, and synchronizes two movements. The proposed visual synchronization task needs many kinds of brain activities. Figure 1 shows the relations among the elements included in the visual synchronization task.
On a trial, our visual synchronization task measures about 100 measurements of pairs of rotation angles of both hands. The finger tapping task measures one difference of time between the stimuli and the tapping. In a trial, the proposed visual synchronization task has 200 times measurements than the finger tapping task.

An infant aged 6 to 7 years old can rotate his hands quickly. To complete the proposed visual synchronization task, a subject must control the rotation angle as the displayed movie. This is more difficult than simple rotation of hands.

The angle of displayed hand’s rotation is controlled as a sine curve in a time series. As a result, the angles of rotations is described as (1).

$$A(t) = \sin(at + c) \times b$$ (1)

In (1), a is the parameter that defines the speed of rotations. In our experiments, a is set to $2\pi$. b defines the range of rotation angle. In our experiments, b is set to 90 degree. The function sin spans from -1 to +1. As a result, hands rotate 180 degree. c define the phase. In our experiments, c is set to $\pi/2$.

If a subject makes complete synchronization to the displayed movie, the resulting observed rotation angle of hands also shows same curve defined as (1).

**Non-Smoothness Measure**

We describe proposed non-smoothness measure as NSM. We define NSM depending on the definition of noise in signal theory. With the precisely controlled hands motions proposed on a display, we can define NSM clearly. The definition of NSM is (2).

$$NSM = \sum_{x=2}^{t/4} \frac{m_x}{m_1}$$ (2)

In (2), $t$ is the number of measurements in a cycle of rotation. $m_x$ is the absolute value of the x-th term of the result of Fourier transform. $m_1$ is the power of the lowest frequency. This represents a one cycle of a hand’s rotation. If the rotation of a hand follows the stimuli images precisely, the $m_1$ carries all powers of the hand’s rotation. Other terms carry no power. In the case, the NSM defined as (2) is 0.

In our experiments, we measure the rotation angle of hands at every 1/100 second. So, we have 100 measurements in a cycle of rotation. We calculate the NSMs at each hands. In a cycle, we have a pair of NSMs. In a trial, a subject make 25 times of hands’ rotations. A subject need some time to synchronize his hands’ rotations to the displayed movie. So, we ignore first 10
rotations. As a result, we have 15 pairs of NSMs at each trial. For evaluating the performance, we select the minimum of the average of continuous three NSMs. In the selected three NSMs, we select the minimum one for the session NSM. As a result, at each trial, we have two NSMs that represent the right and left hands. We implement the NSM measuring system [14].

**Experiments for measuring Non-Smoothness Measure**

At a primary school in Nikko, we measured NSM of all pupils at June/23/2015. Table 1 shows the number of pupils in the primary school. The school is small in Japanese standard. Pupils in Japanese primary schools are aged from 7 to 13 years old.

One session of the measurement needs 25 times of rotations of hands. Each rotation takes one second. The one session needs only 25 seconds. We made two sessions simultaneously. In an hour, we completed all measurements.

In the experiment, there are some failures. Most of failures are the special relation between subjects’ hands and the measuring sensors. The used sensor measures the position of hands and fingers precisely. However, there is a limitation about the special relation between the sensor and the measured hands. In the failure, we guide subjects to keep the proper position of hands.

**Distributions of Non-Smoothness Measures along ages**

We show the average of NSMs by school years in Table 2. Figure 1 and figure 2 show the distribution of NSMs with months from birth of boys and girls, respectively. Boys show a little
correlation between the months from birth and NSMs as in figure 1. Girls aged 6 to 13 years old show clear linear correlation between the month from birth and the NSMs as figure 2. The correlation is described as (3) in linear approximation.

\[ NSM = -0.0038M + 0.7363 \]  

(3)

In (3), NSM is the non-smoothness measure. \( M \) is months from birth. In the approximation, the \( R^2 \) is 0.4895. In other experiments, we have about 0.35 of NSM for adult peoples. However, our adult data mainly includes male. Gender difference about the development of motor control function.

From (3), we can estimate the standard developmental age from NSM as (4) for the girls aged 7 to 12 years old.

\[ M = 193.8 - 263.2NSM \]  

(4)

In (4), \( NSM \) is a measured NSM. \( M \) is the estimated standard developmental age by months from birth. A normal female pupil shows 0.047 decrease of NSM at each year.

Conclusion

Our new visual synchronization task and non-smoothness measure help to observe the development of motor skill of pupils in a primary schools. The visual synchronization task is easy to perform and safe. In normal primary schools, it is easy to measure the NSMs of all pupils. The measured NSM is objective and well defined measure that represents the development of motor skill.

The proposed small experiments shows the standard development of motor skill of girls in a primary school. For estimating standard developmental age of motor skill of boys, we need much more experiments. Our next step is collecting much more measurement results.

ABSTRACT

Recently, we can measure the precise movement of a human with cheap and easy to use sensors. We propose a method to estimate the motor skill of a human. This paper proposes the motor skill estimation method with precise motor measurements of visual synchronization task of both hands. The task needs only 30 seconds. First, this paper proposes a visual synchronization task. Then, we show the motion measuring method about the visual synchronization task. Next, we discuss about non-smoothness measure. Then, we show our implementation. Next, experimental results are proposed. And last, we conclude our work.

Introduction

There are many motor tasks that measure the abilities of motor functions of a human. They are the Purdue pegboard task, a seal affixation task, a tray carrying task, and etc. [1] [2] [3]. These tasks estimate the ability of a motor function of a human with the results of the tasks. There is no observation of the process of the tasks.

There are also some synchronization tasks used to measure human motor functions. For example, they are synchronization of finger taps with periodically flashing visual stimuli and synchronization with an auditory metronome. In these tasks, the timing between the stimuli and the tapping is measured. There is no observation of the process of the tapping [4] [5] [6] [7] [8] [9] [10].

Recently, many cheap and easy measurement methods for the movements of a human body have been developed. For instance, some of these sensors are Kinect sensor, and Leap motion...
sensor [11] [12]. There are many applications that use those sensors for controlling computers. For instance, there are many video games that use those sensors for controlling an avatar in the games [13].

The human hands are the parts of a body that can make the most complex movements. This paper proposes the method that measures the precise movements of hands synchronizing the movements of hands on a display. The synchronization needs visual perception of the displayed hands’ images and precise control of the arm muscles.

We proposed the new synchronization task and the evaluation method. The resulting measure is very sensitive. With this measure, we can observe the developments of the motor function.

This paper proposes the motor skill estimation method with precise motor measurements of visual synchronization task of both hands. The task needs only 30 seconds. First, this paper proposes a visual synchronization task. Then, we show the motion measuring method about the visual synchronization task. Next, we discuss about non-smoothness measure. Then, we show our implementation. Next, experimental results are proposed. And last, we conclude our work.

**New visual synchronization task**

Our new visual synchronization task is synchronization to a proposed movie on a display. The synchronization task requests subjects to synchronize their both hands with the displayed movie. The displayed movie shows the rotations of both hands. In the movie, the rotation angle is precisely controlled as a sine curve. Figure 1 shows the sequence of frames that present an internal rotation of hands. One cycle of hands’ rotation include the internal rotation as in figure 1 and an external rotation.

One session of a new visual synchronization task include 25 rotation cycles of hands. A subject must try to synchronize his hands’ motion to the displayed hands’ movie.
Non-smoothness Measure

In the visual synchronization task, we have 25 cycles of hands’ rotations. A subject cannot synchronize his hands motion to the displayed hands instantaneously. We only use last 15 rotation cycles to evaluate the motor function.

At each rotation cycle, we have a sequence of hands’ directions. We transform the sequence of hand’s directions into frequency domain with Fourier transform.
In frequency domain, the lowest frequency is the constant. The second lowest frequency is the wave that repeats one cycle in the rotation cycle. This wave is same as the wave described by the displayed image.

We describe proposed non-smoothness measure as NSM. We define NSM depending on the definition of noise in signal theory. With the precisely controlled hands motions proposed on a display, we can define NSM clearly. The definition of NSM is (1).

\[
NSM = \sum_{x=2}^{t/4} \frac{m_x}{m_1}
\]  

In (1), \(t\) is the number of terms. \(m_x\) is the absolute value of the \(x\)-th term of the result of Fourier transform of one cycle of hand’s rotation. \(m_1\) is the power of the lowest frequency wave. This represents a one cycle of a hand’s rotation. The wave corresponding \(m_1\) is the wave presented on a display. If the rotation of a hand follows the stimuli images precisely, the \(m_1\) carries all powers of the hand’s rotation. Other terms carry no power. In the case, the NSM defined as (1) is 0. If the rotation of subject’s hand differs from the displayed rotation of hands, \(m_x\) other than \(m_1\) increases. As a result, NSM defined as equation (1) increases.

Non-smoothness measuring system

The proposed non-smoothness measuring system for the visual synchronization task has two main parts. One is the part that proposes the movie of precisely defined hands’ motion. The other part measures the hands’ rotations. We need to propose the movie with precise timing.

Figure 2 shows the relation between the stimuli presentation part and the rotation measuring part. The stimuli presentation part records the presentation timings. The rotation measuring part records the pose of hands with time.

```
Figure 2. Outline of the visual synchronization task generation and measuring system.
```

We implement the visual synchronization task generation and measuring system using Python and pyglet [14] [15]. To measure the poses of hands, we used Leap-motion sensor [12]. Using Leap-motion sensor, we have one measurement of hands’ poses at every 1/100 second. At each cycle of hands’ rotation, we have 100 measurements of ands’ poses.

The movie presentation part and the pose measurement part must move simultaneously. Our implementation has two processes. One process works for presenting stimuli images. Another process works for measuring the poses of hands. With this multi-processing implementation, we can have precise stimuli presentation and precise measurement of hands’ poses.
Non-smoothness measure calculation

We have the precise presentation timings and the pairs of time and rotation angle. At each cycle of rotation, we make FFT (Fast Fourier Transform), and calculate NSM as (1). Our system proposes 25 times of hands’ rotations. One rotation takes one second. As a result, one measurement needs 25 seconds. In 25 rotations, we have 25 pairs of NSMs. A subject need about ten seconds to synchronize his hands’ movement to the displayed movie. So, we ignore first ten pairs of NSMs. As a result, we have 15 pairs of NSMs at each session. In a rotation cycle, the rotation of a hand may synchronize the rotation displayed by chance. For a session, we select the minimum of the average of continuous three NSMs as the best performance in the session. We define the session NSM as the minimum of the continuous three NSMs. Figure 3 shows the session NSM calculation process.

![Diagram of Session NSM calculation process](image.png)

Figure 3. Session NSM calculation.
Experiments

For testing the implemented NSM measuring system, we measured the adult peoples. Table I shows the results. In the column of ‘Subject’, the number is an age, and M/F shows male or female. The average of the session NSMs is 0.35 and the normal distribution is 0.1.

**Conclusion**

The pair of the new visual synchronization task and the proposed NSM measuring system enables to measure the motor skill in a minute. This shortness of task help us to use this measuring system in many applications. The proposed system enables to measure the development of motor skill in objective manner.

We only use the NSM for measuring the performance of motor function. The sequence of NSM at each rotation cycle carries much more information about the personal type.

“Understanding and recognising anxiety in young people: the role educators can play in minimising anxiety in the classroom and thus promoting learning and wellbeing.”

b) Topic Area: Teacher Education

c) Presentation Format: Paper Session

d) Description of presentation:
Mental health issues, such as anxiety, affect 1 in 4 young people. It is imperative that educators focus on ways to help to reduce stress and anxiety in the classroom and the school setting.

This paper will focus on practical, evidence based strategies to help teachers reduce the anxiety levels of the students in the classroom and thereby enhance the learning experience and their wellbeing.

2. Abstract:

“Understanding and recognising anxiety in young people: the role educators can play in minimising anxiety in the classroom and thus promoting learning and wellbeing.”

Anxiety is the most prevalent mental health problem in children and teenagers in Australia today (beyondblue 2015). It is vital that educators understand the impact anxiety has on young people and that they establish strategies that can assist in minimising these often debilitating effects on children.

Through understanding anxiety and the symptoms and triggers that exist in the classroom, educators can gain insight into how anxiety, even at low levels, can affect learning and can interfere in the social, academic and emotional functioning of children and thereby affect the learning experience and wellbeing.

This presentation will focus on establishing an understanding of anxiety and developing practical teaching and learning strategies that can become part of each teacher’s daily pedagogy. These strategies will aim to help students develop a calm mind, a growth mindset to minimise anxiety, maximise performance and enhance wellbeing.

6. Abstract:
   Connecting classroom learning to real-life situations is a critical part of education. This presentation highlights a unique collaboration between freshmen engineering majors, pre-service early childhood education majors, and preschool students. During this multi-week project, teams of engineering students complete a design unit that results in the creation of cardboard, playhouse modules that upon completion are donated to local early childhood education centers. This team-based project is one of several projects created for an end-of-semester freshman engineering design course. The intent of this project is to encourage freshmen engineering students to learn to collaborate, to address the requirements set by a client, and to value the expertise of a consultant.

   Each fall since 2012, two sections of introduction to engineering design (EDSGN 100) have had the good fortune of being able to tap into the knowledge and classroom experience of pre-service elementary teachers and their professor. These sophomore education majors form teams and come prepared to present a broad range of criteria for the budding engineers to consider in formulating their designs. For example, the pre-service elementary teachers caution the engineers to avoid incorporating sharp edges and toxic paints into their designs.

   All total, the elementary education majors meet and interact with the engineers 2-3 times during the 15-week semester. The actual cardboard, playhouse modules are due during the week of final exams. The week prior, the 14th week of the semester, the pre-service teachers are invited back to the EDSGN 100 class to inspect each playhouse module and provide feedback in the form of advice, ideas, and changes needed to assure a safe, quality product (playhouse module) that will be sure to pique the interest (and attention) of their pint-size clients.
MOOC as a Recruitment Tool: A Practical Approach to Marketing for New Graduate Students

Introduction

A MOOC (Massive Open Online Course) can be defined as a free, online course that is open to the public and has no limitation placed on participants. It is widely accepted that MOOCs have been around since 2008 and have much potential to deliver education on a global scale (Liyanagunawardena, Adams & Williams, 2013). MOOCs, in general, do not discriminate participation as they are geared for anyone interested in learning the topic of the course. TOOCs, on the other hand, are targeted open, online courses that provide free course credit to students at institutions of higher learning (Baker & Gentry, 2014). This paper will discuss the background and need for such a course at a regional university, the approach this university took in deploying the course, and the results of the course.

Background and Need

A&M-Texarkana has a presence in northeast Texas, southwest Arkansas, northwest Louisiana, and southeast Oklahoma. As a comprehensive university, A&M-Texarkana offers 17 undergraduate programs and 12 graduate programs. The region is largely rural, and the university attracts a large population of first generation college students. The enrollment at the university hovers around 1800 with a goal of becoming a regional institution that serves approximately 2500; consequently, much of administration’s focus is on ways to attract students. When university faculty and administration considered offering this MOOC, public school teachers in the service area in Texas and teachers in the Texarkana, Arkansas district (TASD) were targeted. There were several key benefits related to providing this MOOC to this population in the summer, 2015:

- Regional school personnel would benefit from meaningful educational experiences related to new and emerging technologies in education;
- Area teachers would receive professional development opportunities for local, public school educators;
- University personnel would benefit from in the following ways:
  o an increase in potential students in the instructional technology program (as well as other programs);
  o an increased awareness of graduate programs;
  o an established reputation for providing quality professional development to local school districts.
In Texas, the state is zoned into service areas, and, within each region, school districts contribute to a centralized service center that provides professional development support for the paying districts within the region. Region VIII Education Service Center serves 48 independent school districts/consolidated independent school districts throughout northeast Texas (AskTed, 2015); A&M-Texarkana is situated within the Region VIII territory. Within the 48 school districts in Region VIII, there are 176 individual schools (AskTed, 2015). The Texarkana, Arkansas, school district, which is considerably smaller than Region VIII in Texas, is also considered as part of the service area of Texas A&M University-Texarkana. TASD currently has 10 schools in its district (Texarkana Arkansas School District, 2015) with over 800 faculty/staff (TASD: Human Resources, 2015). Through an analysis of the technology capabilities and needs within these two target areas—Region VIII and TASD—program faculty determined that individuals within these 186 schools possessed varying skill levels and had a variety of needs. In order to serve each teacher in their individual locations and their knowledge of technology, the following course description was developed:

This course has been designed to address emerging trends, problems and solutions, and technologies and technology applications facing K12. This course will be germane to professionals who serve in a variety of roles in K12 institutions. This course explores innovative ways of utilizing technologies to facilitate learning and to improve the way we teach. Topics include social learning theory/social constructivist learning, flipped classrooms, digital text books, video content, BYOD, virtual schools, social media, student engagement, and problem based learning.

**Barriers to the MOOC Delivery**

The faculty member associated with this project had to overcome several barriers in order to provide the MOOC. Specifically, those barriers included buy-in from administration, communication between the learning management systems, and marketing of the product. First, buy-in from administration presented challenges. To provide content for “free” would mean a loss of valuable revenue to the university. Further, how could the faculty member insure that adequate rigor was maintained for those who wanted the college credit while, simultaneously, keeping the information relevant and interesting enough to encourage participants to complete the course? Finally, how could the university justify paying a faculty member for a “free” course that could potentially generate little or no income for the university? A second challenge involved communication between the learning management system, Blackboard, and the student management system, Banner which is reserved for enrolled students. It
was determined that the MOOC would be delivered through the Canvas learning management system, Instructure (canvas.instructure.com). Third, because of the quick turnaround—once the MOOC was approved—marketing and recruitment of the content had to be completed quickly.

Advertising, Recruitment, and Populations

It was decided early in the MOOC development cycle that our audience would be public school teachers in Region VIII of Texas as well as teachers in Texarkana, Arkansas (TASD). An email was sent to school administrators with a request that the included invitation be forwarded to teachers and paraprofessionals who might benefit from the content. The email provided a description of the course and the information about applying this course toward a future graduate degree. A link to sign up to the course was provided in the email. Figure 1 below is the flyer that accompanied the email.

Figure 1. Flyer Describing the MOOC
The email was sent out approximately three to four weeks before the course began. The original cap of 150 students was optimistic; ultimately, 49 teachers (students) signed up for the course. Although the enrollment fell short of the goal, the 49 participants represented potential students for the university. The students, who were all certified teachers, varied in the year in which they were certified; the earliest being 1974, and the most recent in 2014. Figure 2 shows a scatterplot of the years each teacher reported being certified in. Teaching subject matter and grade level were also widely distributed amongst the students that signed up for the course.

Figure 2. A Scatterplot of Participants’ Year of Certification

MOOC Outcomes

Overall, students reported high levels of satisfaction with the design and delivery of the TOOC/MOOC. Students were asked to submit a course reflection paper at the end of the course. The following bulleted list indicates the most widely recurring examples of likes/dislikes in the course:
• Discussion board/collaborations were greatly enriched because of the variety of grade levels and subject matters taught by the teachers;
• Course participants, when asked about their favorite course assignments, found that two particular modules stood out: The Creation of APPs and BYOD;
• Many would have preferred to have met at least once in a face-to-face environment;
• Students developed bonds with each other through the MOOC and indicated intentions to stay in contact with each other.

From an administrative standpoint, the TOOC/MOOC was considered a success. Forty-nine students signed up to take the course. Of that number, 30 or 61% were completers. Among the completers, 28 or 93% demonstrated success by receiving a C or better as a final grade. Among the 28 students that received a C or greater, 7 students signed up to graduate programs or indicated that they planned to sign up. From the university’s perspective, 14% of those who participated received benefit from the opportunity and became graduate students.

**Future Implications and Conclusions**

There is no doubt that the delivery of higher education has evolved greatly over the last few decades. Wagner (2008) explains that students need seven “survival skills”: critical thinking and problem solving, collaboration and leadership, agility and adaptability, initiative and entrepreneurialism; effective oral and written communications, accessing and analyzing information, and curiosity and imagination. Survival skills such as these along with the continued improvements of learning management systems have driven universities to be creative in their marketing attempts, course/program deliveries, and overall student interactions in order to thrive and not simply survive. Whether a course is offered face to face, hybrid, asynchronous online, synchronous online, or another combination, students must be engaged and challenged in their courses but need to be allowed flexibilities in learning. As educators, we must educate these learners in innovative ways that will ensure their success.

Because of the success of this experiment, the MOOC will likely be delivered again with several modifications. Specifically, four lessons learned from this first effort include the following:

• Outline who is eligible to receive credit for the MOOC. Several individuals who participated in the MOOC were existing students in the Instructional Technology program. As a result, the university personnel had to make programmatic decisions as they occurred.
• Develop a strategic marketing plan. By the time the MOOC was developed, discussed and approved, little time remained for marketing. For the next round, a strategic approach to marketing with enough time to recruit additional participants will be included.

• Consider restructuring content of the MOOC to serve audiences outside of PK-12 education. Clearly, technology inculcates every aspect of today’s life. With a focus on practical application of the technology, the potential to attract other potential students is possible.

• Offer the course as a faculty overload. Because the idea was presented by a faculty member, the administration approved the MOOC to count as one of the two courses for a summer load which proved to be a costly endeavor. For the university to demonstrate a profit in the endeavor, future consideration will be given to pay the faculty member as an overload or to offer the course by an adjunct.

The lessons learned in the development, delivery, and marketing of the TOOC will serve invaluable in the deployment of Texas A&M University-Texarkana’s next iteration: TOOC 2.0.

Abstract:
This literature review investigated co-teaching methods that may benefit English Language Learners (ELLs). Studies indicate that co-teaching strategies utilized in the content classroom have a positive impact on both ELL students and teachers. Research demonstrates positive learning gains for students in an inclusive setting for all learners. This paper will focus on employing research-based teaching strategies for implementing, such as, the one teach, one assist method, parallel teaching, and collaboratively developing lessons.
Co-Teaching as a Method to Benefit English Language Learners

English Language Learners (ELLs) are the fastest growing preK-12 student group in the United States, growing 64% from 1994 to 2010 (National Clearinghouse for English Language Acquisition, 2011). As of 2010, out of nearly 50 million students in the U.S., 5.2 million (10%) were identified as ELL students. There is an increased need to assist the growing ELL population in today’s classrooms, as data show that the academic needs are not being met. For instance, on statewide assessments across the country, the percentage of ELL students who achieve proficiency is 20 to 30 percentage points lower than among their non-ELL peers (Abedi & Dietel, 2004; Hemphill & Vanneman, 2011). ELL students have the challenge of learning grade-level content and a new language all at the same time. Traditionally, the two tasks are separated; but Echevarria, Short, and Powers (2006) found that combining the two has assisted students in learning English without losing subject area content, so one potential method to help students is co-teaching. The purpose of this research is to investigate co-teaching methods that may benefit ELL students.

Co-teaching is defined as “two or more professionals delivering substantive instruction to a diverse blended group of students in a single physical space” (Cook & Friend, 1995, p. 14). Co-teaching appeared in the literature in the early 1990s as a way to better address the needs of special education students. There are several different models of co-teaching that were developed by St. Cloud University researchers focusing on the student teaching experience (St. Cloud State University, 2014). The seven strategies or models described below can be used in a variety of classroom situations to assist students of diverse learning backgrounds better.

1. **One Teach, One Observe:** One teacher has primary instructional responsibility while the other gathers specific observational information on students or the (instructing) teacher.
2. **One Teach, One Assist:** One teacher has primary instructional responsibility while the other assists students with their work, monitors behaviors, or corrects assignments.

3. **Station Teaching:** The co-teaching pair divides the instructional content into parts; each teacher instructs one of the groups, and groups then rotate or spend a designated amount of time at each station.

4. **Parallel Teaching:** Each teacher instructs half the students. The two teachers are addressing the same instructional material and presenting the material using the same teaching strategies.

5. **Supplemental Teaching:** Allows one teacher to work with students at their expected grade level, while the other teacher works with those students who need the information and/or materials re-taught, extended, or remediated.

6. **Alternative or Differentiated Teaching:** Each teacher provides two different approaches to teaching the same information. The learning outcome is the same for all students; however, the avenue for getting there is different.

7. **Team Teaching:** Incorporates well planned, team taught lessons, exhibiting an invisible flow of instruction with no prescribed division of authority. Both teachers are actively involved in the lesson.

Co-teaching is an ongoing process that forces teachers to communicate more intimately with each other and with their students. Different co-teaching methods can require different levels of planning (Cook, 2004).

**Benefits of Co-Teaching**

Several researchers have demonstrated the benefits of co-teaching for students. In a study conducted by Almon and Feng (2012) in an urban elementary school, co-teaching in the
fourth grade classroom had a more positive effect than solo teaching, as measured by student math achievement. The study analyzed the performance of two fourth grade classrooms, one with co-teaching instruction and the other with solo teaching instruction. Students increased their time on task engagement during co-taught lessons versus solo-taught lessons. In addition, St. Cloud University (2014) highlights several examples of the positive effects co-teaching has on students. For instance, these include: a reduction in the student/teacher ratio, an increase in instructional options for all students, an increase in diversity of instructional styles, and greater student engagement and student participation levels. Further, co-teaching models also appear to exhibit success when conducted with student teachers (Merk, Waggoner, & Carroll, 2013).

Much research has demonstrated that co-teaching benefits students. For instance, research done by Walsh (2012) shows that co-teaching can be considered a high-leverage strategy capable of accelerating achievement to close the achievement gaps in reading and mathematics. The study emphasizes that students demonstrate more growth and increased academic performance when teachers are well trained in implementing co-teaching methods and well supported by the school administration.

As schools prepare to implement a co-teaching model and make selections for successful strategies, it would be helpful to know which co-teaching strategies work better than others in an inclusive classroom. However, sufficient research has not been conducted on the specific use and most effective co-teaching methods. It appears that the lack of data is due to the fact that co-teaching is not conducive to large-scale, standardized research (Hanover Research Report, 2012). Also, there is too much variance in the definitions of co-teaching and typically classes are not similar enough to provide meaningful comparative data. However, one study highlighted in the Hanover Research Report (2012) stated that a team of teachers faced with specific behavioral
challenges alternately used parallel teaching, alternative teaching, station teaching, and team teaching. The co-teaching team has to decide when to utilize each strategy. Methods may be implemented independently or in combination, however the most prevalent form of co-teaching in schools is One Teach, One Assist.

**Co-Teaching to Benefit ELL Students**

Only recently has the notion of co-teaching to benefit English Language Learner (ELL) students become more prominent, with early research demonstrating positive learning gains for students. Honigsfeld and Dove (2008) conclude that co-teaching with an English as a Second Language (ESL) teacher a) becomes an effective support for inclusive practices to accommodate the needs of diverse ELL students; b) helps all students meet national, state, and local standards; and c) establishes a vehicle for creative collaboration between ESL and mainstream teachers.

A collaborative approach has worked for St. Paul Public Schools in their work with immigrant populations including Somali, Hmong, and Latinos. Their instructional methods have narrowed the academic achievement gap (Pardini, 2006). For example, Pardini shares how an ELL teacher in St. Paul teaches alongside the mainstream teacher, working with ELL students during a fractions lesson. During the lesson, the ELL teacher uses the One Teach, One Assist method to ensure the correct use of the word “whole” vs. “hole” by reinforcing the fractions concept and giving language support. In this example, ELL teachers work with one or two grade levels in two to five classrooms a day. St. Paul Public Schools can serve as a model for other schools implementing co-teaching in the ELL classroom.

There are many benefits to using a co-teaching model with ELL students. Co-taught lessons are inclusive and offer more support for diverse ELL students. Students are able to stay
in the content classroom and not be “pulled out” for remedial ELL programming. ELL students are also able to interact more with their English-speaking peers.

Research shows that collaborative teaching can provide more support for students. For example, a three-year study in an urban elementary school supports the idea of implementing more collaborative teaching in the classroom with heterogeneous groups of students (York-Barr, Ghere, & Sommerness, 2007). The collaboration models utilized were slightly different by grade level for first and second grade. In first grade, the 90-minute literacy block allowed for the teachers to parallel teach a jointly developed lesson and to switch groups every other day. Later during the block, another ESL teacher arrived, and the special education teacher joined to facilitate four guided readings groups.

In second grade, teachers assigned different models of instruction each day, consisting of whole class instruction, reading level groups, and partnered reading with higher and lower proficiency paired readers. Teachers made decisions on model selection depending on what the lesson called for each day.

At the end of year 1 of the study, teachers had positive responses about the fostered professional support they felt because of the collaboration and combined classroom instruction. Some of the responses included: more flexible and creative use of instructional time, greater shared ownership of students and student learning, increased reflection on individual and collective teaching practices, increased collective expertise resulting in greater effectiveness with a variety of students, decreased teacher isolation and feeling valued by colleagues, and having more energy and greater enjoyment from teaching (York-Barr, Ghere, & Sommerness, 2007).
At the end of year 2 the positive responses about the experience continued. Overall, teachers were supportive of co-teaching and appreciated the growth they saw in the students. Even though the advantages of co-teaching outweighed the disadvantages, there were still some challenges during the process. Teachers stated that they did not appreciate the loss of instructional decision-making autonomy, role shifts and confusion about how to share instructional time (i.e., who leads, who follows, how to co-teach), feelings of insecurity because teaching became public, and differing philosophies (i.e., the term often used to describe differences between teachers related to orientations or beliefs about instruction and professional practice) (York-Barr, Ghere & Sommerness, 2007).

Ultimately, the co-teaching experience was a successful endeavor for the teachers involved. Five key factors attributed to the success. First, teachers were interested in a more inclusive approach to educating ELL students. Second, there was administrative support with the addition of extra staff resources and more time allotted for collaborative planning. Third, more individualized student attention is possible by using the collaborative instructional models. Co-teaching allows for much needed small group instruction (York-Barr, Ghere, & Sommerness, 2007). Teachers emphasized that much of the student learning transpired when teachers taught side-by-side. Fourth, collaborative planning is considered the most essential element for program success. Administrators adjusted schedules for teachers to have simultaneous planning time within classroom teams. Fifth, the teachers appreciated the flexibility to create multiple and varied instructional models as a classroom team. These factors illustrate the benefits of using co-teaching models of instruction, especially in a classroom with ELL students.

Hendrickson (2011) found that 72% of teachers felt their co-teaching experience had been successful that year. Similar results are true in the York-Barr, Ghere and Sommerness
(2007) study. At the end of Year 1 the outcomes were viewed to be very positive for teachers and students. At the end of Year 2 one teacher boasted, “I can’t believe that team teaching was something I was kind of fighting. Now…I am willing to fight to keep it together.” All teachers preferred the co-teaching model to the previously used ESL pull-out model (Pappamihiel, 2012).

Additionally, the study (York-Barr, Ghere & Sommerness, 2007) highlighted how students also benefited greatly from the use of collaborative teaching models. Student changes included: viewing all adults as their teachers, learning from different teaching styles, feeling more included and less scared, experiencing a sense of community and more friendships between ELL and non-ELL students, being more engaged in instructional and social situations, improved behavior, and increased student achievement in both reading and math as indicated by classroom assessments and standardized tests. Research therefore suggests clear benefits for both teachers and students when collaborative teaching models are implemented in classrooms.

**Recommendations for Implementing a Co-Teaching Model**

York-Barr, Ghere and Sommerness (2007), make various suggestions to administrators and schools interested in implementing a model for co-teaching in the ELL classroom. Below are strategies to consider:

1. Provide professional and contextual knowledge that supports instructional collaboration;
2. Strategically allocate instructional personnel;
3. Take a whole-school inventory of instructional resources;
4. Assign specific instructional personnel to teams that support specific groups of students;
5. Create a schedule to maximize instructional support at high-needs times;
6. Provide ongoing opportunities for collaborative learning and development;
7. Build in regular time for collaboration;
8. Actively support co-teaching;
9. Embed ongoing student assessment;
10. Intentionally design flexible student groups;
11. Commit to individual and team development.

Further, teachers should implement more than one co-teaching model even in the same lesson (Hendrickson, 2011). If focused on the students’ needs, co-teaching may look different every day. It is also suggested that teachers co-plan at least 45 minutes per week. This can be done by meeting after-school to plan, having a substitute teacher take the class for two hours per month, or schedule planning time appropriately to allow the ESL teacher time with the mainstream teachers. One of the most important factors of a successful co-teaching model is that team members have a significant amount of time to build positive working relationships (Merk, Waggoner, & Carroll, 2013).

Other recommendations suggest more staff input in the co-teaching pairing. One way to do this is by having teachers fill out surveys as to with whom they would like to co-teach (Hendrickson, 2011). Teachers also stated that they would like to have more co-teaching training at different times of the school year. They would also like to see more modeling of good co-teaching.

**Conclusion**

Murawski (2005) states that for true co-teaching to occur, both professionals must “co-plan, co-instruct, and co-assess a diverse group of students in the same general education classroom” (p. 10). In order for this to happen, co-teachers must use best practice strategies before, during, and after co-teaching. Ultimately, planning time surfaces as the most important part of the puzzle for successful co-teaching. Sometimes little time is needed for co-teachers to
plan together. For a veteran teacher team, only about 10 minutes per week to plan may be sufficient (Dieker, 2001). Co-teaching may seem scary and overwhelming at first to develop and implement, but in the end co-teachers and students confirm that the collaborative teaching method is more successful than the traditional “pull out” method for meeting the needs of ELL students.

Mapping the Intersections between Language and Content Needs for ELLs Using Teacher Preparation Standards as the Roadmap

**Topic Area.** Teacher Education

**Presentation format.** Paper Session

**Description.** This paper describes a collaborative research project designed to support faculty as they infuse strategies for teaching English Language Learners into STEM methods courses at a large teachers college. In our session, presenters will demonstrate the lesson design process for an elementary education science methods class, and they will lead participants through the process of integrating and teaching standards for language within the content methods classroom.

Abstract

This paper presents findings emerging from a large-scale, grant-funded initiative aimed at better preparing teacher candidates to work with students classified as English Language Learners (ELLs). The purpose of the present study was to document a single-case of the course enhancement process in the undergraduate elementary education teacher preparation program. Leveraging an instructional congruence framework (Lee & Fradd, 1998), the course enhancement process is a collaborative effort between Bilingual Education and Science Education faculty as well as ELL instructional coaches. Together we collected data on the alignment between language development constructs written into national teaching standards (InTASC), national language standards (TESOL), and the syllabi for science methods courses in one of the nation’s largest teacher preparation programs. We then identified opportunities to refine science methods course so that teacher candidates could learn strategies for teaching academic language alongside strategies for teaching content. By using both InTASC and TESOL standards to guide the specific elements that should be included in STEM methods courses, we are a step closer to ensuring that all teachers are prepared to meet the academic and linguistic needs of ELLs. This paper advances scholarship that is inclusive of collaborations across disciplines within a school of education in order remedy deficiencies in teacher preparation toward creating classes of pre-service teachers whose skill set is representative of the students they intend to serve.

Introduction

The Mary Lou Fulton Teachers College (MLFTC) at Arizona State University is one of the largest teacher preparation programs in the country and is the largest preparation program in the state, graduating approximately 1,500 new teachers each year. MLFTC is positioned in a state where ELLs are among those with the lowest achievement outcomes (CDF, 2013; U.S.
Department of Education, 2014). Therefore, MLFTC has the opportunity to address the considerable challenges associated with education for English language learners (ELLs), and, in doing so, to become a model for other teacher preparation programs which are not adequately meeting the needs of ELLs. This population of students comprise a significant portion, an estimated 4.4 million students or 9.2%, of the public school population (U.S. Department of Education, 2015).

In Arizona, students who are identified as ELLs are removed from most content classes for four hours a day during each school day to receive English language instruction. One unfortunate consequence is that ELLs students having restricted access to the general curriculum, including science. Many ELLs do not enter schools in Arizona until their adolescent years and because they are removed from core content instruction, to receive second language instruction, they have limited access to learning rigorous content. Therefore, ELLs in Arizona often struggle to acquire math and science content knowledge due to a lack of access, not necessarily due to their English proficiency. In addition, it is important to address the issues of varying definitions of English proficiency, both in Arizona and across the Nation (Linquanti & Cook, 2013), with proficiency criteria often tied to communication ability rather than the ability to use language for learning. This can create a situation in which teachers create lessons to enable development of content (e.g., science, math) not realizing that these lessons also need to include opportunities for use of academic language.

In an attempt to meet the needs of Arizona’s ELLs, and with the generous support of a recently awarded Teacher Quality Partnership grant from the U.S. Department of Education, MLFTC is seeking to address the academic and linguistic needs of ELLs. The four main goals that MLFTC seeks to meet include the following: (1) reform PreK-8th grade teacher preparation to address the need for highly qualified general and special education teachers for ELLs; (2) redesign math and science methods courses to include instructional strategies that promote language and literacy development; (3) redesign course signature assignments to use problem-
based learning (PBL) pedagogy and design principles supporting teacher candidates’ application of knowledge and skills in “real world” classrooms; and (4) integrating and understanding evidence-based practices and scientifically-validated research for teaching and learning of ELLs, including data-driven decision to improve differentiated instruction.

Our first action step is to provide professional development for faculty to integrate instructional strategies for ELLs into science and math methods courses. In order to do this, we need to understand the contexts in which our faculty work and integrate strategies for ELLs with what they are already required to include in content methods courses. This paper describes the first step toward understanding how to support faculty who teach content methods courses by analyzing various professional teaching standards and understanding how we can leverage the standards to better meet the needs of ELLs in science methods courses.

**Literature Review**

The impetus for standards based, k-12 education reform emerged from a public opinion created by the commissioning the report, *A Nation at Risk* (National Commission on Excellence in Education, 1987), which posited that the underachievement of students in our country was a direct consequence of low societal expectations for performance (McLaughlin and Shepard, 1995). Since that time, standards have evolved for student learning (content knowledge) and student performance (assessment). Coinciding with this movement, The National Board for Professional Teaching Standards (NBPTS) (1987) and the Interstate New Teachers Assessment and Support Consortium (INTASC) (1992) have determined the expectations for the skills and dispositions teachers should demonstrate in order to improve student achievement. The standards based reform movement has not evolved without controversy, as many scholars have argued that the achievement gap is really a misrepresentation of the opportunity gap (Carter and Welner, 2013) caused by the lack of fidelity in the implementation of opportunity to learn standards as initially recommended by the National Academy of Education Panel on Standards-Based
Education Reform (McLaughlin and Shepard, 1995). Likewise, the evolution of national teaching standards has been critically examined by scholars concerned about their theoretical underpinnings, particularly in the representation of the skills and dispositions of teachers of urban schools and of culturally and linguistically diverse learners (Beyerback and Nassoiy, 2004; Carter, ed., 2003; Ladson-Billings and Darling-Hammond, 2000; Moss and Lee, 2010).

The approach of some of these scholars has been to first examine the practices of successful urban teachers  (Ladson-Billings and Darling-Hammond, 2000) in order to determine the validity of the national teaching standards for use across social contexts. Findings revealed that the NBPTS were not representative of the skills of successful urban educators, and that the performance assessments of these standards may not be valid for teachers of color (2000). Low validity may be caused by cultural bias in the “conceptualization of the domains to be assessed” (p. 11), which may affect the certification and retention of teachers of color. On the other hand, Moss and Lee (2010) argue that the NBPTS should not dictate or control teaching practices. In their analysis of the narratives of 62 pre-service teachers, Moss and Lee (2010) found that it was the philosophical difference between pre-service teachers that impacted how they “perceived and enacted educational standards” (p. 40). Those with essentialist and perennialist philosophies placed greater emphasis on basic academic skills (reading, writing and arithmetic) and the role of the teacher in preparing students for tests that measure skills they may lack (2010); whereas, teachers who took up progressive and critical philosophies advocated for student-centered education and placed a greater emphasis on the role of culture in learning. In this way, Moss and Lee argue for an application of standards in ways that allow teachers to “actively participate in the politics of education” (p. 43).
Beyerback and Nassoiy (2004) analyzed, with a critical perspective, the language within the NBPTS (2001a, b and e) for experienced teachers, the National Council for the Accreditation of Teacher Education (NCATE, 1994, 1995 and 2000) for pre-service teachers, and the InTASC standards (1992) for beginning teachers. Their investigation included coding the standards for language that attended to themes of diversity and equity by conducted word counts of terms related to equity. Common terms included diversity of learners, equity, diversity and fairness, and respect for diversity (2004). Ultimately, Beyerback and Nassoiy found that the three sets of standards “skimmed the surface on equity” (p. 34), because although equity and diversity terminology was present, these standards “do little to unpack the meaning of these words or how a teacher would accomplish this” (p. 34). The authors (2004) felt that the NBPTS, while still limited, came the closest to defining the role of the teacher as an activist and a driver of critical pedagogies in the classroom. Overall, none of the standards specifically mentioned racism, sexism, or oppression (2004).

Carter and Larke (in Carter, ed., 2003), also found that equity terminology for diverse learners is generically represented in the InTASC standards. Taking up a multicultural education (MCE) framework, the authors (2003) analyzed the InTASC standards in relation to central tenets of MCE including culturally responsive pedagogy, teacher efficacy and deficit orientations, hegemonic behaviors, and learning styles and constructivism. They also reviewed research on the applicability and instruction on these tenets in teacher preparation. Carter and Larke (2003) concluded that while the InTASC standards “are filled with words that use the language of multicultural education,” (p.67), there need to be more deliberate action on behalf of teacher preparation programs in order to support teachers as they operationalize these standards.
The conversation around the national teacher standards seems to in agreement that they are not specific enough to determine how best to prepare teachers to work with culturally diverse students. While such limitations as a lack of validity for teachers of color, or limited representation or clarity of how to apply equity related principles are cited, little as been documented on the compatibility of these standards for use in preparing teachers to teach students who are classified as English Language Learners. Because English Language Learners are the fastest growing subgroup of students in k-12 public schools today, these standards must be analyzed with this specific population of students in mind.

**Professional Teacher Preparation Standards**

MLFTC requires that all syllabi include both Interstate Teacher Assessment and Support Consortium (InTASC) and the International Society for Technology in Education (ISTE) Standards. Course objectives and course assignments are explicitly aligned with both sets of standards. In addition, every course has to be addressed with one other set of relevant professional standards. For example, for science methods courses, the National Science Teacher Association (NSTA) preservice science standards are addressed in course syllabi. Courses that serve as state endorsement courses for a Bilingual or English as a second language endorsement or for a Structured English Immersion (SEI) endorsement also address the Teaching English to Speakers of Other Languages P-12 professional teaching standards.

**InTASC Standards**

In 2011, the Council of Chief State School Officer’s (CCSSO) Interstate Teacher Assessment and Support Consortium (InTASC) published an updated “set of model core teaching standards that outline what teachers should know and be able to do to ensure every K-12 student reaches the goal of being ready to enter college or the workforce in “today’s world”
There are 10 standards organized into four general categories: the learner and learning, content, instructional practice, and professional responsibility (See Table 1). Each of the 10 standards is further described by indicators in the areas of teacher performance, essential knowledge, and critical dispositions. In their standards framework, InTASC defined a diverse learner as “those who, because of gender, language, cultural background, differing ability levels, disabilities, learning approaches, and/or socioeconomic status may have academic needs that require varied instructional strategies to ensure their learning.” (InTASC, 2011, p.21). InTASC (2011) reports that these learners are represented by the inclusion of a variety standards that call for teachers to possess the requisite knowledge and skills for modifying and adapting lesson plans to meet the needs of many types of learners.

TESOL

Teachers of English to Speakers of Other Languages (TESOL) released P-12 Professional Teaching Standards in 2010 with the intention of better preparing English language teachers. The authors of the TESOL professional standards organized the standards by domain and performance indicators (TESOL, 2010). The standards are comprised of five domains, which include: language, culture, instruction, assessment, and professionalism. Each domain includes performance indicators that further describe the standards.

ISTE

According to the International Society for Technology in Education’s (ISTE) website (http://www.iste.org/standards/iste-standards), educators need to work together to provide students with the skills, knowledge, and approaches that they need in order to be successful in the digital age. ISTE has created various ISTE standards to provide students, educators, and leaders with clear guidelines for learning, teaching, and leading in the digital age. ISTE has created the following standards (a) ISTE Standards for Students; (b) ISTE Standards for Teachers; (c) ISTE Standards for Administrators; (d) ISTE Standards for Coaches; (e) ISTE Standards for Computer Science Educators. Since all syllabi within MLFTC are required to include the ISTE Standards for Teachers (http://www.iste.org/standards/iste-standards/standards-for-teachers), that set of standards was included in this analysis.

The ISTE Standards for Teachers including the following five major headings (a) facilitate and inspire student learning and creativity; (b) design and develop digital age learning
experiences and assessments; (c) model digital age work and learning; (d) promote and model
digital citizenship and responsibility; (e) engage in professional growth and leadership. Within
each of those headings, four specific standards are listed. For each major heading, ISTE
provides a short paragraph describing those sets of standards. For example, under the heading of
Model digital age work and learning, the paragraph reads “Teachers exhibit knowledge, skills,
and work processes representative of an innovative professional in a global and digital society”
(p. 1). For each major heading, five specific standards are listed. Under the Model digital age
work and learning heading, specific standards include demonstrate fluency in technology systems
and the transfer of current knowledge to new technologies and situations and communicate
relevant information and ideas effectively to students, parents, and peers using a variety of
digital age media and formats.

**NSTA**

In 2012, the National Science Teacher Association (NSTA) revised their pre-service
science standards. These standards were developed based on reviews of the literature and to align
with the conceptual framework of the Council for the Accreditation of Educator preparation
(CAEP) (NSTA, 2012). These standards list six major areas: (a) content knowledge, (b) content
pedagogy, (c) learning environments, (d) safety, (e) impact on student learning and (f)
professional knowledge and skills. The major areas are each accompanied by a brief description
followed by two or three sub-headings called elements. Table 2 shows an example of Standard 1,
content knowledge and its supporting elements.
Table 2

</tr>
</thead>
<tbody>
<tr>
<td>Effective teachers of science understand and articulate the knowledge and practices of contemporary science. They interrelate and interpret important concepts, ideas, and applications in their fields of licensure.</td>
</tr>
</tbody>
</table>

Preservice teachers will:
1a) Understand the major concepts, principles, theories, laws, and interrelationships of their fields of licensure and supporting fields as recommended by the National Science Teachers Association.  
1b) Understand the central concepts of the supporting disciplines and the supporting role of science-specific technology.  
1c) Show an understanding of state and national curriculum standards and their impact on the content knowledge necessary for teaching P-12 students.

**Methods**

The present study sought to address the following research questions:

1. How do the InTASC and ISTE standards describe effective teaching for language learners?
2. How do the TESOL standards describe effective content-language teaching?
3. How do the NSTA standards describe effective content-language teaching

This quantitative study involved a collaborative process involving science education faculty, bilingual education faculty, and ELL instructional coaches within MLFTC. The goal was to inform our work as we move forward to infuse effective strategies for ELLs in methods course syllabi.

Bilingual Education and Science Education faculty as well as ELL instructional coaches analyzed InTASC and ISTE standards to identify those that consider language development and teaching diverse learners. Inclusion criteria aligned with the InTASC standards framework, which was updated to be reflective of “not only new understandings of learners and learning but
also by the new imperative that every student can and must achieve to high standards” (InTASC, 2011, p. 3). As a group, we reviewed the new standards framework for descriptors including such terms as diversity, diverse learners, second language acquisition, culture, linguistic, language and culture, make language comprehensible, and/or individual learner. Selected standards were coded for performance, essential knowledge, and the critical dispositions, which are the constructs through which the inTASC standards are categorized. Next we evaluated the standards for ISTE (2008), for Teachers of English to Speakers of Other Language (TESOL, 2010), and for the National Science Teacher Association (NSTA, 2012). These standards were analyzed with a functional linguistic lens to identify which standards could specifically address how to teach language within content classrooms. Finally, the list of standards that met our inclusion criteria were documented in a secure spreadsheet, which was shared with research team. We independently reviewed the standards and ranked them with the dummy variable (0) if they represented the essential knowledge teacher candidates must gain in order for them to teach STEM to language learners. This data was quantified to examine the level of agreement that each of the InTASC, ISTE and TESOL standards was representative of teaching content to language learners. We also then measured consensus on which standards should be included in the methods courses.

**Findings**

Each framework of national standards were analyzed to determine the extent to which they addressed language, content, all learners, diversity, and English Language Learners. Table 3 represents the number of standards that met the inclusion criteria for each set of national standards. Results from the standards review are presented in the following four sections: InTASC, TESOL, NSTA, and ISTE.

</tbody>
</table>

**InTASC.** Of the 174 InTASC Standards, 18 overtly address the needs of English Language Learners. For example, standard 2e focuses on English Language Learners and “supporting their development of English proficiency.” Ten percent of the standards address diverse populations while 21% of the standards focus on “all students.”

**TESOL.** All 56 standards threaded throughout five domains were analyzed. As the purpose for these standards include better preparing teachers to work with English Language Learners, a heavy emphasis on addressing ELLs and language was noted. Seventy-three percent of the standards addressed language while 77% of the TESOL standards addressed ELLs specifically. In The TESOL Guidelines for Developing EFL Professional Teaching Standards,
Kuhlman and Knezevic (2010) posit, “TESOL encourages respect for diversity, multilingualism, multiculturalism, and individual language rights” (p. 3). This is evident as domain two of the standards intentionally addresses diverse populations. Eight of the 56 standards explicitly address content.

**ISTE.** When analyzing the ISTE Standards for Teachers, a total of 20 standards under five headings were examined. Five of the standards met the criteria analyzed. No standards specifically addressed issues of language. Although the first major heading, *Facilitate and inspire student learning and creativity* indicates that teachers should use their knowledge of subject matter, only one standard overtly mentioned content. In addressing issues of meeting the needs of culturally and linguistically diverse and exceptional learners (CLDE) (Table 4), two standards addressed issues of “all students,” two standards addressed diverse populations (Table 4), and no standards specifically addressed ELLs.

**NSTA.** All 18 NSTA pre-service science standards elements were analyzed, as they met the standard for analysis. No standards specifically addressed issues of language, diversity or ELLs. As expected, the NSTA standards have a strong emphasis on content. In fact, seventeen out of eighteen standards specifically address content. Table 3, demonstrates this as standard 1’s focus is on content knowledge and the three elements listed all discuss content in terms of domain knowledge as well as standards. Eight of the standards do address learning of all students, but do not specifically address issues of diversity, exceptional or ELLs. Of these eight standards, six address learning in terms of “all students” while the other two standards address “students” in terms of engagement. For example, “students collect and interpret data” and “Engage students….”

**Discussion**

The findings from this study support preceding research indicating that diverse learners are underrepresented in the InTASC Standards (Beyerback and Nassoiy, 2004; Carter, ed., 2003; Ladson-Billings and Darling-Hammond, 2000; Moss and Lee, 2010). For example, only 12% of the InTASC standards specifically address the needs of diverse populations while 10% focus on addressing English Language Learners. Similarly, 10% of ISTE standards highlight the need to address diverse populations. None of the ISTE or NSTA standards address the needs of ELLs.

Each set of standards generically describe effective teaching for language learners. The findings from this study provide evidence that InTASC, ISTE, and NSTA standards emphasize
addressing the needs of “all students.” For example, 44% of NSTA standards focus on addressing “all students” needs. Carter and Larke (2003) warn, “When issues about equity are raised, they are addressed by including language in the standards that make a commitment to high standards for all learners. The standards however do not call attention to teachers whose sociocultural, linguistic, and economic backgrounds are different from their students, nor do they address the ramifications of these factors” (p. 55).

As expected, data revealed that the TESOL Professional Teaching Standards call attention to the needs of diverse learners with an emphasis on language learners. Over 76% of the TESOL Professional Teaching Standards focus on addressing English Language Learners. However, only 14% of TESOL Standards focused on content. The findings from this research suggest the TESOL standards minimally describe effective content-language teaching.

Carter and Larke (2003) assert, “Teachers cannot teach what they do not know – and how can they know if teacher education programs and evaluators do not know how to evaluate the standards through the lens of multicultural education” (p. 67). In response to this assertion, MLFTC is engaging in a systematic approach for preparing all teachers in today’s culturally and linguistically diverse classrooms. We have begun by mapping the intersections of the various teacher preparation standards used to guide our course design. We will continue by taking explicit and purposeful steps to help teacher educators understand these critical intersections to be able to authentically address both the content and linguistic need of ELLs.

**Implications**

Because our university is situated in a state with a diverse cultural and linguistic landscape, we must carefully select standards that explicitly support faculty as they prepare teachers with the skills they need to be successful with diverse learners. Because the national
teaching standards do not specifically focus on the skills teachers need to teach academic content to students classified as English Language Learners, we may find it prudent to train faculty to use other standards such as those from TESOL. Making connections between the standards for teaching in general, the standards for teaching specific content, and the standards for teaching language, is therefore a key component of our efforts to drive curricular reforms with our teachers college. Faculty must not only understand these connections, but they should be prepared to help teachers make these connections as well.

Abstract.
This work is focused to show the importance of the use of computer simulation on the teaching-learning process for the engineering students. There some courses with technical topics about statics, mechanics and mechatronics that student must take during their formation as engineers in universities; nevertheless these courses includes the solution of some complex problems with numerical methods, the understanding is difficult for the students due to these solutions requires the appropriated used of many mathematical and physical concepts and many times a lot of imagination. Nowadays, some computer simulators have been used to improve the teaching methodologies towards the students. The software used during the course in the present work is ADAMS provided by MSC and PACE which was successfully used to teach the student in the mechanic of solid course. The use of this software improved the students’ performance and motivated their imagination to explore beyond about physical and mechanical concepts.

1. Introduction.

The teaching-learning process for students has been quickly changing since 60s, 70s, 80s and 90s1-3. Then the only way to solve a problem about statics or mechanism was the blackboard in the classroom or to take a pencil and a piece of paper. The only ways to be contact with a mechanical analysis or to analyze the performance of a machine and study any particular was a laboratory, to build a prototype or a practical in the real world; unfortunately these methodologies were also tedious and expensive. The most sophisticated tools were some programmable calculators or basic but very expensive computers with limited capacities. So this was not an available option.
Beginners and enthusiasts developed numerical methods and iterative solutions to solve some mathematical and geometrical problems; then some pioneers tried to incorporate these concepts to their particular problems in many engineering areas such as aeronautics, mechanics, electrics, electronics etc. and created some of the first computer simulators [3-6].

Nowadays, the increment in management and storage data and the improvement in programming and numerical methods have allowed the development of new complex computer software for analysis of many engineering problems. Many friendly facilities and graphical displays have also been included providing environments very easy to use [5-8]. These software can solve complex problems in only a few seconds and draw in the computer screen an animation about the model simulated in a virtual concept.

Technology has brought us to the knowledge and new unexpected forms of studies; in addition, the reduction on the cost of electronic devices and gadgets has become more accessible to everyone [3, 4 &7].

The software used to teach many topics during the mechanics of solids course is ADAMS provided by MSC and PACE which has become in a powerful tool for solving and analysis of tasks due to it has many graphical and visual options for display results, which allow verifying many different cases and changing the variables and conditions [8].

2. Complexity of Mechanical Analysis.

Problems in mechanics are complex due to a great quantity of variables and conditions that must be established; reason why the computer simulators divide the problem analysis according with particular purposes. Some problems involve a static analysis only; nevertheless some others involve a kinematical and dynamical analysis.

In mechanical design a model must be created, this is the first step, the model is the machine or mechanism to be simulated. It must be two mechanical components at least with a relation between them. A mechanical component is an isolated piece. Nevertheless mechanical components are also complex thus every element can be a complex geometry or can be formed with some basic geometrical bodies such as spheres, cubes, extruded areas etc. and Boolean operations such as additions, subtractions, holes etc. which are used to become more complex the original geometries. Furthermore special tools have been developed to create complex components directly such as gears, chains, screws etc.

Files in folders are used to store the information; this information is stored separately using an ordered format to provide the option for modifying every model or every component of a single model. Moreover the physical properties such as the materials used for every component are established using data bases provided in the same software system. So the design process is also easy to use.
The second step is to establish a ration between the mechanical components. Then the user can select which component will remain without motion and which others will generate movement or will be moved. The ratio between two mechanical components or more are chosen from pop up menus and are called joints. These joints are also used to declare the freedom grades of every component. In contrast constraints are used to restrict the movement.

The information generated is a set of sentences which are computationally interpreted to make the rules for the simulation and the animation. In the same way files and folders are used to save the information generated during analysis. This management will allow selecting and modifying the conditions for working in a particular model. All this complex management of files and data needs rules for an efficient work; so the best way to do it has been to employ a navigator which allows to load, modify and save new cases and conditions. So the course involves the solution of some typical problems in blackboard; in one weekly theoretical lesson and two weekly practical lessons solving the same or similar problems using ADAMS.

Many of the examples solved in class were tutorials at the beginning of the course; this means that the environments, bodies, mechanism, and simulation conditions have been established and defined previously and provided in a previous training course. Nevertheless the use of these tutorials aided to save time on these topics; once the students had been understood the basic concepts about the ADAMS they were capable to create their own mechanism and conditions for simulation.

The model shown in figures (1a) and (1b) was created by the students in a test. Here a demolition ball is used to hit a box. The purpose of the exercise is to calculate the force of the hit and the measurement of the box displacement along the surface. Then the arm was built over a platform according with a specific data, the materials are also selected and the mass of the box is declared. Here the arm is formed with 2 rectangular sections one vertical and other horizontal; then a ball carried with another rectangular section is joined but allowing a circle movement, the material of the ball is steel and according with the general assumption the ball will down freely from different angular positions (0º, 15º, 30º, 45º, 60º & 90º) in other words only gravity will influence on the impact between the ball and the box. A condition of contact is also established between the box and the ball to test the hit. In addition a drag force is also declared between the box and the surface of the platform.

After all this, the case is run to obtain the results. Then a group of variables such as the angle over the horizontal arm and the balls material are changed to make a more complex analysis.

Figure (1a) shows the initial position and figure (1b) shows the animation of the box movement and the graphical display of the acceleration, the speed and the displacement as a function of the time.
It seems an easy or basic example without any specific purpose; but here the students can practice and test the influence of some physical forces like inertial, gravity and drag on a dynamic system.

Figure (1) Computer analysis of a demolition ball simulated using ADAMS. a) Stationary initial condition. b) Final condition when the box has been hit.

3. Student opinion about computer simulators.

The following questionnaire was asked to the student to know their opinion about the inclusion of the software simulators during the course; the only two responses allowed were yes or not.

1) Are you agreed with the inclusion of computer simulator during the course?

2) Do you think that computer simulation helped you to understand theoretical concepts and complex math solutions?

3) Do you think that computer simulation will aid you on your professional life in future?

4) The examples, solved using computer simulation were appropriated to the course?
The questionnaire was applied to 30 students divided in 3 groups of 10. The graphics in figure (2) shows the students responses to the questions asked, according with their opinion, they think that the inclusion of computer simulation was a great idea to learn the basic concepts about mechanics and reinforce them; moreover they think that computer simulation is a powerful tool to develop their own projects in the future.

![Answers to questionnaire](image)

Figure (2) Students opinion about the inclusion of computer simulation during the course.

Conclusions.

After the end of the course, the students talked about the importance of the inclusion of new technologies in classroom, they think that is especially important in engineering courses due they will work using and developing these and new technologies; moreover the necessity to include in the formation of young engineers using informatics tools is so evident. Students also feel that these lessons put them in contact with real industrial situations.

Software ADAMS has also wake up the students’ enthusiasm and it was consider as a good tool to reinforce knowledge in theoretical lessons.

Abstract.
This work is focused to show the importance on the developing of software to create computer simulators for planning production. The simulator shown here was developed to reproduce the dynamics and operating of the continuous casting process in steelmakers industries. These industries work in journeys of 24 hours at day and 7 at week without interruption; these industries use the basic metallurgical procedures to produce big bulks of steel. Nevertheless the activities must be organized in order to avoid delays and probable risks or undesirable else unexpected situations must be evaluated to minimize impact. Thus engineers and workers must have an appropriated training. The simulator was successfully tested for reproducing many activities for casting; moreover it was also employed to train all the personal about how take the best decision and re-program activities if necessary.

1. Introduction.

Simulation has become in a very powerful tool to reproduce any industrial situation. Physical simulators were the first to be created; some engineers began to reproduce their own experiments under controlled conditions especially in chemical and mechanical; these enthusiasms built laboratories and devices because they wanted to know the influence of any parameter over their entire systems. Nevertheless the evolution in computer science has allowed developing powerful computer simulators to test almost any laboratory condition; and the applications have also been expanded towards nearly every industrial requirement.

2. Importance of training in Industry.

Some industrial processes such casting process requires of a very sophisticated management of the information. The improvement on management and storage of data
capacities became possible to simulate complex problems with computers. Nowadays computer simulation gives precise and fast answers to complex problems.

Today in many industries the importance of very good trained workers is a priority in order to avoid delays, accidents and risk situations; so the students are teaching and educating their workers [1-3]. The workers are being motivated not only for better salaries, there are convinced, a better professional development is important for them shelf. They know that they must remember basic concepts learned on schools and integrated and find all the relationships with their actual jobs [4-7].

In metallurgical industries, the casting operations must be programmed daily as a function of the bulk required, the selection is done according with the grade of steel required by the customers demand and priority. So many casters go farer programming their production activities weekly or a monthly. Thus the simulator must include appropriated tools for changing the geometrical conditions of the industrial equipments (define the strands on the continuous casting machines and their dimensions); the option to modify the ladle and tundish capacities for every casting operation. The grade of steel can also be input and the dimensions of the billets or slabs to be cast. Moreover the operating conditions such as the casting speed and the opening and closing times are defined for every strand in order to run every particular case.

3. Simulation of events during a virtual simulation.

The simulator described in this work was created by some of the present authors [8-9] to reproduce the continuous casting process of steel. The simulator was created to give the user many options to modify the working environment due to every caster is different. In addition appropriated tools were developed to input the corresponding operating conditions.

The simulator initially was created to reproduce one single casting operation; nevertheless the necessity to simulate an interrupted process was evident to obtain a more realistic approach. Thus facilities to simulate different situations were incorporated to the original simulator.

Nevertheless during the simulation many events can affect the casting process; these events can be simulated such as declared events or random events. The declared events are those previously defined by the user; so the user can establish when will occur; this option can be used to include a programmed event such a maintenance works, that will cause a delay in the original planning and then reprogram the activities or how this delay must be compassed or solved.

If a strand is closed; for any reason like: a breakout, a failure in sensors, a problem with the water supply or the final product quality etc. the production will be delayed because the volume remaining inside the ladle and in the tundish will have to be re-driven towards the working strands. In the other hand the random events can occur at anytime, these events are declared only with a probability to happen during the execution of the simulation main loop. Thus, this option is frequently used to include an unexpected event.
Figure (1) shows the flowchart of the main loop executed for the simulation of the continuous casting process; then the events are included during the simulation; here the main loop is a function of the number of casting operations (nt) and the time of everyone. So a simulation for a particular caster can be run with or without interruptions previously defined.

![Flowchart of the simulation process including multiple casting operation and the execution of some unexpected situations](image)

Figure (2a) shows a graphical display about a casting operation indicating the moment when every billet is cut at the end of the continuous casting machine and then it is counted; moreover the figure (2b) shows a graphic for the volume cast in the ladle; the slope of this curve is the steel remaining in the ladle.

Thus when the procedure is nested in a new loop for any number of casting operation the calculation is repeated. These figures represent some of the formats in which the information can be displayed for an easy understanding; although more tables and graphical displays are available. According with this, it is necessary to include appropriated tools for multiple reading data and save the information for every casting operation. The casting time for every casting operation is stored and then the volume remaining in the ladle is also stored with the information about the time when every billet is produced and in which strand were cut.

Figures (3a) and (3b) show the dynamic simulation of the process simulated. Here it is possible to see, what is happening at every step time during simulation. These facilities help the user with visual and graphical information in order to plan the casting operations according with the programmed productivity and are used to provide the most appropriated training course for engineers and workers.
Figure (2) Report of the casting operation simulated with graphical information about the steel cast and the billet production.

Figure (3) Dynamic simulation of the continuous casting process in the computer screen a) continuous casting machine with 6 strands working. b) continuous casting machine with 4 strands at the end of the casting operation.
The training course was divided in 8 lessons the 4 initial lessons were for the engineers who plans and programs the activities for every casting operation daily. Because the organization is their responsibility; they must understand how to establish conditions for working. The workers were included in the second part of the training course due to they are just in contact with the operative conditions and they must be prepared to solve any expected or unexpected situation that was defined by the engineers.

The following questionnaire was ask to workers and engineers at the end of the course in order to know their opinion about the training; questions 1 to 3 were ask to the engineers and questions 4 to 6 to the workers. They had the option to evaluate the simulator and the course in a scale from 0 to 10; here 0 is the worst and 10 is the best result.

1. Do you consider that the simulator can help you to make a more effective programming and re-programming for the casting requirements?
2. Do you consider that the concept for expected and unexpected situations is appropriated in the simulator?
3. Do you think that the simulator allow to interact with the workers to find better solutions?
4. Do you think that simulators can help you to learn about the industrial process?
5. After the training course; do you think you are better prepared to solve any situation?
6. Do you consider as realistic the environment shown in the simulator?

The answers obtained to these questions were positives and are shown in the figure (4). Nevertheless engineers and workers coincide in the fact that the simulator can be improved including more unusual situations.

![Figure (4) Responses to the questionnaire asked.](image-url)
The simulator for continuous casting process originally oriented to reproduce this process was successfully used as a training tool for workers. It was a good visual tool for training simulating hypothetical and unexpected risk situations in a virtual environment, allowing a deeper evaluation and study.

Conclusions.

The simulator developed is capable to simulate different casters and different operating conditions allowing simulating any particular case.

The simulation of multiple casting operations allows the engineers to plan every casting operation in good agreement with the customer’s orders and minimizing death times and reducing unnecessary works.

The inclusion of probable interruptions helps the engineers to develop their own criterions about how to solve any problem.

The simulator can also be employed to train workers and engineers about some unexpected situations but without a real risk; furthermore the training cost is low.

A better trained worker can have a better control of the equipments.

The Real-Time Tutorial

Ann Agee, MLIS
Silke P. Higgins, MLIS

University Library (Dr. Martin Luther King, Jr. Library)
San Jose State University,
San Jose, California 95192
ABSTRACT

It is common for university libraries to provide students with online tutorials that teach information literacy skills. Equally common is for these tutorials to quickly become out of date as the websites, databases, and library services featured change their formats. At San Jose State University (SJSU), the extensive *InfoPower* information literacy tutorial was created in 2002 and remained unchanged until 2014 when the by then outdated state of the tutorial became a priority due to San Jose State University undergoing the accreditation process by the Western Association of Schools and Colleges Senior College and University Commission (WASC SCUC). To accomplish a comprehensive revision of the tutorial in a timely and efficient manner, it was felt that adapting an extant open-source tutorial to San Jose State University’s needs would be the most efficient solution. This paper details how librarians at SJSU used LibGuides, Guide on the Side, and Qualtrics software to create an information literacy tutorial that can be updated in real time to reflect the rapidly changing online environment of today’s university library.

*Keywords*: higher education, academic libraries, information literacy, online tutorials
INTRODUCTION

As institutions of higher learning move towards online learning and academic research materials are increasingly found in electronic format only, students find themselves in a digital environment that can present a number of issues. While access to and retrieval of research materials has undeniably become more convenient, authors Agee and Higgins’ experience has shown that students have difficulty mastering some fundamental research skills. For example, according to conversations held by Higgins with a number of teaching faculty in her assigned liaison departments over the course of the Spring 2015 semester, instances of plagiarism have risen to an alarming level. Most of the faculty pointed out, however, that the majority of these instances turned out to be the result of students truly not having understood the concept of plagiarism--some because of their having been first-semester international students from school systems with differing rules, some because they thought it permissible to copy and paste as long as the citation was listed at the end of the paper.

These and similar examples bring to the fore the immediate need for students to have access to relevant instruction in information literacy. While many librarians describe the ideal situation to be a for-credit course for information literacy, institutions of higher learning may not want to offer such a course, or the “workload of designing and developing the course can be great in comparison to the number of students taking the course” (Yelinek, Neyer, Bressler, Coffta, & Margolis, 2010, p. 352). According to Bowen (2014), Mokia and Rolen (2012), and Yelinek et al. (2010), making available online information literacy tutorials that have been created with LibGuides software presents a viable alternative. LibGuides, an online content management and web-publishing platform created and maintained by Springshare, has multiple advantages over creating similar content in a web-based environment. Librarians “with no web design experience can master the use of LibGuides fairly quickly because firsthand knowledge of HTML and coding scripts is not required” (Mokia & Rolen, 2012, p. 38). Furthermore, the system combines “Web development tools, such as HTML editing software with wikis, blogs, RSS feeds, Web-based videos, and other social networking tools, into one package designed specifically for librarians with or without Web design expertise (Yelinek, et al., 2010, p. 353). Additionally, LibGuides tracks usage statistics and “automatically detects a user’s mobile browser and easily gives patrons access to research content wherever they may be” (Mokia & Rolen, 2012, p. 38).
Bowen (2014), whose comparative research project revealed that “the LibGuides and Web page platform differences were not a significant factor in student learning” (p. 165), writes that the LibGuides system “has become the primary proprietary platform for guide creation within the library world,” removing many of the previous barriers to placing information literacy online (p. 151).

BACKGROUND

At San Jose State University (SJSU), the InfoPower information literacy tutorial was launched in 2002 for use in lower-division courses. Created using HTML and PHP, InfoPower included modules on choosing the best information sources; effectively searching library databases, and evaluating the information found. On average, the tutorial took students 90 minutes to complete. Although the tutorial was overdue for an update, library staffing, workload issues, and other time constraints prevented the restructuring of the tutorial for more than a decade.

When SJSU became due for reaccreditation in 2014, however, the outdated state of the tutorial became a priority. The Western Association of Schools and Colleges’ Senior College and University Commission (WASC SCUC) requires universities to provide evidence of student mastery of five core competencies: writing, oral communication, quantitative reasoning, critical thinking, and information literacy. Using statistics from InfoPower and Plagiarism, another tutorial widely used on campus, the University Library contributed the majority of the data that demonstrate student competency in information literacy. While the library successfully provided evidence to support this competency during the 2014 reaccreditation process, SJSU librarians felt that, going forward, InfoPower should be updated to provide stronger analytics in this area. It was further felt that the content could be streamlined to reduce the amount of time the tutorial required. Equally important, the revised tutorial needed to be in a format that could be updated more easily to keep pace with the rapidly changing information environment.

METHODOLOGY

To accomplish a comprehensive revision of the 2002 InfoPower tutorial in a timely and efficient manner, it was felt that adapting an extant open-source tutorial to San Jose State University’s needs would be the best-fit solution. In its assessment of information literacy for WASC SCUC,
SJSU used the Association of American Colleges & Universities (AAC&U) Information Literacy VALUE Rubric to measure students’ ability to identify, locate, evaluate, and ethically use information (2010). This rubric is patterned on the Association of College and Research Libraries (ACRL) Information Literacy Competency Standards for Higher Education, and it is these latter standards that established the framework for the original *InfoPower* tutorial (2000).

To be consistent in its measurement of student competency in this area, one of the main criteria in choosing a replacement for *InfoPower* was that the new tutorial be structured using these same standards. Two other criteria used in the selection were the quality of the tutorial content and the ease with which it could be adapted to an existing library content management system.

The resource that best met these three criteria was the University of Notre Dame’s Pot of Gold tutorial, which was designed by Laurie McGowan, Instructional Designer; Tim Jones, UI/Graphic Designer; and Sherri Jones, Head of the User Services Learning and Assessment team for the university’s Hesburgh Libraries. It can be found at https://library.nd.edu/instruction/potofgold/. Like the original SJSU *InfoPower* tutorial, Pot of Gold’s content was based on the ACRL information literacy competency standards and introduced students to each of the necessary research skills using a clear, unintimidating presentation. The page-by-page structure of this tutorial also allowed it to be easily adapted to the LibGuides format.

LibGuides is a popular content management system used by many libraries, and it was chosen as the platform for the revised tutorial because it enables library faculty to work collaboratively and edit the tutorial in real time. The original tutorial, a series of web pages, required the library’s Web Services team to make any changes. LibGuides removes this intermediary step and gives librarians the ability to make changes as soon as a resource or the library website is updated, allowing for the tutorial to consistently be kept up-to-date. An additional benefit of using LibGuides for the tutorial was its responsive design, which integrates well with smartphones, tablets, and laptop computers. Lastly, it was felt that because LibGuides are easily duplicated between libraries, using this platform provided the opportunity to create an open educational resource that could be shared with the larger educational community.
Processes and Tools

Site Map
The first part of the conversion process consisted of creating a sitemap that noted the placement of the individual web pages, animations, and interactive elements within the tutorial. This was done manually by paging through the Pot of Gold tutorial.

LibGuides
After the sitemap was finalized, pages were prepared in the LibGuide so the guide's navigation mirrored that of the Pot of Gold tutorial. After this process was completed, text was copied from the original tutorial, pasted as plain text into the InfoPower LibGuide, and reformatted using the LibGuide's text styles. Photos and graphics were saved to the LibGuides image library, and then pasted into the appropriate pages.

Animations
Mapping the animations became an especially important part of the tutorial adaptation because they had originally been created using Adobe Flash, a file format that many popular browsers are in the process of phasing out. The SJSU library's Web Team used Google's Swiffy tool to convert the majority of these Flash files (.SWFs) into HTML5 code, although a few had to be recreated completely. The conversions were successful, and the resulting animations look and function as well as the originals. In addition to changing the file formats, accessible PDFs describing the content of the animations were created and made available as links at the bottom of pages that included animations. SJSU is committed to making all instructional material accessible, and these additions were made as part of that commitment.

Guide on the Side
The original InfoPower created in 2002 was ahead of its time in incorporating a live database search within the tutorial. To maintain this interactive, real-life element, the new InfoPower includes a Guide on the Side tutorial. Guide on the Side is open source software designed by the University of Arizona Libraries and is freely available online in the GitHub repository. Guide on the Side creates a frame around a web page and allows step-by-step instructions to be entered next to the page, so students can use a database by following instructions placed right beside the
search boxes. Within *InfoPower*, Guide on the Side is used to walk students through a live search of the Academic Search Complete database using the "online dating" topic that is the research theme of the tutorial. Students are led from a keyword search to a subject search and are also introduced to the Boolean operators (AND, OR, and NOT), which can be used to connect search terms. At the end of the Guide on the Side segment, students are linked back into the main *InfoPower* tutorial and continue as before.

**Qualtrics**

A major appeal of the Pot of Gold tutorial was its built-in assessment. Evaluative elements appear throughout the tutorial and provide data on specific aspects of students' research skills, such as recognizing the differences between primary and secondary sources. SJSU has a campus license for Qualtrics survey software, and this was used to recreate the "Test Yourself" and "Check Your Understanding" self-check quizzes. One problem created by using Qualtrics was the software’s built-in advance button, which conflicted with the page-forward feature in LibGuides. The problem was solved within Qualtrics by writing custom CSS code that suppressed its advance option.

In addition to the formative assessments, a "Test for Class Credit" was also created for *InfoPower*. This test collects demographic information, such as student ID, class level, gender, and age, and its 18 randomized questions are designed to provide a summative assessment of students' information literacy skills. Qualtrics also allows students to enter their email addresses and have their test results sent directly to themselves. These can then be forwarded to instructors to provide a record of students’ scores.

**Implementation**

The tutorial was completed in time for the Fall 2015 semester and was well received by faculty. Students also benefitted as the average time required to complete the tutorial dropped from 90 to 50 minutes. Because the original *InfoPower* had been a mainstay of information literacy instruction on campus for more than a decade, a redirect page from the old web address was created to lead users directly to the revised tutorial at http://libguides.sjsu.edu/infopower. By
mid-October 2015, more than 600 students had completed the tutorial with only minor technical problems arising.

CONCLUSION

The tutorial that resulted from this revision process provides a model for librarians, faculty, and administrators interested in creating digital learning objects that can be quickly and easily updated to accurately reflect the current information environment. Although initially conceived of as a quick fix in order to have available continuous data on student performance in the area of information literacy, it has quickly become clear that the tutorial created by Agee and Higgins has the potential to become a longer-term solution.

The ever increasing pace of change in teaching and learning environments, and the continuous push to online learning have made it clear that, going forward, it will be impossible to once again retain the same tutorial unchanged for more than a decade. LibGuides provides a platform that allows for the continuous adaptations required by technological change. Already there is discussion among some of the members of the SJSU library faculty about expanding the tutorial in ways that would allow for its use in place of in-person information literacy sessions.

While this appears counter to what many librarians perceive to be one of the most important aspects of their work--namely the opportunity for in-person contact with students in order to share their knowledge about information literacy--they are seeing a rising demand for instruction in upper-division, research-intensive courses. By moving basic instruction online, students receive the necessary foundational information literacy information and librarians are freed to answer the need for more advanced instruction.

While there may be limitations to the long-term applicability of the tutorial, InfoPower’s latest iteration speaks to the current generation of students who were raised with the Internet and have a do-it-yourself outlook. Digital learning objects such as InfoPower make learning accessible around the clock--important for time-poor undergraduates--and contribute to students’ academic success.

Outline of the Study

Abstract

This study responds to the urgent need of complementing traditionally prevalent cognitive perspectives in school educational environments with approaches that target students’ mental health awareness and development. The study reports results of ongoing evaluation and applied research around the innovative projects targeting mental health capacity building in schools, where schools act as hubs or “entry points” for community collaboration on mental health promotion and prevention. The preliminary results focus on students’ awareness of mental health and wellbeing, perceived control over potential mental health or life issues, integration of mental health promotion and prevention in everyday learning activities and possible associations with student academic achievement. The conference presentation highlights a selection of this broad range of results.

Background

The Mental Health Capacity Building in Schools (MHCB) Initiative featured in this submission addresses a pressing need for developing mental health education and literacy in schools for promotion and prevention purposes. More than two-thirds of young adults living with a mental health problem or illness say their symptoms first appear when they were children (Mental Health Commission of Canada, 2013). Schools are ideal venues for developing positive mental health cultures by educating and engaging students, school staff, families and communities.

For many decades education systems were focused on measuring cognitive components of student educational attainment, and summative standardized tests emerged as important ways of measuring academic outcomes. The 21st century societal and associated education systems are distinguished by increased complexity and dynamism of all their major elements, including intertwined multi-cultural and socio-economic realms, family structures and ever changing domestic and world economies, which consistently confront society and education with evolving demands and challenges. Increased complexity of contemporary education systems compel more comprehensive approaches to balancing and measuring aspects that span beyond traditionally considered cognitive educational components into an intricate domain of “non-cognitive” factors. The latter comprise students’ personal qualities other than cognitive ability (Duckworth & Yeager, 2015), as well as beliefs and attitudes. Besides the pressure to meet challenging education standards in a time when college readiness becomes a norm, students face other daily issues associated with peer pressures, uses of technology and social media, unhealthy relationships (including bullying), struggling with sexual and gender identity, substance abuse, etc. Additionally, increasing proportions of immigrant and minority students may face challenges of cultural and language adjustments, fitting in with their peers, meeting academic requirements and other issues. Consequently, school staff are faced with a demanding task of delving into a broad array of non-academic, non-cognitive realms in order to create school environments that are equitable, safe, inclusive, empathetic and stimulating for diverse student populations.

Research suggests that acquirable personal qualities, such as resilience, self-confidence, self-control and emotional intelligence may be important aspects in learning processes, ability to function and career potentials (Christenson, Reschly & Wylie, 2013; Collaborative for Academic, Social, and Emotional Learning [CASEL], 2003; Nadirova & Burger, 2014; Richardson, 2008; Rutter, 1999;
These concepts are closely associated with the notion of positive mental health – a state of well-being that allows individuals to feel, think and act in ways that enhance their ability to enjoy life and deal with challenges they face (Public Health Agency of Canada [PHAC], 2014). Mental health related attributes of complex school environments increasingly attract the attention of researchers and practitioners, including interdisciplinary mergers of mental health and educational research and practice. Indeed, schools are the places where children and youth spend a large portion of their lives, and hence are milieus where educational, relational and mental health issues naturally intertwine. Applied scholarship plays a key role in connecting communities and practitioners with applied research and evaluation to inform the development of school settings that are responsive to both educational and mental health needs of students.

This study will present preliminary results of the third cycle (2014-2017) of ongoing applied research and evaluation surrounding the Mental Health Capacity Building in Schools (MHCB) Initiative in Alberta, Canada. Schools are perfect venues as hubs for community, family and government collaboration to advance student mental health. The MHCB Initiative is led by Alberta Health Services in partnership with the provincial Ministry of Education. The initiative provides supports required to implement integrated, school-community mental health promotion, prevention and early intervention programs. The projects are locally implemented through partnerships with Alberta Health Services Zones, school districts, families, community agencies and other service providers. The diversity of MHCB approaches and programming are reflective of the needs and resources of a broad range of communities, including engagement of traditionally under-served populations. Therefore, the associated experiences and practices transcend the scope of a single initiative and may be of value to a broad audience.

The important feature of the MHCB Initiative is extending beyond a 10 month school cycle by offering year-round diversified programs for children and youth. The MHCB programs are critical in creating a clinical pathway and/or entry point into a larger community-based integrated care continuum as mental health needs evolve and change over time throughout a child’s developmental journey. The envisaged developmental and experiential mental health care model progresses with a child through his or her life journey, challenges and struggles, promoting protective factors (e.g., resilience, coping and social supports) and also access to more intensive supports and services as required. The MHCB Initiative strives to create a transformational change by spawning the learning and developmental process that children and adults (i.e., school staff, families and community members) go through together to create healthy environments, tackle stigma and taboo areas, and create safe space to discuss mental health issues.

The MHCB is an emerging endeavor, which started with only five pilot projects in 2006. By the end of 2014-15 school year the 37 MHCB projects served 70 communities and encompassed 189 schools from 35 public, Catholic and Francophone urban and rural school districts and also a small number of charter and private schools. An important feature of the projects is the focus on an overarching proactive (“universal”) preventive approach to mental health programming, which targets all K-12 students in participating schools along with offering options and resources if issues arise.

Each project has dedicated staff, including a project coordinator, success/wellness coaches and other personnel who work directly with students, teachers, families and community partners. The programming for students include activities and learnings to become literate in mental health and
wellbeing, overcome mental health stigma, become comfortable with mental health issues, develop resilience and attain self-helping skills to address mental health or life issues or seek appropriate external resources. The MHCB staff also delivers professional learning and presentations to teachers and other school staff, as well as learning activities to families and community members. Many MHCB projects have a growing number of satellite (non-project) schools, which receive consultation and information from the projects and model their approaches.

**Objectives of the Study**

The purpose of this study is to examine various aspects of mental health capacity building in schools using the recently collected comprehensive survey data from large samples of grade 1 to 12 students and teachers. The specific objectives include:

1. examining variations in the important intended outcomes, such as reduced mental health stigma in students and perceived ability to tackle potential mental health or life issues depending on students’ engagement in the projects and maturity (length) of MHCB projects in the schools;
2. examining the gender and grade-based patterns in students’ responses to the MHCB surveys;
3. examining the degree of integration of the MHCB projects in everyday education practices as perceived by students and teachers;
4. discussing mental health capacity building practices applied in schools and communities;
5. analyzing possible associations with student academic outcomes.

**Data**

The data sources for the study incorporate comprehensive survey data from over 10,000 grade 1 to 12 students and over 800 teachers from the MHCB schools, as well as the publicly available school-based achievement data for the MHCB schools and comparison schools.

The student survey data were collected via online and paper-and-pencil surveys during spring – summer 2015. Student sampling accounted for the size of student population in each of the MHCB schools. All teachers from the MHCB schools were asked to complete an online survey.

Student achievement data were publicly available at a school level for the recent five school years (2009/10 – 2013/14) and incorporated the results of large-scale standardized tests in grades 3, 6, 9 and 12 (diploma exams). Achievement data were available for the MHCB schools as well as for a carefully selected set of comparison schools. The comparison schools were selected from the pool of schools from the MHCB school districts that were neither MHCB project schools nor satellite schools, or from the adjacent comparable school districts which did not have MHCB projects. The geography, grade composition and school size (student population) were accounted for during the selection of comparison schools.
Data Analyses and Insights

The proposed data analyses for detecting possible effects of the MHCB projects include multiple regression and/or repeated-measures analysis. In addition, the results of t-test and ANOVA will be used to compare student survey outcomes according to gender and grade as well as compare the results across the “older” MHCB schools, with more mature projects, and the “newer” ones, which joined the initiative at later points.

The data analyses will explore the following points:

- **Mental health stigma and comfort level with mental health issues**: Students who report relatively high engagement in the MHCB projects (i.e., seek opportunities to make their contribution) and students from more mature MHCB schools are hypothesized to exhibit less mental health stigma and be more comfortable with discussing mental health issues (including their own mental health) compared to their less engaged counterparts as well as students from the schools which only recently joined the MHCB projects.

- **Gender and grade-based patterns**: Various student responses to the survey will be examined by gender and grade, including relevance of the programming to students in lower and higher grades.

- **Integration of the MHCB projects in everyday education practices**: As the MHCB projects mature, higher proportions of teachers are expected to incorporate (formally and informally) mental health related practices in their everyday teaching and other activities with students. Also, in more mature projects students and teachers are expected to perceive themselves as active partners in mental health capacity building planning and implementation in their schools. Teachers’ and students’ feedback will be examined to confirm these propositions, as well as the accounts of specific associated practices.

- **Association with student academic achievement**: Based on previous research, student mental health and emotional state are hypothesized to be associated with academic achievement. The dynamics in student academic achievement will be compared across the MHCB project schools and comparison schools.

Significance of the Study

The MHCB projects informing this study respond to the urgent need of incorporating perspectives other than cognitive traits into the educational process by helping students, educators, families and communities build school cultures which are supportive of student mental health. A mental health promotion and prevention perspective is an important factor in changing the social and cultural context of education through developing relationships and caring environments to ensure better academic and social outcomes for all students. The MHCB projects offer specific avenues for operationalization of mental health education, promotion and prevention in school environments and building foundations for broader family and community engagement in schools.

Since the MHCB projects involve a wide array of schools with student populations from various cultural and socio-economic backgrounds and span across a broad geography and contexts (from schools in large urban centers to very small rural schools), the associated approaches and applied
research could be of value to many other schools, school districts, governments and health authorities or agencies.

Linguistic Attitudes towards the Use of Hawai‘i Creole (Pidgin): Findings from a Questionnaire

Hawai‘i Creole (locally known and hereafter referred to as Pidgin) is an English-lexifier language spoken in the state of Hawai‘i. In spite of its large number of speakers (an estimated 600,000 speakers) and its important role as an identity marker for locally born residents in Hawai‘i, it has been mostly used only in private domains, i.e., among family members and with friends within the local communities one belongs to.

In public domains, it is often believed that there is a negative role that Pidgin plays especially in educational and employment opportunities. There was even a time when the use of Pidgin was banned at any level of education. One of the reasons for the concerns that using vernacular languages in general in education will be detrimental to students is language interference. It is sometimes believed that introducing vernacular languages interferes with learning standard English.

Researchers have concluded that concerns about the interference are not justified, and have argued that certain methods of introducing vernacular language variety in education are effective. In the case of Hawai‘i, Siegel (2008) says two types of educational programs are effective: accommodation programs and awareness programs.

How do speakers of Pidgin think about the appropriateness of Pidgin used in different settings? The objective of this paper is to explore the linguistic attitudes towards Pidgin by its speakers based on the questionnaire conducted in Hawai‘i in 2007 (N=30). In the questionnaire, young people living in Hawai‘i were asked about how they feel about the use of Pidgin in different domains and settings as well as what they think about the use of Pidgin at school by teachers. Analyses reveal mixed feelings towards Pidgin use in public domains. (280 words)

6. Abstract

Abstract

This teaching plan is for Taiwanese first-graders in senior high school. It aims to help them (1) better understand how to compose a well-organized paragraph, (2) get familiarized with picture description, one of the most frequent genre in college entrance exam, (3) promote their metacognitive skills, enabling them to monitor their own learning process and (4) prepare them to write a composition in their second year. The design is based on two language aspects: paragraph structure and cohesion. There are totally fourteen weekly lessons, which are divided into six stages.

Stage one is intended introduce paragraph structure to students. First, the teacher will lead students to do a warm-up exercise which tap into their knowledge about sentence and paragraph. By doing so, teacher can detect whether there is any misconception or not and try to anchor new information (paragraph) to their prior knowledge (sentence). Then, the teacher will distribute a reading material containing two paragraphs. For the first paragraph, the teacher will guide them to analyze and draw a basic structure of paragraph, providing main function of each part (①introduction: topic sentence, ②body: supporting sentences and ③conclusion: concluding sentence). For the other paragraph, students do analysis on their own.
Later on, the whole class discuss together.

The second stage is like a preparation stage; the focus is teaching students two general organizing strategies: brainstorming and concept map. The teacher will give students three pictures. (Picture A, B and C) For picture A, the teacher will demonstrate first by (1) eliciting students’ ideas related to this picture, (2) writing those ideas down on the blackboard (3) classifying ideas and (4) organizing a concept map: determine the broad concepts, sub-topics and more specific ones, (5) drawing a concept map: use arrows and lines to connect ideas and illustrate relation. For other two pictures, students work as a group (4~5 people) to brainstorm and draw the concept map for each picture.

In stage three, students are going to start writing. The main focus is to teach them how to write appropriate topic sentences. Teacher will first instruct on the function of topic sentence and its relation to supporting sentences and then students do task 1 and 2, which aim to test their understanding.

In stage four, students learn (1) what is HT (hyper theme), MT (macro theme), T and (theme) R (rheme) and (2) what are three common types of thematic progression patterns. It is expected that students can use theme/rheme analysis to examine cohesion of their own writing and gain a clearer picture of text structure. For task 3, students write topic sentences for picture A, B and C.

In stage five, the teacher will give a new picture for students to compose a paragraph of picture description. After their first draft, the teacher will assign pairs for them to do peer-review. Review and revising strategy: theme/rheme analysis is offered to give students some direction for achieving cohesion. Students revise their 1st draft and write their 2nd draft. Their 2nd drafts are collected and commented by the teacher and then students revise again to write their 3rd draft.
The last stage is reflection. Students fill out the feedback worksheet which encourages them to self-evaluate and reflect on their learning process.

The teaching plan is well informed by theories of language learning and systemic functional linguistics. It is hoped that it could provide some insight and a practical new approach to writing instruction.

January 2016
Overview

This paper demonstrates continual use of culturally responsive literature as curricula (K-5) to increase knowledge about “more than a handful” of individuals from diverse populations who used ingenuity to conquer adversity, achieve milestones, and thrive. Strategies are also designed to foster ingenuity among students via multiple intelligences. Plus, professional resources and a comprehensive bibliography with aligned themes is disseminated to eradicate diversity, equity, and inclusion as an afterthought, a fleeting thought, and a superficial thought.

Unveiling the Disconnect: A Lot of Rhetoric, Very Little Practice

Mirror mirror on the wall, who’s the fairest of them all? When issues of diversity and multicultural education arise, across the nation educators and child and family professionals can “talk” very soundly about the importance of culturally responsive practices. However, transitioning the theory into practice can be quite different. A functional assessment was conducted about culturally responsive literature that entailed in-service and pre-service educators to identify two children’s books featuring African-, Asian-, European-, Latino-, and Native Americans, along with multiracial individuals respectively as the main characters. The results showed that the majority of the participants were only able to identify two books for just one group, European Americans (Brinson, 2012). Note: The study has been informally replicated on numerous occasions, and the results were similar-Most participants were only able to identify books featuring European American characters. In the school world of young children from diverse populations what are the implications? If educators cannot identify culturally specific- and multicultural books, realistically there is not an adequate supply included in scholastic programs. Also, the lack of identification strongly indicates the lack of integrating culturally responsive books that are needed to reflect all students in curriculum and instruction. As a result, there seems to be a comprehensive need for professional development in the area of culturally responsive literature children’s literature for preservice- and inservice educators. Consider the startling facts:

Participants were only asked to identify two books featuring African American-, Asian American-, European American-, Latino American-, and Native American-, as well as Multiracial characters respectively. Just two books, and even still, with the exception of European American characters most of them could not. Even more alarming, barring the identification of books with African American characters, the majority of the participants could not identify any other culturally specific- or multiracial books.

“Multiculturalism is, in most instances, being presented as mere “parsley on the plate,” in the words of Joy Degruy-Leary-which is to say, something that feels thrown together as an afterthought. And as with that sprig of parsley next to your meal at the restaurant, mainstream multicultural efforts are there for one of two reasons: either prettiness, or for cover-up. Either way, neither the parsley nor the material about folks of color is understood to be all that important, whether to the meal or the classroom content. When it comes to the way nonwhite folks and cultures are presented and discussed in class, the typical arrangement tends to reduce them to “food, fabric, and festival. By learning what exoticized “others” wear, eat, and how they celebrate, hardly alters the fundamental dynamics at work in the schools-dynamics that continue to favor the dominant group by making that group’s story the center piece of everything that one studies, and everything about which one is supposed to know, in order to be deemed educated.” (Wise, 2008, pp. 19-20)

The Cooperative Children's Book Center (2015) reported that approximately 5,000 children's books were published in 2014. However, all of the children’s books about ethnic groups of color combined only amounted to 396 books (African American-180, Asian American-112, Latino American-66, and Native American-38). Furthermore, the total number of books about ethnic groups of color that were written by individuals of color amounted to 292 (African American-84, Asian American-56, Latino American-59, and Native American-20). The right book can help a child see the importance of his or her culture and its literacy (Brewer, 2001). Books can aid in the development of children's social and emotional capacities as related to self and others (Anderson, 2012).

As childhood educators obtain information about culturally responsive literature a “train-the-trainers” model should be practiced to pass it on to colleagues for on-going use in curricula to help engage all children. The use of multicultural literature enhances student self-esteem, involvement and engagement, and academic performance in literacy (Spears-Bunton, 1992; Willis & Johnson, 2000).
Educators should also share high quality, multicultural literature with parents to encourage reading activities for children in their home settings. Teachers who recommend outstanding books to families model respect for the culture and provide a high standard of book selection for families to adopt (Lilly & Green, 2004).

**Integrating Culturally Responsive Literature into Curricula**

What do slippers, timbales, trails, and wheels have in common? Each of these items was used ingenuously by World Changers like Misty Copeland, Tito Puente, Sacagawea, and Soichiro Honda. Namely, Misty Copeland is a captivating dancer who entered the ballet world at 13 years of age and arabesqued on to make history a few years later as only the second African American soloist at the American Ballet Theatre. After which, Misty pirouetted into history again when she became the first African American female woman named the Principal Dancer at the American Ballet Theatre. Tito Puente was crowned "King of the Mambo;" and, he directed his own Big band, “Tito Puente Orchestra” at the center of the Latin Jazz Explosion. Sacagawea was a fearless Native American woman from the Lemhi Shoshone tribe; she accompanied the Lewis and Clark Expedition as an interpreter and guide during their exploration of the Western United States; and, Sacagawea’s face appears on the United States dollar coin (aka the golden dollar). Plus, Soichiro Honda was a trailblazing entrepreneur whose dream of cars as a child in Japan inspired him to invent the motorized bicycle, and then manufacture cars as his Honda Corporation grew into a global industry.

The primary objective of this paper is to demonstrate the power of culturally responsive literature as curriculum to spark ingenuity (cleverness, resourcefulness, creativity) among students (K-5) that include effective problem-solving and multiple intelligences (e.g., visual-spatial, musical, and bodily kinesthetic) to tap into the strengths, talents, aptitudes, and interests of students. Equally important, strategies depict avenues to integrate a ‘fair-minded amount’ of culturally responsive literature into curricula across content areas; maximize the use of culturally responsive literature on a ‘continual basis’; and, utilize culturally responsive literature in a ‘meaningful manner,’ to help eradicate diversity, equity, and inclusion as an afterthought, a fleeting thought, and a superficial thought.

Research on culturally relevant and responsible instruction indicates that knowledge of students' family, community, and socioethnic cultures-their languages, literacy practices, and values can help address the interests and build on the skills of students (Abt-Perkins & Rosen, 2000). Anderson (2012) noted that people have always told stories; it is the oldest form of remembering. Long before written language was developed, people told stories to preserve the history, traditions, desires, and taboos of their social groups. Each generation told their stores to the next, which in turn told stories to the youth of the generation that followed them. Children are constantly growing and developing and each new stage brings changes in the way they move, think, socialize, and behave (Lilly & Green, 2004). Reading enhances children's ability to flourish academically, socially, and emotionally (Brinson, 2002).

Culturally responsive literature can be utilized to enrich multiple areas of education like art education, indigenous education, mathematics education, music education, science education, social studies education, and special education. Integrating books about multiple cultures into curricula can heighten all students' understanding about individuals from diverse populations. It also prepares children for a future which embraces and celebrates diversity so they will be able to interact successfully in our global society (Gutierrez, 1993). For example, *Firebird: Ballerina Misty Copeland Shows a Young Girl How to Dance like the Firebird* by Misty Copeland, *Honda: The Boy Who Dreamed of Cars* by Mark Weston, and *Sonia Sotomayor: A Judge Grows in the Bronx* by Jonah Winter are examples of enthralling books that inspire students to dream and live in the beauty of the moment.

**The When’s, How’s, and Why’s of Culturally Responsive Literature as Curricula**

**Music Education (Curricula Example): Sparking Ingenuity by Tapping into Multiple Intelligences, Talents, and Interests**

Howard Gardner’s Theory of Multiple Intelligences (1983) proposes there are at least eight different intelligences to account for a broader range of human potential in children and adults (meaning there are a variety of avenues that people demonstrate intelligence). Multiple Intelligences include Verbal-Linguistic (word smart), Logical-Mathematical (numbers/reasoning smart), Visual-Spatial (picture smart), Bodily Kinesthetic (body smart), Musical (music smart), Interpersonal (people smart), Intrapersonal (self smart), and Naturalist (nature smart). Note: Another intelligence that may be formally recognized in the future is Existentialist (Why?-wondering smart). As a result, children learn in different ways, they demonstrate intelligence in different ways, and they possess individualized strengths, talents, aptitudes, and interests.
Culturally responsive literature can be used to profile multifaceted avenues of talents, interests, and abilities to be tapped into for amazing accomplishments. Case in point, intriguing books like *Tito Puente, Mambo King/Rey del Mambo King of the Mambo* by Monica Brown, celebrates positive attributes that make us unique, while profiling the remarkable results of Tito’s musical intelligence. “I’ve got the music in me!” Readers will feel the rhythm of this bilingual story because Tito Puente was making music on anything handy like spoons, pots, and table tops before he could walk. After serving in the United States Navy and attending the Julliard School of Music, Tito’s amazing talent exploded into a musical extravaganza of singing, dancing, composing music, playing multiple instruments, and ultimately directing his own big band (the Tito Puente Orchestra). Tito traveled the world and became loved far and wide for his signature brand of Mambo Music, often played with the bongos, the congas, and the timbales (three of Tito’s favorite instruments). During his remarkable career Tito Puente recorded over 100 albums and won 5 Grammy Awards for his music, but undeniably the biggest reward of all is universal, because the music and passion of Tito Puente is forever imbedded in the heart of society.

**Tito Puente, Mambo King/Rey del Mambo King of the Mambo** by Monica Brown is an excellent book that can be integrated into music curriculum. It is an uplifting, bilingual, picture book that can be also as a resource to help teachers meet the reading needs of students who learn in different ways. For example, the book can be used as a read-aloud for students who are auditory learners. Moreover, due to the bilingual text, the book can be used to facilitate language skills and improve reading comprehension of students who speak English as a second, third, or fourth language. Besides, the book can be used to counter alliteracy (being able to read but being uninterested in doing so) among students. Namely, due to the high-interest content and highly animated illustrations, the book can be used to motivate students to read, and to want to read more often. Hence, this book can be used in early grades like kindergarten and first grade to integrate reading and music into assignments that actively engage students in the learning process. To illustrate, the first time the book is introduced, read it aloud to the class. To immediately engage students in the story, take time to discuss the book cover (e.g., ask students what the book is about based on the title and let students share their favorite aspects about the illustrations). While reading the book, continue to engage students in the story (e.g., pause often to define concepts, assess students’ comprehension, pose questions, encourage student remarks, and let students make predictions). When students are familiar with the book, showcase some of the musical instruments featured in the story (it is okay to include other instruments available from music centers). Be sure to give students plenty of time to learn about the instruments through hands-on explorations and discoveries. Once the students are comfortable with the book and the instruments it is time for another read-aloud. More importantly, this read-aloud will be a student-led, melodic version (e.g., while some students are taking turns reading from the book other students can play up the passages musically).

**Student Projects:** This book can also be used in upper level elementary grades (e.g., third to fifth) to integrate reading, writing, and music into student-led projects. Foremost, after the book is read, let students work together in small groups to research different concepts introduced in the book like Mambo Music and its origin. The talents of students can also be enriched by giving them opportunities to collaborate with peers on shared interests such as composing songs, writing musical scores, and choreographing dance routines, resulting in the most rewarding experiences of all-dancing, singing, and playing to the music they create. Additionally, *Tito Puente Mambo King/Rey del Mambo* by Monica Brown, along with other children’s books featuring musical themes can be used to build home-, school-, and community libraries.

**Social Studies Standards-Based Instruction (Curricula Example): Utilizing Books as a Bridge over Troubled Waters**

How can we halt the miseducation of ALL students and ensure white history, otherwise known as “history” is not the only history taught in school? How can we counter civil and social issues like institutionalized “isms,” teacher habitudes, implicit bias, and generational oppression? Facilitating lessons through students’ cultures is important to nurture equality, justice, and unity. Children who are fortunate enough to be exposed to engaging stories cherish and remember them, even through adulthood. Often they model main characters or act out central themes (Brinson, 1997). Walters noted the importance of opportunities for people to have lasting experiences with literature that provide windows to view others. Equally important are opportunities for people to have lasting experiences with literature that provides mirrors to see reflections of themselves and their loved ones (2002). Bishop (1992) provides a compelling rationale for these points. If literature is a mirror that reflects human life, then all children who read or are read to need to see themselves reflected as part of humanity. If they are not, or if their reflections are distorted, there is the danger that they will absorb negative messages about themselves and people like them. Those who see only themselves or who are exposed to misrepresentations are miseducated into a false sense of superiority, and the harm is doubled.
Culturally responsive books can be used to pass on the rich legacy of reading while abolishing the structure of racism, sexism, classism, and other discriminating practices with students. The books can also foster holistic benefits for students' cognitive-, social-, emotional- and moral development. Moreover, the books can facilitate anti-bias practices because all children need to see their reflections in stories via positive role models, which tends to increase their self-esteem and pride in their heritage (e.g., *Rhythm Ride: A Road Trip through the Motown Sound* by Andrea Davis Pinkney, *Sacagawea* by Liselotte Erdrich, and *The Girl who could Dance in Outer Space: An Inspiration Tale about Mae Jemison* by Maya Cointreau). Stories play an important role in many cultures, weaving words into lessons or daily life (Lilly & Green, 2004). Likewise, vicarious experiences and ensuing emotional involvement with characters of color in well written books have the potential to correct misconceptions about people who are different from the reader. This may also help children avoid developing prejudiced attitudes (Anderson, 2012).

Books model coping strategies for children learning to deal with powerful emotions. Literature also provides information and helps address questions (Jalonga, 2004). Reading books about civil-, social-, and civic issues (e.g., *Child of the Civil Rights Movement* by Paula Young Shelton, *Dia's Story Cloth: The Hmong People's Journey of Freedom* by Dia Cha, *Separate is Never Equal: Sylvia Mendez and Her Family's Fight for Desegregation* by Duncan Tonatiuh, and *The Amazing Age of John Roy Lynch* by Chris Barton) can heighten students' awareness about the experiences of individuals striving for civil rights, equality, and social justice. Although these books illustrate struggles of inequality, they offer methods of past resolutions, and blue prints to overcome possible struggles in the future. When teachers help children interpret stories like these, children become aware of the problems and complexities of issues like inequality (Cowhey, 2006). Through literature, children can perceive how others have encountered and resolved problems that cause sadness, stress, fear, and uncertainty. More importantly, children learn how to use conflict resolution strategies to deal with these problems (Tu, 1999). Exposure to historical accounts also lead readers to discover major contributions of individuals from diverse groups.

Books featuring social reality themes (e.g., *Gordon Parks: How the Photographer Captured Black and White America* by Carole Boston Weatherford, *Only the Mountains do not Move: A Maasai Story of Culture and Conservation* by Jan Reynolds, and *Passage to Freedom: The Sugihara Story* by Ken Mochizuki) can also help children understand the importance of global civil rights and good citizenship. Quality literature takes children beyond their own lives, broadens their experiences, nurtures their imaginations, and helps them develop understanding and respect for others (Hancock, 2000). Plus, compelling books like *All is Different Now: Juneteenth, the First Day of Freedom* by Angela Johnson, can strengthen common bonds that join us together. Seemingly it was just another hot June day full of routine labor. The sun rose as we got dressed, ate, and headed to the fields on the plantation. Hour after hour after hour young, old, and in-between worked hard and steady under the glare of the hot Texas sun. Bending, rising, plopping; bending, rising, plopping; bending, rising, plopping in sync with the usual routine while picking cotton. Suddenly an electrifying buzz of whispers, shrieks, single words, and shouts of glee spread from the port to town, through the countryside, and into the fields, zigzagging the lines in jubilant defiance of the routine. Read from a balcony by a Union general on a seemingly ordinary day, the most extraordinary message: All would be different now. F-R-E-E-D-O-M. As my aunts, uncles, and cousins, and my brothers and sisters, Papa, Mama, and I gathered, more folks joined us, to celebrate, as free people. F-R-E-E-D-O-M.

Planning strategies are on-going to ensure that teachers are sensitive to the need to engage in standards-based teaching. Teacher training should lead to mastery of course content and techniques to teach it meaningfully, with special attention to material in content standards, and include strategies tailored to diverse student populations and students with different learning styles (Spring, 2013). To illustrate, in social studies consider the Thematically Based Curriculum Standard X: Civic Ideals and Practices. Studying civic ideas and practices prepares learners for full participation in society and is the main purpose of social studies. Examining civic ideas and practices across time and in diverse societies helps learners bridge gaps between present practices and the ideals upon which our democracy was founded (National Council for the Social Studies, 2015).

*All is Different Now: Juneteenth, the First Day of Freedom* by Angela Johnson is an effective book for use with Social Studies because it is an informative story of historical fiction that is enriched with spirited illustrations. Likewise, it illuminates a crucial time in American History through a child-friendly perspective; and, it can easily be integrated into the curriculum. Besides, it is well written, includes accurate information; and, portrays characters and settings in a realistic manner. Also, the book introduces readers to a variety of concepts that include family ties, kinship connections, history, slavery, victory, and freedom. As a result, this book can be used to address Social Studies Standards via activities to inform students about the end of American slavery in an amiable manner. Told through the eyes of a child on a plantation, the reality of oppression, hard work, and eventual victory are relayed to readers through a moving, but non-threatening picture book. For instance, it is an excellent resource for read-aloud group activities that can pique students’ interest, stimulate their curiosity, and answer their previously-generated questions while actively engaging them in the learning process. Moreover, the book can be integrated into social studies to help students transition theory into practice.
American Award
Asian Pacific Indian Youth Literature Award recognizes the best writing and illustrations by and about American Indians. Notable literary awards like the following can aide in the selection of high-quality, culturally responsive children’s books.

Guiding Tools children in a gale of positive energy, amiable perspectives, and good-humor (Brinson, 2009). children can facilitate the advancement of thought-provoking competencies, endeavors, and achievements. Literature can also uplift learning and subsequently satisfy inquiries via active engagement. Literature that taps into the intelligences, strengths, and interests of and publishers of high quality fictional and biographical children-, intermediate-, and young adult books that appropriately depict understanding and appreciation of the cultures of all people.

American Award recognizes an outstanding book written by an individual of Asian or Pacific Islander descent. Carter G. Woodson Award recognizes authors of outstanding books germane to social studies that treat topics related to ethnic groups of color with sensitivity and accuracy. Coretta Scott King Award recognizes African American authors and/or illustrator whose books promote an understanding and appreciation of the cultures of all people. Dolly Gray Children’s Literature Award recognizes authors, illustrators, and publishers of high quality fictional and biographical children-, intermediate-, and young adult books that appropriately depict individuals with developmental disabilities. John Steptoe Award for New Talent is given to African American authors and illustrators whose books affirm new talent and offer visibility in writing or illustration at the beginning of their careers. National Jewish Book Award recognizes distinguished children’s books that authentically and sensitively express Jewish thought and experiences. Outstanding International Books recognize stellar books originally published in countries other than the United States and published then published here. Pura Pelpre Award recognizes authors and illustrators of Hispanic heritage who best portray, affirm, and celebrate the Latino cultural experience in an outstanding work of children’s literature.

Student Projects: Practitioners can also incorporate this book into their curriculum via multifaceted, student-oriented strategies. For example, provide students with ample opportunities to process the key terms featured in the lexicon (e.g., abolish, amendment, and Civil War). Likewise, apprise students of the interactive, online sources (e.g., juneteenth.com) noted in the book. Foremost, these resources can greatly increase their understanding about freedom. Also, a sound understanding of key terms and related events can aid readers’ transformation back into history and heighten their mastery of learning. Furthermore, establish a safe, nurturing environment and facilitate on-going opportunities for students to engage in courageous conversations that might include them posing uncomfortable questions. Nevertheless, once answered in a candid manner, they can move forward with their own analyses and resolutions about the issues being addressed. Moreover, provide students on-going opportunities to investigate the timeline of important dates and events (e.g., Emancipation Proclamation) to help them gain a deeper understanding of the complexity of issues related to freedom. Equally important, a comprehensive description of Juneteenth is outlined through both historical and contemporary practices to provide students insight into the progress made over time, along with the importance of maintaining the celebration of freedom in today’s society. As a result, students may be inspired to work cooperatively in groups to develop home-, school-, and community celebrations about Juneteenth (June 19, 1865) that are meaningful to them; thereby connecting social studies learning to additional aspects of their lives via proactive demonstrations. However, in addition to one time celebrations, be committed to providing students with on-going opportunities to engage in a variety of culturally responsive practices designed to benefit everyone equally via anti-bias applications, such as promoting multiple perspectives by letting them share their own perspectives, while respecting the viewpoints of others.

Beyond 28 Days of Fleeting Use: Culturally Responsive Literature Recollected, Present and Accounted for

The history of racial and cultural bias in the United States continues to influence the dynamics in many schools. Most schools in the United States influence their students’ perceptions of who is entitled and who have special privileges in our society through curricula and instructional practices. Thus, when curriculum and instruction in a school focuses primarily on one cultural group to the exclusion of others represented in the student or national population, there can be a harmful impact of the educational outcomes of students whose groups are left out. It is a common condition in many school communities regardless of their demographic makeup. (Browne, 2012). Students not seeing themselves reflected in the curriculum may impact their effort, motivation, and on-task behaviors, which can negatively impact educational outcomes, especially in the absence of other support systems being in place (Noguera, 2008).

Accordingly, multicultural literature is designed to give all children a SIP: Strong Self-worth, Information/Inspiration, and Pleasure (Brinson, 2002). Foremost, children need to be immersed in a variety of literature experiences that make them feel good about themselves in every aspect of their development. Literature provides a wealth of information that can stimulate a lifelong thirst for learning and subsequently satisfy inquiries via active engagement. Literature that taps into the intelligences, strengths, and interests of children can facilitate the advancement of thought-provoking competencies, endeavors, and achievements. Literature can also uplift children in a gale of positive energy, amiable perspectives, and good-humor (Brinson, 2009).

Guiding Tools

Notable literary awards like the following can aide in the selection of high-quality, culturally responsive children’s books. American Indian Youth Literature Award recognizes the best writing and illustrations by and about American Indians. Asian Pacific American Award recognizes an outstanding book written by an individual of Asian or Pacific Islander descent. Carter G. Woodson Award recognizes authors of outstanding books germane to social studies that treat topics related to ethnic groups of color with sensitivity and accuracy. Coretta Scott King Award recognizes African American authors and/or illustrator whose books promote an understanding and appreciation of the cultures of all people. Dolly Gray Children’s Literature Award recognizes authors, illustrators, and publishers of high quality fictional and biographical children-, intermediate-, and young adult books that appropriately depict individuals with developmental disabilities. John Steptoe Award for New Talent is given to African American authors and illustrators whose books affirm new talent and offer visibility in writing or illustration at the beginning of their careers. National Jewish Book Award recognizes distinguished children’s books that authentically and sensitively express Jewish thought and experiences. Outstanding International Books recognize stellar books originally published in countries other than the United States and published then published here. Pura Pelpre Award recognizes authors and illustrators of Hispanic heritage who best portray, affirm, and celebrate the Latino cultural experience in an outstanding work of children’s literature.
**Tomas Rivera Mexican American Award** recognizes the most distinguished books for children and young adults about Mexican Americans. Likewise, more helpful resources include the **Children's Choices List**—Annual list of the best books selected by children; and, the **Children's Book Council**—National non-profit trade association that collaborates with other national groups to help identify books of high interest for children.

**The Audacity of Accountability**

Books with inspirational characters from diverse populations can facilitate on-going meaningful activities, spark ingenuity, help abolish the structure of "isms," and enhance home-, school-, community-, and professional libraries. As a result, educators and child and family professionals should strive to build anti-bias libraries that include a wide variety of culturally responsive books. Equally important, students can select suitable titles for their own interests, self-studies, civic investigations, and social discoveries. Likewise, students can build their own anti-bias, classroom libraries as they discover books that fill in historical omissions, and grow into more social discoveries such as acceptance of themselves and others. Self-selections of apropos titles can speak volumes to denounce differences as deficiencies, while simultaneously celebrating individual expressiveness and strengthening common bonds that join us together.

In light of prevalent practices of 21st century omissions and gaps in curriculum and instruction that lack focus on culturally responsive groups, multifaceted strategies of culturally responsive literature were demonstrated for use in curricula to proactively address civil-, social-, and civic issues with students; heighten recognition of history, customs, and achievements of more than a handful of individuals from diverse populations; and, tap into students' multiple intelligences and individualized talents and interests to facilitate positive self-affirmations. Successively, the ultimate goal is the multifaceted use of culturally responsive literature to eradicate diversity, equity, and inclusion as an afterthought (e.g., drumming up a few culturally diverse books when someone sounds the alarm that they are not present); a fleeting thought (e.g., touting African American books during the 28 days of Black History Month); and, a superficial thought (e.g., just showcasing culturally responsive books to demonstrate a “commitment to diversity”). Therefore, the aforementioned strategies are also reinforced below with professional resources and a comprehensive, theme-based, bibliography of culturally responsive literature to keep the books in mind, present for use, and accounted for in curricula on a continual basis.

**Learning Outcomes**

- Strategies to integrate a ‘fair-minded amount’ of culturally responsive literature into curricula across content areas; maximize the use of culturally responsive literature on a ‘continual basis’; and, to utilize culturally responsive literature in a ‘meaningful manner’ via a “train-the-trainers” model.

- A cache of aligned themes designed to spark students' ingenuity via multiple intelligences, talents, and interests; increase their understanding of civil-, social-, and civic issues; and, facilitate their social and emotional well-being.

- A comprehensive bibliography of culturally responsive literature, professional resources, and guiding tools to continue to select apropos titles to build and enhance home-, school-, community-, and professional libraries on a continual basis.

**Lexicon**

**Anti-bias Practices:** Anti-bias practices include an active approach to challenge prejudice, stereotypes, bias, and the “isms.” It is not enough to be unbiased (and unlikely), nor is it enough to be an observer. Everyone has to actively intervene to challenge and counter personal and institutional behaviors that enable oppression (Derman-Sparks, 1989).

**Applied Cultural Studies:** The utilization of cultural precepts, processes and laws to solve, guide and understand human functioning, requisites and imperatives relative to the stimulation, reinforcement and internalization of the educational process.

**Core Culture:** The central portion/strand or essence of “the process which gives the group its general design for living and patterns for interpreting reality.” It is the “essential spirit” or energy of the group which characterizes and is reflected in all processes consistent with the group's cultural reality, including educational content and methods.
Culturally Consistent Educational Praxis: A systematic process of developing and/or stimulating the knowledge, skill, ability, attitude and character necessary for the subject (student) to undertake socially defined, goal oriented and culturally meaningful activity designed to allow them to achieve mastery of all aspects of human functioning, (re)product themselves in the objective world, make explicit their personality, and validate their self and kind.

Culturally Responsive Literature: Culturally responsive literature reflects an awareness, knowledge, and appreciation of different cultural groups, including sensitivity and receptivity to the sociocultural context of others’ lives. Culturally responsive books also include details that help define the characters as members of a particular group. Awareness of and attention to individual’s perceptions of individual-, cultural-, and institutional prejudice are also considered to be important elements of cultural responsiveness.

Culturally Responsive Practice: The practice is intended to ensure that all groups are benefitting equally from instruction and classroom management practices. It is often applied for race and ethnicity, but should be considered whenever there is a group that is not benefitting in an educational environment. It involves a set of congruent educator/stakeholder behaviors, attitudes, and policies that come together in a system that works for all students. At the classroom level, a culturally responsive approach means being aware of cultural differences, examining teaching materials and practice, and adapting programs and interventions, as appropriate, to respond to different student needs. On an institutional level, culturally responsive practice involves monitoring the effects of programs and interventions for all students, especially those from groups that have been historically marginalized. At its heart, cultural responsiveness involves self-reflection, continuous examination of data, and raising difficult and sometimes awkward questions about why some students succeed and others do not.

Culture: Culture is a human process representing the vast structure of behaviors, ideas, attitudes, values, habits, beliefs, customs, language, rituals, ceremonies and practices peculiar to a particular group of people and which provides them with a general design for living and patterns for interpreting reality.

Implicit Bias: An explicit bias is an attitude that somebody is consciously aware of having. In contrast, an implicit bias is a positive or negative mental attitude towards a person, thing, or group that a person holds at an unconscious level. Research has found that our implicit and explicit biases often diverge (e.g., a person may consciously express a neutral or positive opinion about a social group that they unconsciously hold a negative opinion about).

“Isms” including Racism, Classism, Sexism, Ableism, and Colorism: Racism is the belief that race is a primary determinant of human traits and capacities and that racial differences produce an inherent superiority of a particular race. Or, on the opposite side, racism can be described as the belief that a certain race or races portray undesirable characteristics. In the case of institutional racism, racial groups may be denied rights or benefits, or get preferential treatment. Classism is prejudice and/or discrimination on the basis of social class. It includes individual attitudes and behaviors, systems of policies and practices that are set up to benefit the upper classes at the expense of the lower classes. Classism is grounded in a belief system that pits individuals with differing socioeconomic statuses, and other class related divisions like education, against each other. Classism can be extremely divisive, because in the midst of the current recession a definite distinction is growing between “the haves” and “the have nots.” Sexism is prejudice or discrimination based on gender. Behaviors, conditions, or attitudes that foster stereotypes of social roles based on gender. An important, but often overlooked, part of the term is that sexism is prejudice plus power. Ableism is a form of discrimination or social prejudice against people with disabilities. It may also be referred to as disability discrimination, physicalism, handicapism, and disability oppression. Colorism is a form of prejudice or discrimination in which human beings are treated differently based on the social meanings attached to skin color alone.

**Barriers to Substance Abuse Treatment for Nurses**

Abstract

The aim of this research paper is to address the current epidemic of prescription drug misuse and abuse among the nursing population and bring attention to how substance use disorders, that occur in the nursing profession, affect the profession and endanger the public. Data was synthesized from existing literature to explain discipline and treatment programs and explain why prevalence of nurses that participate in treatment in general is lower than the prevalence of the general public’s participation in treatment. Recommendations and methods are presented in the research that can be used to increase awareness in nursing education programs and within the nursing profession to remove obstacles to treatment. This could significantly impact the number of student nurses and licensed nurses entering into treatment early in their nursing careers; thereby, providing greater protection to the general public.
WISEngineering Kindergarten Kids: A Feasibility Case Study

HAWAII INTERNATIONAL CONFERENCE ON EDUCATION
JANUARY 2016
ABSTRACT

The current research documents findings from a qualitative feasibility case study of a blended engineering design project, WISEngineering Kindergarten Kids, implemented by 5 families with their Kindergarten aged children (5 or 6 year olds). Specifically, the study explores the feasibility of implementation, parental and child engagement, and appropriateness of activity level. The study considers similarities and differences in the way parents implement the activity with their children. Educational implications are discussed.
INTRODUCTION

The current research documents findings from a qualitative feasibility case study of a developmental blended engineering design project, WISEngineering Kindergarten Kids (WISEngineering Kids), that blends formal and informal learning, and hands-on and online learning environments. Specifically, the study explores three research questions: 1) Can WISEngineering Kids be feasibly implemented as a take home activity implemented by parents/caregivers with their Kindergarten children? 2) Do parents and children find the WISEngineering Kids engineering design challenge engaging? 3) Is the activity level appropriate for parents/caregivers and children? Additionally, the study considers similarities and differences in the way parents implement the activity with their children, and discusses educational implications.

As a scale-up of WISE Guys and Gals (WGG), a project funded through a grant from the National Science Foundation (Award Number DRL 1422436) which brings blended learning design challenges to middle school aged learners in informal STEM (science, technology, engineering, and mathematics) settings, WISEngineering Kids builds upon the underlying premises of WGG. These state that children, especially those from groups underrepresented in STEM, will be exposed to and develop engineering design thinking through use of the engineering design cycle, and that exposure to blended engineering design activities will facilitate children’s awareness of and appreciation for STEM careers. WGG activities provide learners with opportunities to engage in problem-solving while developing problem-solving strategies and developing habits of mind, or a set of behaviors that are enacted when answers to problems are not known, from an engineering perspective (Chiu et al, 2013; DeJaegher et al.,
WGG builds upon a Knowledge Integration (KI) framework whereby learning involves “building upon and sorting out the numerous, varied, and often conflicting ideas students have about phenomena” (Chiu et al, 2013).

WISEngineering Kids extends upon the WGG framework by involving a different population of learners, namely Kindergarten students and their parents or caregivers, and integrating three additional lines of thought. The first line builds upon the theoretical framework of social constructivism (Palincsar, 2005) and family systems theory (Christian, 2006) through which families co-construct knowledge and increasing the knowledge, engagement, and interest of parents and caregivers in specific content areas presents the possibility of influencing the knowledge, engagement, and interest of their children. The second line incorporates the understanding that learning of content and of academic language is enhanced when it occurs in context (Gibbons, 2015). This is a key concept acknowledged in the English Language Arts Common Core standards (http://www.corestandards.org/ELA-Literacy/CCRA/L/) that extends to STEM learning environments (Lee, Quinn, & Valdes, 2013). In fact, the Next Generation Science Standards (NGSS) discusses the importance of literacy in developing scientific knowledge, and the work done to draw connections between content and literacy. The content in the current work, as highlighted in the NGSS Crosscutting Concepts, are multi-dimensional and focused on crosscutting concepts in science and engineering (NGSS Lead States, 2013). The third is the understanding that early exposure to social and educational learning experiences increases children’s potential for positive academic outcomes later in life (Howes et al., 2008; Phillips & Shonkoff, 2000).
Family Systems

WISEngineering Kids presents blended engineering design challenges for use by parents/caregivers with their children. These activities offer both parents/caregivers and children opportunities to develop the habits of mind of engineers, engage in problem solving situations, and develop their problem solving strategies. Presenting learning experiences that involve parents/caregivers and their children builds upon social constructivism (Palincsar, 2005) and family systems theory (Christian, 2006).

The connectedness of each family member is a key understanding in family systems theory (Van Velsor & Cox 2000) through which the experiences encountered through family situations impacts how family members behave and form expectations for their interactions with others (Christian, 2006; Kern & Peluso 1999; Nieto 2004). The family system consists of interdependent subsystems (Bornstein & Sawyer, 2005; Cox & Paley, 2003; Minuchin, 1985). The theory involves family cohesion, adaptability, and communication (McHale & Sullivan, 2008; Olson, Russel, & Sprenkle, 1980). Families are constructing knowledge together.

Although the family systems model has been largely applied to clinical settings, research in science and language literacy supports the potential of influencing parent and caregivers in order to influence the child. Lonigan and Whitehurst (2008) conducted research exploring the impact of different shared reading experiences on children’s oral language development. In the study, parents and teachers were trained using videos to implement specific interactive reading techniques. Children were then exposed to different conditions (e.g., control, school only reading condition, home only reading condition, and combined home and school reading condition). Children exposed to home reading conditions experienced the greatest effects. Likewise, in a
study by DeBaryshe (1995) mother’s reading beliefs positively related to their children’s interest in books. Pingree, Hawkins, and Botta (2000) explored the impact of family communication patterns on children’s science story evaluations, and found that when families exhibited orientation towards concepts in science stories their children in turn thought about science issues when engaging with the science stories.

WISEngineering Kids builds upon the understanding that increasing the knowledge, engagement, and interest of parents and caregivers in STEM and their awareness of STEM careers can impact the influence parents and caregivers exert on the knowledge, engagement, and interest of their children in STEM and their children’s awareness of STEM careers. It also supports NAEYC standards for Developmentally Appropriate practice by integrating its key concerns (e.g., learning experiences that are crafted through an understanding of child development and learning theories, individual appropriateness, and attention to cultural considerations) (Copple & Bredekamp, 2009) into activity design and revision considerations, as well as project functioning.

**Learning of Content and Academic Language in Context**

WISEngineering Kids activities provide parents/caregivers and children with the opportunity to enhance their understanding of the content by promoting their academic language development. For example, certain key terms are carried across activities (e.g., design challenge, specification, constraint, and other terms associated with each part of the design cycle). Each activity therefore supports learner comprehension of content and academic language skills as learners use key terms repeatedly and in different contexts (Spycher, 2009) as they review key
concepts, communicate design choices and revisions, and reflect upon key decisions during the
design cycle.

Moreover, research indicates that learning of academic language is enhanced when it
explored kindergarten children’s oral language development through an intentional versus
implicit instructional approach. In the intentional approach, Kindergarten children were taught
key science terms through a vocabulary intervention in science. Children in the control condition
received science instruction but the key terms were not explicitly taught. Findings not only
showed that children receiving the explicit instruction learned more of the target terms, but also
that these children were better able to express their understandings about the scientific concepts.
In this vein, Pollard-Durodola et al. (2011) created a shared book-reading vocabulary
intervention in order to help Head Start preschool children develop vocabulary knowledge
through their understandings of new words which they connected to concepts in science and
social studies.

Therefore, although the project focus is STEM, WISEengineering Kids also addresses
ELA Common Core standards, such as applying “knowledge of language to understand how
language functions in different contexts to make effective choices for meaning or style, and to
comprehend more fully when reading or listening” (http://www.corestandards.org/ELA-
Literacy/CCRA/L/).

**Supporting Early Learning to Facilitate Positive Outcomes Later**

WISEngineering Kids brings STEM learning and awareness of STEM careers to
parents/caregivers and their young children in order to facilitate early exposure to social and
educational learning experiences. Research indicates the importance of early intervention, and the potential early intervention has for increasing children’s positive academic outcomes later in life (Howes et al., 2008; Shonkoff & Phillips, 2000).

Karoly, Kilburn, & Cannon (2005) conducted a literature review to identify evaluations of programs providing early services for children (prenatal though kindergarten). Twenty programs were identified, and considered to have enough evidence of child outcome data to include in the study. Nineteen of the 20 programs evidenced positive effects on children’s development. Programs varied in focus, from those that provided parent education, to those that provided early childhood education, to those that combined parent and early childhood education. While longevity of program outcomes varied, lasting gains were evidenced for outcomes such as grade retention, and high school graduation rates. Additionally, data indicated that the parents of these young children benefited when they were the object of the intervention.

Moreover, McClelland, Acock, and Morrison’s (2006) research on the links between kindergartener’s learning-related skills and pathways in reading and math also support the importance of early intervention work. Their research explored the links between 538 kindergarten through sixth grade children’s learning-related skills (including self-regulation and social competence) on outcomes in children’s reading and math in later elementary school grades. Findings indicated that children’s learning skills predicted their development in reading and math in second grade, and that the gap between lower-rated and higher-rated children’s skills increased from kindergarten and second grade, although the gap then remained consistent until sixth grade. Findings highlight the importance of early intervention.
WISEngineering Kids

WISEngineering Kids breaks new ground by attempting to influence children’s exposure to and engagement in engineering design challenges by exposing and engaging parents/caregivers in these very same activities with their children. WISEngineering Kids unites the aforementioned lines of thought through a program which provides parents with access to blended engineering design challenges which they then implement with their children. Parents are given the supplies needed for each activity and access to the WISEngineering platform. The online component provides parents with all the information they need to work through the necessary content knowledge and hands on component of each activity. Parents and caregivers of WISEngineering Kids do not need to know the content in order to implement any of the activities. As with WGG, in WISEngineering “the activities are based on the informed engineering design pedagogy, where Knowledge and Skill Builders (KSBs) provide the scaffolding information about the challenge so the youth understand why and what they are doing” (Advances in WISE Guys & Gals). The WISEngineering environment contains all necessary information, as well as links to STEM careers. In fact, each activity links to a particular engineering discipline (e.g., Chemical, Mechanical, Civil) and videos engage viewers in thinking about challenges these engineers consider. Participants in the current study implemented “SlimeY” with their children. SlimeY engages participants as chemical engineers in the challenge of creating and testing SlimeY. Participants are then brought through a spiral learning model where they develop domain knowledge, ideate solutions, build a prototype, then test, evaluate, and refine their design. This process can be implemented multiple times until each participant reaches his or her goal.
Next, we will explore the methodology and results of a feasibility study. Core research questions will be considered.

**METHODOLOGY**

Five families provided feedback on the first iteration of the WISEngineering Kids program. All families came from multi-lingual households and all children attended an urban school where at least 40% of the student population is classified as disadvantaged. Each family implemented one WISEngineering Kids activity, *SlimeY*, with their children and had their child create an avatar on the WISEngineering platform. At the start of the program, one parent from each family was given materials for *SlimeY* consisting of borax, glue, and food coloring. This parent was then provided with a logon for the WISEngineering platform, and verbal and written instructions for platform use and avatar creation. Parents were instructed to have their children create an avatar, and complete the *SlimeY* activity following the steps provided in WISEngineering. The parents were also told to explore key platform features for saving thoughts and work (e.g., comments, pics, videos) online through a private journal feature (e.g., *Design Journal*) and for communication amongst families (e.g., *Design Wall*). One parent from each family then provided feedback about *SlimeY* after completing the activity with their child. Feedback was guided by a series of semi-structured interview questions focused on exploring implementation feasibility, activity level, and parent/caregiver and child activity engagement. and prompts related to the three key research questions after creating an avatar for their child and completing one WISEngineering Kids activity (*SlimeY*) with their children. Prior to completing *SlimeY*, participants were given information about the WISEngineering project, the
WISEngineering platform, and provided with logon information for one child and supplies for one child to complete the activity with their Kindergarten aged child.

**FINDINGS**

**Feasibility**

All caregivers were able to implement the WISEngineering Kids activity with their children although implementation varied from caregiver to caregiver. All caregivers, except one implemented the activity with more than one child. Caregivers reported bringing in older and younger siblings, as well as visiting friends to take part in the activity. In total, 14 children participated, with two caregivers implementing the project with 4 children, and the remaining caregivers implementing the activity with 3 children, 2 children, and 1 child respectively. Although all Kindergarten aged children were 5 or 6 years old, ages of siblings and friends ranged from 3 to 10 years old.

All caregivers reported viewing the online portion of the activity prior to initiating the activity with their children, noting they wanted to be certain they explained the concepts correctly to their children and would be able to answer their children’s questions. Additionally, caregivers wanted to see what the hands-on portion of the activity would look like and noted researching videos on the making of slime in preparation for completing the activity with their children.

Two families completed the activities the same day and three families completed the activities over the course of several days. While all children participated in the hands-on portion of the activity, and were shown the avatar, caregivers reported that only older siblings were exposed to all the online concepts and questions, with caregivers selectively choosing pieces
from the online portion to discuss with younger siblings (e.g., *SlimeY* ingredients). Caregivers reported feeling that younger children would not be able to understand all the online concepts but felt some information was understandable even for younger children. Since all families were only given one logon for their Kindergarten aged child, all families used the avatar selection and entered the question responses of the original Kindergarten aged child when completing the online portion of the activity. Additionally, when friends participated, caregivers reported they only took part in the hands on component of the activity. Families reported using laptops for the online portion of activities, although many noted they would prefer to use tablets or smart devices going forward.

Moreover, three caregivers reported doing the activity more than once with their children in order to revisit the underlying concepts and revise their *SlimeY* designs. Although provided with material for only one child, and one implementation, caregivers reported having the majority of supplies needed for the activity in their homes, and purchasing the remaining supplies which caregivers indicated were not costly. Two caregivers noted extending upon the activity by bringing in other items to enhance their *SlimeY* production (e.g., glitter).

**Engagement**

All caregivers reported that the children found the activity engaging (e.g., “They really loved it.” “They are extremely excited and they want to do it again tomorrow.”) Caregivers stated that the children wanted to do the activity again, and found the activity enjoyable. Two caregivers reported that their children even took their slime to school to show teachers and friends.
Challenges were identified in engagement for the online portion of the activity. However, caregivers reported addressing these challenges by breaking up the activity over a series of days, modifying the language, and bringing in online videos (e.g., “Oh definitely they were engaged and even the little one was grabbing at it – I want to stretch or stir. I have your piece – you have mine. Answering the questions was the tougher part of it. Drag and drop – would work much better for the younger kids – because it’s already there for them to see.” “We did a little each day for them to answer the questions properly.”) Caregivers reported engaging multiple children and that all children were enthusiastic and excited about taking part in the activities (e.g., “They are extremely excited and they want to do it again tomorrow. It’s so exciting. [Child Y stated] I’m going to go to school. I’m going to tell my teacher. Child Y’s teacher is the science teacher. So then he said he’s going to show her and tell her how we did it. And why we didn’t have the consistency.” “I love how it keeps them into it – they were never bored during the whole process. So interesting. After the first one they are already asking when is the second one.”)

Additionally, parents reported finding the activity engaging and learning from the activity (e.g., “We didn’t know there is the kind of this thing. We only let them play with the play dough and squishy things. We don’t know this. It’s good for them.” “Can’t say for other kids. I can only say for myself, I would be totally interested in this kind of activity – every other week may be too much but once a month would be totally doable. A simple kind of activity.” “And then this thing called Borax. I kind of – for me it’s the first time I experienced it as well – I was as excited as they were – I want to see what’s the result, what’s going to happen. It’s a really fun activity.”) Parents identified areas where they came across new ideas, struggled with the activity, but used online resources to look further into the information, and ultimately found the activity “fun.”
Moreover, although the online environment offers tools for communication and collaboration, as well as an online journal that is private and where a user can document his or her work and thoughts, caregivers who participated communicated with each other in person (e.g., “I loved it. Heard from Caregiver X – she said the children seemed like they had so much fun. She even went out and got more stuff – [I asked] what other stuff do you need. She got sparkly material, put her own spin on it, and made it more fun for the kids.”) Some caregivers uploaded videos of their children competing activities to YouTube, although they were encouraged to use the Design Wall, a tool built into the online learning environment that allows users to post comments, videos, and pics for all to see. However, caregivers reported using tools with which they were already familiar (e.g., YouTube).

**Level**

All caregivers reported that the activity level was doable with slight modifications. Although, two caregivers reported they were either “scared” or apprehensive prior to starting the activity, referencing lack of prior knowledge or ability to complete the hands-on portion of the activity, these caregivers reported that the activity was doable and enjoyable upon activity completion (e.g., “I was scared I wouldn’t know what to do. But when I started doing it – it was definitely doable and my children loved it. They said thank you.”)

Caregivers reported kindergarten aged children could complete the activity with caregiver support, noting the hands-on portion of the activity was understandable. But, that the language and online concepts required some translation by caregivers so that children could fully understand the concepts. Caregivers reported changing language, showing children online videos, and providing pictures as visual support for the various online concepts. Suggestions for
activity development included changing more questions to drag and drop items, or having item 
responses be visual rather than text based (e.g., picture representations for words) that children 
might touch to answer questions, and simplifying language. However, caregivers reported that 
they were still able to do the activity with their children and that both children and caregivers 
found the activity engaging (e.g., “It’s engaging but at the same token it feels like – there’s a lot 
of steps that I’m trying to figure it out too as I’m learning it so video would help”).

DISCUSSION

Feedback supports the feasibility of parents or caregivers implementing WISEngineering 
at home with children. Reports indicate that the activity is not only doable, but that the activity 
can also be conducted simultaneously with multiple learners as a team through the use of one 
account. Data suggests that the experience could be enhanced through an extended training 
session where parents and caregivers could be provided with more support in utilizing the 
offerings of the online environment (e.g., Design Journal, Design Wall). Additionally, responses 
indicate that activity enhancements should include revising activity language to make it more 
“kid friendly,” revising question items to make them more accessible to younger children (e.g., 
supporting text with pictures), and either shortening activities or creating pre-defined stopping 
points to guide parents as they implement the activities with their children. Finally, feedback 
suggests that including support videos for key concepts and directions in the online platform 
might enhance the experience for parents, caregivers, and children.

Data supported that the WISEngineering Kids activity was engaging for both children 
and parents. It also supported that the activity level is appropriate for Kindergarten students 
when guided through the activities by their parents and caregivers, although slight modifications
are needed (e.g., language revision, item enhancements). Additionally, although parents indicated using external supports to enhance their understanding and implementation of the activity, all reported that they felt the activity was appropriate for their families.

Moreover, all feedback consistently indicated high levels of engagement for both parents and children. Additionally, two parents reported the activity bringing them closer to their children (e.g., “Encourage parents to do this type of work because it connects parents with their children and with the children they are working with because they have fun.”)

**Implications**

Data suggests that the WISEngineering Kids program is feasible, at an appropriate level, and engaging for parents, caregivers, and children. Next steps include exploring changes in participant (e.g., parents, caregivers, children, and teachers) STEM content knowledge, engineering design thinking, awareness of and attitudes towards STEM, and connectedness.

Every family that participated, except one family, involved older and/or younger children and friends with parents supporting children as they engaged in each step of the activity. Families found the WISEngineering platform easy to navigate, although they had suggestions for activity improvements. The program presents a way to bring parents and caregivers together as collaborative learners of STEM. Moreover, the program brings parents and learners together in a developmentally appropriate and socially and cognitively stimulating activity.

WISEngineering Kids presents a way to expose parents to engineering habits of mind, stem careers, and key stem concepts. This program presents the possibility of influencing parental learning and attitudes towards STEM and STEM careers so they in turn can influence their children’s learning and growth regarding STEM and STEM careers.

Interviewing the STEM classroom:

Using hermeneutic phenomenology to better understand the relationship between architectural space and curriculum enactment

Introduction

Although Canadian students are consistently ranked among the highest-performers on international tests such as PISA (Brochu, et al., 2013; Bussière, et al., 2004), the nation’s business, governmental, and educational leaders are increasing concerned that today’s students are not developing the skills and knowledge required for them to prosper in the uncertain economic, social, and environmental landscape of 21st century (Boudreault, et al., 2013; Conference Board of Canada, 2014a; and Orpwood, Schmidt, & Jun, 2012). The assertion that future economic and social progress relies on innovation, and innovation relies on education is replicated in numerous reports published by the Organisation for Economic Co-operation and Development (including Kärkkäinen, Vincent-Lancrin, 2013; OECD/Eurostat, 2005; OECD, 2010; and Toner, 2011). Canadian ministries of education, like their international peers, are working furiously to (re)develop curricula that will facilitate the development of so-called ‘21st century skills’ in their students; skills such as critical thinking, problem solving, creativity, adaptability, collaboration, cultural fluency, environmental responsibility, and technological literacy. Part of these curriculum reform initiatives include movement towards greater interdisciplinary between traditionally discrete school subject areas (Gislason, 2011; Motz, Biehle, & West, 2007) demonstrated, most obviously, by the rising prominence of STEM (Science, Technology, Engineering, and Mathematics) programs of study across the member nations of the OECD.

The Conference Board of Canada (2014b) and the Canadian Organisation of Chief Executives (Orpwood, Schmidt, & Jun, 2012) are concerned that relatively low student participation in Canadian university ‘STEM courses’ and interest in careers in ‘STEM fields’ (compared to rates in other OECD nations) indicate that Canada’s
competitive future is at stake. As such, many school districts are attempting to integrate 21st century and STEM approaches to teaching and learning into their existing programs of study. Yet the vast majority of jurisdictions that try to move towards 21st century STEM integration “will find their progress limited by the facilities available in their schools,” (Motz, Biehle, & West, 2007, p. xi).

The Right Honourable James Bacon, former premier of Tasmania, articulated the need for 21st century school redesign eloquently when he said, “schools should be places in which... young people are granted opportunities to do/make/be/create/explore that are not available anywhere else in their lives,” (Nair, Fielding & Lackney, 2009, p. 15). No longer are classrooms designed for 'sitting-and-getting' information adequate, regardless of the presence of an interactive whiteboard at the front of the room. Teachers need more from their 21st century classrooms; educators who are taking project-based, design-thinking approaches to teaching STEM courses even more so. Academics with expertise in both education and architecture agree that there are significant gaps between how schools are planned architecturally and how they are used by their occupants (Gislason, 2011; Motz, Biehle, & West, 2007; Nair, Fielding, & Lackney, 2009; and Woolner, 2014). As the previously discrete fields of STEM become more integrated in the enacted curriculum of secondary schools, architects are increasingly being asked to design new learning spaces which are adaptable (Hille, 2011) and offer multiple uses and configurations that allow for numerous pedagogical approaches and activities. Building occupants alter their behaviour to fit the built constraints of their physical environment (Leaman & Bunn, 2014), it is essential that teachers and students work with school designers to imagine these new spaces to ensure that they indeed offer new pedagogical possibilities.
A starting point to considering what 21st century STEM classroom spaces could look like is an examination of current science classroom spaces. There are many ways to do this including the rather novel approach of ‘interviewing’ the space itself.

**Interviewing Objects**

In their article “Interviewing Objects: Including Educational Technologies as Qualitative Research Participants”, Adams and Thompson (2011) argue that educational researchers need to pay more attention to the non-human elements that surround teachers and students. They argue:

Educational activities and practices are similarly caught up in, tethered to, and shaped by the artifacts at hand: blackboards and books, passwords and online profiles, and PowerPoint and plagiarism software. Yet, for the most part, things [emphasis in original] are overlooked as incidental or inconsequential entities rather than problematized and enlisted as important participants in qualitative research projects. (p. 733)

Adams and Thompson proceed to demonstrate how different educational technologies can be ‘interviewed’ to better understand their relationships and effects on the learning environment. The authors do not propose the sort of sit down interview that a journalist or researcher may be accustomed to conducting where interviewer and interviewee sit face-to-face for a prolonged dialogue. The sort of interview that Adams and Thompson propose is not so much back-and-forth banter, but the surfacing of insights that result by making an object or artifact the centre of ontological consideration by using eight heuristics to explore its being and connections.

Heuristics are rules-of-thumb, short-cuts, filters, or starting points that may provide possible approaches to new understanding (Adams & Thompson, 2011, p. 734) that
allow the researcher to draw on various experiences and theoretical frameworks to attempt to surface new ways of looking at an issue, problem, or topic. Adams and Thompson, for example, draw on their expertise with hermeneutic phenomenology and actor-network-theory (ANT), respectively, to explore pedagogical human-technology of interactions. Phenomenology orients itself to the experienced phenomena of the world “pre-reflectively, pre-verbally, pre-theoretically” (p. 736). Actor-network-theory explores the network of relationships and intentions between human and non-human actants. While there are areas of overlap and dissonance between phenomenological and actor-network-theory, “both have a primary interest in ‘letting the things of the world speak for themselves’ (Heidegger as cited in Adams and Thompson, 2011, p. 738).

Adams and Thompson suggest that although their paper is focussed on two particular digital technologies that they “believe it is reasonable to apply [their] heuristics to a full range of teaching and learning” (p. 747) objects, artifacts, and things. Rather than using their proposed heuristics to explore a particular technological tool or object, in this paper I provide an interview of the school science classroom itself. Due to the length of discussion that each heuristic generates, I will limit myself to only two of the eight heuristics in this paper: listening to the invitational quality of things and applying the laws of media. In my opinion, these two heuristics are the most eye-opening and thought-provoking of the eight and are best-suited for conference roundtable discussion. I’ll address the remaining six heuristics in future papers.

**Listening for the Invitational Quality of Things**

This heuristic draws on hermeneutic phenomenology and requires the researcher
to be attuned to the objects in their environment. To become more aware of the ‘voices’ of current science classrooms and what they’re telling us about how 21st century STEM spaces should be designed, it is helpful to wonder how classrooms of different arrangements encourage and invite certain behaviours while discouraging or constraining others. The most useful tool to help elucidate this wondering is the theory of affordances proposed by James Gibson (1977).

“The affordances of the environment are what it offers the animal, what it provides or furnishes, either for good or ill” (Gibson, 1977, p. 127). For example a hammer affords the ability to strike objects (such as a nail, wall, or finger) with great force. A large body of water may afford drinking and swimming, but because its materiality in liquid form is not rigid enough to support bodies of a certain weight, it also affords drowning. Affordance is closely associated with perception; an animal must be able to perceive the action potential of an object or surface to hear the ‘invitation’ of what it affords. Here are two examples.

When I was young, I watched at the zoo as a young chimpanzee used a stick to retrieve potato chips which had fallen between the outer security fence and its enclosure. The chips that couldn’t be grabbed by the chimp’s hand were reached using a nearby stick that afforded a longer reach. When the stick could no longer reach the remaining potato chips, the chimp used his stick to retrieve a longer stick and used it to drag the most distant treats towards itself. At this point an older chimp became aware that potato chips were being consumed and came over to its subordinate and took the long stick away. After several minutes of trying to figure out how the stick produced potato chips, the senior chimp left in frustration. He could not perceive how the object afforded access to the potato chips a few meters away.

During my childhood, I would periodically watch episodes of MacGyver. In most
episodes, the titular character would combine mundane objects to solve life and death situations. One of my favourites is a moment when he stops leaking sulfuric acid with chocolate, explaining afterwards that acid reacts with the sugars in the chocolate to create a carbon plug in the cracked container. It is MacGyver’s awareness of what the chemical reactants affords that allows him to escape. When he sees chocolate and sulfuric acid, he perceives a helpful chemical reaction that produces a sooty solid.

When it comes to designing and teaching in a 21st century STEM classroom, school designers and teachers need not have MacGyver’s encyclopedic knowledge of material potentiality; chimp-level awareness should do.

Allow me to demonstrate the nature of affordances by comparing three different types of classroom space where most science-related lessons are currently taught: general classrooms, combination classroom/laboratories, and dedicated laboratories.

**The General Classroom**

My first assignment was teaching science to four different grade five and six classes in one wing of the school. My teaching days were spent driving a cart of supplies from room to room; setting up, teaching, cleaning up, and moving on to the next room. Despite the obstacle of not having a classroom of my own, my students were able to participate in a number of hands-on learning activities over the course of the year.

For lecture-type activities and class discussions, these general classrooms worked well enough. Individual student desks, whether they were organized in rows or pods, afforded sitting and writing. The rooms had whiteboards along the front wall with ceiling-mounted projection screens that could be lowered as needed for instructional purposes. Each room had a portable TV and VCR/DVD combo player (this was a few
years before LCD projectors become widespread in Calgary classrooms) at the front of the room where it could be seen and heard by most students without the need to adjust seating arrangements. These classrooms were well-suited for direct instruction of science concepts, but, as Hodson (1993) points out, science education is not just learning science and learning about science, but also doing science. For hands-on science explorations, these rooms fell short.

The rooms didn’t afford much in the way of usable surfaces for projects and investigations. Despite the total surface area of the student desks, there was a veritable dearth of stable horizontal surfaces on which to conduct scientific project work. Their personal equipment and scientific apparatus (including pencils, batteries, plasticine, drinking straws, and containers of solutions) were constantly falling off their desks or getting kicked across the floor. Every time a student rose from their seat or adjusted their position, the contents of their desks would jiggle, shift, and topple over. Seeking to overcome the shortcomings of their desks, students would work on the horizontal cover of the radiator at the back of the room or on the floor in the hallway.

Each room had a sink which afforded easy-access to water and provided some ability to access water for classroom animals and plants, mix paints and solutions, and soapy water for clean-up. The sink did have a hot water tap but it could take ten minutes for the warm water coming out of the faucet to become hot enough to use to dissolve substances or clean containers with any sort of efficiency. Often electric kettles were brought in to meet hot water needs. Luckily the room had a number of electrical outlets around the exterior walls and only rarely did a circuit get tripped while the class was using kettles, microwaves, and other electrical devices simultaneously.

Along the back of the rooms were banks of windows. This afforded daylighting (the benefits of which have been extensively researched over the past decade) and
transparency; outside weather could be observed and exterior life could permeate the classroom. Only two small window panes could be opened, however, and these only by a matter of about thirty degrees. So natural light could enter the space and the world beyond the classroom could be observed, but functionally, the class was permanently separated from the exterior environment.

Two desktop computers (massive by today’s standards) sat on small wheeled desks at the side of each classroom, their position determined by the location where ethernet cable jacks had been added to the school a number of years prior. This afforded some ability to connect with the internet and access software, albeit for only a small number of students at any given time.

Each classroom came with eight foot tall wooden cabinets that afforded a modest amount of storage for supplies and the teachers’ materials. More often than not, these were disorganized and crammed with ‘dead’ markers, old textbook resources, and forgotten assignments. Sometimes these were better organized and students could easily access scissors, paper, art supplies, and the other materials they needed for project and group work.

A sixth of the useable classroom space in each room was a partially closed-off cloak room which afforded hooks for students to hang their coats and areas to keep their wet boots. Once class began, however, these spaces became more no-space than ‘know-space’: interfering with the flows of children between their desks, the sink, computer, and cupboards.

Although notions of progressive education existed well before the construction of these classrooms, their design reinforced a teacher-centric stand-and-deliver approach to teaching and learning. The presence of the sinks didn’t indicate that learning was going to be active, hands-on, and ‘messy’ as the rest of the space (including the
choice of student furniture and display technologies) oriented the enactment of curriculum towards desk work and passive observation of audio-visual stimuli. Although the outdoors were visible through relatively large windows, the limits of their open-ability and the cloakroom just inside the classrooms’ thresholds silently reinforced that the outdoors were to remain outside.

**The Combination Laboratory/Classroom**

Beginning in my second year of teaching, I was assigned to teach grade eight and nine science in a wing of the school that had been built as part of an extension two decades earlier.

The classroom set-up of this room is what the National Science Teachers’ Association Guide to Planning School Science Facilities (Motz, Biehle & West, 2007) would classify as a “combination laboratory”; the centre of the room was dedicated to student desk space and but the area at the back of the room and its periphery were lined with laboratory benches (including sinks, electrical outlets, and natural gas valves). A large lab bench for teacher demonstration was at the front of the room along with three sliding whiteboards and a retractable ceiling-mounted projection screen. Bookshelves and cabinets lined the room on both sides and an area for four computers had been built along one wall where ethernet ports had been installed.

Due to the placement of the boards and screen, there was a definite ‘front of the room’; it was apparent where information was going to be coming from. So, like the general classrooms, the construction of this room reinforced a teacher-centred model of how science should be taught. The lab benches did afford more space for hands-on science activity than the general classrooms but their placement at the back and edges of the class seemed to advertise that their purpose in teaching and learning were secondary to whatever was happening at the front of the class. I taught in this
room for four years. Although the students were certainly at their desks a lot, I tried to get them up to work at the lab benches as often as I could.

The abundance of horizontal work space was a considerable improvement over students using their desks, radiator, or the floor for their activities. The lab benches throughout the the room afforded the ability for students and materials to be spread out. The combination classroom arrangement allowed students to move from their desks to the lab benches during any particular period. Students would store their textbooks, binders, and backpacks at their desks and take only minimal supplies (such as pencils, pens, and data sheets) to the work benches where space was consumed by the technical equipment of the day. This separation of activity areas allowed students to protect the majority of their supplies from the inevitable spills that occurred when beakers of water and other solutions were to be used. In any given period, students would migrate between their desks and the lab benches; familiarizing themselves with the lab procedure at their desks, conducting their research at the lab benches, and returning to their desks for follow-up analysis writing when their practical work was completed.

Needed lab equipment and consumables could be placed at hubs around the room for relatively easy access. So much of every lab activity is spent on the housekeeping of gathering and cleaning up supplies (Hofstein & Lunetta, 1982; Hofstein & Lunetta, 2004). This combo lab benches greatly facilitated the exchange of materials throughout the period. I could, for example, make supply depots of chemicals and indicators at certain locations around the room and waste containers, garbages, and recycling bins next to the sinks. Rather than lines of students forming to access any resource (which occurred frequently in the general classrooms) the room’s plethora of horizontal surfaces afforded a multidirectional traffic flow.
The lab benches, especially the one at the back of the classroom (which was not attached to the wall), allowed for a different sort of social spatiality to teaching and learning than the elementary students’ desks provided; they afforded ‘gathering around’. Students could lean in close and put their heads together while working on lab activities and group tasks. The whole class could meet up around me at the back of the class so I could lead them through demonstrations, provide more intimate instructions, or talk face-to-face around a sort of science conference table.

The particular science combination class I taught in was windowless. When I first moved into the room, the lack of windows greatly disappointed me. Time passed outside the classroom unseen as my students and I worked isolation from the world around us under banks of fluorescent lights. Only the two students who sat in the centre front-most desks had an inkling of what was happening outside (and this, only because the vent directly above their heads allowed the sounds of song birds or the occasional snowflake to drift down upon them). When walking into the room for the first time, I was disappointed that its windowlessness wouldn’t allow for monitoring changing weather, tracking the position of the sun, and growing plants. But, as Gibson suggests, affordances are present for neither “good or ill”. Over time, I came to see that my windowless classroom offered a unique benefit, one not found in any other room in the school: it afforded total darkness. By putting a strip of felt along the foot of the classroom’s doors, the entire lab became a functional darkroom where multiple photographic enlargers and light-sensitive solution baths could be set-up. I introduced a hands-on photography component to my grade eight light and optical systems unit. My room became an invaluable teaching space for large group instruction before they could work semi-independently in the school’s two dark rooms. By becoming attuned
to the invitation of my windowless classroom, I could suddenly see that it afforded a state that no other classroom in the school could provide.

Although the orientation of the boards and screen reinforced front-of-the-class direct instruction pedagogies, the laboratory work benches afforded other approaches to learning science, learning about science, and doing science. The intentional design of the combination lab (the most common science room configuration at the secondary school level) are to provide a balance between direct instruction and hands-on experimentation. I expect, however, that due to overcrowding, dense outcome-based curricula, and heavily-weighted standardized tests that many of these classrooms are used principally as lecture spaces with only the occasional laboratory activity.

**The Dedicated Laboratory**

Due to budget cutbacks and ballooning student enrollment, it is increasingly rare to have dedicated science laboratory spaces in most schools. These rooms remain the norm for hands-on science learning at the post-secondary level where lab components are scheduled separately from lecture seminars and tutorial class time. Where they still exist at the secondary school level, dedicated lab spaces are usually signed out by teachers for hands-on science activities that would not be safe or reasonable to conduct in their regular lecture-oriented classrooms; learning science and learning about science are conducted in the regular classroom, but doing science occurs in the dedicated laboratory. When no classes are booked in the lab, it sits empty and unused.

I’ve taught secondary science in a number of dedicated laboratories over the last five years of my teaching career. The furniture in these rooms are primarily stationary lab benches which stretch across the class parallel to the front board and projection
screen area. The workbenches contain multiple electrical outlets, natural gas valves, and sinks. Along the walls of these labs are ample storage of the various scientific apparatus that could be needed during investigations and nearby prep rooms contain other materials (such as chemicals) which are kept separately under lock and key. Some labs were to the study of a particular scientific discipline and contained specific apparatus for studies in biology, chemistry, or physics; others were multi-purpose labs that were appropriate for any application. Half of the dedicated labs that I’ve taught in have included specific areas for computer workstations, but these were disappearing near the end of my time as a classroom teacher as laptops, tablets, and wireless internet made built-in desktop computers obsolete.

The affordances of lab benches have been described above in the combo labs, but the extra workspace afforded in dedicated laboratories due to the lack of student desks in the middle of the room, provided students with extra workspace for their investigations and experiments. Whereas combination labs afforded a back-and-forth spatiality for students to move between their desk and lab work, dedicated labs facilitated relatively long-term focussed investigations; in a sense they afforded ‘hunkering down’.

**Affordances and the 21st Century Science Classroom**

In the three classroom types listed above, the classrooms were oriented towards a ‘front’ of the room, the location where information was going to be delivered (most often, by the teacher). A 21st century STEM classroom which is to be more student-centred, needs to afford input from more directions while furnishing workspaces that are not permanently configured for one type of activity or the other.
Rather than whiteboards on a single wall, it is worth (re)considering how students can write on all surfaces. Desks and walls can be coated to afford write-ability (what Gibson called “trace-making”). Windows are already perfect writing surfaces for whiteboard markers and overhead pens; teachers and students just need a small push to perceive framed glass as writing surface. Technology (such as Apple AirPlay) already exists so photos, videos, documents, and drawings on digital tablets and laptops can be sent to monitors and projectors within the same wifi network. It is only a matter of time before students will be ‘dragging and dropping’ content from one surface to the next as easily as Tom Cruise does in the Minority Report or Tony Stark does in the Iron Man or Avengers movies. Information will no longer be coming from the front of the class, it will be found, created, and displayed throughout.

In my description of the combination lab, I mention how the back workbench in my science classroom afforded ‘gathering-around’ and how the ample work spaces in the dedicated lab afford ‘hunkering-down’. Furniture in a 21st century STEM classroom need these affordances to be more front-and-centre. Rather than rows of desks and lab benches, STEM work surfaces need to be octagonal or round so students can gather on all sides and work face-to-face. New classroom spaces must be multiplicitous and configurable. Workbenches should slide apart to make desks, should connect and lock together to make hands-on work areas large and small, all should be height-adjustable. Utilities can still be provided at fixed points around the room so the moving horizontal work spaces do not necessarily need their own gas, electrical, or plumbing as long as these can be connected in a smart way. Already we’re starting to see these sorts of flexible furnishings in some new schools. Lecture spaces can become
laboratories, conference spaces, think tanks, and maker spaces as needed by the students and teachers.

Gone now are bulky desktop computers with their monitors, mice, and keyboards. Twenty first century STEM classrooms need to afford power for charging digital devices (from smartwatches and smartphones, to cameras and laptops) in a way that safely manages the tripping hazard of cords and the potential to spill on digital devices when solutions are present. Fixed ethernet ports are no longer required so long as each room has access to robust high speed wireless internet and the school’s server and firewall design affords easy access to file and resource sharing. Printer space is still worth considering as 3D printers become more commonplace.

Students deserve better than the outdoor world displayed behind glass. They require adjustable windows that can fully open and close, that can be shuttered to afford total darkness or opened for total light saturation. To connect lessons about the natural world and sustainability, STEM classrooms should afford direct passage from the indoor learning environment to well-planned outdoor learning spaces such as gardens, playgrounds, and learning parks. Similarly, the separation of the classroom to other learning areas inside the school should be permeable with movable walls and doors to reconfigure the learning environment to match the demands of the learning activity.

By opening ourselves to the invitational ‘voices’ of existing science teaching spaces, we are more likely to design better STEM classrooms for new and renovated schools. It is important, however, that as we design the schools of the future that we are aware that our innovations, while enhancing pedagogy, can simultaneously reverse it.
Applying the Laws of Media

Marshall and Eric McLuhan’s (1988) four laws of media, allow a “means of identifying the properties of and actions exerted upon ourselves by our technologies and media and artefacts”, (p. 98). The laws proposed by the McLuhans are posed as four related but contrasting questions:

1) What is enhanced or intensified by the new artefact?
2) What does it push aside or render obsolete?
3) Does it retrieve anything that was previously made obsolete?
4) When pushed to the extreme of its potential, what does it generate?

This tetrad of questions are not meant to imply “a sequential process, but rather four simultaneous ones. All four aspects are inherent in each artefact from the start,” (McLuhan & McLuhan, 1988, p. 99). To use an educational technology example, a SMART Board immediately enhances the display capabilities and interactivity of the board at the front of the room while rendering overhead projectors, blackboards, and chalkboards obsolete. Yet, in an attempt to create a more engaging classroom environment, it simultaneously reinforces teacher-directed modes of instruction since only one or two students (if the SMART Board is dual-touch) can be actively involved with using the board at any given time; the rest must sit and observe. When pushed to the limits of its potential, a SMART Board reverses into something akin to a family television screen where the bulk of ‘users’ in the room have no control over its content and turn their attention to their own hand-held digital devices.

“In composing a tetrad, it is helpful to reflect on the more extreme examples” (Adams & Thompson, 2011, p. 743). To this end, let me carry on the interview of science classrooms by composing a tetrad of a “Da Vinci studio”, an ‘extreme’ 21st

“In the real world, scientists work in a variety of environments doing activities such as independent research, working on team projects, engaging in debates in social settings, and interacting via technology with colleagues in other parts of the world,” (Nair, 2014, p. 89). For this reason, the Da Vinci studio contains numerous work areas for different sorts of student activity; from individual workstations to group collaboration areas, from paper and pencil writing and drawing areas to construction bays and wet labs.

Central to Nair’s concept is the notion of interdisciplinarity. “The Da Vinci studio is a metaphor for the twenty-first century, where the hard lines that had separated the arts and the science in the twentieth century are being blurred. Instead of pigeonholing subject areas into right- or left-brain categories, schools need to make more opportunities for students to escape these restrictions and to blend different ways of thinking”, (Nair, 2014, pp. 94-95). Just as Leonard Da Vinci’s workshop would contain artefacts of art, mechanics, anatomy, mathematics, and astronomy, Nair’s Da Vinci studio affords activity areas that can be configured to allow for painting, sculpture, drama, dissection, robotics, and more.

With some basic understandings of how the Da Vinci studio is an ‘extreme’ version of the school science spaces addressed previously, consider now its tetrad (presented in Figure 1, below).
The design of a Da Vinci studio is rooted firmly in student-centred pedagogies so it enhances project-based learning, inquiry, and making while obsolescencing more traditional teacher-directed approaches. Since there is more opportunity for groups of students in the same class to pursue very different projects of the same time, the structure of the school might need to change as well. A ‘cells and bells’ system where students’ days are portioned into periods that occur in certain classroom spaces would be expected to change as Da Vinci studios catch on, providing students the time they need for their work rather than disrupting them for class change every sixty minutes. Changing the learning environment in this ways will lead to significant changes to teacher practice, most obviously a change from being ‘the sage on the stage’ to the ‘guide on the side’. Instead of providing “the answers to all the questions that no student has asked,” (as my colleague, Dr. Kent den Heyer, is fond of saying) teachers

---

**Figure 1.** Da Vinci studio tetrad. Using the laws of media proposed by McLuhan and McLuhan, (1988), this demonstrates how the novel STEM classroom design proposed by Nair (2014) causes simultaneous enhancements, obsolescences, retrievals, and reversals.

will have to become more involved with each student and their work and provide more of a co-producer than a directorial role. As teachers step out from behind their lecterns and behind the ‘genius bar’ of the Da Vinci studio, the way they go about assessing students will change radically. Although this is not the paper to discuss these ramifications in any detail, I don’t believe these changes will amount to the de-professionalization of teachers, but to a new definition of what a 21st century teacher is and does.

Moving towards Da Vinci studios may retrieve certain concepts and notions from the past. Imagine a high school Da Vinci studio with multiple practical workbenches and wet lab areas, similar to what we see on episodes of *Mythbusters*. Students may come to specialize in certain areas of the studio, preferring to demonstrate most of their learning through three dimensional art or graphic design. As staffing models for the school change we may see more teachers or paraprofessionals assigned to mentor students in certain skills which retrieves the model of apprenticeship.

The move towards less teacher-directed and spatially confining classrooms does not only conjure romantic notions of Renaissance apprenticeship, but also visions and memories of the Victorian city square where ‘unwashed masses’ of youth ran amuck and participated in various games and explorations of their own choosing (Burke & Grosvenor, 2008). Perhaps a modern equivalent of the city square is allowing students to use their mobile devices to ‘surf the net’ without any direction for days at a time; they will certainly learn things, gain expertise in some areas, but the lack of structure and pedagogical direction opens up their learning to perhaps an unhealthy degree. What are they learning about?!
Students are noisy and active students even more so. It is entirely possible that the Da Vinci studio will be beset by the same issue as the ‘open’ classrooms of the 1970s. “Open settings contain relatively few barriers to social interaction, noise, and visual distraction, so students need to be relatively self-motivated and self-regulating in order to maintain focus,” (Gislason, 2011, p. 46). It is this retrieval that takes us paradoxically backwards in terms of innovative classroom spaces and pedagogies.

As we open up the closed science classroom to make a Da Vinci studio and enhance student-centred 21st century STEM learning opportunities, we simultaneously reverse this movement by creating situations where teachers could complain about the aimlessness and noisiness of their students and call for more focus on supervision and student discipline. Walls may get put up, teachers may return to controllable default pedagogies, and we may see a contraction from student-centred to more teacher-centred learning.

As the McLuhans (1988) point out, all of these movements and shifts occur at the same time. Initiatives to open up the classroom create reasons to close it off. Student-centred learning, supported by educational research and a widespread desire to produce 21st century citizens who are globally competitive, can be limited and even reversed by teachers who find themselves stuck in a new and uncomfortable paradigm and long for a return to predictability, standardization, and quiet. Creating interconnected interdisciplinary learning spaces can be undone by fears of resurfacing the ‘failure’ of the 1970s open classroom ‘experiment’.

**Conclusion**

Heuristics do not seek to fully address an issue or problem, but may help to
explore a topic from different angles. While this paper only makes use of two of the heuristics proposed by Adams and Thompson (2011), it surfaces various aspects of science classroom innovation that architects and teachers need to pay attention to.

The physical design of science classroom configurations afford different types of teaching and learning. Mobile work surfaces offer flexibility and can be used to configure the class into traditional classroom formats, think tanks, project spaces, or laboratory workbenches. Writing and display areas should not be limited to the front of the room but distributed throughout the space for greater access and use by all. The placement of material distribution and clean-up areas throughout the class need to be carefully considered. The space needs to allow for the use and charging of multiple mobile devices for teaching and learning (and this must be done in a very forward-looking sort of a way since digital devices are evolving so quickly). Perhaps most importantly, all science classrooms must afford access to the outdoors so students can come into direct contact with the natural environment on a daily basis.

While taking affordances into consideration, educators and architects need to attend to the tensions that are revealed by plotting various technologies, pedagogies, and classroom spaces on a tetrad. Certainly new approaches will enhance and amplify desirable qualities in the learning environment. Creating Da Vinci studios, for example result in easier interdisciplinary and student-centred learning activities to be conceived and enacted. Subject divisions and classroom walls may be broken down. But as progress is made, calls for reversal to more traditional patterns of school and instruction will grow louder.

Although there is an obvious need to provide students with the most innovative learning environments possible, careful consideration and continuous conversation between school designers and school users must occur to ensure that the program of
the school, the curriculum to be enacted, the pedagogical values of the faculty, and the space itself all evolve together. Otherwise, we’ll find the students of 2050 sitting in rows staring at the front of the room.

Exploring the metacognitive orientation of school makerspaces:
A research proposal for a sequential explanatory mixed method study

The Emergence of Makerspaces

Over the past five years, the so-called ‘maker movement’ has been sweeping across North America and has resulted in the sudden appearance of makerspaces in libraries, museums, community centres, post-secondary institutions, and K-12 schools (Rosenfeld Halverson & Sheridan, 2014). A school makerspace may resemble an art studio, construction shop, garage, science laboratory, computer room or any combinations of the above. They are places where ‘makers’ work independently or collaboratively on the construction of physical and digital artifacts (Sheridan et al., 2014). The emergence of makerspaces in schools coincides with a swing of the pedagogical pendulum away from teacher-directed instruction to more student self-directed approaches to teaching and learning.

School makerspaces are sites of project-based learning where students can make use of available tools and resources to seek unique solutions to questions posed by their teachers or develop their own personal projects (Harvard Educational Review, 2014).

For instance, a ten-year-old boy began with a simple plan for an old computer mouse: he drew an oval with wheels labeled ‘mouse car’. . . . He figured out how to break apart the mouse, attach wheels, find an appropriate motor, and wire a battery to it to make it move. Initially the car just went around in circles, so he made adjustments so it would drive straight. At first he stopped it by grabbing it and disconnecting the battery; later . . . he installed a metal switch on the top. In a video posted to the makerspace web site, he smiles as he demonstrates that his car moves fast and straight and is easily switched on and off. His design process began with a structured, teacher-led workshop and later became a more sustained, personalized design process.” (Sheridan, et al., 2014, p. 523-524)
Although this example describes an individual student’s quest to make an electrical car from a discarded computer mouse, everyday groups of students across the continent run into their school makerspaces to work on projects that are comparably low tech (such as using hot glue to reinforce linguini bridges or making ballgowns out of plastic bags and duct tape). The learning in a makerspace is social, hands-on, and experiential; it is not only constructivist in its philosophical orientation, but constructionist.

**Constructionism & Design Thinking**

Like constructivism, constructionism posits that people develop knowledge through their experiences, but “adds the idea that this happens especially felicitously in a context where the learner is consciously engaged in constructing a public entity, whether it’s a sand castle on the beach or a theory of the universe,” (Papert & Harel, 1991, p. 1). Constructionism came about when Seymour Papert (a colleague of progressivist John Dewey) noted that students seemed more engaged in art classes (when they were building something physical with their hands) compared to when when they were working in math class on more abstract intangible tasks. Constructionists believe that building not only actively engages learners in meaningful tasks but also provides them with tools which can be used to express their emerging knowledge (Ackermann, Gauntlett, & Weckstrom, 2009). Constructionism and makerspaces go hand-in-hand.

In makerspaces, makers are encouraged to not only ‘build-out’ their ideas, but to draw on ‘design thinking’ principles to more deeply understand project goals, propose alternative approaches, and develop models and prototypes that might lead to a solution (Brown, 2008). Although making a physical or digital product that can be shared and celebrated is important,
engaging in design thinking may be of value on its own. The design thinking process involves an initial period of problem identification or question posing; a period of incubation (or ‘percolation’) that leads to the generation of ideas; and then a period implementation, marked by prototyping, building, and refining of ideas towards an end goal (Ackermann, Gauntlett, & Weckstrom, 2009; Brown, 2008). What may appear to be simple design projects (building a chair and desk out of cardboard, for example) often tend to become extremely complex and require considerable trial-and-error, research, and support beyond what was initially expected (Lawanto, 2010). The sort of thinking required to negotiate such a design problem is not insubstantial. To co-opt a line from a famous Jerry Lee Lewis tune, there seems to be “a whole lot of thinking going on” when project-based learning, design thinking, and constructionism collide in a makerspace.

Unfortunately, it is hard to say for sure what cognitive processes are used by students when they’re engaged in making tasks as there is a veritable dearth of scholarly research on makerspaces (Sheridan, et al., 2014) and, in what literature exists, the topic of metacognition is all but non-existent.

Metacognition

As Brown (1994) suggests, “One of the most interesting things about human learning is that we have knowledge and feelings about it, sometimes even control of it,” (p. 6). The elements of monitoring and control seem to be missing from many definitions of metacognition including those from seminal papers on the subject, where metacognition is defined as “knowledge of one’s cognitive processes and products” (as cited in Thomas, 2012, p. 134). A
useful synthesis of Ann Brown and John Flavell’s definitions proposes that metacognition is the “knowledge, awareness, and control of their own thinking and learning strategies,” (Thomas, 2003). This definition seems germane to a study of thinking in school makerspaces as it aligns with the connection of metacognitive knowledge being related to person, strategy, and task (Flavell, 1979); ergo, that while engaged in the design thinking process, student makers may draw upon knowledge of themselves in relation to other makers (some with valuable expertise), consider the demands of the task at hand, and possess some cognitive flexibility in which strategies they use to work towards their goal.

**Makerspaces and Metacognition**

Although very little has been written on metacognition in relation to school makerspaces, research focused on the pedagogically-similar learning environments found in engineering schools is beginning to explore design thinking and metacognition. For example, a study by Lawanto (2010) found a positive correlation between engineering students’ ability to self-appraise (monitor their cognitive abilities and identify potential difficulty) and self-manage (plan, adjust, and revise their approaches), regardless of project difficulty. Metacognitive ability seems to allow some students to solve problems in more effective ways than others (Lawanto, 2010). Brown (1994) suggests that students with more metacognitive awareness may be better able to transfer their learning strategies and problem-solving skills to different scenarios. Those engineering students who were better at monitoring their thinking and choosing (and altering) the strategies used during design tasks, could be expected to become better problem-solvers when faced with novel challenges. Since many of their project-based learning tasks require engineering students to engage in long-term iterative design processes, it is possible that their
metacognitive abilities evolve with each additional project (Lawanto, 2010).

The degree to which these findings can be extrapolated to students working in school makerspaces depends on how similar these learning environments and learners are. Is the learning that engineering undergraduates receive in a ten week course focused on design-thinking and project-based learning comparable to the sort of learning K-12 students undertake in their school makerspaces over the course of a year? It is hard to say as very little is known about school makerspaces as metacognitive environments. Even in *Invent to Learn: Making, Tinkering, and Engineering in the Classroom* (Martinez & Stager, 2013), ostensibly the teachers’ makerspace bible, there is little mention of design thinking nor any elaboration on the cognitive processes that occur when students are making.

**Research Question**

Although it would be ideal to dive right in to a study which explores how lateral problem solving training impacts student metacognitive ability and mental flexibility while engaged in makerspace design activities, the almost total absence of research focused on the psycho-social environment of school makerspaces suggests that to do so would be to put the cart before the horse. For this reason planning an intervention study (where time in the makerspace is the manipulated variable and metacognitive strategies are the responding) is not yet appropriate. What is needed is an exploration of the metacognitive orientation of the makerspace as a learning environment. While I am very interested in pursuing a study of this sort, my doctoral research on the interaction between 21st century curriculum reform and classroom design will occupy the bulk of my time for the next few years. I offer the following research design for those who may
wish to explore the question *To what extent is a school makerspace metacognitively oriented?* in my stead.

**Research Design**

To explore this research question in a way that will provide detailed data from potential research sites as well as data that can be generalizable across other contexts (Johnson & Onwuegbuzie, 2004), I recommend the use of a mixed method design. According to Creswell and Plano Clark (2007) quantitative research methods tend to go hand-in-hand with experimental studies which employ a deductive approach to research relying on the scientific method. Qualitative research, on the other hand, involves inductive methods and a subjective exploration of individuals and research sites based on the assumption that individuals experience the world differently and that a multiplicity of realities exist. These divergent perspectives initially led many researchers to criticize mixed-method research on the basis that the perspectives are essentially incompatible (McMillan, 2008), but the combination of both quantitative and qualitative research are, contemporarily, seen to be increasingly important and useful.

An explanatory mixed method design where quantitative data from the administration of a learning environment inventory is followed by qualitative data from interviews (Creswell & Plano Clark, 2007; Creswell, 2013) is ideal for the exploration of the research question.

A standard annotation system using capitalization, arrows, and addition signs exists to help clarify to readers the approach taken in a mixed method study (Creswell, 2013). Because the proposed study is sequential and puts greater emphasis on the initial collection and analysis of
quantitative data with subsequent interview data providing supporting detail, the study can be annotated a QUANT → qual.

**Selection of a Research Site**

Although any school with a makerspace could serve as a research site, since so little research currently exists on student thinking in makerspaces, the ideal site would be one where the enacted curriculum sees all students using the school’s large makerspace on a regular basis. This provides the potential for the entire student population to participate in at least the quantitative portion of the study. For example, researchers might want to find schools where recent major renovations replaced an aging library or centrally-located computer lab with a learning commons and makerspace that teachers and students access throughout the day. In my experience, schools with centrally located and accessible makerspaces often see small group of students using the makerspace before school, at lunch, and after school to carry out their own making projects, but all classes make use the space for problem-based learning as part of their various STEM (Science Technology Engineering and Math) related classes.

**Proposed Data to be Collected**

A variety of data could be collected to fully examine the research question from multiple angles:

1. Makerspace observations can be used to gain insights about what students do when they are in the makerspace. Field notes and video recordings from these observations would
be helpful in understanding how students engage in designing and building, but may also produce prompts that can be used in student interviews.

2. Since many students use the makerspace to complete STEM related projects, an instrument designed to explore the metacognitive orientation of Science classrooms would provide valuable quantitative data. A version of the MOLES-S, the Science version of the Metacognitive Orientation Learning Environment Scale (Thomas, 2003) could be used to assess the degree to which the school’s makerspace “supports the development and enhancement of students’ metacognition,” (Thomas, 2003, p. 175). I recommend that the MOLES-S questionnaire be altered to shift the focus from learning Science in a Science-specific classroom to designing and building in a makerspace. I have made a number of alterations to the MOLES-S for this purpose and have included the revised tool in the appendix. So as not to confuse the altered tool with the original, I’ve added MS for ‘makerspace’ in superscript to the instrument acronym. The MOLES-MS could administered to all students in the school over a period of a few weeks (preferably after they have a spent series of class periods in the makerspace). The development of a makerspace-specific instrument (the MOLES-MS?) is research that would be valuable for a graduate student to pursue.

3. Semi-structured student interviews can be used to explore the sort of thinking that students employ while working in the makerspace. Students could be asked to recall and reflect upon previous project work in the makerspace and to seek to identify examples of them demonstrating metacognitive knowledge, awareness, and control in their making. I
have included a potential interview protocol in the appendix. Some questions are adapted from items found on another metacognitive instrument by Thomas, Anderson, and Nashon (2008), the Science version of the Self Efficacy and Metacognition Learning Inventory (SEMLI-S) and focus on the metacognitive orientations of the student makers themselves. Researchers should work with their research site’s teachers and students to select possible interview participants from each class. Ideally interviews should be conducted in the makerspace outside of class time. I recommend that interviews make use of the hermeneutic dialectic circle described by Guba & Lincoln (1989) in which consecutive interviews are conducted with an ever-expanding circle of individuals until interview data converge around similar themes and information gathered from subsequent interviews becomes redundant.

I acknowledge that the primary sources of data collection that I recommend (namely the MOLES-SMS and semi-structured interviews) are what Veenman, Van Hout-Wolters, and Afflerbach (2006) refer to as “off-line” assessments in that the data is collected after makerspace experiences and not during. I considered the use of “on-line” methods of data collection such as encouraging students to think-aloud as they worked in the makerspace and capturing this dialog and student activity by positioning GoPro cameras throughout the makerspace, but I discarded this approach for a number of reasons. First, to ensure that the cameras and their microphones would be able to clearly record all areas of the makerspace would require numerous cameras and intensive set-up and testing. Second, recording hundreds of students as they use the makerspace would result in an amount of footage and transcript data that would be impractical to collect, store, process, and code. Lastly, recording all students over the course of multiple weeks is
almost certainly an invasion of their privacy as students are likely to discuss personal matters as well as their thinking over the course of the research project. What I propose instead is a reasonable compromise. By using a single video camera, a researcher can direct their recording device towards subjects of interest and exclude those who do not wish to be recorded. Regardless of Veenman, Van Hout-Wolters, and Afflerbach’s (2006) assertion that “on-line” assessment is the way to go, I feel that combining data from the MOLES-SMS, student interviews, and field notes provides more than enough triangulation to allow researchers to be confident in their findings.

**Proposed Timeline**

If data collection is to include multiple classes, it will likely have to occur over a two-month period in the middle of either the fall or winter semesters so as not to interfere with class start-up or final exam preparations. Following an initial introduction to the staff and student bodies, I recommend that the will position themself in a central spot of the makerspace each day for the duration of the research project. After an initial two week period of observation (during which time the researcher will hopefully ‘fade into the background’ of the makerspace and have students become comfortable with them) they can begin administering (with the help of the classroom teachers) the quantitative instruments to classes of students immediately after these students have spent a period of time working in the makerspace. It will likely take the better part of a month to collect questionnaires from all classes. Follow-up interviews can be conducted over the final two weeks of the study period. Data analysis should occur on an ongoing basis throughout the research period.
Data Analysis

Quantitative Data

Data analysis will focus on the MOLES-SMS data collectively rather than on individual responses. Responses to MOLES-SMS items will fall onto an ordinal measurements scale; numerical ratings are assigned to each item (such as 5 for a response of “almost always” or a 1 for “almost never”). These ratings imply a ‘greater than/less than’ relationship although the numerical value of the difference between a 5 and 4, for example, is not quantified (Boone & Boone, 2012). “Descriptive statistics recommended for ordinal measurement scale items include a mode or median for central tendency and frequencies for variability,” (Boone & Boone, 2012, p. 3). Quantitative data analysis using SPSS will calculate frequency, mean, and standard deviation for responses to individual items and MOLES-SMS subscales.

Qualitative Data

Interviews should be transcribed the day they are conducted. Typed transcripts could be hand coded to identify potential themes and analyzed using the constant comparative method; a process whereby information raised in one interview or an other data source is fed back into the hermeneutic dialectic cycle at subsequent interviews for consideration and comment by the participants (Lincoln & Guba, 1989). Themes from the quantitative data, field notes, and initial interviews will be continually identified, explored, and refined as the researcher works towards developing consensus.
Potential Benefits and Future Research

As more schools develop makerspaces, it is increasingly important to discover more about the sort of learning that actually occurs in these student-centred, project-based learning environments. This proposed research project is an important first step towards understanding the psycho-social dimensions, and specifically the metacognitive orientation, of constructionist makerspaces. Future research may test the impact of different cognitive strategies that students can employ while designing and building and the impact of these strategies on their development of metacognitive knowledge, awareness, and control. Possible teacher interventions may be explored that are designed to enhance particular dimensions of the learning environment or improve student mental flexibility and problem-solving.

It is possible that the students participating in this research will benefit from completing either the learning environment questionnaire or participating in an interview. Each assessment asks them to reflect on the metacognitive orientation of the makerspace or their thinking while engaging in project-based learning in the makerspace. The reflection required to consider an item on the questionnaire or an interview prompt could be a metacognitive experience (Flavell, 1979); an intervention in itself.

This research proposal was designed to take place in a secondary school, but a similar study should be conducted at the elementary school level. Such research is important since different strategies are required to enhance metacognitive ability in elementary students compared to older students (Dignath and Buettner, 2008).

For some people, making is not something that is only done while working on school-based projects, but it is an important part of everyday life. For students from less affluent homes
where “do-it-yourself activities are not necessarily a hobby but informal ways of knowing, thinking, doing, and surviving,” (Harvard, Educational Review, 2014, p. 494) it might be possible to enhance children’s existing making competence through cognitive training and increase their social mobility by enhancing their metacognition.

Community makerspaces have been criticized as being places of “white male nerd dominance,” (Rosenfeld Halverson & Sheridan, 2014, p. 497). It would be interesting to run an ANOVA analysis on MOLES-SMS data to see if patterns of responses emerge along cultural lines as they did in Thomas’s (2006) exploration of metacognition in Science classes in Hong Kong.

**Conclusion**

Engineers and entrepreneurs don’t only come from wealthy households. I can’t help but think about the ten-year old North American boy mentioned in the introduction who converted a computer mouse into a toy car. He was engaging in interesting making and innovative thinking for the sake of play. Compare this to William Kamkwamba in Ghana who, at fifteen, converted a discarded bicycle into a windmill to power his parents’ home and pump water. Their thought processes while making are likely similar, but the benefits and the stakes for William are much higher.

There is certainly something beneficial about makerspaces, design thinking, and project-based learning. It behooves us as educational researchers to continue to explore the relationship of thinking, metacognition, and building so school makerspaces and be places of even more significant learning.
MOLES-SMS Items & Subscales
Based on (Thomas, 2003)

Students will respond to each item using the following Likert scale:

5- Almost Always  4- Often  3- Sometimes  2- Seldom  1- Almost Never

Metacognitive Demands
In this makerspace:

1. Students are asked by the teacher to think about how they design and build
2. Students are asked by the teacher to explain how they solve designing and building problems
3. Students are asked by the teacher to think about their difficulties in designing and building
4. Students are asked by the teacher to think about how they could become better designers and builders
5. Students are asked by the teacher to try new ways of designing and building

Student- Student Discourse
In this makerspace:

1. Students discuss with each other about how they design and build
2. Students discuss with each other about how they think when they design and build
3. Students discuss with each other about different ways of designing and building
4. Students discuss with each other about how well they are designing and building
5. Students discuss with each other about how they can improve their designing and building

Student- Teacher Discourse
In this makerspace:

1. Students discuss with the teacher about how they design and build
2. Students discuss with the teacher about how they think when they design and build
3. Students discuss with the teacher about different ways of designing and building
4. Students discuss with the teacher about how well they are designing and building
5. Students discuss with the teacher about how they can improve their designing and building

Encouragement and Support
In this makerspace:

1. The teacher encourages students to try to improve how they design and build
2. The teacher encourages students to try different ways of designing and building
3. The teacher supports students who try to improve their designing and building
4. The teacher supports students who try new ways of designing and building
5. The teacher encourages students to talk with each other about how they design and build

**Emotional Support**

In this makerspace:

1. Students are treated fairly
2. Students’ efforts are valued
3. Students’ ideas are respected
4. Students’ individual differences are respected
5. Students and the teacher trust each other

**Student Voice**

In this makerspace:

1. It is OK for students to tell the teacher when they don’t understand
2. It is OK for students to ask the teacher why they have to do a certain activity
3. It is OK for students to suggest alternative learning activities to those proposed by the teacher
4. It is OK for students to speak out about activities that are confusing
5. It is OK for students to speak out about anything that prevents them from learning

**Distributed Control**

In this makerspace:

1. Students help the teacher plan what needs to be learned
2. Students help the teacher decide which activities they do
3. Students help the teacher decide which activities are best for them
4. Students help the teacher decide how much time they spend on activities
5. Students help the teacher decide when it is time to begin a new activity
SEMI-STRUCTURE INTERVIEW PROTOCOL

Including some prompts from the SEMLI-S (Thomas, Anderson, and Nashon, 2008)

1. How is working on projects in the makerspace different than working in a regular classroom? (How are the students different? The teachers? The assignments?)

2. What sort of things have you designed or built in the makerspace this year? (Can you tell me about something you’ve designed or built this year that you’re particularly proud of? – aka X)

3. When you’re in the makerspace working on a project, how do you decide what to build? (Where do you come up with ideas for your designs? Can you tell me about how you decided to design/build X?)

4. What sort of planning do you do before you start building? (Do you ever change your plans after you start? How do you know it’s time to change plans? Can you tell me about a time when this happened? Did this happen when you were designing/building X?)

5. When you’re working on a project, do you try to predict possible problems that might occur or do you just wait and see what problems pop-up? (What sort of problems did you anticipate when you were working on X? Before you start a new project, do you think back on problems that you’ve had before?)

6. When you’re working on a project, what do you do if you get stuck and aren’t making the progress you think you should be? (How do you go about getting ‘unstuck’? Did this happen when you were working on X?)

7. When you’re working on a project how do you know that you’re making progress? (When you were working on X, how did you check your progress? How does checking your work change how you proceed with your project?)

8. In my research I’ve noticed that ____________. What do you think about this? Why do you think it might be?

9. We’ve talked about a lot but is there anything that you think is really important that I might be missing?

10. Who do you think I should talk to next? Is there anyone that you can think of who might have valuable or different answers to these questions?
References

Today’s students need teachers prepared for classroom responsibilities on the first day of school. Research shows it can take up to five years for teachers to develop their craft to the focus on impacting student learning rather than the novice focus on classroom management. Students cannot wait that long. Teachers must be ready on day one. This study examined the impact of a yearlong internship for 16 undergraduate candidates preparing to become middle grades teachers. The results of the mixed methods study showed an increase in the participants’ self-efficacy for preparedness for the classroom, as well as classroom management. A follow-up study is currently being conducted with graduate students preparing to receive initial teaching certification. This study is examining the impact of a yearlong internship on teacher preparation and will follow the participants’ development through their third of teaching.
Classroom responsibilities include so many factors: student contexts, student abilities, behavior management, procedure management, curriculum delivery, impact on student learning, remediation, lesson extension, evaluation, in addition to the mounds of paperwork needed to document all the aforementioned factors. What is a first year teacher to do? How does a first year teacher manage? Research shows it takes three to five years for teachers to move from the stage of survival to that of master teacher (Fuller, 1969, Wong & Wong, 2001). Today’s students cannot afford to wait three to five years for teachers to develop into master teachers and neither can we as a society. Teachers must be ready on day one of the first year to impact students’ growth and development. How do we help teachers be ready on day one? We propose that it is an increase in clinical experience. Clinical experiences have traditionally focused on a division of labor, whereas, the focus needs to be on how the experience helps candidates develop into effective teachers who impact student learning (Anderson & Stillman 2013).

Due to the need to increase the rate of teacher readiness, we decided to take the approach much like a doctor’s internship and place teacher-candidates in a yearlong internship with a master teacher. Our teacher-candidates, with their master teacher, began their academic year together with a workshop on co-teaching and relationship building and then continued their work together with pre-planning week and open house. We eliminated the term student teacher, as that label often gives the impression that the teacher-candidate is a student without authority in the classroom. We wanted the Grade 6-12 students to see our candidates as co-teachers with equal authority in both content knowledge and management as the master teacher and not as a “student”. Thus, we referred to the candidates as interns or co-teachers. To further establish their role as co-teacher, interns’ names were placed on the syllabus and other documents that were distributed to students and/or parents. One of the schools even issued the interns school laptops.
and name badges. The idea was to completely immerse the interns in the culture of the school. Interns attended the same faculty meetings, team planning meetings, and professional development sessions with their master teacher. The interns reported at teacher report time and did not leave their assignment until teacher dismissal time. Other than times designated for university courses, the intern engaged in active learning within the school-based experience. The idea of interns being seen as colleagues of the cooperating teachers is supported by the findings of a study by Glenn (2006). The research question that guided our inquiry was, how does a yearlong internship impact the development of teacher candidates?

The Need for Earlier Teacher Readiness Development

Students are having to compete in a national and international market for post-secondary education admissions as well as positions within a competitive workforce. This means every minute counts, in every learning environment. It is not until teachers emerge from the stage of survival teaching into mastery teaching that they focus less on classroom management issues and other procedural aspects of teaching. At that point, they have learned to integrate their tacit knowledge, content knowledge, pedagogical knowledge, seamlessly. Waiting an extended amount of time for teachers to elevate to the level of master teacher may cost a student their entire secondary academic career. Students cannot afford to wait.

Impact of Clinical Placement

Clinical experiences can provide a space for teacher-candidates to practice their craft but can also be a space of non-educative experiences (Darling-Hammons, 2006). Because the impact of the clinical experience has been directly related to the mentoring component of the cooperating teacher (Osunde, 1996) and because teacher-candidates test their personal theories,
knowledge, skills, and dispositions during clinical experience (Kelchtermans & Ballet, 2002), appropriate placements are crucial.

**Methodology**

This study was a mixed method study. Quantitative data was collected through the Ohio State Teachers’ Sense of Efficacy Scale- long form (TSES, Tschannen-Moran & Hoy, 2001) to measure the self-efficacy of the participants. This data was collected from 16 yearlong interns and 15 students participating in the traditional student teaching program. Data was collected three times throughout the student teaching experience: August, January, and May. Qualitative data was collected from the yearlong interns’ journaling to given prompts related to preparing to be a teacher. Examples of prompts are things I want to steal from my cooperating teacher and best practices. Qualitative data was analyzed separately by the researchers using content analysis (Covert, 1977). After individual codes were established, meetings were held to agree on codes for the study. The quantitative data was analyzed using reliability analysis (coefficient alpha) to measure internal consistency of the items.

**Findings/Discussion**

The findings of the quantitative data showed the participants of the yearlong internship showed a higher level of overall self-efficacy than the traditional student teachers and notably, also in the sub-factor of Efficacy of Classroom Management. The qualitative data supported the quantitative data. Participants were comfortable contacting parents, a trait usually not obtained until after the completion of a preparation program. “I want to make sure that I do utilize my parent contact sheet and keep a record of when I call parents to then later be able to use it when there is an administrator involved.” Another participant stated that she was able to better “Learn management and procedures and really get to know the students.” This was statement was in
reference to how once management issues are addressed, a teacher can focus completely on the students learning.

The data also showed that the yearlong participants are more self-efficacious in preparedness for the classroom. When asked about their experience in a yearlong internship, participants replied in statements that reflected their knowledge of their students and how they learn. One participant stated, “I was able to plan lessons designed for students and their different abilities.” Another said, “[I] was very comfortable most of the year with planning and discipline.” A third replied, “I was able to plan lessons designed for students and their different abilities. I knew the students well enough to effectively use a variety of grouping methods for group and partner activities. I also knew their various learning styles, and was able to incorporate them into my lesson plans.” There were many more that conveyed the same message, that a yearlong internship was beneficial in “acquir[ing] skills more like those of a first year teacher.”

These findings demonstrate that yearlong internships advance the skills of teacher-candidates to that of a teacher completing his/her first year of teaching. These teacher-candidates have undergone classroom situations that only experience can provide. As these candidates enter their own classrooms they are more prepared to impact student learning, more quickly. They have experienced classroom management, parent interactions and other procedural aspects of teaching to the extent that they are now more focused on designing lessons that meet the needs of their students.

Subsequent Research

The previous study was conducted with undergraduate students in the last year of their teacher preparation program (Williams, Gray, Stockdale, 2012). The question of how the results
might differ if the teacher candidates were Masters of Arts in Teaching (MAT) students then emerged. These candidates have a college degree (bachelors or higher) in various content areas and some with professional career experiences, but do not have backgrounds in curriculum, educational instruction, assessment, or student development. Through the MAT program, candidates will gain initial teacher certification upon completion. Based on that question, a subsequent research study was developed. The purpose of the follow-up study is to determine the development trajectory of teacher candidates with an increased amount of clinical hours.

Funded by the Woodrow Wilson Foundation, our Masters of Arts in Teaching program for secondary mathematics and the sciences has been reformed to decrease the number of courses and increase the amount of time spent in the classroom. This was done so that teacher candidates have more of an experience much like their first year of teaching, but with support. Teacher candidates begin the clinical experience with a workshop in co-teaching followed by the school district’s pre-planning week. Candidates take courses in the evening, but spend four to five complete days per week in the schools working with students. After completing a yearlong internship, candidates receive three years of mentoring with a mentor teacher based at their school as well as a mentor from the university.

The subsequent study is a longitudinal mixed-methods study. Quantitative data is collected using the Ohio State Teachers’ Sense of Efficacy Scale- long form (TSES, Tschannen-Moran & Hoy, 2001). This data will be collected during the initial semester of the program prior to any field experience and then again at the end of each of the clinical semesters as well as during the three mentoring years. Qualitative data is collected during the initial semester prior to the beginning of the clinical experience, periodically during the clinical year and continue until the candidates complete their third year of teaching. While in the program, qualitative will be collected in the
form of reflections. This quantitative data and qualitative data collected during the program will be used to measure candidates’ initial self-efficacy and their growth throughout the program. Data collected after graduation and once candidates are in their classrooms, will be used to measure the implementation or lack thereof of the candidates’ self-efficacy and to examine the trajectory of the candidates’ teacher development. Additional data collected during the mentoring years will include, professional development plans the candidates’ development, classroom observations, and interviews.

Preliminary analysis of quantitative data reveals a higher self-efficacy for preparedness for the classroom. Data was collected during their initial semester in the program, prior to any clinical experience. This is consistent with the data collected in the previous study with undergraduate students. In the initial study, students completing a traditional clinical experience, an observational practicum during the fall semester and a student teaching experience during the spring semester, showed a high level of self-efficacy until they actually entered their student teaching experience, whereas the yearlong interns continued to have a higher level of self-efficacy. Data for the subsequent study will continue being collected once the clinical experience begins and will be analyzed to determine if similar or different results occur.

**Conclusion**

It is important for students to be equipped with the skills, knowledge, and dispositions to be competitive in a global market. In order for students to be equipped, their teachers must be ready on day one. This study showed the dramatic impact of teacher-candidates completing a yearlong internship as opposed to a more traditional observational practicum followed by one semester of student teaching. The yearlong internship gave teacher candidates experiences of a first year teacher. They were able to learn to address classroom management and behavior issues
while having the support of a master teacher. They learned first-hand that teaching is a relational profession and that once they got to know their students. Classroom management became automatic, which allowed them to focus more on student learning. The only way to gain these types of experiences is time. Being assigned as a partner in a classroom for an entire academic year provides just that…time. The participants are entering their first year of teaching with the knowledge of a second-year teacher. It is hoped that the preparation experience will lead to impacting student learning sooner. The subsequent research will provide a glimpse into how the yearlong internship actually impacts the classroom performance of teacher candidates with extended clinical time.

Title: Evaluating the Effectiveness of the Interactive Language Program, DISPL-A, with Students with ASD in Self-Contained Settings

Linda Crane Mitchell, PhD
Human Development and Family Studies
307 Rivers West
East Carolina University
mitchellll@ecu.edu

Lauren Stafford, MEd
Monarch Teaching Technology
lstafford@monarchteachtech.com

Autism Spectrum Disorder (ASD) affects 1 in 68 children. Language impairment is a common characteristic of ASD, affecting the acquisition of more abstract language components and concepts. Fifty percent of ASD individuals are unable to interpret or use spoken language in other than rudimentary ways, greatly inhibiting learning at all grade levels and settings. However, existing visual instruction methods use isolated language elements and do not teach critical contextual relationships (such as generalization) between the real world and language representations.

This study focuses upon the development and field testing of a structured application (called “DISPL-A”) of video like scenes and corresponding discrete images could accelerate acquisition of language skills and, by extension, learning by children with ASD. DISPL-A was tested at 4 different national sites representing public and private schools and different teaching/therapeutic approaches (ABA, TEACCH, Language-based, and Blended) with 14 students with ASD, 7 diagnosed as Severe (Group 1, mean developmental age 2 yrs. 4mo) and 7 as Moderate (Group 2, mean dev. age 4 yrs. 1 mo.). Participants were in self-contained classrooms.

After initial baseline tests and 6 to 9 weeks training for 20 minutes per day, 3/4 days/week, Group 1 (severe) students’ showed improvement based upon changes in mean scores and mastery (of appx 70%) was achieved by 3 of 7 students. Group 2 (moderate) students scored at or above the 70% target on the initial baseline, but were included to determine if they were able to improve on generalization measures. Group 2 showed a mean improvement from 1% to 6%. The preliminary results demonstrate the feasibility of facilitating language improvements in children with moderate to severe ASD using the DISPL-A Interactive Language Program. Overall project and results will be discussed.

6. Abstract and/or full paper: See below
Abstract

The homeless problem in Hawaii continues to challenge social and health services in the community. Many of the homeless have taken up residence on the beaches however transitional housing and emergency shelters provide short term alternative. Some nursing students in Hawaii work with the homeless population during their senior year of clinical training. Students engage and develop relationship with their clients to understand their specific situation and health care needs. Over the course of five years, data was collected from different nursing students in their senior year before and after their experience caring for homeless individuals and their families. The data reflects a significant change in student’s attitude toward homeless individuals and better understanding of their role in addressing the health care needs of this population. The majority of students explained feeling less fearful toward the homeless. Students shared a deeper sense of empathy as well as passion to help others. Besides increased awareness and a change in attitude on the part of the new generation of nurses, a bridge will hopefully continue to be built to increase mutual trust and improve access to health care. The results of this project have implications for nursing education as well as for the agencies that work with the homeless.
From Content To Format: How To Make Screenwriting Fun

Art Education

Workshop

A workshop environment focusing on the basic principles of screenwriting and how to teach the subject in a fun and open environment. Will include an original short screenplay reading and a writing exercise.

Samantha Hughes, Graduate Student M.F.A Screenwriting, California State University, Northridge
Samantha.Hughes.293@my.csun.edu

Dianne Durazo, Graduate Student M.F.A. Screenwriting, California State University, Northridge
Dianne.Durazo.253@my.csun.edu
This workshop will be split into three parts. First explored will be the basics of screenwriting including structure, plot, development, and tips and tricks. This will be followed by an original screenplay reading involving audience participation, which will enforce the lessons taught on format and structure. The last section of the workshop will include the audience actively participating in a writing exercise that will highlight the benefits of creating a safe and fun environment for emerging screenwriters.

Scheduled time:

30 minutes dedicated to the presentation
30 minutes dedicated to the script reading
30 minutes dedicated to the workshop

Using our status as recent graduates we’ve put together the most effective methods that we’ve seen played out successfully in the classroom environment. From the hero’s journey to ten-minute meditations, different approaches in screenwriting will be examined and applied. Thus showing that an eclectic approach to screenwriting is a successful formula that allows for individual creativity while maintaining structure.

INT. YONIC BOOKS SINGLES MIXER - NIGHT

In Pinterest style loopy writing a sign reads, "Books and Wine: Oh so fine, they help you mingle. So long being single... Love-the staff of YONIC BOOKS"

Stuffy pale DIVORCEE’S (Late 40s) wander a bookstore attempting to flirt with whoever makes eye contact.

In the far corner, next to a table filled with hard cheeses awkwardly stands BECKY (25) too young and too messy to be there. She grips two wine glasses and chews a ridiculous mouthful of cheese.

She notices a RANDOM DUDE checking her out. She quickly swallows her mouthful of cheese and attempts to flutter her eyelashes.

Random dude is not impressed. He moves in the opposite direction.

Becky sighs and dives in for more cheese.

EXT. OUTSIDE BOOKSTORE - NIGHT

SHELLY (25, hippie chic) stops at the curb in front of the bookstore in a loud beat up old car. Her passenger is a super HOT GUY (25) dressed like a GQ model.

Shelly pulls him by his shirt, roughly kisses him, takes a deep breath and hands him a crisp $20 bill.

    SHELLY
    You’ll know her when you see her.

Hot Guy exits the vehicle and walks with the confidence of a man who’s never been rejected.

INT./EXT. LIBRARY SINGLES MIXER - NIGHT

Hot Guy lures Becky outside and pushes a bewildered Becky into the car. Hot Guy slams the passenger door and Shelly zooms off.

INT. SHELLY’S CAR - NIGHT

    BECKY
    What the hell just happened?

Shelly attempts to explain, but Becky isn’t finished ranting.
BECKY
Why weren’t you inside? Who was that hot unicorn who pushed me in here? Where the fuck are we going?

SHELLY
Calm down.

BECKY
I’m not a fifties housewife, you will not ask me to calm down!

Shelly is so focused on the convo that she is driving like a maniac. The car swerves back and forth.

SHELLY
But you’re acting like a fifties housewife! And by that I mean a woman who is currently 80 years old. You’re in a straight up old lady rut. You’re at a singles party for people over 50.

BECKY
I’m really mature for my age. And plus, they deserve to find the love of their lives for the second time. Second marriages are great because you can be the cool-step-mom half the time.

A car horn HONKS as Shelly causally changes three lanes at once. The girls continue without missing a beat.

SHELLY
You’re 25. You have plenty of time to be a step mom. Last week you skipped out on our lunch date because you wanted to do water aerobics at the YMCA. That’s not mature, that’s geriatric.

BECKY
Screw you.

SHELLY
No, screw you and by that I mean you need get screwed. Tonight, whether you want to or not we are going on an adventure of body, mind, and soul.
BECKY
Are you high? What are you even saying?

SHELLY
I have a plan.

Becky looks terrified. Shelly’s scary smile confirms her fears as she hits the accelerator.

CUT TO:

EXT. SPA - DUSK

CHYRON: BODY 6 p.m.

Becky and Shelly pull up to a spa. Becky looks relieved at the calm and peaceful scenery.

BECKY
I would have willingly gone to a spa.

Shelly pulls out two free entrance coupons.

INT. SPA - CONTINUOUS

Shelly hands over her coupons and in exchange gets two towels. A scantily clad attractive MALE RECEPTIONIST greets them.

MALE RECEPTIONIST
Welcome to Glen Heathen. Ladies locker rooms are to the left. Please remove all forms of clothing before entering the outdoor spa. Enjoy your stay.

Becky and Shelly follow the signs.

BECKY
Is it just me, or are there hot unicorns just popping up left and right tonight?

SHELLY
Girl, we’re about to be at a rare hot unicorn convention...
INT. WOMEN LOCKER ROOMS - CONTINUOUS

Shelly strips off all her clothes. And places them in a locker.

    BECKY
    Wait, did that guy just tell us to take off all our clothes back there? You’re naked.

Shelly does a little twirl.

    SHELLY
    No shit. What did you think when we entered the spa, Glen HEATHEN. This is the hottest nudest colony/spa in Los Angeles county.

    BECKY
    Nudest? As in bare-butt-pong-playing retirees?

    SHELLY
    Today’s theme is 30 and under. I’m not an idiot, I checked the website. And spare me with your agesist comments. I just picked you up from the AARP dating pool.

Becky rolls her eyes and removes the top layers of her clothing, revealing a sports bra and boy shorts.

EXT. GLEN HEATHEN SPA - NIGHT

Shelly drags Becky out to the main spa. Shelly is nude and confident. Becky still wears her sports bra and shorts. Her free hand covers her stomach.

The pair both stop in their tracks as they notice that the NAKED PEOPLE around them are a lot more wrinkled and a lot less firm than expected.

A wonderfully hairy NAKED MAN in his sixties saunters up to the girls. He’s red and sweaty, dabing himself with a hand towel, jiggling with every wipe.

    NAKED MAN
    Hey, I’m Archie, may I just say that you two ladies are keeping it right and tight. I’d never guess you’re thirty.
BECKY
We aren’t?

NAKED MAN
Today is over thirty Thursday
though?

Becky throws eye daggers at Shelly.

SHELLY
Uh, my bad.

The Naked Man gestures at Becky.

NAKED MAN
And you should take off your
clothes before Earl notices. You
won’t like it when Earl gets angry.

BECKY
That’s alright. I’m comfortable
just the way I am. Thank you.

Naked Man walks away, before his towel accidentally slips
off his shoulder, dropping the towel a few feet from the
girls. He picks it up, mooning them in the process.

BECKY
Not today, Satan!

SHELLY
Don’t make a scene. This is
supposed to be a spiritually
enlightening experience for us.

BECKY
Fine. I’ll follow your lead. You’re
lucky I desperately need a massage.

Becky and Shelly find an empty pair of recliners and lay
their towels down.

Earl, a 85 year old staff member, walks up to the duo.

EARL
What do you think you’re doing?
This is a no-clothing zone. This
whole spa is a no-clothing zone.

SHELLY
You must be Earl. I’m Shelly. This
is Becky. It’s our first time. I
think she just wants experience
this in clothing.
EARL
You clowns are ruining our atmosphere. And honestly, I don’t think you’re thirty. You need to buck up and remove your clothing or leave.

BECKY
THIS IS AMERICA. I don’t have to do anything. You can’t force me to get naked.

EARL
Yes I can.

Earl walks towards Becky.

BECKY
Not today, Satan. What, are you Gonna make me? You’re like a 100?

EXT. SPA HEATHEN - DUSK
Becky and Shelly get pushed out of the spa doors and skitter on to the sidewalk. Shelly’s still completely nude as cars whiz past the girls on the street next to them.

Becky rages at Earl as the doors to the spa close.

BECKY
(yelling)
I didn’t know Earl was your nickname, Satan! This is America! This is unjust, misogyny run rampant. You probably fought for Germany you sexist old--

More cars zoom down the street, HONKING And WHISTLING.

Shelly reaches over and covers Becky’s mouth. She attempts to use the hand she has free to cover her exposed breasts while she’s crossing her legs.

SHELLY
STOP. Catcalls Beck. I’m getting catcalled. Priorities. I’m naked on a corner. Even hookers have more dignity with their leather booty shorts.

Becky shrugs.
BECKY
You wanted to be a Heathen.

Becky points to the Spa Heathen Logo.

Their clothes and bags get thrown over the wall, landing on various tree limbs and shrubs. Shelly’s bra tangle at the top of the tree.

Shelly quickly grabs her shirt and shorts from the bushes. Shelly stares at the bra.

SHELLY
I always wanted an excuse to be more free.

She shrugs and the duo walk away leaving the bra behind.

BECKY
The Heathens took more than just your bra. They took our dignity.
I’m writing a letter. I don’t know to who, maybe my congressman. I’ll figure it out.

Becky stomps away to the car, with all her clothes still in her hands.

INT. SHELLY’S CAR - NIGHT

CHYRON: MIND 9:14 pm.

The girls pull up to a sketchy neighborhood. Dogs are howling. HOOLIGANS are partying on the street. Glass BREAKS in the distance.

BECKY
Where the fuck are we now!??

SHELLY
The valley.

BECKY
The valley! No wonder it took us seventy years to drive here.

Shelly growls in frustration.

SHELLY
Come on, let’s go. I can’t handle you sober anymore.

Shelly moves to exit the car. Becky stays put.
BECKY
No way, I don’t want to die in the valley.

SHELLY
Then stay here, asshole.

BECKY
This is your thing, don’t be a dick! Take me home.

Shelly leaves the car without another word. SLAMS the door shut.

Becky runs after her.

BECKY
Wait, don’t leave me here.

Becky catches up at the front of a run down house with a broken screen door.

CUT TO:

INT. DRUG DEALERS HOUSE - NIGHT

An emaciated drug dealer LONNY wordlessly leads the two girls inside. Greets the pair with a simple lift of his chin.

The living room is a disaster filled with fast food leftovers, drug paraphernalia, and a giant TV.

Shelly’s unfazed. She follows Lonny further inside as he gathers her order.

Becky hangs back by the door. Stands, arms crossed. Her eyes immediately dart to the bathroom, which has no door.

LONNY
Shell, is that chick a Narc?

BECKY
I’m not a Narc. I swear. I promise. Cross my heart, I’m cool. Don’t hurt me.

Shelly and Lonny laugh.

DRUG DEALER
Ah, I see she’s just a nerd.

Becky and Shelly are both about to respond when three loud WASTED WOMEN (early 20s) burst through the door.
The door hits Becky and her body makes contact with the RING LEADER.

RING LEADER
EXCUSE ME! Who the hell are you?

The other two wasted women stand behind the ring leader in solidarity. They all look too skinny and too easily agitated.

BECKY
Um...

SHELLY
We’re just here--

RING LEADER
You’re fucking two girls this time!
Fuck you, Lonny! Now I gotta waste my manicure on these ratchets.

Lonny slowly backs down the hall as the ring leader and her friends attack.

The Ring Leader goes after Becky like a caged animal. Clawing and kicking a stunned Becky.

The two friends take on Shelly who looks practiced in the art of street fighting.

SHELLY
Run, Forest, run.

This shocks Becky into action and she shoves the girl as hard as she can and makes a break for it.

In a Hulk like move, Shelly whips the other two girls off her. Grabs the forgotten drugs off the ground and runs out the door.

The wasted women run after them.

BECKY
(running)
Dear God, Make me a bird, so I can fly far, far away from here.

The girls haul ass and make it into the car. The Ring Leader is so close Shelly’s door hits her hand as it slams shut.
INT. SHELLY’S CAR – NIGHT

Shelly speeds off, battered and breathing heavy.

Becky is mid rant.

BECKY
I was hit in the face. The face.
I’ve never been hit in the face.
I’ve never been hit.

SHELLY
You’ve never been hit?

BECKY
I’m an only child. My parents are therapists, I didn’t even have time outs. My best friends growing up were the wind instrument section of band class. We weren’t hitters. We’d all just make out with each other and talked about My Chemical Romance.

SHELLY
Emo? Really Beck?

BECKY
Stop trying to distract me. I’ve been injured because of you!

SHELLY
Woah, no because of that drugged out psycho. I didn’t do shit.

BECKY
Semantics. I’m here because of you. Take me home!

SHELLY
But I got the drugs and the nights not over!

Shelly pulls out a small bag from her pocket. Smiles as she waves it at Becky.

BECKY
You think I wanna do drugs! Take me home.

SHELLY
Fiiiiiiine, wet blanket.
EXT. OUTSIDE OF WAREHOUSE— NIGHT

CHYRON: Soul 11:07 pm.

Shelly pulls up to a giant warehouse with a faint light coming from under the door.

The car sputters and dies.

INT. SHELLY’S CAR – NIGHT

BECKY
I knew you agreed to take me home way too easily.

SHELLY
Did you not just hear my car die!

BECKY
Likely story.

SHELLY
You know you’re the worst, right? You’ve been a total dick this whole night and about as understanding as Stalin.

BECKY
(Sarcastic)
And you’ve just been a peach. You irresponsible, practically an attempted murderer--

SHELLY
You know what I’m fucking happy my car died. You don’t deserve Nikki Minaj.

Becky gasps.

BECKY
Nicki?!

SHELLY
Yah, that rare unicorn got me two tickets to a private after party hosted by the legend herself.

Before Becky can respond, Shelly exits the car, slams the door and heads for the light.
BECKY
(Pained)
Nikkkiiiiiiii

Becky leans back in her seat. Confident, her friend will cool down and come back.

CUT TO:

INT. WAREHOUSE - NIGHT

CHYRON: 45 Minutes Later

A giant party is in full effect. People everywhere, lights, thumping MUSIC.

The beat drops.

An angry Becky makes her way inside.

Shelly crowd surfs around the packed warehouse. Her hands holding the nearly emptied paperbag of drugs.

Becky spots her and bum-rushes the crowd and tries to get Shelly’s attention.

BECKY
Get down here Shelly Marie Silverstein! You just left me!

SHELLY
I’m sorry, it’s too loud. Come closer!

BECKY
Put her down!

Shelly magically floats towards Shelly.

SHELLY
You may release me.

The crowd drops Shelly to her feet.

BECKY
This is not okay. We need to go home and when did you steal my iphone?

SHELLY
I Still can’t hear you.. come closer! I don’t read lips.
Becky elbows her way closer to Shelly. Shelly reaches into her mysterious brown paperbag and pulls out a handful of special pills.

She grabs Becky by the head and stuffs the pills in Becky’s mouth.

**SHELLY**
Shhhh. It’ll be all better soon.

Becky attempts to spit the pills out, but swallows a few in the process.

**BECKY**
Fine, Satan, today you win.

Shelly throws the remaining pills into the crowd.

**SHELLY**
Bless you all. You’re welcome.

Becky wipes at her mouth.

**BECKY**
Ugh, I hate you.

INT. AMAZING RAVE - LATER

CHYRON: One hour later...

THUMPING MUSIC engulfs the venue.

Becky and Shelly dance their asses off in a crowd of people all having the time of their lives.

The girls hug each other tightly.

**BECKY**
I just love you-

**SHELLY**
No, I LOVE you!

**BECKY**
Let’s dance!

MONTAGE:

The girls bust out some amazing choreographed dances.

The girls take shots at a neon bar with two HOT GENTLEMEN.

Shelly and Becky in the DJ BOOTH, one wears the head phones, the other one scratches a record.
The girls get piggyback rides from the hot gentlemen.
The beat drops again.
The whole raves attention is at the front door and in walks NICKI MINAJ!
The girls drop off their rides in shock.

SHELLY
Holy shit! She’s here. How? Why?
Goddess. Dream maker. Icon.

The crowd magically parts and...
Shelly runs to Nicki and literally bows at her feet.
Becky comes running after. Happily screaming.

BECKY
BEST NIGHT EVER!!!

End Montage.

CUT TO:

EXT. OUTSIDE WAREHOUSE - DAY
Becky and Shelly wake up near the trashcans, sprawled across trash and litter. Shelly groans with regret.

SHELLY
What happened?

Becky slowly gets up, holds her stomach.

BECKY
I think last night is coming up.

Becky finds a nearby empty gallon of paint and attempts to hurl.

BECKY
Nope. Last night is definitely coming down and out.

Becky then sits on the empty paint bucket and relieves herself.

SHELLY
Stop, Becky. You’re better than that. Oh, no! Don’t do that. Stop. Please.
BECKY
I’m crowning.

Shelly rises to her feet, wiping her mouth from dried saliva.

SHELLY
Never again. I think I’m dead. You just pooped in a bucket. You were right, old lady life sounds pretty good.

Shelly rubs her face. whimper.

BECKY
Are you kidding me? Goodbye old lady rut! Last night was the best night ever. We danced with Nicki. And she’s bff’s with Bey. So, we were like three degrees away from Blue. Poop shmoop.

Shelly shakes her head in disagreement. Groans as the sun shines in her eyes.

FADE TO BLACK.

SHELLY V.O.
Seriously though, when’s that next wine and cheese mixer? I could make a hot stepmom.

THE END.
FOSTERING INCREASED PARTICIPATION OF WOMEN AND MINORITIES IN STEM STUDIES

Abstract:

Participation of women and minorities in STEM fields is a persistent issue, and one that has its base in education. One study found that the STEM workforce in the United States today is no more diverse than it was fourteen years ago. Data in another report show that in Silicon Valley, for example, the gender and racial gap has even widened since last year. That report indicates that this is rooted in education. Within the past thirty years, there have been major changes in both the economy and the population United States. The economy has moved to an increasing dependency on technology, and the population has become much more diverse. In 2010 the President’s Council of Advisors on Science and Technology stated, “STEM education will determine whether the United States… will be able to solve (the) immense challenges in such areas as energy, health, environmental protection, and national security.”

Our work shows that community colleges can contribute to the effort to increase the participation of these underrepresented groups in STEM studies. There have been programs, efforts, and studies in this area sponsored by government and private organizations, including the National Science Foundation and the US Department of Education. The most intervention work has been in the areas of Supplemental Instruction, Learning Communities, Mentorships, and Early Research Experiences.

Our work shows that lessons learned from Supplemental instruction programs at other educational institutions can aid in creating effective and manageable SI programs in community colleges. We have data that indicates our SI program is particularly effective and valuable for increasing the success in gateway science courses for both community college women and minorities. We have found that the circumstances at community colleges makes creating Learning Communities more challenging. Yet, we will share ways that this can be done, and how they, too, can be part of an integrated program that leads to successful results. We will share the factors and work that has made an early research experiences possible thorough partnerships with surrounding universities, and we will give examples of its success.

While increasing the success and interest of community college students in STEM fields has it own specific and unique challenges, it is an important effort
Introduction:

To address the goals to increase the success of our students in the science, engineering, technology and math (STEM) classes and to encourage underrepresented populations to pursue a STEM career, we have created a culture of STEM awareness and support. We have implemented a comprehensive approach that included academic support for students enrolled in specific science classes, creating a supportive and encouraging environment in Learning Communities, exposing students to STEM opportunities and research experiences, and motivating students to explore STEM courses. Most of this work was funded by a grant from the Department of Education, the Minority Science and Engineering Improvement Program (MSEIP). San Bernardino Valley College (SBVC) is a federally designated “Hispanic Serving Institution” (HIS) and “Minority Serving Institution”, with around 25,000 full time and part time students a year. San Bernardino County has one of the lowest college matriculation rates in California. Only 18.6% of adults age 25 and older in San Bernardino County hold bachelor’s degrees or higher, and 48.3% of adults in San Bernardino County never attended college. Our college has a Hispanic population of over 56% and an African American population of over 15%. This work, therefore, addressed the need for greater educational achievement in a “minority-majority” region of southern California that lags behind the rest of the state in K-12 preparedness, college matriculation rates, and education levels.

The Work presented here has a number of components employed to enhance the success of women and minorities in STEM. Supplemental Instruction, Learning Communities, Early research opportunities and involvement, and early outreach were all part of this comprehensive program.

Support for current STEM students Supplemental Instruction (SI)

The implementation of the Supplemental Instruction program provided a safety net and instructional support for STEM students. Our faculty developed handbooks for the student Supplemental Instruction Leaders, and for the faculty whose class sections were assigned SI leaders. The faculty was introduced to the program at division or department meetings and one-on-one discussions. The student SI Leaders receive extensive initial training and on-going weekly training, led by a combination of classified staff, instructional faculty, and a counselor. Topics in this training include: peer mentoring, time management, redirecting questions, encouragement of active participation, strengths training, techniques for creating mock exams, note taking skills, and strategies to engage the students.
In Supplemental Instruction sessions students review material from class sessions with the direction and support of the SI Leaders. Supplemental Instruction sessions are offered twice a week for 2 hours. There are about 15 - 20 student participants in each session. The SI Leaders use instructional sheets and materials developed with the course instructor. In addition the SI Leaders themselves attend the course lectures. This reinforces the SI leaders own personal knowledge and understanding, and enables them to more directly assist students in being successful in the class. These SI leaders in turn provide mentoring as well as instructional guidance during the SI sessions with students. The SI leaders are trained to encourage and cultivate a community of learners among the students attending their sessions.

The Supplemental Instruction SI sessions are not mandatory, but faculty encouraged students to attend. Data clearly demonstrated a higher success rate (grade C or better) for students who participated in five or more Supplemental Instruction sessions. This enhanced success is particularly prominent with women and minority participants.

This work included over seven hundred students per semester. Touching well about two thousand five hundred students during the course of the program. And, our data indicates that these SI sessions have enabled an increased success rate for our students.

The classes and their enrollment that were evaluated are listed in the chart below.

Our data shows increased success rates for minority students who attended the SI sessions. In the first semester of SI implementation, for example, the success rate for African Americans was 63% for those who attended 5 or more sessions compared to
only 17% for those who did not participate in SI sessions. For Hispanic students the success rate was 64% for those who participated in 5 or more SI sessions while only 35% for those who did not participate in SI sessions. And the data shows over a 25% better success rate for African Americans in each semester of SI service with the exception of one. (Fall 2014 data does not demonstrate a strong difference in success for African Americans, but this anomaly can be due to a small sample size). Success rates for Hispanics are consistently higher in those who participated in 5 or more SI sessions.

The tables below (Tables 1-4) demonstrate a higher success rate for the majority of minorities if the student attended at least 5 SI sessions in a semester.

Gender Success Data for SI

In addition to increased success rates for minority students who attended the SI sessions, the data also indicate that women’s success rate is also higher with participation in these sessions. Again, our first SI implementation semester showed a success rate of 57% for those women who did not participate compared to a 79% success rate for those with at least 5 sessions. Each semester’s results indicates a greater success rate for women who participate in SI sessions.

The tables below (Tables 5-8) demonstrate a higher success rate for female students who attended 5 or more workshops

Support for current STEM students: Learning Communities

Another component of our plan to nurture and cultivate students pursuing STEM careers has been a pilot of “learning communities”. The learning communities consisted of having two classes such as College English with General Chemistry I, or General Chemistry I with General Biology I with the same enrolled cohort. Since students majoring in biology, chemistry, or biochemistry take General Chemistry I (CHEM 150) as their first college level science class, we included this course in most of our learning communities. Faculty from each class worked together to improve student success by aligning the sequence of curriculum, and linking the concepts in the course. Also, different strategies were used to support and nurture the students. For example, the linked faculty members applied “Gallup’s StrengthsFinder” to create more course engagement in students as they utilize their unique skill sets to be successful students. Additionally strengths-based learning, promotes hope in individuals. Others invited counselors to the class to address anxiety and in particular, test anxiety. Several faculty taught note-taking, study and organization skills, and integrated brain-based learning into their teaching. In addition, all students were required to see a STEM counselor once, and preferably twice, during the semester. These students also have greater access to STEM counselors and are provided the guidance for successful transfer to a university and career preparation.

The Learning Communities that we attempted are the following:

<table>
<thead>
<tr>
<th>Year</th>
<th>Classes Offered</th>
</tr>
</thead>
<tbody>
<tr>
<td>2013, fall</td>
<td>Introductory Chemistry (CHEM101) + Preparation to College Writing (ENGL015)</td>
</tr>
<tr>
<td>2014, spring</td>
<td>Attempted General Chemistry I (CHEM150) + Freshman English (ENGL 101)</td>
</tr>
<tr>
<td></td>
<td>General Chemistry I (CHEM 150), only.</td>
</tr>
<tr>
<td>2014, fall</td>
<td>General Chemistry II (CHEM151) + Organic Chemistry I (CHEM212)</td>

<td>Introductory Chemistry, fast track, then General Chemistry, fast track</td>
</tr>
<tr>
<td>2016, spring</td>
<td>Planned General Chemistry I (CHEM150) + General Biology I (BIOL 201)</td>
</tr>
<tr>
<td></td>
<td>General Chemistry I (CHEM150) fast track, then General Chemistry II (CHEM151)</td>
</tr>
</tbody>
</table>
There were some obstacles to establishing the learning communities in this community college setting. It took several trials to find the best methods to register the students in the specific sections of these classes. It also took some time, resources and effort to find the best fit for faculty, and to identify the classes that students were ready to take. Unfortunately, as expected, some interested students had schedule conflicts and could not enroll in the learning community classes. Yet, we were still able to involve a great number of our students.

Visits to local universities (for example, the University of California, Riverside (UCR) are included as part of the Learning community activities. During these visits, students are provided tours of several STEM labs, and interact with panels of students and graduate students who talk about transfer, graduate schools, and STEM disciplines. These visits have generated enthusiasm for transfer, and for persevering as a STEM major and they have encouraged students to continue their long-term planning in a STEM career.

In traditional courses, students typically engage at a superficial level when they collaborate in course assignments and laboratory activities, but learning community students seem more likely to form informal study groups, they seem to challenge each other more often, and the peer-peer bond seems to persist longer and beyond LC courses. Moreover, as students participate in course activities they seem to be more engaged with course content and with the faculty. With the use of Gallup’s Strengths-based education, students have also become introspective about their learning journey which has led them to target specific ways of modifying their learning skills. All these are non-academic predictors of successful students and lifelong learning.

**Support for current STEM students: Field Trips**

To enhance exposure to STEM research and careers, students in the STEM areas participated in STEM field trips, such as tours of the Scripps Institute Center for Marine Biotechnology and Biomedicine or the Salk Institute for Biological Studies, where they were able to talk to researchers and tour their labs. Following their visit to the Salk, the students toured both University of California San Diego (UCSD) and San Diego State University (SDSU.) One of our students expressed this written sentiment:

“The Salk Institute was so amazing!! I felt so lucky to be one of the students to get to see it. It was one of the greatest opportunities I've come across thus far. I really enjoyed visiting both colleges as well. It was super fun and I also feel that it has opened a lot of doors for me and my future career.”
Support for current STEM students: Summer Research

Through a cooperative plan developed with the University of California Riverside, UCR, (the nearest of the University of California campuses) each summer, three to four selected students participated in the UCR Summer Bridge Research Program. This program provided a research experience and mentoring on transfer and graduate school. Each year, we received well over six times as many applicant as we could support, indicating a very high level of interest in these opportunities. The students were selected from the pool of applicants, matched with a faculty member at UCR, and received a stipend for the 10-week summer research experience. These students participated in ongoing research projects conducted by university research faculty. The students actually received a UCR ID card; they participated in lab safety training, and attended a 2-day research “boot camp program.” During the boot camp program, in preparation for their research experience, the students became acquainted with techniques they would use in the lab. For example, students doing research in molecular biology were taught techniques, such as PCR, primer design, electrophoresis, bacterial transformation and basic bioinformatics tools. There was also a review of basic genetics and cell biology.

Our students also attended workshops on research presentations, and how to prepare for more advanced study. Finally, they presented their research at a forum on the university’s campus.

So far ten or our students have had this valuable experience. As a result of this experience, these student participants have become ambassadors for STEM research and future education. On their return to San Bernardino Valley college campus, they were invited to talk about their research to our STEM students. Their presentations both encouraged new groups of students to seek summer research opportunities, and increased the interest and awareness of our STEM students in opportunities for additional studies at universities.

Cultivate new STEM students

To attract and guide more minorities and women into our STEM programs, each spring, over 200 eighth graders were brought to our campus for a “Science and Technology Day”. These activities with the community may attract and guide more minorities and women into our STEM programs. The students were introduced to current college students in our Valley Bound program, who spoke to them about their transition from middle school to high school to college. The eighth grade students were able to identify with the college students who encouraged them to use high school to prepare for college. The eighth grade students then participated in hands-on workshops in the STEM fields. The workshops included experiences such as The
Physics of Motorsports, Fun with DNA, An Hour of Code, Water Conservation, The Chemistry of Lip Balm, and Battle of the G's- Google Earth Meets Geocaching. They were escorted to these events by our college’s Valley Bound students who also participated in the activities. Surveys from the eighth grade students indicated that many students showed an increased awareness and interest in science as a result of their experiences at Science and Technology Day.

Conclusion

A comprehensive approach was used to cultivate an environment that encouraged and supported success of underrepresented populations in STEM courses and that exposed students to potential careers in STEM. Our objectives were to provide support for increased success through the SI program; provide a nurturing environment in learning communities; and stimulate interest in transfer to four year colleges or universities by visiting university laboratories. The SI success data demonstrates that students who attended any SI sessions had increased success rates. Once the students understood the value of SI sessions, they were more likely to attend an SI session for other courses. The summer research experience encouraged students to pursue further research opportunities and to consider continuing their education at the post-graduate level. These interventions are working to foster an increased participation of women and minorities from our community in STEM.
