While there may be significant studies about other minority women veterans such as Hispanics, Blacks and Asians, little is known about Pacific Islander women veterans. Pacific Islander women who volunteer to serve in the Armed Forces then subsequently decide to leave may face transition challenges due in part to their cultural background. They may remain silent about struggles with deployments, mental health, loneliness, or personal well-being conditions since discussing personal matters with non-family members can be considered taboo and disrespectful to one’s family. This study seeks to explore and understand the lived experiences of Pacific Islander women veterans from different generations who have departed the Armed Services and to shed light and give voice to their stories of challenges and successes in securing civilian employment and educational opportunities after serving their country honorably.
Using Technology for Multisite Assessment in Health Science Education

Health Education

Paper Session

A final health team evaluation (Team Objective Structured Evaluation) was conducted using Lifesize technology in order to connect students, a patient and evaluators from four sites. This process was evaluated through feedback received from all participants including an experienced course developer. It was found that this platform provides a reliable technology that allows for effective team interaction and provides a similar assessment process. Students felt that it prepared them for their future practice using technology.

Abstract page 2
Using Technology for Multisite Assessment in Health Science Education

Objectives: A section of students enrolled in a large interprofessional health science team class in three external locations at the University of Alberta in Canada participated in the class utilizing an online learning platform versus a traditional format. The final evaluation of the course was a Team Objective Standardized Assessment (TOSCE) with a standardized patient scenario utilizing Lifesize technology to connect the student team, evaluators and patient. A review of the assessment was completed in order to ensure that the student teams could be assessed in the TOSCE in a similar manner to the traditional in person TOSCE.

Methodology – Using online student evaluations, feedback from section instructors and an experienced course developer, a review was done of the evaluation process.

Results – The use of Lifesize technology provided a reliable technology for use within a team examination. Students felt that they were able to communicate and work effectively as teams and that this type of experience supported their preparation for future telehealth and team practice. Evaluators suggested that this was an effective platform for student assessment.

Conclusion – The use of technology is a viable way to assess students in multiple locations. If appropriate technology is used it can help students also learn skills for future health care practice.
Expert Consulting – Does it need to be in Person for Effective Learning?

Curriculum, Research and Development

Paper

Students working with standardized patients in a mental health course were provided with an opportunity to compare online consultation with a clinical expert versus in situ immediate consultation with faculty. Using qualitative methods the process was reviewed through written feedback, evaluation of online comments and student focus groups. Online expert consultation was found to be an effective method of communication and for some students provided a better learning environment to practice their clinical reasoning skills.

Full abstract page 2
Expert Consulting – Does it need to be in Person for Effective Learning?

Objectives: A senior mental health course in occupational therapy utilizes three standardized patient experiences as part of the student learning strategy. Students were given the opportunity to consult with an expert faculty member immediately after the interview in situ or with an online expert clinician. The purpose was to evaluate the effectiveness of the online consultation versus in situ immediate feedback. Students were told that this was an opportunity to enhance their learning through consultation with an expert. The students were randomly assigned to either the in situ faculty member or online expert on all three experiences so had the opportunity to experience both forms of consultation.

Methods: A qualitative method was used to collect feedback on the types of questions that students asked from both in situ faculty and online clinicians. Copies of all online interactions were collected for analysis as well. Focus groups were also held with the students to discuss their experiences.

Outcome: In situ questions tended to be more frequent and often were process orientated. When students utilized online consultation they delayed asking questions until they had evaluated their own process and the questions were less frequent but had greater clinical significance. Students were very conscious of the time commitment of the online experts and in many cases actually “booked” online time with the expert.

Conclusion: Online consultation appears to provide students with a good learning experience and may better support their clinical reasoning skills, and ultimately provided an excellent learning venue.

Title: Innovative Technology Implementation in Elementary Schools: A Study of Challenges and Successes

Topic area: Educational Technology

Presentation Format: Poster Session

Description: Ten elementary school classrooms were studied as teachers implemented standards-based technology to enhance daily instruction. The presentation will summarize key findings from five data sources; teachers’ pre-implementation descriptions, classroom observation, teacher blogs, surveys, and interviews. Results indicate teachers’ desire and willingness to enhance instruction with technology. However, discrepancies occurred between the teachers’ intended and observable use of technology to improve instruction.

Innovative Technology Implementation in Elementary Schools: A Study of Challenges and Successes

Abstract

Technology implementation in ten K-5 classrooms was investigated to examine how teachers used technology to enhance student content knowledge. Five sources of data were collected: teachers’ pre-implementation description of how they would use the technology to improve instruction, teacher blogs, surveys, interviews, and classroom observations. Data sources were triangulated to check for congruency between self-reported and observed uses of technology to enhance content learning. Results demonstrated teachers’ desire and willingness to enhance instruction by using technology. However, discrepancies occurred between the teachers’ intended and observable use of technology to improve instruction.

Objectives

As more classrooms have access to digital technologies, our inquiry shifts from how to use technology, to how technology can enhance content learning. Voogt Erstad, Dede, and Mishra (2013) support that pedagogy and content should be the driving force for technology implementation. It is not the actual technology device that impacts learning, but the way it is used in the classroom has the potential for improving learning outcomes (Warschauer, Zheng, Niiya, Cotton, & Farkas, 2014). Hence, technology is the instrument used to improve pedagogy. This investigation looks at how teachers are using technology to improve their pedagogy. The nuanced ways in which personal, professional, and external influences impact technological implementation is examined.
Rich and engaging instructional strategies should remain the prominent initiative when focusing on technology implementation (Butcher, Leary, Foster, & Devaul, 2014). Much of a teacher’s success in using technology comes from pedagogy that strives to have meaning and understanding emerge from the students’ active participation in daily conversation that is enhanced by the use of technology (Roe, 2007).

Teachers that aspire to improve their practice by incorporating technology see themselves as change agents (Roe, 2007). They are eager to experiment with technology use and welcome the chance to learn from their mistakes, which improves their technological pedagogy. Systematically documenting what they do and how the technology impacts student learning enables teachers to share their successes as well as learn from others. The sharing process is critical for continued learning and innovation through collaboration, co-teaching, and teaching-revising-teaching (Hepp, et al., 2015).

**Purpose of This Study**

Analysis of the productive use of technology within various laptop environments, diverse teacher competencies, and student groups leads to a fuller understanding of a technological pedagogy model that is developing currently in elementary schools (Cavanaugh, Dawson, & Ritzhaupt, 2011). The purpose of this study is two-fold. The first purpose of this study is to add to the existing literature, seeking to support best practices in instructional technology by investigating the processes that technologically-minded elementary teachers use as they implement new laptop technology. The second purpose is to investigate the successes and barriers that teachers encounter during implementation to further understand the supports necessary to develop successful content learning with technology as the delivery tool.
Perspectives

Technology, pedagogy and content knowledge (TPACK), described by Koehler and Mishra (2009), is the framework underpinning this research. From this perspective, instructional technology practices are viewed as the interaction between content knowledge, pedagogy, and technology knowledge within the construct of digital literacy. Teaching with technology is a complex process that requires much more than technical skill. The TPACK framework views instructional technology practices as the interaction between content knowledge, pedagogy and technology knowledge. Our research seeks to understand the interplay of TPACK components in the planning, instructional and reflective practices of classroom teachers as they implement new technology.

Digital literacy and digital competence (used interchangeably in our research) are constructs with ever-evolving definitions that form a foundation for this study. O’Brien and Scharber (2009) describe digital literacy as “…socially situated practices supported by skills, practices and stances that enable the representation and understanding of ideas using a range of modalities enabled by digital tools” (p. 66-67). Digital literacy has been broken down further into five components of: photo-visual literacy, reproduction literacy, branching literacy, informational literacy and socio-emotional literacy (Eshet-Alkalai, 2004). Synthesizing the five components, Ng, (2012) proposed that digital literacy combines cognition, technological skill and socio-emotional elements. Our research utilizes these five components to aid in understanding the inter-related and nebulous nature of technology implementation in the classroom.
Methods

The participants in this qualitative study are ten elementary classroom teachers in a school district in the Pacific Northwest. This district has a student population of 20,884. According to the Oregon Report card for 2013-2014, 26% of students are English Language Learners, 69 languages are represented, 49% are economically disadvantaged and 14% are students with disabilities.

Teachers in the study are recipients of a “Technology Innovation” grant funded through their district from a bond measure that focused on increasing student achievement through technology implementation. Each teacher applying for the grant was required to articulate a plan for innovative instructional activities utilizing Chromebooks or iPads. Teachers awarded the grant agreed to write a monthly blog post to demonstrate their innovative uses of technology and to reflect on the implementation process. The teachers received the technology at a “Device Kickoff Party,” where they were given a chance to ask questions and get support in an informal setting.

To investigate the process of technology implementation, qualitative data was collected from five sources including a pre-implementation description, teacher surveys, interviews, classroom observations, and teacher narratives from blog postings. The Technology Implementation Questionnaire (TIQ; Wozney, Venkatesh, & Abrami, 2006) was given to collect teachers’ impressions of the usefulness of laptops in instruction and to more fully understand how a teacher’s experience, style, and digital literacy interact to impact computer use in the classroom. The TIQ contains four parts: the teacher’s professional views of computer technology, background and teaching style, experience with computers, and process of integration. Responses were analyzed using a constant comparative approach (Glaser & Strauss,
1967) to discover dominant themes. Constant comparison was used to chunk the data into meaning units. The chunks were coded according to overarching commonalities illustrated in the data. Analysis of the data reported in this study was done using an iterative process of pattern coding (Miles & Huberman, 1994). Coding was done by the researchers to look for themes, patterns, and codes to form a ‘thick description’ (Geertz, 1973).

Classroom observation data was collected from a technology implementation rubric based on Domain 3 of Charlotte Danielson’s Framework for Teaching and Learning (Danielson, 2007). The need to cross-reference self-reported perceptions with observable practice is addressed in this study (Huchison, 2011). The observation focused on technology related instructional competencies.

The primary research questions include:

1. How are laptops used in the classroom to enhance content knowledge?
2. What are the factors that contribute to the successful integration of technology in the classroom?
3. What are the teacher’s perceived barriers that prevent successful integration of technology in the classroom?

Results

Preliminary analysis of teacher survey data show that participating teachers had a belief prior to obtaining the technology grant, that integration of technology is an effective strategy for enhancing student-learning outcomes. 82% of participants reported that they had a strong background using laptops for personal use. However, an even greater number of participating teachers reported the need for more focused professional development in regards to a) which
particular technologies are best suited to specific content areas and b) integrating technology in a manner that adds value to instruction rather than substituting existing resources.

Interview data revealed that the most frequently identified barrier to technology implementation was the lack of time for thoughtful planning. Teachers expressed the need to meet with colleagues and district technology leaders on a regular basis, during the school day, to discuss innovative strategies for improving instructional technological competencies. Analysis of blog narratives showed that this strategy, although helpful in sharing innovations, did not replace the need for face-to-face discussions and peer observations of classroom technological pedagogy.

The second most reported barrier to successful technology implementation was the lack of 1:1 Chromebooks. The need to rotate the students’ use of Chromebooks reportedly created instructional gaps due to the inability to use strategies, such as instant polls, that require all students to be using their device simultaneously. Some teachers reported that the delay in use resulted in a loss of student engagement. An additional drawback was that students did not have the same ownership as they would have with one-to-one use. As Warschauer and Tate (2015) found children were not as careful with the equipment when they weren’t the sole user of that equipment.

The third barrier was lack of sufficient infrastructure to support the technology. In two out of the four buildings, teachers reported connectivity problems in which instructional interruptions were frequent. These connectivity interruptions were so disruptive to the instruction that teachers abandoned the lesson for the week and modified future planned lessons to more traditional methods of laptop use, such as typing final drafts of reports.
Teacher blog entries demonstrated a thoughtful, standards-based implementation of technology in the classroom, without a full understanding of how to integrate technology in order to improve student outcomes. Teachers focused on the organization of the classroom in providing equal opportunity to all students, which included integrated technology use to support and differentiate instruction for various populations within the classroom. Instead of providing open-ended assignments with various entry points, teachers formatted assignments very narrowly. Lesson observations showed that many of the technology-based assignments focused on producing a uniform product rather than encouraging open learning experiences.

Teachers self-reported in many cases that Chromebook use enhanced instruction, although observational data showed that many of the instructional methods simply replaced existing resources. Using the Technology Rubric based on Domain 3 of Charlotte Danielson’s Framework for Teaching and Learning during observations indicated that teachers remain “basic” in most categories (Danielson, 2007). This indicates further need to develop teacher technological competencies. In particular, teachers reported that they very often used technology in their classroom for creative, expressive, and informative purposes. However, observations showed that most teachers used technology to disseminate information and ask low-level questions. While assignments were completed using technology, teachers struggled to create assignments that allowed children to show and apply knowledge beyond the limitations of the teacher’s requirements.

Conclusions

Multiple themes emerged from the data that warrant further discussion. How a teacher implements technology and teaches students to use technology is heavily dependent on the teacher’s personal use of technology. There is a need to provide pragmatic professional
development to deepen teachers’ technological pedagogy to enhance learning outcomes. It is important for teachers to keep the focus on providing quality instruction to help children academically achieve. In order to keep this focus, one needs to focus on the pedagogy of technology and how it is integrated into curriculum to support the learning.

Another discussion point from the data is the teachers’ tendency to focus on using the technology itself with little thought given to how the technology suits the instruction or content. Many skills go into providing students with the best opportunities for learning. A teacher needs to understand content, analyze it for prerequisite knowledge and understand how to apply the best teaching strategies to the content. The correct type of technology for a given subject must be integrated so that the technology enhances the content learning, rather than simply replacing existing resources. There is a danger in technology taking focus away from content and higher order thinking skills being developed. Content and thinking processes need to remain the focus of instruction, while technology is the support in achieving this goal. Our results indicate that it is possible to be proficient in the use of technology on the part of the teacher and student, without the technology enhancing academic sense-making.

An additional discussion point is teachers’ perception of students being more versed in using digital media than they actually were in an academic setting. Because of this assumption, there were missed opportunities for instructional decisions that would have helped students to further their understanding of a topic by using computers. When using the computers for publishing student writing, the students often got frustrated because of the slowness of their typing skills or losing work through not fully understanding how to modify and save documents. This was more prevalent in the younger grades, but could still be seen with older students.
This study investigates the implementation of elementary classroom technology from the teacher’s perspective to understand specific needs in developing a method of technology use that enhances student learning. While teacher self-reported data were analyzed, they were also compared to observational data gathered to inspect possible discrepancies between instructional intent and instructional outcome.

Abstract:
I am currently teaching English to teachers-to-be at college level in Japan. Every student taking Methods in Teaching English at my college is required to give a few mock lessons all in English because the new Course of Study set by the Ministry of Education in Japan requires all high school English teachers to conduct their lessons in English only. So as teacher candidates, they need to be trained to be able to provide lessons using English comfortably. Unfortunately, most of the students have very limited productive vocabulary and have trouble saying what they want to say in English during the lessons. As a result, some have even lost confidence in teaching English through English. To help them improve the productive vocabulary is one of the best ways to solve this kind of confidence problem, but vocabulary improvement is no easy task and usually takes a long period of time. That is why they need to find other ways to compensate for the small vocabulary in order to provide lessons in English.

One of the ways I find useful is to use the skill of circumlocution. When they have difficulty in finding the exact word, they can convey their message across by using this communication strategy. Although circumlocution is an effective way to help those with small vocabulary to communicate, many of my students had
never learned the technique before entering college. Thus, I provide them with opportunities to familiarize them to use the skill of circumlocution.

The following is a list of directions I usually give in my lessons on this strategy:

- Use vocabulary you are comfortable to use.
- Try to come up with other ways to convey the message.
- Explain who use it.
- Explain when, where and why it is used.
- Use the preposition “like”
- Use synonyms.
- Use hypernyms, or superordinate words.
- Learn to use post-modifiers such as prepositional phrases, infinitive phrases, participle phrases, and relative clauses.
- Be aware of parts of speech
- Use an English-English dictionary to learn the typical way to describe a certain part of speech

In my presentation, I would like to introduce the ways I teach the skill of circumlocution so that some audience will find them interesting or effective.

6. **Abstract**

**Purpose**

This study examined associations among adolescent sleep Hygiene and problem behaviors.

**Methods**

A cross-sectional survey design was used. Participants were 276 adolescents (51.4% female, 54.7 % high school students and mean age of 15.5 years). Sleep hygiene was measured by Adolescent Sleep Hygiene Scale (ASHS) and problem behavior was measured by Korea-Youth Self Report (K-YSR). Data were collected from July to August, 2014 using self-reported questionnaires.

**Results**

The mean score of sleep hygiene among participants was 4.62 out of 6 and the mean T-score of total, externalizing and internalizing problem behaviors were 49.3, 48.1, and 50.1, respectively. Participants were middle school students than high school students, perceived
their sleep time as enough and their sleep quality as good, have no problem behavior during sleep, and have no cafffeinated drink for last a week were more likely to have higher score of sleep hygiene. Sleep hygiene score was associated negatively with externalizing, internalizing, and total problem behaviors.

Conclusion

Sleep impacts on physical growth, behavior, and emotional development of adolescent. This descriptive data support the need for further study of strategies to prevent adolescents’ problem behaviors by improving sleep quality and quantity.

Keywords: adolescents, sleep, problem behaviors

Abstract—In Japan, it became difficult to manage universities because of shrinking of the 18-year-old population. Moreover, many universities are expected efficiency, sophistication, and accountability of management for universities. So, the managements of Japanese universities pay attention to Institutional Research (IR for short). However, there are few special human resources who can be in charge of IR. Each of universities works hard to obtain such human resources. Based on this condition, we started “Curriculum of Human Resource Development for Institutional Research” on the second semester of 2013. This curriculum consists of five subjects that each of them has two credits. We have provided the curriculum not only on campus but also outside our university. The curriculum outside our university was provided as the summary of the curriculum on campus. In this paper, we verify the curriculum and clarify the present situations and problems.

I. INTRODUCTION

Japanese universities are required to enhance efforts of Institutional Research (IR for short) in order to cope with change of the environment for management of universities. Then the Japanese government try to promote IR. For example, the university that has established an organization of IR can gain higher subsidy from the government.

IR is the advanced special business that can support decision-making for a university through gathering, storing, analyzing, and providing data from the university. However, it is fact that each of universities is not getting along with IR because there are a small number of human resources for IR.

In Kyushu University, we designed “Curriculum of Human Resource Development for Institutional Research”, and brought it as the subjects for graduate students. Also, we provided it for outsiders of our university. We verify the results of Human Resource Development for IR in this paper. Then, we survey what we should do in the future.

II. THE OUTLINE OF “CURRICULUM OF HUMAN RESOURCE DEVELOPMENT FOR INSTITUTIONAL RESEARCH”

In the Office of Institutional Research where we belong to, we have been gathering and analyzing the data for university evaluation since 2004. Then, we are working for IR from the point of view of effective using a large quantity of these data since 2008.

All teachers who belong to this office have their tenure and namely have to be transferred periodically. So, we feared that the human resources who could work specialized job in IR would go away. Then, we designed “Curriculum of Human Resource Development for Institutional Research” which was consisted of five subjects [1]. Moreover, since the second semester of 2013, these subjects were started as parts of subjects from “KIKAN Education for Graduate Schools”. Here, KIKAN means foundation or key. We also provided the staff of other universities with the summary of the curriculum.

III. HUMAN RESOURCE DEVELOPMENT FOR IR IN KIKAN EDUCATION FOR GRADUATE SCHOOLS

A. Outline of KIKAN Education for Graduate Schools

The contents of “Curriculum of Human Resource Development for Institutional Research” are shown in TABLE I. We composed the curriculum based on the “Information Support Cycle in Institutional Research” shown in Fig. 1. The figure was shown by McLaughlin, G.W, & Howard, R. D [2] Moreover, the relation between information support cycle in institutional research and way of IR function is shown in Fig. 2.

B. Verification of KIKAN Education for Graduate Schools

The number of attendance for this curriculum is shown in TABLE II. These lectures are intended for graduate students in Kyushu University, but the staffs from not only our university
but also other universities can attend them. While a few graduate students attended them, some staffs from other universities attended them. The results of the questionnaire held in second semester of 2013 and first semester of 2014 are shown in Fig. 3. We asked them the degree of satisfaction for each lecture using 5-alternative question which consisted of “Very Good”, “Good”, “Even”, “Bad”, and “Very Bad”. As shown in Fig. 3, almost all attendees were satisfied for our lectures.

Our lectures were held on Saturday, which was a holiday for almost all people. So, it is the fact that the number of attendees is small. Moreover, in Kyushu where is located in west side of Japan, there may be few demands of IR human resources.

IV. HUMAN RESOURCE DEVELOPMENT FOR IR OUTSIDE OUR UNIVERSITY

A. Outline of Curriculum Held Outside

Since 2014, we held the curriculum outside our university to understand the demands of human resource development for IR. Of course, we provided our know-how of IR to the attendees. The targets of this curriculum held outside are staffs or teachers from other universities. We held it 5 times, Kyoto, Tokyo, Kyoto (re-held), Hokkaido, Okayama in Japan.

Our curriculum outside our university, which is held in first two times, consists of follows.

- University management or evaluation and Institutional research: the role of IR from a point of view of university evaluation
- Data aggregation and administration for institutional research: the questionnaire using web and its method
- Data analysis for institutional research: introduction of analyzing method to understand the degree of satisfaction or achievement of study

In last three times, we provided one more lecture including the lectures shown above.

- Management for IR data: method for gathering IR data effectively. showing them, and so on.

B. Verification of the Curriculum Held Outside

The number of attendees is shown in TABLE III. All lectures was full up, except for Hokkaido, in seven days after starting proposal. In the lecture in Hokkaido, the rate for attendance was only 60%.

Kanto (Tokyo) or Kansai (Kyoto and Okayama) are located in center of Japan, so we thought that it was easy for almost all attendees to go to the places. In fact, after deadline of the proposal, many people who would like to attend this curriculum inquired us. It means that our curriculum was attracted. Then the curriculum in Hokkaido had not enough attendees because this place was located in north of Japan and there were a few universities.
are not teachers.

The curriculum as shown in TABLE IV-Q3. It means that the people who are in charge of IR in Japan are staffs, and they are not teachers.

The universities can obtain a subsidy from the Japanese government if they establish IR organization in their universities as shown in TABLE IV-Q2. In Japan, there is the system the people who are in charge of IR in Japan are staffs, and they are not teachers.

D. Results of Questionnaire After Holding Curriculum Outside

We conducted a questionnaire after the curriculum for the attendees of the first two time and the last time. We obtained 80 answers in Fig. 4. Almost all attendees were satisfied with the curriculum, but some of attendees were not satisfied. Problems that each university had were various. So the demands of each university were also various. We think that a part of attendees could not be satisfied with the curriculum. One of our problems in the future is to solve individual demands.

V. Summary

In Fukuoka where is the west part of Japan and has Kyushu University, there were little demands of the Curriculum of Human Resource Development for Institutional Research which was provided in KIKAN Education for Graduate Schools. The people who lived in the distance could not go there to attend the curriculum held inside Kyushu University. The students hardly had demands for IR at least. However, the curriculum should continue because the knowledge of IR becomes to be necessary in the future. Then the curriculum also should be held in the place accessible for the staffs and the teachers from Kyushu University or other universities.

Fortunately, almost all attendees were satisfied with the curriculum which was held outside. We understood that there were various demands. We have to provide the new curriculum corresponded with various demands, kinds of job, and so on. Some of attendees would like to attend the curriculum again. We have to hold the curriculum continuously on KANTO or KANSAI where are the central of Japan.

We have a limit of holding the curriculum outside independently. Then, cooperating with other universities, associations, conferences, and so on, we have to provide the chances for human resources development for IR.

REFERENCES

C. Results of Questionnaire Before Holding Curriculum Outside

Before we held the curriculum outside, we conducted a questionnaire for attendees. In this questionnaire, we ask them why they decided to attend the curriculum, where they were from, and so on. They could cooperate with the questionnaire optionally, but we could 151 answers in 5 lectures. In this section, we describe the results of the questionnaire. The results are shown in TABLE IV.

Many people decided to attend this curriculum for their self-development as shown in TABLE IV-Q1. We thought that they expected to rise their skill of IR in the future.

The greater part of attendees were from private universities as shown in TABLE IV-Q2. In Japan, there is the system the private universities can obtain a subsidy from the Japanese government if they establish IR organization in their universities [3]. They surely were conscious the system.

We also understood that about one hundred staffs attended the curriculum as shown in TABLE IV-Q3. It means that the people who are in charge of IR in Japan are staffs, and they are not teachers.

DANCING IS NOT TO GET A PLACE ON THE FLOOR BUT TO ENJOY EACH STEP ALONG THE WAY

FEBRUARY 18, 2015 | SUSAN TOLER-CARR | 10 COMMENTS

Written by Susan Toler Carr

Submitted to the HICE for the 2016 Conference

Dancing is Not to Get a Place on the Floor- But to Enjoy Each Step Along the Way

The Problems:
A few people have asked me recently: “Why should I burden myself with the problems afflicting other peoples kids?” Trust me, Darrell and I are holding a heavy load that we bravely carry daily. But, I will ALWAYS be Justin’s mother—which also makes me a Mom. For those of you who know me—I will always instinctively give mothering guidance to others—just as I did for Justin and for my friends—this is my letting me BE!!!!!!!

Over the course of a few days I had the following conversations that have been on my mind and I wanted to share:

Friend #1

I have a friend whose son (was in Justin’s class) is away at college. I asked her: ” How is he doing?” She looked at me in astonishment and told me with gratitude that” I was the ” ONLY” mother /parent in the past 6 months who asked this question.” She said the usual question is: ” WHAT is your son doing?” She said the “Parents want to know his major, grades, and where he falls or fails on the social status on his campus???” She said “They have never been concerned about his wellbeing.” I was shocked…

Friend #2

I congratulated my friend whose child turned down what society deems to the HIGHEST TOP tier college. Instead he chose his passion of study at another great University that had the best academic rigor for his chosen field. “What’s wrong with that I asked?” He told me that his child got chastised by his peers/teachers/other parents for “settling” for what seemingly appears to be the “lesser college.” He also told me, that to date, I was the ”ONLY” parent who congratulated him on his sons acceptance. I was flabbergasted!

Friend #3

When I asked a friend (whose child is a Junior in college) “How she was doing?” She looked at me and calmly said: “ My daughter tried to commit suicide a few months ago… and I am trying everything to save her and to pull her out of this deep dark hole… “Not being a professional—but only a concerned “Mom”, I told her I was glad she was taking her daughters condition seriously and doing EVERY-THING in her power to help. I was saddened.

Friend #4

Another friend told me that her son ( who is a Senior at a top Ivy League in the big city) told her he
needed to get diagnosed as being ADHD so he could take medicine (to survive college) like a lot of his peers. She told him that she did not feel that he had this issue and she did not agree with him taking any medicine under false pretenses—but would support him always for getting over any seemingly impossible hump. He felt better after they talked and was glad that he got it off of his chest and that she listened and provided sound advice. That’s what our job is as Parents. To give sound advice.

Paralympic Star #1

US Paralympic Track Star Blake Leeper recently spoke at the HW Middle School. He told the audience that when he was born, the doctors told his parents that he would be wheelchair bound and that he would NEVER walk—let alone DANCE! His parents thought otherwise and embraced and armed him with the “Can do anything” attitude. He profoundly told the crowd that “People laugh at me because I am different, I laugh at them because they are all the same”. He quoted Dr. Martin Luther King Jr. and said:

“If you can't fly then run, if you can't run then walk, if you can't walk then crawl, but whatever you do you have to keep moving forward.”

I must add don’t forget to DANCE…

Blake Leeper just played in the NBA Celebrity All Star Game. He competed for the RIGHT reasons…

For those fortunate students who have the opportunity to seek their higher education, going to college can be a BIG transition for MOST. Moving to a far away place, sharing a room with a
stranger, being outside of their nucleus and thrust into a college atmosphere with a microcosm sampling of what the real world looks like. College days can be lonely and sometimes scary.

Today, it appears that the most popular motto kids/parents have for the pathway to success is BY ANY MEANS NECESSARY. I do not need to list these in detail because everyone knows what they are. The kids these days have limited time to JUST HAVE FUN! They are dealing with (but not revealing) the major issues at hand that seem to be put on the back burner i.e. stress, failure (in the eyes of their parents/peers), isolation, confusion, depression, mental health issues or even having second thoughts about their choice of college/and or major.

I remember having so much fun at college—as my Dad said “Too much fun at USC!” —when my report card got home before I did and I received my first “C” ever! I can’t say that we were not faced with a few stresses and some failures—but not to the extent of sending us over the edge. We had random parties in our dorm rooms, in the cafeteria or campus halls. We Danced (thanks to Merle showing us the latest steps), we laughed, we talked to each other. We dated and collectively with groups we got together to socialize. I can’t honestly say that there were not any “vices” in the room, but that was not the focus either. When a friend was in need, we helped or directed them accordingly. We did not keep blinders on.

Today, the electronic devices and social media have taken over. They are our blinders. People don’t look at each other, talk, or engage without clutching and frequently checking their phones. Some kids have voiced their sentiments saying they wished their college/high school experience were like the years gone by—less competitive, that their peers would get together to really socialize sans the crutch of having to drink, get drunk or hook-up their way to happiness. They just want to connect and to have fun, and actually DANCE at a party… What happened? Justin loved to dance.
We would ballroom dance in the kitchen. He also spent many an hour teaching his friends how to dance so that they would be ready at the parties! I wish I could dance again with Justin.

I also knew (for the most part) if Justin needed help i.e. emotionally, academically or? Darrel and I did not take him for granted. We would often tell him that his only COMPETITION is with himself.

Today, I found my Dad’s college handbook from the 1950’s. It was a small pocket size book that spelled out how to dress, engage on campus, learn the school songs, and to have respect/assist their fellow peers/faculty/staff and how to seek help. As Freshman, they had to carry the booklet with them wherever they went.
They also gave each student a book on “How to Court” and “How to Fall in love.” So much for the good ole days.

I also found a picture of my Dad with my Mom going to the Junior Prom that was held in college… and the little keepsake booklet they gave out at the dance.

I hope that sooner than later collectively society grabs hold of the real issues that afflict OUR kids—who ARE the future. It is time to listen to them, talk to them and pull them away from their isolation as a
“Wallflower” (a person who has no one to dance with or who feels shy, awkward, or excluded at a party) and take time to dance with them, engage, with them and just “Let them be!

People take heed (me included) OPEN YOUR EYES, Fall in love with your family and friends appreciate your life and those around you. It’s ok to stand out instead of trying to fit in. Life is not always a Party. Daily life should not be so competitive that we become more selfish, lack compassion; empathy and genuine support of most people around us- and it should not definitely be the Last Dance. This is my two cents for the evening.

The Solutions:

Condensing a spate of articles, surveys and research reports will support the statements about how imperative it is to go beyond skirting the surface of student struggles, parent traps and College Daze that are taking control and slaughtering the students in record numbers.

Undue pressures imposed on the students by their parents and schools only to get into a "good" college (for the sake of bragging rights or school statics) can be harmful. In lieu of only striving only for the top scores and top schools, it is time to really evaluate the benefit of looking at a student personality to determine what are the right fit options for higher education. There are over 6000 viable options for attending a 2-year, 4-year or Trade School in lieu of a top tier Household Name College or University.

Data will be collected from surveys presented to current middle school, high school and college students and will determine if these standards or methods used for finding the “right fit” college are beneficial or detrimental. In order to place students in the appropriate higher education institutions we will introduce a way of looking into the personalities of each student by utilizing the work of Kazimierz Dabrowski, a Polish psychiatrist and psychologist (1902-1980), who developed the Theory of Positive Disintegration. Even though he described various overexcitabilities (OE) and primary characteristics of the highly gifted, they can also be used to support the development of students in the average population. Dabrowski identified five areas of intensity-Psychomotor, Sensual, Intellectual, Imaginational, and Emotional. Examples and strategies with plausible solutions will be given that will be the catalyst for brainstorming that can in fact help improve the lives of the students and direct them to soar in healthier environments as they obtain their higher education. If the concepts of Dabrowski’s OE are instituted in the schools counseling services, students can yearn to learn, their real passions can be validated and pursued and they will really feel good about themselves and have a better self worth and in turn will no doubt mitigate the rise in mental health issues that are afflicting the students are a direct result of the struggles that they face.
The school-parent trap dynamics allow (helicopter, snowplow, tiger) parents to unrealistically press for achievement. The “Koala dad” (cuddly, protective, non prodding) style of parenting seems to have been overthrown. The outcome—intellectual bullying and rewarded immoral behaviors perpetuating an atmosphere lacking empathy and compassion for all students who should be valued.

Parents still have the topmost effect on a child’s overall development. However, it is time for the schools and colleges to step up and take a stance on how to mollify the parents from being too attuned, over-invested, and protecting the children from unhappiness. It’s okay for a student to be exposed to some discomfort and letdowns. It has been written that many modern parents seem to focus too obsessively on the success and status of their kids and this has backfired as the kids turn into unprepared adults and make transitions to college and careers unmanageable. They also have the “not my kid” attitude when it comes to facing the mental health issues with kids. Statics from the non-profit Child Trends, the Journal Clinical Psychological Science, American Academy of Pediatrics and real life stories will depict the aftermath of what is happening to student as they breakdown from the pressures.

High School and College mental health systems are dazed from an influx of students with pre-existing/latent mental health markers that bloom as they try achieving supernatural success.

Anxiety and depression have been increasing in tandem with self-esteem. Anxiety is the No. 1 mental health diagnosis on college campuses. New mental health awareness platforms and innovative tools will be presented from the institution of mental health kiosk on campuses, check-ins that support the well-being and success of students. Legislation is also being put in place for colleges so that students fill out a form upon enrolling at an institution to designate what mental health information can be released and to whom. Many colleges have labeled their entering as being “teacups” for being too fragile as they break when things don't go their way.

The mental health of today’s college students continues to be a top-level concern for institutions. Findings from the Center for the Center for Collegiate Mental Health CCMH 2014 Annual Report and the National Alliance on Mental Illness NAMI College Students Speak: A survey Report on Mental Health “The National Alliance on Mental Illness (NAMI) conducted a national survey of college students living with mental health conditions to learn about their experiences in school and the findings will also be discussed.
10 THOUGHTS ON “DANCING IS NOT TO GET A PLACE ON THE FLOOR BUT TO ENJOY EACH STEP ALONG THE WAY”

Kate
MARCH 19, 2015 AT 9:41 PM

You and Darrell are so brave to face losing Justin with dignity and retrospection. So many of us get caught up in the “what” is your child doing at college and not the “how?” “How are you?” is actually a very important question. You’ve made me think about how distorting this question distorts our basic humanity. Thank you for sharing your thoughts. I know you came to them through very deep pain.

Susan Toler-Carr
MARCH 22, 2015 AT 8:23 PM

Kate, the pain is beyond imaginable when the hopes and dreams that Justin had and we had for him vanished in an instance. We are now Justin’s voice. I so wished that we could have worked with you to allow him to soar. He is now soaring in a different manor now.
Profound reflections Susan and so true! God Bless you and the pride and joy of being a great MOM!!

Love you,

Lynn

Brightens my day to see our children dancing in this photo. These were the happiest times of high school for her – right beside Justin. This is an important piece to share – so many of our kids are struggling with trying to achieve at great cost to their emotional well-being. Thank you for sharing your insights and continue to parent the children in your community.

Caroline I agree and please share as you see fit. xox Susan

What you wrote here is so true. I wish more kids these days would focus more on actually interacting with each other for the purpose of enjoyment instead of not interacting or being calculating about it. Your Justin was that interacting for the fun of it type person as is my Alexandria. We did have it good in our day with how we were able to interact with each other for fun and develop lifetime relationships that we still treasure and enjoy. Justin followed in your and Darrell’s footsteps in that way and his potential college peers are really missing out on his contribution. Bless you guys!

Ralph I agree and so glad we are life long friends. xox Susan
Mary martin  
FEBRUARY 19, 2015 AT 7:09 AM

Amen to this! I revel in your thoughts and in Justin’s spirit! I LOVE the pics, but especially those of your Mom and Dad! THOSE were the days as far as “class” and “grace” and “style!” Thank you for sharing with me…I always hold you, Darrell and Justin in my heart every single day. You all float in and out of my mind on a daily basis and while heartbreak has hit you in the most deepest part of you and Darrell and your extended family, you have “grace” to share your insightful thoughts…wisdom and grace…they sure don’t come easy!

xoxo
mare

FEBRUARY 19, 2015 AT 6:36 AM

So true. We want the best for our kids and will do anything to help them along the way. But even with love, support and “Whatever it takes”, to make them happy, they may still can be lost…

Robbie  
FEBRUARY 19, 2015 AT 5:24 AM

I think this is your best one yet. Magnificent.
A Study on the effective utilization of the physical tools
convergence and evolution of stage make-up

Barng Kee-Jung*, Kim Jin-Seo
Professor, Dept. of Beauty Health Management Daejeon University*,
Director, Interactive 3D Research Section, SW. Content Research Laboratory, ETRI
Seoul, Korea.

I. Introduction
This study is a research on the tools you use to stage makeup. Stage makeup needs a creative fusion education to youth education and professional career. Training shall be conducted as a creative fusion science and the arts and arts education. To do so is that the use of any tools and the media is very important. Many methods have been developed to take advantage of technology, discovering its potential value. Therefore, this study is to use three-dimensional simulation software to make use of high-tech tools as physical. To take advantage of this program to the convergence of physical education evolved to utilize effective tools in makeup design.

II. Research Methods
Analysis unit of the present study is the group. Elementary School Students in Daejeon 21 people, 40 people middle school students, high school students studied 48 people. Targeting a total of 106 people was conducted make-up artist professional training stage. Research methods aimed at students and vocational training, two hours of research and data collection
on September 1, 2015, October 30, 2015. Choose your character and theme, and the work was made into the use of physical tools to analog and digital devices. The stage was dressed to represent, taking into account the age and subject, as physical tools of paper, pencils, etc. were to be represented using analog tools and digital tools. In this study, I was study use program the Electronics and Telecommunications Research Institute developed this is a three-dimensional facial avatar simulation program, which is available should you wish to use this tool. Results announcement for the evolution of the physical tools through the fusing expressions share how.

III. Results and Discussion

For the purposes of use and beauty makeup and makeup application, makeup can be divided into. Makeup application can be classified as stage make-up, make-up media, and special make-up. Application of makeup is stage makeup, media makeup, can be classified as special makeup. For the purposes of use and beauty makeup and makeup application, makeup can be divided into. A Visual tool has a variety of color, texture and chemical tools for various kinds of paints, cosmetics and chemical products. Makeup application can be classified as stage make-up, make-up media, and special make-up. Application of makeup is stage makeup, media makeup, can be classified as special makeup. Makeup brush in the brush, the air-brush tool, sponge, computer graphics, and many other materials are needed. Visual media have evolved to increasingly integrate computer graphics (CG), incorporating a variety of fields. art makeup design. In this study, I was study use program the Electronics and Telecommunications Research Institute developed this is a three-dimensional facial avatar simulation program, which is available should you wish to use this tool. In this study, we investigated about the type and evolution of the physical tools. The fusion of a wide variety of devices and the hybrid was developed through utilizing the physical tools, time and economic efficiency, how about suggestions.

IV. Conclusion and Suggestions

In this study we were evaluated for the type and evolution of physical tools. Through the fusion of the composite material with a variety of instruments, stage make-up has been developed that take advantage of
the physical tools. Thus the suggestion is to increase the time and cost of the method efficiency. I believe that evaluations and demonstrations the appropriateness of such a novelty approach for the medium is well worth researching, in order to increase the appeal of the medium. This study was recently under scrutiny in relations to digital simulation and various three-dimensional designs, in terms of how to take advantage of a wide range of tools, and how to apply the findings through media and the dissemination of basic research. This study applies the characteristics of the limited existing stereoscopic three-dimensional and digital simulation programs in order to take advantage of the empirical research, providing a basis to implement this research in a meaningful way.

A Comparison of the Twelve Core Values of Thai people defined by the Head of the National Council for Peace and Order (NCPO) found in Thai private and public university students

Patariya Ngammuk, Ph.D
(patariya.n@bu.ac.th)
Bangkok University International College
Bangkok University
Thailand

ABSTRACT

This study aims to examine the twelve core values of Thai people found in Thai university students. The twelve values consist of the following attributes:

1. Upholding the nation, the religions and the Monarchy
2. Being honest, sacrificial and patient with positive attitude for the common good of the public
3. Being grateful to the parents, guardians and teachers
4. Seeking knowledge and education directly and indirectly
5. Treasuring the precious Thai tradition
6. Maintaining moral, integrity, well-wishes upon others as well as being generous and sharing
7. Understanding, learning the true essence of democratic ideals with His Majesty the King as the Head of State
8. Maintaining discipline, respectful of laws and the elderly and seniority
9. Being conscious and mindful of action in line with His Majesty’s the King’s statements
10. Practicing the philosophy of Sufficiency Economy of His Majesty the King. Saving money for time of need. Being moderate with surplus used for sharing or expansion of business while having good immunity
11. Maintaining both physical and mental health and unyielding to the dark force or desires, having sense of shame over guilt and sins in accordance with the religious principles
12. Putting the public and national interest before personal interest.

This study is a descriptive study using content analysis to design a questionnaire to assess behavioral attributes. The questionnaires were distributed to the sample group of 1000 students. They are 500 undergraduate students from private universities (250 students from Bangkok University and 250 students from North Bangkok University) and 500 undergraduate students from public universities. The data was later analyzed by statistical tests using SPSS to compare the results obtained from private university students and public university students. The findings can be used for course development to promote the 12 core values in university level.
Introduction

Scientific developments in every field have been progressing rapidly and seem to be unstoppable causing huge impact on social and cultural changes including values in a society. Particularly in Thai society, technological trends have influenced a wide spread of new cultures passing on both good and bad values to university students. Immediate attention is needed when change in values turns to something inappropriate. At present, Thai society is turning into a face-down society where people keep their eyes on their smart devices all the time. Parents connect with their children via the use of technological devices. Conformity is shown in Thai youth’s behaviors. Thai society is facing serious cultural issues. Good values of Thais are mistaken. Cultural confusion is going on right now and the situation seems to be the most severe in the history of Thailand.

When the National Council for Peace and Order (NCPO) had stepped in to lead the country, a policy to promote the 12 core values was initiated on May 22, 2014 with an intention to revitalize Thai good values and appreciate Thai heritage. This strategic move aims to strengthen the nation and encourage unity among Thai people. The campaign and promotion of the 12 core values focuses on building a strong basis of Thai
youth as they will be the next generation to develop the country in the future.

This gives a rationale for this present study. As a teacher and department administrator, the researcher realized the importance of developing students in this area. The knowledge gained from this study can be applied to any course and activities development to cultivate the 12 core values according to the policy of the National Council for Peace and Order (NCPO) among Thai students.

The objectives of the study:
1. To explore the 12 core values found in university students
2. To compare the 12 core values found in Thai private and public students
3. To propose suggestion for policy planning to university management to promote the 12 core values among university students
Sampling

The study used multi-stage random method to obtain the sampling number. The sampling process was casting lots to obtain 4 samples from private and public universities in Bangkok. The sampling group was 1000 first-year to forth-year students in the academic year of 2015 from private and public universities according to the Yamane’s random sampling table.

Research instruments

The study employed a questionnaire to self-evaluate the 12 core values.

Data collection

1. The researcher submitted a letter to the president of each of the universities and contacted each of the departments to ask for permission to collect the data.
2. Once having received approval, she requested assistance from the universities teachers and staff to distribute the questionnaire copies to students.
3. Some universities allowed the researcher to directly collect the data in classrooms.
4. Once all of the questionnaire copies had been collected, they were checked in terms of completeness. The researcher was able to obtain 825 complete questionnaire
copies. This is equal to 82.5% of all of the questionnaire copies distributed at the beginning.

Data analysis

This study is a comparative study using a questionnaire survey asking the participants to do a self-evaluation on the topic of the 12 values of Thais. The survey was conducted with students in public and private universities. The data was later analyzed using the SPSS/PC to find out mean scores and standard deviation. The results are categorized into 4 parts and presented below:

Part 1: Analysis of students statuses in private and public universities.
Part 2: Analysis of the students attributes based in the 12 core values
Part 3: Examining the differences of the students attributes based on the 12 core values between students in private universities and public universities.
The results are as follows:
Table 1: Mean scores of the students attributes based on the 12 core values from students self-evaluation in private and public universities

The 12 core values | (\bar{x})
--- | ---
10. Practicing the philosophy of Sufficiency Economy of His Majesty the King. Saving money for time of need. Being moderate with surplus used for sharing or expansion of business while having good immunity | 3.95
4. Seeking knowledge and education directly and indirectly | 4.00
5. Treasuring the precious Thai tradition | 4.01

Discussion and conclusion

According to the research findings, it can be conclude that the mean scores of 11 items out of the 12 core values collected from both of the public university students are higher than the mean scores collected from both of the private university students. The 11 items are listed below:

1. Upholding the nation, the religions and the Monarchy
2. Being honest, sacrificial and patient with positive attitude for the common good of the public
3. Being grateful to the parents, guardians and teachers
4. Seeking knowledge and education directly and indirectly
5. Treasuring the precious Thai tradition
6. Maintaining moral, integrity, well-wishes upon others as well as being generous and sharing
7. Understanding, learning the true essence of democratic ideals with His Majesty the King as the Head of State
9. Being conscious and mindful of action in line with His Majesty's the King's statements
10. Practicing the philosophy of Sufficiency Economy of His Majesty the King, saving money for time of need and being moderate with surplus used for sharing or expansion of business while having good immunity
11. Maintaining both physical and mental health and unyielding to the dark force or desires, having sense of shame over guilt and sins in accordance with the religious principles
12. Putting the public and national interest before personal interest.

The mean scores of 8 items out of the 12 core values collected from both of the private university students are higher than the mean scores collected from both of the public university students

Furthermore, table 2-5 demonstrate consistent information that item no. 10 on the list of the 12 core values about the philosophy of Sufficiency Economy of His Majesty the King to carefully spend money and to be moderate with surplus used for sharing or expansion of business while having good
immunity should be promoted among current university students as a priority because it will lay the most essential economic foundation for the country. It is also interesting to find out that all of the universities show low mean scores for item no. 4 (Seeking knowledge and education directly and indirectly) and item no. 5 (Treasuring the precious Thai tradition) on the 12 core values list. This reveals that these two values need to be worked on and focused. Moreover, only one university show a low mean score for item no. 2 (Being honest, sacrificial and patient with positive attitude for the common good of the public) and 11 (Maintaining both physical and mental health and unyielding to the dark force or desires, having sense of shame over guilt and sins in accordance with the religious principles).

Suggestions

According to the findings, the researcher would like to propose the following suggestions:

The researcher would like to give 3 main suggestions for promoting the 12 core values in universities:

1.1 In terms of policy planning, all universities must have a campaign and policy planning aiming at research for new knowledge about how to cultivate students to be autonomous learners and put emphasis on studies about constructing a good basis of learning since kindergarten. Students should be encouraged to seek for knowledge by themselves. Moreover,
universities should have a clear policy to revitalize Thai culture and preserve Thai traditions. The focus should be put on visible implementation of the university main missions.

1.2 As for curriculum and instruction, universities must improve their instruction to become more integrated and encourage students to be autonomous learners, practice analyzing and do more participatory learning and create their own concepts and ideas. The philosophy of Sufficiency Economy should be included in all of the courses focusing on students’ understanding and ability to apply to their lives. Students should be taught to realize the importance of this philosophy because it can be used as a basis for developing the economy of the country. More free elective courses about ethics, morality and Thai culture should be added into the curriculum.

1.3 Regarding students’ activities, universities must provide more extra-curricular activities gearing toward Thai culture related activities and activities that support the philosophy of Sufficiency Economy. It is recommended to set up a Thai cultural center to provide students knowledge about Thai culture and learn about their roots.

Recommendation for further studies

1. More studies concerning Thai culture and traditions and promoting the
philosophy of Sufficiency Economy among students are recommended.
2. There should be studies conducted with students in each university to examine the students’ values. The findings can be used as a guideline to develop the students in line with the 12 core values.

Faculty of Applied Arts
King Mongkut’s University of Technology North Bangkok

ABSTRACT
This research aims to analyze students’ quality who enroll in Badminton course according to twelve values announced by the Head of the National Council for Peace and Order (NCPO) as follow:

1. Adore the nation, religion, and HM the King.
2. Be honest, dedicated, patient, and have a fine ideology for public.
3. Be grateful to parents, guardians, and teachers.
4. Study hard, always.
5. Maintain good Thai customs and traditions.
6. Be ethical, honest, well-intentioned, and generous.
7. Learn and understand the democracy headed under HM the King properly.
8. Be disciplined, obey the laws, and pay respect to elderly people.
9. Be conscious, thoughtful, and make good things by following HM the King’s statement.

10. Live philosophically with the self-sufficiency economy.

11. Set the mind and the body strong, overcome desires, and be afraid of sins as stated in religion.

12. Be dedicated to the public’s and the nation’s benefits rather than one’s own benefits.

This was basically a descriptive research. A questionnaire related to the behavior was prepared to examine the twelve values as stated above. The sample consisted one thousand students of King Mongkut’s University of Technology North Bangkok who were enrolled for Badminton course in second semester of the academic year 2014. The data was analyzed by descriptive statistics along with standard deviations, means and frequency. The outcome of the study will be a model for teaching in order to improve students’ quality implementing the twelve values announced by the Head of the National Council for Peace and Order (NCPO).

**Background of the study and significance of the problem**

The world changes constantly in all aspects: technology, science as well as thoughts and values. As a result, all countries must develop quickly in order to stay competitive. Thailand is also one of the countries in need of development in many areas to catch up with many other nations. With too much
emphasis on climbing the ladder of economic performance and materialistic achievement, preserving Thai culture and Thai values might be neglected and overlooked. What has happened to many Thai youths is that technological progress seems to have taken priority over Thainess. They have forgotten all about the Thai values. Therefore, when the National Council for Peace and Order (NCPO) seized the power to run the country, they have initiated 12 Thai values and has been promoting the 12 values since May 22, 2014. This is considered a start of Thai cultural revitalization heading toward building a stronger nation with harmony and patriotism. The 12 values are listed below:

1. Adore the nation, religion, and HM the King.
2. Be honest, dedicated, patient, and have a fine ideology for public.
3. Be grateful to parents, guardians, and teachers.
4. Study hard, always.
5. Maintain good Thai customs and traditions.
6. Be ethical, honest, well-intentioned, and generous.
7. Learn and understand the democracy headed under HM the King properly.
8. Be disciplined, obey the laws, and pay respect to elderly people.
9. Be conscious, thoughtful, and make good things by following HM the King’s statement.
10. Live philosophically with the self-sufficiency economy.

11. Set the mind and the body strong, overcome desires, and be afraid of sins as stated in religion.

12. Be dedicated to the public’s and the nation’s benefits rather than one’s own benefits.

Office of the Basic Education Commission has ordered all of the school in Thailand to integrate the 12 values into all of their curriculums and to organize activities and contests to put the 12 values into practice. Dr. Kamol Rodklai Secretary-General of the Office of the Basic Education Commission said on November 3, 2014 that all of the schools in Thailand were starting to teach Thai history intensively. The instruction would go beyond content but aim for instilling a sense of Thainess and patriotism in today’s Thai youth.

Gen. Suthat Karchananon, advisor to Assistant Minister for the Ministry of Education also said that it is very crucial to establish the 12 Thai values by starting at schools of which school administrators realize the importance of the need to strengthen the nation and encourage morality, ethics including loyalty to his Majesty the King of Thailand. Therefore, every history course should aim at building trust in the monarchy and cultivating ethics to unite people in the country both in theory and practice.

Realizing the significance of developing students in this particular aspect, the researcher, an instructor of a badminton
course, explored the attributes based on the Twelve Values Announced by the Head of the National Council for Peace and Order (NCPO) of students taking her badminton course with a hope that the findings can be used and applied to development of courses and activities to encourage students to realize the importance of the 12 values of Thais according to the policy of the National Council for Peace and Order (NCPO).

The objectives of the study are listed as follows:

1. To study the attributes of students taking badminton in accordance with the 12 values of Thais.
2. To create an evaluation form to evaluate the students’ attributes based on the 12 values of Thais in the badminton course.
3. To find out how to improve the course implementation to promote the 12 values of Thais.

Scope of the study

1. The participant of this study was 1,167 students taking the badminton course in the 2nd semester of the academic year of 2014.
2. The variables of the study are gender, major, year of study
3. Behaviors relevant to the 12 values of Thais

Methodology and data collection
This study is a descriptive study using a questionnaire survey asking the participants to do a self-evaluation on the topic of the 12 values of Thais. The survey was conducted with 1,167 students taking the badminton course in the 2nd semester of 2014 at King Mongkut's University of Technology North Bangkok. The data was later analyzed using the SPSS to find out the percentage, mean scores, standard deviation. The results are presented below:

Conclusion

It can be concluded that the attributes rated very high as the values that the students possess the most are presented (from the highest to the lowest) below:
<table>
<thead>
<tr>
<th></th>
<th></th>
<th>Being grateful to the parents, guardians and teachers</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>12</td>
<td>Putting the public and national interest before personal interest.</td>
</tr>
<tr>
<td>4</td>
<td>7</td>
<td>Understanding, learning the true essence of democratic ideals with His Majesty the King as the Head of State</td>
</tr>
<tr>
<td>5</td>
<td>8</td>
<td>Maintaining discipline, respectful of laws and the elderly and seniority</td>
</tr>
<tr>
<td>6</td>
<td>9</td>
<td>Being conscious and mindful of action in line with His Majesty’s the King’s statements.</td>
</tr>
<tr>
<td>7</td>
<td>11</td>
<td>Maintaining both physical and mental health when facing challenges</td>
</tr>
<tr>
<td>8</td>
<td>6</td>
<td>Maintaining moral, integrity, well-wishes upon others as well as being generous and sharing</td>
</tr>
<tr>
<td>9</td>
<td>2</td>
<td>Being honest, sacrificial and patient with positive attitude for the common good of the public</td>
</tr>
<tr>
<td>10</td>
<td>10</td>
<td>Practicing the philosophy of Sufficiency Economy of His Majesty the King. Saving money for time of need. Being moderate with surplus used for sharing or expansion of business while having good immunity</td>
</tr>
<tr>
<td>11</td>
<td>4</td>
<td>Seeking knowledge and education directly and indirectly</td>
</tr>
<tr>
<td>12</td>
<td>5</td>
<td>Treasuring the precious Thai tradition</td>
</tr>
</tbody>
</table>
The results from Table 3 show that item no. 10 (Practicing the philosophy of Sufficiency Economy of His Majesty the King, saving money for time of need. Being moderate with surplus used for sharing or expansion of business while having good immunity), item no.4 (Seeking knowledge and education directly and indirectly) and item no. 5 (Maintaining discipline, respectful of laws and the elderly and seniority) gained the lowest mean scores. On the contrary, item no. 1 (Upholding the nation, the religions and the Monarchy, which is the key institution), item no. 3 (Being grateful to the parents, guardians and teachers) and item no. 12 (Putting the public and national interest before personal interest) received the highest mean scores. Therefore, it is suggested that emphasis should be put on teaching students to preserve Thai culture and traditions, be an autonomous learner and practice the philosophy of Sufficiency Economy.

Table 4: the mean scores (listed from lowest to the highest) of the 12 values

</tr>
</tbody>
</table>

The above table illustrates clearly that students taking a badminton course should be encouraged to speak politely and be able to seek knowledge by themselves and realize the importance of preserving Thai culture and learn to save money as indicated in the philosophy of Sufficiency Economy.

**Suggestions:**

Based on the findings, as a badminton teacher, the researcher would like to propose four suggestions as follows:

1. In terms of course implementation, instructors should emphasize on working diligently working by promoting self-studying and suggesting students to review their previous lessons after class. Students can watch badminton international matches on Youtube and other websites and take turns to give
presentations to their classmates every week. Students should also be assigned to practice different moves before and after each class lesson.

2. Emphasis should be given on the badminton playing etiquettes, manners and being polite. Instructor can also teach students to pay respect to people and encourage students to demonstrate Thai greeting (Wai), to smile, say ‘thank you’ or using Thai martial arts to warm up their bodies before playing in order to promote Thai culture. Instructors may consider granting rewards and giving penalty to reinforce positive behaviors and control negative behaviors.

3. Students should be taught how to select proper equipment and maintain their equipment. This is to encourage students to spend money carefully and for the best benefit.

4. In-class activities should be included to teach students about self-conscience and having sportsman spirit. Students should learn to help those who are weaker or less skillful. Instructor can pair students up having the more skillful teach their partners who are less skillful. More teaching and practice on the gentleman spirit, generosity, being a giver and not too much focusing on the result should be integrated into class lessons using role-plays and case-study discussions.

Recommendations

1. For universities
1.1 As for students activities, There should be more activities concerning the 12 values with an emphasis on treasuring Thai culture and traditions and practicing the philosophy of Sufficiency Economy of His Majesty.

1.2 A policy planning and campaigns to promote good manners and speaking politely are needed and implemented seriously with uses of reinforcements.

2. For further studies

2.1 This study was conducted with students taking the badminton course only. A similar study can be conducted with students taking other courses.

2.2 A study examine students values in other aspects can shed some light on developing extra-curricular activities or adjusting instructions.

Cultural heritage is the historical fruit and the vestige of the past, and the important property to deliver for the future. It brings diverse values in society, culture and education. Culture cannot be exclusive to the human being and the survival mechanism. Humans’ non-instinctive behavior is culture through the time and space. Time and space in culture give us materials to learn something from the past. Cultural heritage is useful education material for classroom to teach the followings such as the way of living, the way of thinking and way of feeling. Cultural heritage has diverse educational values, and so it deserves to analyze educational program using cultural heritage, especially World Heritage.

To analyze world heritage educations, we researched the world heritage education programs with a search word “world’s cultural heritage (WCH)” in the domestic (Republic of Korea) and the international database website. We analyzed the educational program using WCH based on the following criteria: the whole information of education program, the meaning as World’s Cultural Heritage, and the educational value.

Analysis results show the several characteristics. First, the educational programs of WCH were classified into three categories – the education about World Heritage, the education for World Heritage, and the education through World Heritage. The world heritage educations were mainly developed as the education through World Heritage, more than the education about World Heritage.

Second, the educational programs of WCH were mainly developed in the area of history, culture, and art. A small part of them were developed in the area of science, music, and mathematics. Despite WCH’s high values and applicability in education, the educational programs showed limitations in terms of their lack of comprehensiveness and value-oriented.

There was a slight different utilization of WCH between Korean WCH education and the world-wide WCH education. It means that WCH education could be different in each country’s history, culture, and situation. We need to develop the world heritage education with consideration of the socio-cultural background, the social condition, and the characteristics of World Heritage.

Nationalism and Multiculturalism: 
Unification Education in South Korea Curriculum

Eun-Young. Yoon. 
(Sinjang Elementary School)

Abstract

The division of Korea is primarily political, though the physical separation and isolation of one state does create some notable differences in ideology, culture and language. In this situation, homogenous nationalism has been a vehicle for unification education in South Korea. However, South Korea is quickly becoming a multicultural society, so it is hard to emphasize on “a single nation” in unification education any longer. To respond to this new condition, unification education should be examined and revised. Furthermore, school curriculums should be designed to have a significant impact on students’ perception and image of North Korea and unification even before they have personal contact with North Korean refugees.

Within this context, this paper examines how unification and North Korea are being taught in South Korean classrooms. The analysis of the curriculum and textbooks regarding unification in South Korean elementary schools, this study uses nationalism and multiculturalism as major theoretical frameworks. Within these framework, this study not only critically analyzes the curriculum and textbooks, but also builds a new paradigm of unification education.

Major findings show that there are only four lessons dealing with unification and North Korean refugees in elementary school curriculum. As textbooks are based on emotional approaches like appealing North Korean refugees’ difficulties, it is hard to understand the necessity and objective circumstances of unification. Because unification and a changing Korean society are being taught separately, students have a slight chance to consider a unified Korea. Currently, students have difficulties to acquire a balanced and complicated understanding of North Korea and unification by school curriculum.

Based on these results, the curriculum and textbooks in South Korea should describe unification with North Korea in great depth. Not only North Korean refugees’ difficulties but also North Korean cultures should be taught in the classroom. Thus, it is the first step in unification education;
school curriculum teaches how to make sense of domestic diversities with North Korean refugees. And the balancing between “global citizenship” and “national identity” is needed.
Education for health-care-workers to popularize Animal Assisted Therapy (AAT) in Japan

Abstract:
This study aims to clarify the issues to popularize Animal Assisted Therapy (AAT) in Japan. In recent years, Animal Assisted Therapy (AAT) starts to gain attention in Japan. However it has been not popularized widely yet. due to hygienic reason in Japan, it is very hard to introduce AAT at general hospitals. Only 5 years ago, the facility dog with a nurse handler was first introduced at one of Children’s hospitals for the first time to launch AAT in Japan, and spread publicly after that. Although it has been almost 5 years since AAT was first introduced in Japan, there are only 3 hospitals to have introduced facility dogs with nurse handlers (two of them are children’s hospitals and the other is a convalescent hospital). From
those results, it cannot be said that, AAT has not become widespread in Japan.

From the result of literature research about the cause of this issue, we found that there were 2 points of causes by culture differences and how people view animals. 1: Not to be established AAT’s system. 2: There is resistance to introduce therapy dogs by lacking of knowledge of health-care-workers. It is important to educate health-care-workers and to cultivate handlers. Further more, it is necessary to demonstrate the scientific effects as well.

Introduction

In 2010, a facility dog with a nurse’ handler was introduce at one of the Children’s hospital for the first time to launch AAT in Japan. And in recent years, Animal Assisted Therapy (AAT) has started to gain attention in Japan, however it has been not spread widely yet. To popularize Animal Assisted Therapy (AAT) in Japan, AAT have to be discussed as historical, systematized and existing actives’ ways to compare with the Western countries and Japan.

Definitions

Animal-Assisted Active (AAA) is purpose of interaction animals and people, to give the emotional stability by interact with animals, it is an activity recreation to improve Quality Of Life. Animal-Assisted Education (AAE) is in Kindergartens and various schools, etc. it is an activity to learn the importance of the relationship and life with others by being interposed animals in education. Animal-Assisted Therapy (AAT) is formally defined as “a goal directed intervention in which an animal that meets specific criteria is an integral part of the treatment process” by Delta Society (Kruger, Trachtenberg, & Serpell, 2004, p .4). AAT is one of the Complementary & Alternative Medicine and has involved specific treatment goals. The notable difference between AAA and AAT is that AAT has scheduled sessions, each session involving specific treatment goals.

Purpose

This study aims to clarify the issues about popularizing Animal Assisted Therapy (AAT) in Japan by overviewing the history, systems and existing activities.
**Method**

To overview the history, systems, effort and existing activities of AAT, and to focus on the difference of culture and outlook of animals in the Western countries and Japan by literature research.

**Results**

**History of AAT**

It has been already described the idea of using animals in the treatment in Greek era. However, the first documented case was in England at York Retreat which is psychiatric hospital to assist animals for patients to treatment. As animals involved in therapeutic settings became more prevalent, scientific medicine was introduced and pushed AAT aside until the late 1960’s when Boris Levinson’s work came about (Allderidge, 1991). Levinson is a psychotherapist and pioneer of AAT incorporated a dog into therapy sessions with clients. The late 1970s and 1980s marked a turning point in the growth of AAT as a credit field (Fine, 2000).

**Types of animals**

The animals to be involved in AAT, a wide variety such as dogs, cats, rabbits, horses, fish, dolphin and so on. Most commonly used is dogs is the most common type of AAT. The interaction between dogs and clients is an important aspect in canine-assisted therapy (Fine, 2000; Thompson, 2009).

**Effort of Animal-Assisted Therapy**

The Effects of AAT are psychological, physical and social. The psychological effects are that people can heal and get relief and also establish their own relationship methodology by touching dogs. The physical effect is emollient and a decrease of blood pressure. Recent interest in AAT and medical value has been gained by a study conducted that found heart attack victims had prolonged life due to owning pets (Urichuk et al., 2003).

A study conducted by Friedmann, Katcher, Thomas, Lynch, and Messent (1983) measured the blood pressure of twenty six children when a dog entered the room. The children did not have contact with the dog but were able to see it. Friedman and colleagues found that the children’s blood pressure decreased when the dog entered the room. The study concluded that the very presence of a dog can decrease anxiety and lower blood pressure (Fine, 2000; Friedman et al., 1983, Pichot et al., 2007).
The social effects are as follows: it has been proved that people who have dogs attend hospital for a decreased amount of time. In Germany, IAHAIO has shown that medical expenses decreased by as much as 750 billion dollars.

**AAT's activities in the U.S.A and Japan**

AAT's activities in Europe, in 1947 Green Chimneys was established as an educational facility. That institution supervises children who have ADHD, was raped, or who has special needs. In that institution physicians and psychiatrists are stationed, and health care providers such as Ns and Pt provide AAT care. Not only in educational facilities but also in prisons, elderly facilities, in home care, hospices, psychiatry, pediatrics and acute stage implementation of AAT.

On the other hand, activity of AAT in Japan is mainly in kindergartens, elderly facilities and hospices, but in 2010 at a child hospital it was the first introduction of AAT for nurses as handlers. And now in the east of Japan AAT activities are spreading at hospital departments of pediatrics, and also in hospices animals have to be stationed. In Japan, there are less opportunities than in Europe.

**The history of canine and human's relationship**

To compare the Western countries and Japan in terms of canine and human history, in the Western countries and Japan as the time varied, canines were used as domestic animals and to be as partners with hunting. However, there was a turning point that made the relations of canines and humans change at the Western countries and Japan.

In the 19th century at the Western countries canines were intended to be pets, and in the 20th century canines were changed from pets to companion animals as means of living life together.

On the other hand, at the end of the 19th century in Japan, people had canines for pets, however over the Meiji era and at the beginning of the Syowa era, a lot of canines were killed because of the wars and spreading Rabies. And now it changed from pets to companion animals. By that historical background, Canine and human relationships happened at different times.

**The difference of AAT system between United States and Japan**

In the United States, there is an organization of AAT called DELTA Pet Partners which is approved by the government. This organization raise handler of Dog for AAT and established a qualification of AAT.

In Japan, there are some organizations which are doing dog therapy individually and no
official qualifying system is existence. As mentioned above, there is not any official qualification system for medical site. In some hospital, there was a nurse who graduated from dog training school and gain personal and private license which some private organization issued. But such school or organization gives individual method or license so that there are not same qualities and required handling ability is totally different. On the other hand, knowledge deficit of medical professionals is the reason why AAT has not been spread in Japan. In fact, not many people know not only effectiveness of AAT but also the word AAT itself. Not a few people in Japanese hospital believe animal such dogs are all dirty so it is hard to get permission to take dogs into the hospital. In order to break the deadlock in current conditions, AAA and AAT as a complementary and alternative medicine should be taught at the university of medical course.

**Discussion**

The late 1970s and 1980s AAT was introduced in the Western countries, though it has started to gain attention in Japan since 2010. Despite dogs as most common animals, there are wide varieties such as dogs, cats, rabbits, horses, fish, and dolphin by AAT in the Western countries. Dongs are the only ones introduced as AAT in Japan. There is a significant difference at AAT filed between the Western countries and Japan as well. Activities of AAT in Japan are mainly in kindergartens, elderly facilities and hospices, and a few activities of AAT have been spreading at pediatrics departments in hospitals since a child hospital had first introduced in 2010. In Japan, there are fewer opportunities than in Europe.

Because of the fewer opportunities of AAT in japan than the Western countries, the history of AAT has not only influenced, the historical background of canine and human’s relationship has also influenced.

The lagging behind in Japan compare with the Western countries, those historical differences about AAT and canine and human’s relationship caused the difference of AAT system between the western countries and Japan as well.

From the result of literature research about the cause of this issue, we found that there were 2 points of causes by culture differences and how people view animals. 1: Not to be established AAT’s system. 2: There is resistance to introduce therapy dogs by lacking of knowledge of health-care-workers. It is important to educate health-care-workers and to cultivate handlers. It is suggested to consider and to study of the effort of Animal-Assisted Therapy in Japan.
**Conclusion**

The main findings are as follows:

1) AAT system hasn’t been established in Japan yet.

2) It’s very hard for medical professionals to accept to introduce dog therapy because of knowledge deficit.

Thus, It is suggested to consider and to study the effort of Animal-Assisted Therapy in Japan. And to provide education of AAT for people who dedicated for medical site and training handler are important to spread AAT in Japan.

Poster session : Abstract

【 Introduction 】
As instructors at a nursing college in Japan, we teach injection methods to second year students. This subject consists of 15 combined lectures and skills training sessions. During the skills training, nursing students listen to teachers’ explanations of the procedure, watch a demonstration, and then practice the procedure using a commercial simulation model. Blood drawing is included in the training, and is one of the skills evaluated before students obtain their degrees. Venipuncture is a difficult technique for beginner students to master, particularly advancing the needle into the vein without penetrating the posterior venous wall. We perceived the need to better prepare students to master blood drawing. Therefore for the past five years we carried out brief experiential training sessions in which students practiced inserting syringe needles into inexpensive transparent straws (4.5 mm in diameter and 180 mm in length) that functioned as simulated blood vessels (fig.1). These sessions took place during the lecture and prior to skills training. We presented some of the results of this program at the 13th Annual HICE. This report describes the effect of brief experiential training using modified materials to simulate blood vessels with overlying skin based on comparison of the opinions of this year’s and last year’s students.

【 Modified simulated blood vessels with overlying skin 】
Last year, 60% of students commented that the surface of the straws used in the training sessions was hard and slippery, which made insertion difficult. A few students requested that simulated skin be added to the straw surface. Therefore, we recently modified the simulated blood vessel by covering each straw with a semitransparent tube made of silicon (fig.2). These tubes were procured from unusable replacement parts used in commercial simulation model. As the tube and the straw had the same outer diameter, the tube was cut along its entire length to make it easier to place it over the straw.

【 Conducting the brief experiential training 】
Students followed the instructions after one of the teachers demonstrated the techniques using the modified simulated blood vessel. The demonstration was recorded with a portable document
camera and the image was projected in real time onto one large screen and four smaller ceiling-suspended liquid crystal displays.

1) Set up the modified simulated blood vessel by covering the straw with the tube.
2) Place the simulated vessel lengthwise on the desk and secure its upper end to the desk with scotch tape.
3) Place the thumb or forefinger of the non-dominant hand on the bottom end of the simulated blood vessel.
4) Insert the syringe needle at a 15-to-30 degree angle with the dominant hand.
5) Lower the angle of the needle a little and then advance the needle through the lumen to half of the needle length.
6) Visually confirm whether the needle has penetrated the simulated vessel.
7) Repeat venipuncture as many times as possible until the end of the training session.
8) Fill out a brief voluntarily, anonymous questionnaire.

【 Results 】
Of the 107 students (99%) who responded this year and the 98 who responded last year (94%), 90% and 80%, respectively, stated that the training session enabled them to visualize performing the venipuncture technique. Compared to last year’s students, a significantly greater proportion of
current-year students responded that they were strongly able to visualize the venipuncture technique \((p=0.021)\). Sixty-one percent of last year’s students stated that they succeeded on the second try, compared to only 41% of current-year students. Compared with last year’s students, students this year had a lower success rate on the first try \((p=0.014)\). Half of this year’s students succeeded after the third attempt. For current-year students there was a significant association between succeeding at the third attempt or beyond the third and those who could visualize the venipuncture \((p=0.010)\). We considered the possibility that brief experiential training did not improve the readiness of this year’s students as much as last year’s. Therefore, we compared percentages of the two groups who achieved the appropriate puncture angle and syringe needle insertion length. Sixty-five percent of this year’s students used the correct puncture angle, and there was no significant difference compared to last year’s students \((76\%)\). However, 74% of current-year students used the correct needle insertion length, compared to 91% last year, which represents a significant decline \((p=0.001)\). This statistical analysis was performed using a chi square test with a level of significance of 5%.

Only 29% of students this year provided their opinions, compared to 70% of students last year. None of the students in this year responded regarding the hardness or slipperiness of the surface of the straws. Most of the opinions centered around two points. First, that there was a limited range of wrist motion while using the syringe because the modified simulated blood vessel lay directly on the desk. Another was that the modified simulated blood vessel was not adequately secured to the desk and was subject to movement during the technique.

【 Conclusions 】
The simulated blood vessel that used a semitransparent silicon tube over a straw in order to simulate skin appears to have helped students visualize the venipuncture process. However, students tended enter the vessel at a higher angle than normal due to the simulated skin. The proportion of this year’s students who used the correct angle was 65%, similar to last year’s. It is possible that not using a transparent straw made it difficult for students to see the length of the needle and to succeed on their first attempt.

However, the ratio of students who could visualize the venipuncture process increased this year over the last, and there was no significant difference in the percentage of students using the correct insertion angle. This suggests that the addition of simulated skin improved students’ experiences. An approach should be devised to enable students to recognize the location of the syringe needle tip in the modified simulated blood vessel. In addition, we think there is room for improvement regarding methods of securing and positioning the modified simulated blood vessel on the desk.
Consideration of support using Areal Feature and SNS (Social Network Service) for nursing-students job-hunting

**Abstract:** This study aims to find another way of nursing-students’ job-hunting tool by interviewing with small-and-medium-sized hospitals about how to employee enough number of novice nurses, and current situation of nursing-students’ job-hunting tools. Nursing-students mostly use “Internet website of hospitals (17%)”, “career fairs (17%)” as important Information sources for job-hunting. And Internet is one of the most important job-hunting tools. Although small-and-medium-sized hospitals prepare great emphasis to provide great working environment and fulfilling Internet website of the hospital to introduce their hospitals and nursing activities, they still hardly have some questions, requests or comments from nursing-students through emails or blogging comments. Small-and-medium-sized hospitals should be selectable for nursing-students. And it is necessary to build another introducing tool to match those nursing-students and small-and-medium-sized hospitals. We found that small-and-medium-sized hospitals had difficulties to introduce their hospitals, nursing-students had difficulties of job-hunting from varieties of hospitals. Social Network Service can possibly make those difficulties decrease from both sides.

**Background**

According to Japanese Nursing Association in 2012, job opening-to-application ratio was 2.7 per person that had being increased by more than 3 times since 2003. It’s said that this increasing job opening-to-application ratio trend would last until 2025. And it is estimated to be necessary about 2 million nurses in 2025 due to aging population in Japan.

Although the necessity of nurses population, the number of nurses has always been shorted at every hospital and clinic in Japan. Current situation of nursing-students’ job-hunting, they tend to look only at large-sized hospitals such as academic-medical-centers and university-hospitals. The attitude survey of job-hunting for nursing-students in 2011 by SMS co., ltd, nursing-students putting great value of job-hunting tools were “Internet website of hospitals”, “career fairs”, “authentic voices from the nurses working in the hospitals”.

In the point of view of perfect match with nursing-students and their working place, small-and-medium-sized hospitals should be selectable as well.
Purpose

This study aims to find another way of nursing-students’ job-hunting tool by interviewing with small-and-medium-sized hospitals about how to employee enough number of novice nurses, and current situation of nursing-students’ job-hunting tools.

Method

We used a question paper with six categories originally (Demographic, information sources for job-hunting, interesting information of hospitals, utilization situation of Internet, utilization situation of Smart-phone, utilization situation of Social Network service) and investigated a questionnaire. Objects are nursing-students belonging to a nursing school in A prefecture in Japan, 80 in total.

We also interviewed with 2 directors of nursing in 2 small-and-medium-sized hospitals about the difficulties and current situation of how to employee enough number of novice nurses.

Ethical considerations

We got an approval from the ethical committee in Digital Hollywood University, Japan. We explained the purpose of this study, how to collect question papers, method of analysis, and privacy consideration to ensure that it is not possible to identify an individual by an explanation paper.

Results

We collected 80 question papers from a nursing school in A prefecture Japan. Those students were expected to graduate and becoming novice nurses in 6 months time (70 female and 10 male). Information sources for job-hunting were “Internet website of hospitals (17%)”, “career fairs (17%)”, “real experience from nursing practice in the hospitals (16%)”, “authentic voices from the nurses working in the hospitals (15%)” (Figure1). Utilization situation of Internet for job-hunting was more than 60% (Figure2). From the viewpoint of nursing-students, “programs of orientation and education for new nurses employees (19%)”, “Nonworking days per week and number of days on night-shift (19%)”, “nurses and other co-medical workers well-developed relationships (17%)”, “starting salary (17%)” were the most important information for those students to see the Internet website of hospitals. “A sense of fulfillment in nursing (12%)”, “authentic voices from the nurses working in the hospitals (12%)” were also expected to see in the Internet website of hospitals as important information for nursing-students’ job-hunting.
On the other hand, about the difficulties and current situation of how to employee enough number of novice nurses from the interviews with 2 directors of nursing in 2 small-and-medium-sized hospitals, there were many difficulties for collecting enough number of novice nurses since so many large-sized hospitals such as academic-medical-centers and university-hospitals were placed near-by. So those hospitals put great emphasis to provide “childcare facility for nurses’ children”, “dormitories for nurses”, “programs of orientation and education for new nurses employees”, “system of home leave vacation for nurses”, “overseas training system for nurses”. They also put strong emphasis to make individual nursing website linked with the hospital and introduce “features of nursing in the hospital”, and “work environment”, and “blogs of authentic voices from the nurses working in the hospitals” although there are only few Internet websites shown hit numbers and almost no question, request or comment they received from future novice nurses related with nursing-students’ job-hunting by emails. They also prepared internship program for nursing-students, and try to make many chances to introduce their hospitals by visiting many nursing schools, universities, colleges, and career fairs. Surprisingly they paid the traveling expenses of nursing-students coming to the hospitals for entrance exams or employment interviews. One of those 2 directors of nursing told us that this small-and-medium-sized hospital put about 500,000 USD for nurses Recruitment budget per year.

Figure 1: Information sources for nursing-students’ job-hunting
Figure 2: Utilization situation of Internet for job-hunting

Figure 3: Nursing-students expectation in hospitals’ Internet website
From the result of question papers, nursing-students mostly use “Internet website of hospitals (17%)”, “career fairs (17%)” as important Information sources for job-hunting. And Utilization situation of Internet for their job-hunting was more than 60%. According to Ministry of Internal Affairs and Communications in 2011, More than 80% of all population in Japan use Internet. And more than 96% of people between 13 to 29 years old use Internet. Penetration rate of Smart-phone carriers between 10 to 29 years old in Japan is over 70% in 2013 by IDC Japan co., ltd. And the number of Facebook users is more than 22 million in 2013. It’s said that over 50 million people use Social Network Service such as Mixi, Facebook, Twitter and Line in Japan. People between 15 to 19 years old use Social Network Service about 162 minutes/day, people between 20 to 29 years old use Social Network Service about 84 minutes/day in 2013 by Hakuhodo DY holdings. Those spending time of Social Network Service were more than its time of Google searching or watching YouTube. So that, most nursing-students use Internet commonly. And Internet is one of the most important job-hunting tools.

Although small-and-medium-sized hospitals prepare Internet websites of the hospitals and individual nursing Internet website linked with the hospital and introduce “features of nursing in the hospital”, “work environment”, and “blogs of authentic voices from the nurses working in the hospitals”, they still have difficulties of collecting enough number of novice nurses since so many large-sized hospitals such as academic-medical-centers and university-hospitals were placed near-by. They also prepare great emphasis to provide “childcare facility for nurses’ children”, “dormitories for nurses”, “programs of orientation and education for new nurses employees”, “system of home leave vacation for nurses”, “overseas training system for nurses”. Despite the great working environment and fulfilling Internet website of the hospital to introduce their hospitals and nursing activities, they still hardly have some questions, requests or comments from nursing-students through emails or blogging comments.

Small-and-medium-sized hospitals should be selectable for nursing-students. And it is necessary to build another introducing tool to match those nursing-students and small-and-medium-sized hospitals. Social Network Service can be one of the great ideas since nursing-students’ utilization situation of Internet and Social Network Service. Using Social Network Service make it easier for small-and-medium-sized hospitals to put authentic voices from patients on areal feature of Public Health on community which nursing-students expect for a sense of fulfillment in nursing as well.

Moreover, exchanging communication through Social Network Service between one nursing-student and one small-and-medium-sized hospital can not only be one to one communication. Those communications can also share with other many nursing-students. Since nursing-students have already got used to use Social Network Service, Social Network Service can make it easier for nursing-students to
give some questions, requests or comments to hospitals compare with nursing-students emailing with business manner.

**Conclusion**

We found that small-and-medium-sized hospitals had difficulties to introduce their hospitals, nursing-students had difficulties of job-hunting from varieties of hospitals. Social Network Service can possibly make those difficulties decrease from both sides.

Abstracts

The medical safety theory course is taught to second-year students in the second semester. A method of incorporating digital photos and text was utilized in both individual and group work, as well as in classroom presentations. The purpose of this survey study is to determine the extent that third-year students who have completed their clinical training are able to retain medical safety lessons learned in the medical safety theory course taken over a year earlier.

Title

Nursing Student Medical Safety Education Results: Analysis of Learning Content that is Retained for at Least One Year

Introduction

In 2006, some 9.3% of nursing college graduates in Japan decided to leave their job after becoming a nurse. The primary reason cited for leaving the job was a lack of confidence that their skills and nursing knowledge would be adequate to work in an advanced medical institution, and concern that their inadequacies might result in a serious medical incident. In 2011, the Ministry of Health, Labor and Welfare Ministry and Ministry of Education revised the basic nursing education curriculum, and inaugurated a new course in medical safety theory. By 2012, the turnover rate had fallen to 7.5%, a significant decline of 1.8%. Our nursing school operates in Japan as a three-year college, and students take the medical safety theory course in the second semester of their second year in college.
Through the course, students are first made aware of medical safety issues through lectures and exercises, which are then followed up by practical training that ensures students are well aware of medical safety practices in medical settings so that they won't leave their job after they become a nurse. This combination of lectures, exercises, and training has proved very effective, and has enabled virtually all students to anticipate and avoid risks and hazards before an incident can occur 4).

This study, based on a questionnaire, verifies that students retained the medical safety theory course content even as third-year students after their clinical training was completed, a full year after taking the course. The results presented here are based on responses of 48 student nurses who completed the survey (out of 77 students who were approached to participate in the study, a response rate of 62.3%).

(1) Survey findings revealed that 40 nurses (83%) found the individual MY 5S, BEFORE and AFTER work 3) helpful for assessing the safety of medical settings by learning how to promote a safe environment around the student at school. (5S stands for seiri (sort), seiton (systematize), seisou (sweep), seiketsu (standardize), and shitsuke (self-discipline).)

(2) Survey findings also revealed that 40 nurses (83%) found the Hazard Prediction Training (KYT) group work helpful for improving risk prediction abilities. (KYT stands for kiken yochi toreningu, or hazard prediction training.)

(3) It was also found that 36 nurses (75%) found the individual Hazard Situation (Near-Miss or Close-Call Incidents) Observation Report work helpful for improving student risk awareness observation abilities during training.

(4) Finally, all 48 nurses (100%) who participated in the survey agreed that they were quite capable of caring for their patients while remaining conscious and aware of medical safety concerns during their clinical training.

The findings clearly demonstrated that at least 75% of the nursing students still retain a solid awareness of medical safety issues even as third-year students who have completed their clinical training, well over a year after taking the medical safety theory course. It is thus apparent that the nursing students continue to retain the lessons learned regarding medical safety.

Research Objectives

The medical safety theory course is taught to second-year students in the second semester. A method of incorporating digital photos and text was utilized in both individual and group work, as well as in classroom presentations. The purpose of this survey study is to determine the extent that third-year students who have completed
their clinical training are able to retain medical safety lessons learned in the medical safety theory course taken over a year earlier.

**Research Methods**

2. Subjects: Third year nursing college students, 48 students out of 77 students responded to solicitations (62.3% response rate).
4. Ethical considerations: Survey was conducted with the full consent of Aichi Kiwami College of Nursing Research Ethics Committee.
5. Analytical method: Simple tabulation of questionnaire findings.

**Keywords**

5S, KYT, near-miss incident, medical safety aware nursing

**Results**

1. **Was the individual MY 5S, BEFORE and AFTER work helpful during clinical training to assess safety of medical settings by learning how to create a safe environment around you at school?**

   1) In response to this question, 40 nurses out of 48 (83%) answered that the individual work was "very helpful," "somewhat helpful," or "helpful." One year ago, 52 nursing students out of 65 (80%) gave similar responses to this question.

   ![Graph](image)

   “Did the method of incorporating digital photos and text stimulate your interest?”
2) The subjects described their improved abilities as follows:

(1) Became aware of the ward environment, how things are laid out and arranged.
(2) Realized that assistance goes more smoothly depending on how the environment is set up.
(3) Started to think of medical settings as safety environments.
(4) Try to adapt hospital rooms to patient preferences.
(5) Exercises were helpful when creating environments.
(6) Try to create environments that are easy to use, both actually and for patients.
(7) When I straighten up environments around patient beds, I try to eliminate clutter and organize electrical cords.
(8) I was able to prevent patient falls by organizing the environment better.
(9) The exercise proved helpful when organizing the environment during training.
(10) Keep things neat and tidy when organizing the environment.
(11) Created environment to make patients' bedsides neat and well-organized to reduce potential risks of accidents.
(12) If you put things in their proper place, you know where they are.
(13) Made conscious effort to keep the nurse's station desk and locker neat, and hospital cart well-organized.
(14) Now I notice if tables in the ward are dirty.
(15) Record were often illegible, so I made an effort to keep records neat and well-organized.
(16) Since I have started keeping things neat and organized, I don't lose things so often.
(17) I learned to keep things neat and well-organized.
(18) Detected a hazardous situation, so took extra precautions.
(19) Became keenly aware of places I think are hazardous or risky.
(20) Always be concerned as to whether there are hazards or risks.
(21) A disorganized locker is unsafe, so I organized locker; this reduced risk and made it more convenient.
(22) During training, it's better to keep your locker tidy and storage locker in the ward neat and risk-free.
(23) Mopped up wet floors.
(24) There used to be a trash-can in front of the door to the evacuation area; I realized this was dangerous, and moved the can to the corner.
(25) Noticed risk factor of patients falling, so took steps to ensure that doesn't happen.
(26) Made sure bed rails were firmly in place, so patients wouldn't fall.

These responses can be divided into the following four categories:
(1) Helps when organizing environments: 11
(2) Keep things neat and well-organized on a routine basis: 10
(3) Learned to spot potential hazards: 7
(4) Prevent slips and falls: 3

2. Was *Hazard Prediction Training* (KYT) group work helpful for improving your risk prediction abilities during clinical training?

1) In response to this question, 40 out of 48 nurses (83%) answered that the group work was "very helpful," "somewhat helpful," or "helpful." One year ago, 64 nursing students out of 65 (98%) gave similar responses to this question.

2) Subjects described their improved abilities as follows:

(1) Learned to detect hazardous places/situations.
(2) Hazardous hospital room situations on my mind after the group work session, so naturally looked for hazards in hospital rooms during training.
(3) Became easier to predict hazardous places/situations.
(4) Considering hazardous situations, became adept at determining if schemes would work or not.
(5) Became aware that the exit at the gate was dangerous, so slowed down when entering/exiting (when getting together after training).
(6) Now able to predict situations I used to think were hazardous.
(7) Tried to become more aware of situations dealt with by the group.
(8) Group work helpful by improving awareness about safety around patient beds.
(9) Became keenly aware of potential risks after the hazard prediction class.
(10) Ability to predict risks would make environments safer.
(11) Noticed a decline in nurse calls.
(12) Now able to pursue training with constant care around patients' beds.
(13) Gave more thought to patients falling.
(14) Having raised "falling risk" as a nursing issue, we should consider hazard prediction in the nursing-care plan.
(15) Became aware of tangled intravenous lines and risk of falls around patient beds.

These responses can be divided into the following three categories:

1) Predicting hazardous locations or situations: 6
2) Safety awareness around patients' beds: 6
3) Anticipating falls: 3

3. Was the individual Hazard Situation (Near-Miss or Close-Call Incidents) Observation Report work helpful for improving your risk awareness observation abilities during training?

1) In response to this question, 36 out of 48 nurses (75%) answered that the individual work was "very helpful," "somewhat helpful," or "helpful." One year ago, 61 nursing students out of 65 (93%) gave similar responses to this question.

2) Subjects described their improved abilities as follows:

(1) Developed ability to immediately sense hazard or risk during training.
(2) Developed heightened awareness of hazard or risk even under normal circumstances.
(3) Noticed things in the patient environment that could pose a hazard or risk.
(4) Able to look back on hazardous or risky situations.
(5) Developed ability to observe, look back on what I learned during training about identifying hazards.
(6) When looking at ward or hospital room environment, now have my own perspective as to whether hazards are present.
(7) Seeing potential risk, I proceed with caution.
(8) I slow down and recheck things as I go through a room, and this has had good results.
(9) In some situations the number of nurse calls has declined.
(10) Developed ability to focus and pay attention.
(11) With wheelchairs scattered around elder wards, increased risk of patients bumping into them.
(12) Maintain awareness during training.
(13) Create environment tailored to scope of patient activities.

These responses can be divided into the following three categories:

(1) Sense dangerous places or situations: 7
(2) Increased awareness: 7
(3) Create environment tailored to scope of activities: 1

4. Are you able to care for your patients while remaining aware of medical safety concerns during clinical training?

1) In response to this question, all 48 nurses (100%) stated that they were "very aware," "somewhat aware," or "aware" of medical safety concerns. One year ago, 62 nursing students out of 65 (95%) responded similarly, but one year ago this question was not included among the question items.

2) There are no situations described as very aware.

Conclusions

1. The number of nurses finding the MY 5S, BEFORE and AFTER work helpful increased by 3% over last year, thus indicating that the medical safety theory course
is quite helpful for students. The subjects offered 31 descriptions of situations where this work proved helpful, and these descriptions can be divided into the following four categories: "useful when organizing environments: 11," "keep things neat and well-organized on a routine basis: 10," "learn to spot potential hazards: 7," "prevent slips and falls: 3."

2. The number of nurses finding the Hazard Prediction Training (KYT) group work helpful decreased by 15% since last year. However, 40 nurses (83%) endorse this training, so I believe it will continue. The participants offered 15 descriptions of situations where this work was helpful, and these descriptions can be divided into the following three categories: "predicting hazardous locations or situations: 6," "safety awareness around patients' beds: 6," and "anticipating falls: 3."

3. The number of nurses finding the Hazard Situation (Near-Miss or Close-Call Incidents) Observation Report work helpful decreased by 18% since last year. Note, however, that 36 nurses (75%) endorse this work, so I think it will probably continue. The subjects offered 15 descriptions of situations where this exercise was helpful, and these descriptions can be divided into the following three categories: "Notice something that could become hazardous: 7," "increased awareness: 7," and "create environment tailored to scope of patient activities: 1."

4. Finally, all 48 nurses agreed with the statement that they were "quite capable of caring for their patients while remaining aware of medical safety concerns during their clinical training," for an increase of 5%. The participants offered no descriptions of awareness situations (either last year or this year) regarding this statement.

It is apparent that the nursing students, even in the second semester of their third year in college, still retain much of what they learned from the various exercises in the medical safety theory course over a year ago: MY 5S, BEFORE and AFTER individual work, Hazard Prediction Training (KYT) group work, Hazard Situation (Near-Miss or Close-Call Incidents) Observation Report individual work, and the ability to care for patients while remaining keenly aware of medical safety concerns during their clinical training. The course exercises taught to second-year students during the second semester—(i) photographing and analyzing 5S situations as individual work, (ii) tackling KYT situations as group work by photographing, analyzing, and discussing situations in class, (iii) developing awareness of hazardous situations in medical sites while undergoing clinical training, and so on—were clearly very helpful to the nurses a whole year after they took the course. This suggests that the nurses will continue to draw upon the descriptions of beneficial situations and awareness they learned as they
deal with patients and users in the course of their clinical training.

Consciousness Research of Teachers for Technology Education of Japanese Junior High Schools about 3D-CAD and 3D-Printer

Koichi MIYASHITA
Department of Technology and Information Education, Naruto University of Education
748, Nakashima, Takashima, Naruto-cho, Naruto-shi, 772-8502 Japan
miyasita@naruto-u.ac.jp

1. Introduction

The past few years, 3D-Printers are expected to be utilized as teaching materials because the price became down. Therefore, a training about 3D-CAD and 3D printer for teachers of technology education was implemented in August, 2015 and 13 teachers of supervisor level participated from each prefecture in Japan.

In the training, DesignSpark Mechanical were used as a free 3D-CAD software because of its high functionality, being free of charge and Japanese notation. Though most participants use 3D-CAD for the first time, they were able to master it to some extent through the training of approximately five hours. Furthermore, they worked on the design of original flowerpots and produced them using 3D printer.

According to the questionnaire result after the training, they had an extremely strong interest for use of 3D-CAD but they thought that introducing 3D printers into a class were difficult because the price of 3D printer is expensive for school and the time required for production is very long.

2. Summary of training

The contents of the training are technical intern training about 3D-CAD(4.5 hours), design of the original flowerpot as an exercise(1 hour), start of output with the 3D printer(0.5 hours) and discussion about introduction 3D-CAD and 3D printer to the class of the school. The contents of the technical intern training about 3D-CAD are as follows.

- Explanation of various tools included in 3D-CAD
- Three-dimensional drawing by turn
- Correction of the shape by stopgap
- Exercise of concrete drawings(Engine Parts, Mug cup, Bolt)
- Free curve, mirror, extension of straight line, pattern
- Sweep
- Basics of three-dimensional drawing
- Assembling of parts
- Drawing and transformation of spherical part
- Dividing method of parts
- Movement of sketching plane

3. Consciousness Research

Before and after the training, the consciousness research about 3D-CAD and 3D-Printer were carried out for participants. The items in the research are as follows.

(Q.1) Have you used 3D-CAD? When is it?
(Q.2) Are you interested in 3D printer?
(Q.3) Have you used 3D printer?
(Q.4) What do you want to make with 3D printer?
(Q.5) If you will let a junior high school students design and produce anything, what are they? Why?
(Q.6) Do you want to take in 3D-CAD and 3D printer for a technology class of the junior high school?

What kind of contents do you want to teach?

Before the training, 31% of participants have experience of 3D-CAD, 100% interested in 3D printer, 0% have experience of 3D printer, 62% want to take in 3D-CAD and 69% want to take in 3D printer for the class of the junior high school.
Improving Interpersonal Relationship Skills in University Students:
Development and Evaluation of a Program Combining Techniques from Emotional Education,
Assertion Training, and Project Adventure

Yoshiko Okada

1 College of Engineering, Liberal Arts, Teaching studies, Shibaura Institute of Technology
307 Fukasaku, Minuma-ku, Saitama-shi, Saitama 337-8570, Japan
y-okada@shibaura-it.ac.jp

I. Problem and Aim

According to a report from Japan’s Ministry of Education, Culture, Sports, Science and Technology
1, an increasing number of university students are unable to get along well with other people, and the number of students
who refuse to go to school, take breaks from school, or drop out is on the rise. As a way to address these students’
problems, more universities are establishing specialized facilities for student counseling, such as counselor
positions, student guidance rooms, and counseling rooms (Ministry of Education
2).

Ishikuma3 proposes three stages of psychological assistance service. The first assistance service is intended for
all young students. According to Kondo4, the first assistance service contains facilitative assistance and
preventative assistance. Facilitative assistance is a service that supports the development of basic skills (for
example, interpersonal relationship skills, study skills, and problem-coping skills) necessary for tackling
developmental and educational issues that children face during their student lives. In other words, it is a service that
actively assists in the development of students’ personal resources or the skills young students need to tackle issues
and to cope with problems. The second service is preventative assistance intended for students who have greater
assistance needs and is based on the idea of trying not to let the problems grow so large that they interfere with the
children’s development (Japan Association of Educational Psychology5). The third assistance service targets
students who have very serious assistance needs (special students).

If we apply the thinking behind these three stages of psychological and educational assistance services to
university students, we could say that student guidance through counselors, which takes place at most universities
today, equates to the second or third assistance services. However, there are very few cases of facilitative assistance
services that aim to develop specific skills such as interpersonal relationship skills and problem-coping skills in
Japanese universities.

This study aimed to create a program that fosters university students’ social skills. Thereafter, the study intended
to implement the program in a university and investigate its effect on the students.
II. Methods

1. Program Implementation Methods

1) Implementation Form

The program was implemented through 15 lectures on “Human Relations” from a university’s Humanities and Liberal Arts department.

2) Implementation Subjects

126 university students, ranging from first-year to fourth-year students, at X University in Japan’s Kanto region, participated in the class.

2. Program Development

1) Program Goals

The goal of the program was to improve interpersonal relationship skills in university students. The program created was composed of three elements: emotion, behavior, and recognition (Figure 1). I devised a step-by-step process to study the three elements of emotion, behavior, and recognition to improve interpersonal relationship skills. This was based on the belief that, to be effective, skills (behavior) training was not enough. Therefore, it was necessary to acquire the ability to understand personal emotions through emotional education (emotions) and then acquire skills to appropriately express emotions using assertion training methods (behavior) while simultaneously learning about perceptions that hinder self-expression, which revolve around irrational beliefs (recognition). It was hypothesized that the stages a person must progress through until the material learned can be applied in everyday settings are knowledge (stage of knowing)→experience (stage of thinking and trying to apply knowledge to oneself)→integration (stage of integrating while utilizing the necessary knowledge for problem solving)→application and practice (stage of actively using these in everyday settings). The knowledge and experience stages were formed with on-campus lectures and exercises while the integration stage was formed with off-campus experiential learning through the Project Adventure (hereafter, PA) (Figure 1).

![Figure 1. Program Composition](image-url)
2) Program Content

Table 1 shows the details of the 15 lectures. Lectures 1 through 11 were held in classrooms at the university. Lectures 2 through 11 each included exercises (experiential) such as role playing, worksheets related to the lectures (knowledge), and lecture content. Each lecture was 90 minutes. Lectures 12 through 14 conducted the PA off-campus at an outside facility. The PA was a three-hour, half-day course. Lecture 15 was held at the classroom on-campus and comprised of wrapping-up and reviewed the entire course.

3. Measurement

1) Emotional Intelligence/Social Skills

To investigate the program’s effect, I obtained responses for a social skills scale and an emotional intelligence scale before and after the program implementation. To assess social skills, I used Kikuchi’s social skills scale KiSS-18 (18 items, 6 scales: elementary skills, advanced skills, emotion processing skills, skills to replace aggression, skills to handle stress, and planning skills). For emotional intelligence, I used Toyota and Yamamoto’s emotional intelligence scale.
Japanese version of the emotional intelligence scale WLEIS (16 items, 4 subscales: emotional regulation, emotional evaluation of self, emotional evaluation of others, and use of emotions).

2) Connecting the PA with Class Content
To investigate how students connected the learned content from Lecture 2 to Lecture 11 with their experience in the PA practical learning, I conducted the following survey after the completion of the PA. Students were presented with the 21 keywords shown in Table 2 that clearly indicated the learned content from the lectures, along with simple explanations. They were instructed to “Please choose three keywords for which you feel there has been a related event or situation during your practical learning (PA).”

3) Connecting Class Content with Everyday Life
To investigate how students connected learned content from lectures to their everyday lives, I presented the keywords and explanations in Table 2, as in the previous survey, after the completion of Lecture 15. They were instructed to “Please choose three keywords learned in class that you feel are helpful in everyday life and that interested you.”

Table 2. Lecture Content: 21 Keywords

<table>
<thead>
<tr>
<th>Keywords</th>
<th>Category</th>
<th>Explanation</th>
<th>Lecture</th>
</tr>
</thead>
<tbody>
<tr>
<td>Information and emotional exchange</td>
<td>Emotion</td>
<td>The most important feeling is “wanting to talk.” If you try to have a conversation without feelings, it becomes simply an exchange of information, and it becomes difficult to understand what you really want to say. It’s better if you can have an exchange of feelings.</td>
<td>Lecture 2</td>
</tr>
<tr>
<td>Assertive self-expression</td>
<td>Recognition</td>
<td>There are three types of self-expression: A) nonassertive (yourself○ / your partner×), B) aggressive (yourself× / your partner○), and C) assertive (yourself○ / your partner○). Assertive self-expression is self-expression that honors both yourself and your partner.</td>
<td>Lecture 3 Lecture 4</td>
</tr>
</tbody>
</table>
| Three components of understanding emotions    | Emotion        | I Question: What kind of feeling?  
II Direction: To whom is it directed? In response to what?  
III Amount: How strong is it?  
If you understand emotions through these three components, they become easier to organize and easier to understand. | Lecture 5 |
<p>| Sympathy and empathy                          | Emotion        | To someone who says “My stomach hurts, that’s why I feel terrible…” | Lecture 5 |</p>
<table>
<thead>
<tr>
<th></th>
<th>Understanding one’s emotions</th>
<th>Emotion</th>
<th>A reason self-expression is difficult is because one does not understand his/her own feelings. The Gradations of Emotions and Emotion Map was a teaching material aimed at self-understanding of one’s emotions. Clearly understanding one’s own feelings is the first step toward skilled communication.</th>
<th>Lecture 5 Lecture 6</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>I-messages and you-messages</td>
<td>Behavior</td>
<td>An I-message is a way of expressing feelings by making one’s self the subject, as in “I feel …” or “I think ….” It is an expression skill for skillfully relating one’s emotions. A you-message is an expression that makes the other (you) the subject, as in “You are ….” It is easy to feel blamed and unpleasant when you hear this type of statement.</td>
<td>Lecture 8</td>
</tr>
<tr>
<td>7</td>
<td>Assertion right I: The right to be respected</td>
<td>Recognition</td>
<td>“I have the right to be respected by anyone and to be treated as important.”</td>
<td>Lecture 9</td>
</tr>
<tr>
<td>8</td>
<td>Assertion right II: The right to choose one’s own behavior</td>
<td>Recognition</td>
<td>“I have the right to choose my own behavior, such as whether to meet the expectations of others, and to express this behavior and take responsibility for the results.”</td>
<td>Lecture 9</td>
</tr>
<tr>
<td>9</td>
<td>Assertion right III: The right to make a mistake and take responsibility for it</td>
<td>Recognition</td>
<td>“I have the right to make a mistake and take responsibility for it.” ⇒It is important to create the opportunity for atonement regarding human failures, and you can have confidence precisely because you have the right to fail.</td>
<td>Lecture 9</td>
</tr>
<tr>
<td>10</td>
<td>Assertion right IV: The right to get what one pays for</td>
<td>Recognition</td>
<td>“I have the right to get what I pay for.” For example: If you are paying the medical fee, it is okay to tell the doctor your requests and ask what you want.</td>
<td>Lecture 9</td>
</tr>
<tr>
<td>11</td>
<td>Assertion right V: The right to not</td>
<td>Recognition</td>
<td>“I have the right to not assert myself.” ⇒It is okay to choose at your own risk whether to</td>
<td>Lecture 9</td>
</tr>
<tr>
<td></td>
<td>assert oneself</td>
<td>assert yourself or not.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>---</td>
<td>---</td>
<td>---</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| 12 | How are emotions produced? | Recognition | × A (event)→C (emotion)  
○ A (event)→B (How do you perceive it?)→C (emotion)  
Situations and events do not directly produce emotions, but emotions are caused depending on how you perceived the event. |
| 13 | Irrational beliefs a.  
People have to be liked by everyone and always be accepted. | Recognition | How can I change these beliefs?  
“It is nice to be liked by people, but I won’t always be liked by everyone, and I definitely do not have to be liked.” |
| 14 | Irrational beliefs b.  
People should be perfect and cannot fail. | Recognition | How can I change these beliefs?  
“Try to do the things that I do anyway the best I can.” |
| 15 | Irrational beliefs c.  
It is the end of the world if things don’t go as expected. | Recognition | How can I change these beliefs?  
“Search for a way to improve the situation.” |
| 16 | Irrational beliefs d.  
It is not good to hurt others. Therefore, people who hurt others should be held responsible. | Recognition | How can I change these beliefs?  
If I have hurt someone, “How can I repair it?”  
If I have been hurt, “Tell them gently.” |
| 17 | Irrational beliefs e.  
When fear arises in response to danger, one becomes anxious and is unable to do anything | Recognition | How can I change these beliefs?  
Before thinking “It’s hopeless,” think “I’ll manage somehow.” |
| 18 | Try to open oneself up | Recognition | It is difficult to become close to people without letting them know about yourself. Let people know about your thoughts and feelings, even a little at a time is acceptable. |
### 4. Ethical Considerations

I explained to the participants that responding to the scales was not mandatory. In addition, written consent was obtained for the data to be aggregated and presented in a form that does not identify individuals.

### III. Results

1) **Emotional Intelligence/Social Skills**

Paired *t*-tests for the social skills and emotional intelligence subscales were conducted (Table 3, Table 4). For all subscales, there was a significant difference in average scores and post-implementation scores showed improvement over pre-implementation scores.
Table 3. Social skills scale (KiSS-18), average scores (standard deviation), and t-test results and effect size

2) Connecting PA and Class Content

Figure 2 shows the aggregated survey results from our investigation on how the students were connecting content learned in class to experiences in the practical learning PA.
Figure 2. Keywords that were likely associated with events and situations during the PA (multiple responses)

a) 1–21 show the 21 keywords from Table 2.

b) The bar graph colors show categories: red (emotion), green (behavior), and blue (recognition).

The recognition category “18. Try to open oneself up” received the greatest number of nominations, followed by the recognition category “14. Irrational beliefs b. People should expect perfection and never fail”; the emotion category “1. Exchanging not just information but also feelings”; and the behavior category “19. Try to provide added ("bonus") information”; and “21. Become a better listener.” Meanwhile, the following categories each received less than three responses: recognition categories “13. Irrational beliefs a. People have to be liked by everyone and always be accepted,” “10. Assertion right IV: The right to get what one pays for,” “12. How are emotions produced?” and “16. Irrational beliefs d. It’s not good to hurt others. Therefore, people who hurt others should be held responsible”; and the emotion category “3. Three components of understanding emotions.”

3) Connecting Class Content to Everyday Life

Figure 3 shows the aggregated results from the survey investigating how learned content from lectures was connected to everyday life.

Similarly, for the PA results, the recognition category “18. Try to open oneself up” received the most responses. Next were the behavior categories “21. Become a better listener,” “20. Open questions and closed questions,” and “6. I-messages and you-messages,” followed by the emotion categories “4. Sympathy and empathy” and “1. Exchanging not just information but also feelings.” Meanwhile, the emotion categories “9. Assertion right III: The right to make a mistake and take responsibility for it,” “17. Irrational beliefs e. When fear arises in response to danger, one becomes anxious and is unable to do anything,” “10. Assertion right IV: The right to get what one pays for,” and “16. Irrational beliefs d. It’s not good to hurt others. Therefore, people who hurt others should be held
responsible” each received less than five responses.

Figure 3. Keywords that were felt to be helpful in everyday life and that students gained interest in (multiple responses)

a) 1–21 show the keywords from Table 2.

b) The bar graph colors show categories: red (emotion), green (behavior), and blue (recognition).

IV. Discussion

The \( t \)-test results confirmed that post-implementation scores for both social skills and emotional intelligence were higher than pre-implementation scores. Therefore, I found that the development and implementation of this program had a certain level of effect on university students’ interpersonal relationship skills.

The investigation on the connection between the PA and class content showed many responses for keywords pertaining to all three elements (emotion, behavior, and recognition) learned in class that students felt related to events and situations in the experiential learning. This suggested that the PA fulfilled a role in the integration stage, in which the students integrate learning while utilizing necessary knowledge for problem solving, as was intended during the program’s creation. However, it was found that some content was difficult to connect to the PA activities.

Similar to the PA results, the investigation on the connection between class content and everyday life showed that all three elements (emotion, behavior, and recognition) learned in class were helpful in everyday life. This suggested that it is possible to connect content learned in class to application and practice in everyday life (stage of active use in everyday settings) through knowledge (stage of knowing), the experience of exercises in lectures (stage of thinking and trying to apply knowledge to oneself), and integration through the PA (stage of integrating while utilizing necessary knowledge for problem solving). However, I also found that within the recognition categories, some content is difficult to connect to everyday life. In the future, I aim to perform more specific investigations on the factors that raise social skills and emotional intelligence and use these as foundational data for program improvement.

Implementing Story Maps for Elementary School EFL Learners

Pei-Yi Wei

ABSTRACT

The proposal will examine the effect of story maps implementation on the reading comprehension of elementary school students in Taiwan. The research questions of this study are presented as follows: (1) Will implementation of story maps enhance EFL students’ reading comprehension as assessed by recall? (2) How do EFL students make progress on the products of story maps over time? The participants will be about sixty elementary school students in Hsinchu City. Prior to the treatment session, all participants will complete a pretest first. For the treatment weeks, the experimental group (n=30) will receive instruction of story maps, including Story Elements and Story Mountain designed by the researcher. For the control group (n=30), instead of story maps, the researcher will ask questions about the story. After the treatment, all the participants will be given the posttest and a questionnaire. ANOVA was used to examine whether the training of story maps enhance EFL students’ reading comprehension. In order to see if there is any improvement in the product of story maps over time, the participants’ worksheets of story maps will be compared. Additionally, the researcher will do the triangulation through comparing the results of analysis with the participants’ questionnaire.
Purpose of the study

The purpose of this proposal is to examine the effect of story maps implementation on the comprehension of elementary school students in Taiwan.

Theoretical framework

Reading comprehension

Reading comprehension is defined as an interaction between readers’ linguistic competence and experience and writer’s idea through a text (Phuakpong, 2013). The general definition of reading comprehension is the interpretation of the information in the text. As for the essential of comprehension, it is readers’ ability to mentally interconnect different events in the text and form a coherent representation of what the text is about. (Kendeou et al., 2007) Reading comprehension involves higher level language skills and lower level language skills. Higher level language skills involve the integration of information across sentences and ideas in a text including inference and integration, comprehension monitoring, and knowledge about text structure. These skills are important for comprehension because they help the reader to construct an integrated and coherent model of a text’s meaning. However, young children’s reading comprehension is strongly predicted by other lower level language skills, such as word reading accuracy and verbal and semantic skills (Cain, Oakhill & Bryant, 2004).

Story Maps

The term “story schema” is defined as an idealized internal representation of the parts of a story and the relationships among those parts (Mandler, & Johnson, 1977). A formal device for capturing the important properties of a story schema is “story grammar” (Graesser, Golding, & Long, 1991, p. 179). Many researchers (Mandler & Johnson, 1977; Rumelhart,
1980; Stein & Glenn, 1979; Thorndyke, 1977) have conducted empirical research on story grammars and found that story grammars are not only good descriptions of a class of narratives but also effective predictors of comprehension (Fitzgerald, 1989, 1992; Graesser et al., 1991). Various story grammar structures, outlines, or graphic representations such as story maps can be used to facilitate students' development of story schema and promote their reading comprehension (Baumann & Bergeron, 1993).

Story mapping is a visual-spatial representation of key information in narrative text. Story maps can direct students’ attention to relevant elements of stories through specific structure (Boulineau, Fore, Hagan-Burke, & Burke, 2004). Readers can use story maps before reading, while reading and after reading (Boulineau, Fore, Hagan-Burke & Burke, 2004). Before reading a passage, story maps can help readers elicit prior knowledge and record relevant information about a topic. The use of story maps serves as guidance for readers to record important information while reading and provides a way to review after reading.

Story-mapping procedures have been used, modified, studied, and evaluated with readers with different grade levels (Beck & McKoewen, 1981). Story maps have been utilized to increase readers’ reading comprehension through prompting them to recognize story elements such as character, setting, and problem (Dimino, Taylor, & Gersten, 1995); organizing the sequence of the story (Pearson, 1985); and making connections between story components (Pearson, 1982).

**Research questions**

The research questions of this study are presented as follows: (1) Will implementation of story maps enhance EFL students’ reading comprehension as assessed by recall? (2) How do EFL students make progress on the product of story maps over time?
Method

Participants

The participants will be two classes of sixth graders in an elementary school in Hsinchu city. Class A which includes about 30 students will be the experimental group. Class B which contains about 30 students will be the control group. All of them have accepted formal English learning since they were in the third year of elementary school.

Instruments

Reading materials. The main reading materials will be the following eight picture books: The Very Hungry Caterpillar, A Bit Lost, A Mother for Choco, The Pig’s picnic, The Smartest giant in The Town, Farmer Duck, The Mixed-Up Chameleon, and A Good Day (Appendix A). There are three main reasons why the researcher chooses them: (1) interesting plot which can grasp the participants’ attention, (2) repeated sentences which can facilitate the participants’ understanding of the story, and the most important one (3) clear structure which is suitable to design story maps.

Story maps. Two kinds of story maps designed by the researcher are used in this study: Story Elements and Story Mountain. Story Elements contain four main elements in the story, including character, setting, problem, and solution. Story Mountain is a visual display of story structure in the shape of mountain. It can make readers recognize important events (beginning, climax, and ending) and supporting details in the story.

Study design and procedure

This research will be conducted for 18 weeks. For the Week 1, all the participants will take the pretest. The treatment weeks (Week 2 ~Week 17) include 8 cycles, each containing two session-weeks, during which one book will be covered. Both groups will undergoing the same activities which include reading instruction and reviewing the story in each cycle,
except the following differences. For the first session of each cycle, the experimental group will have Story Elements. In the second session, they do the Story Mountain. As for the control group, instead of Story Elements, the teacher will ask questions about the elements in the story in the first session. In the second session, the teacher will ask questions about the more detail plots of the story. For the Week 18, all the participants will be given the posttest and a questionnaire.

*Common Procedure across Two Groups*

For the procedure of the reading instruction for the first week of each cycle, the teacher will use picture books as materials and 1) tell the story to the students. In order to make the
participants more familiar with the vocabulary in the story, the teacher will 2) teach the words with word cards and visual aids, followed by 3) word activities including matching game, word-search and word-cross. After the participants learn the vocabulary, the teacher will 4) give story script and do the read aloud.

Since not all participants in Class A known the concept of story maps before, the researcher would like to make them do the story maps from group discussion to individual work in order to provide the scaffolding for them. From Week 2 to Week 5, the participants will collaborate with their group members and complete the story maps [Appendix B]. From Week 6 to Week 9, they will do the story maps individually. From Week 10 to Week 13, they will do the story maps with some hints individually [Appendix C]. From Week 14 to Week 17, they will do the story maps with no hints individually [Appendix D]. Additionally, the participants in Class A will take the class reflections in certain four weeks (Week 5, 9, 13, 17).

**Data Collection**

The data include results of participants’ pretests and posttests from both groups, and Experimental Groups’ worksheets of story maps, class reflections and questionnaires.

*Pretest and posttest.* In order to see if E Group participants make progress on reading
comprehension after the treatment, both groups are asked to take the pretest/posttest before/after the treatment. In both pretest and posttest, they have to read a picture book and do the recall (in English or Chinese).

Class reflections. Because the participants may not be familiar with the story maps, the researcher would like to know their E Group students opinions of it. If the participants have any learning problem, E Group students can also write them down in the reflections. [Appendix E]

Questionnaire. In order to obtain qualitative data, a questionnaire is designed to help the researcher understand the participants’ feelings of story maps. The researcher would like to know if the participants can understand the elements in the story from story element. Additionally, the researcher wants to see if they can understand the structure of the story and find the important events (beginning, climax and ending) through Story Mountain. [Appendix F]

Data Scoring

To score the recall data (pretest and posttest), two raters will read the story and point out the important events and supporting details. Then, two raters will check the participants’ recall data and count the points they get. One important event counts two points and one supporting detail count one point.

Data Analysis

Quantitative analysis. The researcher will compare the posttests of Class A & B, with pretest scores covariated, using ANCOVA analysis and see if the training of story maps enhance EFL students’ reading comprehension. The results of analysis can be used to answer the first research question.

Qualitative analysis. The data resource will mainly from the worksheets of the story maps
and the questionnaire. The researcher will compare the participants’ worksheets of story maps (Week 2 to Week 17) in order to see if there is any improvement in the product of story maps over time. Additionally, the researcher can do the triangulation through comparing the results of analysis with the participants’ questionnaire. This analysis can be used to answer the second research question.

Abstract
In our work with students preparing to become K-12 teachers, we at the California Polytechnic University, Pomona have developed and, now present a science course that provides the state, and the nation, with a model of professional development for teachers in science. Our new course is constructivist, and uses hands-on, learner-centered activities so that students experience and more deeply learn important principles. Several types of evaluations have been conducted over time, looking at both affective and cognitive domains. The results reveal that students show increased learning, as well as increased interest in, and comfort with, science. The course offers innovations that can be transferred to other university settings, and allows enhancements with new technologies. Here we will Share the development, conduct, and evaluation of a model science course for pre-service teachers grounded in science education reform efforts.
Introduction:
We believe that by creating good science teachers we are indeed, “Touching the Future”. In our work with “students preparing to become K-12 teachers”, we at Cal Poly Pomona University have developed and, now present, a science course that provides the state, and the nation, with a model of professional development for teachers in science. The Cal Poly Pomona work has allowed us to create the first course in the undergraduate science program at Cal Poly Pomona to use an approach truly in tune with the national science reform efforts. Our new Chemical Sciences course uses hands-on, learner-centered activities so that students experience science, and therefore more deeply learn important chemical principles.

In the book “College Pathways To the Science Education Standards” (2001 NSTA press: The Role for Higher Education) the point is made that teaching science to “non-science” majors is extremely important work.

“These are the people who will guide the future of society’s endeavors, and they will base their decisions on their understanding of science and technology and its impact in their lives.
Of the non-majors we teach, there may be no more important group than those preparing to become K-12 teachers. These students will carry the primary message of science understanding to society. It is particularly important that they experience good and varied models of science instruction, rather than just lectures, verification-type laboratories, and textbook assignments that typify most college science courses.”

With the award of a National Science Foundation grant, and a grant from NASA, we put together a course development team, to transform our traditional non-majors course into a course design for pre-service teachers.

"The strongest programs result from collaborations among teachers, developers (such as university faculty science education coordinators and teachers), and other stakeholders”

National Science Education Standards

Our Cal Poly course development team consisted of two mentor teachers, two Cal Poly Pomona graduates who were fourth year teachers, two Cal Poly Students of Education, the two full time Cal Poly Faculty who led Chemical Sciences course, and the chair of the Teacher Education Program. The development team met twice a month over a period of four months in designing and planning this course.
Our new “Chemical Sciences” course is based on the fundamental belief that the most effective learning occurs through inquiry based, learner-centered, and constructivist investigations. Our team developed the learning experiences that provide students with a solid base of knowledge and understanding. Those experiences are also models of teaching and learning from which our students may draw upon when they assume their roles as facilitators in the K-8 science classroom. Through this course our prospective K-8 teachers are not only competent in content, but are also comfortable with teaching science.

Our project began with three important goals:
1. To increase the chemical knowledge base of pre-service teachers, using hands-on, learner-centered, inquiry based, reflective pedagogies.
2. To provide experiences that enable the students to become life long learners of science.
3. To provide undergraduates with experiences in elementary schools by having them conduct activities as part of an after school science club for children. There is agreement that school experiences with children make better teachers.

The New Course Description
Traditionally the Chemical Sciences course was taught as a lecture and a separate laboratory. The course included topics from atomic structure to drugs and medicines. In the course, the entire class of about 50 students met in a "lecture room" twice a week for an hour and fifteen minutes. The class was divided into two "lab" sessions, which met once a week for three hours (from 4:00-7:00 p.m.) The only scheduling change made to accommodate our new course design was to schedule our lab time one hour earlier (3:00-6:00 p.m. to accommodate after-school visits to area elementary schools). The new course contained all the same topics. As a result of discussions and planning our Cal Poly Pomona team modified the Chemical Sciences course to include the following innovations.

I. Science clubs at local elementary schools to involve college students with elementary school children; there are 2-4 schools and up to 200 elementary children involved each year.

II. The total integration of "lecture" and laboratory" to assure best use of time and relevance of activities.

III. A new textbook approach that is investigative and activity based to model teaching and stimulate higher-level learning.
IV. **Papers on people in science** so that our pre-service teachers have an appreciation of the human dimension of science, and have models to share with children.

V. **Directed inquiry laboratory activities** to have students experience science investigations.

VI. **Collaborative test taking** to promote the view that sharing and talking enhance learning, and that fellow students are sources of information and support.

VII. **Speakers** to offer some real-life examples of professional chemists and elementary science teaching.

VIII. **Weekly journal entries (blue books)** so that students can share insights and questions with the instructors and get regular feedback.

IX. **Team teaching** which provides students with more than one outlook and approach to teaching and chemistry.

Below is a more detailed description of each component.

I. **Science clubs:**

“I enjoyed the Science club requirement, before this I really had no idea what it would be like to be in a classroom…. I learned a lot about myself.”

Student Comment*

To enhance students’ learning and to give them a taste of teaching children, our students were asked to share their science learning with children at local elementary and middle schools. Two of their laboratory periods required them to go into a school and share science with kids there.

After-school science clubs were established at four elementary schools in the first quarter, each with about 25 students. The program was so successful and popular that a fifth school asked to be involved and was included in the second quarter. The after school science clubs were set up to be at nearly the same time as our scheduled 3:00 p.m. lab. The clubs met after school for one hour for four weeks (one school made it five weeks by setting up a visit to our university). The site teacher did all the school site coordination and management of the club, and monitored our students. Our students worked in teams to share activities with ten to fifteen kids. One pair of students from our course was assigned at each school as coordinators. They organized the Cal Poly Pomona student groups for
site visits and they were present at each of the after school science clubs to provide additional support whenever needed. The coordinators appreciated the opportunity to be able to observe the variety of activities done in the science clubs.

Activities done by elementary school kids in the science clubs were chosen, as much as possible, to reflect and enhance the Chemical Sciences course material. Therefore, many of our students took science club activities from the Wonder Science book. Each pair of students prepared activities including the teaching methods and materials. The activities done ranged from making rain sticks to studying the properties of water using games.

During the first quarter some clubs were held on days other than those scheduled for our class. These were not continued because of low student participation.

In an end-of-course survey, more students indicated “science clubs” as “the best part of the course” than any of the other components.

The schools and the site teachers were all very excited about the science clubs. One site teacher said, “This has been a wonderful experience for our students. They look forward to it with delight.”

II. The total integration of "lecture" and "laboratory"

At least part of the designated lecture time was used having the students carry out chemistry activities which illustrated, reinforced, or brought into question some basic chemical concepts. These types of activities were traditionally done only during the “lab” time. For example, students prepared slime the first week of class as a way of investigating some of the properties of liquids and solids. They then took the slime home for further study. Students learned about acids and bases and the pH scale through the analysis of household materials using purple cabbage juice. They also carried out chemical tests for carbohydrates and proteins on foods. Students also prepared ice cream where they learned about the relationship between energy and changes of state. Students used molecular models to learn about the three dimensional aspects of simple molecules, about isomers in organic chemistry, and about polymerization reactions.

The lab time, with its smaller groups, was sometimes used for instructional dialog, for presentations of the people paper poster, for discussions of chemical
issues related to the environment or the public policy, and finally for school club visits.

The integration of lecture and laboratory has enabled us to model the important and necessary connection between chemical content knowledge and its practical applications. The inclusion of discussions, presentations, and school site visits as part of the laboratory also reinforces the idea that chemistry is more than just chemical facts. This integration is also an effective way for professors to model the active learning pedagogies that pre-service elementary teachers can use when they go into the classroom.

III. **A new textbook approach**

*The Wonder Science book will be a great resource. The Wonder Science book will be extremely useful in the classroom.... Valuable resources*

Student comment*

We believed that the text should not only be a source of basic chemical facts but also provide real life practical applications of these principles. For this reason we chose the Wonder Science book published by the American Chemical Society and the Usborne Chemical Dictionary as texts for the course. The Wonder Science book is a collection of science activities for adults to share with kids. It is a resource that students value and retain after the course is over. The dictionary was chosen because it provides quick, straightforward answers to student questions. We also developed supplemental handouts and worksheets for many of the topics for added reinforcement throughout the course.

Weekly homework assignments were made from the Wonder Science text. This ensured that students made the connection between abstract chemical concepts and their physical manifestations in the real world. These assignments also reinforced the idea that chemistry is accessible to all. Often times these assignments were focal points for discussions in the class.

IV. **Papers on people in science**

*I think the people paper was on of my favorite assignments ... It is important for us to learn about the contributions of minorities and women, especially living in Southern California, which is culturally diverse. The people paper is a great way to form a connection with chemists and to discover why some people enjoy chemistry.*

Student comment*

Science is the human activity of discovery. Stories and information about people, events, and ideas bring science to life for teachers and students. Students were
given a list of chemists to choose from for the paper and they were encouraged to work with partners on the people paper and presentation. Students’ papers were bound into a booklet so they will be able to use these as a resource when they get into the classroom. The papers were indexed according to both gender and ethnicity. Of the 28 people profiled in the one quarter, 13 were women and 12 were minorities. Likewise in another quarter, of the 27 people profiled, 13 were women and 9 were minorities. The production of the booklet by the class enabled the students to realize that they could successfully collaborate to develop curricular material. The booklets will be put on the web site.

V. Directed inquiry laboratory activities

*I liked that we were able to find things out for ourselves. They helped bring chemistry to a “real life” level. Fun and Interesting!!!*

Student comment*

The laboratory activities were framed in a real life scenario to stimulate investigation and collaborative problem solving. They were planned to give students experiences with chemistry and to illustrate concepts. For example students learned about heat and chemical reactions through the following:

<table>
<thead>
<tr>
<th>Energy Content of Nuts</th>
</tr>
</thead>
<tbody>
<tr>
<td>Your company is interested in using <strong>Biomass as</strong> an alternative to fossil fuels for the production of electricity and heat. They realize that fossil fuels are non-renewable resources and cannot be depended upon through the next century. Your group is asked to find which nut provides the most energy per pound. Cost is also a consideration as well as availability.</td>
</tr>
</tbody>
</table>

VI. Collaborative test taking

*I like being able to take the tests individually and then as a group. This helps us to see things we may have missed the first time and be able to make up for the mistakes. This testing method reinforces the fact that you must be a strong individual, but you must also be a team player. They allow for us to talk about our answer and with discussion I believe comes better understanding.*

Student comment*

Testing is best when it is also teaching. In addition to the performance assessments provided by student science club work, paper presentations, laboratory work and reports, and home assignments, we gave written content exams. The exams were designed to be done individually then immediately followed by the same exam done as part of a group. The students were allowed to form groups of 4-5 as they wished. The final grade for the exam was the average of the individual and group grades. This meant that the exams were half as long as the traditional class period exam.
We found that students recognized the testing as a valuable learning experience. While the grade generally went up as a result of the group exam, the final grade on the exam for over 70 percent of the students was increased by less than 10 percentage points. Additionally, we as instructors could see areas of strengths and weaknesses in the class’ learning.

VII. **Speakers**

*I especially enjoyed and learned a lot from the guess speaker…He really helped bring organic chemistry to life…He was so enthusiastic about what he was talking about that I think it made everybody else eager to learn more …He could answer any question anybody threw at him. (Student comment)*

Contact with real scientists and teachers is a valued part of our course. We used the science club site teachers as visitors to show how science is presented and shared with kids. We also had scientists visit and make presentations and answer questions. Four visitors use almost 10% of the "lecture time".

VIII. **Weekly journal entries (blue books)**

*Gave me a chance to reflect on what we had gone over during the week. If there was something I didn’t understand I could just write a question. I found this very convenient. It helped me realize what I did learn. I appreciate the comments you make in response to my question and statements. It is helpful and insightful. (Student comment)*

Weekly blue books provided an avenue for individual discourse between the student and instructors. Students were encouraged to ask questions and to express their feelings and ideas about the class and/or its content. Students were asked to grade and comment on their overall performance each week in order to introduce them to reflective, self-evaluation practices which will be important in their teaching.

The weekly blue books also provided the instructors with feedback on the effectiveness of our teaching and so helped us to improve and refine the course as the quarter progressed. These journals were not graded.

IX. **Team Teaching**

*With two teachers you can answer more questions and we can get different perspectives. This I believe really prevent the lectures from ever being boring and keeps the class moving at a remarkably quickened pace while not overwhelming. (Student comment)*

Team teaching was not originally planned as part of the course design. However, both instructors wanted to see how the new pedagogy would unfold, so they
both ended up in class most of the time. At the end of the course some students commented that team teaching was “the best part” of the course.

The activity based teaching invited team teaching. The instructors met before class to outline our teaching plans and to review where they were. It was found that team teaching requires good coordination and was time demanding but was rewarding because that instructors learned from each other. This course has been successfully team-taught by two science faculty, a science and an education faculty, a faculty member and a graduate student, and a faculty member and an undergraduate science major.

**Evaluation**

We conducted several different types of evaluations as we developed and presented the course. These included:

- Pre and post attitude survey
- Pre and post strategies survey
- Comparison of Chemical Sciences students with General Chemistry students
- Pre and post content exam
- Final exam comparison with traditional class.

The results of these assessments are presented here looking at both affective and cognitive domains.

**Affective Evaluations**

I. **Survey Results on Attitudes toward science and teaching.**

Part of becoming a "lifelong learner” of science (goal#2) is the development of an appreciation for science and a curiosity about it. Our attitude survey results indicate that this course is successful at improving, and indeed developing, a positive attitude about science.

The attitude survey shows a full point increase in response to questions like:

(a full point increase is equivalent to moving from “agree” to “strongly agree” or moving from “neutral” to “agree” in regards to the statement.)

- I feel confident that I can teach concepts related to chemistry to K-6 students. (1.07) Question #9
- I know how to conduct a science investigation. (1.43) Question #16
- I know nothing about chemistry. (-1.17) Question #44
- I understand some key concepts related to chemistry. (1.02) Question #50
There was over a .50 increase in questions:

- I would like to take more science. #32
- I enjoy talking to scientists. #33
- I feel I understand the science involved in most current issues. #34
- I enjoy reading articles about science in a newspaper or magazine. #35
- I see myself as a scientist. #46

These data certainly support our belief that we are developing in our students an appreciation of chemistry that may lead to “life-long learning”.

II. We also conducted a Strategies Survey, which addressed collaborative learning issues. That survey indicated that there was some improvement, but no major increases (over a change of 0.50).

III. In an attitude survey taken by both the Chemical Sciences and first quarter General Chemistry (Chem 121) students, our results showed:

In regards to understanding, visualizing, and applying concepts in chemistry, our Chemical Sciences students showed significant increases, while the General Chemistry students showed little change.

It is interesting to note that General Chemistry students showed a significant decrease in the their perception of the “importance of performing laboratory experiments”. However, the view of the Chemical Sciences students toward the importance of laboratory did not change or may have improved slightly.

Cognitive Evaluation

We believe the affective evaluation showed that this course increases enthusiasm for both science and teaching. The following evaluations were carried out to determine whether the valued content was still learned.

I. Pre/Post Test Results
The pre/post test consisted of 31 multiple-choice questions taken from the traditional course final exam and used as a representative sample of the valued content.

The results indicate no decrease in content learning.

*The number of students in the class was exactly the same.

Final Exam Comparisons with Traditional Class.
Another measure of content learning was obtained by comparison of the performance of our students in the new course to those in the traditional course. The complete traditional course exam could not be given because the format did not fit the new course. Instead, eight questions from the traditional final were included in the new course final exam. A trained student using the same rubric independently graded the questions.
In the first quarter we found that the new course students did better on the essay questions requiring thinking and expression. Those items are given below.

Changes given are changes from the traditional course compared to the new course.

1. Which of the following elements most closely behaves chemically like chlorine?
   a) potassium  b) argon  c) fluorine  d) magnesium  e) oxygen
   **Change from 3.33 to 3.15 out of 4.00**

2. The molecular weight (mass of one mole) of carbon dioxide, CO₂ is
   a) 5  b) 10  c) 17  d) 44  e) 52
   **Change from 3.70 to 3.84 out of 4.00**

3. If the half-life of iodine-131 is 11 days, how much of a 100 gram sample will be left after 55 days?
   a) none  b) a trace amount  c) about 3  d) 12.5  e) 25.0
   **Change from 3.10 to 2.77 out of 4.00**

4. What is the basic difference between chemical reactions and nuclear reactions?
   **Change from 2.50 to 3.08 out of 4.00**

5. Draw a picture of a carbon atom.
   **Change from 5.37 to 5.56**

6. Why do chemicals react? Why, for example, does Na react with Cl to make NaCl?
   **Change from 4.50 to 5.06 out of 6.00**
   **Change from 22 to 39 people making the max 6/6**
   **Change from 16 to 7 people making 3/6 or below**

7. What are the four molecules of Life?
   **Change from 3.96 to 3.56 out of 4.00**

8. Name two scientists who made contributions to the area of chemistry and describe their contributions.
   **Change from 5.46 to 5.88 out of 6.00**
   **Change from 10 people making below 5 to only 2**
   **Change from 43/53 to 48/52 people making 6/6**

**Observation Skills Comparison of Chemical Sciences and Gen Chem Students**

Students were given an exercise in experimentation and observation having to do with a sucker dissolving in water. Surprisingly, our Chemical Sciences students showed overall better observation skills than third quarter General Chemistry (Chem 123) Students. They reported in greater percentages those items deemed important by the instructor.
After ten years of practice:

We continue to see success in this course over the years. We are constantly making updates and enhancements as will be outlined below.

In 2009 Our Cal Poly course was part of a new study funded by the National Science Foundation, entitled National Study of Education in Undergraduate Science (NSEUS). That study was evaluating the impact of the redesigned professional development programs that targeted making reforms in science courses for pre-service teachers nation wide. Our Cal Poly course was one of these courses. The National Study of Education in Undergraduate Science evaluation included pre- and post-testing of students, classroom observations in the Cal Poly course, and a comparison with other science courses. In addition, interviews were conducted with the faculty members teaching these courses, and student focus groups involving 5-6 students from each course. Long-term impacts were assessed by observation of three elementary classes taught by teachers who had completed the Cal Poly course, as well as three comparison teachers who did not take that course. In addition to the observations, there were interviews with several current and former students to ascertain their thoughts about the impact that his course had on their science content knowledge and attitudes toward science teaching.

The results of that study found that while many students indicated that they were fearful of science, chemistry especially, before taking this course, after taking the class they felt very confident in their ability to understand science concepts and to teach them to others. In the observations of the performance of the teachers produced, it could be seen in their classrooms that they were teaching in ways that promoted their own students’ growth and learning.

Indeed, our course has been so successful that over the more than ten years since its implementation:

- Our Cal Poly course was offered as a model at six NASA science education national conferences
- We received funding to conducted a two-day workshop for California State University science faculty who teach pre-service teachers to share the course. Twenty-one faculty members from 11 CSU campuses participated that two-day University Faculty Science Teaching workshop.
- We received a grant from NASA to offer mini-grants to CSU faculty to encourage redesign of their courses.
• We produced a publication about the course and its impacts in the Journal of Chemical Education.
• We have made more than 20 presentations over the past ten years about the course.
• We received a grant to offer a workshop (with mini grants) for Community Colleges. Faculty teams from seven community colleges in southern California eight community colleges received mini-grants.
• We received a grant to develop and conduct an after-school academy for middle school.

Updates and Enhancements
Over the years there have been enhancements to the course. Because we have an extensive collection of reports on minorities and women in science, they have been placed on a website. Now student assignments are use these people resources as a basis for making a science lesson learning center, which they share in class. The midterm exam is now an activity-based project which students present to the class. The class assignments like power-point presentations of interesting things about interesting elements and common compounds, first were placed on a CD, which all class members received at the end of class. With increased use of technology, all assignment are now placed on a class Facebook page so that reports on drugs and medicines, information on polymers and materials, games and projects from midterms are all available as resources, to our students as they move into their teaching careers. The after-school science club activity has expanded to include our students’ involvement in annual judging of projects in elementary school science fair and discussions of the science and the work of the elementary school children. These course enhancements and modifications show that this course is not only effective, but also adaptable.
Abstract. One of the important objectives in science education is for students to understand what the nature of science is. The National reform document, Science for All Americans (AAAS, 1990) emphasizes the importance of the nature of science in guiding science educators in accurately portraying science to students. Therefore, it is important that textbook materials convey an accurate conception of the nature of science. This study employs a content analysis to examine the chapters from first-grade, second-grade, third-grade, fourth-grade, and fifth-grade elementary school science textbooks with regard to the four aspects of the nature of science: (a) science as a body of knowledge, (b) science as a way of investigating, (c) science as a way of thinking, and (d) the interaction of science, technology, and society (Chiappetta, Fillman, & Sethna, 2004). Intercoder reliability was determined by calculating Cohen’s kappa (Cohen, 1960). Kappa values were determined among three coders who independently analyzed the science content from the chapters of the elementary science textbooks. The percentages of the nature of science categories found in each of the elementary science textbooks are examined and reported for each of 20 textbooks.
According to survey findings requested by the California Commission on the Status of Women and the California Department of Veterans Affairs (Blanton & Foster, 2012), women veterans face issues with navigating higher education. The purpose of this panel discussion is to explore the stories of the learning experiences of four women veterans who transitioned into a graduate school as one means to understand how their military culture affects their academic persistence and self-efficacy as scholars and societal contributors.

Questions for the panel discussion are:

1. What are the transitional learning experiences of women veteran graduate students?

2. What are the motivational and social needs of transitioning women veterans?

3. What recommendations do women veteran graduate students make to improve services to women veterans returning to the collegiate environment?

Abstract

WOMEN VETERANS AND HIGHER EDUCATION: TRANSITIONAL LEARNING EXPERIENCES, SELF-EFFICACY, AND UNSPOKEN NEEDS

Transitioning out of the military may be stress-free for some women veterans; however, according to survey findings requested by the California Commission on the Status of Women and the California Department of Veterans Affairs (Blanton & Foster, 2012), women veterans face issues with navigating higher education and re-entering domestic society.

The purpose of this panel session is to gather stories of the learning experiences of four women veterans who transitioned into a graduate school as one means to understand how their military culture affects their academic persistence and self-efficacy as scholars and societal contributors.

The panel discussion provides a voice for four female veterans who are prepared to describe their separate learning experiences as military veterans enrolled as graduate students. Each panel member is asked to encapsulate her military to civilian transitioning experiences, awareness of self-efficacy, and needs for academic support and student services. Responding to the needs of women who transition from military-to-academic life has the potential to provide for a more relevant veteran-friendly campus.

CONFERENCE PROCEEDINGS

Bridging Common Ground: University Sponsored Projects Building Capacity for Teachers and Administrators of English Learners

Symposium Abstract: This symposium panel session featuring five groups of presenters will convene scholars, researchers and educators to present a review of teacher and administrator professional development of university sponsored projects funded through U.S. Department of Education. The scope of each panel presentation reflects stances of culturally and linguistically responsive teaching. Common issues, concerns and program features will be discussed intended to foster critical competencies needed in schools to support overall EL students’ academic success.

Introduction

This symposium session seeks to highlight the work of universities across the U.S. that support school districts and schools through professional development programs designed to support preservice and inservice teachers and administrators. The projects discussed are federally funded programs intending to elevate teachers’ and administrator competencies through a sustainable platform of education and/or professional development. Overall, each program addresses building capacity through culturally and linguistically responsive practices.

Often times, state language policy shifts initiate a university sponsored professional development initiative as a sponsored project. Academic Content Combined with English in Secondary Schools is sponsored project (2008-12) which implemented an ESL professional development program for mainstream teachers in any subject area for one urban school district in Arizona. The project intended to bolster teachers’ knowledge, skills and dispositions in response to state policy changes and to build a cadre of mainstream teachers with dual ESL and single subject qualification.

Professional development for mainstream STEM and English teachers intended to expand upon teachers’ knowledge and affirming dispositions through an ESL framework while supporting changes to practice are the aims of Teaching English Learners Academic Content. This Arizona project, which is the sister project of ACCESS, utilizes a course framework that seeks to blend key ESL foundational and methods practices as well as teacher inquiry through coaching as a means to facilitate participants’ shifts in practice.

Through preservice education designed to create a shift in teacher preparation education, Preparing for a Cultural Shift: Integrating STEM, Literacy and Language to Prepare All Teachers to Teach English Language Learners, the presenters overview the systemic curricular changes to preservice education efforts as means to prepare all teacher candidates to teach ELs. This paper presents innovative program changes in teacher preparation and ELLs.

Culturally Sustaining Pedagogy through Teacher Action Research is a program in Alaska that utilizes an 18 credit ESL program similar to the ACCESS project. In order to facilitate the process of shifts in teaching practices, the project utilizes a model of reflective teaching and
various forms of teacher action research in support of bolstering teachers’ practices to reflect culturally and linguistically relevant teaching.

The goals and results of professional development for administrators and auxiliary staff who support ELs in schools are presented in the paper *Introducing PK-12 administrators and auxiliary staff to the world of English Learner: Findings from an intensive summer academy*. The presentation highlights changes in perceptions and its impact on shifting their operating paradigm for supporting ELs through a long term summer academy in Illinois.

Each of the panel members address issues, concerns, and opportunities within their respective programs serving teachers and administrators who are in the daily trenches working to shape the academic futures of multicultural and multilingual learners in diverse settings throughout the U.S.

**Panel Presentations**

The following is an overview of each panel presentation.

**Perspectives on ESL Professional Development: Mainstream teachers conflicting perspectives on what's really important and (not) important when teaching ELs**

*Anthony J. Trifiro, Ph.D. – Arizona State University*

The Arizona context of restricted language policy shifted significantly instruction and the use of students’ first language in Arizona classrooms. Through Prop 203, instruction in Arizona schools became English only. The Arizona state mandated policy includes the implementation of Sheltered English Immersion (SEI) (A.R.S § 15-756.01) requiring all teachers to hold an SEI endorsement. For many teachers and school districts meeting the minimum state requirements for SEI become a top priority.

Moving beyond the immediacy of teachers obtaining an SEI endorsement, the Arizona context of restricted language policy raises the question of whether meeting the minimum basic requirement is indeed sufficient. Arias(2012) posits that Arizona’s restricted language of English only in classrooms places a spotlight on teacher preparation and professional development for teachers of ELs. While many school districts and vendors provide SEI curriculum for teachers, such programs simply address state curricular objectives without considering the complex instructional needs of mainstream ELs (Arias, 2012, Markos & Arias, 2014). The narrow focus of PD SEI programs coupled with a lack of multicultural/lingual general emphasis in teacher preparation prior to the state’s implementation of English-only instruction and SEI, effectively undermined many teachers’ readiness to teach in an English only environment. The capacity gap created through lack of preparation versus what is needed to teach ELs is bridged through teacher learning that provides knowledge, skills and understanding of EL students which in turn bolsters student academic success (Arias; de Jong, Arias, & Sanchez, 2010). ACCESS’s project goals intended to remedy the capacity gap for one school district. The research study sought to learn “what do teachers consider important relative to teaching English learners after completing an 18 credit ESL endorsement program” as understanding would lead to addressing instruction through participants' perspectives and understanding (Sandberg & Pinnington, 2009).
The paper presents findings of an 2011 research study of four ESL teacher professional development (PD) cohorts participating in a university partnership sponsored project that provides the educational professional development preparation through graduate level ESL endorsement coursework. *Academic Content Combined with English in Secondary Schools* (ACCESS) (2008-2013) provided secondary mainstream teachers in a major urban southwest metropolitan school district with a cohort-based professional development program intended to extend their knowledge, skills and understanding of teaching English learners. The participating district stakeholders in cooperation with university members formed early on in the development of the NPD grant. The university and school district partnership sought to support the project goals which aligned clearly in developing a future cadre of mainstream teachers who are dual ESL endorsed and certified in a subject area. Through university and district participation as stakeholders, collaborating with a single purpose, projects such as ACCESS are able to support teacher development for teaching of ELs in the Arizona restricted language context (Garcia, Arias, Harris-Murri, & Serna, 2009). All cohort members are from one of the largest urban high school district in the southwest with a majority of Hispanic students who are first language speakers of Spanish and are primarily of lowered social economic status (SES).

The paper utilizes knowledge-for-practice Cochran-Smith & Lytle (1999) as its theoretical perspective underlying the notion of building upon teachers’ previous knowledge and skills. The study’s research question relies heavily on the research of culturally responsive teaching (Villegas & Lucas 2002) and linguistically responsive teaching (Lucas & Villegas, 2010) and the theoretical understanding of cultural responsive teaching. Desimone, Porter, Garet and Yoon (2002) support the nature and quality of the ACCESS program in that consistent, high quality professional development can lead to sustained changes (p. 105). Professional development (PD) that supports teacher learning relative to linguistic and cultural sensitivity to EL students must reflect content and activities tied to teachers’ classroom practices.

In providing meaningful and equitable education for EL students, teacher PD must include a broader understanding of cultural norms, values and school expectations. The sponsored project’s curriculum utilized readings and activities that reflect culturally and linguistically responsive teaching. The convergent model of six core areas were linked together with activities that fostered a robust understanding in core courses such as: language minority education, instructional strategies for ELs at the secondary level, assessments for EL learners, bi-literacy in mainstream classrooms, survey of second language acquisition and bilingualism, and parents and communities. The ACCESS curriculum provided ample opportunities for cohort teachers to consider the sociocultural and the broader contexts of learning/schooling, and teacher advocacy for EL students (Faltis & Coulter, 2008; Lucas, Villegas & Freedson-Gonzales, 2008; Walker, Shafer, Liams, 2004, Villegas & Lucas; Walqui, 2008). Teachers understanding the sociocultural dimension of schooling relative to EL students success in academic settings, requires teachers to have knowledge and skills that go beyond “just good teaching” (de Jong & Harper, 2005).

The study utilizes a mixed method qualitative approach. A constant comparative method (Strauss & Corbin, 1994) is used as means to develop relative themes. The case of four cohorts in ACCESS, (n=88), includes only participants who completed all the 18 credits of coursework and met the educational requirements for a full ESL endorsement. Partial program completers were not included in the study. The primary data source is a post participant likert and free response survey of teacher respondents, (n=42) which is triangulated with pre/post program
evaluation surveys (n=64) for the entire program as well as post program interviews of some cohort members.

The study’s findings revealed three overall orientations by participants. The three orientations are: Knowledge of first language and culture, skills for building English and teaching content and perceptions of ELs academic success. The study reveals teachers’ perceptions about their EL students demonstrating the need to build background and connect with EL students’ community and culture. However, the data presents conflicting teacher understanding and perspectives with respect to the role of language, English only versus English plus while instructing in English based on the SEI mandate, the fairness of Arizona language policy and the ELD model, and the role of culture and fostering connections to community. Overall, many post participant responses suggested a greater need for advocacy from participating teachers to non-participating teachers and administrators.

The study’s significance suggest that professional development program models intended to build capacity using an ESL endorsement curriculum must align closely with school district goals for teachers, administrators and the diverse student populations of multicultural and multilingual English learners. Through robust convergent curriculum, participants are able to draw upon and build an awareness of their EL students connecting culture, language and community supporting pedagogical practices that are culturally and linguistically grounded.

Making a Difference: Expanding the role of language and culture in content area classrooms Dawn Lambson, Ph.D. – Arizona State University

In the state of Arizona in 2014, approximately 7% or 70,000 of the 1,000,000 students in K-12 schools were identified as Limited English Proficient. Of the English learners (ELs) enrolled in high schools that year, only 20% graduated within four years (Arizona Department of Education State Report Card, 2015). By comparison, the next lower group “students with disabilities”, had a graduation rate of 63%. Although all teachers in the state are required to take classes and be certified in Structured English Immersion (SEI), the state’s mandated English language development model, few teachers feel confident and capable of meeting the growing need of teaching English learners in mainstream classrooms.

From a professional development perspective, there is a great need to provide teachers and administrators responsible for the achievement of ELs with knowledge, skills, and experiences that can translate into effective and appropriate classroom practices for helping ELs succeed.

Teaching English Learners Academic Content (TELAC), a grant-funded project through the U.S. Department of Education/Office of English Language Acquisition (OELA), was established in 2012 to support middle and high school STEM and English teachers of ELs in a large urban area in Arizona. Much of the programmatic features of TELAC are built upon the programs’ previous project ACCESS. The TELAC program is designed to build upon and expand teachers’ understandings of the language and learning needs of ELs in mainstream STEM (science, technology, engineering, math) and English/Language Arts classrooms. The aim of the program is to build and refine mainstream teachers’ dispositions, attitudes, understandings and teaching practices in support of students from diverse cultural and linguistic backgrounds.

Villegas and Lucas (2002) and Lucas, Villegas and Freedson-Gonzalez (2008) outline key components of a culturally and linguistically responsive approach for preparing teachers of
English learners. They state that culturally and linguistically responsive teachers must have a combination of affirming dispositions for students from diverse backgrounds, crucial knowledge of appropriate and effective teaching practices for ELLs including a knowledge of how language develops, and the skill to design learning activities that build on and honor who students are and what they know and bring to the classroom.

The TELAC Program was designed to incorporate many of these components in its effort to increase capacity of mainstream STEM and English teachers in the state. The program builds foundational knowledge and understanding of teaching strategies for supporting English learners through six credit hours of graduate course work at a local university. Participants also take three additional credits of practicum in which teachers receive one-on-one coaching as they work to apply their learning within their own mainstream classroom context. In the practicum course, teachers take up their own inquiry to investigate aspects of their teaching practice and understand how these impact their English learners. Through ongoing observation, data gathering, and analysis of student work and their teaching practice, teachers gather data to help them make intentional refinements and modifications designed to support student learning and growth.

Using an “embodied understanding of practice” framework proposed by Dall’Alba and Sandberg (2006), this study focuses on teachers’ “understanding of and in professional practice”, rather than on an accumulated set of skills, which allows for examining the embodied understanding of how teachers’ practices were shaped and refined by their experiences in the program.

The study uses an interpretive qualitative approach (Erickson, 1985) to understand, from teachers’ perspectives, how participation in the program impacted their learning and development. Data for the study were collected from participants’ portfolio assessments and class artifacts and analyzed to understand how, according to teachers’ reports, their participation in the program’s learning activities helped support the teachers to develop and refine their teaching practices making them more culturally and linguistically responsive to the needs of their ELL students.

Findings from the study show that teachers report growth in the following areas: (1) understanding the teaching of English learners; (2) knowing the English learners in their classrooms; (2) understanding the role of language and culture in learning; (3) focusing on language use and development in their content teaching; and (4) making substantive changes to their practice as a way to better meet the language and learning needs of their ELL learners.

Through course experiences and learning, teachers reported a deeper understanding of what it means to teach English learners. One teacher reported that an important result of her participation in the program was developing an “understanding that ELLs are a diverse group of learners and [that] the schooling students have received before coming into my classroom greatly impacts their current abilities and readiness for a content area classroom.”

Many teachers also reported a new or deeper understanding of the role of language and culture in learning. These reports included understanding of both oral and written language development as well as teachers describing a new perspective and value for learning about and building on students’ funds of knowledge. In particular, some teachers reported an understanding of how use of students’ first language in the classroom could benefit student learning and success.
Some teachers identified a need to provide greater access to language use through scaffolding oral language with sentence frames and vocabulary study. Others described trying out new ways of promoting social interaction in the classroom as a means for increasing opportunities for students to speak more and develop their academic English. Overall, a majority of teachers reported that focusing on language in their classrooms was a significant area of growth.

Along with a greater focus on supporting students’ language development and use, a majority of the teacher participants reported making substantive changes to their practice as a way to better meet the language and learning needs of their ELL learners. Refinements to practice included changing expectations for ELL speaking and engagement in class, using scaffolding to make language more comprehensible and accessible to ELL learners, creating safer and more comfortable environments for ELLs, and implementing a variety of teaching strategies to support ELL student understanding, engagement, and learning.

Through the TELAC Program, the teachers were provided opportunities to build foundational knowledge of ELL education as well as practical knowledge through classroom-based course assignments, teacher inquiry and support through individual coaching. As a result of participation in the program, mainstream content area teachers acknowledge substantive growth and development in dispositions, knowledge, and skills in teaching their English language learners, and are becoming more linguistically and culturally sensitive and responsive to the needs of their English learners.

**Preparing for a Cultural Shift: Integrating STEM, Literacy, and Language to Prepare All Teachers to Teach English Language Learners**

*Margarita Jimenez-Silva, Ed.D., Jaclyn Hernandez, Ph.D and Malissa Thibault – Arizona State University*

Through the generous support of a Teacher Quality Partnership grant from the U.S. Department of Education, the Mary Lou Fulton Teachers College (MLFTC) at Arizona State University has set forth four goals to prepare elementary teachers on content-based second language acquisition. These goals include (1) reforming PreK-8th grade teacher preparation to address the need for highly qualified general and special education teachers for ELLs; (2) redesigning math and science methods courses to include instructional strategies that promote language and literacy development; (3) redesigning course signature assignments to use problem-based learning (PBL) pedagogy and design principles supporting teacher candidates’ application of knowledge and skills in “real world” classrooms; and (4) integrating and understanding evidence-based practices and scientifically-validated research for teaching and learning of ELLs, including data-driven decisions to improve differentiated instruction.

MLFTC is one of the largest teacher preparation programs in the country, graduating approximately 1,500 new teachers each year. An additional 600 teachers in 20 partner school districts will be supported by this grant. In meeting this goal, we have begun planning for induction programs for graduates alongside mentors in their teaching sites. Due to the multifaceted approach of this project, we have numerous stakeholders that are critical to the success of our program. These stakeholders include college-level administrators, faculty, and support staff that interact directly with pre-service and in-service teachers. District personnel are also essential partners in this endeavor if the larger culture of how we engage with ELLs is to change.
In the first year of implementing the iTeach ELLs grant, considerable time has been spent establishing relationships and building trust among various key stakeholders. Several opportunities to dialogue about the goals of the grant have been offered. In focus groups of content-area faculty, site coordinators, and other key stakeholders, participants have felt comfortable expressing concerns. Through surveys, key stakeholders have had opportunities to provide input regarding the major concepts related to ELLs and PBL that are being addressed through the grant. By being sensitive to the needs and concerns of our major stakeholders, as well as tapping into the wealth that they bring to the table, we are establishing a strong foundation for the work that needs to be done for improving how we meet the needs of ELLs. Without the support of key stakeholders, systemic change will not take place. Too often with grant-funded projects, innovations disappear once funding has ceased. In order for our model of preparing teachers to work with ELLs to be sustainable, a cultural shift needs to take place and bringing in major stakeholders to working alongside us is key to that shift.

In the current iTeach program at ASU, pre-service teachers are required to complete a student teaching year-long residency. While completing the residency, they complete the final year of their coursework at an assigned school site. Instructors teach the required university courses at the school site in an evening during the week and most of the school day on Friday. A site coordinator is assigned to each school site and cohort of students. The students are placed in cohorts by their pre-service teaching program, for example, elementary education. The site coordinator is critical to the success of the students during the year-long residency and along with teaching courses, the site coordinator is responsible for student teaching observations and evaluations. Because the site coordinators have such an impact on what occurs in the year-long residency, within a few months of the grant being awarded, several key meetings took place between the grant investigators and site coordinators. The grant investigators introduced the grant goals to the site coordinators and feedback was solicited regarding the problem-based pedagogy aspect as well as the focus on ELLs. One of the main challenges that the site coordinators identified was working within the pedagogical structures already in place in the schools where student teachers are placed. They suggested that grant investigators and instructional coaches working with the grant meet with administrators at various governance meetings to discuss how we could work together to better meet the needs of students, especially ELLs. In addition, throughout the first summer of the grant, grant investigators met regularly with site coordinators to plan implementation of the grant.

In moving forward with the goals of redesigning math and science courses to include PBL pedagogy and infusing instructional strategies that promote language and literacy development, Program Enhancement Teams (PET) were formed to develop and pilot lessons in math and science methods courses during the spring semester following the grant award. PET teams met to discuss the grant goals and lead instructors, which included tenured and clinical faculty, developed a common lesson plan. Working with grant investigators and coaches, shared their experiences with other faculty across the college regarding their work on the teams. Many discussions took place regarding the definition of PBL and the role of instructional strategies for developing English language skills in math and science. Furthermore, faculty with expertise working with ELLs were brought alongside faculty with expertise in math and science methodology courses to further refine tools that will be used in subsequent semesters. Furthermore, during the first faculty meeting of the semester, the grant investigators and coaches were given time during the meeting to introduce all faculty to the grant goals and the grant team led the faculty through a PBL experience as well as invited faculty to future PET meetings.
Plans are underway to engage other stakeholders - school administrators, mentor teachers, and support staff - in discussions about the grant goals and implementation. The ultimate goal of the grant is to address and help close the achievement gap for English language learners in Arizona, especially in math and science content areas. Through curriculum reform and a PBL pedagogical approach, MLFTC can prepare the next generation of teachers to better meet the academic and linguistic needs of ELLs. However, before that can happen at a college-level and in order for that change to be sustainable, a cultural shift has to occur redefining how all key stakeholders need to work together to better address the needs of ELLs. Throughout the life of the grant, the grant team will continue to meet with stakeholders to address challenges that arise as well as celebrate achievements as they come.

Culturally Sustaining Pedagogy through Teacher Action Research

Cathy Coulter and Irasema Ortega – University of Alaska Anchorage

Project LEAP (Language, Equity, and Academic Performance) is a grant funded by the Department of Education’s Office of English Language Acquisition (OELA). Project LEAP focuses on staff development for teachers with high numbers of English language learners and Alaska Native students. This 18-credit graduate certificate program results in in-service teachers obtaining an ESL endorsement on their Alaska teaching certificate. More, it provides the training necessary to support culturally sustaining pedagogy (Paris, 2012) and academic performance for ELLs in some of the nation’s most diverse schools (Anchorage Daily News Dispatch, March, 2015).

During this program, participants enroll in coursework designed to increase their knowledge of current concepts and research-based practices related to culturally sustaining language and literacy development, particularly within STEAM-related content areas. The first semester of the program is dedicated to create a common understanding of current, research-based sociocultural practices. The second semester brings participants from across the state of Alaska together to work side-by-side on curricular projects of their own design, revising practices to better address the needs of English language learners. Then, along with a class on policy, law, and advocacy, participants move into their identity as scholar-practitioners as they begin to focus on researching their own classroom practice.

There are two integral components to project LEAP: a) teacher action research projects in which teachers engage in inquiry about their own practice; and b) Critical analysis and design of STEAM curriculum. These two components are supported by an intensive summer course in which all students from around the state come to collaborate on projects that include revising their existing curricula (and practices) in order to better meet the needs of ELLs in their classrooms. During the third semester of the program teachers evaluate science and math curriculum and infuse it with pedagogical aspects that address the needs of ELLs. Students subsequently engage in research about their revised teaching approaches. They also engage deeply in existing literature about teaching and learning with ELLs.

This study focuses on what happens when in-service teachers engage in teacher action research on their own practice, focusing on shifts in instructional approaches and whether or not they move toward more culturally sustaining practice. Data collected include qualitative sources
consisting of field observations of teachers in their classrooms, interviews, reflections, surveys, and student artifacts. Quantitative data includes WIDA assessment data and additional state and district assessments.

Preliminary results indicate that while teachers initially engage in substantive changes in teaching approaches they continue to need support beyond the scope of the graduate certificate program. Scripted curricular programs are difficult to work around in creating a classroom environment that is inclusive of different language and learning needs (as well as particular aspects of teacher strengths and style). Therefore, time to work with other teachers across the state and to engage in classroom curricular revisions was found to be very beneficial. Engaging in research on their own teaching resulted in tangible changes to practice. As a result of these findings, Project LEAP is adding professional development coursework designed to encourage ongoing cross-cohort Professional Learning Communities (PLCs) whose focus will include ongoing professional development and the creation of teacher leaders who can engage their respective districts in staff development trainings. These PLCs will allow Project LEAP community members to continue their contribution to the experiences of ELLs throughout the state.

Another important aspect of this project relates to the impact the project has had on subsequent teacher roles in their school and district (which the formalized PLCs will support). For instance, several teachers who completed project LEAP during the 2014 academic year decided to participate in a STEAM kit project sponsored by the largest district in the State and funded by the National Science Foundation. Their input and expertise gained during the STEAM Methods course was crucial to their contribution to this large project and had an impact on thousands of students. Other teachers from the 2015 cohort have volunteered to pilot the STEAM kits in their classrooms. Yet another participant from the second cohort accepted a position at a district-level curriculum committee as an expert on ELL issues. These are just a few examples. Overall, the preliminary findings on this project indicate that through the experience and expertise gained through their participation in class and small discussion and the curriculum evaluation and teacher action research project the participants built their capacity to address issues related to addressing the needs of ELLs in their classroom, school and district levels. Standardized assessments reflect academic growth of students in participants’ classrooms. Continued research is needed to assess long-term outcomes of this program.

Introducing PK-12 administrators and Auxiliary staff to the world of the English Learner: Findings from an intensive summer academy  

James Cohen – Northern Illinois University

There has been a call by professional organizations (i.e. American Educational Research Association, National Association of School Psychologists, American Psychological Association, and Association for Supervision and Curriculum Development) to increase the number of school personnel professionals, especially school leaders to be more familiar and sensitive to the needs of English Learners (ELs). According to Hamayan & Freeman-Field (2012) attention must be paid by school administrators to the increased numbers of immigrants and difficulties that immigrants face in schools. Zacarian (2011) states that in order “to advocate for the best program and to support their teachers, school leaders need to understand their EL populations very well from a cultural and linguistic perspective…that they come from diverse backgrounds, and have varying degrees of school readiness” (pgs 9-10). These calls are in response to the vast majority of teachers, and therefore administrators, not having any experiences or training in working with ELs (Hollins & Guzman, 2005, Hamayan & Field-Freeman, 2012).
To this end, as part of Project DREAMS (Development of Reading, ESL, eArly childhood, Mathematics, Science), funded through OELA/NPD/U.S. Department of Education, we created a four-day, 32 hour intensive summer academy specifically for PK-Administrators and auxiliary staff to introduce them to the world of the EL. Topics such as the following are discussed: 1) State and federal laws pertaining to ELs, 2) Second language acquisition, cultural awareness, and implications on interactions with ELs; and, 3) Best practices from the various professional fields (nursing, counseling, etc.). After the summer academy, the participants return in late October to present what they learned in the academy and how they have infused this new knowledge into their daily routines. We then follow this up with an interview a few months later to see 'where they are' in regards to the content they had acquired in the academy.

Coupling exit surveys and participant PowerPoint presentations in fall with an hour-long follow-up interview in spring, not only are we collecting data, but we are essentially insisting the participants not forget what they learned and make them accountable for changing the status quo. This following –up with them forces the participants to continue to think about the content they learned in the summer academy and make them continuously reconsider and rethink and reflect on the ideas that were presented.

In my presentation, I will report on the paradigmatic shifts that the participants experienced and the effects this ‘shifting’ affected both their actions and beliefs regarding ELs in their schools. For example, many of the participants began their summer academy experience with very little to no knowledge of ELs. They understood that ELs were causing their test scores in their respective schools to be lower, and came to the academy to learn what they can do about it. These participants often viewed ELs from a deficit paradigm, meaning they viewed them as problems in their schools, students who they had to deal with instead of students from whom they can learn and had a tremendous funds of knowledge. Other participants arrived with a general knowledge of ELs, but clearly wanted to deepen their understanding. They were typically on the hypothetical fence between deficit and strengths paradigm, frequently going back and forth throughout the academy. Then there was a third group of individuals who already had a good deal of understanding of ELs. They understood that ELs were causing their test scores in their schools to be lower, and came to the academy to learn what they can do about it. These participants often viewed ELs from a deficit paradigm, meaning they viewed them as problems in their schools, students who they had to deal with instead of students from whom they can learn and had a tremendous funds of knowledge. Other participants arrived with a general knowledge of ELs, but clearly wanted to deepen their understanding. They were typically on the hypothetical fence between deficit and strengths paradigm, frequently going back and forth throughout the academy. Then there was a third group of individuals who already had a good deal of understanding of ELs, already viewed ELs and other culturally and linguistically diverse students from a strengths model, but went to the academy to simply learn more about ELs and the latest research available. For them, this academy rejuvenated them into why they went into education in the first place, and provided them an opportunity to network with other colleagues in similar positions (administrators and auxiliary staff) as they are. In fact, one principal ultimately hired a social worker, a co-participant she met in the summer academy.

Some direct actions that were taken as a result of the academy are quite impressive. One superintendent not only required that all of her principals and assistant principals attend the summer academy, but they as a group have now converted their school district from an ESL pull-out program to a maintenance (late exit) bilingual program with the intention of eventually creating a dual language program. A school nurse broke down and cried when she gave her presentation in October, indicating she never knew that she was discriminating against her “brown” students. And yet, another participant, a school psychologist, has become “an advocate (force) to deal with” in her district, according to a colleague. To top it off, two curriculum coordinators from one district have begun asking the question before asking any other question, “how is this decision going to affect the ELs in our district?” according to the bilingual director of that district.

Although these are only a few of the results of the summer academy that will be shared with the participants of the conference presentation, they will also leave having a greater understanding
of what constitutes solid professional development as a whole, but specifically for administrators and auxiliary staff.

Discussion

The panelist as a group represent the combined efforts of five projects whose primary goal is to bridge the capacity gap for teachers and administrators through professional development and preservice education. In light of the fact that graduation rates are significantly lowered for ELs, often by more than one third less (Ballantyne, et al, 2008), the professional development programs presented while directly support teachers and administrators, influence EL student outcomes in many ways.

The development of a sponsored project requires broader considerations of project goals and objectives that directly impact each program’s curricular development on top of recruitment, retention, location, duration, and results. Oftentimes, building flexibility becomes a key factor in a project’s effectiveness that mitigates the natural tension of project goals and what can be realized (2015 HIC Conference on OELA/NPD Grantees’ Issues of Requirements, Recruitment, Retention, Results and Reality). However, each project has a curricular foundation that links to the notions of bilingual education and English as a second language education. In building a professional development program for teachers and administrators of English learners, the programmatic structures are intended to support and augment participants’ previous learning and often times serve as an opportunity to reframe factual understanding and realign dispositional misconceptions. All of this yields to a greater understanding of the broader social context, developing a sociocultural consciousness, (Villegas & Lucas) and expanding participants’ knowledge and understanding relative to the connections that join EL students’ language, language identity, community, culture, bilingualism and second language learning (Faltis & Coulter; Lucas & Villegas, Lucas, Villegas, Freedson-Gonzalez). All of these achieved by developing appropriate learning activities that are coherent to participants’ individual classroom, school context and facilitate active engagement (Garet, Desimone, Birman & Yoon, 2001).

Each of the papers presented in this panel reflect broad key notions that are relative to teacher and administrator learning and can be summarized.

ACCESS, underscores the need that robust ESL education for mainstream teachers strongly influences teachers’ understanding and perceptions of advocacy and connections to EL students’ language and culture. Teachers shifts in perceptions and development of a sociocultural consciousness and broader connections to language and culture are noted.

TELAC, a continuation of the ACCESS program in 2012, provided the refinements needed in ACCESS, by building capacity beyond course work but through guided teacher inquiry and coaching as a means to make substantive changes to practice. Bridging culturally and linguistically responsive teaching practices is supported through the process.

Project LEAP builds capacity by supporting mindfulness through research and establishing communities of teachers who can continue to grow and support one another. Also, tangible STEAM-related curricula writing within districts is a great way to influence classroom practice in a way that benefits ELLs through networking that is not directly related to our grant program.
ITeachELLs is a program designed to be a catalyst for change in teacher preparation and underscores the notion that instrumental change, presented as dynamic shift in teacher preparation, requires many stakeholders who share a common vision. ITeachELLs recognizes that all key stakeholders need to work together to help close the achievement gap for English language learners. University faculty, administrators, support staff, district partners, and mentor teachers can effectively collaborate to support preservice teachers to use project-based learning to provide access to STEM content to ELLs.

Project Dreams reinforces that there are key characteristics that yield to successful and impactful professional development. Project Dreams underscores the need to have professional development to have a longer duration, the minimum of 32+ hours to create any recognizable paradigm shift. However, continual follow-up is also important to maintain their energy and provide an opportunity for the participants to fully internalize the messages taught in the PD. In addition, participants’ must share an “interest convergence” as in an effective and productive ways of convincing participants such as there is truth behind the notion that both bilingual education and bilingualism are both beneficial to students.

Significance
Regardless of the intended results of these programs, the larger benefit of these project is the EL students and communities each program serves. Consider the multiplier effect of change of bridging teachers’ and administrators’ knowledge, competency and affirming perceptions around the notions of culturally and linguistically responsive teaching. How many students do teachers and administrators interface every day? While it is difficult to measure how each of these interactions might be different and attribute these changes directly to participation in any one of these sponsored projects individually, however each of these grant projects bridge the common ground that exist among teachers, administrators, EL students, and their communities.

Cognitive Coaching: Mediating teachers’ practice changes to support English Learners

Anthony J. Trifiro, Ph.D.
Department of English
College of Liberal Arts & Sciences
Arizona State University
ajtrifir@asu.edu

The paper presentation is a in-progress study of two cohorts enrolled in a university partnership professional development sponsored project intended to support STEM and English teachers. The program curriculum provided to participants meets the requisite knowledge, skills and practicum requirements leading to an approved state ESL provisional endorsement. While at face value, the program meets state endorsement requirements, the program’s curriculum is aligned closely to culturally and linguistically responsive teaching (Villegas & Lucas, 2002; Lucas and Villegas, 2010).

The paper addresses the role of cognitive coaching for in-service middle and high school (K6-12) (n=37) teachers participating in a two semester academic program that intertwines bolstering existing knowledge of sheltered instruction through a two semester program of building foundational and methods knowledge. Participants also complete a two semester practicum focusing on teaching practices using sheltered instruction for English learners (ELs). The program model’s two semester practicum
focusing on transforming teaching practices through reflective inquiry on practice,
integrates cognitive coaching to foster teachers’ reflection on practice throughout the
program. This is achieved through coaching conversations with specific coaching
prompts and reflective post activities to support thinking for the purpose of transforming
practices.

The urban K6-12 teachers participating in the sponsored project are from multiple
southwest school districts in a large metropolitan area in the southwest. The vast
majority of participants are K9-12 from one large urban high school district. Teachers in
this program find themselves struggling with many sociocultural, language, cultural and
economic issues reflecting urban districts and schools with diverse demographics.
While the majority of students are of Hispanic origin, there are many students that come
from diverse refugee populations from east Asia and Africa. More than 70% of the
student population are speakers of a language other than English (LOTE) and primarily
have lowered social economic status (SES) and greater majority are on free and
reduced lunch.

All teachers in this restricted language state are required to participate in a Structured
English Immersion (SEI) training (A.R.S § 15-756.01). The implication of this state
mandate is that schools with highly diverse multicultural and multilingual student
populations are instructing in English only as only English is the medium of instruction.
While the SEI full endorsement is set at 90 seat hours, the training has many different
foci including discrete language study. The SEI curriculum also minimizes instruction
concerning language acquisition, the role of first language, cultural and community connections but placing high emphasis on instructional strategies (Markos & Arias, 2014). A practicum, that connects content knowledge with instruction however is not required for the SEI full endorsement. As a result, teachers receive a focused strategies instruction, minimized English as a second language (ESL) instruction and lack of understanding of key principles (Markos) to integrate it completely.

Arias (2012), posits that teacher preparation that simply meets state SEI instruction requirements inadequately prepares teachers to fully address the challenges of a very diverse multilingual and multicultural mainstreamed students. Many English language development students (ELD) are earning math or science general education credits and are placed in mainstreamed general education classrooms. Additionally, the 2013-15 marked significant changes for the majority of math teachers leading to curricular district roll-out focusing on the implementation of Common Core in first and second year mathematics at the high school level added literacy for ELD students to master without obtaining fully English proficient (FEP) status. For those students who continue to retain the EL label as long term EL (LTELs) (Faltis & Arias, 2007) and who characteristically have strong oral productive language while simultaneously lacking grade level reading, writing and solid academic literacy for successful school completion, these students also struggle in mainstreamed SEI classrooms.

In-service professional development is needed to bridge this knowledge and skills gap, particularly at the secondary level as graduation rates for ELLs are 30-40% lower than
non-ELs (Ballantyne, Sanderman, & Levy, 2008). Along with scarce and or absent connections to any or robust multicultural focus in university teacher preparation programs (Menken & Antunez, 2001, Gandara & Maxwell-Jolly, 2006) the teacher capacity gap widens when placed in situational context of urban schools described in this study.

However, professional development not only requires linking teacher learning to culturally and linguistically responsive teaching practices, but must also requires coherent linkage to teachers’ classroom context (Garett, Porter, Desimone, Birman & Yoon, 2001) if reform or transformational teaching practices are intended as a desired outcome. It is through the lens of reflective practice and cognitive coaching, that acts as the supporting structure and bridges the thinking process of teachers. Coaching on reflections to practices, reviewing observational data provided by coaches, as well as planning for new teaching practices are opportunities for dynamic changes to classroom practices. Therefore, cognitive coaching acts as the converging process linking the various parts of the professional development program (e.g. course work, teacher inquiry and practice) as a means to foment changes to practice.

**Theoretical connections to English Learners and teaching practices**

Participating teachers embarked on a year-long practicum in addition to course work focusing on bridging existing practices and reaching towards practices that reflect culturally and linguistically responsive teaching (Villegas & Lucas, 2002; Lucas & Villegas, 2010). According to de Jong and Harper (2005), teachers that engage in
practices that foster opportunities to provide feedback as well as monitor language and bilingual development, enact practices that support ELs’ academic school success (de Jong & Harper, 2005). Many of the participants addressed aspects of pedagogy that reflected on some of the key eight components of Sheltered Instructional Observational Protocol (SIOP) (Echevarría, Vogt & Short, 2010). Batt (2010) reiterates the importance of the role of the cognitive coach who serves as a mediator supporting teachers through reflecting on practice, planning on practice and enacting on changes to practice (Bratt, 2010, p.999).

The paper utilizes the theoretical frames of Embodied Understanding of Practice, Dall’Alba & Sanberg (2006) and culturally and linguistically responsive teaching, (Villegas & Lucas, 2002; Lucas & Greenburg, 2008; Lucas & Villegas, 2010) for the purposes of addressing reflective teaching practices. The works of researchers Costa & Garmston (1999) as well as Ellison & Hayes (2003, 2010) provide the foundational theoretical understanding of cognitive coaching as a means to mediate teachers’ thinking of teaching practices, reflection, and planning.

Cognitive coaching relies on a fundamental premise that as the coach supports the thinking process through structured conversations, teachers are encouraged to reflect, plan and problem solve instructional problems. The cognitive coaching process conversations that occur between cognitive coach and teacher inherently serves as the structure for the coaching interaction. As a result, the interaction between cognitive coach and teacher serves as the opportunity for the teacher to begin thinking differently
and more often than not, serving as a catalyst in bolstering teachers’ reflection and analysis on their individual learning.

Overall, the coaching conversation acts as a supporting structure or scaffold. Since teacher learning relative to transforming practice is not a linear process, then the coaching conversation often requires a scaffold, a coaching conversation processes (Ellison & Hayes, 2009, p. 81) for reflection, planning and implementation of teachers’ goals. The paper addresses the research questions: What do teachers learn about their own teaching practices through the process of cognitive coaching? How does cognitive coaching support the reflective process for transforming teachers thinking about their own teaching practices?

**Data and analytic method**

The study addresses teacher development of the case of two separate cohorts (2013-14) and (2014-15) on transforming practices for in-service teachers that includes cognitive coaching as part of their practicum experience. All participants (n= 37) had previously completed the minimum state requirements for an SEI endorsement and the vast majority had instructed their subject areas between five and nine years. Participants were primarily STEM and English teachers with in subject areas such as math (n=17), English/language arts/reading (n=16), and science (n=3). The majority of participants are K9-12 (n=32) and middle school K6-8 (n=5). The qualitative study utilizes a constant comparative method (Strauss & Corbin, 1994) and includes data
sources such as pre/post surveys, reflections, and coaching conversations. The paper utilizes excerpts of coaching conversations and includes data on cognitive coaching conversational flows utilized with teachers for purposes of clarification and illustration of findings.

**Preliminary Findings**

Through focused attention on shifting teaching practices to reflect culturally and linguistically responsive teaching, participants had opportunities to reflect on practice and be coached through a teaching reflecting model which includes reflecting, planning, enacting, analyzing and then selecting how to transform teaching practices. Teachers also worked on special projects in their classrooms which required reflecting on pedagogical problems and thinking about different ways to solve or perhaps reinvent a new way of teaching.

Preliminary findings suggest that when comparing cohort participants’ experiences and overall process, some participants selected topics that closely related to planned activities in class while others took many more steps within the inquiry. Many teachers enacted projects that involved “stretch” in their teaching styles. While both reflection and planning coaching conversations were used, remarkably the conversations supported some teachers to move beyond where they intended to safely stay.

*Using Coaching to clarify a teacher’s role*
When one math teacher embarked on different ways of looking at the literacy component of teaching first year algebra, the coaching conversations centered around learning about his interpretations of academic language and reconciling within his thinking the differences of academic vocabulary as a teacher and how his students would use vocabulary.

Through coaching the teacher reflected on and opted to plan for utilizing different teaching methods to develop language of his EL students. It was through his trial and error and later through reflective coaching conversations did a clear path of developing literacy emerge. In a reflective conversation, the teacher was asked to discuss his writing strategy implemented to help students complete departmental assessments that require explaining algebra math concepts. While he could not name the content literacy strategy, he could reflect and personalize how the activities he implemented did in fact support his students which were "ways to write and explain ideas easily, to the point, and in a common sense way that anyone could understand". When asked if he considered himself a math teacher who teaches his students writing, he reiterated that he teaches his students to use language that expresses academic concepts.

*Using coaching to enact new changes – planning for implementation*

Overall, the majority looked at different elements of SIOP and selected areas that were areas of concern primarily or areas where they could personally strengthen. Teachers’ direction and degree or level of shifting practices ideas changed as their own unique
sense of efficacy increased. For some, coaching conversations were the opportunity to allow them to explore ideas, plan and enact them. The inquiry coupled with coaching conversations supported the directions and degree teachers directed their practice changes.

Through cognitive coaching process maps, participants were able to reflect on their inquiry process, reflect on their implementation and also consider ways to plan, enact, and critique their instruction suggesting enhanced agency relative to EL instruction in their content area. Teachers’ survey comments and other artifacts demonstrated and increased awareness of their own perceived abilities relative to sheltered instruction. Cognitive coaching supports teacher efficacy and awareness of teaching practices. While teachers reflect considerably on their learning, coaching conversations revealed that not only did teachers develop a greater sense of efficacy when teaching ELs, but also developed increased consciousness of their own teaching style, personal limitations that acted as barriers to their own development. Having achieved this sense of their teaching, provides opportunities for further changes to practice through renewal (Costa, pp 13-15).

**Scholarly Significance**

The implementation of cognitive coaching as part of a practicum or as a mediating structure for teachers in a professional development program promotes reflective thought, planning and implementation of practice. Often times professional development
lacks the structure to facilitate changes. In PD programs designed to foster culturally and linguistically responsive teaching practices, cognitive coaching conversations enable teachers to more aptly implement sheltered instructional strategies.

Title: Creating A Positive Learning Environment That Supports The Anxious Child's Transformation from Stuck To Thriving

Topic Area: Elementary Education

Presentation Format: Paper Session

Description:
This presentation will provide educators with tried and true classroom activities that support self-regulation and empower the anxious child to thrive in a safe learning environment.

Author:
Presenter : Suzanne Clease, B.Ed., MPS -Art Therapy (candidate)
Organization: St Stephen's College , Edmonton, Alberta, Canada

E-mail: sclease29@gmail.com
Students who struggle academically are often suspected of having learning disabilities by their parents and teachers. Have you noticed an increase in anxiety amongst young students? Could anxiety issues rather than a learning disability be the source of poor academic performance?

The complex nature of our society challenges educators to create a safe and nurturing environment that fosters student self care and a love for learning. In this presentation, I will review anxiety symptoms observed in the classroom and provide tried and true arts based tools that promote student self-regulation. I will highlight how these tools transform anxiety into confidence and create an engaging environment for all students to learn.

6. [Abstract]

[Aim]
This study aims to examine the effects of three-year nutrition education for high school students that is conducted through distance communication with ICT with the objective of “preventing life style diseases during a lifetime.” The theme of the first year is “to understand the concept of amount,” more specifically, “understanding the energy amount necessary for oneself a day and the appropriate amount of staple food.”

[Subject and Methodology]
The subjects of the study were Private High School N in SI Prefecture and Private High School U in SA Prefecture. Quasi-experimental design was structured setting up an intervention group and a control group in each class. The following activities were conducted in the course of the study: preliminary research in July (measurement of body composition, ex-ante questionnaire, Food Frequency Questionnaire, and Food Mapping), distance learning for the three schools (University E, High School N, and High School U were connected each other via Skype) in October, group work with the KJ method in November, a distance communication class in December, and ex-post research in March.

[Results]
The preliminary research revealed that it was necessary to promote the boys’ understanding about the appropriate intake amount of grains, snacks and lipid and that the girls generally had negative perceptions about eating. The distance learning was conducted with the theme of “Knowing about one’s own body: how to interpret the measurement results.” The boys generally had the perception that their own body shape and composition were appropriate compared to the girls. The group work consisted of the task of considering “a title and a catch phrase for a game of life.” The students shared their ideas with the KJ method and submitted them using tablets.
More than 80% of the student participants from both schools voluntarily responded that the distance education was a good opportunity for them to think about their future health. Those students who had high expectations and motivations for the distance communication class responded that they enjoyed the class and that they felt as if they were taking the class with the partner school.

The weight and knowledge about energy intake of the students in the intervention group increased in a statistically significant manner after the activities. The Nutrition Education contributed to raising their knowledge level. The girls have problems about the “rhythm (irregular meals, eating between meals and midnight snacks)” of eating behaviors, which are closely related to their “desire to be thin,” “stress,” and “confidence in self management of dietary habits.” On the other hand, the boys have problems about the “ways of eating (eating fast, eating while doing something else, and unbalanced diet),” which are correlated with their “self esteem feeling.”

[Conclusion]
It is necessary to conduct nutrition education about eating between meals and midnight snacks for the girls from next year, while it is indispensable to provide nutrition education about eating fast and eating while playing games with a smartphone for the boys.

Abstract:

For those new to teaching in Christian colleges and universities, there is often a learning curve involved with faith and learning integration. Even if faculty members are experienced in teaching, research, and their discipline, becoming competent and finding meaningful ways to bring faith into the classroom can take considerable effort and practice. Complicating matters is a lack of consensus about what constitutes faith-learning integration. The purpose of this qualitative paper presentation is to detail perspectives on faith integration found in the literature, to examine methods that might be used in various helping disciplines, and to provide insight into the lived experience of one faculty member (the author) as she learned to find an authentic means of weaving faith discourse and reflection into her own classroom.
Title: Instrument Development for Measuring Pre-service and Inservice Teachers’ Self-Efficacy in STEM (Science, Technology, Engineering, and Mathematics)

Topic: Teacher Education

Presentation Format: Paper Session

Description:

In this session, researchers will discuss the processes involved in the development and validation of an instrument to assess pre-service and in-service teachers’ self-efficacy in teaching mathematics and science, and the utilization of technology and engineering practices in the classroom. The results of the study provide evidence that the instrument is adequate. Future research is needed to continue the validation of this instrument on a larger sample of preservice and inservice teachers.
Abstract:

The purpose of this pilot study was the development and validation of an instrument, the Teaching Self-Efficacy – Science, Technology, Engineering, and Mathematics (TSE-STEM), to assess pre-service and in-service teachers’ self-efficacy in teaching mathematics and science, and the utilization of technology for instructional purposes and engineering design and practices in the classroom. Self-efficacy, as defined by Bandura (1977), was the theoretical framework for the development of the instrument. To do this, we identified five factors to represent various aspects of self-efficacy (pedagogical content knowledge, instruction, student engagement, classroom management, and outcome expectancy) through the literature review and generated items to fit with the constructs. A panel of five university faculty experienced in PK-16 education settings and in the STEM field served as experts to review the instrument for content validity. A 25-item instrument, utilizing a 5-point Likert scale (strongly disagree, disagree, uncertain, agree, strongly agree) was created and administered. Fifty-nine participants completed the survey.

The teacher self-efficacy instruments considered in the study included the Science Teaching Efficacy Belief Instrument (STEBI), (Riggs & Enochs, 1990); Math Teaching Efficacy Belief Instrument (MTEBI), (Enochs, Smith, & Huinker, 2000); the Teachers’ Sense of Efficacy Scale (TSES), (Tschannen-Moran & Woolfolk Hoy, 2001); a technology survey, Teacher’s Technology Self-Efficacy Tool (Farah, 2011) and an engineering instrument, Teaching Engineering Self-Efficacy Scale (TESS) (Yoon, Evans, & Strobel, 2012).

An exploratory factor analysis (EFA) was conducted to investigate underlying factor structures of the instrument and to identify extraneous items that do not fit into any of the factors. Findings from this pilot study indicate the reliability of the instrument is adequate; however, a larger sample size is needed to further validate the reliability and validity of the instrument. In Phase II of this research study, the researchers will further validate the reliability of the instrument. In addition, findings from the Phase II study may inform teacher preparation practices, inform professional development needs of pre-service teachers and in-service teachers, transform STEM learning for teachers, provide strategies for STEM education improvement, and inform administrative support for teaching effectiveness.
Eliminating the Racial Predictability of Student Academic Achievement through Non-Evaluative Teacher Feedback

Educational Measurement and Evaluation

Workshop

This workshop will train attendees on a data driven, researched based, non-evaluative teacher feedback program adapted from New Zealand for K-12 schools in the United States with the goal of effectively supporting the academic success of students of color. The feedback program allows teachers to reflect on their own racial backgrounds and the impact of racial stereotypes on their worldviews so they will become empowered to grow in their teaching and learning.

ABSTRACT: Eliminating the Racial Predictability of Student Academic Achievement through Non-Evaluative Teacher Feedback

“High help environments, especially when accompanied by high perfectionism, elicited better behavior and greater academic engagement in classrooms of all racial compositions, but appeared substantially more important for classrooms where three-quarters or more of the students were students of color. Hence, combining cheerful helpfulness with pressure for producing correct answers is an antiracist strategy for raising achievement and narrowing achievement gaps” (Ferguson 78).

“One effective intervention is to continue to provide critical feedback but to accompany it with an explicit, two-step message: a reference to high performance standards and a personal assurance of students’ capacity to reach those standards. In our research we found that African American college students trusted critical feedback as much as their European American peers when that feedback was motivated by (1) an explicit statement on the part of the teacher that the critical nature of the feedback was motivated by high performance standards…; and by (2) an equally explicit statement that the student in question has the capacity to reach those standards… when given critical feedback in this manner, African-American students were even slightly more motivated to revise their essays than were European American students” (Cohen 83).

Research Objectives: Through studying how this innovative teacher feedback program supports students of colors in academic environments, we know that the program is successful when it meets five key goals:

Goal 1--Holistic Community Education
- supports the whole student, academically and socio-emotionally
- fosters interdisciplinary collaboration among teachers. The positive connections and collaboration among faculty will enhance the overall school environment.

Goal 2--Equity
- provides concrete, researched based coaching on best practices for educating students of color
- allows teachers to continue their courageous conversations about race with faculty members
- places students of color at the forefront as our indicators of progress in successfully educating all students

Goal 3-- Supportive Learning Environment
- creates positive and strong relationships between students and teachers
- refocuses learning conversations to academic conversations versus behavior conversations

Goal 4 --Transformational Teaching and Learning
- allows teachers to learn from each other in safe spaces
- uses research based practices to improve teaching and learning
- grants teachers the capacity to create and monitor their own professional goals that are supported by the teacher coach
- uses data and graphs to monitor progress throughout the year

Goal 5-- Transformational Leadership
- provides data and qualitative feedback on what professional development teachers want and need in the classroom

**Proposal**

On the New Zealand Ministry of Education website, there is a quotation by Basil Bernstein that reads, “The culture of the child cannot enter the classroom until it has entered the consciousness of the teacher.” Research supports that if teachers are able to reflect on their own racial backgrounds and the impact of racial stereotypes on their worldviews, they will become empowered to grow in their teaching and learning. Our students will come and go in four years, but our teachers will stay for decades. Therefore, in order to change school culture and to improve student success, we must impact adult learning. Because as teachers we are all in different places in our learning and understanding, the coaching and teacher cohort model helps support teachers where they are in their teaching for equity journeys.

Through this program, teachers will:
- receive comprehensive, non-evaluative feedback on their teaching that is both data driven and research based with the goal of using best practices for teaching students of color.
- form interdisciplinary teams of teachers to support their learning and growth.
- use the feedback as a gateway to learning about other current best practices for teaching, such as restorative justice/peace circles, executive functioning, and socio-emotional learning.

**What does the program entail?**

The program is inspired by Jessica Stovall’s 2014 Fulbright Distinguished Award in Teaching grant to New Zealand. Some schools in the country have created a researched based and data driven teacher feedback program that has made significant decreases in the racial predictability in student academic achievement between Maori and White students in New Zealand. For example, a case study was completed by Jessica Stovall at a school in Wellington, New Zealand, where students went from 24% meeting national standards to 75% meeting the standards in just one year—and the only change was utilizing the teacher feedback program to change teacher mindsets about the types of learning conversations going on in their classrooms.

This program has since been adapted by Jessica Stovall, who teaches English at Oak Park River Forest High School and is currently writing a book about successful mindsets for educating students of color, and Patrick J. Hansen-Schmitt, a Harvard Graduate School Alumnus and Assistant Principal at Hawthorne Scholastic Academy, the highest ranked non-selective elementary school in Chicago Public Schools. The adaptation has included research to ensure that the feedback program fits the U.S. context and racial demographics, as well as across age levels. Both Jessica and Patrick will pilot this teacher feedback during the 2015-2016 school year—Patrick in K-8th grade, and Jessica in 9-12.

The workshop at the Hawaii International Conference on Education will provide the background on the teacher feedback, as well as provide training on how administrators, teacher education leaders, and teachers can utilize this new program in their schools and universities.

The implementers of the teacher feedback program are critical friends in the reflective practice of this program, and this program is due to its non-evaluative. Instead, it uses an effective data driven tool as a catalyst for teachers to transform their classrooms.
The Pa Harakeke Program
This program is a part of New Zealand’s Ministry of Education’s initiative to raise Māori student achievement. The case study school possessed similar racial demographics percentage breakdowns as Oak Park and River Forest High School and Hawthorn Scholastic Academy (40% Māori, 10% Pasifika, and 50% white) and only 24% of students met the National standards two years ago. However, after using this program after just one year, 75% of students met the standards the next year. This year, the school’s goal is 80% meeting national university readiness standards.

The program involves four teachers that form a cohort. Each member chooses three target students, usually students of color (if applicable). The trained teacher coach in a non-evaluative role goes into each teacher’s classroom at least once a quarter and completes a 30 minute observation. This observation provides only quantitative data; there are no subjective elements. Essentially, every 20-30 seconds, the teacher coach will observe and mark the engagement (and type of engagement) for the four target students of color as well as two achieving white students (as controls). The teacher coach will also note what the teacher is doing at the time of that students’ observation of engagement. The teacher coach can note for co-construction, positive or negative behavior feedback, positive or negative behavior feedforward, positive or negative feedforward academic feedback, positive or negative feedback academic, prior learning/prior experiences, monitoring, and instruction.

The program facilitator will also mark where the teacher stands in the classroom at ten different points in the 30 minute observation. The teacher will then receive his or her data of the overall percentage of engagement for each of the five students. The teacher will also receive an in-depth analysis of the types of learning conversations going on the classroom, and the percentage of positive to negative comments, the percentages of whole class, small group, and individual student conversations.

Connections to Culturally Relevant Teaching and Learning Pillar
After receiving all of this data, the teacher and the teacher coach will sit down and discuss the results. Studies show that minority students succeed best from positive feedforward behavior/academic and co-construction, rather than negative behavior feedback (which is often what students of color receive, causing students of color to internalize that they are “bad” or “dumb” students and/or that their teachers do not like them. Both of these issues create major barriers to academic success). The teacher coach and teacher will reflect together on the engagement percentages and set goals for the next observation.

Each quarter, the cohort of four teachers will meet and discuss their data with the teacher coach present to facilitate. They will help each other by providing feedback, support, advice, and sounding boards. They will come up with group goals that are inspired by strategies, interactions, relationships, positioning, and experiences. The goals are made in partnership for an overall objective of creating more equitable classrooms. Each quarter they will assess how they are doing on their collective goals and can elect to observe each other in their practice as a catalyst for positive growth.

The data is only for the teacher and his or her cohort of teachers for their own personal growth as it is non-evaluative. The teacher coach will provide general recommendations for professional development as trends and themes arise.

New Zealand’s reaction to this program:
“…Pa Harakeke has enabled me to gather real world data on how I teach. It has helped me to see the patterns of movement I use, the students I focus on, and the success or failure of the strategies I use. As a result of my reflection on this data I have been able to shift my practice towards more pedagogically sound ground, away from simply instruction and towards a style of teaching which better engages those students who often fall through the cracks. I have much fewer instances of off-task behavior, my students appreciate the way I teach them, and my Māori and Pasifika students want to attend my classes. Students know that they will be pushed to do their best, given feed forward that helps them to take next steps, and be respected and appreciated during their time in the class.

“Pa Harakeke is not designed as an oversight tool to beat down on hard-working teachers. It is a helpful, refreshing look at my classroom and my practice.”

3. Abstract

   Workshop

   Just like surfing, accreditation at any level can be an intimidating process. How well an institution aligns its Institutional Learning Objectives (ILOs) to “Core Competencies,” and assesses its performance are major focal points for the college and university accreditation agencies. Developing the process and methods to assess ILOs can be a formidable task because institutions should create methods and assessment rubrics that are best tailored to the individual needs and goals of the institution. Just standing up, or getting started, is difficult without models to help you through the process. The ideas presented in this workshop will help faculty members at universities charged with these kinds of responsibilities to position themselves to assess institutional learning outcomes and ride the wave of accreditation. This task is frequently delegated to committees made up of faculty who do not have excessive training in the area of university or department accreditation. In addition, these faculty members are often already trying to establish or maintain their own research agenda. The daunting process to establish a university-wide research project that requires the participation and buy in from a significant portion of faculty at a university can seem arduous and might suffocate other work faculty members are trying to accomplish. The purpose of this workshop is to share the process and methods developed at one university to assess institutional learning outcomes and help other faculty and administrators searching for a helpful model to avoid a wipeout.
Title: Using Student Orientation to School Data with Art Therapy and Designed Interventions to Support Students

October 17, 2015

Topic areas: Academic advising and counseling; Educational measurement and evaluation; Other areas - Student engagement.

Presentation format: Paper session

Presentation description: Rocky View Schools has implemented routine assessment of student engagement with school. Student Orientation to School Questionnaire (SOS-Q) results identified Grade Six and Nine students at a middle and a high school who were disengaging from school. In response, a Success in Schools and the Cochrane Healing Arts Time (CHAT) Room were implemented in 2014-15. We detail how SOS-Q data has been applied with specifically designed interventions to re-engage students.

Using Student Orientation to School Data with Art Therapy and Designed Interventions to Support Students

Introduction

Rocky View Schools (RVS), located in Alberta, Canada has been actively researching student engagement for the past four years using the Student Orientation to School Questionnaire (SOS-Q). The SOS-Q uses a Likert type five point scale from strongly agree to strongly disagree, to measure individual student responses to the following constructs: peer relationships, safe and caring school, internal resilience, external resilience and self confidence in grades 4-12. At the middle and high school grades additional constructs are measured including: extra-curricular activities, utility of school and, if a student works in a part-time job, work-school integration and handling work-school pressures are also measured. See the SOS-Q Program Manual at [http://www.rockyview.ab.ca/jurisdiction/research/sos-q](http://www.rockyview.ab.ca/jurisdiction/research/sos-q) for comprehensive information on the SOS-Q.

Results from the SOS-Q are used by school administrators to identify and work with students who may be at risk of disengaging from their socio-emotional connectivity to school. In one high school the results for grade 9 students in 2014 indicated that a variety of students were at risk of disengaging from school due to academic and social alienation and a lack of confidence and control. In response to this identified need, one intervention developed is the Cochrane Healing Arts Time (CHAT) Room. Guided by a caring professional, the CHAT room has led students experiencing anxiety, physical, sensory, cognitive, social or other stressors through art therapy to experience a process of self-exploration and resolution. This process has helped students learn to express themselves and ultimately enables them to be more productive and successful within an educational setting.

In a middle school the staff has adapted a Success in Schools (SIS) plan format to work with students identified as at risk on the SOSQ. The advantage of using and adapting the SIS format is:

a) it uses the student's voice to articulate what he/she needs to succeed
b) it engages parents
c) it identifies a plan of supports to move forward
d) the plan can be reviewed after several months or in the following school year to look for progress.

The staff has adapted the Success in schools format to reflect the SOS-Q categories (safe and caring, resiliency, peers etc.) for the plan portion of this intervention strategy that is focused on Grade 6 students. The intervention team initially consisted of Grade 6 teachers (3 English, and 3 French Immersion) the administration and the Child Development Advisor. This team worked with students who appeared 'in the red zone' (more than two standard deviations below the mean) on the SOS-Q. The SOS-Q is usually administered in the winter of the student's Grade 6 year at this school. Within this approach to student supports, the classroom teacher has an initial meeting with a student in the red zone and develops the adapted Success in School plan based on the SOS-Q data categories. After the initial meeting, the teacher, student, parent, admin and CDA meet to review and further develop the plan and monitor progress over time. At Ecole Airdrie Middle School, the follow up has now followed to the Grade 7 year. A description of the follow up findings is found in the ‘case studies’ portion of this paper.

By supporting students through the use of Success in Schools model or the Healing Arts within a Universal Learning Environment (that ensure each learning experience is designed to be accessible to all learners), these initiatives have empowered students to develop their self-esteem, confidence, advocacy, resilience, efficacy, peer relationships, and 21st century competencies.

**Context**

There are many educational benefits of using the arts to facilitate student learning. According to Spier (2010) qualitative and quantitative data supports the hypothesis that art therapy programs in schools can improve students self-concept, social roles, understanding of peer groups and involvement in school experiences. Students who participated in this study showed a “…greater increase in scores on the Developing Self-Reliance subscale, which suggests that group members may be able to cope better with peer pressure” (Spier, 2010, p. 81).

Healy’s work on art therapy suggests this work is an emerging field that holds much promise. Healy (cited in Nelson, 2010, p.67) has concluded, “We do not always have the answers; however, we are and will continue to be a program shaped and molded by the students we
serve like clay waiting to respond to the needs presented, always fluid, always flexible, hospitable, welcoming, and safe.”

On her website at The Prairie Institute of Expressive Arts Therapy, Richardson (2015) has observed that “Immersion into the healing arts offers a fresh perspective, increased potential for change, insight and a deeper connection to self and others.” Additionally, in her study of the potential relationships between art education and art therapy, Black (2011) explored comprehensive impacts of art therapy within education contexts, especially as applied to students with special needs. She concluded that, “Having a basic understanding of some of the principles of art therapy... would allow art educators to see their practice in a different way, and to better understand the nature of development and creativity, thereby providing additional strategies for teachers and allowing them to successfully and optimally teach to a wide variety of learners” (Black, 2011, p.102).

The Success in School (SIS)Plan framework was developed by the Alberta Ministry of Education premised on the recognition that educational achievement results for student who are at risk lag behind those for the general student population. For example, significantly more children and youth in care drop out of school, do poorly on achievement tests, fall farther behind in school as they get older, and are less likely to graduate from high school. The staff at Ecole Airdrie Middle Schools have adapted the SIS plan to ensure supports available at the local level work together with the student, their caregivers and other appropriate partners to share information and engage in joint decision-making to plan for and support school success for students who are at risk of disengaging from school.

Action research within Rocky View Schools is demonstrating that a positive school climate can reduce absenteeism, suspensions, substance abuse and bullying, stress and anxiety, while increasing student achievement, engagement, motivation and psychological well-being. The CHAT Room and Success in Schools initiatives are targeting four key components of school culture related to students’ affective experience:

1. flexible, adaptable, student-centered learning spaces and experiences,
2. safe and caring learning communities that nurture positive social learning and interactions,
3. ongoing support, mentoring, instruction and coaching, and
4. coordinated wrap-around community services.
The design of both projects is predicated on Social Emotional Learning, including self-awareness, self-management, social awareness, relationship skills, and responsible decision-making (see http://www.rockyview.ab.ca/21stC/learning/social Emotional).

**Prototypes for a new vision for Learning Support**

Implementation of the CHAT room at Cochrane High School and the Success in Schools intervention model at Ecole Airdrie Middle School have provided opportunities for co-teaching, research, parent and community involvement and importantly, peer mentorship. The referral process at both schools involves the identification of students with multiple risk factors and the completion of a referral form.

At the high school students may be referred by the school administration, guidance department, learning support or Learning Centre staff, or by parents. Students who score below average on the SOS-Q constructs or on the total SOS-Q scale score are interviewed to discuss whether their SOS-Q result indicates a need for support, including the option of the CHAT Room. Additional supports may be accessed within the broader community, including:

- Art Community - The Paint Box, Cochrane Art Club
- Native Community - Healing Arts/Cultural Connection
- Work Experience Opportunities - Local School Partnership
- Guest Artists
- Medical/Mental Health Collaboration
- Rotary Club

An exciting benefit of art therapy is the fit with five of the main, curricular-based drivers of 21st Century learning (see http://www.rockyview.ab.ca/21stC/supporting). A focus on Creativity and Innovation; Social, Cultural, Global and Environmental Responsibility; Communication; Lifelong Learning and Personal Management; and Collaborative Leadership helps students in a Universal Learning Environment to reinforce their well-being and achieve their goals. Through the use of the arts, learners are given the opportunity to use flexible instructional materials, techniques, and strategies that are adaptive and innovative. This creative process will ultimately empower them to take an active role in their learning while acquiring 21st Century competencies.
Case Examples

Some examples of underlying theory and case work being provided in the CHAT Room or the Success in Schools intervention model are discussed next.

1. High school students experiencing anxiety may find it difficult to express their emotions and learning needs. Communicating with peers and teachers is challenging when you are faced with the everyday stressors of school. The regular classroom setting, combined with the academic expectations of high school, often trigger anxiety for many students. The CHAT Room has provided a calm, welcoming space for students with anxiety issues to explore and uncover personal challenges that may be holding them back from reaching their full potential. Using the arts to communicate can be a much easier way for students to demonstrate understanding and promote wellness and growth.

2. The CHAT Room has provided a space for all students, from all social groups, to work together. To have a space such as this in a large high school is important. Cochrane High is already a school that demonstrates inclusion. Previous collaboration between teachers and students has given everyone the opportunity to work together and observe a variety of learning styles. The CHAT Room however, is a unique space that allows for this collaboration to extend beyond classroom assignments and social interaction between classes. Students who work in this room build relationships in a different way. When the stressors of regular classroom work and expectations are removed, students work and communicate differently. They are also exposed to peers and interactions with others that they may have never had before. Acceptance of other people’s skills, personalities and past experiences grows. Any student, from any grade can access the CHAT Room. Mixing age, skill set and past experience allows students the opportunity to build meaningful relationships in a safe environment. Using the arts and the art making process, ultimately gives students the opportunity to build social skills and improve social interactions.

3. One of the most important outcomes of using the arts to facilitate learning and communication can benefit non-verbal students. As we know, understanding cannot always be expressed in words. The arts provide these non-verbal students the
opportunity to demonstrate their knowledge and feelings in a different format. Accessing the CHAT Room and participating in the healing arts activities is providing these students with the opportunity to communicate through the arts. In addition, the possibility of working collaboratively with other teachers is exciting. This collaboration between the CHAT Room teacher and the subject teachers benefits everyone. The learners experience success in a universal learning environment and are given the chance to demonstrate their knowledge through the guided activities and practices of the CHAT Room.

4. There are so many different styles of art. The variety of materials, tools and techniques involved allows students with physical challenges to develop their skills. The CHAT Room provides these students with an inclusive universal learning environment to explore their abilities in a safe and exciting way. The arts are unique in the sense that there is truly no “wrong” in the art making process. Any student with any skill set, can benefit from participating in the creative process.

5. Ecole Airdrie Middle School is following individual students identified in the ‘red zone’ (two or more standard deviations below the mean on the SOS-Q) in Grade 6 as they move into their Grade 7 year. This follow-up includes meeting with the student to review the personal voice slide show from the previous year, discussing what aspects are the same or have changed this year. Similar meetings are held with the parents and the new teachers of these students as strategies to support the student’s emotional development are documented in the planning form. In the follow up, parents expressed sincere gratitude that the school had invested the time and care in this process. Teachers and other staff were often surprised at the way students were able to articulate what they needed to change in the school environment, and there was a genuine commitment to implementing the plan to assist the student.

6. The value of following the success in schools type plan is becoming apparent. In one case, the student had undergone a program change in her Grade 6 year, and had felt considerable stress during the first year of the change. As she reviewed her slide presentation a year later, she actively commented on how she
was feeling last year, and added several details. Throughout her follow up interview, she commented on how things were now different for her at school and in general. In her second year in her new program, she reports feeling much more at ease. She likes her class and the supports to her learning; she values a friendship she has formed. This student is now serving on the school’s peer support team where students offer friendship and support to other students.

7. In working with another student, it became clear that there was a dissonance between how the student viewed himself, how the staff observed this child, and how the parent understood the child’s needs. For example, the student stated that he had lots of friends, whereas the staff observed that this child is often alone. This lead to including in his plan, continued work on friendships with the school counselor. The SOS-Q process and the patient follow-up led the school to look deeper into a child’s issues and carefully plan for supports.

**Evidence of success**

Student outcomes are being monitored with the SOS-Q especially in relation to: improved self-confidence, decreases in anxiety, improved peer relationships, sense of a safe and caring environment including a connection to a caring adult figure, and internal and external resilience. Additional measures will include attendance and school achievement marks as well as qualitative observations relative to student’s overall self-advocacy, coping strategies and academic readiness. (These and associated student outcomes data will be reported in the final paper to be presented at the Hawaii International Conference on Education in January 2016).

**Conclusion**

The CHAT Room based on the emerging field of Art Therapy and the Success in Schools intervention model are promising examples of intervention supports for students who are at-risk of disengaging from school. Although the current study is delimited to a middle and high school setting, similar interventions could be implemented in any school. Responding to student’s affective experience of school and associated socio-emotional needs is a relatively recent and rapidly developing area (Christenson, Reschly and Willie, 2013). The on-going action research
in Rocky View Schools based on the Student Orientation to School Questionnaire (SOS-Q) provides rich data to inform a range of student supports, the CHAT Room and Success in Schools model being only two. Education Practices for Early Identification of Communication Concerns in Young Children

Topic Area: Special Education

Description of Presentation: This study was completed to gain an understanding of the identification and referral practices of educators in the identification of communication delays for very young children. The coordinators of a Midwestern home visiting program, who provide screening and developmental surveillance to young children and their families, were surveyed regarding the procedures used in their programs to identify communication delays. Responses indicated three primary themes as important for the early identification of communication delays.

Abstract

Communication delays in infants and toddlers are significantly under-identified, prohibiting early intervention for many children and their families who might benefit from services. Recognizing communication delays early in life is critical for appropriate brain development to allow children to reach their potential. Researchers have sought to identify earlier and more accurate predictors of language development. There is a need for special educators to have sensitive methods to assist in the early detection of communication delays.

A Midwestern state recognizes the need for early detection of development disabilities and has developed home visiting program for screening and developmental surveillance of young children. This program consists of educators who conduct home visits at regular intervals to provide developmental surveillance and screening for any child in the state aged birth to three years. This study was completed to gain an understanding of the identification practices of educators in the area of communication delays for very young children. The coordinators of a Midwestern home visiting program who provide screening and developmental surveillance to young children and their families were surveyed regarding the procedures used in their programs to identify communication delays.

Analysis of the responses indicated three primary themes as important for the early identification of communication delays: experience and knowledge is essential, an understanding of typical development is paramount, and tracking observations is important. Understanding the key themes will potentially provide for an earlier and more accurate method to identify young children with communication delays. Recognizing communication delays early in life is critical in order for children to access early intervention and reach their potential.
Introduction

It is estimated that developmental disabilities affect 12 to 17 percent of children in the United States (Boyle, Decoufle, & Yeargin-Allsopp, 1994; Glascoe & Shapiro, 2005; Palfrey, Singer, Walker, & Butler, 1987). It is well documented that developmental delays are not diagnosed soon enough. Many studies document the under-identification of young children with developmental delay (Drotar, 2004; Flanagan & Nuallain, 2001; Glascoe & Dworkin, 2005; Hamilton, 2006; Harrison & McLeod, 2010; Lock, Shapiro, Ross, & Capute, 1986; Palfrey et al.1987; Shevell, Majnemer, Rosenbaum, & Abrahamowicz, 2001; Sices, Feudtner, McLaughlin, Drotar, & Williams, 2003).

This literature cites several factors that contribute to difficulty with the early identification of developmental delays in young children. For instance, there is no “gold standard” for developmental screening for children less than three years of age (Nelson, Nygren, Walker, & Panoscha, 2006; Rydz, Shevell, Majnemer, Oskoui, 2005). Another factor is the significant variability in existing developmental surveillance and screening practice (Harrison & McLeod, 2010; Nelson et al., 2006; Sices, Feudtner, McLaughlin, Drotar, & Williams, 2004). Furthermore, the literature states that physicians use a formal screening tool less than half of the time when screening young children’s development (Frankenburg, Dodds, Archer, Shapiro, & Bresnick, 1992b).

Communication delays in particular are not identified soon enough. According to the American Speech-Language Hearing Association (1993), approximately 15 to 25 percent of young children have some type of communication disorder. Less than 30 percent of children with communication delays are identified by the time they enter kindergarten, however (Palfrey et al., 1987; Tomblin, Records, Buckwalter, Zhang, Smith, & O:Brien 1997; Sices, 2007). This lack of identification indicates that many children with communication delays are not receiving services prior to school age.

A number of factors contribute to later identification of young children with communication delays. First, many professionals believe that language begins around 12 months of age with the first words (Hess, Dohrman, & Huneck, 1997; Sices, 2007). Many language precursors have been identified that occur prior to the emergence of first words, for example, number of consonants, eye gaze and joint attention. These precursors are not widely understood by the general public or professionals outside of the field of communication sciences and disorders.

Second, criteria have not been established for distinguishing typical from delayed language development for children less than three years of age. The criterion most often used to decide if a child’s language is showing a delay is the number of words and word combinations that the child uses (Paul, 1996). Because of the large variation in vocabulary development, this criterion is not meaningful for children less than 24 months of age. At 18 months the average vocabulary is 100 words, with a standard deviation of 111, and the average vocabulary at 24 months is 300 words, with a standard deviation of 175 (Fenson et al.,1993).

Third, formal screening tools are of limited use. Their sensitivity and specificity have a broad range (Nelson et al., 2006) depending on the age of the child (22% to 97% for sensitivity, 66% to 97% for specificity). Research has found that this test only detects 30% of young
children with language impairments (Glascoe, Byrne, Ashford, Johnson, Chang, & Strickland, 1992; Hamilton, 2006).

Statement of the Problem

It is well documented that the identification of communication delays is challenging for children less than three years of age. Waiting until a child misses a major milestone such as talking may result in late recognition of a delay. An understanding of the practices of educators/practitioners in identifying communication delays of young may lead to the earlier identification of a greater number of young children with communication delays.

Purpose

The purpose of this study was to gain an understanding of the identification practices of educators/practitioners in the identification of communication delays for very young children in a birth to three developmental surveillance and screening program.

Research Question

The following research question was addressed by this study using descriptive data collected from interviewing coordinators of a developmental surveillance/screening program for children birth to three years of age: What are the identification practices that educators/practitioners use to identify children under three with a potential communication delay?

Methods

Participants

The participants included each of the eight regional coordinators of a Midwestern home visiting developmental surveillance/screening program.

Survey Method

The eight coordinators across the Midwestern state were contacted by phone. Each coordinator was asked a set of survey questions to determine the specific practices that were used in their developmental surveillance/screening program to identify children birth to three with potential communication delays. The survey questions consisted of eight questions addressing the identification and referral practices used to identify potential communication delay.

Data collection

Semi-structured, one-on-one telephone interviews were the main means of collecting data for this study. The questions addressed in the interview included: types of screening tools used, age screenings performed, procedures for completing the developmental screening/surveillance, specific behaviors that may alert educators to a communication delay, steps that follow a “suspect” communication delay and thoughts regarding the adequacy of procedures for identifying communication delays.
Data Analysis

Initial interviews were conducted by telephone and lasted approximately one hour. The researcher took notes during the interview. These notes were then used for initial coding purposes. After the initial coding was completed, and the notes were re-read several times, a new file was created and the transcripts were re-coded and collapsed from 64 to 40 codes. The constant comparative method (Glaser & Strauss, 1967) of data analysis was used to make comparisons and create categories at each step of the analysis, (Charmaz, 2006; Creswell, 2013). Three categories emerged from the data.

Results

In addition to using formal screening tools, three categories around practices related to developmental surveillance emerged from the data. These categories included: the experience and knowledge of the educator is essential in providing effective developmental surveillance, an educator’s understanding of typical development is paramount in providing effective developmental surveillance, and an educator’s skills in progress monitoring to track observations is important so that young children with possible communication delays can be identified as early as possible.

Category 1

Category 1 included responses around the importance of the educators having experience with young children and knowledge of development so that they can draw on those experiences to make decisions about communication development. This included educators having a “gut” feeling that this child is developing differently than expected, experience to understand the layering of indicators that place children at a higher risk for delay and an understanding of the interplay of all areas of development. The coordinators comments reflected they felt that there is a link between accurate and informed observations and an educators experience with young children. Many of the coordinators discussed that accuracy of clinical judgment is related to the amount of experience an educator has working with young children. Several responses included comments that as educators had more experience that their clinical judgement increased in accuracy and subsequently children were identified at an earlier age.

Category 2

Category 2 included responses around educators having a strong foundation of typical development in order to make decisions about a young child’s communication skills. Each of the coordinators stressed the importance of knowing all of the milestones in each of the area so that educators know right away when something has deviated from the typical range. Across regions, coordinators commented that the thought that there may be a link to child with lower fine motor skills and a possible communication delay. This was felt to be more important in the area of communication delay because the milestones for children birth to one are not understood as well for those with less knowledge and skills in early development

Category 3

Category 3 included responses around the importance of educators tracking observations over time so that they can make decisions about child’s early communication skills. The
coordinators stressed the importance of providing developmental surveillance/ and screening services on regular intervals, especially to the youngest children, so that developmental observations can be compared and contrasted across visits. The coordinators also indicated the importance of the use of checklists so that there is a formal way to track observations in addition to using a formal screening tool.

**Summary**

In addition to screening, the majority of the practices reported as important in identification of probable communication delays were based on developmental surveillance practices. Yet, there is little information in the literature that empirically addresses what those specific surveillance activities should be in relation to communication. The coordinators surveyed reported that the most important developmental surveillance activities for early identification of communication are the following:

1. The experience of the educator is especially important because less is known about specific milestones in the first year of life in the area of communication as compared to other areas of development.
2. An understanding of typical development is important, especially the specific early communication skills.
3. Tracking observations over time of early communication skills to improve early identification.

**Recommendations**

The results of the current study indicate a need for future research on the early detection of children with communication delays with a specific focus on developmental surveillance activities. Following are the recommendations:

1. What specific skills do “experienced” educators/practitioners have that contribute to an early identification of children with probably communication delay?
2. What are the early communication indicators that place a child at risk for communication delay?
3. More information is needed on detailed communication milestones, especially prior to first words.
4. What are the age intervals that are most important to provide screening and developmental surveillance?

Taking a Step to Identify How to Create and Develop
a Professional Learning Community in School

Abstract

This study intends to identify the key factors in creating and sustaining a school-based professional learning community through a case study of a South Korean high school. Data were gathered through classroom observations, analyzing questionnaire, minutes of PLC meetings and a comparative record of students accepted into selective universities from 2011 through 2013. Nineteen participants, including 16 teachers, the principal, the assistant principal, and a leader from city department of education who assisted the school reform process completed the questionnaire. The study provides a detailed description of the case study school, including challenges that faced the school, five main characteristics of PLC initiative of it, its bottom-up reform process, efforts to share their experiences with other schools, sharing the core value and putting that into practice, shared leadership and teacher empowerment, and regular sessions to share classroom practices (PLC meeting). The study indicates that empowering teacher leaders with principal’s leadership staying in creating supportive conditions, securing designated time for PLC meetings, creating PLC in each grade level, and building trust and respect that ensure teachers that they would never be criticized in PLC meetings are favorable factors and conditions for creating and sustaining a school-based teacher professional learning community.

Keywords: professional learning community, creation, grade level, shared leadership, trust, empowerment
Professional learning communities (PLCs) have been believed to offer an effective infrastructure for addressing many types of challenges that face schools, such as teacher isolation, difficult interaction with colleagues, and challenging students (Morrisey, 2000). And it is also well documented that PLCs contribute to schools becoming better places where teaching improves and student learning increases (Darling-Hammond, 2010; Hord, 2009; Louis & Marks, 1998; Newmann & Wehlage, 1995; Thiessen & Anderson, 1999).

Hord (1997) identified five dimensions that successful professional learning communities hold; supportive and shared leadership, shared value and vision, collective learning and application of learning, supportive conditions, and shared personal practice, for which research show a surprising level of agreement (Bolam, McMahon, Stoll, Thomas, & Wallace, 2005; DuFour, DuFour, & Eaker, 2008; Kelly & Cherkowski, 2015; Morrisey, 2000; Owen, 2014; Stoll, Bolam, McMahon, Wallace, & Thomas, 2006). But, how these characteristics of professional communities can be created, developed, and sustained are still not so clear, and little has been written about (Cowan, 2009; Hord, 1998; McLaughlin & Talbert, 2006; Morrisey, 2000). This study intends to take a small step in figuring out some key factors on how to create and develop a professional learning community in school through a case study on a Korean public high school which has been transformed from a low-performing urban school that served predominantly underprivileged, low-achieving students into an exemplary professional learning community with enhanced student achievement and higher student acceptance rate to selective universities.

As we know both from research and experience, finding actual cases of schools of mature communities of teacher reflection and inquiry is not easy (Hord, 1998; McLaughlin & Talbert, 2006). And many schools in South Korea which externally manifested PLC also gave up their
reform efforts in a few months failing in gaining sincere cooperation and participation from their teachers. Transforming a school into a place of continuous inquiry is never an easy project, because it takes not only structural changes, but also cultural changes including a fundamental shift in the habits of mind of teachers. Change of teachers’ mind is essential, because it is the individual teachers that actually attend the PLC meetings, reflect on their teaching practice, change pedagogy, and eventually accomplish school reform. When mandated, teachers can still act as if they all agree and they already share values and common beliefs, but in reality they stick with their old patterns in, what is called, a pseudocommunity (Grossman, Wineburg, & Woolworth, 2001). So, reform initiatives and teacher participation would be more favorable to be operated on voluntary basis in order for a reform process to be authentic and sustainable. It is whether teachers can find shared personal practice to be really helpful in improving their teaching skills and student learning, and whether they find themselves enjoying being in PLC meetings, not being forced to “be there” anyway that determine the success and failure of a given school reform initiative. If forced, they can pretend to confer and cooperate with each other, but they would never be able to grow as teachers who readily adjust their instructions to meet student needs, and the sustainability of school reform initiatives in those schools would be hard to be guaranteed, scratching the surface all the time. From this point of view, this study intends to hear from the teachers, principal, assistant principal, and a leader from city department of education, and learn from them on what is the most important infrastructure, what is the ideal unit for implementation of PLCs, who they think the key leader is, what are key factors in PLC meetings, and what encouraged them to move on during their school reform process.

Research Questions and Methodology
The study intends to answer the following questions:

1. What are the essential infrastructure, preparation and social organization in a school which intends to create a professional learning community for the first time?

2. What is the ideal unit in implementing PLC in schools? Is it school-wide, grade-level, or subject-level?

3. What are the biggest encouraging factors that help teachers to overcome the implementation problems, and continue the reform process?

4. Which level of leader is the most influential, and what kind of leadership is the most effective in creating and implementing PLC in school?

5. What are the essential factors in PLC meetings, and “how often” is ideal for teachers in helping them grow without making them feel tired?

Data for the study were collected between 2011 and 2015 through classroom observations, analyzing questionnaire, minutes of PLC meetings and comparative record of students accepted into selective universities in South Korea from 2011 to 2013. The author of the study was both participant and researcher. The study draws on survey data from 19 people including 16 teachers who taught at Taegu High School from 2011 through 2013, and three administers including the principal, assistant principal at the period, and a leader from Taegu City Department of Education who assisted the transformation process of the case study school for the 3 year period. The teachers and administrators were asked to complete a questionnaire to discover how the PLC in their school could be created, implemented, and sustained during the 3 year period. The 19 questions for teachers, and 16 questions for administrators were across four dimensions of
preparation, implementation, leadership, and PLC meeting. The response rate of the questionnaire was 90.48% (19 out of 21).

Challenges That Faced the Case Study School

Morrissey (2000) identified five core issues that adversely affect school improvement efforts. The case study school used to be a typical place that had all of the five core issues before the implementation of PLC initiative in 2011; organizational structure, focus of improvement work, personal and social dynamics, contextual influences, and leadership.

1. A school for underprivileged students

The case study school was a typical school that serves predominantly underprivileged students whose parents’ socioeconomic status is low. The students gained much less on achievement tests than those from other schools in the district, producing only 4-5 students getting admitted to selective universities each year out of around 400 graduates. One of the main reasons why parents did not want their kids to be assigned here was the overall classroom atmosphere caused by many disruptive students. Due to recently launched tracking system in high schools in South Korea, those who were not eligible for entering those schools for “smart kids” were not motivated at all during classes. In some classrooms in the case study school, more than half of the students were sleeping while teachers were instructing, and they would not listen to teachers’ directions.
2. Antipathy against sharing personal practice

There has long existed a very unique antipathy against classroom observation and subsequent meetings among teachers in almost all levels of Korean schools. In such meetings, participants would take turns to make comments on the teacher’s instruction, mainly criticizing the instructor’s teaching practice, which would be extremely embarrassing to the person who opened the classroom. This made opening classroom and sharing one’s teaching practice the last thing teachers would want to do during their teaching career, which is unfortunate for all. This traditional judgmental structure seems to be closely tied to authoritarian leadership of principals who feel free to open the classroom doors and reprimand teachers even in front of students, which is far from an image of a principal who is ready to empower teachers or share the leadership, as well as a torchbearer of school improvement efforts.

3. Work conditions for teachers

Most high school students in South Korea stay at school until 9 or up to 11 at night depending on schools, and keep studying, which entails many teachers’ overwork for the sake of supervising the students. This is a part of dark side of those excellent achievement scores of Korean students in international assessments in recent years. And unlike such countries as Belgium, Finland, France, Italy, the Russian Federation and Slovenia, where teachers are not required to spend time on non-teaching activities (OECD, 2011), Korean teachers are required to handle many administrative tasks even after their work hours, which also makes it extremely hard for teachers to concentrate on preparing and teaching. In this situation, it was also extremely
difficult for teachers in the case study school to secure time designated solely for sharing personal teaching practice.

4. **Low self-efficacy of teachers under authoritarian leadership**

Type of principal leadership is believed to directly influence the effectiveness and motivation of teachers. According to a survey, Korean teachers showed the lowest self-efficacy among the countries surveyed, being ranked 23rd out of 23 countries (OECD, 2009). Things were not much different in the case study school before the implementation of PLC initiative. Though the teachers had weekly meetings every Monday morning, they were busy writing down the directions and announcements from principal rather than discuss or share ideas with colleagues. Opportunities to suggest and share ideas were rare, and those efforts were often ignored by administrators, which resulted in low morale and self-efficacy among teachers. Former principals showed little to no instructional leadership, but showed strong characteristics of bureaucratic management that emphasizes finishing administrative tasks on time and reporting to the higher authorities. They were not so much vigilant about disruptive student behaviors in classroom, and taking care of those students was the responsibility of individual teachers. Because teachers were struggling with both disruptive students in classroom and with overwhelming amount of administrative tasks which often kept them late at night at school, they were neither ready, nor willing to launch any school reform efforts.

**Main Characteristics of Professional Learning Community in the Case Study School**
In this section of the study, 5 characteristics that PLC initiative of the case study school had will be discussed. This school shares many aspects of Hord’s (1997) 5 dimensions of typical PLC schools, but it also has two unique features: (1) bottom-up reform initiative; and (2) efforts to share their experiences with other schools in the district.

1. **Bottom-up reform initiative**

External influences often have negative, rather than positive effects on school improvement by imposing unreasonable tasks or regulations, and/or rapid change in different policies (Newmann & Wehlage, 1995; Spears & Oliver, 1996). And many of school reform efforts have been top-down process (Spears & Oliver, 1996), including many school reform initiatives with PLC process in mind. A common picture is that state or district department of education, and/or principal, and/or regional university take the initiative and offer necessary funds and professional development for teachers, expecting teachers’ participation and cooperation. Part of the uniqueness of the reform procedure in the case study school was that it began from the bottom; the initiative was taken by core group teachers, and the air spread into colleagues in the school and into other schools in the district, finally resulting in affecting the city department of education to set PLC implementation in other schools in the city as one of their main policies in the following year. In other words, in 2012 school year, city department of education assigned special budget and provided support measures for those schools which wanted to introduce PLC initiative having focus on student learning. Before the 2011 school year began, the core group teachers in the case study school suggested to the principal that they need to have an interactive workshop to share the core value of enhancing high-quality student learning through creation of
PLC in their school. The principal readily accepted the suggestion, appropriated necessary budget, and assigned the core group teachers to a same grade level. During the interactive workshop held right before the school year began, they shared their wish to collaborate in sharing instructional practices, and secured agreement on that from the rest of the teachers who belonged to the same grade level. Right after the kickoff of the 2011 school year, they began to observe classrooms of one another, had weekly PLC meetings to share personal practice and reflect on their instruction, and tried to figure out the causes of enhanced or impeded student learning. The movement continued in 2012 and 2013 school year, causing school-wide professional learning community to become possible including the other two grade-level teachers.

2. **Efforts to share their experiences with other schools in the district**

Their bottom-up commitment for school reform was not limited to implementing a successful learning community in their own school. From the 2012 school year which was their second year of reform initiative, they regularly opened their classrooms of all subjects to teachers from other schools and leaders of city department of education. They also demonstrated their PLC meetings for the audience to observe their collegial conversations. Their PLC meetings comprised of reflection on the causes of enhanced or impeded student learning without any fault-findings or direct advice for other teachers’ instructional practice were totally different from what those teachers from other schools had experienced before, and positively affected them. The core group teachers were also often invited as guest speakers to speak in professional developments and workshops in other schools that wanted to launch PLC initiatives. Teachers in the case study school even made a visit to Japan in 2012 in order to observe classes, and share professionalism
and classroom practices with Japanese teachers in successful learning community schools in Hiroshima and Okayama, Japan. On their trip to Japan, they invited teachers from other schools and a leader from city department of education for the purpose of sharing their experiences and disseminating the value of teacher collaboration and inquiry.

3. Sharing the core value and putting that into practice

The case study school was one of the typical schools where teachers would glance at the cover of the curriculum book when asked to tell the core value of their school which nobody would remember otherwise. Their priority was to finish the overwhelming amount of administrative tasks on time and report to higher authorities, rather than enhance student learning. In the 2011 school year, which was the first year of launching PLC initiative, teachers and the principal worked collaboratively to set up a new slogan as their core value: Learn Together, Grow Together, Taegu High School Learning Community. Not only did the principal emphasize the new slogan by repeatedly articulating it whenever possible; in professional development, weekly staff meetings, and parents conferences, but he also carried it out into practice in order not to let it forgotten as rhetoric. He appropriated fund from city department of education, and employed 4 additional administrative assistants in order for them to take over much of the administrative tasks which had belonged to teachers before. He also pulled together 12 teachers in the same grade level into a large office to increase teacher proximity, so they can have more opportunities to confer with their colleagues for the purposes of sharing personal practice and enhancing student learning. With all these supports from the principal, the teachers who had
already taken the initiative to launch the school reform, could be more empowered to collaborate with each other for learning and growing together.

4. **Shared leadership and empowerment**

The principal renovated his office from a place with luxurious sofa and coffee table into a conference room with a table for 16 people to be seated around. He also installed a projector on the ceiling with a built-in screen made of glass board on one side of his office wall on which the image from computers could be projected and letters could be written with markers at the same time. That change turned out to be very useful for collaborative works. The 14 heads of the departments had a weekly meeting in principal’s office, and they could share their ideas more effectively through this technological support. This also made it much easier for teachers to bring a flash drive and share their ideas to improve their instructional practices. Believing that empowering staff is the very starting point of creating collaborative culture, the principal made three small schools in his school by informally calling the heads of the three grade levels *principal of each grade*. He was short on rhetoric and long on resolute empowering. He valued the leadership of heads of each grade level who were in charge of running the PLC meetings by appropriating necessary budget and staffing the teachers each head wanted to work with. He accepted the suggestion from grade level heads that all the teachers in the same grade level need to be gathered in one office, and gathered them in a big office with individual desks and a meeting table. Also, taking the suggestions of the grade level heads, the principal allowed teachers to teach same students for three years until they receive diploma. Teachers said teaching same students for three years was extremely helpful in preparing the students for early decision for colleges that had more than 3,000 types of matriculation assessment which required teachers
to fully understand individual students in order to advise them better and write best recommendation letters.

5. Regular sessions to share classroom practices among faculty (PLC meeting)

As supported by research (Morrissey, 2000; Oliver, Chen, Huffman, & Wang, 2015), the issue of setting aside appropriate time for sharing classroom practice was a central issue for teachers in the case study school, too. In the first year of their reform effort, there was no fixed period of time for PLC meetings, and they had gathered after school was over. From the second year, however, they rescheduled the school time, and set aside 90 minutes on every Thursday afternoon with administrative support from the principal. Each grade level appointed a teacher who is solely in charge of making schedule for classroom observations, reminding PLC meetings of the day to teachers, and keeping minutes of every PLC meeting. Though it was very fortunate for the teachers to secure a special time for reflecting on and improving instructional practice, more important was to make sure that all the participants come to believe in collaborative learning and self-reflection through the PLC meetings. For achieving the purpose, the core group teachers thought that the top priority would be to make sure all the teachers share their everyday classroom activities without any decoration on it. The tendency to show off something new to others is believed to have originated from critical and fault-finding culture in classroom observation and subsequent meetings in Korea from long ago. In the same sense, giving direct advice to other teachers was technically forbidden until all the teachers in PLC meeting could feel comfortable in sharing both success and failure. Instead, they were advised simply to say what they had observed and what they had learned through observation until enough collegiality
was formed among the participants. After a while, they could freely give and take feedbacks from others, ask questions to learn from others, and share failure as well as success.

Visiting and observing other teachers’ classroom was very limited on the first year of PLC implementation in Taegu High School, as in other schools (Hord, 1998; MetLife, 2009). It was partly because they could hardly find time to, and partly because they were not fully confident in the effectiveness of PLC meetings. But as the teachers increasingly glean useful information from classroom observations and PLC meetings, they could put their priority in attending them. From the second year, they began to videotape all the demonstrated classes which were offered almost every week by different teachers. At the same time, they decided to turn the camera toward students instead of teachers, with a bigger focus on how students learn, not on how teachers teach.

Findings: How to Create and Sustain PLC

There always exists some disparity between what the research says and school’s ability to put that into practice (Morrissey, 2000). Schools might have implementation problems and obstacles because teachers and administrators can face and struggle with many unexpected difficulties in their school reform efforts. This study intends to figure out some key factors in preparing and implementing PLC initiative through the voices of teachers and administrators who experienced all the stages of developing a school into PLC.

1. Preparation
When asked to list necessary overall infrastructure in order of priority for a school that decided to launch a professional learning community, the teachers in the case study school and the administrators in unison put “teacher leaders” on top of their list, followed by teachers ready to devote themselves to school reform. Interestingly enough, both the teachers and administrators put financial and administrative support from city department of education at the last among the 4 options. They also thought having leader teachers is more urgent and necessary than having a principal who well understands the PLC process when initiating PLC movement in school.

To the question of the very first step in launching PLC provided it were a month before a new school year begins, teachers said core group meeting should be the most urgent and important, with opportunities of being given a lecture by some brought-in guest speaker at the last on their list. Teachers said building a new structure of its own is more important than just being told what to do.

When asked to say what the most important structural condition for launching PLC initiative in their school was, they put securing a designated time for PLC meetings on the very top of their list. In high schools in Korea, normal school hour ends around 4 in the afternoon, but supplementary classes follow for about two hours, followed by self-study session until 9 or up to 11 at night. Not only do students get tired from this overwhelming study load, but also teachers can hardly find time to plan lessons and talk about students and their learning with colleagues. The core group teachers in the case study school suggested to the principal that they need to secure a designated time for PLC meeting in place of two supplementary classes on Thursday afternoon, and the principal accepted it, which led to securing 90 minutes every week. Teachers regarded increased teacher proximity as the second most important structural factor of their school’s success. Teachers used to spread out in many different offices even though all the
classes and administrative works were done around each grade level. The principal pulled together the 12 teachers who taught the same grade level into one office that had individual teacher desks and a table for meeting. This increased teacher proximity and they were more easily able to build relationships of trust and respect, and share their practice through PLC meetings.

When asked to say what the most important social organization that the teachers need to share or the principal need to show before launching PLC initiative was, most teachers (87.5%) said it was building trust and respect with one another about the fact that they would never be blamed or criticized in PLC meeting. As stated above, this seems to originate from the old tradition in Korea that teachers used to be criticized by principals and colleagues in meetings after classroom observation. In the same sense, the vast majority of teachers said the last thing a principal would do before launching PLC initiative is showing his/her persistent will of implementing PLC with any difficulties. They also said the number one cause of failing in implementing PLC initiatives in other schools in their district was principal’s pushing forward without securing staff’s agreement and understanding of goals and process of PLC.

About the necessary systematic support for PLC to be created, many teachers said the size of each class they teach needs to be reduced. In average Korean high schools in urban areas, teachers teach 35 to 45 students in one class and 400 to 600 for a grade. Moreover, unlike American high schools where a teacher has three to four classes of which he/she is exclusively in charge about teaching and assessments, three to four Korean high school teachers teaching same subject share those responsibilities on several hundred students, and rotate the classes they teach, which make it extremely difficult for them to understand each individual student’s strengths and weaknesses. In this situation, not only teachers cannot have discretionary decision-making power
in their own teaching and assessments, but also it is extremely difficult for them to get to know each student in a school year.

2. Implementation

Teachers were asked about which unit would be the most appropriate in launching PLC, what was the encouraging factor to make them go ahead in the face of difficulties during the reform process, and what was the main difference between their PLC initiatives and other reform initiatives they had experienced before.

75% of teachers thought each grade level would be more appropriate unit in implementing PLC than subject level or school-wide reform. They thought grade level would be the most appropriate in that most of teaching and administrative practices are done around grade level, which makes the collegiality among teachers in it stronger than any other unit. They also thought they were able to observe individual student’s learning in different subjects, which let them better understand their learning styles and strategies.

It was found the biggest encouraging factor that helped teachers overcome implementation problems and move forward was the change of students who used to sleep or did not pay attention to classroom activities before. Private after work meetings with colleagues and enhanced self-efficacy coming from teacher empowerment by principal followed, but the administrative and financial support from city department of education was favored by none of the teachers as the encouraging factor for them.
To the question of what was the main difference between PLC initiative in their school and other school reform movements in the past, 87.5% of teachers and all of the three administrators said that it was the fact that PLC movement in their school was the one from the bottom, not from up somewhere. Considering the purpose of sharing leadership and creating supportive conditions in PLC schools is to let teachers voluntarily share personal practice and apply the learning to their teaching practices, the fact that their reform initiative began with three core teachers and spread upward seems to meaningfully contribute to implementing culture of collaboration and inquiry in their school.

3. Leadership

Asked about the most effective type of principal leadership in PLC implementation, the vast majority of teachers said it was the one who readily shares his/her leadership and is sensitive to teachers’ needs. The teachers and administrators were also asked to say who would be the most influential leaders in school in the creation and development of collaborative culture and teacher inquiry. Most teachers (87%) said it was the head of each grade level, whereas administrators regarded both head of grade level and principal had equal importance. Teachers believed staffing prepared teacher leaders in each grade and increasing teacher proximity was the most helpful support done by principal, rather than his direct exertion of omnipotent leadership.

4. PLC meeting
When asked about the key factors in achieving sustainability of PLC meetings, most teachers said building trust and respect with colleagues was the most important, followed by the readiness to receive feedback and learn from others. About the most appropriate frequency of PLC meetings, having weekly and biweekly meeting got about the same support from the teachers and administrators, with just two teachers said once a month would be appropriate.

The concept of teacher-professionalism has been widely accepted, and enhancing self-efficacy of teachers is one of the key factors of it. A teacher who is not allowed to participate in decision-making process at school, or is not given the discretionary power to use his/her practical knowledge acquired from their own reflection and collaborative dialogue with colleagues on their teaching practice cannot be said to be a professional. The core group teachers in the case study school thought enhancing teachers’ interaction in a more formalized structure was the first thing to do for enhancing professionalism. So, with the support of principal, schedules were arranged to allow a designated time of 90 minutes every Thursday afternoon solely for PLC meetings. Unlike the prevalent PLC practice where other teachers and instructional coaches at the meeting offer solutions and advice (Pirtle & Tobia, 2014), teachers in the case study school made it a rule not to give solution or advice to other teachers’ instructional challenges, let alone criticizing them. Instead, they were expected to simply share what they observed and felt in the course of classroom observation. As expected, teachers, at first, just scratched the surface for a while in PLC meetings. But once some teachers shared instructional challenges rather than success, other teachers began to feel safer, and could gradually share their own classroom challenges without fear of being criticized. They went on to talk about strategies to adjust their instructions to meet student needs and engage students in learning, including discussing how to create worksheets which go beyond the simple fill-in-the-blank type into the ones that effectively
stimulate collaborative conversation and higher-order thinking process in the small groups. In order to enhance opportunities of reflecting on what they talked in previous PLC meetings, they assigned a teacher the role of typing all the conversation during each PLC meeting into documents, and sent the minute files to colleagues through school intranet network. The teachers went beyond talking about personal classroom practices, and moved on to amending curriculum to best fit students’ needs in applying for early decision college matriculation, to assessment improvement, and effective counseling skills on college readiness.

**Discussion and Conclusion**

There could be no one-size-fits-all guide or strategy in establishing a professional learning community in school. Just as each individual teacher needs to find instructional methods that best fit him/her, so each individual school will need to find adequate strategies that best fit them, which will lead them into community of continuous inquiry. However, this study intended to take a step and shed some light on the question of *how* we can guide a school in creating and sustaining a school-based learning community, where both teachers grow as professionals and students learn as effective learners.

The finding regarding the first research question reveals that teachers and administrators thought they needed teacher leaders as an overall prerequisite in launching PLC initiative in school. About the very first step in launching PLC one month before a new school year begins, teachers said the core group teachers’ meeting would have the priority. They also said securing a designated time for PLC meeting was the most necessary structural condition for launching PLC initiative. As for the most important social organization that teachers need to share before
launching PLC initiative, the vast majority of teachers said it was building trust and respect with one another about the fact that they would never be blamed or criticized in PLC meeting.

When it comes to the ideal unit of PLC implementation, which is related to the second research question, teachers thought each grade level has more advantage than any other unit in school, such as subject level or even whole school unit, because teachers in the same grade are more likely to have stronger collegial relationships with one another, and they can get better pictures about students’ learning strategies in different subject classes than they can with colleagues with same subjects.

The finding on the third research question indicates that teachers believed the change of disruptive or unmotivated students was the biggest encouraging factor for them to overcome the implementation issues and keep moving on to build a learning community in their school.

As for leadership dimension, which is related to the fourth research question of the study, the head of each grade level was regarded as the most influential leaders who could contribute to creating, implementing, and sustaining PLC initiative than (assistant) principal, head of subject level, or external facilitators such as personnel from city department of education. Teachers believed that principal’s leadership could be the most effective when it stays in creating supportive conditions such as staffing prepared leaders in place and being sensitive to teachers’ needs, rather than become omnipotent or authoritarian principals.

The finding on the fifth research question about the development of PLC meetings reveals that teachers thought building trust and respect with colleagues was the most important factor, followed by the readiness to receive feedback and learn from others. Having weekly or biweekly PLC meeting was supported by teachers on about the same percentage. Teachers
thought they needed to feel free from showing “something” to others, and must share their ordinary practice with others for the practice of classroom observation to be well settled down.

It might be difficult to generalize the study findings to other schools of different levels and cultures, because the study was conducted about PLC implementation of a Korean public high school. But the significance of the study results will contribute to shedding some light on the key factors of preparing, launching, and sustaining PLC in school, and on the necessary infrastructures including physical and social organization. It is expected that principals, teachers, and external facilitators would be able to get insights from the awareness of the teachers who experienced an actual process of preparing, launching, implementing, and sustaining a learning community in their school.

The teachers in the case study school suggested that there should never be pressure from outside in implementing PLC initiative. PLC can never be the goal of a school reform initiative, but is a supporting structure (Morrissey, 2000) that enables the staff to voluntarily collaborate with each other and focus on enhanced student learning. The initiative to transform a school into a professional learning community requires a fundamental shift in teachers’ habits of mind and change in the professional culture of the school. That would also need a lot of time, patience, and cooperation from many people. But the initiatives to create caring communities where teachers and students learn and grow should never be ceased as long as fresh evidences that they enhance the effectiveness of schools and help our kids learn continue to show up.

**Abstract:** In Japan, many kinds of medical information systems have been implemented in clinical practice, such as those using electronic medical charts. It is necessary for nurses to learn the operating procedures of computerized patient file management systems as part of their own works. Moreover, along with the re-examination of medical fees for the Japanese health care system, which are predominantly covered by the Japanese National Health Insurance, inpatient management and other related fees are being newly created. As a result, there is great need for record keeping. Thus, in addition to basic nursing records, nurses’ daily record keeping involves keeping new records and studying their required definitions. One of these new records is called “nursing care needs,” a concept newly introduced as part of the health care fee revision of 2008. In the present study, we constructed a support system for evaluating nursing care needs and investigated the effectiveness of the nursing care needs education on nurses. Nine people participated in the present study and used our support system to evaluate the nursing care needs of model cases. The results of the study indicated that in a single model case, the time spent entering the nursing care needs evaluation was shortened, and the academic performance of the evaluations significantly improved when our system was used (p<0.05). The nursing care needs evaluation support function included in our system allows the evaluation of nursing care needs of patients and facilitates the definition of the evaluation items to be displayed on the input screen. Thus, our system may have decreased the input times owing to two reasons. Firstly, definitions are displayed and referenced in our system while entering the nursing care needs evaluation. Secondly, when filling out the nursing care needs evaluation, support functions were only used in cases where there was confusion about the evaluation. We suspect that the increased evaluation performance despite the decrease in required input time was a result of the knowledge regarding the evaluation of nursing care needs that the nurses gained with our system. Therefore, the authors believe that the nursing care needs and evaluation field display function is an effective educational tool to facilitate the knowledge acquisition regarding nursing care needs.

**BACKGROUND**

The systemization of medical information has been progressing actively in Japan, ever since the e-Japan strategy was launched in 2001. Such systemization encompasses the development and installation of electronic patient record systems in the medical field. Furthermore, multiple medical information
systems, in addition to electronic patient records, have been introduced in medical sites. Therefore, as practitioners of the medical profession, nurses are required to learn about the operation of electronic patient records as part of their nursing tasks. In addition, in conjunction to the revision made to the medical service payment system, an inpatient management fee was newly introduced in the Japanese medical system, which centers on the medical treatment covered by the Japanese National Health Insurance. Nurses are often asked to maintain the records associated with the new fee system. Therefore, in addition to maintaining nursing records, nurses are expected to maintain daily records, which require them to first learn the definitions of the terminologies used in the new records. As such, in addition to nursing duties involving providing assistance for daily medical care and livelihood support, nurses are required to perform their duties while learning many new materials, including the newly introduced medical information system (i.e., electronic patient records) and various records related to the hospitals’ profit.

The concept of nursing care needs level is one such item that was newly added in the revision made to the medical service payment system in the 2008 fiscal year. With reference to the evaluation of the nursing care needs level, Tanaka stated, “the training of the evaluator will become a prerequisite when introducing the nursing care needs level”\(^1\). Evaluator training requires practice, and therefore, the introduction of the new evaluation system will require an adequate preparation period. Furthermore, continuous learning is required in order to perform an accurate evaluation. Such learning may encompass training based on the evaluation index and the scope of learning opportunities\(^2\).

Therefore, in the present study, a system was developed to support the accurate evaluation of the nursing care needs level, in order to examine the educational effects of nursing care needs level assessment on nurses.

**PURPOSE**

To clarify the educational effects of the nursing care needs level assessment on nurses using a nursing care needs level evaluation assistance system.

**Method**

Nurses who consented to participation in the study were asked to use the system. The nurses were then asked to evaluate the nursing care needs level of 5 model cases set by the researchers, and enter the results. The SPSS Statistics Version 21 software was used for the analysis.
Analysis method

1) Data input time
The time required for the nurses to look through each of the model cases set by the researchers, to evaluate the nursing care needs level, and to complete entering the details was measured.

2) The nursing care needs level evaluated
The data of the nursing care needs level entered by the subjects in the system was extracted, and the concordance rate with the model answer was calculated for each case. The calculated concordance rate was treated as a nursing care needs level evaluation score, and significance differences in the changes in the scores were examined.

RESULTS

1) Background data of the research subjects
In total, 9 nurses consented to participate in this study. They had no prior experience in evaluating the nursing care needs level. The mean years of experience the nurses had in using computers was 7.56±5.09.

2) Nursing care needs level evaluation and data input time

The time it took to evaluate the nursing care needs level of the model cases and to enter it into the system was the longest for Case 1, with the time tending to be shorter thereafter. Nurse 8 took the longest, for Case 1, which was 24 minutes and 26 seconds, with the shortest duration being for Case 5,
by Nurse 3 (2 minutes and 30 seconds). Many nurses evaluated the nursing care needs level for Case 1 only after looking through all the information provided. However, as they conducted more evaluations, the number of nurses who simultaneously analyzed the case information as well as evaluated and entered the nursing care needs level increased.

3) The nursing needs evaluation scores

The mean nursing care needs level entered in the system was 86.90±8.558 (highest: 100, lowest: 72.41). A Mann-Whitney’s U-test between the score of the first case and those of the second and fifth cases revealed a significant increase in the nursing care needs score (p<0.05).

![Figure 2 Trends in the nursing care needs evaluation score entered by the nurses](image)

**DISCUSSIONS**

The nursing care needs level evaluation assistance system displays the nursing care needs levels and the definitions of the evaluation items on the screen. The duration for evaluating the nursing care needs level of the model case and entering the data into the system became shorter from the second case because the subjects may have required additional time to carefully read the definitions displayed in the system and understand them while evaluating the nursing care needs level for the first case. The nurses that consented to participate in this study did not have any prior knowledge on nursing care needs level assessment. Therefore, all the nurses took time to read the definitions of the nursing care needs levels and understand them, consequently requiring them to spend more time for evaluating the nursing care needs level, and entering the data for the first case. On the other hand, from the second case onward, nurses
simultaneously evaluated and entered the nursing care needs level as they analyzed the case. This suggested that the system facilitated the understanding of the definitions of nursing levels.

Furthermore, though there was a reduction in the time required for evaluating and entering the nursing care needs level, there was a significant increase in the nursing care needs score. This indicates that the reduction in time was not a result of being familiarized with the operation of the system but was the effect of nurses’ understanding of the definitions of the nursing care needs levels. Conditions that promote this kind of knowledge acquisition are: 1) Understanding the meaning of the material, 2) organizing knowledge, and 3) actively participating in the learning activities\(^3\). Nurses using this system to evaluate the nursing care needs level of model cases are believed to have assisted learning by organizing their newly acquired knowledge on nursing care needs level and relating it to their previously acquired knowledge related to nursing. This led to the reduction of the evaluation and entry time of the nursing care needs level and an increase in the nursing care needs score. This result suggests that the system function of assisting nursing care needs level evaluation had an educational effect as it helped nurses acquire knowledge regarding the nursing care needs levels.

However, there was a decline in the nursing care needs level evaluation scores for the 4th case, and only 5 cases exhibited a 100% accuracy rate. Therefore, we need to examine the factors that led to the score decline and the lack of accuracy, in order to identify systems that allow more effective knowledge acquisition.

**CONCLUSION**

1) This system exhibited educational effectiveness because the nurses were able to attain new knowledge regarding the nursing care needs levels.

2) The nursing care needs scores decreased in some cases. As such, systems for attaining more effective educational effects need to be examined.

Entrepreneurism Immersion creates Self Actualization in Primary Education: Partnering with an Accelerator

Williamson R and Forth KE.

Abstract

Background: Entrepreneurism is increasingly popular in middle and high school curricula, reflecting the general trend of increasing entrepreneurship in business; yet, exposure to entrepreneurship in elementary education is minimal. In contrast, immersion techniques are commonly used in elementary schools, although they are typically used for language acquisition. Partnerships between schools and external resources are also commonly used to enhance primary learning, for example, topic appropriate school trips and outreach events. Enhancing learning opportunities that lead children to self-actualization is paramount when preparing children for a successful future by helping learners reach and realize their full potential and foster a desire to become high achievers and transfer new, lifelong skills.

Purpose: Teachers at the British International School of Houston and business professionals from the Texas Medical Center accelerator (TMCx) partnered for an eight week immersive innovation curriculum. The purpose was to teach the children entrepreneurial skills and knowledge that would allow them to become autonomous inventors, accumulating in a pitch and showcase of their invention at TMCx in front of a panel of executive judges.

Intervention: Individuals, including teachers, were supported by the accelerator to become self-regulated, independent learners. Eighty children formed ‘start-up’ companies in teams of two to four. Techniques and expertise developed by the TMCx business professionals assisted the children in learning the iterative process of invention and commercialization.

These included: customer interviews, customer led solutions, team brainstorming, research about competitors and realistic operating features, and iterating their ideas based on all of those inputs. The children invented marketable health care solutions and created endpoint outcomes of a display model, executive summary and showcase display as well as a team pitch presentation.

Conclusion: Collaboration, motivation and immersion techniques played a fundamental part in developing perseverance and change in perspective amongst the eighty children involved. The process of becoming young inventors and experts in their invention provided opportunity for the children to experience, understand and embrace failure, and also experience and foster ownership, ambition, challenge team work and individual accountability. A dramatic change in mindset and a significant rise in academic progress was observed, as well as a desire to use and apply new skills in other subject areas. The partnership allowed children to use their intuition, previous knowledge, newly acquired knowledge and creativity to reach self-actualization.
While an entrepreneurism curriculum can be challenging for young children, the impact and rewards of exposing such a curriculum at a young age can be broad, ranging from achieving critical thinking to exposing girls to equality before they perceive external limitations. This partnership between a primary school and an accelerator created an innovative way of facilitating a deeper understanding of a new concept and achieved self-actualization through entrepreneurism immersion in the primary classroom.

Introduction

In primary education, immersion is a tool commonly used with language education, but is rarely used in science, technology or entrepreneurism for periods longer than a week. Entrepreneurism in particular is dramatically increasing in the general global population. The US has over 412 accelerators, and there are approximately 60 startup programmers operating across the UK (Telefonica UK, 2014). Accelerators are by definition immersion techniques with intensive learning for adult entrepreneurs to accelerate the progress of their startup companies and increase success rates (Cohen & Hochberg, 2014).

High school and middle school curricula are starting to reflect the trend towards entrepreneurism, including app writing challenges, pitch competitions, and hack sessions. However, entrepreneurial skills are rarely taught in primary school as a separate subject (European Commission Education, 2012), and if so, usually in a limited capacity, such as, operating a lemonade stand, which focuses on the financial aspects of an enterprise. Entrepreneurial skills that stretch beyond financial management include: creativity and creation, critical thinking skills, research, following an iterative process, resilience, and communicating ideas through persuasive written and verbal communication.

All of these key learning areas are transferable and fundamental for primary age development if children are to become self-actualized. Self-actualization is the expression of one’s full potential and a desire for self-fulfillment (Maslow, 1954). Children’s intrinsic motivation and mindset are critical as to whether children self-actualize (Burleson, 2005).

An individual’s mindset can be classified as either a growth or a fixed mindset and is greatly influenced by the individual’s reaction to failure (Dweck, 2006). Individuals with a fixed mindset strive to prove themselves and believe that ability is a direct measure of their potential, not something that can be developed or changed. People with this mindset interpret failure as a lack of ability and prefer to avoid challenge rather than risk failure, and often give up easily, become defensive, lack effort, ignore negative feedback and are threatened by success (Dweck, 2006). The growth mindset, on the other hand, is based on the belief that basic qualities can be cultivated through effort and can be developed provided individuals invest effort or study (Dweck, 2006). People that possess the growth mindset display opposing tendencies to the fixed mindset; they embrace challenge, show persistence when failing, see effort as a route to mastering skills, learn from criticism and learn from success (Dweck, 2006). Given that the child’s mindset is critical for achieving self-actualization it is useful to assess a child throughout a curriculum on these qualities.

The International Primary Curriculum is a curriculum that operates with discrete periods of immersion learning through three to eight week topics. As the International Primary Curriculum takes a thematic approach, the children aim towards mastery of skills in the foundation subjects through immersion of subject matter. “Inventions that changed the world” is an innovation topic introduced to children aged 7 years to 11 years of age. An eight week
innovation topic affords the opportunity of 7 to 8 year old pupils to be immersed in innovation learning through exploring, researching, trying, and questioning their experiences and knowledge through planned learning outcomes. This paper described how a partnership with an external innovation accelerator and their professionals, provided greater depth to the children’s learning opportunities and their learning outcomes to achieve self-actualization learning.

**Methods**

The primary teaching staff of the British International School of Houston, Texas, partnered with a startup accelerator, the Texas Medical Center Accelerator (TMCx), to provide children aged 7 to 8 with a defined version of the International Primary Curriculum related to science and mathematics. Eighty children divided across a four form Year group, led initially by four teachers participated in the adapted curriculum.

The learning spanned 8 weeks with an overall goal of inventing, as a team, a healthcare solution followed by a presentation of the work in a project showcase and a pitch event in the final week. Together, the business professionals and teachers collaborated to define a new curriculum. Table 1 lists revised and adapted objectives created to maximize the teaching of entrepreneurial skills through a rigorous and challenging curriculum.

<table>
<thead>
<tr>
<th>Existing objectives</th>
<th>Revised objectives</th>
</tr>
</thead>
<tbody>
<tr>
<td>• To be able to design a product to meet a specific need</td>
<td>• To be able to ‘pivot’ ideas as opposed to ‘improving’ ideas</td>
</tr>
<tr>
<td>• To be able to make usable plans</td>
<td>• To be able to iterate skills and ideas in a variety of contexts</td>
</tr>
<tr>
<td>• To be able to make and use labeled sketches as designs</td>
<td>• To be able to collaborate as a ‘company’ and amalgamate ideas</td>
</tr>
<tr>
<td>• To be able to use simple tools and equipment with some accuracy</td>
<td>• To be able to effectively research specific healthcare products and the science behind them</td>
</tr>
<tr>
<td>• To be able to identify and implement improvements to their designs and products</td>
<td>• To learn about the problems associated with health and healthcare</td>
</tr>
<tr>
<td>• To be able to identify the ways in which products in everyday use meet specific requirements</td>
<td>• To be able to investigate health related issues and existing solutions</td>
</tr>
<tr>
<td>• To target a specific audience through exploratory questions</td>
<td>• To target a specific audience through exploratory questions</td>
</tr>
<tr>
<td>• To find out about the uses of a variety of materials and how these are chosen for specific uses on the basis of their simple properties</td>
<td>• To be able to pitch inventions with confidence</td>
</tr>
</tbody>
</table>

Teachers were responsible for the children’s learning in their classroom while a variety of business personnel from the Accelerator Team supplemented the process. These included:

1. A current inventor in the startup who visited weekly, sharing insights into how to achieve the next step in the invention process.
2. An executive leader of the accelerator who created an ambitious and inspirational meaning to their work.
3. A team of 10 business analysts to critique work at the communication phase.
A critical goal across teachers and accelerator personnel was to create a growth environment that would promote self-regulation through application and experience. Children and staff were trained to understand the new objectives in which they were expected to work and staff were supported so that they could yield control to the children.

The structure immersed the children in the topic, allowing them to develop and master challenging entrepreneurial skills through the embedded formative assessment and expertise, see Table 2.

Table 2: Five “key strategies” of formative assessment (Leahy et al., 2005)

During the first day, teams were formed consisting of no more than 5 children; teachers intervened only where necessary, with subtle consideration given to academic ability. The children were reminded of the International Primary Curriculum learning goals and how they relate to entrepreneurism. These included: communication, resilience, adaptability, cooperation, morality, respect, enquiry, and thoughtfulness. The learning journey from the entry point to the exit point was split into four phases, each phase building on the previous phase’s achievements giving the immersion program a definable structure.

**Phase 1-Challenge and Entry Point**
Prior to the partnership, children were questioned by teachers about inventions and healthcare solutions. Health related solutions were chosen for this particular partnership as the partnering accelerator was the TMCx, which specializes in life science and healthcare innovations. The definition of an accelerator was taught by scribing the differences between the Texas Medical Center (TMC) and its accelerator; a new concept to both children and staff.

After clarifying the partnership, the children were set the challenge of identifying a healthcare problem and inventing a solution. Children sketched anatomically correct human bodies before identifying health problems that were related to individual parts.

**Phase 2-Accelerator Intervention**
A current entrepreneur from the TMCx was introduced to the children during the second week of the topic. Weekly visits were used to introduce specific techniques and skillful questioning was used at an appropriate level of challenge aimed at accelerating the children’s thinking. Effective, frequent communication ensured the next necessary teaching points and entrepreneurial lessons from the external visitors were appropriate to the learning. Clear learning intentions were shared with the children in a variety of forms, including questions and statements, before each weekly visit. Weekly session themes included: interviewing, shaping ideas, and communicating ideas. The entrepreneur taught the children specific skills and concepts around these themes. The entrepreneur presented the concept of shaping their ideas using an iterative process during the first visit, see Figure 1.

Figure 1. The iterative process for shaping an idea.

The children were led through the iterative process via a series of open and closed questions displayed on an interactive whiteboard. Existing inventions were introduced and visual prompts identified the innovation behind two commonly used items: the plaster and the water bottle case. The entrepreneur identified the problem, and demonstrated the process required to arrive at a solution. The process of shaping an idea was tangibly demonstrated by manipulating a malleable piece of playdough from a ball into a person. Forming each limb and the head was analogous to the response of each probing question, which shaped and created the final form. The 80 children involved in the demonstration were encouraged to refer to these prompts throughout the hour long session.

The children understood that the process was a cycle and that non-viable solutions would result in a pivot; a term introduced by the entrepreneur meaning ‘change strategic direction’. Classes were allotted time with the entrepreneur to iterate the process until they felt confident enough
to apply the process independently. Visual prompts, such as questions, were replicated in each classroom to consolidate learning.

During the second week, a research technique, based on the ‘Lean Start Up’ (Ries, 2011) and LaunchPad method (LaunchPad) was used. Critical thinking techniques, via a deep-dive questioning strategy, encouraged the children to think about their invention from a number of different perspectives. All of the children involved were required to interview “customers” in their inventive process. Year 6 at the school was used, although any school year would be valuable. The children composed 10 exploratory questions. The interview session lasted 40 minutes and specific invention ideas were not mentioned or discussed. Children conducted their interviews in a productive, serious manner. Their choices for recording the answers included, a journal, paper later organized into a folder, or directly onto their initial draft. Teacher’s modeled analyzing data during a daily session prior to the analysis. Results were analyzed by the children and required them to think critically about continually modifying preconceived ideas and suiting the needs of a consumer.

Teams delegated mini tasks and used findings of their research as feedback. Research techniques used included: effectiveness of materials, the impact an illness can have on lifestyle, healing time, the healthcare problem, competitors, and gaining more knowledge and understanding of the area. The children were taught to research by using search engines and reference books in the school library.

A visit from a C-level executive from TMC who was also a successful entrepreneur was used to set the scene for phase 3. His 90 minute visit added gravitas to the experience by explaining his success, providing valuable tips and raising the profile of the final pitch. During the visit, incentives were added such as pitching to a panel of expert judges from esteemed Universities, leading healthcare executives and business analysts. The executive asked questions about each team’s invention and raised the importance of being able to communicate their invention as an entrepreneur. He gave equal importance to each team and gave honest feedback about the inventions.

**Phase 3-Communicating the invention**
A pitch and showcase with a display and model were created with the goals of communicating their invention and its development in a concise manner.

**Visual Communication**
Children used their final design to make a model of a prototype. The children were shown how current entrepreneurs showcased their inventions on current television shows such as UK based Dragon’s Den and USA based Shark Tank. Children followed their design brief and specification for a period that spanned over 2 weeks. Some of the teams made lists and gathered required materials, while other teams assigned ‘resource monitor’ roles to members of the team. These roles appeared to be fluid and changed daily without disruption or disagreement. Teams were allotted 2 hours a day for model making and could decide when
and how they would like to use their 2 hours. For example, some teams worked on the verbal communication aspect discussed below, whilst others made models or started their tri boards.

**Verbal Communication**
The teams wrote a 2 minute pitch that involved every member of the team. The pitches were written against a set of success criteria class, and equal participation was required. The criteria included:

- I can state my team’s opinion by making strong points
- I can use a new line when a new member of my team is speaking
- I can back up my opinion with evidence of consumer needs
- I can use statistics as evidence
- I can use conjunctions such as therefore, furthermore, although, to add extra information
- I can use exciting vocabulary to make the judges want to invest in our invention
- I will include a convincing conclusion

Team members individually wrote their pitch in the form of a play script before valuing aspects of each other’s ideas and filtering any unnecessary statements to collaborate their ideas into a final draft. The teams used previously taught proof reading and editing skills to add further justified edits. Teachers proofread finished drafts.

A series of practice and feedback sessions occurred to help the children refine their pitches. The entrepreneur gave individual feedback to each team relating to pace, body language, pitch content and relevance. Eight business analysts from TMCx and 2 local University accelerators (Rice University and the University of Houston) came to the school for 2 hours. This helped with pitching and questioning techniques as well as providing the children with the opportunity to practice in front of many different, unfamiliar people. Analysts were assigned to specific teams so that on the final pitching day, they could help put the children at ease.

The external pitch feedback sessions with the entrepreneur and TMCx business analysts facilitated direction and confidence as they helped teams to refine their pitches and strategically plan action for public speaking. Feedback followed the following structure:

1) Clarifying the team’s intentions.
2) Valuing aspects of the pitch that worked really well.
3) Stating any concerns and need for improvement.
4) Suggesting ways of making improvements to pitch content, body language, inclusion of statistics, interaction with the audience, ability to answer questions about their invention and techniques for improving confidence.

Individuals were assigned to different companies to provide expert guidance relating to pitch content, relevance and performance. The accelerator organized a rotational pitch practice
carousel. One team pitched, another team acted as the audience and the final team acted upon feedback in order to polish their pitch before repeating the process. The children were impeccably behaved, engaged and self-regulated. Teachers monitored, observed and learnt strategic planning techniques from the accelerator, so that they could repeat techniques prior to the main event.

Additional pitch practice included the children pitching in different locations to different objects such as flowers, teddies, TV, mirrors, walls and benches. A competition was set up for the most ‘extreme’ pitch. Children sent videos and pictures into school as evidence of them practicing their pitch in different ways. These included swimming pools, trampolines, video blogs, visits, practice to family pets and zip lines. This technique was used to practice the pitch in variable settings so the new environment in phase 4 would still feel comfortable. It was also used to instill confidence in the children, develop their ability to memorize a script and deliver their pitch effectively.

Written communication
Tri boards were made to display the 8 week learning journey so that information could be shared without explanation. A generic list of criteria for the tri boards was agreed upon as a guide. The list included: technology, photographs, final design, executive summary, pivoting. The children were provided with an example of an executive summary written by the entrepreneur from the accelerator before writing their own. The short document communicated their invention through explanations of the main features and benefits of their invention as well as information about their team. As well as displaying the executive summary, hypothetical investor questions were prepared to enable teams to summarize their inventions in a concise manner, allowing them to rapidly acquaint people with their invention.

Phase 4-The Main Event.
A pitch and showcase event with esteemed judges from the TMC and local businesses occurred at the TMCx building in Houston on June 23rd 2015. Parents and other distinguished guests attended with an audience of over 200 people. Each team pitched their invention on stage to the judges. The pitches were 2 minutes long and therefore had to be both convincing and powerful in a succinct manner. The judges asked 1 or 2 questions to the team on stage after the pitch. Teams also showcased their inventions with a display and model on their own display table situated around the auditorium. Name badges for each child and team names on each table set the scene for a grand event rich in gravitas as they described and demonstrated their inventions to passersby. Teams were judged on pitch and showcase presentations as part of a set of criteria. Trophies for specific entrepreneurial categories were awarded: Most Innovative, Quickest to Market, Best Pitch, Best Prototype, Biggest impact. The executive presented medals to every child to celebrate commitment, dedication and effort. A celebratory private lunch with the accelerator executives and staff was provided as well as goody bags containing personalized memorabilia from TMCx.
Impact

Phase 1
Written responses that elicited prior knowledge varied, they lacked understanding of the topic and all had a common theme. The majority mentioned a specific inventor, a specific invention or an opinion about inventions. While sketching and mind mapping as a team, the children discussed what they deemed to be the best solution and were able to arrive at an end point in less than 60 minutes. The outcomes of the initial designs were cartoon-like and included various parts of machinery such as drills, robotic arms or buttons. Sketches consisted of multiple buttons and gadgets that were robotic in appearance. A number of the teams labeled their designs, but labels mostly referred to generic materials such as plastic, wood and metal or devices such as buttons, handles and helmets. Captions on the initial designs were vague, provided little explanation and predominantly referred to individual parts without comments about their function. Solutions that were produced as a result were impractical, over complicated and unrealistic. When asked to set some personal, team goals, many children set individual goals often unrelated to the topic, these included “trying their best”, “helping one another”, “making writing neat”, “listening” and “designing the best invention”, with little consideration given to costing, solutions that already exist, marketability or working as a company.

Challenges. Conversations observed during Phase 1 consisted of children discussing with one other child or talking in parallel to each other.

Obstacles. Generally, children had not recognized their own strengths to contribute to the project.

Criticism. Many of the initial inventions were mechanical, although the children had a limited understanding of what the mechanisms were or how they worked. When questioned, basic responses included children stating how the metal or mechanical part would fix the problem through movement. When critiqued, the children were polite, but expressed a strong desire to submit their first design as a final solution and saw no scope for improvement. Conversations lacked knowledge about health care. Assumptions and misconceptions made by the children regarding specific illness and individuals refused to take accountability for their chosen solution. Many children lacked independence and sought an adult to reassure and question them before questioning members of their own team.

Success. The majority of children exhibited frustration during this initial stage and struggled to negotiate with each other. Many conversations were competitive, in the first person and egotistical. When questioned by teachers about their first ideas, the children fought to be heard; which resulted in children failing to respect each other’s opinions. Children became deflated and displayed this in different ways; some children withdrew from team discussion, refused to participate, cried and made many negative comments. Individuals displaying these behaviors rarely participated in discussion with other individuals and refused to initiate
discussion. Many of the teams sketched individual drafts of their ideas and did not work collaboratively. As a consequence disagreements surfaced between individuals.

**Phase 2 - The iterative process**

At the beginning of this phase the children were talking about their inventions in a vague context with little entrepreneurial terminology, knowledge or understanding. Many teams gave generic answers referring to people as a whole rather than individuals experiencing specific health problems. The children were able to answer closed questions such as ‘What is it?’ with ease, but challenges were encountered when responding to open questions in the context of inventions. This was addressed through consolidating and reinforcing the iterative process.

Captions and labels continued to lack depth and minimal consideration was being given to materials. Two weeks later, they were no longer using generic terminology, instead accurate scientific phrases were used to communicate between individuals. For example, in one team the children were discussing the central nervous system, the function of nerves and motor control. In comparison to early designs, the children now talked about properties of materials, the cost of material, suitable mechanisms and whether or not their research focused on their specific problem.

**Challenges.** Thinking was challenged through discussion about how their invention could have an impact on the world. Some teams deliberated over how they could modify their ideas when they had multiple ideas on the paper. Teams interacted simultaneously and then decided to merge their ideas into a third draft. The iterative process was providing the framework for subdued children began to take an active role in contributing ideas. Resilience was resonating throughout the teams as they supported each other through assistance towards their end goal. Rather than becoming frustrated by the concept of pivoting, they were observing and questioning aspects of their learning. Failure was embraced socially and academically as they confronted the challenge.

**Obstacles.** The majority of children established how they could use interview responses to improve their invention and many pivoted. Discussion centered on the impracticalities of how their initial ideas took place in many of the teams. A number of the children became angry, deflated and defensive about reverting back to the start of the process. Similar behaviors seen in Phase 1 presented themselves while others embraced change by adding to their previous sketches or starting over again. Many of the designs were highly focused on consumer needs, but further research into design detail was needed for progression.

**Effort.** Children showed initiative by pairing with their peers, translating language, creating visual pictures, modifying initial designs and requesting adult guidance. Teachers explained terminology before progressing with their interviews. Children were iterating the process independently by using techniques such as splitting from the team and then rejoining to share their knowledge. As many healthcare solutions already existed for their chosen problem,
children found the need to investigate illness further. The children established early a lack of knowledge about the cause and its effect of illness on the self and the physical human body. Every child was motivated, showed increased persistence when carrying out their task and was fully engaged in their research.

Criticism. The children questioned each other as well as the entrepreneur about their inventions. Eagerness and intrinsic motivation were expressed by inviting the entrepreneur to see their first drafts. Teams took ownership of their ideas. Initial ideas were modified and most teams generated an abundance of independent ideas. They then began to learn cooperatively to amalgamate their ideas. Withdrawal behavior was replaced by individual children taking an active role in suggesting ways to merge ideas. A larger percentage of the children involved were beginning to respond to and act upon feedback immediately. They were receptive and immediately accepted advice from an expert. Teachers witnessed children debating over new terminology such as the comparison between invention and innovation. Rather than arguing, becoming frustrated and competitive, children arrived at the solution by enquiry. Although support was needed when shaping ideas, the children made criticisms of their initial ideas and identified a need for improvement. They identified next steps in a positive manner and implemented taught skills by drafting and re-drafting solutions.

Success. The children began to collaborate and converse in the second and third person when improving their initial thought processes by pivoting. They accepted advice from other teams and valued other perspectives. Children that had refused to cooperate or listen to ideas were equally participating in discussion about how to pivot. Some of the more confident, natural leaders in the teams delegated roles by identifying strengths and weaknesses within the team while working hard to find success. Children collaboratively mind mapped physical effects related to their invention and their idea was furthered by considering the social and emotional impact of illness on the human body.

The majority of children used effective strategies to set achievable goals for their teams. The children were less competitive, motivated and managed their time effectively. Members were aware that every team member needed to persist in order for the whole team to succeed. Ideas were enhanced by evaluating their own work as well as self-monitoring progress at a sensible pace. Some of the children became overwhelmed with the amount of existing healthcare solutions, however, most children realized how competitive the market is and were driven to not only improve existing solutions, but improve them in an efficient, organized manner. Various resources were brought from the home setting, as well as being created by their self-initiated research.

Children praised each other’s progress and made suggestions for improving elements of their invention. The potential of using elements from existing solutions was considered and suggestions were made about how to produce more effective designs.
The pace of the teams’ progress varied as each team shaped their ideas. Some teams finalized designs while other teams encountered logistical difficulties. Teams welcomed the idea of taking risks to overcome these difficulties by preparing ways of moving forward. They supported each other through the process and encouraged each other consistently. The children began to take pride and ownership of their inventions and mind mapped other possible solutions independently. During the final stages of Phase 2, most of the teams were working cooperatively and recognized the potential of themselves, others and their designs. Specific teams were able to talk with confidence and could answer questions succinctly.

Examples of team specific learning:

1. During week 4, through self-regulated research, one of the teams discovered that their invention already existed. Instead of displaying negative behavior, the children showed resilience and agreed upon a solution to their new problem. Two members of the team immediately thought back to the iterative model, and used the skill of iteration. Consequently, after four weeks the team was independently using entrepreneurial techniques.

2. A team that had invented a mask to prevent nose bleeds discussed the benefits of using synthetic polymers inside the mask. They used the current vocabulary, but also gave a definition of the words by directing peers and teachers to the original research source. When further questioned, team members confidently demonstrated their new learning by cutting open a baby’s nappy (diaper). They were able to disseminate new knowledge to a wider audience.

3. A team of children that had developed a mobile to monitor a baby’s health had daily conversations about equations and combinations, whilst another team discussed the spatial slider mechanism used to retract wheels in an airplane. They were overcoming obstacles without becoming frustrated and negotiating by applying and understanding an extensive new vocabulary. They were fully immersed in their learning. The children had employed the techniques introduced by the accelerator and they understood, fully, the ambitious aim of producing high quality innovative solutions.

Phase 3

When mind mapping success criteria with the intention of writing an investor pitch, it was evident that the children’s ideas were inhibited by their experiences with marketing media. Children were shown clips of current entrepreneurial television programs and quickly began to focus on the financial aspect of entrepreneurship. Initial discussions were heavily focused on how much revenue their invention would generate. The entrepreneur intervened at this point and used a strategy that modeled how to pitch the unique features of innovation, the impact the invention would have on the world, the statistics behind the research, the amount of market research involved in the iterative process and the effectiveness of the company.
**Challenges.** Even though the children were faced with challenges when creating models, they regulated actions towards the end goal by referencing previous briefs, setbacks, drafts and research. Many teams used their design brief to identify their key aims by underlining key words.

**Obstacles.** A trial and error approach was taken when using various materials. Many of the teams discussed materials that would be suitable for the model, considering mechanisms that marketable products require. When parts of their models appeared to be defective, teams worked as a production line using iterative strategies in a self-regulated manner.

The pitches could be assessed against the success criteria previously agreed upon, however, the pitches represented commercial advertisements and a huge proportion of the children lacked confidence and language capability when speaking in front of an audience. Accountability fell upon the children with better proficiency in English, children who could confidently talk in a new context, children who could engage their audience with appropriate body language and children that speak in a suitable tone of voice.

**Effort.** Initiative was taken to create a working prototype and, unlike behaviors seen during Phase 1, children worked with impetus and dedication. Quiet, focused teams discussed strategies that would enable them to improve their pitching skills. Interestingly, the team of children that had been given the most praise during the executive visit, lacked effort and were less accepting of feedback. They listened, were polite, but made minimal improvements to their final pitch.

**Criticism.** Traits of withdrawal reappeared in the less confident children. They rounded their shoulders, were distracted by the responses of others and became upset. The children compared themselves to the more confident speakers. When the more confident speakers presented in front of the class, less confident children either became uninterested, fixated on the confidence of other children or commented about other children’s superiority.

**Success.** Children showed compassion and empathy and did not let failure define them. The iterative process needed to be followed regularly and children directed each other to overcome barriers. For example, a team inventing a baby monitor was hindered by factors such as the weight and angle of the toys suspended from the frame of their model. The team took the initiative to destroy the first attempt and start again. The destruction of their model was undertaken in a positive, productive manner. They worked cooperatively and collaboratively to improve and they had evidently learnt from previous mistakes.

Teachers observed the children muttering to themselves during independent time, standing and talking to rubbish bins, walls and doors. One teacher observed that she walked past the children’s bathroom at playtime and could hear a child practicing to the mirror. Other children were present; however, the child was unconcerned. More importantly, the child could be heard speaking with confidence and correct intonation from the corridor. The children were choosing
to practice their pitches independently with dedication, shown via self-initiated, regulated practice.

**Phase 4**

The final event was an impressive display of 7 and 8 year old’s inventions and communication. None of the 22 teams faltered and they performed at their best during the pitches and for the judge’s questions. Most importantly, the children experienced sense of success because of their achievements and experiences. They were amazed at what they had produced and their ability to present confidently. They also understood the value of specialist support and challenge in this whole process. The end of this specific TMCx journey occurred June 2015 but the continuation of their lifelong learning journey continues using these new found skills and knowledge.

**Conclusion**

The immersion of entrepreneurism in primary education through a partnership with an accelerator maximized learning and growth. The final display and work achieved reached a level far beyond their years, and critical thinking, failure resilience, self-regulation, and team cooperation were all dramatically improved for all children. This is in stark contrast to the asymmetry in performance between the top and bottom 10 percent of pupils (Wiliam, 2007), and also the asymmetry witnessed at the beginning of the curriculum. Excelling beyond age group expectations can be viewed within the self-actualization context as more of the children’s potential was realized through this curriculum. The two key features of the curriculum: immersion and partnership with an accelerator, were critical for this success.

The immersion training fostered ownership of the project for the children and enabled deeper thought and analysis as they worked through long, uninterrupted learning periods without additional learning obligations. The immersive environment also meant there was little opportunity for challenge or obstacle avoidance, accelerating the process of facing failure.

The partnership with the accelerator provided external accountability for the children. However, it was the expert teaching the accelerator provided that proved invaluable for guiding the children as they experienced inevitable failures and provided a role model for how the consequences of failure can be minimal or minimized (Shank & Neaman, 2001). An innovation accelerator is well versed in challenges, obstacles and the skills necessary to persevere through failure. These are the daily struggles of entrepreneurs. An entrepreneurism curriculum, where children invent their own solutions in an iterative manner, provides the environment of repeated failures, consequently, resilience to failure is indirectly learned and self-actualization is facilitated.

Indeed, the resilience to failure was a dramatic observation of the children in the present curriculum. The children’s mindset can be further broken into Dweck’s mindsets throughout the phases of the curriculum. Traits of the two mindsets, fixed and growth, heavily influenced
the children’s journey towards self-actualization during the immersion curriculum. Traits of a fixed mindset were apparent in many of the children in phase 1 and early phase 2, see Figure 2. Challenges were avoided with lack of participation and ownership, obstacles were viewed as failure, competitiveness and negative responses to feedback were common.

In contrast, more children than anticipated displayed traits of a growth mindset by phase 4. By phases 2-4, the children were independent and happily talked about feeling self-motivated; they were self-regulated (Butler and Winne 1995), and were able to monitor, direct, and regulate actions towards the end goal by acquiring knowledge, expertise, and self-improvement (Paris & Paris 2001). The majority of children were embracing challenge and viewed failure as an opportunity to learn, a part of the iterative process.

Another critical part of Dweck’s mindset model is how failure is managed in the context of others. Throughout Phase 1 and 2, team dynamics changed. In the initial stages it was apparent that some children were addressing self-esteem issues, whilst others were consolidating trust and friendships within the team. By the end of Phase 3, the children displayed deep friendship bonds and positive interdependence (Johnson, Johnson & Holubec, 1998). Many of the children gave empathetic responses when others found things challenging. They praised the process strategies that their peers were using and iterated learning from failure. Compassion had developed in the vast majority of the teams. Conversations in the first person shifted to the second and third person, and children saw value in their collaborative efforts. Children were feeling accepted by their peers and through self-evaluation, had a sense of academic affirmation.

Overall, those with the growth mindset found success in doing their best, in learning and improving (Dweck, 2008). Challenges were embraced, collaboration and feedback was sought and ownership was strong. With the right mindset and the right teaching the children realized their potential (Dweck, 2008). In fact, the curriculum also influenced the teaching staff as their
assessment were also in terms of growth. A fixed assessment was not possible within this
curriculum and thereby, automatically encouraged teachers to implement the growth learning
concept (Vygotsky, 1978). As a result the children experienced a dynamic and beneficial
learning environment where at each point of the child’s learning the teacher had to make
an instant assessment, which then led to the next learning point for the child. That in turn led
to the next creative solution to the problem and still more learning. Communication between
the accelerator point and teachers was critical for maximizing this effect and the subsequent
learning.

Together, the partnership and immersive techniques created a powerful, tailored curriculum
that empowered the children to be experts of their invention. It positioned the children as
enquirers, developing entrepreneurial expertise. They were entrepreneurs, learning in a
purposeful context through trialing methods that would lead them to success (Donaldson,
1979). What was evident however, was the children’s uninhibited creativity, flare and passion
for the topic. Through immersive curriculum in partnership with an accelerator the spirit of
entrepreneurship can be instilled from an early age, helping children reach a growth mindset to
achieve self-actualization.

Still Standing: Documenting the History of the Bilingual/ESL Teacher Preparation Program at Arizona State University

**Topic Area.** ESL/TESL and Teacher Education

**Presentation format.** Paper Session

**Description.** This presentation will share a portion of a larger project currently documenting the history of the Bilingual Education (BLE) and English as a Second Language (ESL) teacher education program at Arizona State University from its inception in the 1980’s to its current form. Using interview data of founders of the program as well as archival materials, we will share our findings through a digital timeline that is being used to archive the program’s history.

**Introduction**

As a nation it is crucial that a high quality public education is provided for English language learners (ELLs) in schools. Students whose primary language is not English have been a part of the education landscape in the U.S. since the nation's earliest days (Crawford, 2004; Duran, 2008; Jimenez, Garcia, & Pearson, 1995; Lee & Luykx, 2005; Vaughn et al., 2006). Although American teachers have always had ELLs in their classrooms (even though students were not always labeled as such), the population of ELLs in schools has been increasing steadily
for the last three decades (Shin & Kominski, 2010). From 1994 to 2010, the percentage of ELLs in the U.S. grew over 63% and has grown steadily since then (National Clearinghouse for English Language Acquisition, 2011). Overall, the population of non-English speaking people also has increased. According to recent census data, nearly 40 million people, or 13% of the total population, are foreign born and nearly 20% of the U.S. population report that they do not speak English well (Shin & Kominski, 2010). These data have important implications for schools and, consequently, for teacher education programs that prepare teachers who will meet the needs of this growing population of students and their families. At present, one in four children in the U.S. come from immigrant families and speaks a language other than English when they go home (Mather, 2009). This number is projected to increase to one in three by 2060 (U.S. Census Bureau, 2012). Roughly half of the nation’s language minority student population is in the process of learning the English language and, therefore, considered as ELLs.

The U.S. Department of Education (2014) has identified shortages in Arizona of teachers with endorsements in English as a second language (ESL) or bilingual education (BLE). This is of great concern. Currently, Arizona teachers may pursue specialized endorsements in bilingual education, teaching English as a second language, or structured English immersion (SEI). Arizona State University's Mary Lou Fulton Teachers College (MLFTC) is one of the largest teacher preparation programs in the country and is the largest preparation program in the state, graduating approximately 1,500 new teachers each year. It is situated in a state where ELLs are among those with the poorest achievement outcomes (CDF, 2013; Annie E. Casey Foundation, 2013; U.S. Department of Education, 2014). Currently, MLFTC graduates only 25 to 28 teachers per year-with BLE/ESL endorsements, representing less than 2% of our annual graduates.
The Current BLE/ESL Teacher Preparation Program

The BLE/ESL teacher preparation program in MLFTC at Arizona State University leads to a K-8 teaching credential plus a BLE or ESL endorsement from the state. The program includes 30 credit hours of English language education coursework in foundations and methods of teaching English learners in addition to coursework common to all teacher preparation programs at the college. To fulfill the state’s requirements, the coursework includes the following:

- 3 credit hours of foundations of instruction for non-English-language-background students
- 3 hours of ESL methods
- 3 hours of teaching reading and writing to limited-English-proficient students
- 3 hours of assessment of limited-English-proficient students
- 3 hours of linguistics
- 3 hours of courses dealing with school, community, and family culture and parental involvement in programs of instruction for non-English-language-background students

Students also take 15 credit hours of field experience and student teaching in ESL or Bilingual classrooms. Beyond the teacher preparation coursework, students receiving an ESL endorsement take 6 credit hours of a foreign language, while those receiving a BLE endorsement must pass a state language proficiency exam.

In the past twenty years, MLFTC at Arizona State University has seen numerous reorganizations and consolidations that have affected teacher education programs differently. This presentation will share a portion of a larger project that is currently documenting the history of the Bilingual Education (BLE) and English as a Second Language (ESL) teacher education program at MLFTC from its inception in the 1980’s to its current form. Due to the various transitions, there is a dearth of archival materials documenting the establishment of the BLE/ESL
program and the various programmatic decisions and program implementation that have shaped the program’s current structures. Through the use of focus group and individual interview data of founders of the program as well as an analysis of archival materials, the history of the program is being systematically documented. In this conference proceeding, we lay the foundation for understanding of where the program stands today. In subsequent writings, we will document the history of the program using a variety of artifacts and interview data. Despite Arizona’s controversial English-only policies regarding the education of English language learners, the BLE/ESL teacher preparation program at Arizona State University is still standing and continues to contribute significantly to the preparation of teachers in Arizona.

Providing a Context

Prior to 2009, Arizona State University (ASU) maintained three schools/colleges of education: the College of Education (later named Mary Lou Fulton College of Education) at the Tempe campus, the College of Teacher Education and Leadership (CTEL) on the West campus, and the School of Educational Innovation and Teacher Preparation on the Polytechnic campus. A major reorganization of the education programs at ASU occurred in May of 2009. As this point, the Mary Lou Fulton College of Education, which was ASU's original College of Education, became the Mary Lou Fulton Institute and Graduate School of Education. This new school focused exclusively on graduate-level programs and research. All teacher preparation degree programs (including all undergraduate education programs) were consolidated into the College of Teacher Education and Leadership (CTEL). A year later, in May 2010, these remaining two education colleges were merged into the Mary Lou Fulton Teachers College, which now administers all graduate and undergraduate. We have begun documenting this history using a timeline and through digital storymapping that will be shared with participants at the conference.
Positionality

The concept of positionality first emerged from the geographical sciences (Sack, 1974), and it has had many reiterations. Positionality as it relates to the politics of knowledge construction was later developed (England, 1994; Rose, 1997). McDowell (1992) wrote that researchers must especially take account of their own position in relation to the research participants and research setting. More specifically, the reconstructing of insider/outsider status in terms of one’s positionality in respect of education, class, race, gender, culture and other factors, offer us better tools for understanding the dynamics of researching within and across one’s culture (England, 1994; Merriam et al., 2001; Rose, 1997). As Lave & Wenger (1991) note, positionality allows for a narrative placement for researcher objectivity and subjectivity whereby the researcher is situated within the many aspects of perspective and positionality. This often serves to inform a research study rather than to invalidate it as biased or contaminated by personal perspectives and social or political viewpoints (Merriam et al., 2001).

As researchers, it is important to acknowledge our own positionality in the research reported in this proceeding paper. Dr. Margarita Jimenez-Silva joined faculty at ASU in 2005. She was originally hired by the College of Teacher Leadership and at the West Campus. Her involvement with the BLE/ESL program was very limited until 2010 when she invited to work with colleagues across the other colleges and inform the BLE/ESL program. After receiving tenure in 2012, she began to teach in the program and became program coordinator. She has continued in this role to the present time.

Dr. Dawn Lambson became a full time faculty at ASU in 2007 and was predominantly hired to teach literacy/biliteracy courses in the BLE/ESL (MLMC at the time) program. She did her doctoral studies in Language and Literacy with an emphasis on Reading and ESL at ASU.
where she studied and worked as a teaching and research assistant with senior faculty who had established the program several years before. In 2009, Dr. Lambson became program coordinator for the BLE/ESL program, assuming the position just prior to the time when all three colleges of education at ASU were reorganized under one administration. She held the position until 2011. During that time, the program went through several name changes and multiple transitions as the college worked to consolidate and revise all of the teacher certification program and revise program major maps.

**History of BLE/ESL**

**Beginnings**

In our efforts to document the history of the BLE/ESL, we contacted various faculty members that had been instrumental in the BLE/ESL program as far back as we could recall. We are in the process of transcribing data from several faculty who worked in the program in the 1980s. This data will be shared in the full paper and presentation at the conference.

**From the Reorganization in 2009 to 2011**

With the reorganization of Arizona State University’s Colleges of Education in 2009, the BLE programs at all three campuses were combined. At the time, the Multilingual Multicultural (MLMC) Program on Tempe campus was the most robust of the three. The program at ASU Polytechnique Campus was very small and almost nonexistent as a separate program. Similarly, the program at ASU West Campus, while more organized and distinct than at Poly Campus, was somewhat integrated into the regular elementary education program with students taking many of their courses with regular education students. At Tempe, the program, was distinct and separate. While smaller than other teacher certification programs in student enrollment, the MLMC Program was recognized as an independent teacher certification program in the college, mainly
as a result of faculty investment and the strong support it had received from senior faculty for a number of years.

At the time of the reorganization, the program in Tempe had a new coordinator, Dr. Dawn Lambson, who had just recently assumed the position. Dr. Lambson held the position as coordinator for two years during which time the program went through a number of significant changes.

**Faculty Role and Support**

The reorganization of the colleges of education led to an upheaval in the ranks of faculty across the three colleges. Many senior faculty, unhappy with the changes taking place, ended up leaving the college or retiring, bringing about a change in the dynamics and role that faculty played in the BLE Program. Whereas before the reorganization, there was a core group of course instructors, junior faculty, and senior faculty, including the interim dean of the college in Tempe, who met in monthly program meetings to make decision about student enrollment, course offerings, curriculum, recruitment, etc., this group changed considerably. While a core of people continued to meet monthly to discuss the program, the aim of the meetings turned more to disseminating information about the changes being implemented than about the program itself, its vision and direction. Meetings were now held virtually to include faculty from across the campuses, and much of the work of the meetings revolved around ensuring that faculty on all campuses were up to speed on program changes being determined not by the group itself, but by a select task force given the job of reorganizing the program and creating a new major map outlining courses and program requirements for the degree.

**Role of the Coordinator**

Another change during this time affecting faculty, students, and the program itself was that the
hiring of course instructors became a shared task between administration at the division level and the program coordinator. Whereas in the past, the program coordinator was responsible for staffing all courses offered by the program, under the new system, the coordinator’s role was more consultative, often leading to situations where some instructors teaching ESL or BLE courses did not have strong theoretical background or quality teaching experience in ESL or BLE education. Additionally, there was little agency by the coordinator to select instructors who shared the same vision and commitment to English learner education.

**Student Enrollment:**

In the year prior to the reorganization, the number of students enrolled in the program had declined considerably. Previously, the program had two cohorts of new students each year, one in fall with 25 to 30 new students, and a smaller cohort in spring with 18 to 22 students. The drop in enrollment in the MLMC program during this time was thought to be related to the political climate of the state in recent years. In 2000, a state initiative, Proposition 203, was passed, restricting English learners to English-only classrooms. The state further adopted Structured English Immersion as the mandated program for educating English learners in 2007 and required that all educators in the state have 90 seat hours (6 credit hours) of SEI training leading to an SEI endorsement for all teachers. While teachers working with English learners before Prop 203 generally had a full English as a Second Language (ESL) or Bilingual Education (BLE) endorsement (18 credit hours of coursework), teachers now needed only the 6 hours of SEI to be considered qualified by the state to teach English learners. Moreover, it was found that some school principals were only concerned that perspective teachers have the mandated 6 hours of SEI training and even rejected more qualified teachers who had an ESL endorsement if they did not also have the SEI endorsement. In this dismissive climate, there was much
confusion and misunderstanding about the value and need for teachers to have a full ESL or BLE endorsement. Recruiting students for the program became more aggressive and extensive and required meeting with college faculty and student services staff to “educate” them about the program, its aims, and requirements. We also engaged former and current students to recruit, having them visit classrooms in the college to talk about the program and their experiences in it.

To Be Continued

In the full paper, we will provide an update to the history of the BLE/ESL program that we have been gathering. Artifacts, a digital storymap, and a digital timeline are being constructed to share that story. At the present time, there is no systematically documented story of the program and as faculty members retire, the institutional history of the program is being lost. This attempt to document the history of the BLE/ESL program will help ensure that the original vision and goals of the program will remain true.

Abstract:

In Education, where monetary gain is not the main motivation, large amounts of technologies and services are provided and used, but how institution administrators decide to acquire those products and services is in question. The risk of making the wrong decision can literally cost students their education. Williamson’s (1973) Transaction Cost Economics (TCE) provides a framework for these decisions. This study used TCE as the lens to analyze the buy or make decision of Western Global University (WGU) for the college’s learning management system (LMS). The study followed along WGU’s evaluation process of the current LMS and two other products/vendors. Through interviews, observations and document analysis, this study analyzed factors within this process via four guiding research questions. Themes were developed to address those questions providing more research for higher education administrators to make better-informed LMS outsourcing decisions. The literature suggests that while sourcing is occurring across education, strategic approaches are still infrequent. In WGU’s case, deciding as a team, time, and both peer acceptance and product difference were assessed as contributors to final outsourcing decisions. Considerations such as functionality, organizational resources, support, product reliability, user experience, relationships and organizational mission were major factors being weighed by various stakeholders. Vendor and institutional values were revealed to be more similar than different, with the priority being on the experience of the faculty with the product and service. However, many questions remain due to the unique nature LMSs and Educational Technology play at institutions versus other Information Technologies.

6. Abstract:
Educating the future STEM workforce is key. Increasing numbers of graduates from STEM majors are struggling with seeking job opportunities, though well trained in their technical fields, having been prepared for research or teaching. These students need more opportunities to enhance their education directly connected to STEM business and industry, and educational institutions need help aligning these areas with students’ subject interests. Since 1997, Keck Graduate Institute (KGI) has been developing innovative graduate programs in several different curricular areas in Applied Life Sciences. KGI was an early innovator in creating a Professional Science Masters (PSM) degree. For example, the curriculum in Master of Bioscience (MBS) at KGI complements professional skills and experiential component courses with basic STEM contents. Students participate in an internship and in an extensive industry Team Master’s Project (TMP) as their final group project, which requires collaborative work with potential employers. This PSM curriculum laid the groundwork for additional STEM education around the country. A Corporate
Advisory Council supports KGI’s successful PSM program, as business, industry, and public agencies seek highly-skilled, well-trained STEM graduates who can contribute immediately to the workplace, and educational leaders are seeking ways to inspire higher quality students to not only attend their programs but also succeed professionally immediately after graduating. In this presentation, we would share our efforts and student outcomes from reshaping Science education to prepare future generations of leaders in the life science fields. Similar approaches would be useful at the undergraduate level or in other areas such as teacher education programs as well where employers are requiring more relevant and immediately applicable training and preparation to the jobs for which they are hiring. Teacher Education in particular is a great example, where credential students who concurrently are seeking Master’s level education both seek specific courses of studies in their areas of interest, such as art, history, science or math, but also require immediately usable skills in the classroom, not just for teaching and learning, but also classroom management, curricular development, academic administration, counseling, and so on, emblematic of a PSM degree, combing specific academic subjects with work preparation. Our presentation will discuss the specific case study of PSM and KGI, but the lessons learned are applicable across disciplines and are in fact the direction of undergraduate, graduate and doctoral-level education today and looking into the future.
Building a Lego EV3 Snake to Improve the STEM Education of 12th Graders in Panama

December 14, 2015

Abstract

The project consisted on building a Lego EV3 Snake to learn mathematical concepts that students learned in traditional classes. A cohort of fifteen students from 12th grade worked with Lego EV3 kits. The use of Lego Mindstorms EV3 did not only allow students to assemble mechanical parts, but also control robot’s movements through the use of Matlab and Simulink. Students developed experiments to control the speed of the snake to slither on a trajectory that contained curves. This allowed them to collect data from distance, time and velocity. At the end, students participated in a competition where their snakes slithered on a curvy path and attacked a target. A marker was placed at the top of the snake head to mark the bullseye on a dart board. The competition consisted of two stages: first, students programmed their snakes to slither in the fastest time possible. Second, the snake that hit the center of the bullseye obtained the highest point. All the collected data regarding distance, time and velocity was analyzed by using mathematical concepts that students learned in 12th grade. Additionally, all the students developed a poster and prepared for a presentation that encompasses the experiments performed in the program and the concepts they learned from the team leaders. The program was held during the two week period October 5th – 16th, 2015 from 2:00 pm to 5:00 pm. Meetings were held at the Technological University of Panama in David, Chiriqui. The meetings were twice per week, 3 hours per day for a total of 12 hours – after the students terminated their regular school days. The program was an after school program. Travel arrangements were made to transport the students from their schools to the Technological University of Panama. The expected outcomes were divided into: (1) the intellectual merit and (2) the broader impact. In intellectual merit, not many studies are conducted on this specific topic; therefore, this study contributed to develop new tools and methodologies, support future dissertation research, enable Arizona State University to be one of the leading research centers in interdisciplinary fields and international collaboration. For broader impact, this project provided a most efficient method to improve the quality of education in developing countries. This brought the possibility to develop new applications that seeks to improve the learning process of mathematics, physics and engineering concepts. This program directly benefited fifteen participants from 12th grade from three different high schools in the David school district: Colegio San Francisco de Asis, Instituto David and Colegio San Agustin. Additionally, this project promoted interest among the younger generation concerning engineering, especially within the Hispanic population which represents a minority in the engineering field.
1 Introduction

The project consisted on building a Lego EV3 Snake to learn mathematical concepts that students learn in traditional classes [6], [8]. A cohort of twenty students from 12th grade worked with the Lego EV3 kits. This Lego EV3 snake was used to showcase robotic prototypes at the DiscoverE Day and the Night of the Open Door at Arizona State University. It attracted a myriad of people, especially little kids. These activities sought after to promote the engineering fields among young students.

The use of Lego Mindstorms EV3 did not only allow students to assemble mechanical parts, but also control robot’s movements through the use of Matlab and Simulink [5]. Students developed experiments to control the speed of the snake to slither on a trajectory that contained curves. This allowed them to collect data from distance, time and velocity. At the end, students participated in a competition where their snakes slithered on a curvy path and attacked a target. A marker was placed at the top of the snake head to mark the bullseye on a dart board. The competition consisted of two stages: first, students programed their snakes to slither in the fastest time possible. Secondly, the snake that hit the center of the bullseye obtained the highest point. All the collected data regarding distance, time and velocity were analyzed by using mathematical concepts that students learned in 12th grade.

Additionally, all the students developed a poster and prepared for a presentation that encompassed the experiments performed in the program and the concepts they learned from the team leaders. We sought to develop an integral program where students not only learned mathematical and engineering concepts, but also develop presentation skills before an audience.

2 Achieved Goals

The emphasis of the proposed engineering enrichment outreach program was engineering, but STEM was given a high priority. Given this, the paramount goals of the proposed outreach program were met and are described as follows:

1. We captured the imaginations of targeted high school program participants by providing the students with a solid understanding of exciting engineering grand challenges and career opportunities, engineering methodologies and hands-on engineering design projects.
2. We showed program participants how to become actively involved in the ongoing and forthcoming engineering revolution.
3. We empowered program participants with some fundamental perspective, skills and tools to motivate them, focus their passion and help them get started toward a career in engineering.
4. We encouraged current and future undergraduate and graduate as well as professionals to become IEEE members in Latin America.

3 Objectives

The completed objectives were achieved and are listed here as follows:

1. We demonstrated the utility of new empowered engineering outreach materials and techniques for high school students everywhere – particularly in Latin America.
2. We demonstrated a program that can be sustained and scaled up across Panama and Latin America.
3. We empowered program participants with skills and tools that enabled them to immediately participate in the ongoing robotics revolution.
4. We demonstrated the importance of school work, academic success, using projects/internships to discover one’s technical passions and participating in professional organizations such as the Micro Air Vehicle Club, Society of Hispanic Professional Engineers (SHPE), and IEEE to promote continued professional development.

4 Dates and Location

The program was held during a two week period of October 5-16, 2015 from 2:00 pm to 5:00 pm. Meetings were held at the Technological University of Panama in David, Chiriqui. The meetings were held twice per week, 3 hours per day for a total of 12 hours – after the students have terminated their regular school days. The proposed program was an after school program. Travel arrangements were made to transport the students from their schools to the Technological University of Panama.

5 Expected Outcomes

We divided the expected research outcomes and outputs in two sections: (1) the intellectual merit and (2) the broader impact.

5.1 Intellectual Merit

Not many studies are conducted on this specific topic; therefore, this study contributed to develop new tools and methodologies, support future dissertation research, enabled Arizona State University to be leading research center in interdisciplinary fields and international collaboration [2], [3] [4].

5.2 Broader Impact

This project provided an efficient method to improve the quality of education in developing countries. This brought the possibility to develop new applications that sought to improve the learning process of mathematics, physics and engineering concepts [9], [11]. This program directly benefited 15 participants from 12th grade from three different high schools in the David school district: Colegio San Francisco de Asis, Colegio Beatriz Miranda de Cabal and Colegio San Agustín. Additionally, this project promoted interest among the younger generation concerning engineering, especially within the Hispanic population which represents a minority in the engineering field [7].

6 Methodology

The program was divided into four sessions of three hours each session. Each participating high school brought five-12th grade student to develop all the activities. Each participating school conformed a different group during the program. All the sessions described the general objective, an overview of the activity, the standards addressed and the major accomplishments, conclusions and future work. All the sessions involved a hands-on approach to reinforce the mathematical concepts learned in traditional classes. A survey was applied before the start of the first session and at the end of the fourth session to measure the students’ perception about Science, Technology, Mathematics and Engineering. Additionally, students were asked to respond questions regarding the use of Simulink and mathematical concepts such as: plotting data, obtaining the equation of a straight line and calculating the probability of an event. A full description of the developed sessions are provided in sections [7] through [10].
7 Session 1 - Building a Lego EV3 Snake

The overall objective of this activity was to build a Lego-based EV3 snake robot. This introduced robotic concepts with a hands-on approach to learning with Lego EV3 kits to twelve graders to be able to understand their functions and capabilities [10].

7.1 Overview of Activity and Approaches Taken

The main goal of this activity was to understand what the Lego EV3 kits were, what can be built and programmed with these devices. Students built a Lego EV3 Snake as provided in the building instructions. This configuration used mechanical Lego parts, three servomotors and an infrared sensor. Through the use of Lego brick students learned how to program the Lego EV3 Snake, so that different tasks could be developed. They learned the basic components that can be connected to the Lego brick such as different sensors and motors to perform different applications in robotics.

Student used an instruction manual to build the Lego EV3 Snake shown in Fig. 1. The instructions were given step by step to provide a clear understanding of how the pieces had to be put together. Also, the manual included figures that indicated where each motor had to be connected to be consistent with the program developed in Simulink. In this session students finished constructing their Lego Snakes to have it ready for the following session when the programming skills were needed.

![Lego EV3 Snake](image)

*Figure 1: Lego EV3 Snake*

7.2 Major Developments, Accomplishments, Conclusions and Future Work

Students learned how to integrate Lego pieces together in order to build a Lego EV3 Snake. Moreover, they verified the correct connection of motors to ensure a proper functioning of the robot. Additionally, they learned the capabilities of the Lego EV3 kits together with Matlab/Simulink. This information was used to control a mobile robot in sessions 2 and 3.

As a future work, we would like to develop other configurations that may allow us to cover more mathematical concepts.
8 Session 2 - Studying algebraic functions with a Lego EV3 Snake

The overall objective of this activity was learning how to program a robot to study a linear algebraic function by calculating the velocity of the Lego EV3 Snake.

8.1 Overview of Activity and Approaches Taken

Students used Simulink to control the Lego EV3 Snake. The wheels of the mobile robot were attached to two motors and were be used to control the robot’s direction.

Some of the standards addressed in this activity included: 1) Domain and co-domain of a function, 2) How to plot in a two dimensional space, 3) Linear algebraic equation, and 4) Equation of a straight line. Students used the following materials: Lego EV3 kit, Wifi nano adapter, USB cable, computer, notebook, pencil, eraser, stopwatch, measuring tape along with the software Matlab and Simulink.

The approach followed by students was to:

1. Build a Simulink model in Fig. 2

2. Measure the diameter “D” of the wheel attached to motor B and introduce this value in the Simulink model.

3. Download the Simulink model on the Lego brick through the Wifi nano adapter.

4. Complete a table increasing the gain value in the Simulink model by 10 units in the power of motor B. This is the domain of the function.

5. Measure the distance traveled at each value with a measuring tape and compare it to the results given by the Scope.

6. Calculate velocity at each step. This will be co-domain of the function.

7. Plot the velocity as a function of the power applied to the snake’s motor.

8. Find the equation of the straight line. (e.g. y=mx+b). Determine the value of the slope “m” and the interception with the y-axis “b”.

9. Determine the maximum, minimum, average and range for the velocity of the Lego Snake.

![Simulink model to control the velocity of the Lego Snake EV3](image)

8.2 Major Developments, Accomplishments, Conclusions and Future Work

Students learned how to program the Lego brick to determine the velocity of the robot. In addition, they plotted the velocity of the Lego Snake and found the equation of a straight line. As future work will involve the use of accelerometers to obtain quadratic functions.
9 Session 3 - Probability of an event

The overall objective of this activity was to study and determine the probability of an event. The standards that were addressed were 1) concept of probability; 2) probability tree diagram.

9.1 Overview of Activity and Approaches Taken

Students used the following materials: Lego EV3 kit, Wifi nano adapter, USB cable, computer, poster paper, markers, Matlab and Simulink. The students used the Lego EV3 to calculate velocity and obtain the equation of a straight line using domain and co-domain concepts.

The approaches that were taken are listed here:

1. Glued a marker on the head of a Lego snake.

2. Placed the body of the Lego EV3 Snake at a distance of 10, 12 and 15 cm, respectively from the bullseye.

3. Applied a power of 20 units for 1 second to the motor and connected to port D. This motor controls the head of the snake.

4. Repeated the experiment ten times at each distance. Counted the number of times that the marker hit each ring. The probability of each event would be determined by dividing the number of times the marker hit each ring over the total number of times.

5. Drew a probability tree diagram based on the results.

6. Used the information given in sessions 2 and 3 to program the robot for the competition.

7. Started preparing the poster for final presentations. A template of the poster was provided in the attachments.

![Figure 3: Probability Tree Diagram of the Snake Hitting Different Rings at the Bullseye](image)

9.2 Major Developments, Accomplishments, Conclusions and Future Work

Students learned how to determine the probability of an event. In addition, they drew a probability tree diagram based on their results. Future work involves the use of an ultrasonic sensor to determine the distance from the head to the bullseye for more accurate reading of the sensor information.
10 Session 4 - Competition and poster Presentation of Completed Work

The overall objective of this activity was to apply the concepts learned in the previous sessions to win the competition. Additionally, students presented their results in a poster in front of students, teachers, professors and their family members.

10.1 Overview of Activity and Approaches Taken

The approaches that were taken are listed here:

1. Tested their Lego EV3 Snake prior the competition.
2. Participated in the competition where the winner whose Lego Snake went through the path in the shortest time and hit the center of the bullseye.
3. Presented their posters in front of an interdisciplinary audience.

Some of the standards addressed in this activity included: 1) Domain and co-domain of a function, 2) Domain and co-domain of a function, 3) Linear algebraic equation, and 4) Equation of a straight line.

Students used the following materials: Lego EV3 kit, Wifi nano adapter, USB cable, computer, Matlab and Simulink.

The students participated in a competition where the Lego EV3 Snake would go through the path shown in Fig. 4 in the shortest time. At the end, the marker placed on the head of the Lego Snake should hit the center of the bullseye. Additionally, students presented their finalized work that encompassed the design and programming of the Lego EV3 Snake. This was important because the students gained understanding on what factors impacted the performance of designing and testing robotic prototypes.

![Figure 4: Path for the Competition](image)

10.2 Major Developments, Accomplishments, Conclusions and Future Work

Students successfully used a hands-on approach to learn different mathematical concepts taught in 12th grade. They applied those concepts to participate in a competition to drive their Lego Snakes through a path with obstacles. At the end of the program, students presented a poster with all the concepts learned in this outreach program. Future work will involve the use of different sensors and configurations to perform more complicated tasks with robots.
11 Results and Discussion

A survey was applied at the beginning and the end of the outreach program. Although we evaluated several ideas about Science, Technology, Engineering and Mathematics (STEM), some of the responses did not significantly change over the two-week period. Some of them included questions such as majors’ interest among students. This result was consistent with what we could expect from a program that does not last longer than two weeks. However, we would like to highlight some of the significant results that we obtained from the outreach program. For example, when students were asked if they knew how to use Simulink, they increased from 27% to 86% as shown in Fig. 5. Many of them had never used Simulink until the program since this is a program that is usually taught at high level college courses.

![I know how to use Simulink](image)

Figure 5: I know how to use Simulink

---

Additionally, students developed experiments to combine the use of a Lego-Snake with mathematical concepts that they learn at 12th grade. When they were asked if they knew how to plot data, they increased from 47% at the beginning of the program to 79% at the end of the program. This shows that the collected data of velocity had a great impact to be able to plot two-dimensional data.

Moreover, students used the velocity data collected from their Lego-Snakes to determine the equation of a straight line. At the beginning of the program 60% of the students knew how to perform this calculation. However, when we finished the program 86% of the students learned how to determine this equation which represents an increase of 26%.

Finally, students performed a repetitive task using a marker located on the top of the snake’s head and a bullseye. They placed the snake at three different distances from the board and tried to hit it ten times. This allowed them to calculate the probability of hitting each of the rings of the bullseye at each specific
distance. Initially 53% of students said that they knew how to calculate the probability of an event; however, this number increased to 71% at the end of the program.

Based on the data collected from the probability event, students were able to draw a probability of a tree diagram. At the beginning, only 27% of students knew how to draw it while 79% of students reported that they learned how to represent a probability of a tree diagram at the end of the program.

12 Conclusion

The results of this study show that the use of a Lego EV3 Snake is beneficial to improve the education in Science, Technology, Education and Mathematics (STEM) of 12th graders in Panama. During the two-weeks program, students demonstrated that their knowledge in mathematical concepts improved by using innovative tools. Some of these concepts involved the use of Simulink, how to graph data, how to obtain the equation of a straight line and calculation of the probability of an event and how to draw tree diagrams. This does not only allow students to improve their high school education, but also makes it attractive by using non-traditional methods to teach math and engineering courses. However, it is important to mention that not all the mathematical concepts learned in 12th grade could not be covered in this program. Therefore, a future work will involved the use of more sensors and different robot configurations to tackle more advanced terms.

13 Acknowledgments

This work was supported by the EPICS in IEEE, under Grant ID. Victoria Serrano. The IRB number approval for this study was STUDY00003133. We greatly thank Dr. Iveth Moreno and the Technological University of Panama, Dr. Rodriguez and Dr. Tskalis for supporting this program.

Abstract

In this study the author investigated 228 preservice teachers’ experiences with a global learning wiki project in an undergraduate educational technology course at a large Midwestern University in the US. The project connected students around the world on a wiki site, participants and their overseas partners posting questions about topics of interest to them and responding to one another’s questions on the site. They collaboratively developed a wiki website filled with information, images, and videos that helped their overseas partners learn about the education practices, school structures, and cultures of their home countries.

Research Objectives

The purpose of the study was to help the instructor understand what students enrolled in the Educational Technology course thought about the global learning project, what they learned, and how they used technology in the project.

Participants

Participants were a total of 228 preservice teachers enrolled in the Educational Technology course from across the disciplines during three semesters volunteered and signed the consent form for this study. In fall 2012 semester 78 students enrolled; in spring 2013 semester, 86; and in fall 2013 semester, 64. Most of them were in their second or third year of study.

Methodology

Participants were asked to complete an online survey with multiple-choice questions and open-ended questions about their learning experience at the end of the project. The multiple-choice questions were used to measure participants’ attitudes toward this project. The open-ended questions provided insight into participants’ learning experience.
Results

Results of the study show that participants were satisfied with the global learning wiki project and the learning outcomes. They not only gained more knowledge about other cultures and became more comfortable working with people in different cultures but were also interested in incorporating global components into their own classrooms one day. However, their responses were mixed about the professional benefits and enhancement of their technology skills. The use of wikis in the project demonstrated a great way to collaborate and work with educators and students in other countries when synchronous face-to-face communication is not feasible.

Abstract

Project Empowerment (pseudonym) is a student support organization in the Office of Multicultural Affairs at a large predominantly White Southern university. The purpose of the organization is to enhance retention among its undergraduate minority male members. This paper examines how being a member of Project Empowerment fosters the academic persistence of two Black male members. A qualitative research approach was employed to examine the factors that participants perceived as critical to their persistence. Overall findings show that active participation in Project Empowerment enhances how Black males persist in college. The findings implicate the need for more ethnic-based organizations for Black male at other predominantly White campuses, and for colleges and universities to encourage early Black male participation in these organizations. Tinto’s (1975) student integration model was useful in framing how student engagement in the campus community is critical to persistence.
Background

More than half of all students who matriculate into a baccalaureate program depart their institutions prematurely (Museus & Quaye, 2009). Among all student groups, there is widespread concern about the early departure of Black males enrolled at these institutions. According to Kimbrough and Harper (2006), only one-third of Black males had earned a bachelor’s degree in 2000. Data from the U.S. Department of Education (2009) show lower graduation rates for these students, compared to their gender and ethnic counterparts. Low graduation rates demonstrate a critical need for higher education institutions to implement practices that promote a culture of high degree attainment among Black males. Given how past policies have led to increased access and enrollment of Black males in higher education (Strayhorn, 2008), there is great potential for higher education to enact policies that address the problem of low degree attainment among Black males. This potential for improving Black male retention was the catalyst for this study, which explored how a campus-based organization enhances retention among its undergraduate Black male members.

Purpose of Study

There is little research information on how campus-based organizations can enhance Black male retention. As such, research inquiries are needed that bridge the gap between what we already understand about retaining Black male students, and what we must know for improving their retention and graduation outcomes (Tinto, 2005). The purpose of this study was to examine the factors of persistence for Black males involved in Project Empowerment (pseudonym), a student support organization designed to enhance retention among its student members. The term persistence in this study was conceptualized as a student’s desire and wherewithal to remain in college from matriculation to degree attainment (Seidman, 2005). The term also embodies the personal efforts that students make to engage with the academic and social realms of their institutions through graduation (Astin, 1993; Bailey, Jenkins, & Leinback, 2005). To achieve the study’s purpose, this research sought to answer these two questions:

- What factors do undergraduate Black male members of Project Empowerment perceive as critical to their persistence toward a bachelor’s degree?
- How do the program components of Project Empowerment help to promote the retention of Black males?
These two questions were developed in anticipation that the findings from this study could be used by higher education institutions in their effort to develop and sustain a campus-based organization; with a primary intent to facilitate retention among Black males. I begin this paper with an overview of Tinto’s (1975) student integration model, followed by a brief review of the literature on how student organizations shape student retention in higher education. The paper then summarizes the methods, discusses the emerged findings, and concludes with implications of the study on higher education.

**Student Integration Model**

This study employed Tinto’s (1975) student integration model as its framework. On the whole, the model illustrates the confluence of background, commitments, and integration that compel persistence or departure decisions. It posits that students who actively engage with the academic and social realms of college are more likely to persist. Per the model, most essential to persistence are elements related to academic readiness, integration, and background characteristics.

**Academic Readiness**

Academic readiness makes a difference in the trajectories of college students (Strayhorn, 2008). Students who perform well in rigorous high school curriculum are deemed academically prepared and more likely to persist in college. Adelman (1999) noted that class ranking and grade point average also are positively associated with undergraduate persistence. In exploring the factors of persistence among 229 first-year undergraduate Black males, Schwartz and Washington (2002) found that high school rank was the strongest in predicting degree attainment beyond matriculation. In light of rank and grade point average being instrumental to persistence, an interesting finding was that high achieving Black male high school students were 8 times more likely to persist in college than low achieving Black males. Seemingly, experiencing a strong curriculum in high school may offset any inherent disadvantages that Black males may have entering college (Strayhorn, 2008). However, for Black males entering college with little or no exposure to robust curricula, there are opportunities for engagement in Summer Bridge, federally funded TRIO programs, or other intervention initiatives designed to strengthen the pathways toward graduation (Swail & Perna, 2002).
Integration

Notwithstanding academic readiness, elemental to Tinto’s (1975) theoretical model is the notion of academic and social integration. Braxton and Hirschy (2005) said that “academic and social integration [is what] influences a student’s subsequent commitments to the institution and to the goal of college graduation” (p. 67). The basis for academic integration is that through interaction with the institution, students acquire knowledge, and possess the wherewithal to form positive relationships with faculty and other members from their academic department. Harper and Quaye (2009) noted that students “who are actively engaged in educationally purposeful activities, both inside and outside the classroom, are more likely than are their disengaged peers to persist through graduation” (p. 4).

On the other hand, persistence through degree attainment centers on a student’s ability to identify and socially “integrate” with the social structures of the academic system (Braxton & Hirschy, 2005; Pascarella & Terenzini, 2005). Supposedly, social integration occurs through faculty and peer interactions, and through involvement in intellectual and social activities (Stage & Hossler, 2000). For Black males, early and continued engagement into the fabric of campus life is significant to their persistence (Pascarella & Terenzini, 2005). For these students, involvement in campus activities and maintaining networks “provide the social and cultural capital necessary to succeed on a predominantly White or historically Black campus” (Strayhorn, 2008, p. 80). As such, ensuring sustained levels of involvement and networking with faculty and peers can stimulate Black males to successfully negotiate their educational environments and persist toward a college degree.

Background Characteristics

Tinto’s (1975) student integration model also accounts for how student background (i.e., gender, race, parental education, socioeconomic status, etc.) influences persistence. For instance, Black students are less likely than White students to persist toward degree completion (Leppel, 2002). The proportion of males earning a college degree within six years is lower than for females (U.S. Department of Education, 2009). First-generation students are less likely to complete college compared to peers “whose parents possess a bachelor’s degree” (Gupton, Castelo-Rodriguez, Martinez, & Quintanar, 2009, p. 248). And for low-income students, financial barriers limit the extent to which they can engage in campus activities. These students are usually working to cover the cost of financial aid not awarded to them; thus losing valuable
opportunities to sustain purposeful engagement in the higher education community. As such, lower levels of engagement decreases the probability of persisting toward a college degree (Gupton et al., 2009). In the end, background factors shape a student’s initial commitment to attending and remaining in college. Students with high levels of commitment to their education are more likely to integrate successfully into the academic and social systems of their institution; thereby positively affecting their trajectories in college (Braxton, 2000).

**Student Organizations**

According to Kuk and Manning (2010), campus-based student organizations serve as the gateway for enhancing persistence toward graduation. Harper and Quaye (2009), Pascarella and Terenzini (2005), and Tinto (1993) all have also cited degree attainment as an outcome for students involved in campus-based organizations. Padilla, Trevino, Gonzalez, and Trevino (1997) realized utility for minority students who participate in ethnic-based organizations. Not only do these organizations promote persistence, but they allow minority students to “retain and nurture a sense of ethnic identity on campus” (p. 134). They pointed out that having a strong sense of ethnic identity helps minority students to bridge the cultural gap between their home environments and the milieus of their predominantly White campuses. While the findings from Padilla et al. (1997) support the merit of minority student involvement in ethnic-based organizations, they fail to highlight the usefulness of these organizations specifically for Black males. Therefore, research is needed that examines the utility of ethnic-based student organizations in enhancing Black male retention (Guiffrida & Douthit, 2010).

Black male participation in student organizations is relatively low on both Historically Black Colleges and Predominantly White campuses. Harper and Wolley (2002) noted that in lieu of participating in organizational activities that may promote persistence, Black males are more likely to “assert proficiency in activities that create ostensibly more masculine reputations” (p. 194). These activities often center on sports, video games, obtaining material possessions, pursuing relationships with women, and engaging informally with other Black males. There has been poor strategic institutional effort to invite and encourage student organizational participation among Black males (Harper & Wolley, 2002). The lack of effort has resulted in Black males from being connected to these organizations. Consequently, and to a certain degree, poor institutional effort perpetuates the continuation of low retention and graduation among Black males. Colleges and universities must increase their efforts to engage Black males in
student organizations as to counter low retention outcomes. This endeavor is especially important at predominantly White institutions, where Black males tend to socially integrate through formal organizations; by which the members of these organizations are characteristically Black (Tinto, 1993).

**Methodology**

In this study, I employed a qualitative case study approach to understand how Project Empowerment enhances the retention of its undergraduate Black male members. This research approach was suitable for this study because it allows the researcher to provide an "in-depth description and analysis of a bounded system" (Merriam, 2009, p. 40). Qualitative research itself allows participants to create data using their own voices. In the end, this results in a meaningful understanding of the examined phenomenon (Marshall & Rossman, 1989). The research took place at a large public Southern University. The participants are undergraduate student members of Project Empowerment, an organization developed to enhance the retention of African American men. Following negotiations for access with the Associate Dean of Multicultural Affairs and the student president, I attended Project Empowerment mass meetings as a way to recruit participants. Initially, four students Black males were identified for the study, but only two students committed. Those two students were assigned the pseudonyms of “Mike” (20-years-old) and “Jordan” (25-years-old).

I conducted semi-structured interviews with each participant on two separate days. These interviews gave me the opportunity to elicit and examine the participants’ perspectives on factors they perceived as critical to their own persistence toward graduation (Bhattacharya, 2007). The interview structure offered flexibility for me to probe for details, and for the participants to go deeper in their responses. Both interviews were slightly over an hour, were digitally recorded, and were transcribed verbatim for analysis. Within a month after the initial interviews, I met with each participant again to check the accuracy of information given in the first interview. Coding was the technique that I used to analyze the interview data. The coding process allowed me to make notations next to pieces of data that I perceived as relevant to the study (Merriam, 2009). The notations then allowed me to construct patterns among the data. In the end, the data collected were analyzed in relation to the research questions.
Findings

The findings from this study revealed three broad themes, each characterizing factors that the participants perceived were critical to their persistence and degree attainment. They were: (1) college preparedness, (2) social connections and relationships, and (3) growth through student organizational commitment.

Theme 1: College Preparedness

Mike and Jordan attended “good” high schools in their respective hometowns. Although they had different experiences in the way their schools prepared them for college, their accounts reflect the importance of teachers and family members to their college preparedness. Mike attended Catholic school for 12 years, and felt very prepared for college. He never before considered why his parents sent him to Catholic school, nor did he have any insights into the benefits of his private school experience. In hindsight, Mike described the appreciation he had for his high school experience. He said,

Catholic school definitely had an impact on how I studied, the way I was disciplined.

Nothing against the instructors at public schools, but I feel like the instructors at a private school, they really care about the students and what they’re teaching them.

Tinto’s (1975) student integration model reveals how a strong pre-college school experience can positively influence a student’s persistence in college. Notwithstanding his school’s rigorous curriculum, Mike sensed that his teachers cared for his overall academic development and well-being; and he felt a high degree of comfort in his ability to persist and be successful in college.

Jordan felt differently about his high school experience. He believed that the teachers at his large, predominantly White, ranked public high school were disinterested in preparing him for college. He also reported how his counselors did not take a stake in his academic development, nor were they willing to assist him in making the transition to college. He perceived his status as a student-athlete hindered him from receiving much needed academic assistance. He said,

I don’t think I went to a bad school. I’m just saying that I didn’t get any learning from it because I was a sports player. And so they basically let me do what I wanted to do. They definitely could have done a better job preparing me for college. They were just trying to get me out of there.
Jordan’s description may be consistent with the politics of K-12 school systems, whereas school personnel tend to perpetuate Black male exclusion into the postsecondary education pipeline (Strayhorn, 2008). Though Jordan wished he had firmer teachers that supported his learning, he nonetheless remained encouraged, self-determined, and worked relentlessly to graduate from high school. It is quite possible that these attributes functioned to counter the exclusionary tactics that kept Jordan from being adequately prepared for college; and these attributes were likely foundational to his early commitment to matriculate and persist in higher education (Braxton, 2000).

**Theme 2: Social Connections and Relationships**

College and university campuses are the context for social exchanges among students; and serve as open spaces for students to be involved in clubs, organizations, and other activities. Involvement is one way for students to develop relationship with peers and faculty. Both participants perceive these relationships as critical to their persistence and future success. Mike discussed how interaction with peers in a learning community continues to foster his persistence and academic success. He said,

The living learning communities here [at his campus] is a great way for people to branch out and meet people. Academically, if I have trouble getting a concept or if this person gets the concept, then that person can help you to understand the concept.

Mike’s involvement in his learning community is an important factor to his academic success. His “belonging” and perceived satisfaction of the living learning community represents congruency with findings that positively link campus-based supports to student persistence (Patton, Morelon, Whitehead, & Hossler, 2006). Mike also perceived that developing good relationships with faculty and staff is important to his persistence. He stated,

If you have a good relationship with professors and other people in higher spots [vice-presidents and provosts], and you talk to them, they more than likely will help you out in some way…to help you graduate, or to help you obtain a job or internship. I think that brings a settling experience for a college student…especially at a big institution.

Jordan also finds that peer interaction through leadership development activities is significant to his persistence and future success. He is actively involved in a number of campus leadership experiences; and perceives the interactions from these experiences as helpful to him in achieving his goal. He stated, “I want to do as much leadership as I can do…only because I want
to work in a hospital as a social worker.” The statement suggests that Jordan desires the interaction from his leadership experiences to be the conduit of his long-term goal of becoming a medical social worker. Beyond this particular account, Jordan offered a significant statement on leadership that marked a different perspective from this theme. Extraneous data revealed Jordan’s enthusiasm for leadership, evidencing his motivation to succeed. He said,

Leadership is very great on this campus. Leadership involvement is awesome. It's perfect. It's what you want. It's what you need. You know, there's all types of leadership involvement that [city omitted] has in general if you wanna be a leader. I've been in leadership ... freshman mentoring. And there's a lot more opportunities to come.

The level of involvement and networking on the part of both participants is likely to promote their persistence in college. Strayhorn (2008) noted that involvement provides the social and cultural capital that Black males need to succeed on any college campus. Therefore, relationship building and the accumulation of cultural knowledge can serve as the means for Black males to earn a college degree.

Engagement with minority faculty was of particular importance for both participants in their academic experiences. Mike reported having two minority professors during the period of data collection; whom he maintains contact with on a regular basis. He described how the interaction with his minority professors continues to influence his desire to be successful:

You know…when you see [or] associate a minority with a college degree, or any type of higher education experience, it kind of gives you a little signal. They know what they're doing. They have their head on straight. It kind of gives you hope that ok, yeah, this is why I need to finish. They’re at where they’re at [because] they have a college degree.

Jordan also reported regular contact with minority professors, and described how this interaction continues to influence his achievement as a college student:

They just make sure they hear me out. And if I need to do something, they're there to let me know what I should do, what I could do. They let me know really what I need to be on, how I need to think. So I do like…the fact that they’re on me…in a good way.

Making sure I’m doing what I do [to] graduate.

Jordan’s remark suggests that some of his professors are supporting of his academic persistence. This is in relative contrast to Jordan’s high school experience, where his teachers seemingly failed to prepare him to transition into the higher education pipeline. On the whole, both
participants reveal that peer and minority faculty connections support the value of participating in higher education, and earning a degree.

**Theme 3: Growth through Student Organizational Commitment**

The participants in this study view their participation in student organizations as highly important to their academic experience. Many scholars regard student involvement as positively related to persistence and degree attainment (Harper & Quaye, 2009; Pascarella & Terenzini, 2005; Tinto, 1993). Involved college students have opportunities to serve their institution, grow academically, and establish lasting networks. Project Empowerment epitomizes these opportunities, all while promoting Black male retention. Mike and Jordan described how they became involved with Project Empowerment, and how they remain committed to the organization. Mike noted.

When I was in frosh camp [transition program for first year students], they talked about it. I went to the first [Project Empowerment] meeting, paid my membership, and I became involved with the organization. And I did certain things with them. They’ve asked me to work the career fair, and be an ambassador representing the organization. To represent the school or to raise money for [hospital name deleted]. Just different events that Project Empowerment supports.

Jordan said,

I got involved by hearing about it. Seeing posters over the school [Hearing] you should get in Project Empowerment if you trynna get more involved with school. So I seen one of the guys that had been in it for a while, and I let him know that I was interested. He was telling me to come to it. I was telling him that I’ll do it next year when I got my suit game up. So I did exactly what I told him I was gonna do. Jordan reportedly attended meetings regularly after joining, demonstrating an unwavering commitment to Project Empowerment.

Project Empowerment empowers its members and fosters their personal growth. Mike shared how committing to the organization helps him to stay on task and develop as a student: It keeps me on track with everything I have going on while I’m in college. Project Empowerment was founded to help increase the retention rate [of Black males]. The organization helps me keep focused. If I don’t feel like studying, I go to the meeting to
help empower me for the next week or semester. Project Empowerment helps you to become very open and opinionated…and [it] has helped me to mature as a man. Jordan’s participation in the organization’s sponsored men’s conference empowered him to understand the realities of Black men in life and in education. Here is an excerpt of how the conference shaped his thinking:

They had some inspiring people come to speak. They asked, ‘Who do you think, is more people in college or jail?’ And most people would feel like there’s more Black men in jail, but really, it’s more Black men in college. It just gave me a different look…like, don’t listen to folks man. So you go to know who to listen to.

This event not only influenced Jordan to think critically, but it likely inspired him to stay committed to his education.

Intellectual Empowerment Sessions (IES) and the Educational Support Program (ESP) are components of Project Empowerment that foster academic development and success for members. IES purports to improve academic skills through group study. Mike noted that during IES, “everybody will get together and study, [and] help others.” ESP offers free academic assistance and tutoring to current students. Mike and Jordan are generally satisfied with ESP. Mike noted that tutoring “was very beneficial,” while Jordan perceives ESP as helpful in improving his Spanish and writing skills.

**Discussion**

In this study, the participants credited their personal backgrounds, social relations, and membership in Project Empowerment as focal to their persistence. The findings led to several general conclusions around each theme. First, pre-college experiences were perceived as important to college persistence. For example, Mike recognized early how his private school experience prepared him, and influenced his commitment to remain in college. Despite Jordan’s experience of exclusion from the personnel at his high school, he was steadfast and eager to accomplish his goal of graduating from high school. Second, developing relationships with minority faculty was strong in the “social connections and relationships” theme. The participants’ interactions with minority faculty enabled them to stay focused on earning their degree. Mike was inspired to achieve by witnessing the success and position of his minority professors. Jordan felt academically supported by his minority professors, which evidently was in contrast to his high school experiences. Finally, the participants viewed their involvement in
Project Empowerment as significant to their persistence. The components of this ethnic-based student support organization seem to have equipped both participants with the tools and resources to adjust and be successful in their higher education environment.

Implications and Conclusions

The findings from this study suggest several implications. Foremost, higher education institutions must be strategic in involving Black males early in ethnic-based student organizations. Pascarella & Terenzini (2005) contend that Black males who are engaged almost immediately in the social context of campus life are more likely to persist toward graduation. Predominantly White institutions, in particular, must support early organizational involvement by offering an array of ethnic-based venues for its relatively few enrolled Black males (Harper, Carini, Bridges, & Hyak, 2004). Jordan illustrated in this study how his high school failed to prepare him for college. This alludes to the need for higher education institutions to engage at-risk Black males in a program such as Summer Bridge. This program helps vulnerable students transition from high school to college by offering academic classes, mentoring, and relationship building during the summer before their college matriculation. Although program goals vary, the aim is usually to enhance college readiness and improve retention through academic and social enrichment programs (Kezar, 2003-2004). The participants did not report involvement in early intervention programs that would have assisted their transition. However, their acumen for academic achievement is what guided their entry and transition into the college environment.

Data were collected from two participants in this study. Although the information was insightful, a larger sample of Black males involved in Project Empowerment should be studied to explore their perceptions of persistence, and to substantiate the findings from this study. Having more participants potentially diversifies the findings and research literature; which could inform the restructuring of Project Empowerment such that it strengthens the organizational components that lead to improved outcomes. Finally, Project Empowerment and its program components should be routinely evaluated. An ongoing assessment of Project Empowerment could demonstrate sustained effectiveness of organization on retaining Black males. Long-term evidence of positive outcomes might spark other institutions to revise their policies, or implement a program similar to Project Empowerment to address their own problems with retaining Black males.
In conclusion, the fundamental purpose of this research was to examine the factors of persistence for Black males involved in the Project Empowerment student support organization. The participants seemed to have formulated their perceptions of persistence from personal background experiences, relationship building with peers and faculty, and engagement with the institution on several levels. Importantly, the participants are determined to succeed, and continue to demonstrate a steadfast attitude toward achieving their goals. Their active engagement with Project Empowerment illustrates how the organization fosters their persistence toward graduation. In addition, their reflective stories exemplify significant insights about what it takes to navigate successfully their college environments. While these insights were important to the study, the findings and conclusions should be viewed with some caution. This qualitative study was primarily based on the participants' responses; in which these responses best reflect their perceptions of persistence through their own voices. In addition, the study was conducted within a single institutional context and organization. Therefore, any generalization of the findings from this study should be limited to the parameters of Project Empowerment at the focal institution.

Abstract

This document focuses on integrating technology within the education curriculum of a magnet high school. This integration process is an example of an educational policy change that can be implemented across the U.S. The promise of digital technology in the classroom across the United States has been muddied by its inefficient implementation. Programs to place technology in the classroom have failed in part because these programs or initiatives neglected to take the role of teachers into consideration when developing new technology integration models. This document addresses the systemic issues related to implementation failures and prescribes a process to develop well scoped and reliable technological resources. The document outlines strategies for professional development, technical support and maintenance, and digital technology/learning technology.
Comprehensively Integrating Technology within a Magnet High School: A Policy Proposal

“A transformative shift in education to the personalized, student-focused, lifetime-learning model that the Information Age demands will happen, many scholars say. It’s just a question of when.”

– Marcia Clemmitt, Digital Education, 2013

Introduction

Governmental mandates in 1998 required all American public schools to be connected to the Internet by 2001. Ideally, educators were to integrate technology into lesson plans and instructional strategies, and students would benefit from engaging activities which tapped into their interests bringing about greater learning opportunities, building requisite skills, and increasing test scores.

Unfortunately, integrating technology into public schools was not a great panacea. Schools fully equipped with Internet access and various technologies (desk tops, laptops, tablets, etc.) are still struggling with student engagement, reading levels, math competencies, and the like. And although today’s students may be adept at social media, gaming, and cell phone usage, they are not becoming adept at marketable technological skills. Further, teachers struggle to meet technology integration expectations due to lack of information, lack of training, resistance to change, and fear.

Area

This proposed policy centers on a mid-sized, urban magnet high school in Houston, TX. Ranked in the top 20 amongst 150 area schools by the organization Children at Risk which utilizes available school data to determine how well schools have prepared students and also
listed in the fourth edition of *U.S. News & World Report Best High Schools*, this magnet school has done well educating children in the past, yet has recently begun to experience decline in student behavior, grades, test scores, and employee morale – with a 25% rate of teacher turnover after the 2014-2015 school year.

The campus has over 300 student computers which includes two student computer labs as well as mini-labs of 5 to 10 computers in most English and math classrooms. Problems exist with internet connectivity, broken or outdated hardware, inability to print documents, and school-wide accessibility to the limited number of computer labs.

Each classroom teacher has a dedicated computer for administrative tasks, clerical duties, and curriculum preparation and presentation. Last year, each teacher was issued an iPad. Most either took the iPads home for personal use or locked them in their classroom closets. Although some technology training is provided by the district, it is offered after-school or on Saturdays, which oftentimes is not convenient for teachers. Any educator with school-age children or weekend obligations might find it difficult to attend these professional development sessions. Thus, few campus educators are aware of the myriad of possibilities that technology integration could offer them.

**Thesis**

Programs to place technology into the classroom have failed, in part, because they neglect to train the teacher in how to incorporate the use of technology into the curriculum efficiently. These programs are further hampered as the support and maintenance requirements of the technology seldom make it into the classroom, the school, or even to the school district.

**Professional Development**
One of the major missing elements of K-12 technology integration is teacher training and professional development. Both pre-service and in-service educators must have continual, consistent and relevant training and professional development which focuses on technology integration.

...[R]elevant literature shows that effective professional development related to technology integration: (a) focuses on content (e.g., technology knowledge and skills, technology supported pedagogy knowledge and skills, and technology-related classroom management knowledge and skills), (b) gives teachers opportunities for “hands-on” work, and (c) is highly consistent with teachers’ needs (Hew & Brush, 2007, p. 238).

Communities of Practice

Steps must be taken which allow teachers to become increasingly comfortable utilizing technology which advances curriculum goals and enhances daily lessons. One way to assuage teacher fears and uneasiness regarding working with technology is through a mentorship or buddy program centered on technology integration. “…[T]eachers who learned to integrate technology with a mentor more easily overcame barriers such as finding time to integrate technology, learning to troubleshoot problems with technology, and learning to integrate technology into an actual classroom setting” (Franklin et al., 2001 as cited in Kopcha, 2010, p. 177). Because of the benefits of technology communities of practice, both new and experienced teachers must be required and encouraged to participate.

Technical Support and Maintenance

One of the key components for improving technology integration in our educational system is to better align technology infrastructure with online educational resources which can be utilized in the classroom. For example, teachers require software applications that support
their curriculum, but often the specifics of the software is not taken into consideration when the technology resources are deployed. Thus, creating a software performance problem for teachers because adding software to a saturated network is the fastest way to ensure inconsistent software performance. When this occurs, teachers and students lose faith and interest in online teaching resources.

The resolution to this problem is to develop infrastructure resources with specific software applications and specific performance standards in mind. The best way to support teachers and students going forward is to develop an education portal that considers the teaching tool in the classroom as well as the evolving teaching software applications at the time the infrastructure is designed. This will give teachers an opportunity to identify their application performance requirements as well as their growth strategy so that infrastructure developers can right size networks, servers and routers for optimal performance.

**Framework: Instruction**

Educators cannot simply place Internet-connected computers in the classroom and call it a technology enhancement. Although this approach may work to satisfy the immediate needs of a specific technology mandate, it is doomed for failure. Education experts see the need for change, and new markets continue to emerge.

**Digital Technology/Learning Technology**

From laser discs to CD-ROMs to interactive whiteboards to on-line content and mobile applications, tech. businesses - both small and large - have attempted to provide educational organizations with beneficial learning tools which assist teachers and appeal to students while keeping pace with dynamic technological advances.
According to The New Media Consortium (NMC) Horizon Report: 2015 K-12 Edition, which “…examines emerging technologies for their potential impact on and use in teaching, learning, and creative inquiry in schools,” there are seven categories within educational technology:

1. Consumer technologies: applications and tools that were created for business, personal, or home use which can also be beneficial in educational settings.

2. Digital strategies: these strategies are not technological advancements, rather “…ways of using devices and software to enrich teaching and learning, whether inside or outside the classroom” (p. 34).

3. Enabling technologies: transformative technologies which make existing hardware and software easier to manage or more beneficial.

4. Internet technologies: “…techniques and essential infrastructure that help to make the technologies underlying how we interact with the network more transparent, less obtrusive, and easier to use” (p. 35).

5. Learning technologies: applications, technology, and online resources created specifically for the education sector.

6. Social media technologies: online social networks have permeated all sectors allowing for “…new ideas, tools, and developments coming online constantly” (p. 35).

7. Visualization technologies: ranging from presentation tools and applications to visually analyzing data “[t]hese technologies are a growing cluster of tools and processes for mining large data sets, exploring dynamic processes, and generally making the complex simple” (p. 35).
Virtual (Online) Learning

In recent years, there has been a steady increase in online or virtual offerings for K-12 students. “As of 2010, at least 27 states had at least one entirely full-time, publicly funded online school, including high schools and schools serving pre-kindergarteners through 12th grade” (Clemmitt, 2013, p. 208). Students and their parents may choose to have students work from home taking all of their classes online, or students might complete some classes online during the traditional school day.

Blended Learning

Blended learning combines online learning with traditional face-to-face instruction. Students are able to receive the benefits of self-paced or individualized online instruction along with the guidance and assistance that only a classroom teacher can provide. “In many cases, blended learning paves the way for other approaches — including competency-based models — that enable personalized learning, promote skill mastery, and inform new roles and responsibilities for teachers” (The New Media Consortium [NMC], 2015, p. 16)

Model School Districts

Ultimately, it is up to local school districts and campuses to decide which technological tools, applications, software, and hardware will be most beneficial for state curriculum, classroom instruction, and student needs. And fortunately, there are some districts who are making great strides towards fully integrating technology. In their Annual Review of Policy and Practice, Keeping Pace with K-12 Digital Learning (2014), highlighted seven school districts (Figure 1) of which “…several … are considered among the leading examples of digital learning implementations” (p. 37).
The benefits of integrating technology into primary and secondary schools are numerous and far-reaching. Technology integration benefits all school stakeholders: students, teachers, administration, parents, and community members. Basic technological tools allow teachers to...
efficiently and easily take attendance, calculate and track grades, prepare lesson plans, and communicate with parents and students. Students develop word-processing, communication, presentation, research, and emerging technology skills. And, parents and community members can be assured that graduates are prepared for higher-education and 21st-century employment.

...advocates for 21st-century skills stress the importance of literacy in information and communications technology (ICT) for performing learning skills, such as thinking and problem solving, communicating effectively, and enhancing self-direction and productivity. (National Education Association [NEA], 2008, p. 22)

Thus, when a school or school district lags behind the current technological landscape, those students (along with all the other stakeholders) suffer. According to the National Education Association’s 2008 Survey of America’s Teachers and Support Professionals on Technology in Public Schools and Classrooms, “adequacy of technology in urban schools fell well below that available in suburban schools and, to a large extent, below rural schools as well” (p. 34). K-12 education in America cuts across all demographic and socio-economic lines, and when some children receive sub-standard instruction due to where they live or where they go to school, educational equity for this student population is in jeopardy.

As technology continues to rapidly advance, it is key that all schools and districts diligently work towards full integration of technology.

**Review of Literature**

Empirical data regarding educational technology integration and its effectiveness is emerging yet relatively scarce. There is a plethora of technological choices for districts and
campus – some of which have been researched and tested while others have been theorized or merely thought to be effective. “… [T]here is insufficient empirical support to claim that access to technology has either increased test scores or improved the quality of instruction to enhance student learning” (Inan & Lowther, 2010, p. 137). However, there are numerous plans and theories regarding implementing the integration of technology: overcoming barriers and training teachers.

Barriers to Technology Integration

Once a school or district has mandated increased technology integration, the organization must be cognizant of barriers to the technology plan and develop ways to navigate these barriers. Kopcha (2010) and Hew and Brush (2007) compiled the following barriers:

- Lack of time – most teachers are already pressed for time, and many see learning a new technology as another time consuming task
- Access to resources – not having enough fully functioning computers, and devices; malfunctioning software and/or licensing problems; internet connectivity issues all cause great frustration for teachers
- Attitudes and beliefs – teachers may hold negative beliefs about technology
- Professional Development – many teachers lack the knowledge and skills to use technology within their curriculum, lesson plans, and classrooms
- Culture – school climate and norms may have a negative impact

Hew and Brush (2007) also included the following institutional barriers:

- Leadership – school administration may be unsupportive; teachers want to be a part of the decision-making process (Byrne, 1998; Brown, Finch, MacGregor, & Watson, 2012). “Supportive and shared leadership is the phenomenon when ‘school administrators
participate democratically with teachers sharing power, authority, and decision making” (Hord, 1997 as cited in Brown, Finch, MacGregor, & Watson, 2012). As educational professionals, teachers want to be a part of the solution. “If the top down system of administration is abandoned in favor of policy decided by all the constituent elements of a school community including supervisors, teachers, parents, and students, a more harmonious atmosphere based upon individual responsibility will prevail” (Byrne, 1998).

- Bell schedules – the amount of time within each class period may hinder tech. heavy lessons
- School planning – school may attempt to integrate technology without a strategic plan

**Strategies for Overcoming Barriers**

Hew and Brush (2007) determined five categories for overcoming tech. integration barriers:

1. Develop a shared vision and technology integration plan: developing a shared vision allows educators to imagine and visualize what can be, and the integration plan provides the steps to reach the goal

2. Find ways to accumulate additional resources: creative thinking and creative problem-solving are crucial to overcome this barrier; sharing equipment, fund-raising, and grant writing are a few options

3. Change attitudes and beliefs: providing the vision, plan, and support assists with changing attitudes

4. Conduct professional development: the additional knowledge and skills gained will allow teachers to feel comfortable using technology in their classrooms as well as bolster positive changes in attitudes and beliefs
5. Rethink assessments: school standards are set in an effort to raise test scores and funding is allocated based on improving standards; teachers may use applications or software to easily assess students, and meticulously formatted state test questions can also be presented via technology.

Although the list of strategies is short, the tasks may be daunting to educational professionals. The researchers developed a summary chart (figure 2) to assist with tackling barriers.

Table 1 Summary of strategies to overcome barriers of technology integration
Figure 2. Summary of Strategies to Overcome Barriers

Path Analysis

The barriers and factors which limit technology integration (lack of time, limited resources, attitudes and beliefs, professional development, and culture) are inter-related problems and concepts. Path analysis is one way to analyze the barriers and extrapolate to what extent they inter-relate. “Path analysis is an advance statistical technique for examination of dependent and independent variables to reveal the relative effects of each variable on the other variables in the model” (Inan & Lowther, 2010, p. 139).

Looking at factors and barriers to tech. integration, Inan and Lowther (2010) used the following variable to create the path model:

- Age
- Years of teaching
- Computer proficiency
- Computer availability
- Teacher’s beliefs
- Teacher’s readiness
- Overall support
- Technical support
- Technology integration

Inan and Lowther (2010) found that “the eight variables hypothesized to impact technology integration in the model explained 56.4% of the variance of teacher’s technology integration” (p. 144). Thus, there are also various unexplained reasons as to why educators are reluctant to utilize or embrace technology.
Also, the Inan and Lowther (2010) found three key variables which positively affected technology integration: teachers’ readiness, teachers’ beliefs, and computer availability. “This finding suggests that the higher the value of these variables, the higher the teachers’ technology integration” (p. 145). This information can be valuable both when principals and administrators hire new teachers and when they consider yearly budgets.

**Economic Analysis**

E-Learning and virtual schools environments do not further exacerbate the financial bind schools often find themselves in. When you consider E-Learning, schools can be setup anytime, anyplace offering educators the ability to revise and combine core curriculums and lesson plans seamlessly. Both educators and students benefit from the use of a technology utility that provides digital application resources such as online books, tools for special needs students, and collaboration tools for student and teachers to work together.

The government is allocating funds for technology growth in education in an effort to improve technology resources. However, what we see is that technology is replacing traditional resources more cost effectively. According to the Thomas B. Fordham Institute, schools are finding that by developing individualized learning in digital e-learning labs for students, students use adaptive educational programs to learn reading and math skills schools at a cost savings (Battaglino, Haldeman, & Laurans, 2012). In fact, the Fordham Institute found that traditional school operations models cost approximately $10,000.00 per student per year, using a blended model cost approximately $8900.00 per year per student. The fully virtual model cost approximately $6400.00 per year per student (Battaglino et al., 2012). The financial value proposition is clear—using technology resources is cheaper than traditional education models.

### Figure 4. Costs of Blended Learning
Another major problem facing education’s use of technology resources has been inadequate implementation and mismanagement of infrastructure resources. The computer hardware and software used in schools has not been right-sized to meet the demand of students and educators. Implementation processes (when developed and utilized) have been based on available funding and outdated equipment. Teachers do not use the computers they have today because they do not have software installed that can be used to aid the teaching effort.

Currently, there does not seem to be an effective methodology in place that presents the most benefit to each school at the best value. Schools are not concentrating their efforts together to develop one standard offering as a district. Each school is using the allocation of funding to develop their technology solutions on a case-by-case basis. What is needed is a technology solution that is standardized to meet the needs of all the schools in the district.

The solution is distributive computing model currently used in the private sector to service multiple enterprises using right-sized hardware.

**Implementation**

Implementing change within any organization is always a precarious project. And, it is exceptionally difficult within a school as most teachers and administrators are subject-matter experts who believe they know best. In order to bring all school stakeholders into the process of technology integration will be phased in over two years and include two components: the SPELIT Power Matrix needs assessment and John P. Kotter’s Eight Step Change Model will be utilized.
**SPELIT Power Matrix**

The SPELIT Power Matrix is a model for assessing the needs within an organization. It assesses the social, political, economic, legal, intercultural, and technological issues associated with a problem or organization. The administrative team (principal and assistant principals) will discuss, analyze, and complete the SPELIT needs assessment before moving on to the components of Kotter’s change model. Prominent and possible campus needs and issues are as follows:

*Table 1*

**Campus Technology Needs Assessment**

for all the teachers, students, and staff who want to use them. The Internet routers and servers may lack the capacity for the increased usage.

Kotter’s Change Model

Figure 5. Kotter’s Eight Step Change Model

The Comprehensive Technology Integration Plan will be phased in over a two year period. Steps one, two, and three (Establishing a Sense of Urgency, Creating a Guiding Coalition, and Developing a Vision and Strategy) will begin the summer before the first school-
year of implementation. The Guiding Coalition must consist of the school principal, curriculum assistant principal, assistant principals, technology specialist, librarian, and department chairs – plus any other concerned, interested teachers willing to volunteer their time during the summer.

Understanding the need for greater student engagement, curriculum and hardware/software re-tooling for 21st century learners, increased teacher morale, increased test score performances, and optimal utilization of campus-wide technological resources, the Guiding Coalition will gather and disaggregate data regarding declining test scores, student discipline statistics, teacher morale, professional development needs, and results from the Texas School Technology and Readiness Chart – which is a survey which measures teachers readiness for and use of technology within the classroom.

The Texas Teacher STaR Chart can assist in the measurement of the impact of state and local efforts to improve student learning through the use of technology as specified in No Child Left Behind, Title II, Part D. It also can identify needs for on-going professional development and raise awareness of research-based instructional goals.

(Texas STaR Chart website, n.d.)

In order to create a sense of urgency, presentations, posters, handouts, and emails will be generated which “… relentlessly bombard employees with information about problems …, potential problems …, [and] potential opportunities” (Kotter, 2012, p. 47). The first round of these communications will be presented to faculty and staff during the beginning of the school year staff development sessions. The Guiding Coalition will be introduced and the school principal will be first to explain the campus’ new focus, vision, and plan. This vision and plan will also have been conceived and fine-tuned during the summer. The vision and plan will encompass all campus stakeholders: administration, teachers, staff, students, and parents.
Involving all stakeholders sets the stage for Kotter’s stage 5 “Empowering Employees for Broad-Based Action.” In order to make positive, effective change within a school, teachers, students, parents, and support staff must have buy-in and feel a part of the process.

“Environmental change demands organizational change. Major internal transformation rarely happens unless many people assist. Yet employees generally won’t help, if they feel relatively powerless. Hence the relevance of empowerment” (Kotter, 2012, p. 105). The school will institute the following campus-wide initiatives:

- Student Technology Advisory Board
- Teacher and staff Technology Communities of Practice
- Parental access to library computers
- Community technology training sessions
- Recognition and awards for teachers who successfully integrate technology into their lessons

Recognition and awards are also a part of Kotter’s sixth step: “Generating Short-Term Wins.” Short-term wins bolster momentum and are evidence that the new initiatives are working. Three elements are important for short-term wins:

1. It is visible; large numbers of people can see for themselves whether the result is real or just hype.
2. It is unambiguous; there can be little argument over the call.
3. It is clearly related to the change effort. (Kotter, 2012, p. 126)

Campus technology integration progress will be celebrated and documented using the following measures:
• Technology Professional Development Bingo (educators will receive prizes for attending certain types and amounts of trainings)
• Tech Triumphs shared in professional learning communities and school-wide
• Tech Recs. (educators, students, and staff can write and post recognition for anyone who is using technology in an innovative and/or interesting way)

Kotter’s stages seven and eight (“Consolidating Gains and Producing More Change” and “Anchoring New Approaches in the Culture”) will be addressed during year two of the implementation plan.

In order to continue producing change, activities that were suggested during year one will become required. Educators (including administration) and staff will be required to complete at least ten hours of technology professional development – which will be tied to end of the year evaluations. And, technology integration into written lesson plans and executed in the classroom will be required with the goal of lessons having a technological component at least twice a week.

Embedding these technological changes into the culture of the campus will be an ongoing endeavor. Campus-wide technology integration will be continually in the forefront of the goals and visions for the campus and will continue to be promoted via staff meetings, staff developments, incentives, and communications. Kotter (2012) explains that changing a culture:

• Comes last, not first
• Depends on results
• Requires a lot of talk
May involve turnover

Makes decisions on succession crucial (p. 166)

With these tenets in mind, the Guiding Coalition must be willing to dialogue with stakeholders, be flexible, and make changes as necessary.

**Conclusion**

Because the landscape of education is constantly changing and evolving, innovation and adaptation must be a hallmark of all educational decisions as well as practices. For example, continued technological advances require a technologically savvy workforce. Innovator and Ashoka Fellow Rafael Alvarez, founded Genesys Works which “… prepares eleventh and twelfth grade students with the technical skills they need to provide value in the corporate workplace, and the opportunity to gain professional experience. Genesys employs the students, assumes the risk, and relieves employers of recruiting, training, placing and supervising the youth” (Rafael Alvarez, 2006). Alvarez is fulfilling a need for job training for low-income and minority youth, inspiring hope for a fruitful life after high school, and providing employers with a technologically trained employees.

The fiscal challenges and additional obstacles associated with the educational system will also require educators to be constantly nimble and innovative. Finally, accountability for all stakeholders is tantamount to success as parents, students, community-members, teachers, and staff must all work together and have a part in the process.

Comprehensively integrating technology into a school or school district is no easy task and requires commitment from all stakeholders. However, the benefits to students, teachers, and
parents far outweigh any negative aspects. As our society continues to become more technologically advanced, we must make sure that our children keep abreast and become educated, well-rounded 21st-century learners.

Title: Mobile technologies enhance learning in a health professional program across two sites

Topic Area: Curriculum, Research and Development

Presentation Format: Paper Session

Description (75 words):

Two cohorts (n=213) of occupational therapy students, across two urban sites, used five types of mobile technologies for learning: (1) LiveBook, an online, interactive platform for case studies, (2) texting or email to consult with experts, (3) goniometer apps, (4) skype for remote clinical supervision, and (5) Wiki for peer support in role emerging fieldwork placements. According to usability surveys (93% response rate) and focus groups, learners thought the technologies enhanced academic performance and learning.

Mobile technologies enhance learning in a health professional program across two sites

Objective: The objective of this study was to examine the usability and benefits of using mobile technologies to enhance learning in a health professional program across two sites.

Methods:

A sample of two cohorts (n=213) of occupational therapy students, across the main campus and a satellite site located 300 KM away, used five types of mobile information communication technologies (ICTs) in course and fieldwork. The five technologies were: (1) LiveBook, an online, interactive platform for case studies, (2) online consultation with expert practitioners, (3) goniometer apps, (4) remote clinical supervision, and (5) Wiki for peer support in role emerging fieldwork placements. Pre and post surveys, and focus were used to examine usability and benefits of the mobile technologies for learning.

Results:

The data was collected during the 2014-2015 academic year. There was a 93% response rate for surveys. Mean age was 24.8 years (SD 9.9 years), percent Female/Male: was 90.6/9.4, and percent of students in site A/site B was 82.5/17.5. According to the students:

1. Mobile ICTs helped them increase their academic performance and learning (78% agree or strongly agree)
2. Mobile ICTS were easy to use, or not complicated (76% agree or strongly agree)
3. Intention to use mobile ICTs was influenced by peers or instructors (38% neutral, 36% agreed)
4. Resources and technical support were available (75% agree or strongly agree)
5. They had a strong intention to use ICTs for learning (72% agree or strongly agree)

Although students had a positive attitude toward using ICTs, there are currently few devices and applications for academic purposes.

Conclusion:

University students in this study were positive about the portability and practicality of using mobile technologies for learning. This is consistent with the literature. As few applications are available, this is an area for curriculum experts to invest resources.

The Efficacy of Modeling Instruction in Chemistry: A Case Study

Topic area: Science Education

Presentation format: paper session, panel session poster session

Abstract:

Modeling Instruction in Chemistry is a constructivist and model-based curriculum that has been utilized in teacher workshops and classrooms for approximately ten years. This curriculum was developed from theory and techniques developed in Modeling Instruction in Physics, a well-established course with proven efficacy in improving student conceptual understanding. However, there has been little empirical research into the efficacy of the Modeling Instruction in Chemistry curriculum. This case study is a first attempt to determine the effect this instructional program has on conceptual development in Chemistry.

The Efficacy of Modeling Instruction in Chemistry: A Case Study

Abstract
Modeling Instruction in Chemistry is a constructivist and model-based curriculum that has been utilized in teacher workshops and classrooms for approximately ten years. This curriculum was developed from theory and techniques developed in Modeling Instruction in Physics, a well-established course with proven efficacy in improving student conceptual understanding. However, there has been little empirical research into the efficacy of the Modeling Instruction in Chemistry curriculum. This case study is a first attempt to determine the effect this instructional program has on conceptual development in Chemistry.

Introduction
In order to promote deep understanding of concepts, the recent NRC Framework for K-12 Science Education (2012) has recommended a move away from memorization of routine facts towards a focus on learning via engagement in scientific practices. One of the practices highlighted is the use of modeling in science classes. Modeling requires students to develop, refine and use models to explain and predict scientific phenomena thus making sense of the world around them (Next Generation Science Standards, 2013).

Models are idealized representations of the real world that scientists use for various purposes which can include description, explanation, exploration, communication, and prediction (Giere, 2004; Svoboda & Passmore, 2013). Traditionally, in education, the term “models” has been used to describe physical representations of a real life object, for example, a three-dimensional molecular model. However, in scientific practice, such physical representations are thought of as simply one representation of a specific scientific model. Other representations could be an algebraic equation, a verbal description, a graph or picture/diagram. Together all of these representations constitute a scientific model, which represents a mental model of a phenomenon that can be used to describe, explain or make predictions (Buckley, Gobert, Kindfield, Horwitz, Tinker, Gerlits & Willett, 2004; Wells, Hestenes & Swackhamer, 1995). Representations are not just snapshots of a phenomenon but represent causal events, processes or structural features (Buckley et al., 2004). No one representation provides a complete picture of the mental model, but as a dynamic, coherent, interacting set, the different representations can provide a more complete description both of the phenomenon and a person’s mental model (Giere, 2004; Hestenes, 2010). Experts can flexibly switch between these representations, and recognize that multiple representations may be needed during problem solving (Harrison and Treagust, 2000).

Studies have demonstrated that model-based physics curricula, specifically Modeling Instruction in Physics, produces an increase in student content performance and can also help students to develop a more coherent understanding of the topic. Wells, Hestenes and Swackhamer (1995), assessed the effect of Modeling Instruction™ curriculum in physics by examining pre and post test scores on two separate mechanics diagnostics. The students were 11th and 12th grade students from three high school honors classes, one taught by lecture, one by inquiry, and one by Modeling Instruction™. Students in the Modeling Instruction™ course achieved greater gains pre to post than students in either the lecture or inquiry course. Malone (2008) determined in a qualitative analysis of problem-solving that 11th and 12th grade physics students trained via Modeling Instruction™ used a greater variety of problem-solving strategies and displayed more metacognitive solution checking behaviors. Furthermore, these modeling instruction students showed more expert-like knowledge structures than traditionally instructed students and the quality of the knowledge structures produced correlated with Force Concept Inventory (FCI) scores. Therefore, the time spent with multiple representations seems to allow for the development of coherent expert-like models. Coletta, Phillips & Steinert (2007) found that physics students taught with Modeling Instruction™ also demonstrated improved scientific reasoning skills. Not surprisingly 9th
grade students taught physics with Modeling Instruction™ have demonstrated greater conceptual gains (Malone & Reiland, 1993; O’Brien & Thompson, 2009) as well as improved scientific reasoning skills (Schuchardt, Malone, Diehl, Harless, McGinnis & Parr, 2008). Recently, research in the use of models in biology have shown promising results in conceptual gains in the areas of natural selection and heredity (Malone, Schuchardt & Schunn, 2015; Schuchardt & Schunn, in press).

There has been less research on the role of modeling in chemistry instruction. However, those studies that have been conducted suggest that Modeling Instruction in Chemistry should be as effective as its counterpart in physics. Dori and Kaberman (2012) found that students trained with a modeling based computerized curriculum unit demonstrated more flexibility moving between model representations as well as a better understanding of the connection between macro and molecular levels in chemistry than traditional students. There are few yearlong model based curricula that have been proven effective.

Harrison and Treagust (2000) followed one high school student studying chemistry via a model based approach. The student moved from initially describing atoms and molecules using a one dimensional concrete analogical model to multiple representations. The student recognized that each representation described limited aspects of the conceptual model and could that they could be used to make predictions. Harrison and Treagust (2000) make the case that the student moved from a novice modeler who believed in a 1:1 correspondence between models and reality to a more expert modeler who believed models consist of multiple mental representations. However, there was no comparison between this student and a similarly capable student exposed to a non-modeling curriculum.

Dukerich and Royce (2004) developed a full year Modeling Instruction™ in Chemistry curricula that utilizes the same pedagogy as the highly successful Modeling Instruction™ in Physics (Jackson, Dukerich & Hestenes, 2008). Teachers report that students show gains in conceptual understanding using this curriculum. However, studies comparing the efficacy of modeling instruction in chemistry against a comparison group using traditional instruction have not been published or conducted to our knowledge.

**Purpose:**
This study addresses the gap in research on the efficacy of Modeling Instruction in Chemistry. In this case study, chemistry content knowledge gained by students taught with Modeling Instruction will be compared to the gains made by students taught using traditional instruction.

**Research Question:**
*When compared to a more traditional yearlong chemistry program, does a Modeling Instruction in Chemistry yearlong program result in greater gains in students’ conceptual understanding?*

**Method**
*Participants and Classroom Context:* The participants in this case study were academically and socio-economically similar and enrolled in an independent high school in a northwestern state in the United States. This study took place over the course of three years. In the first year of the study the teachers taught their tenth grade chemistry students (119) in a traditional manner. In the next two years the teachers taught their tenth grade students (119 and 133 students, respectively) chemistry utilizing Modeling Instruction™ in Chemistry. All students enrolled in the study had previously taken Algebra I. All of the sophomore chemistry classes were taught by the same teachers in all three years. The modeling chemistry students all took Modeling Instruction™ in Physics class as freshman while the non-modeling chemistry students were enrolled in a traditional biology class. All three chemistry teachers received training in Modeling Instruction after the first year of the study.

During all three years of the study students experienced a homogenous curriculum in their other high school subjects. No changes were made in English, math, history or language courses during the time of the study.
**Instrument:** The chemistry courses’ conceptual outcomes were tested in using Chemistry Concept Inventory (CCI) (Mulford & Robinson, 2002). The CCI is a 22 question multiple-choice inventory whose alternative choices are based on intuitive student beliefs. Mulford & Robinson (2002) report that test’s Chronbach $\alpha$ was 0.704 demonstrating consistency in individual responses thus suggesting students were not responding randomly to the questions.

**Data**

Pretest scores on the CCI were significantly different between non-modeling and modeling chemistry year 1 and year 2 students. To determine if year 1 and year 2 students in modeling could be grouped together, t-tests were conducted on their pretest scores. No significant differences were found ($p<0.126$). Therefore, the two years of modeling instruction were grouped together. On the CCI posttest, modeling students scored significantly higher than non-modeling students taught by the same instructors (Figure 1, $p<0.05$). For non-modeling chemistry students, the posttest average score ($n=105$) was 24%. The modeling chemistry students scored an average of 46%, an almost two-fold difference. However, because pretest scores for modeling and non-modeling chemistry students were significantly different, normalized gains were calculated to control for the differences. Normalized gain, $G$, is defined as the change in average scores divided by the maximum possible increase:

$$G = \frac{(posttest\ score\ % - pretest\ score\ %)}{(100 - posttest\ score\ %)}$$

Nonmodeling chemistry students had a normalized gain of 5 as compared to the modeling students’ normalized gain of 18, a threefold difference. The normalized gains were statistically significant ($p<0.001$).

The calculated Cohen’s D effect size between the modeling and non-modeling cohorts is 1.58.

**Discussion**

This case study of switching from traditional to modeling instruction shows that after receiving modeling instruction, students outscored by almost two-fold students in a prior year who received traditional instruction. This increase in conceptual understanding is unlikely to be due to teacher differences or other changes to the curriculum. The same teachers taught both groups of students. Moreover, there were no other curricula changes in instruction in math, English, or history occurring over the span of this study. However, they begun the chemistry curriculum with one group outscoring the other on the CCI. This may be because the modeling chemistry group had received prior instruction in modeling physics, while the nonmodeling group had one year of traditionally instructed biology. However, this difference did not account for difference in the posttest scores, because when student differences in pretest scores were accounted for by calculating a normalized gain score, modeling chemistry students showed significantly greater gains in conceptual understanding than nonmodeling chemistry students.
**Conclusion**

The data suggests that Modeling Instruction in Chemistry curricula materials allow for greater content gains over traditional chemistry instruction. The data shows a jump in the pretest scores between the non-modeling and the modeling students. This suggests that the modeling cohort may have obtained cognitive and metacognitive skills during their freshman modeling physics class that allowed them to perform at a higher level. The normalized gains and post-test scores were statistically significant thus showing that Modeling Instruction prepares students well for college chemistry. Actually, the modeling students’ average post-test score of 46% compares favorably to college freshman post-test scores of 51% as reported by Mulford & Robinson (2002).

Abstract: The advancement of technology has impacted the modes, media, and concept of literacy. Mobile devices, including iPads, tablets and smart phones, are embedded in the everyday experiences of many young children. Educators and researchers need to understand the complex and multifaceted relationships between home and school literacy experiences in order to support the development of a literacy curriculum that better acknowledge the changing contexts of children’s literacies. This paper will explore the findings from a four-month qualitative intrinsic case study that examined preschool children’s multiliteracy and technology practices as they engaged in inquiry projects. The study was generally grounded in Vygotsky’s (1978) socio-cultural theory of learning and particular attention was given to the role of adults and more capable peers in scaffolding children’s learning within their zone of proximal development (ZPD). During the period of the study the importance of teacher and peer...
scaffolding emerged as significant themes. Teacher scaffolding techniques supported the children’s use of iPads, which resulted in the children acquiring higher levels of technological skills, and creating multimodal texts at a higher independent level of performance as the puppet and dinosaur inquiry projects progressed. This presentation will focus on instances of peer scaffolding that emerged from the children’s ongoing use of iPads and creation of multimodal texts. These include cooperating (i.e. peer tutoring) with more capable peers as well as cooperation with equally capable peers on literacy tasks that required knowledge and skills to utilize iPads. This study offers parents, teachers, educational researchers and policy makers insights into how young children may be engaged in and scaffolded in their multiliteracy practices prior to formal schooling.

Role of peer scaffolding in developing preschool children’s multiliteracy practices through the use of iPads

This paper presents findings from a qualitative intrinsic case study that examined and described young children’s early multiliteracy practices at a preschool center in a large city in western Canada. The study first identified the different forms of technology and literacy practices that young children participated in within their homes. It then examined the multiliteracy practices that these young children were engaged in in their preschool context, and how these were scaffolded by their teachers and later by more knowledgeable peers. The study was generally grounded in Vygotsky’s (1978) sociocultural theory of learning and particular attention was given to the role of adults and more capable peers in scaffolding children’s learning within their zone of proximal
development (ZPD). Multiliteracy events were also interpreted using Green’s (1988; 2012) three-dimensional view of literacy. The experiences documented occurred over a four-month period in which the children were involved in inquiry projects on puppets and dinosaurs. During the period of study, there was evidence of both teacher and peer scaffolding, as well as independent use of iPads and apps in the classroom. Teacher scaffolding techniques supported the children’s use of iPads, which resulted in the children acquiring higher levels of technological skills, and creating multimodal texts at a higher independent level of performance as the puppet and dinosaur inquiry projects progressed. The focus of this paper is on the instances of peer scaffolding that emerged. These include cooperating (i.e. peer tutoring) with more capable peers, as well as cooperation with equally capable peers on literacy tasks that required knowledge and skills to utilize iPads.

**Digital technology and the changing nature of (early) literacy practices**

Increasingly, young children are entering early childhood education as regular and competent users of multimedia. As a result, their literacy practices are often mediated by information communication technologies (Burnett, 2009; Davidson, 2009; Marsh, 2011; O’Mara & Laidlaw, 2011). New media such as mobile devices (e.g. tablets, iPads, etc.) and smart phones are embedded in the everyday lives of many young children. Preschoolers’ home literacy experiences as a result are now significantly different from experiences prior to the digital era. These background experiences with digital technology help to shape the knowledge that children bring with them to school (Beecher, 2010). If one examines children’s engagement in various
forms of literacy over the last decade, it is clear that involvement in multiliteracy and digital practices has become highly significant. These practices continue to play an important part of young children’s daily lives and informal early literacy learning (Bazalgette, 2010; Burnett, 2009; Davidson, 2009; Marsh, 2011; Merchant, 2009; Yelland, 2011).

Although the advancement of technology has impacted the modes, media, and concept of literacy, unfortunately the need to use and produce multimodal and digital texts tends to be largely unrecognized in early childhood literacy curricula (Carrington, 2008; Levy, 2009; Marsh, 2010, 2011; Merchant, 2005; O’Hara, 2011). Much of current literacy instruction in early learning settings still remains focused on literacy skills of reading and writing of printed texts (Burnett, 2009; Davidson, 2009; Marsh et al., 2005). This approach to literacy today is inadequate and insufficient for young children in the 21st century (Government of Alberta, 2009; Lankshear & Knobel, 2006; Marsh, 2010; Organization for Economic Co-operation and Development, 2010). The impact of new technologies on our daily lives is one of the factors that has motivated policy makers and educators to rethink and reform school curriculum in the province in which the study took place (Government of Alberta, 2009). It is increasingly recognized that children of the 21st century “will need skills associated not only with reading and writing and reckoning, but with creating, deconstructing and generally ‘understanding’ the diverse textual products of the new times” (Rowan & Honan, 2005, p. 198). As a result, in many OECD countries, introduction of 21st century competencies and skills has occurred via general reform initiatives.
As access to technology continues to increase at home and in the community, young children already possess the skills to navigate diverse media and popular culture texts, information technology, smart phones, texting, gaming systems and apps (Rowan & Honan, 2005), even if educators struggle to understand these modes of learning and literacy. Young children, as digital natives, have grown up with these various forms of literacy and are extremely capable and comfortable communicating and making meaning (Yelland, 2008). However, issues arise when formal schooling does not recognize and value the rich multiliteracy experiences of some young children, and they are not provided the opportunities, time and space to develop and extend such literacy experiences. Jones and Beecher (2000) found that the majority of teaching staff interviewed in early childhood education settings do not consider these practices to be relevant to children’s literacy development in the school. This is a situation that clearly needs to change if early years settings are to build effectively upon children’s early learning in the home and incorporate 21st century literacy practices. Educators and researchers need to understand the complex and multifaceted relationship between home and school literacy experiences of contemporary preschoolers to support development of literacy curriculum that better acknowledges the changing contexts of children’s literacies.

Theoretical Framework

This study is grounded in Vygotsky’s (1978) sociocultural historical theory of learning in general and the role of adults and knowledgeable peers in scaffolding children’s learning within their zone of proximal development (ZPD), in particular.
Sociocultural-historical theory of learning, as informed by the work of Vygotsky views knowledge as being actively constructed by learners as a result of their interactions with others in meaningful activities in a sociocultural context; that is, people learn through their active engagement with others, with objects, and with the environment. The sociocultural theory of learning also provided grounding for our understanding of how the use of one particular digital device (i.e. iPad) served as a mediating tool used by the teachers in the program to scaffold children’s multiliteracy experiences. Terms that are significant to the study are defined in the following ways:

Zone of Proximal Development: Vygotsky's (1978) concept of ZPD emphasizes the role of “experts” in guiding a learner using interpersonal interaction to achieve more than they could alone. Often misconstrued as an instructional strategy, the ZPD is defined as "the distance between the actual developmental level as determined by independent problem solving and the level of potential development as determined through problem solving under adult guidance or in collaboration with more capable peers" (p. 86). Vygotsky insisted that the ZPD reveals “(a) skills on the edge of emergence, and (b) the limits of the child’s development at this specific time” (in Bodrova & Leong, 2007, p. 43). Vygotsky's concept of the zone of proximal development spawned various instructional applications postulating ways in which more skilled partners assist in learning processes. Among those, scaffolding (Wood, Bruner, & Ross, 1976) is best-known and used in classroom practices.

Scaffolding: Wood, Bruner and Ross (1976) propose that an expert (provides support within the ZPD to enable the novice/the learner to perform or solve a problem at a higher level. The assistance or external support gradually decreases as the learner
becomes more skilled in performing the task and is eventually able to perform it on his/her own. Bodrova and Leong (2007) clarify that “during scaffolding the task itself is not changed, but what the learner initially does is made easier with assistance. As the learner takes more responsibility for the performance of the task, less assistance is provided” (pp. 211-212).

While scaffolding is typically understood to occur during teacher-child/student interactions, in a second language learning context, Storch (2007) stated that scaffolding could also occur in peer interaction, when learners work in smaller groups or pairs. Donato (1994) who explored the notion of “mutual scaffolding” in second language learning showed that intervention among learners can also be as effective as intervention among learners can also be effective as intervention among teacher and students. Smith (2008), in her dissertation on peer scaffolding during musical play in a preschool, found that more capable peers were significant in supporting young children’s growth of musical understanding. There is however a paucity of research on peer scaffolding in the context of learning to use digital technology (i.e. iPad) in a preschool classroom.

**Methodology**

This was a four-month qualitative intrinsic case study (Merriam, 1998; 2009; Stake, 2000) that examined preschool children’s multiliteracy practices in their homes and in class. As the use of iPads in early childhood classrooms in North America increases, we considered this study a case “in all its particularity and ordinariness.” As Stake (2000) elaborated:
I call a study an *intrinsic case study* if it is undertaken because, first and last, the researcher wants better understanding of this particular case. Here, it is not undertaken primarily because the case represents other cases or because it illustrates a particular trait or problem, but because, in all its particularity *and* ordinariness, this case is of interest. (p. 437, italics in original)

The study reported here was a “bounded entity” as it was conducted in one program, taught by the same teachers who introduced a particular digital technology (i.e., iPads) in both the morning and the afternoon class in order to enrich preschool children’s multiliteracy practices over the course of four months. The case allowed the research team to “see” the scaffolding techniques the teachers used as they supported children’s technological skills as well as their abilities to use technology as part of their multiliteracy practices: creating multimodal texts.

**Participants and research site**

There were three participant groups included in this study: children, their parents and teachers. The children attended preschool for three hours either in the morning or the afternoon four days a week. From the preschool group there were twenty-five children out of a total of twenty-eight from the morning and afternoon classes who participated in the study and were observed. Seven children also participated in one-on-one interviews with the purpose of gathering more information regarding their understanding of the types of technology they had access to and how they used it in their homes.
This study also used a multiliteracy questionnaire to gather perspectives from thirteen parents and two teachers regarding their perceptions of the children’s multiliteracy practices that included digital technology. At the end of the classroom data collection, the two teachers also participated in a focus group discussion with the research team to reflect on the findings related to the use of the iPads in the context of their puppet inquiry, and to plan future steps in scaffolding children’s multiliteracy development mediated by the use of digital technology.

Data Collection

The study gathered initial data from parent and teacher questionnaires on the perceptions, abilities and skills that these preschool children already possessed. Parent questionnaires commented on the number and types of technology in the home, and which of these the children were able to independently access, and which of these they were not allowed to use. Similarly, the teachers also completed a questionnaire outlining their perceptions of the children’s use of technology in relation to multiliteracies. Data gathered through parent and teacher questionnaire became important for how the teachers approached the iPad activities and scaffolding based on what they perceived the children’s independent level of use of digital technology to be.

Classroom data were gathered through thorough observations, detailed field notes, interviews with the children, and examining digital artifacts consisting of photographs, videos and transcripts from the puppet and dinosaur inquiries. The two teachers in the classroom also recorded videos and made anecdotal notes on an ongoing basis capturing the multiliteracy events and practices that were occurring.
naturally in the classroom when the research team was not present. Data collection was formally collected over ten half-day classes – five half-day observations for each preschool class (morning and afternoon) over the four months of the study.

The researchers assumed the role of participant observers in the preschool setting. We joined in with games and play activities when invited, but tried not to interfere or disrupt the everyday activities of the classroom. Because the iPads were readily available to the children, photographs and videos were easily captured throughout the puppet and dinosaur inquiries even on days when the research team was not observing. These digital recordings allowed for the opportunity to be revisited and analyzed on an on-going basis.

After the data were analyzed there was a focus group discussion with the teachers to discuss the preliminary findings, and what the next steps for using the iPads in the classroom might be.

Data analysis

Careful close reading of the transcripts and field notes, and reviewing of digital artifacts helped distinguish the strong, significant big ideas that were relevant to the research question from the less significant ones (Vaughn, Schumm, & Sinagub, 1996). Information from the parent and teacher questionnaires, transcripts from interviews, digital videos, and photographs were reviewed multiple times in order to identify preliminary themes or emerging patterns (i.e., interim analysis), categorize the emerged patterns, and note relationships among them that were relevant and helpful to answer the research question.
Through this process, teacher and peer scaffolding emerged as significant big ideas. However, for the purposes of this paper, we will briefly discuss how the teachers scaffolded the children’s iPad use to create multimodal texts, and then focus on the emergence of the peer scaffolding process that occurred later in the student’s inquiry projects. The data collected were analyzed in an ongoing, recursive and nonlinear process. Special attention was given to categories that emerged from the data informed by Vygotsky’s (1978) theory of ZPD, more specifically, the scaffolding techniques used by both the teachers and the children.

Findings

Teacher scaffolding of children's multiliteracy practices

The study findings stress the importance of establishing the level of skills and knowledge the children already have so that the teachers can focus on scaffolding individual children’s multiliteracy practices to their higher level of independent performance. For this particular group of the children, the scaffolding was not about teaching the children how to use an iPad; instead it was to assist them in how to use an iPad with a meaningful purpose for documenting events from their inquiry projects and everyday life in the classroom. As a result the teachers could quickly move from presenting a simple problem of how to turn on the iPad into a more complex problem of how to turn the camera into a video recorder. When the teacher first introduced this concept of recording a video a couple of the children were able to perform this skill at an independent level, however the rest of the children did not know what to do and this would become where scaffolding and support would be provided. During this activity the
teacher also introduced a new concept – a “puppet story video” whereby she recorded her own sock puppet informational video and then with the help of the children who were at that level of independent performance found where to review her video.

Over the next few months the children used of iPads within the context of their puppet inquiry. The iPads provided an additional tool for the children to capture and revisit their puppet shows when their classmates, teachers and parents were not immediately available to watch their show. With the support of their teachers they also were supported in making informational videos about their puppets. After a week of formally introducing how to record videos on the iPad it was observed that many children still needed help with setting the iPad up to record. The children could stop their recordings, and find their videos, but many were still not aware if the video was actually recording. Teacher scaffolding and modeling on how to use the video function became the main focus during the first month of the puppet inquiry. Also by watching and viewing them during the group time at the carpet the teachers also emphasized the importance of children’s digital creations.

Through the formal observations over the next few months, and analyzing the video and photographic data gathered, the following pattern of scaffolding within children’s ZPD emerged: first, the teachers initially were asking the children if they could record what they were doing. At this stage, the teachers made use of continually recording the puppet shows that were occurring during the playtime in the classroom. Second, after a child or a group of children made a video, one of the teachers would watch the video with the child or the group. At this stage, the teachers asked the children not only about how to record but also what to record. Last, but not least, the
teachers encourage independent use of iPads for recording puppet videos by using rich descriptive language during their demonstration in order to make their problem solving process verbally explicit and thus using language as a way of scaffolding children’s own problem solving in regards to digital technology.

In the last month of the study the classes had moved onto a dinosaur inquiry and the analysis of the artifacts created at the beginning of this new inquiry project, demonstrated that the iPads were now being independently used by the children to support their learning. The practice of making the iPads readily available in the classroom continued and there was ongoing evidence that the children were using the iPads more often on their own. The more recent videos made independently by the children required less adult support, and the children had begun to take their own photographs and record videos about what they felt was important for their inquiry into dinosaurs. The teachers were not being called to problem solve iPad issues or asked how to take a video anymore. The children during the observations were also able to change the iPad from photo to the video recording on their own. After recording they would watch the video by themselves or show others what they had recorded.

**Emergence of peer scaffolding**

During our analysis of the video and photographic data gathered there were several examples of small groups of children creating a series of their own informational videos telling their peers and teachers about discovering different types of dinosaurs found in the non-fiction books and cards in the reading area during the last month of the study. The videos recorded by the children ranged from 1 seconds to 40 seconds in
length. There were two video series recorded. The first video series involved two boys, whom we gave pseudonyms Jacob and Calvin, at different times holding up various dinosaur cards and a girl, whom we gave a pseudonym Amie, supporting the videos by narrating about a “new and discoverable” dinosaur discovery. This group of three children recorded twelve successive videos. The second video series involved Amie and another girl, whom we gave a pseudonym Emily, recording two dinosaur book informational videos. In each of these video series Amie took charge with narrating the videos, and was giving directions and support for the other children. In several of the videos Amie would check with the rest of the children if they were ready to start, and a couple times told them to bring their cards or books into the frame. She used prompts like “put it down here” while pointing at the iPad screen. She also checked back with Calvin if he wanted to review the video they had just recorded. Through the filming of these series Amie was cooperating through providing peer tutoring as well as cooperating with equally capable peers on literacy tasks that required knowledge and skills to utilize iPads.

The dinosaur discovery video series started out with Jacob standing silently and holding a dinosaur card up to the iPad. He recorded seven of these videos. Acting as a more capable peer, Amie stepped in on the eighth video and modeled the addition of dialogue and description to what Jacob was doing by saying “he found something … this is cool so please put it on TV.” After these videos Calvin then attempted to record a video of his own while Jacob was out of view. He recorded three videos on his own, and like Jacob he also was standing silently and holding the cards up for the viewer. In the fourth video Amie jumped into the background and told the camera about the picture
that Calvin was holding up. In both of her videos Amie was directing the “production” of the video and deciding the relevant content to be included. In the next two videos Amie continued the idea that this video would be watched again online as evidenced by her comments and prompting for one of the boys in the group to “say hello to the new original TV online, say hello and get this TV on,” and “get this video on and take this video and show it to everyone in town.” The directions she gave imitated the experiences that the class had while viewing their videos on the big screen and using the Internet to research their dinosaur questions. Amie also mirrored her teachers by providing the audience with a description about what the videos were about. In the second video series she introduced Emily to the camera and told the viewer that “this is Emily and she found something about dinosaurs and she wants to record it on the iPad.” During these videos Emily held the book up and let Amie direct the activity.

What makes Amie’s interaction with her peers “scaffolding” rather than “bossing” is the fact that she had a very clear picture in her mind what the final product (i.e. the video) should look like, including its purpose and audience. She guided her peers who appeared to be at different, but lower than her own, stages of their ability to use the iPad independently as a tool for creating multimodal texts. Unlike her teachers, Amie used different scaffolding techniques to help her peers learn the skills required for the production of this type of videos. While she clearly imitated her teachers in following the general sequence of steps in the production and presentation of the videos, she also used different approaches with the peers with whom she was working in order to guide them within their individual ZPD. Her actions demonstrated clearly that the ZPD is a “construction zone” (Newman, Griffin, & Cole, 1989) in which children who only had a
partial understanding of the goal or the means to achieve the goal, can practice under the guidance of a more capable peer, and appropriate the concept of multimodal informational videos. It is not surprising therefore, that a few weeks later the teachers observed that Jacob independently used the iPad to record an answer to his dinosaurs’ inquiry questions that would be shared with the class. He created his own narrative on his own and together with a friend they acted out the answers while another child was video-documenting their performance. These types of multiliteracy events now occur independently because of their teachers’ and more capable peer’s continued scaffolding and support. As the findings have shown many of these children are at a new level of independence regarding their skills to create personally meaningful multimodal texts.

**Conclusion**

This study offers parents, teachers, and educational researchers insights into how young children may be engaged in and scaffolded in their multiliteracy practices prior to formal schooling. Preschool children who have rich digital experiences at home demonstrate that they have great knowledge and preexisting skills. As a result, the preschool environment was able to build on their existing multiliteracy practices and, through both teacher and peer scaffolding, to achieve higher independent level of performance within their ZPD, namely, to create multimedia texts. The study’s findings stress the importance of establishing the level of skills and knowledge the children already have so that the teachers can focus on scaffolding individual children’s multiliteracy practices to their higher level of independent performance. For this particular group of the children, the scaffolding was not about teaching the children how
to use an iPad, instead it was to assist them in how to use an iPad with a meaningful purpose of documenting events from their inquiry project and everyday life in the classroom. As a result, instances of peer scaffolding where able to emerge from the children’s ongoing use of iPads and creation of multimodal texts. These included peer tutoring or cooperating with more capable peers or equally capable peers on literacy tasks that required knowledge and skills to utilize iPads. These are skills that will be beneficial and transferable to other areas of their lives and for their futures.

This classroom-based case study also demonstrated how the use of digital technology can motivate the teachers to move beyond interaction with just print-based texts, and towards greater interaction with technology and multimodal forms of expressions that are individualized and personally meaningful and relevant for their students (Yelland, 2008). Through the puppet inquiry, the children were able to view, use, access, create information and make meaning in a sociocultural relevant context (Freebody & Luke, 1990). However, in order to implement these multiliteracy practices in the classroom, children must have the opportunity to not just make sense of a variety of texts, but also to use their emerging literacy skills to produce and create their own multimodal texts (Yelland, 2008). As demonstrated by the findings even these youngest learners are well on their way to becoming literate participants and members of our contemporary society.

**Scientists’ Views on the Importance of Science Fair Participation and the Practices of Science**

As concern that the United States is in danger of losing its position as a global leader for STEM innovation continues to grow, it is important to examine how science education enrichment activities can potentially engage students in STEM practices similar to those used by STEM professionals. The *Rising Above the Gathering Storm* (2007) report recommends enlarging the STEM pipeline of students ready to earn post-secondary degrees in STEM fields by expanding opportunities for middle and high school students to conduct inquiry-based research (p. 6).

The main objectives of the study reported below are to examine science fair participation through the lens of STEM professionals who volunteer as science fair judges for a large, county-level, urban science fair and to determine to what extent STEM professionals’ perceptions of science fair participation align with the Science and Engineering Practices outlined in the Next Generation Science Standards (NGSS). Might science fairs possess the potential to complement the NGSS’ call for explicit student engagement in scientific and engineering practices coupled with content (NGSS Lead States, 2013)?

**Background**

Science fairs can take on a wide range of formats ranging from a strictly school-based activity that is a formal part of the curriculum to an informal learning environment that is free-choice and has no connection to the participant’s formal schooling. For the purpose of this study, a science fair is defined as a culminating event in which K-12 students communicate the results of their independent research projects through the use of display boards and face-to-face interviews with STEM professionals volunteering as judges. Students’ science fair research must follow the ethics and safety guidelines set forth by the Intel International Science and Engineering Fair (ISEF). Projects that are demonstrations, book reports, model or kit building, are strongly discouraged (Society for Science and the Public, 2015).

Each year tens of thousands of students participate in science fairs. There is currently a network of 352 science fairs in the U.S. and 110 science fairs internationally that serve as feeder fairs to the Intel ISEF program (Society for Science and the Public, 2015). Yet, despite their widespread popularity, there is a dearth of research on science fairs. We have a rather insufficient understanding about the extent that science fairs impact student engagement in STEM based upon a limited number of published studies having a wide divergence of methodology and focus. For example, Czerniak (1996) investigated relationships between success in a district science fair and self-concept, parental influences, motivation, and anxiety and found that pressure to succeed exerted by parents was related to high ratings from judges. Gifford and Wiygul (1992) and Pyle (1996) found opposing results in regard to the relationship between access to resources and winning prizes. Adamson, Foster, Roark, and Reed (1998) found no gender differences in overall participation or award distribution in a two year study of an elementary school’s science fair. Researchers also report conflicting results in terms of increased understanding of and engagement with STEM, as well as impact on attitudes toward science (Abernathy & Vineyard, 2001; Yasar & Baker, 2003).
Theoretical Framework

Current views on how people learn and move from novice to expert influence this research (Bransford, Brown, & Cocking, 1999). This view suggests, “Instruction that enables students to see models of how experts organize and solve problems may be helpful” (p. 49). Thus, gathering information on STEM professionals’ (the experts) views of which elements of science fair participation are useful for students (the novices) can inform how these activities can be better designed to contribute to STEM learning. Additionally, “[i]dentifying common ground between learners’ practices and practices in the domains of interest may be a productive route to experiences that move learners toward deeper understanding and capability in the domain,” National Research Council, 2009, p. 31).

This study is also guided by the “community of practice” sociocultural perspective put forth by Lave and Wenger (1991). In regard to their notion of legitimate peripheral participation, engagement in the process of conducting science fair research moves participants toward empowerment within their communities of peers. According to Lave and Wenger, “peripherality, when enabled, suggests an opening, a way of gaining access to sources for understanding through growing involvement,” (1991, p. 37). This perspective on engagement suggests that science fairs may open the door to further involvement in STEM practices.

Methods

The study presented here is a segment of a larger, multi-dimensional, research project. The research takes the form of an exploratory, descriptive case study. The case study is useful when attempting to understand contemporary and/or highly contextual topics, over which the researcher has little or no control (Yin, 1994). The unit of analysis for the study reported here is a group of 435 STEM professionals who volunteered to serve as science fair judges between 2012-14. Archival records of the judges’ registration forms provide both qualitative and descriptive quantitative data.

The science fair in this study maintains extensive electronic program records, including judges’ registrations saved as Microsoft Excel spreadsheet files extracted from survey forms hosted on a Surveymonkey.com paid account. The on-line registration form asks judges to complete three optional questions related to their own past science fair participation, as well as their views on the importance of science fair participation for students, and the factors that influenced their own STEM career pursuits. Archival records from the 2012-14 judges were merged into one comprehensive data set. All identifiable, personal information was removed by the science fair committee prior to sharing it with the research team; hence, the study was deemed exempt from IRB review. Preliminary analysis included descriptive statistical calculations and qualitative content analysis performed within Excel (Meyer & Avery, 2009). Advanced qualitative content analysis of the open-ended questions included open coding and constant comparative methods using NVivo software to ensure the formation of an unrestricted array of concepts (Merriam, 2009).

The science fair in this study was founded in 1979 and serves a large, urban city in the mid-Atlantic region of the U.S. The science fair is open to any student attending school and residing within the city limits. Approximately, 800 students register annually. It is co-sponsored by a university, a science museum, the city’s school district and
archdiocese, and is coordinated by a volunteer committee (One of the authors has been a member of the committee for over twenty years.). Students are not required to enter a school-level science fair prior to this competition. However, most students are sponsored by their school’s science teacher. There are two separate fairs, an elementary fair for grades four through six hosted by the museum and a secondary fair for grades seven through twelve hosted by the university. Winners in the grades 7-12 fair advance to the regional fair. Approximately 200 individuals register to serve as volunteer judges each year. Judges participate in a full day of activities, including an orientation, independent review of assigned projects, student interviews, providing written feedback for students, and selecting prize winners.

This paper investigates the following questions:

1) What are science fair judges’ views of why science fair participation is important for students?
2) In what ways are science fair judges’ views of student science fair participation aligned with the NGSS Scientific and Engineering Practices?

Results

The participants, 435 STEM professionals who volunteered to serve as science fair judges between 2012-14, hail from a wide variety of backgrounds. Based upon self report of their place of work or professional affiliation, the greatest number of the judges are employed by a STEM-related business or corporation (21%), followed by colleges/universities (17%), undergraduate and graduate STEM students (11%), government laboratories (10%), K-12 schools (10%), community-based organizations (10%), government agencies or military (10%), hospitals (5%), and informal science education institutions (4%).

A total of 240 (55.2%) judges indicated that they had participated in a school science fair as a K-12 student. Eighteen (4.2%) judges had actually been former participants in the county science fair described in this study. Fifteen (3.4%) judges indicated that they had participated in the regional fair for which the county fair in this study feeds into. Forty-three judges (9.9%) identified other types of science research competitions that they had participated in as youth.

An open-ended question on the judges’ registration form asked, “In your own words, why is it important for students to participate in science fairs?” The database included a total of 384 responses to this question. Six broad categories emerged during the preliminary coding. Responses indicate that the science fair is an important activity for students because it: a) promotes interest in STEM, b) promotes interest in STEM careers, c) provides opportunities for participating in the process of science, d) builds science literacy, e) increases confidence in conducting science research, and f) develops communication skills. Promoting STEM interest is the most prevalent theme amongst the judges. [Judges quotes supporting the above findings were removed due to space limitations.]

In order to answer the second research question, the researchers coded and mapped the judges’ responses to the eight NGSS Science and Engineering Practices (Table 1). With the exception of Practice 2 - Developing and Using Models, the judges’ responses aligned to the remaining Practices. Practice 7 - Engaging in Argument from
Evidence was most frequently mentioned (103 responses). Judges stressed the importance of the components that require students to “construct, use, and/or present an oral and written argument based on data and evidence and make and defend a claim based on evidence…that reflects scientific knowledge and student-generated evidence,” (NGSS Lead States, 2013). Practice 1 - Asking Questions was the next most frequently identified practice (68 responses). One judge stated, “Unlike learning in a classroom, …full quote will appear in full paper.”

Another judge captured several of the practices in a single response, “It provides an opportunity… quote will appear in full paper.” Several judges also expressed concern that traditional school science does not provide adequate opportunities to engage in the scientific process. One of the judges stated, “City students do not … full quote will appear in full paper.”

Discussion/Conclusions

As with all case studies validity is a concern and readers should be cautious in making inferences or generalizing the results to other populations or contexts (Yin, 1994). Additionally, the researchers acknowledge their bias due to their close relationship with the science fair. Despite the limitations of this study, the participants offer important insight into the role of science fairs as a means to achieve increased authentic engagement in STEM. According to the judges, science fairs are a viable learning environment for providing students with the opportunities to engage in science practices, especially the ability to ask their own, authentic, scientific questions. The culminating judging event allows students to showcase their understandings of the STEM practices as well as the content associated with their research projects.

Several participants felt that science fair participation could, in turn, increase access to understanding, and ultimately, sustained STEM participation as either scientifically literate citizens or in a STEM career path. As one judge stated: “I absolutely believe … full quote will appear in full paper.”

In support of their perceptions, the majority of judges in this study had themselves participated in science fairs or competitions. This finding aligns with other studies that have found that doing research during high school is related to long-term engagement with STEM (Roberts & Wassersug, 2009; Subontik, Duschl, & Selmon, 1993).

The results of this study demonstrate the critical need to further investigate other aspects of science fair activity. We must begin to determine which characteristics of science fairs best support the implementation of the NGSS. In the meantime, researchers may wish to encourage practitioners to evaluate existing science fair activities to determine to what extent science and engineering practices are supported through opportunities for sustained inquiry-based investigations. Not all schools possess the resources to offer science fair activities. Informal science education and out-of-school time organizations can fill this gap by incorporating science fairs into their STEM programming.

Abstract:

Teacher education programs face common areas of concern for beginning teachers including struggles with classroom management, organization, curricular and pedagogy concerns, self-efficacy, commitment to the profession, and leadership. Successful student teaching experiences are key to developing future teachers, increasing student success, and keeping effective teachers in the classroom. The teaching profession is often associated with a high level of attrition in beginning teachers. Our world faces a problem in our school systems with high turnover, which has a negative impact on student learning. This case study examined three research questions: 1) What predictors point to a successful student teaching experience, 2) What teacher candidate preparation affected the success of student teaching, and 3) What are the specific experiences of the student teaching placement that are most influential and problematic in shaping a successful placement? The study incorporated five data sources. A Likert scale survey, open-ended surveys, observations, information interviews, and quantitative data analysis allowed the researchers to gain insight about student teaching experiences to modify teacher education programs therefore increasing successful teaching practices and reducing attrition.
Over the past half-century the United States has spent sizeable sums of money on teacher professional development (PD). PD comes in several forms including after school seminars, weeklong workshops, and even multi-week long term programs. Regardless of the amount of time spent in the PD workshop, one important element of program implementation that is often overlooked is the follow through with the teachers in teaching situations where they can see examples of the program at work and receive mentorship as they work to develop their own skills. Evaluation of a Math/Science Partnership (MSP) grant indicated that without follow through few of the teachers implemented the workshop materials and methods in the classroom. Recognizing this problem, a second MSP grant included follow-up training over the course of the school year to assist teachers in the classroom with program implementation. The results indicate that the group receiving the follow through mentorship had significantly more success at implementing their reform program than the group that did not. Suggestion for effective implementation are reviewed and discussed.

6. Abstract and/or full paper.

An analysis of the 1996 National Assessment of Educational Progress 8th Grade Main Mathematics Assessment to determine the effects of policies supporting the use of calculators in mathematics education on students’ mathematics achievement and the potential for over-reliance on calculators.

With the development of the electronic calculator came the debate of whether or not calculators should be used in mathematics education. Supporters claimed that calculators were a tool to help facilitate mathematical learning; opponents considered them a crutch that would artificially support the mathematically feeble.

Calculators are now commonplace in schools, but the debate continues with regard to what effect they have on students’ mathematical achievement. After 30 years of debate, has the calculator actually become the technology that allows students to “learn more mathematics more deeply”, or have calculators fulfilled the ominous prediction of being a “crutch” to support those who have achieved “calculator-assisted mathematical incompetence”?

A valuable source of information for assessing the results of large scale calculator implementation is the National Assessment of Educational Progress (NAEP). The 1996 NAEP Mathematics Assessment included several items that could be used specifically to assess the effects of policies advocating the widespread use of calculators on mathematics achievement. This research analyzed the data from the 1996 NAEP to assess the large scale implementation of calculator use in schools. The analysis utilized quantitative methods within the causal-comparative (aka ex post facto) design in order to assess the cause-effect relationship between calculator use and achievement in mathematics. This method was selected because the NAEP data is specifically designed for secondary analysis procedures based on the presence or absence of a condition and not the experimental manipulation of the condition.

Four questions guided the research. Their results and discussion are presented in order below:

Question 1: How does frequency of calculator use in the classroom relate to mathematics achievement on the NAEP Mathematics Assessment?
Results clearly indicate that more frequent calculator use is associated with higher achievement levels as measured by the 1996 NAEP Main Mathematics Exam. These results are significant at the $p < 0.0001$ level when comparing the daily users to all three other calculator use categories. There was only a 2 point difference in score (out of 500 possible points) between the weekly and monthly use groups, and this difference is statistically nonsignificant ($p = 0.4472$). Those in the never group fare the worst, finishing 22 points behind the daily group ($p < 0.0001$), 10 points behind the weekly group ($p = 0.0001$), and 9 points behind the monthly group ($p = 0.0027$).

The effect-size calculations indicate that the daily use of a calculator produces a $d = 0.61$ in score when compared to those who never use a calculator. To put this in perspective, the average student in the daily group would finish at the 73rd percentile in the never group. Such an effect size is between medium and large and would be “visible to the naked eye”. The effect sizes for the weekly ($d = 0.29$) and monthly ($d = 0.24$) groups are considered small, but they are still worth noting.

The one thing that is noticeably absent in this analysis is any evidence to support the “calculator as crutch” theory. There is not a single instance of a less frequent calculator use group outperforming a more frequent use group.

**Question 2:** How is this relationship with achievement affected when potentially confounding variables are controlled?

Controlling for gender, socioeconomic status, parent’s level of education, NAEP achievement level, and type of school attended (public vs private) had no effect on the results initially found in Research Question 1. The only factor that did make a difference was the teacher’s knowledge level of the NCTM Principals and Standards.

In nearly every case the trends consistently indicate that higher scores are associated with more frequent use of the calculator, and in the vast majority of comparisons, the differences are statistically significant. What is remarkable about these analyses is the consistency of the results. Some factors would be expected to show a difference between groups, but the within group results showed time and again that students who use a calculator more frequently will, on average, score higher than those who use it less frequently.

**Question 3:** How is this relationship affected when the data are disaggregated by question type, where the calculator is allowed on some NAEP questions but not others?

The results of this analysis indicate that more frequent calculator use is associated with a higher percentage of correct responses regardless of whether the calculator is allowed or restricted, and there is no significant interaction effect between the two item types and the students’ frequency of calculator use. The daily users, on average, answer 8% more items correctly than the never users on both the calculator—allowed and the calculator—restricted items. According to former NCTM president John Dossey, such an effect is the equivalent of one grade level of achievement. This result continues to hold when questions are further divided by their difficulty levels, content strands, and ability levels—in all cases the percent of correct responses gradually steps down with each decreasing level of calculator use.
Question 4: How does frequency of calculator use relate to whether students recognize that it is appropriate or inappropriate to use a calculator to solve specific NAEP problems?

The results show that all four calculator use groups are equally adept at properly withholding calculator use when it is inappropriate (93% properly withheld). What they are not equal at is applying the calculator when it is appropriate and being able to come up with the correct result. Daily users used a calculator 65% of the time when it was required, while the never group only used it 46% of the time (80% or more was considered the benchmark). The probability that a student will appropriately apply a calculator and get the correct answer is as follows: daily, \( p = 0.475 \); weekly, \( p = 0.357 \), monthly, \( p = 0.297 \), and never, \( p = 0.283 \).

   Abstract

   This presentation will present a case study of a 50 person staff moving from a traditional hierarchical structure, to a format of participatory leadership in a complex, high-needs school. At the end of the presentation, participants will have an understanding of the powerful effect of participative decision making on staff engagement and student achievement.
Educators are the critical contributor to student engagement and achievement. Engaging staff, all staff, boosts their desire and willingness to contribute to the success of the students and school. Leaders who create a school culture of engagement for all participants move multiple voices from silence to participation.

How many of your staff are engaged participants in the life of the school? Leaders often experience the frustration of a few eager staff members who contribute to intramurals, clubs, and committees. Often, there are a few staff members who rarely contribute. Support staff may be left out completely. In staff meetings, a few voices seem to dominate decision-making. Engaging everyone in the work of the school provides a wonderful model for students, the community, and makes teaching much more purposeful.

Using a case study of a 50 person staff, this session will outline a school that moved from a traditional hierarchical structure, to a format of participatory leadership in a complex, high-needs school. At the end of the presentation, participants will have an understanding of the powerful effect of participative decision making on staff engagement and student achievement.
Get the Job You Want: Acing the Resume, Cover Letter and Interview

Black Ink Coaching and Consulting

26 Woodland Glen
Calgary, Alberta, Canada T3R 1G4

Kerry.blackinkcoaching@gmail.com, ekerryb@yahoo.ca

Abstract

This workshop will help you prepare your resume and cover letter to highlight your skills and talents and encourage a prospective employer to invite you for an interview. You will practice and be ready to answer common interview questions so you can shine and get the job you want.
Many educators change jobs infrequently. Writing your cover letter, preparing your resume, and then participating in an interview can be challenging. Being prepared to “strut your stuff” is one of the hardest things that we do. Getting that ideal position can seem out of reach.

This workshop will help you know yourself, and reflect on possibilities for your career. It will provide you with a format for your resume and cover letter that will highlight your skills and talents and encourage a prospective employer to invite you for an interview.

Templates and easy to use formats for the resume and cover letter will be presented. Tips for networking and using online application systems will be shared. The workshop will also help you practice, and be ready to answer common interview questions that will allow you to shine and get the job you want.

Program Book Description: (75 Word Limit)
Children and adolescents are exposed to multiple psychosocial stressors that can limit their ability to effectively self-regulate their emotions and behaviors in the educational setting. Inspired by the concept of Emotional Intelligence and the Mindfulness movement, this poster session will explore how school counselors can incorporate an “Emotionally Mindful” curriculum that will aide students with effective identification and regulation of feelings. Participants in the poster session will have access to actual tools and techniques.

Abstract:

Today’s student is exposed to multiple psychosocial stressors that can limit their ability to effectively self-regulate their emotions and behaviors in the educational setting. Evolving state and federal government academic and standardized testing requirements, the rise of technology based bullying and its impact on peer relations, dysfunction within the home setting, and genetic predisposition to psychiatric conditions are only a few factors that contribute to students increasing mental health needs within the educational setting. The result is overwhelmed students, frustrated educational staff, and schools that struggle to implement mental health interventions in a non-clinical setting. According to the National Research Council and Institute of Medicine report (Preventing Mental, Emotional, and Behavioral Disorders Among Young People: Progress and Possibilities, 2009) which collected findings from previous studies indicated that up to one in five American children experience a mental health disorder in a given year. This pattern of social emotional
factors impacting academic achievement will only worsen if left unattended or if inadequately addressed by reactive or fragmented behavioral interventions.

Often interventions under the umbrella of Positive Behavior Supports (PBS), particularly in secondary schools, focus on undesired behaviors that need to be extinguished rather than a proactive preventative psychoeducational skill building approach to encourage improved distress tolerance and self-regulation. Inspired by the concept of Emotional Intelligence and the Mindfulness movement, this interactive poster session will explore how school counselors can incorporate components of an “Emotionally Mindful” curriculum that will aide students with effective identification of feelings, regulation of behavioral reactions, and development of problem solving skills.

Mayer et al. (1997) and Goleman (2008) have proposed that Emotional Intelligence is as critical as an individual’s intellectual intelligence in that it assists with regulation of emotion, empathy, and improved awareness that benefits social skills. Emotional intelligence is not only an innate ability, but also a skill set that can be taught and developed through a child’s formative years. Over the last decade, the concept of Mindfulness, or cultivating the ability to be fully present, has been more accepted in the clinical world due to the proliferation of such evidenced based treatment approaches as John Kabat-Zinn’s Mindfulness Based Stress Reduction research. This research has indicated that Mindfulness can assist with regulation of emotion, improved attention, and a decrease in anxiety symptoms. A recent NBC news report on a San Francisco school that incorporated meditation, a form of mindfulness, revealed that the school experienced less disciplinary issues, improved attendance, and an increase in overall grade point average.

It is proposed that an approach that combines mindfulness, or the ability to be fully present, and a psycho-educational curriculum focused on the development of Emotional Intelligence skills could assist students not only with the regulation of emotions and behaviors, but would also allow students to better manage the psychosocial stressors that contribute to or exacerbate mental health conditions. This poster session will provide an overview of the components of this curriculum and several specific approaches/tools that can be implemented in varying degrees to compliment a secondary school’s Positive Behavior Supports (PBS) or Response to Intervention (RTI) programs.

Abstract: Submission ID # 765

Interdisciplinary Approach to developing a Health Navigation Certificate Program between Health Education, Nursing and Social Work Programs

Background: With the advent of health care reform, there is increased emphasis on reducing the number of hospitalizations individuals experience through promoting preventative health services. Hospitals, health systems, and local community organizations are utilizing existing health care professionals and other staff to help patients and community members navigate the complex medical and social support systems. To date the role and educational requirements for this type of worker are poorly defined and there is no clear or consistent job title for these individuals. The purpose of the study was to develop a clearer understanding of the role of a health navigator in a post-industrial urban Midwestern city. This study addressed the following questions: 1) what types of roles or responsibilities do health navigators perform? 2) What characteristics do individuals depict who are serving in the role of health navigator? 3) What educational background is needed to fulfill the role of health navigator?

Methods: Focus groups were conducted to gain information on the role of health navigators in the health care system. This descriptive study utilized two focus group sessions facilitated by social work and public health researchers at a Midwestern urban university. Focus groups were conducted with participants who work in a variety of health navigation roles in a post industrialized urban community.

Results: Data were analyzed to identify common themes that emerged across focus group participants. Eight themes were identified from the data. Interested faculty from the health education, nursing, and social work programs worked collaboratively to develop a health navigation curriculum utilizing focus group feedback, information on health care reform, and a review of existing curricula to develop a health navigation program. The program was developed as a minor or certificate to meet the needs of bachelor level students and community members who are seeking a certificate in this area.

Conclusion: As health care is changing to a more team based approach, it is essential to conduct more interdisciplinary approaches to health. As a result we must also train and educate our students through interdisciplinary academic programs and research creating a new archetype of student.
Title: Utilizing non-traditional methods and strategies to teach community assessment in a post industrialized urban educational setting

Author: Shan Parker, Ph.D, MPH

Affiliation: University of Michigan-Flint

Address: Department of Public Health and Health Sciences
University of Michigan-Flint
303 E. Kearsley
3124 William S. White Building
Flint, MI 48502

Email: shanpark@umflint.edu

Abstract #766

Utilizing non-traditional methods and strategies to teach community assessment in a post industrialized urban educational setting

Background: Needs assessment strategies such as focus groups, surveys, and interviews are validated means of conducting community assessment. However, while effective, they may not always be the most appropriate way of assessing the community especially populations in urban settings. There are non-traditional methods that are effective and may be more engaging to community participants. In addition, while students are taught to include the community in the assessment process, few courses involve population of interest or lay community expert in teaching students the most appropriate ways of engaging the population of interest in the assessment process. Inclusion of community in all aspects of addressing their health is necessary to effectively impact health. Teaching non-traditional strategies and involving community members in teaching students assessment methods is a critical component in the needs assessment process.

Methods: Non-traditional assessment methods such as PhotoVoice, story circles, windshield tours, community dialogues, were introduced and taught to graduate level health education students. Students enrolled in a Community Assessment course learn how to understand and assess a community’s needs and assets through non-traditional assessment methods. These non-traditional approaches were taught to students by lay health persons and community experts who were engaged in health education/promotion practice in the local community. Utilization of such methods have proven to be effective at engaging communities’ in addressing their own health needs.

Lessons Learned: It is essential to community assessment to have varied strategies of assessing a community’s needs. Inclusion of community members and utilization of non-traditional methods can 1) be perceived as less intrusive 2) provide a setting where participants are more receptive to discussing issues and 3) provide opportunities for students to learn to utilize the expertise in the communities in which they work. By focusing on such methods, students are exposed to multiple strategies for
community assessment beyond more traditional methods. Students learn to work with community members in a team approach utilizing the expertise of the community to address its own health needs.

Abstract

Integrating a Global Perspective into the Classroom

In today’s increasingly international world, leadership theories, capabilities, and practices must evolve to meet the demands of a global society, be it in business, non-governmental, or governmental organizations. Whether in the home country or abroad, this complex international environment means there is a greater need for leaders and followers who are globally minded and equipped with global leadership skills (Bikson, Treverton, Moini, & Lindstrom, 2003). Therefore, it is essential for leaders and followers, and consequently students to learn to navigate our increasingly complex global environment. The changing global environment demands that educators prepare students differently in that they must prepare their students to think, act, and work from a global perspective.

The increased demand for intercultural competency skills (Stokke, 2013) that facilitate positive relationships between people who are different from one another is essential in our global society. As a result of the specialized cognitive, behavioral, and emotive abilities required to lead effectively cross-culturally, it is difficult for organizations to find candidates with this global perspective, also referred to as a global mindset. Additionally, research confirms there is a limited hiring pool of global leaders (Lam & Selmer, 2004). The growing necessity for global skills and abilities, points to the need for development before one enters the workforce. By developing global capabilities, students will gain a competitive advantage in the global workplace, reinforcing the responsibility of today’s educators to guide their students in developing global skills and abilities, all of which are vital to student success.

This is valuable information to K-12 and higher education faculty in that it not only introduces the concepts of global mindset and global leadership, but also urges these educators to recognize the concept of global mindset as vital to students’ success in both their personal lives and careers in a global society. This interactive workshop introduces research and practical applications of methods of developing and enhancing a global mindset and global leadership capabilities in the classroom that will enable students to become productive global citizens and leaders.

Abstract

Teaching and serving students of hidden diversity: Cross Cultural kids, Third Culture Kids, and Global Nomads

Teaching and serving students of hidden diversity: Cross Cultural Kids, Third Culture Kids, and Global Nomads, is based on cross cultural kids, global nomads, global transitions, and international education fields of research. The workshop discusses methods of supporting the often-unrecognized student population returning “home” after years of living as expatriates outside of their home countries, also referred to as passport countries. Some of these students hold multiple passports, further complicating their identities. Additionally, students of minority cultures already living within their home country face cultural identity issues as they daily transition between their homes and schools. The value and importance of this topic is demonstrated in the comments of Dr. Eva Gortner a licensed psychologist, who specializes in serving the expat community:

“Returning teens are often expected to remember how to behave and feel at home, which can be hard when they have internalized the norms and behaviors of other cultures…it may also take time to re-adapt to the unique colloquialisms and speech patterns in their peer community at home – leaving them open to peer scrutiny. All of this can lead to feeling like an outsider.” (Stephens, 2013, n.p.)

Not only does their experience abroad make it difficult for them to fit in upon return to the home country, affecting relationships with peers, it also affects their ability to succeed academically, whether K-12 or higher education, or even in the workplace. As our world becomes increasingly global requiring more and more families to live and travel outside their home or passport countries, so is there an increasing responsibility of educators to understand the needs of these global students and adapt accordingly to support student success.

This session will define hidden diversity and discuss challenges facing this population, including their needs and strengths that emerge from their unique growing up experience. It will also offer suggestions and tools for teaching and serving these students successfully. Additionally, the workshop provides participants the opportunity for self-reflection of one’s own cultural identity and introduces tools to help educators promote student success within this population. More specifically, the session includes the following material:

a. Who are they?
   o Define and discuss, Cross Cultural Kids, Third Culture Kids, and Global Nomads
b. Why do educators need to recognize and understand who they are?
   o Discuss challenges of this population’s unique growing up experiences and the impact on their self-esteem, self-identity, and ability to adapt to living and attending school in their home culture or dominate culture.
c. What are their characteristics and abilities?
   o Explain characteristics and abilities and how do these influence their education and ability to adapt to college environment in the US.
d. What are their needs and potential contributions?
   - Discuss the need to say goodbye and grieve
   - Discuss the unique needs and strengths that emerge from these challenges and attributes

e. How can educators support them for student success?
   - Introduce ways to support cross cultural kids and global nomads in the classroom
   - Introduce ways to support these students through student services and counseling

Our Teachers College enacted a plan to change how we teach and develop teachers for a changed world. We embrace Problem-Based Learning as a method (a) to prepare future teachers and (b) that graduating teachers will implement. Simultaneously, we advance the goal of developing a faculty with the disposition, knowledge, and skills to develop general education teachers to effectively work with English language learners. The goals are merged into a program called Problem-Based Enhanced-Language Learning.
Developing Teacher Competencies in Transformed Societies:
Problem-Based Learning and Promoting Academic Achievement with Language Learners

Problem-based learning (PBL) with enhanced language support can contribute solutions to two different school challenges. Immigration continues to change world regions (Kaufman, 2014) and thus classrooms. Students not proficient in the language of instruction face academic challenges (OECD, 2010). In our state of Arizona, only 25% of English Language Learners graduate from high school (Stetser & Stillwell, 2014). PBL experiences in content areas with design elements to enhance language development can help these learners. PBL naturally presents opportunities for thinking and discussing, and by developing these engaging openings PBL can be an ally when working with language-minority learners. We call our language-rich PBL approach Problem-Based Enhanced-Language Learning (PBELL).

The second challenge arises from opportunities that digital technologies foster for making information readily available. In his 1859 essay, Spencer (1911) asked the famous question “what knowledge is most worth knowing?” Over 150 years the question was never resolved and with the world’s knowledge increasingly accessible and growing, the answer is more elusive. A new reality calls for shifting education’s focus from memorization of knowledge to competencies including problem solving, using information, collaborating, and communicating (NRC, 2011). To create an alternative to rote learning, PBL needs to become a prominent method in schools.

Despite the changing needs of learners in today’s classrooms, the practices of the past prevail (Schwerdt & Wuppermann, 2011). Our teachers college is moving to help bring about change through preservice teacher education. This paper describes the change we seek in K-8
education and how we are revamping what we do as a college to accomplish these goals.

**Problem-Based Learning**

While ideas related to problem-based learning (PBL) can be traced back to Dewey (1938), PBL was established in the field of medical education in the 1970s, with origins at McMaster University (Barrows, 1996; Barrows & Tamblyn, 1980; Zubaidah, 2005). Challenging the existing lecture and memorize method, medical students learned content and clinical reasoning ability by identifying symptoms in real patients, simulated patients, or written case studies (Barrows & Tamblyn, 1980); diagnosing medical conditions; and prescribing treatments (Barrows, 1996). From medical doctor education, PBL has been used in other professional fields including nursing, architecture, engineering, advertising, physical therapy, and business administration (Barrows, 1996; Gould & Sadera, 2015; Quinn & Albano, 2008; Rideout & Carpio, 2001; Zubaidah, 2005). PBL has moved into preK-12 education where the focus is not on specific clinical skills or problem-solving within a context of a single profession, rather curricula are designed to prepare learners for many possibilities in life (Delisle, 1997; Edwards & Hammer, 2007; Marle et al., 2012; Torp & Sage, 2002).

**Problem-Based Learning Definitions**

With a variety of PBL uses, there are a variety of PBL definitions (Barrows, 1986; Zubaidah, 2005). The following three definitions resonate well with our approach: (a) “Problem-based learning is the learning that results from the process of working toward the understanding or resolution of a problem” (Barrows & Tamblyn, 1980, p. 1); (b) “Problem-based learning is an active learning approach in which problem solving provides a context for students to apply prior knowledge and acquire new knowledge” (Quinn & Albano, 2008, p. 330); and (c) “Problem-
based learning is an approach to learning where curricula are designed with problem scenarios central to student learning in each curricular component (modules/units). Students working in small teams examine a problem situation and, through this exploration, are expected to locate the gaps in their own knowledge and skills in order to decide what information they need to acquire in order to resolve or manage the situation” (Savin-Barden & Wilkie, 2006, p. 3-4). The following operational definition guides our work and communication: Problem-based learning is an instructional approach where learners grapple with meaningful problems and collaboratively work toward their resolution.

**PBL Key Components**

Our operational definition is broad and inclusive, which can provide great flexibility. To offer guidance, we have also identified the nine most salient components of PBL for the preK-12 classroom.

**Meaningful Problem**

Ranging from situations to simulations to real world questions, there are a variety of contexts for problems that can be used in PBL (Barrows, 1996). In some experiences, teachers can give the problem, in other situations students develop their own problems. To engage the students and sustain learning, the problems have to be both meaningful to the students and the solutions are not immediately evident (Hmelo-Silver, 2004).

**Problem First**

Instruction has long been dominated by a tell-first system (Ross, 1991). In mathematics, the teacher would explain how to do a particular calculation and then provide a question for students to solve using the explained approach. Science teachers would describe a particular
concept and then students’ lab work would allow them to see and possibly confirm the concept. PBL is different; it begins with a situation that contains a problem (Boud, 1985). Thus, learning begins with uncertainty.

**Solution Seeking**

A meaningful problem creates a drive to solve it (Jonassen, 2000). The solution-seeking state is achieved when learners are engaged and have not been previously taught how to solve this particular problem and/or have not seen similar problems. Thus, solution seeking is marked by thinking that is discussed, rejected, modified, and put into action. The process typically requires observations, manipulation of materials, and/or research to gather new information.

**Collaborative Work**

In PBL there is a premium on learners working together in teams to grapple with and solve problems (Hmelo-Silver, 2004). These interactions and conversations are the bridge to learning and skill building. The collaborative work also includes teachers acting as coaches alongside the teams (Hmelo-Silver & Barrows, 2006). As teams experience needs, teachers help them discover methods to reach their goals. Collaboration could also include contacting outside-of-the-classroom people for their thoughts, ideas, and expertise.

**Solution Sharing**

Some of the best problems in PBL are those without a clear right solution. As students grapple with their problem and consider many variables and influences, they will eventually move towards what they consider to be the best solution to their problem. In the solution sharing process the teams describe their problem, how they came up with their solution, and their evidence and claims for why it is the best solution (Marle et al., 2012). Typically the sharing is
with other students and the teacher but the audience could also include people outside of the classroom.

**Problem Guides the Learning Approach**

The problem influences the learning environment and what is learned (Boud, 1985; Jonassen, 2000). Some problems may best be solved with mathematic manipulatives or science materials, and access to outside resources such as the internet could circumvent the problem solving process. Other problems might best be solved through out-of-classroom resources. Learning supports often need to be created to assist students in developing an understanding of the content.

**Student Centered**

Students are active learners as they grapple with problems, discuss, and search for solutions. Their activity is often self-directed, where learners take responsibility for how they will solve their problems (Hmelo-Silver & Barrows, 2006). When completed, they share their solutions and listen and provide feedback on the solutions of others.

**Focused Outcomes**

Communication, collaboration, critical thinking, creativity, content learning, decision making, inquiry skills, problem solving, reasoning, research skills, and teamwork are among the possible potential positive outcomes that can be achieved with PBL (Barrows & Tamblyn, 1980; Boud, 1985). For our approach we have added an integrated language outcome to support content learning and language development. (Jonassen & Hung, 2015).
Evaluation

Evaluation is an important PBL component (Chaves, Baker, Chaves, & Fisher, 2006). Some PBL experiences will be sustained over time and involve significant student work so assigning grades based upon their work may be appropriate. Formative and summative evaluation helps teachers know if the outcomes are met. This is essential to evaluate and improve the PBL experience and to use this knowledge in the planning of subsequent learning experiences.

Language Learning

Teachers are more effective in increasing ELLs’ academic achievement across content areas when they have a greater amount of specialized preparation in meeting the specific needs of ELLs (Maxwell-Jolly & Gandara, 2006). Menken and Look (2000) have identified what they consider to be the specific knowledge and skills needed by teachers of ELLs to be effective in working with this population and include the following:

a) an understanding of basic concepts in second language acquisition
b) the nature of language proficiency
c) the demands that mainstream education places on culturally diverse students
d) the role of first language and culture in learning
e) the capacity to make academic content accessible
f) the ability to integrate content and language instruction
g) an understanding of how differences in language and culture affect students’ participation in the classroom
h) an understanding of the needs of students with limited formal schooling

i) an understanding and ability to work with students whose families may have little knowledge of U.S. schools

j) a belief in students as individuals and an understanding that their limited English is not a deficiency.

Frequently, teaching ELLs is seen as simply a matter of applying “just good teaching” (deJong & Harper, 2005), although there is general consensus among second-language experts in the field that specific knowledge and skills such as those identified by Menken & Look (2000) are critical for all teachers working with ELLs. General education discussions of ELLs continue to fail to acknowledge the language and literacy demands specific to ELLs (deJong & Harper, 2005).

Although many strategies that are effective for native English speakers can be effective for ELLs, there are also a number of issues that teachers need to be aware of in order improve the academic achievement and language development of ELLs. In many of our content area courses in teacher preparation programs, professors and instructors typically cover the content standards and effective strategies for delivering instruction within the content area. However, too often there is a lack of discussion regarding how to effectively address the specific struggles with language and content that ELLs may face.

Problem-Based Enhanced-Language Learning (PBELL) is still in the infancy and as it is evolving, it draws from the Sheltered Instruction Observational Protocol (SIOP) which was developed by Echevarria, Vogt, and Short (2006). SIOP provides an operational description of
sheltered instruction, a method by which content is made accessible for language learners. The SIOP model is composed of eight sections (a) lesson preparation; (b) building background; (c) comprehensible input; (d) strategies; (e) interaction; (f) practice/application; (g) lesson delivery; (h) assessment.

**Content and Language Objectives**

One critical area that PBELL is addressing in our goal of infusing effective strategies for ELLs into science methods courses is the integration of content and language objectives. Both are critical to addressing both the academic content and linguistic needs of ELLs. SIOP (2006) defines content objectives as an objective that identifies what students should know and be able to do at the end of the lesson and leads to assessment. It is linked to engaging activities and to the learning outcomes. Language objectives are defined as process-oriented statements (action verbs) of how students will use English with the content. In PBELL, we are promoting the integration of both content and language objectives. In addition, we are differentiating between two types of vocabulary that teachers should be aware for when designing and implementing science lessons for ELLs. The PBELL Lesson Template includes a listing of Operational Vocabulary, defined as vocabulary needed for the lesson experience and vocabulary that should be introduced prior to when it is needed in the lesson. Conceptual vocabulary is vocabulary that will be developed as a result of the lesson experience.

**Language Supports**

In order for ELLs to access both the academic and linguistic content, specific language supports need to be intentionally integrated into the delivery of the lesson. In these early stages of implementation, PBELL has focused on three specific language supports (a) sentence starter;
(b) graphic organizers; and (c) manipulatives.

**Sentence Starters**

Sentence starters provide a partial frame for students to begin their idea or sentence (Hermann, 2015). The point is that sentence starters only begin the idea, and students are responsible for completing the idea. The following are examples of sentence starters.

- An example of a type of pendulum is…
- I would explain momentum as …..
- The first step in designing our own pendulum was…
- Immediately following that we...

Sentence starters include a variety of academic terms, some at higher levELLs than others. In order to address the various language proficiency levELLs of the ELLs in a class, it is important to use a variety of sentence starters. In order to help ELLs move to higher levELLs of academic language proficiency, it is important to challenge them with sentence starters that are just above their current language level. Providing sentences starters can help ELLs engage in academic conversations that provide various intentional opportunities to engage in extended, meaningful talk in school (Zwiers & Crawford, 2009).

**Graphic Organizers**

An early definition of graphic organizers comes from Estes, Mills, and Barron (1979) who defined graphic organizers as a “visual and verbal representation of the key vocabulary of a learning task in relation to more inclusive or subsuming vocabulary concepts that have previously been learned by the student” (p. 41).

Echevarria, Vogt, & Short (2006) address the use of graphic organizers in several of its
eight sections including in lesson preparation and in practice and application. They are promoted as valuable tools for scaffolding content and language for ELLs. However, as Echevarria, Vogt, & Short (2006) emphasize, the use of graphic organizers needs to be purposeful. Moore and Readence (1984), in their quantitative and qualitative review of graphic organizer research, emphasize that fitting graphic organizers into instructional context requires systematic attention. They also found that teachers reported feeling more prepared when they presented content through graphic organizers. Furthermore, they reported that graphic organizers tend to produce the most learning when they mirror the presentation of content and when vocabulary is used as the criterion variable, important to keep in mind when working with ELLs.

**Manipulatives**

Manipulatives, in an educational context, are physical tools of teaching, engaging students visually and physically with objects such as blocks, puzzles, and markers. The use of manipulatives is constructivist since students are actively engaged in discovery during the learning process (Firestone, 2015). Shaw (2002) reports that manipulatives are effective for the following reasons: they are multi-sensory, they represent ideas in more than one way, they promote communication among students, and they increase confidence, leading to lessened confusion and deepened understanding. Manipulatives help students make the leap from intuitive to logical thinking, from the concrete to the abstract (Hartshorn & Boren, 1990). Furthermore, Ruzic and O’Connell (2001) in a study for the National Center for Accessing the General Curriculum reviewed a number of studies and found that ELLs benefit from using manipulatives.

**Language Learning Methods to Optimize PBL**

PBL provides authentic and meaningful occasions to develop language. For ELLs,
opportunities to practice and interact using relevant academic language can help them achieve academically while simultaneously developing English language skills. However, while the focus should be the academic content, it is critical that language has a central role in PBL lessons. Language learning does not occur by chance but through careful planning and intentional scaffolding by the teacher.

**The Role of Preservice Education**

The proliferation of accessible information has decreased the need to memorize and has led to calls for competency based education (NRC, 2011). People in the workforce need to be able to work together and communicate. Perhaps above all, there is a recognition that people need to be good problem solvers as they lead their lives (Jonassen, 2000). “Today, because of rapid economic and social change, schools have to prepare students for jobs that have not yet been created, technologies that have not yet been invented and problems that we don't yet know will arise” (Schleicher, 2010). There has never been a better time for the large scale incorporation of PBL in schools.

Immigration is changing many parts of the world. The United States, Canada, New Zealand, Liechtenstein, and Russia, each had more than a 5% increase in immigrants between 2000 and 2009, resulting in immigrants representing 8% to 30% of these countries student populations (OECD, 2010). Students that are not proficient in the language of instruction face academic challenges (OECD, 2010). As mentioned earliery, in our state of Arizona, only 25% of English Language Learners (ELLs) graduate from high school (Stetser & Stillwell, 2014). The challenges start early, for example, in the 2012-13 school year only 40% of ELLs passed the Arizona elementary math assessment and only 53% passed the reading assessment (Arizona
DEVELOPING TEACHER COMPETENCIES

Department of Education, 2013). Research that suggests non-proficient-language-of-instruction students tend to have lower academic achievement have contributed attention to the situation.

The will to overcome these challenges, however, is not evident on a global basis. Immigration is a very hot topic in conversations and the media (Skey, 2014). In high-immigration situations there is often anti-immigrant sentiments (Kaufman, 2014). This, as well as costs and lack of expertise by teachers and administrators (Edwards, 2012; Samson & Collins, 2012), may hinder the development of resolve to implement school solutions for language-minority learners.

The National Center for Education Information documented that 87.5% of the teachers they surveyed had little or no training in teaching ELLs (NCELA Newsline Bulletin, 2005). Most teacher education programs are currently lacking in explicitly attending to the linguistic and cultural needs of ELLs (de Jong & Harper, 2005). In a study providing an overview of the preparation of teachers working with ELLs, Menken and Antunez (2001) found that less than 1/6th of the 417 institutions of higher learning in their study required specialized preparation for mainstream teachers regarding the education of ELLs. Even among those programs that did provide preparation for meeting the linguistic needs of ELLs, oftentimes it was embedded within multicultural education courses in which ELLs were but one of several populations addressed (Morrier, Irving, Dandy, Dmitriyev, & Ukeje, 2007).

School traditions have resistance to change. Lectures and memorization have been the system for so long that even with superb access to electronic information and calls for competency-based education, prior practices prevail (Schwerdt & Wuppermann, 2011). The best prospects for change may be with new teachers joining the profession. Yet according to the US
Secretary of Education, colleges of education “are doing a mediocre job of preparing teachers for the realities of the 21st-century classroom” (Duncan, 2009). Our teachers college seeks to produce change through teacher education.

**Our Teachers College Approach**

The MLFTC has taken the approach of integrating strategies to promote English language and literacy skill development in all math and science methods classes programs for the early childhood and elementary (PreK-8) preservice teachers through the use of problem-based learning. Initially, reforms are being implemented in math and science methods courses before being implemented in the rest of the teacher preparation courses. The four main goals that MLFTC seeks to meet are as follows: (1) to reform early elementary and elementary teacher preparation programs to address the need for highly qualified general and special education teachers for ELLs; (2) to redesign math and science methods courses to include instructional strategies that promote language and literacy development; (3) to redesign course signature assignments to use problem-based learning (PBL) pedagogy and design principles that support teacher candidates’ application of knowledge and skills in “real world” classrooms; and (4) integrating and understanding evidence-based practices and scientifically-validated research for teaching and learning of ELLs, including data-driven decision to improve differentiated instruction. To begin this process, several strategies have been implemented: (a) establishment of program enhancement team (PET); (b) hiring of instructional coaches; (c) design, development and implementation of PBELL lessons; and (d) re-design and development of signature assignments.
To achieve educational reform, we recognized the need to work collaboratively across disciplines to reform and enhance coursework by creating a change in culture. We began by engaging faculty in PET, using the principles of the professional learning communities’ framework, to cultivate a culture of change for how we prepare teacher candidates to meet the needs of ELLs (DuFour, Eaker, & DuFour, 2005). MLFTC has engaged faculty to integrate evidence-based practices for language and literacy skill development in math and science methods courses. The program enhancement team provides the forum for faculty to work together around the common goals of the iTeach ELLs grant, where all faculty will have ownership and contribute to program reforms and enhancements. In these meetings, faculty have worked to: (a) establish a culture of change; (b) understand academic vocabulary, literacy and language acquisition strategies; (c) developed PBELL lessons; and (d) share experiences in developing and implementing PBELL lessons. Thus, through the PET meetings, faculty have been able to model for preservice teachers PBELL lessons.

To aid in implementing these reforms, we have added additional expertise in the form of coaches. Ultimately, we will hire coaches focused on the two key features of the reform – practices for English language learners and project-based learning. Thus far, we have acquired two coaches with expertise in ELLs. So far, these ELL coaches have co-taught with MLFTC faculty in targeted science method courses, infused greater language enrichment into PBELL experiences, taught PBELL experiences in a low SES and high ELL population middle school, assisted in planning and conducting of PET meetings, and provided other research and program support. In the future, coaches will co-teach with site coordinators who teach and supervise teacher candidates in partner schools. Coaches will support faculty and students in the implementation and evaluation of these practices.

**Early Successes and Challenges**

The first pilot year has seen a host of successes. In the first year, our approach has seen
the formation of a PET team, development of PBELL lessons, the addition of ELL coaches and the first iteration of changes to methods courses. The PET team met several times during the semester. These meetings helped to identify what prior knowledge of PBL and ELLs bring with them. The PET meetings also provided a forum for learning strategies for scaffolding ELLs in the development of academic vocabulary—both by identifying strategies that were already being implemented as well as additional strategies for developing PBELL lessons. In addition, faculty were able to design and implement a PBELL lesson in their method courses. These lessons are now a part of an archive of lessons for future use by both faculty and preservice teachers in their placements.

The additions of ELL coaches have also supported the implementation of reforms. The coaches have provided the opportunity to begin piloting changes in science methods courses. For example, the coaches have been able to work with two science methods faculty to pilot how to write content-language objectives and implement lessons that model for preservice teachers how to support ELLs during PBELL lessons. Coaches have both observed the teaching of lessons and co-taught lessons with faculty. The ELL coaches have also helped in identifying opportunities to infuse strategies for helping ELLs to develop academic vocabulary. Moreover, they have assisted in the design of a PBELL lesson template for science methods courses.

The process of making these changes has not been without challenges. Though the PET teams have been very successful, keeping faculty involved has proven to be a challenge. Faculty have many responsibilities and their ability to participate depends on their teaching schedule, service and other factors. Though we hope to keep involved, we cannot control whether or not participants are teaching the targeted courses or do not have other priorities that conflict with
PET meeting times.

The hiring of coaches with an ELL focus has been a great success. We also desired to hire a PBL coach. The initial posting indicated we wanted to hire a coach, with early elementary or elementary teaching experience, knowledge of PBL and experience with ELLs. However, this search proved to not be successful. This was because not enough applicants with PBL experience and/or applicants did not have ELL experience. Thus, we have revamped the posting for the position to be more explicit about the knowledge of PBL desired and not included a requirement for experience with teaching ELLs.

**Conclusion**

Immigration and digital technologies have transformed our societies and the needs of our schools. PBL begins with a question that engages students in learning and then develops learning competencies. Many specific language learning techniques can be implemented with PBL and in other situations to advance academic growth of learners. To embrace these needs, teachers need to have knowledge, abilities, and attitudes to implement PBL and methods for language-minority students. Our teachers college is moving to meeting these goals.

The Image and the Word in Film/Literature

Submission ID 778
Cross-Disciplinary Areas of Education
Panel

This panel intends to present cross-disciplinary approaches to human imagination, focusing on culturally significant images and exploring the interaction between imagery and spoken/written words in film/literature. Particular attention will be paid to discrepancies between the visual and the verbal to show that film/literature can be enriched by such discrepancies. Four panelists will tackle the image-word relations from a cross-cutting perspective. Ima-Izumi will examine the image of the legendary female “white snake” in Japanese and Chinese film/literature. Masuda will analyze the image of “tunnels” pertinent to male characters in American film/literature. Karasawa and Kaizu will deal with the images of “beer” in the West (U.K.) and of “pottery” in the East (Japan) respectively.

The Female White Snake in Japanese and Chinese Films

Yoko IMA-IZUMI
Institute of Humanities and Social Sciences
University of Tsukuba, Japan

Abstract

The snake symbolically has many faces. It is a reminder of Satan or the cause of evil in Christianity, but it can be an ouroboros, a snake holding its own tail in its mouth, which symbolizes eternity, just to mention a few. It indeed has a variety of characters and meanings, among which I select a legendary female white snake which transforms into a human female in order to get married to a human male.

The legend of the white snake had widely spread in China until it was edited and published in the collection of legends and short stories by three different editors at three different periods of time—by Ri Bo in Taiping Collections in 978; by Ko Ben in The Legends of Towers in West Lake in 1551; and most thoroughly by Fu Bo Ryu in The Legends of Wisdom in 1624. The third version has been the primary source of the later novels and films not only in China but in Japan.

This paper explores the image of the female white snake in films made in Japan and China in reference to the above-mentioned written texts in modern translation. It pays particular attention to discrepancies between the visual (films/TV dramas) and the verbal (the written text of the legend), thus making a cross-disciplinary approach to literature and film. It also intends to clarify the cultural differences in representation of the female snake between Japan and China.

Films to be examined are two canonical Japanese films, The Bewitched Love of Madam White (1956) and The Legend of the White Snake (1958), two from Hong Kong films, The True Legend of the White Snake (1978) and Green Snake (1993), and three films/TV dramas from China, White Snake (2004), White Snake Again (2011), both of which were broadcast in the mainland China, and The Legend of the White Snake (2011).

Key Words
white snake; film; literature; legend; Japan; Hong Kong; China; representation; female; Bai Niang; Xu Xian; Fa Hai; cross-cultural; cross-disciplinary
Introduction

The intermarriage between humans and non-human creatures is depicted in myths and legends all over the world. Zeus in Greek mythology, for example, transforms himself into a swan to get physically involved with Leda. It is often the male who goes through a change in the west, but it is more often the female than the male who is a transformer in Asian imagination. Analyzing Japanese and Chinese white-snake films and literary texts, I wish to clarify the interplay between the visual and verbal expressions of a non-human female creature who desires to unite with a human male.

The legend of the white snake had widely spread into all China from the region of Hangzhou, the location of Leifeng Pagoda and West Lake, until it was fixed in words and published by three editors at different periods of time. The three published texts of the legend share two significant features of the story: the nature of the white snake as femme fatale and the function of Leifeng Pagoda as a container to lock her in. The first feature concerning the nature of the white snake is already seen in the first version (978), where she is continually replaces her husband by a new man. When asked by her maid “Madam, a new man has come today, and the old man is no longer useful, isn’t he?” The white snake answers: “Cook him in hurry and serve it [the cooked body] with drink to Xi xuanzan [the newcomer].”?1 This image of the femme fatale or fatal woman is carried over to the third written version of the legend (1624). Though it introduces the new element of love into the relationship between the white snake and her only husband, by deleting all other men, Bai Niangzi reveals her nature as a fatal woman by reproachfully saying to him: “You believe in what an irresponsible stranger says and damage to our married life. I am honest with you. If you willingly listen to me, everything will be all right. But if you have a mind to betray me, I will kill all the people in your town by cruelly drowning them in big waves.”2 The three written versions also share the conclusion in which Bai Niangzi is locked in Leifeng Pagoda by the collaboration of the monk Fa Hai and Xu suan, who abandons the white snake under the supervision of the monk.

A large number of the white snake films have been made in Japan and China,

---

and they invariably depict the white snake or Bai suzhen as a dedicated wife who would even risk her own life for her love of her husband. There is no single film that should depict Bai suzhen as a fatal woman who would kill her husband. I will quote the ending few sequences from each film and, examining the differences between the written text and the visual representation, clarify the meaning of the change.

The protagonist is variously named as Bai Niang, Bai Niangzi, Bai Suzhen, and Bai Niangniang in the written texts and films, but I will use Bai Niang in this paper for convenience sake. As for her human husband who is also variously named as Xu Xian, Xu xuan, and Xi xuanzan, I will use the term Xu Xian.

**Japanese Imagination (1)**

**A Double Suicide in The Bewitched Love of Madame White (1956)**

The first film to be examined, *The Bewitched Love of Madame White*, is a canonical film both in Japanese and Chinese (including Hong Kong) film history. The project of making the white snake film was suggested in the mid-1950s to Toho, one of the biggest Japanese filmmaking companies, by Shaw Brothers, the most successful Hong Kong film company at the time, which was known as Hollywood in the East and was to create the golden age of Hong Kong films in the late 1960s and 70s. The staff were all Japanese; Shiro Toyoda was appointed as the director, and the big movie stars such as Toshiko Yamaguchi, Ryo Ikebe, and Kaoru Yachigusa were cast for the main characters. The special effects were assigned to Eiji Tsuburaya, who had successfully brought *Godzilla* (1954) to the worldwide attention, and color cinematography was assumed by Mitsuo Miura, who let Toyoda win the Honorable Mention at Berlin International Film Festival for the use of color. The last three sequences form an unexpected, unique ending which is devoid of either of the two characteristics of the written versions of the legend: the representation of Bai Niang as a fatal woman and the function of Leifeng Pagoda as a prison to lock in Bai Niang. The film presents a quite original and Japanese interpretation of the legend.

The first of the three sequences depicts the flood caused by the powerful spell of Bai Niang and her attendant Green Snake (*Figs. 1-3*) to make Fa Hai surrender and let Xu Xian, whom the monk has kept in his temple, run free. During the fight, Bai Niang sees her husband Xu Xian in danger of drowning and stops casting the spell (*Figs. 4-5*). She is far from the fierce fatal woman in all the written texts of the legend. Bai Niang in the film is feeble, and her attendant Green Snake is contrastingly a strong character. Green slaps her idle mistress and blames her for
standing in a stupor. When finding her mistress incapable of proceeding with the spell, Green decisively says: “I am disappointed with you because you are so cowardly.” Green abandons her mistress and swims away. There is no written text, or in any other film whether Japanese or Chinese, that depicts Green Snake abandoning Bai Niang. The sequence of the flood, emphasizing the solitude of the female protagonist, concludes with the shot of her lying limply and alone on the shore (Fig. 6). Despite the fact that she has been living for over a thousand years and is capable of making excellent use of sorcery, she is reduced to a miserable small creature washed by waves on the shore.

The topic of solitude is reiterated in the next sequence, where Bai Niang is abandoned even by her husband. She uses all her strength that is left to come close to Xu Xian, but cannot constantly hold her human form. When she appears as a woman, Xu Xian approaches her as if he desired to touch her (Figs. 7-11). But when she appears in the form of a snake and clings to his straw hat, he is repelled by the sight and steps all over the snake, knowing that it is his wife (Figs. 12-14). Tramped continually, Bai Niang finally fades away (Fig. 15), with the hint that she is dead.

3 Quoted from the flood sequence in The Bewitched Love of Madame White (1956).
4 The intense hate of Xu Xian against the snake is not unrelated with the director Toyoda’s extraordinary abhorrence of snakes. He is said to “be absent from the days scheduled for shooting the snake scenes.” Quoted from the accompanying Commentary to the LP version of The Bewitched Love of Madame White (1956) distributed by Toho.
The final sequence begins with Xu Xian recollecting his happy married life with Madam White on his way home in Hangzhou. He suddenly comes to the realization that he loves her no matter what she is, and he begs her forgiveness in his monologue: “What was I afraid of? .... Please forgive me, Bai Niang. I really didn’t care what you were. I was happy with you.” When he is determined to return to Madam White, the monk appears in front of him and makes Xu Xian fall dead on the ground (Figs. 16-17). The next moment Xu Xian’s transparent form escapes from his physical dead body and, with the monk’s words that “you should leave this world and fly, hand in hand, to an island of supernatural beings,” he flies up into the sky with the equally transparent human form of Madam White. The film ends with the shot of the transparent couple being connected to each other by the read long scarf and flying upward (Fig. 18).
The film thus uniquely introduces the traditionally Japanese notion of double suicide to have the two conflicting stances exist at the same time: the one is to deny the anti-intermarriage between the human and the non-human, and the other is to let the couple go happily ever after. The couple are forbidden to be happily married in this world by crossing the boundary of the species, but they are allowed to be united in the after world. Fai hai is given a significant role to control the fate of the couple.

It is clear that the film does not adopt either of the two fundamental features of the legend: it neither depicts Madam White as a fatal woman nor introduces Leifeng Pagoda as a prison to lock her in. Madam White is always dedicated to Xu Xian, and never becomes a fatal woman. She is feeble and dying, and does not have to be locked in Leifeng Pagoda.

The film credits for its source both the Chinese legend and a Japanese novel by Fusao Hayashi, *The Witchcraft of Madam White* (1948), which is based on the legend. The novel has a very different ending from the film, for it emphasizes the sweeping victory of Madam White over the monk, who gracefully admits his defeat: “I am completely lost. Xu Xian is yours.” In the novel, Xu Xian is always in love with Madam White, no matter what shape she takes. His strong attachment to her enables her to take him back from the monk. The novel by Hayashi glorifies the victory of Madam White and deletes the episode of Leifeng Pagoda. Both the novel and the 1956 film in Japan regard the negative characterization of the white snake and the role of Leifeng Pagoda as nothing significant. *The legend of the White Snake* in 1958, which I am examining, takes the same approach to the two basic elements of the legend. The white snake is always loved by Xu Xian and Leifeng Pagoda does not lock her in.

---

Japanese Imagination (2)
A Happy Married Life in *The Legend of the White Snake* (1958)

Satisfied with the success of the Japanese film of 1956, Shaw Brothers suggested a new project to create an animated version of the legend of white snake to another big film company in Japan, Toei. Shaw Brothers probably wanted to sign a contract with each of the big five Japanese film companies. They had previously coproduced with Daiei a successful film *Yokihi* (1955) nominated for Golden Lion in Venice Film Festival. The following year they coproduced with Toho the well-accepted *The Bewitched Love of Madam White* which won the Honorable Mention at Berlin International Film Festival. Next was Toei that was expected to coproduce an animated film of the white snake. But the project went to an unexpected way. The head of Toei was so ambitious that he decided to independently make the first Japanese feature-length animation film in full color by their own efforts. He built a most advanced studio specialized in making animation films, and Toei was soon to be called Disney in the East.

The ending sequence of the animated film *The Legend of the White Snake* (1958) depicts the fight between Bai Niang and the monk. The flood arises due to the spell of Xiao qing, the spirit of a blue fish and the attendant of Bai Niang. Bai Niang cannot cause the flood, because she is no longer a spirit but a mortal woman as she has given up her perpetual youth and longevity in trade for a flower of life to restore dead Xu Xian to life. Seeing Bai Niang and Xu Xian almost drowned in the flood, Fa Hai comes to the realization that he has no reason for disrupting their coupling because both are now human and avows that “I am on your side now.”6 He sends a boat to the drowning couple among the waves, and saves their lives (Figs. 19-21). The reformation of Fa Hai is the clue to a happy life of the couple.

---

6 Quoted from the last sequence of *The Legend of the White Snake* (1958) with Taiji Yabushita as director.
Leifeng Pagoda is crossed out in this film as well as its precursor of 1956. But a seven-storied pagoda, which looks exactly the same as the real Leifeng that collapsed in 1924, appears in an unexpected way. It appears in a dream of Xu Xian, in which the image of Bai Niang dissolves into the image of pagoda (Figs. 22-23). He soon arrives at the pagoda (Fig. 24) to find that Bai Niang and Xiao quin are living there. Leifeng is not a prison but a pleasant home for the female protagonist and her attendant.

Fig. 22 Fig. 23 Fig. 24

Hong Kong Imagination (1)
Father and Son in Love of the White Snake (1978)

The representations of the white snake in Chinese and Hong Kong films and TV dramas show a different aspect from the Japanese examples. In The Love of the White Snake (1978), a Hong Kong film with the director Chen Chi-Hwa, the white snake gives a birth to a son. The last two sequences depict the prime happiness of Bai Niang and Xu Xian and the ensuing misery caused by Fa Hai.

The couple create a beautifully symmetrical composition with the baby in the middle (Fig. 25). This symmetry means their harmonious happiness, but is soon disrupted by the absence of Xu Xian, who excuses himself for a moment. The disruption of the symmetry triggers the intrusion of Fa Hai into their home, with his face being ominously in shadow (Figs. 26-27). Scared by his appearance, Bai Niang stares at him (Fig. 28). Their fight soon takes place and she is eventually caught by him in a bowl (Figs. 29-30) so that she may be taken to Leifeng Pagoda.

Fig. 25 Fig. 26 Fig. 27
Xu Xian detects that Fa Hai is a hypocrite who only wants to disrupt their happiness. He shouts at the monk and the baby held in his arms cries in the turmoil (Figs. 31-32), but no one prevents the monk from disappearing with the bowl (Fig. 33). This is the first explicit expression of the wickedness of the monk in the white snake films, and it is to be adopted by the ensuing films in Hong Kong and China.

The film ends with a brief sequence of Xu Xian and the grown-up boy coming to Leifeng Pagoda to look up in silence as if to greet Bai Niang inside (Figs. 34-37). The silent, sad, and grim expression in their faces intensifies the cost the Fa Hai has brought to this family, and attests to the remark that Xu Xian has given: “You only want to destroy our happiness.” This negative characterization of Fa Hai in the 1978 Hong Kong film also marks the 1993 Hong Kong film to which I am now turning.

---

7 Quoted from the ending sequence of *Love of the White Snake* (1978, Hong Kong, director: Chen Chi-Hwa).
Hong Kong Imagination (2)
Bai Niang Killed by Leifeng Pagoda in *Green Snake* (1993)

*Green Snake* (1993) produced in Hong Kong shares with its precursor the idea of Bai Niang giving a birth. But the birth does not give even a momentarily happy family image. The last two sequences depict the conflict between Bai Niang and Fa Hai, so that she may get back her husband. She causes the flood with the help of Green Snake, but in the middle of the fight with the monk, she suffers from such a heavy labor pain that she must interrupt the fight (Figs. 38-40). Looking at Bai Niang giving a birth, Fa Hai for the first time comes to a realization that “she’s really elevated herself to a human!”\(^8\) Bai Niang is exhausted and has the strength left only to hold her baby high up among the waves (Figs. 41), when Fa Hai shouts “Bai Niang, Leifeng Pagoda is coming to you. Danger!”\(^9\) The repentant monk saves the baby, but Bai Niang is left in the water to be struck by the pagoda spire to death (Figs. 42-43).

---

\(^8\) Quoted from the flood sequence of *Green Snake* (1993, Hong Kong, director: Tsui Hark).
\(^9\) Ibid.
Not only Bai Niang but Xu Xian are dead. The latter is stabbed at the heart by Green (Fig. 44), who wants to send him to the after world where Bai Niang has gone, telling him “You should be with her.”¹⁰ Unlike the Japanese film of 1956, the couple after death are not depicted. Fa Hai is left alone with Bai Niang’s baby in his hands (Fig. 45). The silent misery fills the film, and the uselessness of the fight is intensified. The only positive element in this film is that Fa Hai has repented and that the line between a human and a non-human is eliminated.

Chinese Imagination (1)

**Xu Xian Guarding Leifeng Pagoda in Madam White Snake (2004)**

In China, there have been quite a number of the broadcast TV dramas of the legend. They all agree to represent the monk as an evil spirit, thus expanding the negative interpretation of the monk in the Hong Kong films of 1978 and 1993. Moreover, the TV dramas introduce a new element of the ambivalent feelings of the monk for Bai Niang. His obsessive rejection of Bai Niang is, as defined by the successful TV drama *The Legend of the White Snake* (2004), derived from his repressed love for her. The inner voice of Fa Hai is heard, when the close-up of his own ear is shot: “You’re afraid of falling for her, that is why you want to kill her” (Fig. 46). His inner voice further points out: “Why do you interfere with other people’s business? ... You have become a demon ... Those who destroy love leave the world to

---

¹⁰ Quoted from the last sequence of *Green Snake* (1993, Hong Kong, director: Tsui Hark).
become a demon.” What he desires to destroy is a happy family built upon the love between Bai Niang and Xu Xian (Fig. 47).

Fa Hai and Bai Niang make a contrasting pair. The former is defined as a human being degraded to a demon, while the latter is a snake demon elevated even to a human and further to a deity. In the last sequence Bai Niang rides on a boat bound for the heavenly kingdom to become a deity (Fig. 48). But she chooses to return to this world to see Xu Xian only once more.

In the final meeting of the couple, Xu Xian gives to Bai Niang a symbolically significant umbrella which, throughout this TV drama, is repeatedly lent from Xu Xian to Bai Niang as an indication of his love for her as well as her loving gratitude for him. Holding the umbrella against her bosom and being seen off by him, Bai Niang gradually drifts upward in the air (Figs. 49-52). When she is locked in Leifeng Pagoda, the voice of Fa Hai is heard: “You can only spend your life here” (Fig. 59).

---

*Quoted from the episode 11 of Madam White Snake (2004, China, director: Li Peisen).*
Deprived of his dear wife, Xu Xian determines to go to his enemy’s temple, which is close to Leifeng Pagoda, and to become a monk himself, because only monks are allowed to approach the immediate vicinity of the pagoda. Seeing that he successfully becomes a monk (Figs. 54-55), Fa Hai quickly changes to an ugly, gaunt loser (Fig. 56). Xu Xian enters the vicinity and begins taking care of the pagoda by sweeping the ground (Fig. 57). In response to his words, “If you’re aware of this, could you please respond?” the umbrella that he has given to Bai Niang appears above his head and stays there as if to protect him (Figs. 58-59). Xu Xian is satisfied with this peculiar way of communicating with Bai Niang, and this image of Xu Xian with the umbrella above him (Fig. 60) is indicative of their happiness and victory over Fa Hai. This way of communicating with each other continues until Xu Xian becomes an aged man and the umbrella becomes ragged (Figs. 61-62).

---

12 Quoted from the episode 30 of Madam White Snake (2004, China, director: Li Peisen).
Chinese Imagination (2)

*Love of the Millennium* (2011), a TV drama that was made seven year later, follows its precursor in that Fa Hai is sexually attracted to Bai Niang. The monk’s love is more emphasized than ever, and his daydreams of her tender response to his desire are often depicted (Figs. 63–67). As he never gets her attention in reality, he uses a dirty trick to put her asleep and caresses her during sleep (Figs. 74–75). He obsessively retains Xu Xian from Bai Niang out of jealousy, and he is appropriately called “hypocrite” and “dictator” by Xu Xian (Figs. 78–80). The theme of this TV drama is not the line between a human and a non-human but a triangle love. All the main characters of this TV drama, including Bai Niang, Xu Xian, and Fa Hai, are inhabitants of the heavenly kingdom before they come to this world. They are incarnations of non-human creatures to begin with, and Fa Hai’s excuse for disrupting the relationship between a human and a non-human is not really valid. This TV drama is most far away from the legend in that it presents Fa Hai as a monk who is unreasonably attracted to another man’s wife.

---

13 Quoted from the episode 35 of *Love of the Millennium* (2010, China, directors: Liu Feng Sheng, Xuhui Kang).
The last sequence, however, shows a trace of the legend of the white snake. Leifeng Pagoda is depicted as a place for locking in Bai Niang. She accepts her fate and graciously walks to the pagoda with many monks lined up on both sides of her path (Figs. 75-76). The drama shows Bai Niang looking up the facade sign of the building in close-up to confirm that it is unquestionably Leifeng Pagoda (Figs. 77-78). She enters it and sits there motionlessly (Figs. 79-80). But when she finds Xu Xian approaching the pagoda, she sends out the small umbrella that she has
kept as a token of their love romance in the heavenly kingdom before they come to this world (Figs. 81-83). The couple exchange their smile across the door of the pagoda (Figs. 84-85). They can thus commune with each other even though they are separated in and out.
Re-introducing the Intermarriage between a human and a non-human in *The Sorcerer and the White Snake* (2011)

*The Sorcerer and the White Snake* in 2011 casts away the triangle love and re-introduces the issue of the line between a human and a non-human. Unlike the contemporary Chinese TV dramas, this film emphasizes the nature of Bai Niang as a white gigantic snake (Fig. 86). Fa Hai’s obsession to repel a non-human is equally re-introduced, and the deadly final fight between the snake and the monk forms a climactic spectacle.

The last sequence depicts such a spectacular fight which is triggered by the monk’s kidnapping Xu Xian, to whom Bai Niang is married while she is in the form of a woman. The white snake breaks a blockage of the monk’s temple and reaches dormant Xu Xian (Figs. 87-88). She carries him out to a safe place, which happens to be the walkway leading to the facade of Leifeng Pagoda (Fig. 89). The pagoda is thus introduced in the scene. The fight shows the greater power of the snake than the monk’s but, when Bai Niang is about to win, Buda’s hands appear and throw her into the pagoda (Figs. 90-94).
It turns out to be Budda's intention, rather than the monk's, to lock the snake in Leifeng Pagoda. Bai Niang's wish to see her husband only once more is granted by Budda, and their final embrace is shot with a song glorifying an eternal love (Figs. 95-99). This Chinese film has a quite unique ending that Xu Xian peeps into the pagoda where the white snake is enshrined under the supervision of Budda (Figs. 100-101). Leifeng Pagoda functions as an instrument of Budda. Xu Xian decides to take care of it as a guard for the rest of his life (Fig. 102).
Conclusion

There are cultural differences in the representation of the white snake between Japanese and Chinese films. The Japanese Snake is not locked in Leifeng Pagoda. Such a pagoda and the West Lake in Hangzhou have no significance to the Japanese spectators, who would not care where the story should take place. The spectators in Japan obviously preferred the couple's happiness to their misery. That the couple should have a happy ending is the key issue.

The Chinese films and TV dramas, on the other hand, are constrained by the existence of Leifeng Pagoda, on which all elements should converge. The pagoda is destined to separate Bai Niang and Xu Xian, thus leading the whole story to a tragic ending. To most Chinese people the specified location, Leifeng Pagoda in Hangzhou, means an obstacle to a happy life of their heroine, and should hopefully be removed. One of the representative Chinese novelists, Lu Xun, affirms that, when the real Pagoda collapsed in 1924, “people must have exploded in great exultation” to learn of the long-waited release of Bai Niang from the pagoda,\textsuperscript{14} for the legend tells that the snake would be liberated only if the pagoda falls down. Leifeng Pagoda is the key to the white snake films in China.

Besides the cultural differences, some discrepancies between the written text of the legend and films/TV dramas can be perceived, as examined. The text emphasizes the negative nature of the white snake as a fatal woman, who would have taken Xu Xian’s life if the monk had not distanced him from the snake. The action of the monk to disrupt the marriage between the white snake and Xu Xian is therefore justified in the written text. But the white snake in films/TV dramas is deeply in love with Xu Xian. Her pure love is accepted by Xu Xian with pleasure and they could lead a happy married life if the monk did not interfere with their happiness. The monk in films/TV dramas is a villain.

\textsuperscript{14} Lu Xun’s words are quoted in Kenji Nakano, The Record of Chinese Places (Toho Sensho, 1988), pp. 198-9. Nakano mentions several movements to save Bai niangzi out of the pagoda prior to its actual fall in 1924.
This paper has thus examined the selected Japanese and Chinese films and TV dramas based on the legend of the white snake in the cross-cultural and interdisciplinary perspectives to understand the differences in characterization of the white snake, her human husband, and the monk.

The Representation of Inner Darkness of the Characters in
Arthur Miller’s *A View from the Bridge*

Hikaru Masuda
Faculty of Modern Culture
Tokyo Junshin University, Japan

Abstract

Alfieri, a lawyer in Arthur Miller’s *A View from the Bridge* (1955), describes the leading character Eddie Carbone’s eyes “like tunnels” to indicate his psychological blindness in seeing only the fixed goal of his fate on the other side of the tunnel. Eddie is not the only character who is described as psychologically blind and dark in Miller’s plays. Joe Keller in *All My Sons* (1947), Willy and Ben Loman in *Death of a Salesman* (1949), and Phillip Gellburg in *Broken Glass* (1994) are similar characters to Eddie in terms of the limited scope of insight, to name a few. In this paper, the meaning of this inner darkness is explored through the visual analysis of Sidney Lumet’s film version of the same title, made in 1962. Based on Miller’s play, Lumet changed the portrayals of Eddie, his wife Beatrice, and his niece Catherine, including a radical ending to Eddie’s fate. How did Lumet employ the early 1960s filmmaking style to describe the relationships between Eddie, Beatrice, and Catherine? What effects did he introduce to revitalize Miller’s play? What is the significance of Lumet’s film adaptation of Miller’s play in the early 1960s? These are the questions that this paper will answer to reevaluate *A View from the Bridge*, which, until recently, had received little attention from both academics and critics in the United States.

Lumet’s Changes to the Ending of the Film

In the original play, Eddie is killed by accident in the confrontation with Marco, one of his relatives about whom he informs illegal immigrant status to the bureau of immigration. Alternatively, in the film, Eddie kills himself with a hook (or a dock spike, which symbolizes longshoreman’s life), upon realizing he is completely isolated from his community. Frank R. Cunningham points out the reason for this change as follows: “In Lumet’s vision, the death is not accidental, but the director charges Eddie with greater responsibility for his end, as for his life.”15

---

15 Frank R. Cunningham, *Sidney Lumet: Film and Literary Vision* (Lexington, KY: The
Lumet characterizes Eddie as an existential hero, like Miller’s John Proctor in *The Crucible*, who takes responsibility for his own life and death. However, what Miller originally created in his play is a tragic hero who is unable to change his fate. Miller’s Eddie is like the tragic heroes of Greek tragedy. For this reason, Miller has the lawyer Alfieri describe Eddie’s eyes “like tunnels.” The word “tunnels” does not only mean the narrowness of Eddie’s mind like the similar expression “tunnel vision,” but also signifies the fixed fate of the character. Like Sophocles’ Oedipus, Eddie cannot change his fate. Unlike Oedipus the king, Eddie is a working class man of the 1950s who acts according to his own instinct rather than his intellect. However, both Oedipus and Eddie cannot change the course of their lives according to the situations surrounding them. Eddie is a character who advances forward even though he knows the tragic end is coming closer. Thus Alfieri’s description of Eddie’s eyes “like tunnels” fits well in the context of the play. Then how does Lumet change the portrayal of Eddie for his cinematic adaptation?

Lumet employs large depth of field in his *A View from the Bridge*. Instead of using Miller’s words “like tunnels,” the director takes advantage of in-depth composition to express Eddie’s inner darkness. In this film, the characters in the shallow foreground dominate the subjective points of view in each scene. In many cases, the characters in the middle of the field express confrontation and the characters in the deep background are the object of desire for those in the shallower field. As a whole, this in-depth composition functions “like tunnels” that confine the scope of field in which the characters think and act. The confined space which stretches only into the deep background signifies the destiny which they cannot avoid. Lumet skillfully and successfully converts Miller’s play into an early 1960 American film in which the staging of in-depth composition was an artistic convention in the industry. Elia Kazan, John Cassavetes, and John Frankenheimer are examples of characterization created by in-depth composition to name but a few. So what are the particularities of Lumet’s use of this convention which distinguish him from his contemporaries? How is the characterization of Eddie, Catherine, and Beatrice affected by the alteration of the ending and subsequent use of in-depth composition?

**The Change in the Depiction of Eddie**

Eddie is shown in the open space of the waterfront near Brooklyn Bridge at
the beginning of the film. He can freely walk around the docks surrounded by his fellow longshoremen who trust him as a leader of the community. He is an honorable man who never betrays his friends and relatives. He lives in a humble neighborhood where he is a role model of the community and trusted by people of all ages. He is even treated as a hero by the children of the neighborhood. Eddie’s free movement in the open space all the more emphasizes his sense of confinement inside his apartment. Eddie’s intimate relationship with his eighteen year old niece, Catherine, is depicted in a narrow bathroom where he washes his face in his underwear while she, sitting beside him, applies her perfume. She serves him beer and later lights his cigarette. Framed in a two shot, they appear affectionate enough to be mistaken for lovers (Figs. 1-3). Eddie evidently feels too much intimacy towards Catherine than an uncle should, and she, likewise, expresses too much affection towards him, even though, for her, he is a surrogate father figure. Since she is an orphan, it is her basic instinct to try to be an object of her uncle’s love and even desire to extract as much care and concern from him until she finds her young and handsome protector outside of the family.

Fig. 1

Fig. 2
When Eddie notices Rodolpho, another relative from Italy, taking Catherine for a ride, ignoring his wife’s warning, he violently grabs the knob to open the front door, which is shown in Dutch angle through a mirror’s reflection, to chase the young couple. The use of Dutch angle in this crucial moment means something is wrong with the situation and this is further exaggerated by shooting through the mirror. When Eddie opens the door, shot from this slanted angle, he chooses a difficult path in his life (Figs. 4-6). From now on, all he can do is reach the other side of the tunnel, which leads to his destruction.
Eddie follows the young couple through the city streets and enters a Horn and Hardart automat in which Catherine and Rodolpho are on a date. He sips coffee alone and his isolation and loneliness are emphasized in a low angle close-up, which clearly shows his expression, with fixed eyes staring at the empty space before him. He leaves the automat alone and starts walking straight towards the lights far ahead of him. He moves into the night and the darkness of the city street. Here Lumet visualizes Eddie’s inner darkness using the dark city night. (Figs 7-9).

![Fig. 7](image)

When Eddie decides to accept the duel with Marco, he opens the same door to reach his tragic end. The front door of Eddie’s house in the film is depicted as the tunnel’s exit. Eddie’s fate is decided from the beginning in the original play. As Stephen A. Marino points out, “Eddie’s real tragedy is that he does not recognize the tunnel he is walking through.”

---

16 Stephen A. Marino, “Verse, Figurative Language, and Myth in *A View from the
to open the door to tragedy himself. He is conscious of the fact that he is walking through the tragic tunnel, however, he cannot stop walking. Simply put, he cannot stop loving Catherine. Eddie does not listen to Beatrice’s last plea, “You want somethin’ else, Eddie, and you can never have her!” (p. 70) His determination isolates him from the community so completely that his close up is shot against the complete darkness. Eddie’s face looks as if it were his death mask (Fig. 10). He hurries down the dark stairs (Fig. 11). He gets out of his apartment, ready to have the duel (Fig. 12).

Fig. 10

Fig. 11

Fig. 12

17 All the quotations of _A View from the Bridge_ are taken from Arthur Miller’s two-act version published in 1957. (New York: Penguin Books, 1957)
The Change in the Depiction of Catherine

In the original two-act play, Catherine is unconscious of Eddie’s desire for her. However, in the film, Catherine shows her intimate and affectionate relationship with Eddie in front of Beatrice. Catherine in the film is competing with Beatrice for Eddie’s love and desire in order to secure her position in the household as an orphan. Thus, when Catherine is warned not to act as if she were a twelve year old girl and not to walk around in front of Eddie in her slip, she pretends to have forgotten the warning. Consequently, she lies to Beatrice and that lie is pointed out by her.

Catherine gives a beer to Eddie and lights his cigarette. When she is asked not to wear high heels nor “walk wavy,” she says to Eddie, “Well, I don’t know what you want from me.” (p. 4) She is aware of Eddie’s desire to preserve her chastity. At the same time, as a grown woman, “Catherine shows acute sensitivity to Eddie’s needs as a man and remarkable perception that Bea does not provide for them.”\(^\text{18}\) In the film, she is aware of Eddie’s sexual desire for her and Beatrice’s jealousy towards her (Figs.13-15).

---

\(^{18}\) Marino, p. 207.
The Change in the Depiction of Beatrice

Beatrice is depicted as a frustrated wife who realizes her husband’s desire for his niece from the beginning of the film. She warns Catherine not to behave as if she were a twelve year old girl in front of Eddie. Beatrice tells her to act like a grown woman who keeps appropriate distance from her uncle. Beatrice is quick to see through Catherine’s lie about staying at her uncle’s as long as she can. She fully understands that Catherine considers Eddie’s protection to be just a temporary shelter for her life, so promptly denies Catherine’s remark about her staying with Eddie: “You’re lying.”

Beatrice is positioned in the shallow foreground when she confronts her husband about their sexual relationship. She dominates the foreground of the frame while Eddie is lying on the bed in the background (Figs. 16-18). This framing expresses the idea that Beatrice is the subject of the scene and Eddie is the object. Beatrice asks him, “When am I gonna be a wife again, Eddie?” (p. 25) She continues, “What’s you gonna stand over her till she’s forty? Eddie, I want you to cut it out now, you hear me? I don’t like it!” (p. 25)
Beatrice does not witness the violent scene in which Catherine and Rodolpho’s love affair ignites Eddie to kiss Catherine on the lips and threatens Rodolpho with a broken beer glass, pointing its jagged edges at him (Figs. 19-21). This image appears dark and blurring and dimly-lit to represent the darkness and sinister side of the characters’ relationship. Significantly, Catherine and Rodolpho’s love scenes are presented fully lit by contrast, as this is deemed a more appropriate relationship. So Beatrice rather convincingly remains a faithful wife to Eddie until the end of the film. In the original play, Beatrice sees Eddie passionately kiss Catherine on the lips. Beatrice in the film is characterized as a dutiful woman who understands and forgives Eddie out of genuine love for him. She even slaps Catherine’s face when she insults Eddie as “this rat.” (p.68)
Alfieri’s Depiction of Eddie

Alfieri functions as a chorus in Greek tragedy which predicts the fate of tragic heroes. When he gives legal advice to Eddie in his law office, Alfieri realizes that Eddie is not a man who follows advice. After the consultation with Eddie, he confesses that “I could see every step coming, step after step, like a dark figure walking down a hall toward a certain door. I knew where he was heading for, I knew where he was going to end.” (p. 38) Alfieri’s depiction of Eddie is visualized by Lumet in the dark street scene in which Eddie walks into the dark street as if he were seeking the other end of the tunnel. After this visual image, Alfieri receives Eddie in his office and gives him his final warning. Alfieri fully understands Eddie’s desire for Catherine saying, “Somebody had to come for her, Eddie, sooner or later. You won’t have a friend in the world, Eddie! Even those who understand will turn against you, even the ones who feel the same will despise you! Put it out of your mind! Eddie!” (p. 54) Alfieri is unable to stop Eddie for reporting two illegal immigrants, Rodolpho and Marco, to the Immigration Bureau to get young Rodolfo out of Catherine’s life.

When Eddie leaves his office, the door is shot in a dimly lit background towards which he is walking. Or more precisely, wherever he goes, that place is shot in low key lighting. He is a character who is destined to a tragic end. Alfieri says in the original play, “But I will never forget how dark the room became when he looked at me; his eyes were like tunnels.” (p. 53) Stephen A. Marino gives his
interpretation of this line, “Alfieri describes Eddie’s eyes ‘like tunnels’ to indicate the light and inevitability of fate through which he was traveling.”

Marino’s interpretation of the line emphasizes Eddie’s fixed fate. However, unlike the original play, the words “like tunnels” are not used in the film. Instead, what is projected on the screen is the way in which Eddie makes his final choice in life. The close up of Eddie is shot against the dark background to express his dark will to get rid of Rodolpho, whatever price he must pay for it (Fig. 22). He dashes through the door and heads straight for a telephone booth. His direct movement emphasizes his strong will to walk through the tunnel towards his final destination. (Figs. 23-24)

Fig. 22

Fig. 23

19 Marino, p. 212.
Conclusion

Eddie's fixed eyes are depicted in upward and downward tilt rather than horizontal shots like pans or tracking shots. He is constantly shot in in-depth composition to indicate the narrowness of his mind. He is shot against the complete darkness in crucial moments when he reveals his dark nature. He does not try to overlook the situation around him to broaden his mind. He is a character who lives in a limited circle of people and community. He is a human being who is incapable of living in isolation from his fellow citizens. Since he committed the sin of incestuous desire for his niece and the betrayal of his relatives from Italy, he has been expelled from his community. In the film, Eddie is clearly warned to put Catherine out of his mind by Alfieri and Beatrice. It is his choice to let his obsession with Catherine continue, even though he is fully aware of the consequences. Therefore, Eddie's death is more suitably depicted in the film than in the original play. Eddie's death is a suicide chosen by his own will rather than an accident caused by the confrontation with Marco. In this sense, the film version of the play is more suitable to the realism of the American 1960s. The characterization of Eddie, Catherine, and Beatrice is more convincing to the audience of the 1960s, especially in France and other European countries. Lumet, who knows the taste of the European audience, turned Miller's rather naïve interpretation and depiction of the characters into a more mature one and made the film more sophisticated for the world audience.

The Image of Beer in William Hogarth's *Beer Street* and *Gin Lane*

Kanoko Karasawa

Graduate School of Humanities and Social Sciences

Abstract
The pair of engravings by William Hogarth, *Beer Street* (Figure 1) and *Gin Lane* (Figure 2), show a clear difference in terms of drinking. The engraving about beer drinking shows happy people in pleasant atmosphere, on the other hand, that of gin drinking shows degenerates groaning under miserable state. Those engravings are published in the time of gin craze to alarm danger of gin drinking.

The image of beer is the key to searching the differences between the two engravings, and it is determined by small items arranged in them. A basket accompanied by a man on the right corner of each engraving enhances the image of each atmosphere. The fictional book *Politicks vol. 9999* in the basket in *Beer Street* is the most important material which shows people's attitude which leads to happiness or misery expressed in each engraving.

Plato argues in *Laws* that a rightly held banquet is good for education. His ideal education is training for becoming a perfect citizen who rules himself by his consideration. The book *Politicks vol. 9999* is the influential book about knowledge which is befitting citizen and this shows that the people in *Beer Street* are interested in being perfect citizens. The image of beer is connected to education and self-discipline to show Hogarth's ideal.

Introduction
When we think about the contrast between *Beer Street* and *Gin Lane*, we are likely to conclude that alcoholic drink in each engraving caused their happiness and misery. This is the authentic answer for this question, but when we pay attention to other materials, we will discover hidden meanings which help to understand Hogarth's ideal expressed in his works. Charles Lamb emphasizes that Hogarth's print is readable\(^\text{20}\). Reading is the most effective way to analyze his works.

I will clarify the image of beer by small items such as books, newspaper, and foods in baskets which are arranged in the foreground of *Beer Street*. I will also point out importance of pleasant atmosphere in the engraving. The poems dedicated

\(^{20}\) Lamb, p. 106
to the pair of engravings give comprehensive image for us to read Hogarth’s works. Plato’s *Laws* and *Protagoras* help my analysis of the meaning of the fictional book *Politicks vol. 9999* and positive image of beer drinking.

Figure 1 *Beer Street* by William Hogarth (1751)
My analysis will mainly be made on materials and people in the foreground of *Beer Street* and I will point out that of *Gin Lane* when necessary. First I will argue materials such as books, pamphlets and newspaper to explain about the function of letter, and then I will start to analyze meaning of the fictional book *Politicks vol. 9999* in the basket. I will also make clear function of pleasure with beer in mugs and
foods in baskets. The obvious connection among beer, politics and education will be discovered in the end.

**Knowledge in Beer Street**

When we look at *Beer Street* we find the satisfied people who are working and drinking. Contrary to the people in *Gin Lane*, they are in the calm and convivial atmosphere. The pleasant people in the foreground are singing, arguing, and wooing, and the people in the background are also pleasant to work except the pinched pawnbroker.

The books, the pamphlets, and the newspaper in the foreground are emphasized by being put at the front of the people, and this shows that they are satisfied to be educated to be rational. Those materials are shown as knowledge of enlightenment which helps them to control their emotion. People's deeds in *Beer Street* are led by their rationality which is obtained by the study at the beer banquet.

Contrary to the calm people in *Beer Street*, we find the violent people in *Gin Lane*:

Gin, curst fiend! with [*sic.*] fury fraught,
     Makes human race a prey:
It enters by a deadly draught,
     And steals our life away.

Virtue and Truth, driv'n to despair,
     Its rage compels to fly,
But cherishes, with hellish care,
     Theft, murder, perjury.

Damn’d cup! that [*sic.*] on the vitals preys;
     That liquid fire contains:
Which madness to the heart conveys.
     And rolls it through the veins.

This poem was specially written for this engraving by James Townley, an artist, who is a friend of Hogarth. He describes gin as the worst thing in the world. Cheap gin easily deprives health and sanity, just as the saying on the gin shop’s entrance
shows as follows: drunk for a penny, dead drunk for two pence, clean straw for nothing.

As Henry Fielding alarmed, increase of thieves, destruction of morality and loss of laborer were the grave problems to be reformed. Agricultural progress throughout the Eighteenth Century gave birth to wealth for all classes. Overproduced corn is brewed to gin, which bewitched Londoners between 1720 and 1750 and it is called ‘gin craze’. Londoners, especially people in lower class consumed cheap gin excessively for recreation, and this lead to increasing crime and death rate.

Townley’s poem has fierce image of demolition of humanity caused by gin drinking, and there are many criminal deeds in Gin Lane. Henry Fielding wrote in his An Enquiry into the Causes of the Late Increase of Robbers, &c. that gin drinking drives people to bad deeds:

This will appear from considering, that however cheap this vile potion may be, the poorer sort will not easily be able to supply themselves with the quantities they desire: for the intoxicating draught itself disqualifies them from using any honest means to acquire it, at the same time that it removes all sense of fear and shame, and emboldens them to commit every wicked and desperate enterprise. (375)

The people in Gin Lane are the very people who Fielding wrote in his work. They are not far from rationality but from discipline to stop their desperate motivation. He also wrote that their crime was caused just because they were intoxicated and when they became sober they were no more wicked criminals. As Fielding says, the people in Gin Lane are deprived of rationality by gin drinking, and if they do not drink gin they would be less desperate.

Through searching letter in Gin Lane we find two types of it: letter as the gadget in this tragedy and letter in signs. The former is used in the ballad in the gin seller’s basket in the foreground, and it is shown only to the spectators to explain that the misery was caused by gin drinking. The latter are used in the signs of the gin shop, the pawnbroker, and the gin distiller. Those signs are both for the spectator and the people in this engraving.

There is no educating material is shown in Gin Lane. Contrary to Beer Street, letter in Gin Lane is mainly used for the signs of those shops, and this shows that
there is letter only for commercial purpose, not for education. What they have is savagery in the mess of gin drinking.

The Ideal Education

There are the baskets in the foreground of each engraving. They are described as containers which hold items in them and there are more baskets in Beer Street than in Gin Lane. The Baskets in Beer Street have fresh fishes, vegetables, and books, on the other hand, one and only basket described in Gin Lane has a gin bottle and a ballad “The downfall of Mrs. Gin”.

Two of the most important baskets in my investigation are on the right corner of each engraving. Each basket is accompanied by a man who has the same image to each engraving: the man who has small and empty basket in Gin Lane is poorly dressed and almost dying, and the man who has big and full basket in Beer Street is neatly dressed and vigorous.

The basket full of knowledge is accompanied by the lively man who is drinking beer delightfully. Those books are strongly tied in case of scattering while materials in other baskets are not. Those books are the essays in those days except the fictional book Politicks vol. 9999. Compared with the almost dead man who has only dramatic gimmickry in his basket in Gin Lane, we can read Hogarth’s message here that knowledge and beer are essential for one’s life.

Our issue now is the fictional book Politicks vol. 9999, which is put on the base of other books. The books are tied so strictly that they are not changed their position. It is important that Politicks vol. 9999 is the base of those books and knowledge which is essential to one’s life. Also we know from its title that political knowledge is very important among the people in Beer Street.

There is an argument about politics and banquet in Plato’s Laws. The thesis which tells a rightly held banquet is good for education is argued eagerly in the Book 1 and 2. The Athenian stranger shows the ideal education as follows:

οὐ γὰρ ταῦτα ἡγομένων, ὡς ἔοικεν, εἶναι παιδείαν ὁ νῦν λόγος ἢν εἴη, τὴν δὲ πρὸς ἁρετήν ἐκ παιδείων παιδείαν, ποιοῦσαν ἐπιθυμητὴν τε καὶ ἔραστην τοῦ πολίτην γενέσται τέλεων, ἀρχὴν τε καὶ ἀρχεσται ἐπιστάμενον μετὰ δίκης. (Laws, 643Ε)

But I think our talk until now is not about the subject on education now. The education we speak of is the training from childhood for goodness, which makes a man who desires and loves to be a perfect citizen understanding how to rule
and to be ruled righteously. (translation mine)

He emphasizes that the ideal education is the training for becoming a good, not the training for becoming a businessman. The issue is how to be a member of his community in order to give it the greatest benefit and the Athenian stranger also shows that intelligence and justice are the important materials. According to him, even a banquet will be an educative event because who educated rightly usually become good people and education is the greatest gift for good people.

It is important that this ideal education is just for freeman. The people in Beer Street consist of workers of lower class and women, whom Plato excluded from the argument here. I will argue this issue later and would like to go on to the next article:

Καὶ μὴν πάλαι γε συνεχισάμεν ὡς ἀγαθῶν μὲν ὅντων τῶν δυναμένων ἄρχειν αὐτῶν, κακὸν δὲ τῶν μη. (Laws, 644B)

We even agreed a little while ago that who can rule themselves are good, but who cannot is bad. (translation mine)

The distinction made by Plato fits in the image of each engraving that Beer Street is good and Gin Lane is bad. The people in Gin Lane seem to fail to control themselves against both pleasure of forgetting reality and pain of stopping gin drinking. Actually the pleasure which they choose is a bad one which will bring them more pain.

There is another argument about controlling oneself in Plato’s Protagoras. According to Socrates people usually fail to rule themselves:

οἶσθα οὖν ὅτι οἱ πολλοὶ τῶν ἀνθρώπων ἐμοὶ τε καὶ σοὶ οὐ πείθονται, ἄλλα πολλοὺς φασι γιγνόσκοντας τὰ βέλτιστα οὐκ ἔθελεν πράττειν, ἐξὸν αὐτοῖς, ἄλλα ἄλλα πράττειν. καὶ ὅσους δὴ ἐγὼ ἠρώμεν ὧ τι ποτὲ αἰτίων ἐστὶ τοῦτο, ὑπὸ ἥδονῆς φασιν ἠπτωμένους ἢ λύσης ἢ ὅν νῦν δὴ ἐγὼ ἔλεγον ὑπὸ τινος τούτων κρατουμένους ταῦτα ποιεῖν τοὺς ποιοῦντας. (Protagoras, 352D~E)

Now you know that most people will not listen to me and you, but say while many people know the best thing, they refuse to do it, though they are allowed to, and do other things. And once I asked what the reason of this is, they say
those who act so are defeated by pleasure or pain or conquered by one of the things I mentioned before. (translation mine)

Those kinds of people are not rare, but this is the problem. It is clear that gin craze continued because people failed to stop drinking gin, even if they knew the importance of their health. The degenerates in *Gin Lane* were the common people with normal character from the first, and they were far from people with evil intention.

Contrary to the normal people in *Gin Lane*, the People in *Beer Street* seem to succeed in controlling themselves. They are also lower class people and the difference between them is the important point. Those good people know what the best thing to do is and they also perform it without being defeated by anything. The moral difference between the two of engravings is explained from the knowledge arranged in the foreground of *Beer Street*:

Now do you imagine that knowledge is basically good and is able to govern man, and that whoever learns good and bad will never be conquered by anything to act otherwise than knowledge orders, and that prudence is a sufficient assistance for humankind? (translation mine)

The people in *Beer Street* are ruled by knowledge which orders them to perform the best thing, that is, to drink beer, while the people in *Gin Lane* do wrong thing, that is, to drink gin, because they lack knowledge. The miserable people in *Gin Lane* are governed by gin and this is explained by the sign of the gin shop which says “GIN ROYAL”. The tyrant of fire water comes with a draught in their brain to take their moral away.

The Athenian stranger adds value on prudence in *Laws* as a conductor for ruling oneself. He says that one’s motivation is made by five factors as pleasure, pain, fear, boldness, and consideration. Consideration helps one to tell good from bad and it is necessary for self-discipline because of its function. He also says what is good and what is bad have to be taught righteously in one’s community from
childhood.\textsuperscript{21}

Those five materials, which are able to lead one both to good and bad, attract one to perform each deed which is effected by each thought and passion.\textsuperscript{22} The Athenian stranger emphasizes that consideration is the only factor which helps one to perform and become good to control oneself. So it is important for one to resist other thought and passion but this factor. He also says that laws are the common statement in a nation which are made by the lawgiver’s consideration.

The image of happiness is the other important element in \textit{Beer Street}, and it concerns with their alcoholic drink:

\textit{oίον δὴ λέγω ἐδοική μὲν καὶ πόσει καὶ ξυμπάση τροφή παρέπεσθαι μὲν τὴν χάριν, ἢν ἣδονὴν ἄν προσείπομεν· ἢν δὲ ὑρθότητα τε καὶ ὑφέλειαν, ὅπερ ύμεινὸν τὸν προσφερομένων λέγομεν ἐκάστοτε, τούτ’ αὐτὸ εἶναι ἐν αὐτοῖς καὶ τὸ ὑρθότατον. (Laws, 667B\textendash{}C)}

For instance, as I say, food, drink and nutriment in general are accompanied by charm, which we call pleasure. And, as for correctness and utility, the very thing which is wholesome every meal and which is contained in nutriment are what we call the most correct element. (translation mine)

We can find not only beer but also meat, fish and vegetable in the foreground of \textit{Beer Street}, and those nutriments except meat are hold in mugs and baskets. Meat is grappled tightly in the smith’s hand, and it has image of strength. Those images show just as the books in the basket that nutriment is essential for one’s pleasure and strength. On the contrary to \textit{Gin Lane}, the people’s pleasure in \textit{Beer Street} is not the motivation for their behavior, but gift of beer drinking.

Those nutriments are movable because they are not fixed in the baskets, and it shows that they are less important than the books. Also, if they change their baskets in the \textit{Beer Street}, the meaning they have is not changed. They are just pleasure held in the containers.

Correctness and utility of those nutriments, especially beer, are shown in the people’s health in \textit{Beer Street}. In regard to gin, it is not described as nutriment because those who in \textit{Gin Lane} are far from wholeness. The only thing to have

\begin{footnotes}
\textsuperscript{21} Plato, \textit{Laws}, 653

\textsuperscript{22} Ibid, 644C\textendash{}645C
\end{footnotes}
correctness and utility in *Gin Lane* is money, and it is shown in success of the gin shops and the pawnbroker. Their houses are handsome and gorgeous in the wreck because they drain all of money in the lane.

We go on an argument about learning next:

Καὶ μὴν καὶ τῇ μαθήσει παρακολουθεῖν μὲν τὸ γε τῆς χάριτος τῆς ἥδονῆς, τῆς δὲ ὀρθότητα καὶ τὴν ὑφέλειαι καὶ τὸ εὖ καὶ τὸ καλῶς τῆς ἀλήθειας εἶναι τὴν ἄποτελοῦσαν. (*Laws*, 667C)

Also, learning is accompanied by charm which we call pleasure, and what makes correctness, utility and goodness is truth. (translation mine)

Learning, which helps one to train consideration, has pleasure, correctness and utility, just as nutriment does. According to this, the people in *Beer Street* have double advantage compared to those in *Gin Lane* by both beer and knowledge.

Townley also wrote a poem for *Beer Street*. Contrary to that of *Gin Lane*, It has bright image, which is expressed by the words as happy, strength, cheer and health. Those words fit in the argument now:

Beer, happy product of our isle,
    Can sinewy strength impart;
And, wearied with fatigue and toil,
    Can cheer each manly heart.

Labour and art, upheld by thee,
    Successfully advance;
We quaff the balmy juice with glee,
    And water leave to France.

Genius of health, thy grateful taste
    Rivals the cup of Jove;
And warms each English, generous breast,
    With liberty and love.

The barley nectar cheers the healthy people and gives them enough vitality for working and art performing. This poem also shows that they are enjoying not only
banquet of beer, but also correct and useful element in their nutriment.

Although beer is expressed as the upholder of art in this poem, the artist who is painting the sign in the foreground does not drink beer. Moreover the motif is a gin bottle and the artist seems to be pleasant painting the sign of gin. He is a skinny person with poor clothes, while his countenance has no difference to other people in the foreground. The artist is the only person who is with gin, which destroyed the lives of the people in *Gin Lane*.

Each engraving contains a few elements which has the image of the counterpart. The artist in *Beer Street* has the same image of poverty to the people in *Gin Lane*. The dogs in *Gin Lane* may be fighting dogs for bear baiting, which was played in alehouse. There are also common motifs in two and it is the pawnbroker. In Gin Lane it gripes all money and belongings of people, as its name on the sign says, on the other hand, in *Beer Street*, it is pinched and the shopkeeper buys a half-pint of beer through the hole in the door, withdrawing in the shop.

Most of the elements which have the image of the counterpart are in a miserable state, while the artist of the gin sign looks happy in *Beer Street*. He was arranged in the foreground with other pleasant people drinking beer, and his mysterious smile seems to be the key to this issue.

If smile on the artist’s face is not caused by beer drinking, why does he look pleased? Plato argues in *Laws* about pleasure concerning art as follows:

> Οὐκόν ἣδονὴ κρίνοιτ' ἂν μόνον ἑκάστα ὀρθῶς, ὃ μήτε τινὰ ὑφέλειαν μήτε ἀλήθειαν μήτε ὁμοίωτητα ἀπεργαζόμενον παρέχεται, μηδ' αὐτῷ γε βλάβην, ἄλλ' αὐτῶ τούτῳ μόνῳ ἐνεκα γένοιτο τοῦ ἵμαρσαι τοῖς ἄλλοις, τῆς ἀλλιτικής, ἢν δὴ κάλλιστα τις ὁνομάσαι ἄν ἣδονὴν, ὅταν μηδεν ἀυτῇ τούτων ἐπακολουθῇ; (Laws, 667D-E)

Then the only thing judged by the criterion of pleasure is what provides neither profit nor truth nor similarity, nor yet harm, and what is produced for itself, being accompanied by the other elements. The charm is named pleasure whenever it is accompanied by none of them. (translation mine)

The Athenian stranger says that music and art are important for education to teach people good and bad so a judge is required goodness. He also says that value of music and art should not depend on whether they are pleasing, but on whether their theme and expression are fit for the purpose.

---

23 Ibid, 653D-674C
According to the Athenian stranger, pleasure is an element which is just pleasing. It seems that there are two types of pleasure in Beer Street which is made by different causes. Investigating other elements which are named in the article should show us the reason for the artist’s smile.

The gin sign is small compared with the beer sign above, and the picture is not very similar to the bottle hanged as a model. It is not clear whether the upper sign was painted by him, but the gin sign which the artist is painting now is too small to make enough profit to change him a plump, neatly dressed man as other people enjoying drinking beer.

The bad effect brought by this sign seems to be little because the people regard beer as the best and the only alcoholic drink, so scarce attention is paid to it. The gin sign seems to be used for a material which shows that the time of the pair of engravings are almost same, that is, the time of gin craze. Degeneration of gin in Beer Street is effective for education to teach the spectator that beer is good but gin is bad.

The gin sign is not accompanied by harm, profit, truth or similarity, and this shows that the artist smiles just because he feels pleasure in painting itself. He may be satisfied with his talent of painting, but the sign does not show the truth and the similarity concerning to art which Plato argues in Laws.

The common element which the people in foreground have is pleasure. As for the artist, he is rather an additional element to the beer sign which says “Health in the Barley Mow”. The outdoor pub under the gorgeous sign provides them happiness, and teaches the spectators superiority of beer over gin in everything.

Their pleasure has good effect on the spectators too:

Οὐκοῦν ὁ μὲν μὴ χωρίζων λόγος ἥδυ τε καὶ δίκαιον καὶ ἴγαθόν τε καὶ καλὸν πιθανός γ’, εἰ μηδὲν ἔτερον, πρὸς τὸ τινα ἐθέλειν ζῇν τὸν ὅσιον καὶ δίκαιον βίον, ὡστε νομοθέτῃ γε αἰσχροτος λόγον καὶ ἔναντιώτατος ὃς ἂν μὴ φῆ ταῦτα οὕτως ἔχειν: οὐδείς γὰρ ἂν ἐκὼν ἐθέλοι πειθεῖσθαι πράττειν τούτο ὅτι μὴ τὸ χαίρειν τοῦ λυπεῖσθαι πλέον ἔπεται. (Laws, 663~663B)

In fact, the opinion which does not separate pleasure from justice, good and beauty is persuasive, if nothing else, to let someone live a devout and just life, so, to the lawgiver, the opinion which refuses this is the most shameful and the most opposing of all. For no one is willingly persuaded to do a painful thing which is not accompanied by more pleasure. (translation mine)
Pleasure helps people to live good lives when it is the concomitant to a lesson. The first concern to the lawgiver is how to lead the people to do their nation the best, and it should be performed with their agreement. It is important to teach them what the happiest life is, and the two kinds of lives are easy to imagine.

If the lawgiver teaches them that the happiest life is the most pleasant life, it is too human to suit to the point of view that laws are endowed by gods. On the other hand, if he teaches the happiest life to be the justest life, they choose the pleasant one because it has more charm than the other. So it is persuasive to connect justice with pleasure when the lawgiver leads the people to the purpose, because pleasure is very attractive for those who are subject to their passion. Most of the people are not trained enough to control themselves.

The pleasant people in the foreground of Beer Street are gimmickry to teach the spectator what the happiest life is, and it is the very purpose of the pair of instructive engravings. Banishment of gin may be accompanied by pain, but one get more pleasure to do their country good, with a mug of beer.

**Conclusion**

Now we need to remember the thesis that a rightly held banquet is good for education. The banquet in Beer Street is the right one which is effective for instruction. The Athenian stranger shows the ideal banquet as follows:

Οὐκοῦν ἔφαμεν, ὅταν γίγνηται ταῦτα, καθάπερ τινὰ σίδηρον, τὰς ψυχὰς τῶν πινόντων διαπόπους γεγονόμενας μαλθακωτέρας γίγνεσται καὶ νεωτέρας ὡστε εὐπαίγονος ξυμβαίνειν τῷ δυναμένῳ καὶ ἑπισταμένῳ παιδεύειν τε καὶ πλάττειν, καθάπερ ὡς ἦσαν νέαι; (Laws, 671B–C)

You know we said that when they are held, the souls of the drinkers become just like hot iron and turn softer and younger, so they become easy to lead for the man who has the skill and ability to educate and mold, just as when they were young. (translation mine)

The rightly held banquet is an educative place for people’s soul organized by the lawgiver who can instruct them to be good. He also expects that people never have a drunken brawl if banquets are administered in this way and each drinker endeavors to train himself. As the case of ruling oneself, even consideration is
regarded as an important factor in a banquet.

According to the Athenian stranger, prudence should be trained in the ideal banquet. There are two elements which are essential to ruling oneself, and they are courage and prudence. He also says that the former is trained in fear, aided by law, on the other hand, the latter is trained in the situation which make one bolder, that is, in a banquet. The ideal banquet is not an event to just be merry, while pleasure in Beer Street is important for its lesson.

As the saying goes, alcoholic drinks sometimes disclose the character which people does not show usually. It is useful not for spying out someone’s shortcoming but for knowing weakness in the soul of oneself. The Athenian stranger also regards banquet as the event to know the state and the character of the attendance’s soul. He also says that this process helps to take care of oneself.

Here the Athenian stranger mentions the art related to banquet:

Τοῦτο μὲν ἄρ’ ἂν τὸν χρησμοστάτον ἐν ἑι, τὸ γνώναι τὰς φύσεις τε καὶ ἐξεις τῶν ψυχῶν, τῇ τέχνῃ ἐκείνῃ ἥς ἔστι ταῦτα θεραπεύειν· ἐστὶ δὲ ποι, ὡς οἴμαι, πολιτικὴς. ἥ γὰρ; (Laws, 650B)

This, the event to know the natures and the conditions of the souls, will be one of the most useful things to that art to take care of the souls. And I suppose the art is the art of politics. (translation mine)

The ideal banquet is the educative place for the softened souls to know the nature and the condition of themselves and to train their prudence aided by consideration. Moreover it is necessary for the art of politics, that is, the art befitting a citizen. It is the training to become a perfect citizen which the Athenian stranger defined the ideal education. Whoever wants to be a perfect citizen should rule himself with his consideration, and, at the same time, he is ruled by laws which are made from the lawgiver’s consideration.

The fictional book Politicks vol.9999 hold in the basket in the foreground of Beer Street is the book about the art of politics, which contains the knowledge for being a perfect citizen. It is also noteworthy that the book is very voluminous. It takes a long time to compile 9999 books, so we can imagine that the art of politics have been the primary concern to the people in Beer Street.

---

24 Ibid, 646E–650B
25 Alcaeus, 333, 366
The art of politics is accompanied by banquet, and it should be that of beer. Beer which is described in *Beer Street* is not the alcoholic drink for intoxication while gin which is described in *Gin Lane* is just for intoxication. This contrast is also shown in the poem by Townley. In his poem, gin only deprives people from everything, and it never gives anything good to them. Contrary to the description of gin, beer is mentioned as the giver of grace.

Two men on the right corner of the engravings have the same images to their world, and they are characterized in the plump or skinny bodies. The image of the body of each man is determined whether he has the pleasure, the correctness and utility in his alcoholic drink.

The gin drinker is skinny and is about to die because he does not receive those good elements from gin. In other words, gin has the only element of drunkenness, so he cannot take any other nourishing elements. The poor thin man is dead drunk and he seems not to have any intention.

On the other hand, the plump body of the beer drinker shows the extra good elements in beer. There are nutriments and knowledge in *Beer Street*, and he is enjoying good elements in all of them. He is not dead drunk and he looks vigorous. He shows his intention by quaffing beer to absorb more goodness from his alcoholic drink.

We can see a passage of time in *Beer Street* in the volume of the book, while momentary events are shown in *Gin Lane*. There seems to be an expectation that gin craze is just a temporary nightmare and that the people have enough power to recover their reason and pride. Once they get consideration again, they begin to train themselves to be perfect citizens aiming for goodness.

We have a pending argument about the members of *Beer Street*. They are workers of the lower class and women, who are excluded from the discussion in the Plato's ideal education. Although there is a disagreement between the engraving and the materials, it is effective way to stir up the imagination of the spectators. Charles Lamb writes about the work of imagination in Hogarth's engraving in *Critical Essays on the Genius and Character of Hogarth* as follows:

Through a gap in this wall are seen three figures, which appear to make a part in some funeral procession which is passing by on the other side of the wall, out of the sphere of the composition. This extending of the interest beyond the bounds of the subject could only have been conceived by a great genius. ...This he well calls *imaginary work [sic.]*, where the spectator must meet the artist in
his conceptions half way; and it is peculiar to the confidence of high genius alone to trust so much to spectators or readers. (111)

The argument here is about the three people in the most interior part of the background of *Gin Lane*. The three parish beadles behind the funeral of the young mother are heading for the rightward, while the place they are going to go to is not shown to the spectators. Here imagination works for the spatial extension, and we know that the lane is not the one and only place where gin is destructing the lives of the people, and that funerals are held everywhere.

Lamb appreciates Hogarth’s ability to show spectators more things which is not described in his work to call him a great genius. The subject on the three parish beadles shows us clearly the extended problem of the more victims and the more death caused by gin drinking. The imagination of the spectators is aroused when they do not see but read Hogarth’s works, and, as a result of this, the hidden meanings and messages in them emerge to the surface.

The work of imagination helps us a lot when we arguing about our issue now. For we can regard the disagreement between the members of the engraving and the people referred in the Plato’s materials as the element which stirs up our interest. The imagination is extended both to space and class to understand Hogarth’s message and ideal expressed in *Beer Street*.

We are likely to expect that the people in higher class are also good, if we see the people of the lowest sort living devout and just lives. The people in lower class, both men and women, in *Beer Street* succeed in controlling themselves helped by knowledge. Then we are interested in the people in higher class, imagining that they also live in goodness. This is the expansion of imagination to the class.

Lamb’s argument about the three parish beadles passing through the most interior place in *Gin Lane* shows the expansion of space, and it is also useful to read *Beer Street*, too. It can be imagined that the people in higher class are training themselves to be perfect citizens in beer banquet somewhere Hogarth did not describe. We also imagine that there are also pleasant and educative place besides the street.

Imagination reveals Hogarth’s ideal which is hidden in the unseen place. He hoped that every people in every class, both men and women, can be perfect citizens when they drink beer again. His message becomes very persuasive when two engravings, *Beer Street* and *Gin Lane*, have strong contrast of good and bad. Motivated by indignation over gin craze, Hogarth described the present condition to
be reformed and the ideal state to be aimed for.

The Image of Pottery: Muneyoshi Yanagi’s Art in Abiko

Noriko Kaizu

International and Advanced Japanese Studies

Abstract
Muneyoshi Yanagi, as also known as “Soetsu” resided in Abiko in the early twentieth century. He is the leader of an artists’ colony in Abiko, he was interested in creating pottery. The image of pottery is significant in his artistic activities, as well as his large body of writings.

Introduction
Muneyoshi Yanagi is the founder of the Mingei Movement. The word “Mingei” has entered the English lexicon and even now in the twenty-first century, studies on Yanagi continue to be carried out both in Japan and abroad. The Mingei movement is thought to have begun in 1926 when Muneyoshi Yanagi discussed the movement together with Shoji Hamada, Kanjiro Kawai in a temple in Koyasan and later published “Plans to Establish the Japan Folk Crafts Museum.” To examine the reason behind the birth of this movement, it is important to note that famed British potter Bernard Leach’s kiln was built in the artist colony founded by by Yanagi in Abiko. Also, it seems the exchanges among artists, discussions about pottery, Yanagi’s meeting with the Asakawa brothers, and the fire which destroyed Leach’s studio all influenced Yanagi’s later activities. As a few years passed, Yanagi expanded discussions on art theories of Mingei, exchanges and social movements.

The Mingei Movement was fertilized at a village of Abiko, Chiba Prefecture near Tokyo.

Beginning of the Artists’ Colony in Abiko
This section will examine the years spent in Abiko as a crucial point in Yanagi’s work because it considered that Abiko provided Yanagi with an opportunity to enjoy daily communications with Shirakaba members, the suburban environment and changes in his lifestyle. Abiko attracted much attention as a location for villas outside of Tokyo.

Yanagi’s uncle Jigoro Kano was a great educator with an international perspective and is known as a founder of Judo. He was one of the first people to purchase a villa in Abiko.

With Daisetsu Suzuki’s instructions as well as his uncle Jigoro Kano’s international perspective, Yanagi began to cultivate a viewpoint that was beyond the idea “West versus East.”

After Edo changed in name to Tokyo, it became a megalopolis. Yanagi lived in its center. In
the late Meiji era, when Japan was trying to modernize herself with the notion that the West is ahead of the East, “catch up and surpass the West” became a widespread thought in Japanese society then.

While Yanagi and his friends were at Gakushuin school, they first met Bernard Leach from Britain. But as Leach became more and more interested in Eastern art, he stopped teaching them etching, a technique used in Western art. Leach became interested in pottery.

In 1906, Leach showed Yanagi a book on William Blake2, Yanagi was very much influenced by Blake’s artistic vision. When Leach arrived in Japan, Blake was regarded as heretical in his own country. There were a few artists who came to admire Blake’s work, like the Rossetille brothers who began to understand Blake’s work (Sato: 2015). Yanagi, who had been endeavoring to express his spiritual world, was very inspired by Blake who drew mystical paintings and composed prose (Mizuuo: 2004).

Then in September, 1914 after moving to Abiko, Yanagi met Noritaka Asakawa. Yanagi was struck by the beauty of a piece of Korean pottery which Asakawa brought him. In 1915 Yanagi traveled to Korea and further developed his interest in Korean crafts and culture. The following year he stayed in Korea for a month, traveled to Beijin and met with Leach. He insisted Leach come back to Japan to Abiko, instead of returning to Britain. Yanagi proposed to build a kiln and to provide Leach with room and board. After this trip, Yanagi began writing about Eastern culture in Shirakaba. It was the first unique attempt in the journal, which had mainly introduced Western Art to its readers (Shirakaba, July issue, 1919).

Fig. 1 is a sketch of Yanagi’s study done by Leach. We can see a pottery behind Yanagi. He had purchased a Korean pottery in an antique shop in his youth (Tsurumi: 1976). We can also see Rodin’s sculpture “A Small Shadow”(Fig. 2) on the upper shelf. The Shirakaba members admired Rodin, the brilliant art. It was one of the three pieces of sculpture sent by Rodin, to thank Shirakaba members for the Ukiyo-e prints they had sent to him.

Despite the fact Yanagi was the youngest in the group, it is understandable that Rodin’s sculpture was placed in Yanagi’s home (Kumakura: 2005), as his knowledge on art and excellent language skills were greatly admired, and he might have worked hard to receive.
With such exchanges in and outside Japan, Yanagi were gradually altered to revise eastern art upward. But at the same time his study room, which he designed and had built by a local carpenter who specialized in building temples, remained his favourite place. He could see Tega Lake and Mt. Fuji and watched farmers work from there. “It was a good decision to come here,” he wrote (Yanagi: 1980-1992). Stating his impression of Abiko, he wrote “The most beautiful place on earth” and “it is like Leonard’s nature” (Yanagi: 1980-1992).

He enjoyed looking at the lake every day and sometimes he would row a boat on it. He may have wished for the West and the East to be unified. He seemed to have thought of the times
when Japan and Korea were active in their cultural exchanges.

Throughout the Abiko period, there are three main influences which created and sustained it at various times over the years.

**Leach’s Kiln**

In early twentieth century Blake was not well understood in Britain; however, Leach was one of the exceptions. The Shirakaba members were excited about Blake. Especially, the 25-year-old Yanagi was enthusiastic about Blake’s work and was writing papers on his research about Blake. Yanagi often went to Shinshu (Nagano) to give lectures. Readers of *Shirakaba* in Shinshu included young teachers, because the journal was influential on young people. Kaneko, who was a classical singer, held concerts there to encourage them up. Readers in Shinshu had donated much money to Shirakaba Art Museum and followed to New Village Movement, some of them sold their house to donate money.

Key members of Shirakaba; Naoya Shiga and Saneatsu Mushanokoji were also newly married and Yanagi suggested that they too move to Abiko nearby Yanagi. These announcements were printed in *Shirakaba* and it was said that readers of Shirakaba visited Abiko and that it gave the impression of being an artists’ colony (Yanagi: 1921).

At the same time, Leach was living in Beijing and worrying about what he should do. Yanagi persuaded Leach to leave Beijing and build a kiln at his residence in Abiko, and he promised Leach that he would arrange everything. This led Leach to making the first step to a studio potter.

When he met the Shirakaba members, Leach understood immediately that they were talented young artists. In addition, Yanagi understood Leach was an artist who had a strong interest in the East, such as no other Westerners had. The two of them got over the hardship of the war period by friendship, through their experience and memories around the kiln which was brought from the sixth generation Kenzan Ogata³, Leach’s teacher. Yanagi and Leach both influenced each other. They are spoken of as the “Father of British studio pottery” and the “Founder of Mingei.” Even through World War II, these two continued to maintain their friendship and were destined to become the go-betweens of East and West.
The bowl in Fig. 3 has three Chinese characters inside it which mean Abiko and a design of a boat on Tega Lake. Through this pottery he tried to create a line with Asian taste at Abiko kiln for his pottery as his drawing in the above circle of Tega Lake (right) and Chinese characters (left). Through the design of the pottery (Fig.3), Leach tried to create a line with Asian taste, which he was learnt by Korean lines. Yanagi wrote in his article Shirakaba journal that he notices the different concept of lines and forms from the Chinese and Korean pottery.

Fig.4 was evaluated as an early work, but Leach was already showing his originality. It shows that his restoration slipware technique is successful as a combination of Western and Eastern arts and philosophies. Kenkichi Tomimoto found the book about western traditional pottery by
Charles Lomack by chance and knew the technique as eastern one also had. Leach had revived its image in Abiko kiln at last. After that, those his works were sold out when exhibited at a gallery, which tells of his success after his Abiko training period.

The stone memorial for Bernard Leach at Abiko is engraved with some lines that Leach chose. The same as Leach, Yanagi was deeply impressed by Korean pottery. Abiko was the place where Leach established a kiln after having apprenticed with the sixth generation Ogata Kenzan. From the eleven firings carried out, Leach was able to create pottery to a high degree of perfection. Pottery is the result of a fusion between clay and fire and subtle differences can affect the aesthetic appeal of a piece. Ultimately the potter has to leave everything up to the force of nature. Glaze on pottery undergoes a change according to how the kiln is fired. Therefore, it can be said that nature is the deciding factor on whether or not a pot will turn out well.

![Fig. 5 Bernard Leach Memorial Stone, Abiko](own source (2015))

**Korean Pottery and the Asakawa Brothers**

The Asakawa brothers, Noritaka and Takumi, made appeals for the preservation of Korean pottery and other crafts. They travelled all over the Korean peninsula to carry out surveys and the pottery they found was exhibited at the Korean Folk Art Museum in Seoul, forming the museum’s collection. Yanagi was extremely impressed by their activities and also by the Korean artistry and by the prolific culture of Korea. A close relative of Yanagi’s was involved in the Japanese colonial regime in Korea; however, Yanagi was antagonistic towards Japan’s colonial policies in Korea. He made a determined stand against the regime by meeting with activists in the independence movement and showing his cooperation by supporting Korean students. This
was because he had become aware of how Japanese culture had been influenced by Korean culture during his travels in Korea with Noritaka and Takumi Asakawa.

Yanagi’s meeting up with the Asakawa brothers had a positive influence on research in both Japan and Korea as he passed on information about pottery-producing areas in Korea to Japanese potters such as Tomimoto, Shoji Hamada and Kanjiro Kawai, and Bernard Leach, as well as showing them shards of old Korean pottery. Noritaka Asakawa went to Korea to work as a teacher while his younger brother, Takumi, followed him to take up a post as a forest engineer. They lived in typical Korean houses and generally assimilated themselves into the Korean way of life. Noritaka began to devote his attention to pottery from the Joseon period (1392-1910) and became the top expert on Korean pottery. Both Noritaka and Takumi were devout Christians. They were very sympathetic to the Korean people and often arranged for the payment of scholarships (Takasaki: 2005).

As the Shirakaba journal had thus far focused on introducing Western art, it took two and a half years until illustrations of Eastern antiques appeared in the journal for the first time, in the July 1919 issue. Yanagi pointed out that Eastern art was of as much value as Western art and as deserving of respect with a universal sense of values in life. When Yanagi visited Korea again with his wife Kaneko in May 1920 for lectures and concerts, he was shown a porcelain jar that Noritaka owned and he was deeply impressed by it (Takasaki: 2005-306). He wrote in his diary “It was like a dream” and he could not hide his amazement at how wonderful the pot (Fig.6) was. Chinese’ pottery was excellent in form and pattern but K It was at this time that he began to Korean’s was excellent in creative lines. He began to clearly voice his idea for setting a Korean National Folk Art.

Source: Osaka Museum of Oriental Ceramics collection (Joseon Period, latter 18th century)
It was after Yanagi had met up with the Asakawa brothers that the March First Movement occurred. Yanagi issued statements voicing his opposition to the violent manner in which the Japanese government dealt with the growing independence movement. It is thought that Yanagi was influenced by the manner in which Noritaka and Takumi responded to the Korean people with love, based upon their Christian faith, which he observed during his stay at Takumi’s house.

In the February 1920 issue of Shirakaba, Yanagi wrote about Eastern art for the second time. In that commentary, he asserted unique qualities of Korean art:

> Even though a deep historical relationship exists between them [China and Korea] and Japan, I feel that a significant difference exists in their expression of beauty. The strong form of Chinese art cannot be seen in Korea while certainly the line in Korean art is the property of the Korean people only.

Observations such as these derive from Noritaka’s hard work and dedication in carrying out his own individual surveys and research all over the Korean peninsula, and he established his own research method - Tohen kara Yomu [Reading Pottery Shards]. He was known as the “patron saint of Korean pottery.” Noritaka’s work triggered further conservation and identification of many pottery shards throughout the Korea peninsula which suffered much wartime destruction in the past. As one of the few intellectuals to express his opinion, Yanagi’s method of discussing Korean art in the public arena was his way of fighting against the Japanese government which was trying to strengthen its colonial grip on the Korean people. Yanagi was most likely inspired by seeing with his own eyes how sincere and earnest Noritaka and Takumi Asakawa were in their activities. Yanagi continued to publish articles about Korean art and worked to bring about the establishment of the Korean Folk Art Museum. However, with the worsening of Japanese and Korean relations after the war, the museum was closed and the whereabouts of its collection are unknown.

In light of these circumstances, the exhibition “Yanagi Muneyoshi” held in 2013 at Korea’s National Museum of Modern and Contemporary Art in Seoul was of great importance to both Japan and Korea. When taking into consideration the political difficulties between the two countries, one can understand how much effort was required of the Asakawa brothers and Yanagi in selecting pottery and other craft items for the collection of the Korean National Folk Art Museum and their activities to preserve them.

**Contributions by Kaneko Yanagi at the artists’ colony**

When replying to an interview in her latter years, Kaneko Yanagi remarked “If I had known
that we would end up with the police following us because of our resolute endeavors in Korea, I
may have thought twice before I married Yanagi.” His wife’s unwavering support was the
deciding point for those in Yanagi’s immediate circle to continue backing Yanagi. How was
Kaneko, who married at the age of 22 years, able to carry on so bravely? One reason given by
Kaneko was having Jigoro Kano as a neighbor; that made her feel quite secure. Leach’s pottery
workshop and kiln shed near the Yanagi’s house burnt down very early one morning in 1919. At
the same time, Yanagi had released his paper Chosenjin wo Omou [Letter to the People of
Korea] and was being watched by the Japanese secret police. This all happened when a teacher
in Nagano, who belonged to the Shirakaba group, was sacked and had come to Abiko to help
Leach in his pottery.

Around the time of his marriage, Yanagi was devoting his time and energy on research about
William Blake. He published many articles in Shirakaba about Blake, subsequently compiling
them into book of more than 700 pages which he published. This was he was living at Abiko,
six months after his marriage. As the illustration of Yanagi’s study shows, at the time lamps
were used for lighting in Abiko (Fig. 1). Kaneko wrote out a clean copy of the text and also
made up a list of errata. She was the first person to read Yanagi’s book on Blake and was
Yanagi’s sympathizer. She came to understand the essence of art though her contact with
Blake’s works and became a singer unusual in the respect that she tried to get as close as she
could to that essence.

Kaneko Nakajima met Yanagi in the autumn of her eighteenth year when he was twenty-one
and had just entered university (under the educational system of the time). Yanagi had been striving to find answers from a scientific approach and undoubtedly Kaneko brought about major changes in Yanagi. After exchanging letters almost every day and meeting up with each other, Kaneko withdrew from music college in line with the rules (Matsuhashi: 1984).

Kaneko formally studied Western music under Hanka Petzold at the Tokyo College of
Music and great hopes were held for her to become a singer. Kaneko held a concert which
served to introduce Korean students to Western music. People she taught went on to become
instructors in Korea musical circles. She took it upon herself to be active in Korea. Kaneko gave
many concerts in Korea at the request of their Korean acquaintances and took care to choose
pieces from her repertoire that would encourage those in the audience. She was rewarded with
thunderous applause. Kaneko was determined to thoroughly support her husband, Yanagi, and
with her musical activities, she raised money towards the building of the Shirakaba Art Museum,
the Korean Folk Art Museum and the Japan Folk Crafts Museum. Kaneko’s name can be seen at
the top of the list of the record of donations in Shirakaba. Keiko Matsuhashi, who wrote a
biography on Kaneko Yanagi and has compiled a chronological record of her life, states that

61
“Yanagi’s income was used to collect craft items in Korea, books and so on; so it was mostly up to Kaneko to find the money for living expenses.” Kaneko’s husband spent large sums of money in activities to preserve Korean pottery, leaving the pieces of pottery that he purchased in the museum established in Seoul, for the sake of friendship between Korea and Japan. Any criticism of Yanagi in regards to Orientalism can be recognized as invalid after learning about how this couple worked together with the Korean people to bring this project to fruition.

The change in Yanagi’s interest from the West to the East overlaps with his move to Abiko. Kaneko played a major role in helping to support the artists’ colony with its pottery. Leach received enormous help in setting up his pottery and kiln. One year after moving to Abiko, a country life that she was unfamiliar with, Kaneko gave birth to her first child. While looking after her child, Kaneko did a lot of cooking and also provided bread and butter for Leach. She came up with the idea to put miso in curry, which was still very unusual at the time. The Yanagi’s dinner table, which they shared with their Shirakaba friends, was quite international with a blend of Japanese and Western style flavors. Exchanges with the first-class artists living close to the Yanagi family provided a stimulus to Kaneko. She was the first woman to be awarded the Imperial Prize by the Japan Art Academy.

The flavors of both East and West that Kaneko tried so hard to incorporate in her cooking would have undoubtedly made Leach twice as happy when things went well while providing solace when failures occurred. When speaking of his memories of his time at Abiko, Leach said it was the happiest time of his life. He was doubtlessly very grateful to Kaneko.

Conclusion

Muneyoshi Yanagi was born and grew up in the central Tokyo. Despite this, he chose to live in the countryside in Abiko from 1914-1921. Yanagi invited artists from the Shirakaba group to also come and live in Abiko and they enjoyed interactions while living close by one another during those years. Yanagi began to have a closer connection with Bernard Leach during this period although their mother countries, Japan and Britain, were destined to become enemies as World War II loomed on the horizon. It was also during his residency at Abiko that Yanagi deepened his connection with Korea which had been colonized by Japan. A dedicated pacifist, Yanagi was determined to maintain frequent contact with his friends from other countries. Especially, he published papers in which he protested about Japan’s colonial policies.

Time was necessary for Japan to rebuild its relations with its neighboring countries in the aftermath of World War II and also for the rest of the world to recognize Yanagi’s theory of Mingei. The manifestation of Yanagi’s theory of beauty can be traced by to his late twenties when he was involved in the effort to establish an artists’ colony. Research into the colony at Abiko elucidates what Yanagi was aiming towards while revealing an image of Yanagi who
wished for a peaceful marriage between East and West.

The Japan Folk Craft Museum, established by Yanagi, has in its collection many pieces discovered by the Asakawa brothers. These pieces are a testament to the deep relationship between Korean and Japanese culture. The significance of this can be seen by the steady stream of visitors from outside of Japan who come to see the museum.

To say that the establishment of the Japan Folk Craft Museum laid the groundwork for the Mingei Movement is too simplistic a view. Yanagi called upon his Shirakaba associates and together they formed the artists’ colony where they lived close by one another. Yanagi’s house, which had Leach’s kiln nearby, formed the center of the colony. Leach’s pottery evolved by a system of trial and error. Yanagi witnessed this firsthand and gave Leach encouragement. A friendship was built that was not hindered by differences in nationality or by war in that era. Yanagi’s real intention is clear. The geniuses experienced failures but were lead ultimately to success. They did not give up or stop along the way. They stayed focused on their end goal and worked towards it. In accordance with their motto of looking towards the future goal, they were able to achieve their mission. The memory of being encouraged by the gathering of artists at Abiko was their driving force.

1 Yanagi's teacher at a peer school. An author of books and essays on Buddhism, Zen and Shin that were instrumental in spreading interest in them to the West.
2 An British artist, poet and mystic of the Georgian to early Victorian eras.
3 Leach's master of pottery. A book about was written by Leach, entitled Kenzan and his Tradition (Faber & Faber in London, 1966).
4 Hanka Petzold studied the piano under Liszt and singing under Mathilde Marchesi. Born in Norway, she came from a musically talented family. Her brother was a famous composer.
Abstract

Municipalities in Japan have a “Childcare Support Center” for the sake of young parents who do not have an opportunity to talk about their children with their own parents. Young mothers take part in activities of these support centers to communicate each other, take counsel with the staff about childcare, or are taught how to play with children by the staff. Although there exist these facilities, the number of counseling on child abuse in Japan is increasing year by year; for example, the figure was 26,569 in 2003, and 40,639 in 2007. About sixty percent of abusers are children’s real mothers. While the birthrate and the number of children are both declining, the number of counseling on child abuse is growing up. It may be because childcare itself has become difficult for mothers. This research tries to reveal the actual condition of childcare, especially about how much mothers who are bringing up their children utilize a childcare support center. Subjects of the survey: We surveyed those who are bringing up their children and using childcare facilities in City M. We distributed the question sheets to 200 people at two childcare facilities in City M. One-hundred and twenty-nine respondents (5 males and 124 females) returned the sheet; namely, the return rate was 64.5%. Twenty-nine respondents were in their twenties, 82 in their thirties, and 18 in their forties. Fifty-two respondents (40.3%) have used the childcare service, and 77 (59.7%) have not used. The reasons of the nonparticipation were “The time of activities is not convenient” (47.8%) or “I do not have to use it” (32.2%). More than half of those who have not used the support centers answered that they have not used because the time was not convenient. On the other hand, more than half (53.8%) of those who have used the support centers keep using it. Among those who have used it four times or more, 20 people (71.4%) are in their thirties. Now that working mothers are increasing in number, operating hours of support centers have to be reconsidered.

Keywords: Childcare Support Center, municipalities in Japan, young parents

1. Background

Municipalities in Japan have a “Childcare Support Center” for the sake of young parents who do not have an opportunity to talk about their children with their own parents. Young mothers take part in activities of these support centers to communicate each other, take counsel with the staff about childcare, or are taught how to play with children by the staff. Although there exist these facilities, the number of counseling on child abuse in Japan is increasing year by year; for example, the figure was 26,569 in 2003, and 40,639 in 2007. About 60% of abusers are children’s real mothers. While the birthrate and the number of children are both declining, the number of counseling on child abuse is growing up. It may be because childcare itself has become difficult for mothers. This research tries to
reveal the actual condition of childcare, especially about how much mothers who are bringing up their children utilize a childcare support center.

2. Method

(1) Subjects of the survey

We surveyed those who are bringing up their children and using childcare facilities in City M.

(2) Survey period

The survey period was from June to September in 2010.

(3) Survey method

We conducted the questionnaire survey on those who were bringing up their children. The questions include whether they participated in activities of a support center, how many times they have participated, why they have not participated if not, what they are conscious of in childcare, etc. The respondents answered them in writing.

3. Results

We distributed the question sheets to 200 people at two childcare facilities in City M. One-hundred and twenty-nine respondents (5 males and 124 females) returned the sheet; namely, the return rate was 64.5%.

Twenty-nine respondents were in their twenties, 82 in their thirties, and 18 in their forties.

Fifty-two respondents (40.3%) have used the childcare service, and 77 (59.7%) have not used. The reasons of the nonparticipation were “The time of activities is not convenient” (47.8%) or “I do not have to use it” (32.2%).

Among the respondents, 13 people have participated just once, 5 have participated twice, 5 have three times, and 28 have four times or more. The benefits of participation were “I made a friend” (26%) and “It served as a mental diversion” (24%). About childcare, 91.4% answered “I would like to consult,” and its contents are related to “child’s development” (28.7%), “discipline (20.9%), “treatment of poor physical condition” (18.6%), etc.

4. Discussion  
According to the result of Longitudinal Survey of Newborns in the 21st Century\(^1\), the employment rate of mothers was 55.4% one year before giving birth. However, the rate declined to 25.1% immediately after giving birth and bounced back up to 60.5% one year later. It means that about half of the mothers have returned to work after their children's growth. More than half of those who have not used the support centers answered that they have not used because the time was not convenient.

On the other hand, more than half (53.8%) of those who have used the support centers keep using it. Among those who have used it four times or more, 20 people (71.4%) are in their thirties. Now that working mothers are increasing in number, operating hours of support centers have to be reconsidered. According to previous researches\(^2\)\(^3\)\(^4\), those whom mothers would like to ask for advice about childcare include “spouse,” “mother,” “friend,” and “doctor” in this order. Nakanishi et al. (2004)\(^4\) indicates that 46.4% of their respondents made friends with other participants after participating a childcare circle. To be concrete, 35.7% of them go out or have a walk together, 30.4% exchange emails, and 28.6% consult with each other about childcare. Especially, 60.7% of the respondents who have participated three times or less made friends. Our survey shows that those whom they would like to ask for advice about childcare include ”friend”(83), ”spouse”(78), and ”mother”(76). These results suggest that mothers bringing up children prefer friends as advisor about childcare because both of them live in similar situations.

Comprehensive Survey of Living Conditions\(^5\) shows that 18.5% of all households are three-generation family while our survey shows that 107 (82.9%) are nuclear family and 19 (14.7%) are three-generation family. These results mean that nuclear family increases in local communities. It may be that “friends” have become closer than “relatives” because of the expansion of nuclear family. A Childcare Support Center should utilize the manpower in the local communities to give advice to mothers who tend to isolate themselves. Mothers who are bringing up children hardly experience various types of childcare in these days because they have few opportunities to communicate with others’ children. We suppose that this situation causes mothers to seriously worry about children and consequently leads to child abuse or nervous breakdown due to childcare.

Local communities have to be empowered not only by promoting mutual communication between specialists and mothers or between mothers themselves but also by involving elderly people with childcare. We believe that establishment of support environment also leads to the security of manpower in the support center.
4. Conclusion

We have to consider measures to create an energetic local community where the whole community supports childcare so that mothers can bring up their children without anxiety.

Since this research did not survey the situation of local community itself, we have to study effective measures concerning that viewpoint.

Title: Reframing Discipline: Connecting with Every Child

Topic Area: Elementary Education / Cross-disciplinary areas of Education

Presentation Format: Workshop

Description: Children have challenging behaviors that connect to their social-emotional development. This workshop focuses on a variety of techniques, tools, activities, resource and research for preventing behavior problems through building a relationship between the teacher-student and student-student. This relationship will develop and create a safe, inviting, comfortable and risk taking environment for children to have a positive experience while engaging in their learning.

Sylvia Harkins, Ed. D.
Faculty
College of Education
Grand Canyon University
dr.harkins@gmail.com

Abstract:
When children feel valued, accepted and understood, they are more likely to cooperate with adults. Developing a positive relationship with an adult is a difficult task for most children and sometimes they have no idea on how to develop those relationships. There are children who have had a negative experience with an adult, which then translates into challenging behaviors for these children in the classroom (Joseph, 2010). Educators will be taught how to apply techniques on preventing behavior problems through building relationships with even sometimes ‘difficult to engage children’. Through role-play, table discussions, and creative hands on activities, educator will learn to create a safe and inviting learning environment for students for both higher positive experiences and academic achievement.

Group Work in Online Business Education – Pain or Gain?

Abstract

In business education being able to collaborate is an important graduate attribute. However, group work often leads to frustration among students. The paper investigated how students in an online business unit perceived group work. Results revealed distinctive student profiles. Some students thought they gained from it and clearly saw value in different characteristics of group work. For other students group work was a pain. The paper concludes with recommendations how to address these student groups.

Introduction

In 2014 more than 74% of all job ads on seek.com.au, Australia’s number one job website, included ‘team’ as a keyword, showing the importance of team skills for today’s workforce. In the near future the importance of this employee skill increases. In 2020 being able to work collaboratively online is one of the key workforce skills in a globalized business environment (Davies, Fidler, & Gorbis, 2011). Consequently business education has to consider this essential skill in curricula to prepare graduates accordingly.

Contemporary business education makes extensive use of team-based pedagogies (Colby, Ehrlich, Sullivan, & Dolle, 2011). However, especially in online education, students are often frustrated when having to work in teams (Capdeferro & Romero, 2012). It is therefore necessary to understand how students perceive group work in an online setting to improve learning outcomes.

This study focuses on the student experience of a group work presentation assessment task adapted for an online cohort of business students at an Australian University.

Literature review

Online courses play an important role in tertiary education. In 2012 more than 25 percent of all tertiary students in the US were enrolled in distance education (US Department of Education, 2014). For students online studies offer convenience and flexibility of time and place (Arbaugh 2000). However online education has limitations which could affect how students perceive the delivery of an education course.
Online education relies on computer mediated conversation to offer students a convenient learning environment. However, online communication is limited. Online communication are semantically poor, text based, exchanges with limited non-verbal cues. Furthermore most online courses use asynchronous communication models which offer participants more time to reflect and generate a considerate response but lack in spontaneity (Curtis & Lawson, 2001).

This time-lag often results in frustration when group work among students needs to be done, especially when peers are in different time zones or have time pressures because of work or family commitments (Belland, Kim, & Hannafin, 2013). Therefore supporting students is essential to avoid frustrations diminishing learning outcomes.

First of all curriculum designers have to acknowledge that assessments which require working in teams have benefits but require scaffolding. Less experienced students for example need to learn additional skills such as how to work in a team, how to make decisions in a group and how to negotiate to help them being successful with their team. Also at least an initial face to face contact helps to get to know peers and reduce misunderstandings because of the described online communication limitations (Macdonald, 2003).

In this face to face meeting a process of setting ground rules such as roles and responsibilities, milestones, contact information and escalation can be at least started (Macdonald, 2003). Clarifying at an early stage that non-participants have limited benefits from the efforts of participants and active participation is recognised in the final outcomes will further reduce the potential for frustration at a later stage (Goold, Craig, & Coldwell, 2008). Given this early stage of a group building process, facilitation can support the learning process (Soon & Campbell, 2011). Still, it is unclear how students perceive group work.

**Methodology**

Learners enrolled in the online version of the ‘Organisational Behaviour’ unit of an Australian university were asked to fill in an online questionnaire about their perception of a group work assessment. The questionnaire covered several areas such as demographics (age and gender), the experience with the team and if students found the assessment worthwhile.

As part of the assessments in class, students had to do a team presentation and comment on work of others. The students undertook an online teamwork assessment to produce a presentation. They were provided with scaffolding around the timing of various steps in the completion of the presentation and when to gain feedback on a draft from their peers. A ‘how-to’ teamwork guide was
developed and provided, which conveyed the importance of teamwork as a skill to develop for the future workplace, along with suggested steps for the teamwork process to assist teams in approaching the task. Learners were also provided with learning and practice for how to frame feedback constructively as a part of their learning in the unit. Following the ‘how-to’ guide to support the teamwork process was not a compulsory aspect of the task submission – ie. marks were mainly focussed on the product of the teamwork (ie. the submitted presentation).

16 students returned the questionnaire. 1 case had to be deleted because of missing values, leaving 15 valid cases.

$X^2$ tests investigated differences of students disagreeing (strongly disagree and disagree) and agreeing (agree and strongly agree) in the following outcome based questions: ‘Overall the team presentation assessment was helpful for my learning’ (Helpful for learning), ‘Will you participate in a team presentation again in your study’ (Team presentation in the future), ‘Creating a team presentation has made me more interested in my study’ (More interested in my studies)

**Results**

The following table 1 shows how students differ in their perceptions when agreeing or disagreeing to the above mentioned questions.

<table>
<thead>

</tbody>
</table>
Students agreeing or disagreeing to the three outcome based questions showed different profiles in regards to the other questions. Most students answering that they found the team presentation helpful for their learning regarded giving and receiving feedback positively, thought that it was easier to work in a team to do the assessment and saw value in it such as being more creative and gaining new skills and abilities from it. Overall they enjoyed the assessment and had no problem with the guidelines.

Most students agreeing that the assessment has made them more interested in their studies agreed that the assessment was useful and helpful in their learning, enjoyed participating in it and want to participate in a similar assessment again but were ambiguous in regards to the other questions.

Students who would do a team presentation again also found the assessment useful and helpful in their learning. They also liked giving feedback to another team and saw value in the assessment in regards to gaining new skills and abilities. These students enjoyed the assessment but questioned the time commitment.

**Discussion, Limitations and Future Research**

Comparing students’ agreement or disagreement to different questions showed a clear profile regarding the view how helpful the group work assessment was for learning. The ‘groupwork is a gain’ students agreed that this assessment was helpful, saw value in different features of the group work assessment such as giving and receiving feedback and less effort working in a team than working on your own. In regards to the other questions, asking if students were more interested in their studies because of this assessment and if they would do it again, less distinct profiles arose.
Using ‘helpfulness’ as a satisfaction metric, this study could indicate which factors in a group work assessment could increase student satisfaction. Obviously peer review, highlighting creativity and other benefits of group work could support the group work process and reduce frustration.

The ‘groupwork is a pain’ students did not view the assessment as useful or helpful to their learning, nor did they find value in the feedback of others or skills gained (eg. teamwork or presentation skills). Consequently the need for greater scaffolding in the teamwork assessment design may be required for these students. This could include mandating the following of steps around the teamwork process (rather than providing suggested guidelines), along with explicit statements in the assessment around which teamwork skills were being acquired at each step in the teamwork process.

While the survey results show that the majority found the task requirements clear and unambiguous, there are a number of students that found that working a team did not make preparing the presentation easier, and found that it took up too much time to do prepare the team presentation. This may indicate potential for diminishing the requirements of the ‘product’ outcome of an online teamwork task, if the focus is to be more on learning the ‘process’ for successful and a satisfying online teamwork experience.

A limitation of this study is the categorical character of the variables reducing options for analysis given the four point scale. Future research should use a 7 point Likert scale or other metric scales.

Furthermore including an established satisfaction scale could provide a better understanding how students view group work and how frustrations in doing group work could be limited.

Also future research should use a larger sample of students as results could be more stable than the results of the tiny sample used for this research.

6) Abstract
Abstract

Distance learning has evolved globally through the electronic technology embraced by tertiary educational entities including universities. Universities benefit from increased student tuition without the need to accommodate their presence on campus. In addition to increased revenue, universities benefit from a more diverse student population due to the trend of life-long learning. Yet, not all students or staff are equipped to successfully navigate the demands of online learning and teaching as indicated by the low on-line retention rate. There are myriad barriers that preclude a higher retention rate, including mental health problems. For many, mental health issues are an insurmountable barrier to achieving their academic goals. This working paper proposes investigating on-line students with mental health issues including staff’s lack of awareness and training. In addition, this paper suggests a support framework to potentially increase student and staff on-line learning success.

A student's ability to read well is crucial for him or her to master any academic subject. How well students can read is now not only constantly monitored, assessed, but also compared within and between nations. Progress in International Reading Literacy Study (PIRLS) 2011 is the third comparison of reading achievements of fourth graders from 45 participating countries. This study investigates the effects of student factors (e.g., whether a student likes reading, is motivated to read, is confident about reading, and is engaged in reading) and instructional factors (e.g., classroom libraries, instructional strategies) on reading achievement based on the standardized results released by PIRLS 2011. Reading achievement is categorized by three criterion-referenced levels: basic, proficient or advanced. The linear mixed-effect quantile regression is used to estimate the effects of covariates for each category. In 27 out of 45 countries, significant interaction effects were found between student and instruction factors.

**Description:** This case uses five elements to describe the formation of a student’s customer experience in Yrityslabra (Business Lab) learning environment at Laurea University of Applied Sciences. Examination and development of the student’s customer experience have become an even more important part of Yrityslabra’s operating model and its success. Making the student’s customer experience the focus of development moves Yrityslabra’s activities towards customer orientation, which in turn makes the opinion of students the most important viewpoint.
Abstract

Formation of students' customer experience in a learning environment: Case Yrityslabra

"The customer experience is the qualitative aspect of any interaction that an individual has with a business, its products or services, at any point in time” (Watkinson, 2013)

This case uses five elements to describe the formation of a student's customer experience. The case describes Yrityslabra (Business Lab) learning environment located on the Lohja campus of Laurea University of Applied Sciences, where students complete studies in workplace-oriented projects. Development of Yrityslabra began in 2010. The aim of the new learning environment was to speed up the pace of studies for students at the Lohja campus, stop the decline in student numbers on the campus, and ensure student employment after their studies. Yrityslabra’s operating model was developed from the customer experience viewpoint, and the following five elements were identified as being most important in terms of developing the customer experience: an informal physical environment, an informal social environment, the student's personal learning process, the teacher's role as a mentor, and tools to support the student's studies. These elements provide the foundation for customer-oriented development, and each element has an impact on building the student's customer experience.

Examination and development of the student's customer experience have become an even more important part of Yrityslabra's operating model and its success. Making the student's customer experience the focus of development moves Yrityslabra's activities towards customer orientation, which in turn makes the opinion of students the most important viewpoint.

Case Yrityslabra has demonstrated that developing the customer experience of students has improved students' commitment to their studies. The students also have better opportunities to develop their competence according to their own areas of interest. In addition, students are better able to determine their study schedule, have more open cooperation with the mentoring teacher, and build a confidential atmosphere with the teacher and other students. Developing the customer experience has affected the results of the Laurea Lohja campus by accelerating the pace of studies, reducing the number of student transfers to other campuses, and improving student employment after completion of their studies.

From Formative Assessments to Learning Outcomes:  
A between-course approach to freshmen studies at two Japanese universities

Abstract  
This study considers the relationship between formative assessments and learning outcomes by comparing students’ responses on courses with and without formative assessments, while considering the possibility of intermediation by length and distribution of learning time. A path analysis of 220 courses in two Japanese universities reveals that: (1) the relevance of formative assessments to course objectives has a larger effect on learning outcomes than experience or feedback from the assessments; (2) time distribution has a greater effect on learning outcomes than the duration of independent learning; and (3) the type of formative assessment causes the paths to vary in terms of the length and distribution of learning time, as well as the most sensitive learning outcome. These findings are interpreted in the context of methodological research issues and the quality assurance of higher education. It is also suggested that international comparisons and panel research are necessary to understand the effectiveness of formative assessments more in depth.  

Keywords: formative assessments, learning outcomes, path analysis, Japanese undergraduate education
1. Background

The effectiveness of formative assessments

This study examines the effect of formative assessments\(^1\) on student learning using an evidence-based approach. As readers may be aware, previous research, such as by Black and Williams (1998), Yorke (2003), and McMillan et al. (2013), has discussed these impacts, and newer findings on university education continue to emerge. Previous studies can be separated into three categories according to the unit of analysis: in-course, between-course, and between-program.

Most in-course studies investigate the efficacy of specific formative assessment techniques. These are generally based on the responses of students taking the same course, module, or subject delivered by different instructors. Most research on formative assessments falls into this category. In fact, in *Assessment & Evaluation in Higher Education* from 2000 to 2013, 15 out of the 17 studies with titles that included the term “formative assessment” adopted an in-course method. This strategy is popular in other journals as well. For example, Lipnevich et al. (2014) analyzed data on 100 students enrolled in child development courses at a large, urban university in the northeastern United States. They found that the writing of students who received detailed rubrics for their formative evaluations improved compared to other students.

A between-course approach attempts to discern the differences in learning experiences resulting from the use of formative assessments in university courses. A course, which normally lasts one semester (15 weeks in Japan), is a unit of study with a corresponding awarded credit.\(^2\) Although the between-course style is not as common as the in-course method, Nishigaki and Yabe (2008) give an example of the former. They studied 300 students at a Japanese national university and concluded that there were no significant differences in self-reported outcomes for courses with different formative assessment conditions. In contrast, McDowell et al. (2011) developed the Assessment for Learning Questionnaire and collected 698 responses at an institution in the United Kingdom. They showed that students who took part in an “assessment for learning” module were more likely to report having a deeper learning approach and greater engagement with the subject matter.

Most macro perspectives use a between-program approach; in formative assessments, this technique is part of or characteristic of entire degree programs, and is
not specific to individual courses. Based on audits of 23 degree programs in 8 universities and 1,220 responses from the Assessment Experience Questionnaire, Jessop et al. (2014, 84) asserted there was no significant correlation “between [the] volume of formative assessments and [the] quantity of effort” ($r = .109$, $p > .05$). Conversely, Morozumi (2009) used the results of a nationwide student survey in Japan, and found that mid-semester assessments significantly increased learning times in engineering departments ($\beta = .243$, $p < .001$).

Although each of the three types of analysis can be used to discuss the effects of formative assessments, this study employs a between-course comparison, because in-course studies in Japan have little relevance for English-speaking countries since the discrepancy in teaching languages makes it difficult to share the nuances of tangible practices in the classroom. Furthermore, between-program studies do not seem to attract much attention due to certain particularities of the Japanese undergraduate curriculum, which will be explained in the next subsection. In view of these circumstances, this study will use the between-course approach, and not the in-course or between-program techniques.

**Students’ recognition of learning outcomes**

The undergraduate curricula at Japanese universities contain two unique components: one’s major and general education courses. Students generally take general education courses until the middle or end of their sophomore year, and then proceed to choose their major.iii Courses included in the general education curriculum often include foreign languages, interdisciplinary thematic programs, and introductory courses outside of one’s major.

The required courses for general education normally vary depending on the university. Accordingly, it is not relevant to compare the learning outcomes of the courses of freshmen by looking at academic grades or grade point averages. Rather, students’ own recognition of learning outcomes is more suitable for relative comparison, regardless of course or university attributes.

In this paper, learning outcomes are measured using three dimensions: satisfaction, achievement, and motivation. All of these are essential to retain students, especially freshmen; however, they are usually treated separately as learning outcomes. Horstmanshof and Brownie (2013) cite several prior studies that assert that formative
assessments positively influence student satisfaction. Hodgson and Pang (2012) found that for the dimension of achievement, 90.2% of participants agreed or strongly agreed that one could reach an in-depth understanding through formative assessments. In Weurlander et al.’s (2012) qualitative research of medical students at a Swedish university, they concluded that formative assessments motivate students to study in several ways.

While the aforementioned findings are derived from in-course studies, this study will try to validate the relationship between formative assessments and students’ recognition of learning outcomes through a between-course approach.

**Research questions**

In light of previous findings and the characteristics of Japanese higher education, this article has three main research questions.

1. What aspects of formative assessments relate to learning outcomes? Despite a basic consensus that formative assessments impact learning outcomes, there are some contradictory findings. One possible reason is that the focused aspect of formative assessments differs among studies (MacMillan et al. 2013). This article distinguishes between the quality of formative assessments and experiences with them, and compares the effectiveness of both elements on learning outcomes. In this way, it will be clear whether experiences with formative assessments or their quality is more important for student learning.

2. How does learning time intermediate the relationship between formative assessments and learning outcomes? In addition to the direct effects of formative assessments on learning outcomes, there are presumed to be indirect impacts in terms of the length and distribution of learning time. Formative assessments force students to prepare for tasks (Hodgson and Pang 2012), so learning outcomes must depend partially on learning time. The link among formative assessments, learning time, and learning outcomes will be examined using path analysis.

3. Does the relationship expressed by the path diagram differ depending on the type of formative assessment? For independent learning, whether a formative assessment task is done in or outside the classroom should have a bearing on the path diagram. It is reasonable to predict that formative assessment tasks done outside the classroom will have a bigger influence on learning time, and possibly on learning
2. Methodology

Survey procedure

The participants in this study were from two Japanese universities located in different parts of Japan: national university A and public university B, both with around 10,000 undergraduates studying a wide range of fields. Sixty-nine/twenty-five freshmen from university A, and 44 from university B volunteered to respond to the online questionnaire in August 2014.

Respondents were asked about the courses they took on a certain day of the week. The author of this article predetermined the chosen day to randomize the answers, which was necessary because on average, freshmen in Japan register for 16 courses a semester and meet with instructors once a week (National Federation of University Co-operative Associations 2014). Course categories tend to be scheduled for a certain day of the week or time of day. It can thus be difficult for students to answer questions about all of their courses, and course categories could be biased if the day was not randomly appointed. Each respondent answered questions about 1–4 courses, depending on their registration, and information on a total of 220 courses was collected.

The online questionnaire was developed in 2012 and has been revised several times, with reference to the results of semi-annual surveys. The version used in August 2014 consisted of four sections. Students gave information on their personal details in section 1, an outline of their courses in section 2, their learning experiences in section 3, and their perception of assessment tasks in section 4. For sections 2–4, students answered the questions for each course taken. Learning outcomes and times were gauged in section 3, and questions were asked regarding experiences with formative assessments and their quality in section 4.

The procedure for this study focuses on students’ views of assessments and learning. Studies such as Gilles et al. (2001) that focus on teachers’ perspectives of assessments are indispensable in order to see how they are actually used in practice. However, to understand the relationship between formative assessments and student learning, it is reasonable to ask students about how they experienced these evaluations, and to judge their quality (Struyven et al. 2005).
Data description

This paper divides formative assessments into two types: “in-class” and “hand-in.” In-class formative assessments (ICFAs) require students to demonstrate their knowledge and abilities through tasks such as mid-term exams, quizzes, and presentations. In contrast, hand-in formative assessments (HIFAs) require students to write reports or complete assignments outside of class and submit them to the instructor.

For both types, respondents were asked about their experiences (Was there an assessment in the course? Yes = 1, No = 0), relevance (Was the assessment task relevant to the course objectives? Definitely yes = 5 to Definitely no = 1), and feedback (Did the feedback about the task help you understand the reasons for the grade you got? No feedback = 0, No = 1, Yes = 2). Table 1 shows the number of respondents (N), the means, standard deviations (SD), and the minimum and maximum (Min. and Max.) values for the data. The percentage of students who reported experiencing ICFAs (39%) is slightly less than for HIFAs. The mean scores for relevance and feedback are higher for ICFAs than for HIFAs.

The survey also asked questions concerning the length of independent study (How long did you study outside of class for the course during this semester?) and the distribution of learning time (Did you consistently spend time studying out of class? Definitely yes = 5 to Definitely no = 1). Since one semester consists of 15 weeks in both universities, the mean score in Table 1 indicates that the respondents spent less than 30 minutes a week per course on studying outside the classroom. The mean score of time distribution implies that learning was concentrated near the end of the semester, possibly due to preparation for summative assessments, such as final exams and reports.

The learning outcomes are considered based on the three dimensions described earlier: satisfaction (Were you satisfied with the learning in this course?), achievement (Did you learn a lot in this course?), and motivation (Did this course motivate you to learn more about the theme or subject of the course?) All questions were answered using a 5-point scale, ranging from definitely yes = 5 to definitely no = 1. Table 1 displays the results. A comparison of the three mean scores reveals that it is more difficult to motivate students to learn further than it is to make them feel satisfied or have a sense of achievement from the course.

3. Path analysis

**Analysis model**

The relationship between formative assessments and learning outcomes can be examined using path analysis, with consideration of the indirect effects of learning time. Figures 1 and 2 illustrate the basic models. The experiences with and quality (i.e., relevance and feedback) of formative assessments are analyzed separately due to the difference in sample size; only respondents who answered “yes” for experience are included in the quality analyses.

Figure 1 is based on the hypothesis that experiences of formative assessments directly influence the three learning outcomes, and impact them indirectly through the length and distribution of independent learning time. Error variables for learning time and learning outcomes are correlated accordingly. The influence of formative
assessment quality (i.e., the relevance of assessments to course objectives and feedback on the assessments) is presumed to be related in a similar way. This can be seen as in Figure 2.

Both analyses were performed based on in-class and hand-in formative assessments, described in the next subsection. The path analysis begins with the basic
models (i.e., Figures 1 and 2), then paths are removed based on statistical significance until all remaining paths are $p < 0.1$. The resulting models are shown in Figures 3 and 4, with fit indices (acceptable standards are $p > .05$; GFI/AGFI > .90; and RMSEA < .05). Subscripts for the paths are the standardized regression coefficients (**$p < 0.001$, **$p < 0.01$, *$p < 0.5$), and those for the variables are $R^2$ values. Error variables and the correlations between them are not included in Figures 3 and 4.

**Results**

Figure 3a indicates that experiences of ICFAs have no direct effect on the duration of learning or learning outcomes. However, students tend to learn more evenly outside the classroom in courses with ICFAs, and the distribution of the learning time elevates the outcomes slightly (the degrees of variance explained are 2%–5%).

The effect of the quality of ICFAs is stronger than that of experiences with them (Figure 3b). If ICFAs are relevant to course objectives, students are more likely to be satisfied, learn a lot, and feel motivated. Although the degree of feedback is not related to learning outcomes, it can affect the duration and distribution of independent learning time.

---

Figure 4 depicts the results for HIFAs. The diagram for experiences with HIFAs is almost the same as that of ICFAs, except for the path to the duration of learning, which does not lead to learning outcomes. This difference is reasonable.
because HIFAs are usually in the form of homework assignments.

The relevance of HIFAs directly influences the three learning outcomes (Figure 4b), and relates to all three learning outcomes, although the relationship is weaker than for ICFAs. Additionally, feedback has an effect on satisfaction and achievement, but the statistical significance is $p < .10$. Learning time can increase through HIFAs, but it does not change the recognition of learning outcomes in the same manner as experiences with HIFAs.

4. Conclusion

Discussion

The findings can be summarized in response to the research questions as follows. First, the relevance of formative assessments has a greater effect on learning outcomes than experiences or feedback. Experiences themselves do not impact learning outcomes directly, but do have an indirect effect via the distribution of learning time. This is compatible with Biggs and Tang (2011) and McConnell and Doolittle (2012), who ascertained that the alignment between expected results and assessments is important for learning outcomes. Furthermore, despite the amount of previous in-course studies that emphasize the importance of feedback—for example, Drew (2001), Nicol and Mafarlane-Dick (2006), and Hounsell (2007)—feedback was not found to be significant in the between-course approach.
This implies that feedback on formative assessments relates to learning outcomes for individual courses, but is not a decisive factor for students' relative recognition of learning outcomes when comparing each course with the other courses. Alternatively, the contradiction between this study and previous research may be owing to the selection of learning outcomes. While feedback enhances objective outcomes such as grades on final exams or academic grades, it is probable that subjective results of student learning do not change considerably through feedback on formative assessments.

Second, it is suggested that time distribution has a greater impact on learning outcomes than the duration of independent learning. The length and distribution of learning time did not intermediate between the quality of the formative assessments and learning outcomes, but time distribution did intermediate between experience and the outcomes. This is an interesting result because it is intuitively reasonable that time spent on tasks should positively relate to learning outcomes; empirical research has generally supported this connection (please see a review by Gog, 2013 for further details). In Japan, since the Central Council of Education (2012) questioned the sufficiency of students’ learning time, universities have been pushed to make students learn more specifically outside the classroom in order to improve the quality of their graduates. However, this study has indicated that simply increasing learning time through formative assessments is not enough to result in greater satisfaction, achievement, and motivation, at least for Japanese students.

Finally, the type of formative assessment causes the paths to vary in terms of duration and distribution of learning time, as well as regarding the most sensitive learning outcome. For the paths to learning time, it is evident that feedback on formative assessments can motivate students to learn longer and more evenly only when they perform tasks in the classroom. Experiences with formative assessments and their relevance influence the duration of independent learning only when tasks are completed outside the classroom. The most sensitive learning outcome varies, as seen in Table 2.

Using class time for formative assessments is supposed to make students feel satisfied because they can see that the teacher cares about their academic progress. It is assumed that HIFAs do not relate strongly to satisfaction because they force students to spend their spare time on tasks outside the classroom. However, students do realize that they learn a lot in courses with HIFAs. Table 2 also suggests that it is not easy for
teachers to motivate students through formative assessments. Although they can incentivize learning (Walvoord and Anderson 2010; Sambell et al. 2013), they seem to not be able to encourage students to learn more about the theme or subject after a course ends. These discrepancies make us aware of the different, notable points of formative assessments so that students can better recognize learning outcomes.

**Limitations**

One of the most notable limits of this study is the sample design. Although the number of respondents and their answers about the courses are acceptable as a case study, they are not enough to generalize the findings. A large sample would allow analysis of the differences in the relationship between formative assessments and learning outcomes in accordance with students’ traits (Sambell and McDowell 1998). The connection may differ depending on a student’s stage of study, their department, or learning orientation. In light of this, the sample of freshmen at two Japanese universities examined in this study is only a starting point for research on the effect of formative assessments using a between-course approach. Moreover, if it is possible to compare the results of analyses internationally, the findings will have greater relevance for undergraduate curriculum development.

Another conceivable improvement of the research framework is to widen the indicators of the learning outcomes. In addition to students’ recognition of satisfaction, achievement, and motivation, academic grades should be considered. This is especially so for international comparison because some evidence of relationships between formative assessments and grades or degree classifications has been reported in the
context of higher education in the United Kingdom (Gibbs and Simpson 2004). On the
other hand, long-term outcomes should not be ignored either. In this study, questions
about the recognition of learning outcomes were asked just after courses ended. More
time might be required to precisely judge the value of courses, and panel research could
be used to gauge long-term effects.

---

1 In this article, “formative assessment” refers to the tasks assigned by instructors during a
course of study, and not at the end of the course, regardless of their purpose and method of
academic grading. Generally, as can be seen in the work of Irons (2008), Brookhart (2011),
and others, it is assumed by definition that the results of formative assessments are always
used to improve students’ learning and teachers’ instruction. Nevertheless, the definition in
this paper emphasizes the timing of assessments because feedback is treated as a variable of,
but not a given condition of, formative assessments.

2 The credit system established by the Japanese government requires that a student earn at
least 124 credits in the four years to graduation. The minimum requirement is altered to
188 credits in medical and dental programs, 186 in pharmacy programs, and 182 in
veterinary science programs. These programs last for six years.

3 The curriculum structures of Japanese universities and liberal arts programs in
American higher education have a lot in common. The big difference is in the admission
systems. Japanese college students are forced to complete general education coursework,
even though they decide their major before being admitted and before they have entered a
specific department.

4 One credit equals approximately 45 hours of study in the Japanese credit system. The
required contact (in-class) hours vary depending on the instructional style: 15–30 hours in
lectures and seminars, and 30–45 hours for experiments and practicals. This system is
similar to the European Credit Transfer and Accumulation System (ECTS) with a
standardized number of credits to complete a degree (Gonzalez and Wagenaar 2008), and to
the American in-and-out of class time distribution approach (United States Department of
Education Office of Postsecondary Education 2011).

Abstract

Many professions adopt a code of ethics to regulate members of their profession. The teaching profession is also governed by a set of code of ethics. This paper compares the Code of Conduct for teachers in Nigeria with the Code of Ethics for educators in Georgia, USA. The two codes were compared in terms of their purpose, governance/control, focus, scope, organization, location of violation, dissemination and enforcement. Although the two sets of codes cover the same topics, there were differences in purpose, tone, organization and strategies for dissemination and enforcement. Specifically, the purpose of the Georgia code is to protect the students and provide a safe learning environment, while the Nigerian code emphasizes the professionalization of the teaching profession. The significant difference is in the efforts being made and strategies being used by the governing bodies to make educators aware of and knowledgeable about the codes. Georgia has made awareness and familiarity with the Code of Ethics a condition for entrance into teacher education program and a condition for initial certification and renewal, whereas Nigeria is yet to enforce teacher registration as a condition of employment. Nigeria could borrow a leaf from the strategies that Georgia has perfected.
Introduction

Some of the characteristics that distinguish a profession include a highly specialized level of education or preparation, self-regulation or accountability and code of ethics. The professions establish standards for preparation, licensing/certification and behavior or operation. The professions also establish sanctions that help to ensure compliance of their membership. Professions like medicine, law, engineering, counseling, have enjoyed undisputed recognition as professions longer than the teaching profession which has continued to fight for that recognition and acceptance. The teaching profession is unique in that unlike the other professions, it is almost universally true that the code of ethics for the teaching profession is established and enforced from outside the profession, often by the government, rather than by members of the profession. In the United States, accreditation from national education associations like the NCATE, TEAC, now, Council for Accreditation of Educator Preparation (CAEP) is voluntary. The accreditation is also for the program providers so the associations do not issue license for individual practitioners. The approval that counts is the one from the government agencies like the Georgia Professional Standards Commission (GaPSC). Such agencies not only approve the preparation programs, they set the standards for licensing individual practitioners and establish and enforce the code of ethics for teachers, in the case of countries like Nigeria, or for all educators as in Georgia where all educators, not just teachers, require a license or certificate to work in public school systems.

The purpose of this paper is to examine the code of ethics for teachers in Nigeria (called Teachers’ Code of Conduct (TCC)) and the code of ethics for educators in Georgia, USA. Georgia is chosen as a purposive sample out of convenience. The two sets of code of ethics will
be compared in terms of context/background, governance, scope, focus, the organization of the standards, dissemination and enforcement.

**Context/Background**

Nigeria decided to “professionalize” the teaching profession in 1993 by enacting a law, ACT. No. 31 of 1993 that established the Teacher Registration Council of Nigeria (TRCN) which was empowered to enact and develop laws and rules that parallel those guiding the medical, law and engineering professions in Nigeria. According to TRCN,

[T]he history of education in Nigeria show[s] that teachers occupied the position of great honour and influence in their communities. They epitomized integrity, knowledge, leadership, moral rectitude and selfless service. They spearheaded the development of their communities and country. But over the years things appeared to have changed for the worse. In order to maintain and restore the teacher’s enviable status and qualities, there is the need to enact this code of conduct to define the minimum standards expected of professional teachers in terms of thoughts, words, and actions. (2005, p. 10).

Consequently, the first objective of the TCC was to “re-awaken the sense of self-esteem, dignity, honour, selfless service and moral rectitude in the teacher”, (TRCN, p.10). Another interesting objective of the TCC was to “boost public confidence in the ability of the teaching profession to regulate itself and to bequeath to the nation products that are capable of making maximum contribution towards the development of the nation in particular and the world in general” (TRCN, p.10). This objective is interesting given, as shall be seen under
governance, that it is the government, not the profession that regulates teaching. Officially, the teaching profession is accorded the same respect and privileges as the other professions in Nigeria. A major difference is that while the other professions determine through medical board or bar examinations who practices medicine or law in Nigeria, thus, self-regulating, the teaching profession remains the “ward” of the federal and state governments. The TRCN is an agency of the federal government which has the authority to set standards of preparation, practice and sanctions to ensure compliance. Incidentally, the same is true in the United States, specifically, in Georgia.

The Georgia Professional Standards Commission (GaPSC) parallels the TRCN of Nigeria. The GaPSC is a state agency established by law in 1991 to set standards for preparation and certification of educators in Georgia (GaPSC, 2015). The agency approves and renews approval for public and private colleges of education to prepare educators in the state. It ensures that only educators prepared in such approved programs can receive certification/licensure to teach in Georgia.

A sister agency, the Georgia Practices Commission, was established at the same time to set up and enforce the Code of Ethics for Educators. The GaPSC absorbed the responsibilities of the Georgia Practices Commission in 1997 (GaPSC, 2015). The GaPSC since 1997 has three divisions that oversee its regulatory responsibilities of educator preparation, educator certification and educator code of ethics. The Code of Ethics for Educators is maintained and enforced by the Ethics Division. The Georgia Code of Ethics and the Nigerian
Codes of Ethics in Education in Nigeria and Georgia (USA)

Code of Conduct are the focus of this cross-cultural comparison. The remainder of this paper will focus on similarities and differences in the characteristics of the Georgia Code of Ethics and the Teachers Code of Conduct in Nigeria, as summarized in Table 1, how they are enforced and the sanctions imposed. The next section focuses on the governance of each agency that administers the codes of ethics.

Governance/Control

The first obvious difference between Nigeria and Georgia is the level of control. In Nigeria, the profession is centrally controlled at the federal level, while the level of control is at the state level in Georgia. Thus, the Teachers Code of Conduct is established at the federal level by the TRCN for the whole country. The TRCN then establishes a Teacher Investigation Panel (TIP) in each state and in the federal territory. The panel comprises five members appointed by the TRCN, one of which is a legal practitioner. The TIPS receive complaints, conduct investigations and decide whether or not a case should be dismissed or referred to the Teacher Disciplinary Committee (TDC) at the national level. The TDC comprises 10 members appointed by the TRCN and chaired by the chairperson of the TRCN board. The TDC is a tribunal and functions in the same way as the 20-member GaPSC Commission. The TDC conducts hearings on the cases referred to it, makes a judgment of guilt or innocence, decides on the sanctions and metes out the punishment. In Georgia, on the other hand, the GAPSC sets the standards in the educator Code of Ethics; this is in turn communicated throughout school systems and is accessible to the public via the agency website. The Ethics division
serves a similar role as the TIP in Nigeria. It investigates valid complaints of improper conduct and when necessary, ethics cases that have merit are sent to the GaPSC commission for deliberation and appropriate disciplinary actions. The sanctions in Nigeria include advice, reprimand, suspension from registration as a teacher, or deletion from the federal teacher register. These parallel the decisions in Georgia: Clearance to continue employment, reprimand, suspension, and revocation of certificate.

Scope

Another interesting difference between the Codes of Ethics in Nigeria and Georgia is the scope or the various professional categories they cover. In Nigeria, as the name indicates, the Teachers Code of Conduct is specifically for teachers alone. On the other hand, as the name implies the Georgia Code of Ethics for Educators, applies to all categories of educators who work in the school systems and are associated in one way or the other with providing services to students. These categories include the administrative, service and teaching fields. The administrative includes superintendents, and their deputies, principals, assistant principals, all who hold administrative positions at both the building level or at the central office. The service fields include all categories of individuals that provide services that facilitate student learning such as psychologists, guidance counselors, media specialists, technology specialists, etc. Teachers include all levels of teaching from para-professionals to the highest level of teaching. In Georgia, everyone who requires a certificate from the GaPSC to work in the public school system is covered by the codes. It is telling that not all the directors
and other administrators in the schools or states’ boards of education in Nigeria e.g. the Anambra State Universal Basic Education Board (ASUBEB) or the Anambra State School Services Commission and their deputies in Nigeria are under the Teachers Code of Conduct.

**Focus**

The focus of the Code of Ethics for Educators in Georgia is the protection of the students while in Nigeria, the focus is on the “professionalization of teaching.” Thus, in Nigeria the Code of Conduct enunciates an ethical framework for “what the new cherished values, ideals and practices should be” (TRCN, p.4) for teachers. As Obaji (2005) puts it, the code of conduct in Nigeria “defined what is now acceptable or unacceptable in the occupational and even personal lifestyle of teachers” (p. 4). In Georgia, the code of ethics comprises a set of standards. Each standards states what an educator shall or shall not do and is followed by examples of unethical conduct that would violate that standard. For example Standard 2 - Conduct with Students states: “*An educator shall always maintain a professional relationship with all students, both in and outside the classroom.*

*Unethical conduct includes but is not limited to:*” This is followed by a list of examples of what constitutes unethical conduct such as “committing any act of child abuse, including physical and verbal abuse” (Georgia PSC Rule 505-6-.01, p. 2). The *Teachers Code of Conduct*, because of its purpose to provide guidelines or principles that make a profession, covers more topics/ground than specifically what constitutes ethical or unethical behavior like the Georgia Code of Ethics does. The Nigerian document describes both the structure of the chain of
command in the oversight of the administration of the code of conduct for the teaching profession, as well as the role of each level. Specifically, the TIPs receive and investigate complaints about teachers at the state level and forward those that have merit to the TDC which conducts hearings, passes judgements and hands out sanctions where necessary.

The document also includes nine chapters on the relationships with colleagues, the role of teachers as administrative/academic leaders, relationship with learners, relationship with parents/guardians, the relationship with employers, relationship within the society and other general comments. These chapters consist of what the actual code of conduct is in Nigeria. The tone is more positive than that of Georgia. For example item 53, Respect of contract, under the Relationship with Employers, says that “Teachers should strive to fulfill contractual obligations and to render their services only in accordance with the terms of the contract or the law”. The GAPSC Standard 8 - Abandonment of Contract, on the other hand, states that “An educator shall fulfill all of the terms and obligations detailed in the contract with the local board of education or education agency for the duration of the contract. Unethical conduct includes but is not limited to: 1. abandoning the contract for professional services without prior release from the contract by the employer…” (GaPSC p. 4).

While the Nigerian code implores the teacher to “strive” to fulfill a contract, the Georgia version states clearly that an educator shall fulfill it
and goes on to specify that doing otherwise, without being properly released from the contract, is considered unethical.

**Organization**

Another striking difference between the Code of Ethics in Georgia and the Codes of Conduct in Nigeria is that Georgia’s is organized as succinct standards of behavior e.g. legal compliance, conduct with students, refrain from use of alcohol or drugs, honesty, use and handling of public funds and property, remunerative conduct, handling confidential information, abandonment of contract, reporting, demonstrating professional conduct and administering state-mandated assessments. In Nigeria, the codes or expectations of behavior are couched under relationships with stakeholders in the education enterprise: specifically, relationship with colleagues, learners, parents/guardians, employers, and the rest of the society. Organizing behaviors by the stakeholders involved may lead to duplication. For example, corruption or not accepting gifts are repeated under relationship with student, parents, employer, and the society. A better presentation would be to pull all these under a remunerative conduct as in the Georgia’s codes. Nigeria’s codes emphasize relationships with the stakeholders and reflect a cultural phenomenon where interpersonal relationships and group membership, family or community, are esteemed and sometimes interferes with, or even prevents, objective application of the law.

Stating the code of conduct in terms of relationships probably required the use of a positive and less legalistic tone. For example, in relating with colleagues, teachers are expected to be loyal to one another and “should cooperate with one
another to achieve professional goals” and with regard to integrity, “teachers should be honest, by demonstrating integrity in all contacts, should respect persons and property, be trustworthy and preserve confidence.” In neither of these, nor in many other codes, does it specify or illustrate what an unethical conduct would be. This leaves room for individual interpretations and judgements as to what constitutes ethical and unethical conduct towards a colleague.

**Location of Offense**

In Georgia, educators are bound by the Code of Ethics even when they are not on school property or at work. Under the *Conduct With Students*, teachers are liable if they fail to prevent students’ use of alcohol or illegal or unauthorized drugs while under their supervision, “including but not limited to at the educator’s residence or any other private setting” (p.2). This extends to off campus activities sponsored by the school, e.g. School field trips or excursions to local, out-of-state or even foreign countries. While the Nigerian Code of Conduct expects teachers to be role models to the learner at all times, it does not specify locations where the teacher may be held responsible. It would probably take challenges to sanctions imposed under this code to get greater clarification as to what is unethical conduct.

**Dissemination and Enforcement of the Codes of Ethics**

The *Teachers Code of Conduct* in Nigeria is 10 years old this year, yet research (Agih, 2013) indicates teachers’ lack of awareness or knowledge of the existence of the document or the expectations of behavior. Agih’s study was conducted in Bayelsa state Nigeria using 1,980 secondary school teachers and 80 secondary school principals. He found that principals were quite knowledgeable about the *Teachers Code of Conduct* and “comply with some of the acts adjudged to be misconduct in the profession.” Both principal and teachers were most familiar
(97.5% and 92.6%, respectively) with an indicator of “forgery or mutilation of official
document.” There was also reasonably high but flipped compliance rate of 70% and 88% to the
indicator among principals and teachers, respectively. Both groups were very familiar (96.3% vs
92.6%) with the indicator of not fighting on school premises and also complied (98.8% vs.
90.5%). Yet, only 66.3% of principals and 28.4% of teachers knew that teaching without
registering with TRCN was adjudged a misconduct, with 60% and 14.7% compliance,
respectively. It is not clear whether the author investigated the source of the familiarity or
knowledge. In other words, is it possible that respondents have no personal knowledge of the
document, but just know behaviors that could be considered reprehensible for teachers?

The findings of Agih (2013) are probably not unique. Even though a copy of the
document is available on the TRCN website, many teachers neither know to look for it or do not
have access to internet and so are ignorant of the codes of conduct and, as would be expected, do
not observe them. The Teachers Code of Conduct document proudly lists organizations,
institutions of higher learning, government agencies and professional associations that provided
feedback and probably received copies of the final version. The important group that is not listed
is the classroom teacher, except as represented by the Teaching Council of Nigeria or the
Nigerian Union of teachers. Also, missing was a plan of how all teachers would get a copy of
this document or at least be made aware of it. As Agih (2013) pointed out, the document cannot
guide behavior if teachers do not know of its existence or its contents.

In Georgia, there is a wide dissemination of the Code of Ethics. Educator preparation
programs teach about it, and the codes are communicated throughout school systems and are
accessible to the public via the GaPSC website. It is interesting, however, to note that the Ethics
division of the GaPSC still handles a huge number of ethics complaints and violations.
Consequently, the commission has implemented other ways to increase familiarity and compliance. In Georgia, since 2014, teacher candidates in teacher preparation programs are required to obtain a pre-service certificate to be allowed in public schools for observation or student teaching. One of the conditions for obtaining that pre-service certificate is submitting a copy of certificate of completion of an online training on Educator Ethics. The program is designed to teach the candidate, through scenarios, the Georgia code of ethics and when they meet a pre-determined acceptable level of performance, a Certificate of Completion is generated which candidates will submit with their applications for the pre-service certification. At the end of candidates preparation (one to three years later), they are required to take an Ethics assessment in which they must obtain a passing score, just as they must pass certification tests in their content areas to receive a teaching certificate from the GaPSC to teach in Georgia public schools. The development and administration of all these tests are contracted out to an external testing company. Teachers already employed are expected to take and pass their Ethics test when they renew their teaching certificate, usually three to five years, depending on their current level of certificate on Georgia’s tiered certification system.

In Nigeria, the code of conduct could be embedded in a specified required course in all teacher preparation programs. Alternatively, a copy could be given to new registrants at the point of registration or induction. The TRCN has to invest money in professional development using education faculty members in collaboration with the states’ school boards during the summer vacations. For teachers to participate in such mandatory professional development, attendance has to be made a condition of continued employment. Copies of the Teachers Code of Conduct should be one of the workshop materials distributed and discussed. If these workshops are organized close to home, teachers would not incur undue costs and would not need to be
reimbursed for participation. The fact that only 28.4% of the secondary teacher survey knew they were expected to register to be teaching and that only 14.7% actually complied shows that the TRCN has its work cut out for it. Copies of the Teachers Code of Conduct need to be placed in the hands of all teachers if they are to serve as guide for teacher behavior. For registration with TRCN to be taken seriously, there has to be sanctions for schools or principals that hire or allow any teacher that does not show valid registration to teach in their schools. That means that the TRCN should also facilitate verification of registration validity. The current requirement for annual renewal of registration is burdensome on teachers and probably not sustainable. TRCN could try a five-year validity period as Georgia and some other states in the USA have in place. It must also have enough staff and technology to ensure quick turnaround for applicants trying to register or renew their registration.

The TRCN has authority to enforce registration since Section 17(2) of the TRCN Act of 1993 specifies that:

[I]t is a criminal offence for any individual who is not registered by TRCN as a teacher to do the job of a teacher or earn the reward of a teacher or use the title or identity of a teacher. […] It further states that the employer(s) or facilitators of such an individual shall be liable for the same fine or two years imprisonment or both (TRCN, 2010, p.4).

The TRCN is aware that compliance with registration is low and intends to do something about it as this statement indicates: “TRCN is poised to commence the enforcement of this Act systematically and steadily until the offenders appreciate that the TRCN Act is the same as the ones being used by other agencies of government now regarded as powerful because they have the political will to enforce their enabling laws” (TRCN, 2010, p. 4). This
statement was made in 2010! Agih (2013) and Onwuka and Onwuka (2014) suggest that enforcement is lax or non-existent.

**Conclusion**

While the Nigerian *Teachers Code of Conduct* and the Georgia *Code of Ethics for Educators* cover similar topics, they differ in purpose or focus, tone, scope, organization, dissemination and enforcement. Georgia’s is focused on the protection of the student and thus appears more legalistic in tone. On the other hand, Nigeria’s is focused on its primary purpose of helping the teacher behave in a manner that befits a profession. Thus, the tone is mild and many times the code does not specify what constitutes unethical behavior.

A few cultural differences can be observed in specifying expectations of behavior on similar topics. For example, Codes of Conduct are organized around relationships with stakeholders in Nigeria while they are organized as standards of behavior in Georgia. There is more emphasis on drugs and alcohol in the Georgia Code of Ethics than in the Nigerian version. On the other hand, the Nigerian Code of Conduct specifies that teachers should not be involved in sexual misconduct, drug addiction, and cultism and should not patronize student associations that are not lawful and should help to eradicate them. Cultism was specifically mentioned because that has been a major problem in some Nigerian universities and even secondary (high) schools (Martin’s Library, 2014), but a non-issue in Georgia where even the problems in fraternities and sororities, common at the university and college levels, are non-existent at the grades Pre-K -12 levels.

The state of Georgia has developed a full-proof method to ensure educator familiarity of the codes of ethics by making it a condition for entry into and completing teacher preparation (Ethics Entry test) and a requirement for certification (Ethics Exit test). The TRCN has the authority and structures to enforce registration. It just needs strategies like those the Georgia
Codes of Ethics in Education in Nigeria and Georgia (USA)

Professional Standards Commission has put in place to ensure familiarity with and knowledge of the code of conduct and to enforce compliance.

Abstract: Second year students at Nursing Universities mainly lean about nursing in hospitals focusing on patients during treatment period of the time. That makes it difficult for them to understand about the patient as a person having a life in a community. And that is the challenge on education of Public Health Nursing for those students as well. Therefore, We offered "Practice lessons of community exploration” during the 15 times lectures’ program of “Introduction to Public Health Nursing” after proving knowledge of Public Health Nursing to those second year students as a classroom lecture style. These practice lessons were an approach for those students to develop their viewpoints of people as community residents through their own experiences. The 15 times lectures’ program of “Introduction to Public Health Nursing” was set as following. 1; The knowledge of Public Health Nursing as a classroom lecture style, 2; Group work based on training of Community assessment on Community-as-Partner Model (Anderson. & McFarlane, 2004) to the municipal borough where the university belongs. 3; Practice lessons of community exploration. We made a separation of this municipal borough as in 5 blocks based on the local community centers for these “Practice lessons of community exploration”, and the second year students of the nursing university made explorations of these through the viewpoints along Community-as-Partner Model (Anderson. & McFarlane, 2004). In addition, the students interviewed about how the residents think or feel of their towns with residents joining some programs that those local community centers provided. After the experience of “Practice lessons of community exploration”, the students extracted categories with viewpoints of people as community residents such as “Nature environment”, “Education”, “Institution”, “Topography”, “Public safety”, “Local culture”, and “Communication skills in community” apart from Gordon’s 11-functional-health-patterns (Marjorie Gordon 1987). For the difficulty of second year students at nursing universities to understand about the patient as a person having a life in a community, this approach of "Practice lessons of community exploration” during the 15 times lectures’ program of “Introduction to Public Health Nursing” made an effect on the second year students at the nursing university. Moreover, We would like to consider more about the instructional mode for those students in order to explicate the knowledge of Public Health Nursing.
Introduction

Public Health Nurse is responsible for the health maintenance and promotion of the residents of the community. In order to work as a Public Health Nurse, You have to pass the national examination. It was able to obtain the exam requirements of the national examination of the Public Health Nurse as long as graduating from the college until now. However, the qualification of taking the national exam is given only results superiors from 2012.

Specifically, the number of credits of nurse training is increased to develop expertise. Meanwhile, the majority of the students who are not selected will be subject to fulfilling nurse training. Students of “Introduction to Public Health Nursing” are directed to all members not only the selected. These beginners in nursing have learned about the patient to be treated in a hospital. So that, it is difficult for them to understand about the patient from the perspective of public health nursing. Therefore, after having learned the necessary knowledge in the classroom, they developed the point of view that includes the subject and the society in which patients live through Practice lessons of community exploration in the lectures “Introduction to Public Health Nursing”.

We report the methods and results of the specific initiatives.

Method

Objective

81(male 13: female68:) Students at N Nursing Universities

Survey was carried out for two periods (180 minutes) in the first semester (spring to summer) of second year.

1. Readiness of the students:

   (1) first grade

   -Lecture:

   Liberal Arts (foreign language, second foreign language, biology, chemistry, etc.)
   Specialized subjects (Anatomy and Physiology, pathology, pharmacology, psychology,
   Introductions of basic nursing)

   -Exercise:

   Specialized subjects (Practice of basic nursing, nursing process)

   -Practice:

   Early experience training (to communicate the various generations of patients),
Basic nursing training 1 (to provide the skills of livelihood supports for patients who are hospitalized)

First year students were promoted to the second year to get these credits of subjects above. They studied disease theory, health assessment, Introductions to adult nursing in the first semester of second year.

(2) We taught them “the concept of Public Health Nursing, health promotion and primary health care, the history of Public Health Nursing, Public Health problems and health care and welfare systems and institutions in Japan, theory and methods of community exploration, regional diagnosis in Public Health of the model area (1) and (2) among the lecture “Introduction to Public Health Nursing”. We taught them “the concept of Public Health Nursing, health promotion and primary health care, the history of Public Health Nursing, Public Health problems and health care and welfare systems and institutions in Japan, theory and methods of community exploration, regional diagnosis in Public Health of the model area (1) and (2) among the lecture “Introduction to Public Health Nursing”. regional diagnosis in Public Health of the model area (1): We explained “Community-as-Partner Model” at June 25, 2015. We had them collect information of a modeling area and report it to share their thoughts with each other at the same day. We distributed the finished version of the district diagnosis of modeling area. We also showed a case of the nursing process of one of the patients and applied Gordon’s 11-functional-health-patterns (Marjorie Gordon 1987) to information for 11 categories.

2. Practice of community exploration (at June 25, 2015)
(1) We organized 8 groups in 12-13 persons per group and divided N city into five blocks. Then we made the local community center of each of the district as a base of activity.
(2) We interviewed residents participating the activities in those local community center that how they think the city you were living. Moreover, we spoke to the residents participating in group activities such as hula and calligraphy in the community center.
(3) We observed the area to walk around the local community center with the viewpoint of Community-as-Partner Model.

3. Presentations (90 minutes)
(1) We gave a presentation about the area where they had investigated in each group.
(2) We instructed to add information that they seemed to have missed to understand someone at that time to the practice sheet.
4. The practice tools and the use of them

(1) We showed a case of the nursing process of one of the patients which was the same patient information we had used on 25th June 2015.

(2) We again applied Gordon’s 11-functional-health-patterns (Marjorie Gordon 1987) to information for 11 categories.

(3) We instructed to add information that they seemed to have missed to understand someone at that time to the same practice tools in the week after Practice of community exploration.

5. The learning goals

(1) The student can understand that a patient comprehensively to become more aware of his background; district, city, and prefecture, country.

(2) The student can understand that you are affected by the history of the area, culture, industry, transportation, medical care, welfare, and the community.

(3) The student can understand that all patients do not normally belong to hospitals and they live in community.

(4) The students can understand their overall picture of N city has their university.

6. Ethical considerations

We explained the gist of our study and got agreement in writing with them to promise that results was not used for a purpose other than the study and that we considered as individual was not identified.

Analysis

The exercising tools based on the case that had been presented to the students was used before and after Practice of community exploration. They were classified in 11 categories along Gordon’s 11-functional-health-patterns (Marjorie Gordon 1987) theory before the Practice of community exploration. After the Practice of community exploration, student made Labels of add information that they seemed to have missed to understand someone at that time to the same practice tools in the week after the Practice of community exploration.

The above labels were collected and categorized for qualitative integration by Affinity Diagram. The analysis was done by 5 teachers who had participated the investigation involves 3 public health nursing and 2 home nursing teachers.
**Results**

Although labels are 289 sheets has been extracted, the following labels which apply to 11 categories of Gordon is omitted.

1. activity, exercise (16) : occupation
2. Self-perception, self-concept (18) : independence, hope, motivation, interest
3. Health perception, health management (4) : eating habits, diet, daily habits
4. Roles, relationships (16) : family structure, family, relationships with the people around, friendship
5. Stress tolerance, Coping (3): Stress

The labels relevant to the viewpoint of public health

1. Living environment (63 labels) : construction products, shopping environment, the atmosphere of the city, dwelling form, sports environment, presence or absence of the park, The number of apartments, eating out environment, environment of medical facilities, welfare facilities
2. Communication between local residents (28 labels) : relationship, communicate with neighbors, communication with the local community, communication
3. Safety and transport (23 labels) : means of transportation, traffic, public transportation, the distance between the workplace and the home, commuting means
4. geography (22 labels) : the topography of the area where A lives, geographical environment, the topography of N city, land, the number of a hill
5. environment (22 labels) : climatic impact, environment, climate, atmospheric state, temperature, water quality
6. economics (20 labels) : economics, economics in your district, economic resources, employment
7. institution (18 labels) : institution, government, politics, social and health service, welfare service, public health activities of the company, improvement of public services
8. education (11 labels) : education environment, study environment, education, presence or absence of a university, presence or absence of a private university
9. avocation (7 labels) : avocation, amusement
10. Heredity (2 labels) : Heredity
11. security (2 labels) : security, regional security
12. culture (1 label) : culture

**Consideration**

Public Health Nurse activities contains cultural backgrounds such as regional climate and temperament,
lifestyle (Marutani, 2005). Students, however, do not have the viewpoint to count these cultural backgrounds in because they have learned about the care of patients undergoing treatment in the hospital. Therefore, they need a gradual education to develop the skill of Public Health Nursing activities.

Students follow the 5 stages learning process such as “see the real image of the district and the people”, "see the target", "analyze the data associates with dates", "see the strengths of the background and region to discover health issues” and “see the outline of the institutions of the plans” in the research on learning process concentrates on how students are learning the deployment process of regional diagnosed in Public Health Nursing Practice (Nishizima, 2007).

We had them understanding the needs of the viewpoint of public health to conduct an assessment and grasp a patient. Hereby, we achieved the leaning process “see the real image of the district and the people” in the context of Nishizima(2007) to see the data in N city and do the Practice of community exploration. Next, they achieved the stage “see the target” to have the viewpoint of effects on a health condition of the patients from the cultural background of his region. It is found that they got the viewpoint such as geography, environment, living environment, security and transportation from the results of the content analysis. The viewpoint has spread to the background such as institution, economic, education and culture.

According to Tawara (2003), it is very important to see the historical background to for understanding the community activities. And "Inheritance" was interpreted as an endemic that continually occurs in the specific area and relates closely with a geographical factors such as geography and climate of the area. Although the students were able to broaden the perspective enough for a beginner of public health nursing, it is difficult for them to have a point of view of history and culture.

Although the learning goals (3) and (4) are almost achieved, learning goals (1) and (2) are, to be determined from the number of the labels, poorly understood. Thus, it is required that we teach them the viewpoint to correlate considering these historical course with understanding the health issues. Our approach based on an experiences to look at the environment and interview with residents became the help of basic understanding of the public health nurse activities.

**Conclusion**

Our goals is that students are able to expand the perspective to the background of the patients and
connect it to the viewpoint of public health nursing to understand their objects widely. The viewpoint of the students spread by exercises with experimental learning. Although the purposes are almost achieved, it is required that the accuracy of the connection between the purposes and the contents of the lectures are modified to get the viewpoint that historical or cultural course relates closely with the current health problems.

6. Abstract
English has become the major language in research communication and being able to conduct effective presentations is one of the essential skills for scientists for their research life. However, it poses a great challenge to non-native English speaking scientists, especially novice members. We thus need to urgently develop an effective training program for academic presentations in the English language, to help them establish their careers.

There are, however, fundamental problems which need to be dealt with, that is to say, specific knowledge on how to conduct a good academic presentation is, at this point, insufficient, and past studies on discourse of academic presentations are based on linguistic view points and lack audience perspectives. In response to these circumstances, clear guidelines for teaching academic presentation and systematic methods are required to be developed, along with the contents of teaching based on the genre knowledge incorporated for discourse members.

Thus, in this research, the essential elements that constitute a good academic presentation are comprehensively investigated through the use of 105 questionnaires from the Japanese scientists' perspectives of an audience. Then, the author would like to examine what the implications are for the pedagogy of teaching academic presentations and discuss what should be included in classroom teaching for realizing effective presentations.
Examining Mathematics Instruction in Inquiry-Based Classrooms:

Kindergarten to Grade Three

Trudi Tallerico

University of Calgary

© Trudi Tallerico 2015
Abstract

The current political and educational climate in Alberta is in flux over how to teach mathematics. Since the rise of inquiry or discovery-based mathematical learning, parents and educators preferring traditional methods of teaching math have attributed diminishing student mathematical test results to the removal of traditional methods of instruction. This literature review examines a variety of current scholarly and related educational resources to determine how Kindergarten to Grade Three children in inquiry-based schools develop a deep foundational knowledge of mathematical thinking. The study found four key teacher competencies: deep discipline knowledge, solid pedagogical knowledge, the ability to provide rich open-ended problem-based tasks and skill in probing student learning are required to deliver a successful mathematics program. Findings also noted that both discovery-type and traditional instructional strategies are necessary to successfully understand mathematical outcomes. Recommendations suggest that a balanced mathematics program combining inquiry or discovery-based learning with traditional instruction enables students to work at a deep conceptual level through a real-life problem-solving lens.

Key terms: mathematical thinking, inquiry-based learning, discovery-based learning, traditional methods of learning, Kindergarten to Grade 3
The current political and educational climate in Alberta is in flux over how to teach mathematics. Recently in Alberta a group of parents, business people and politicians have expressed the desire to go “back to the basics”, specifically returning rote memorization of basic facts and algorithms to the mandated curriculum (Alcinil, 2014; Mertz, 2014). In addition, this group has voiced concerns that the rise of discovery-based mathematical learning in the province beginning around 2008 has resulted in students no longer being taught standard methods of problem solving leading to a deficit in their understanding. Moreover, declining provincial and international standardized test scores since this implementation has fueled this discussion (Wente, 2014).

Debate around this issue is intense however. Teachers using inquiry-based learning have found that students are more engaged with mathematical learning when it is done through a real-life problem-solving lens and are able to articulate a deep understanding of the concepts being taught. Researchers have established “that real-life problems constitute authentic contexts within which students can be expected to learn and experience the power of mathematical knowledge” (Chinnappan & Pandian, 2009, pp. 198-199). “There is [also] a growing body of academic evidence that [international standardized] test scores aren’t accurate reflections of student learning” (Campbell, 2014).

I argue that inquiry-based math instruction can successfully address curricular outcomes and ensure young learners develop deep foundational knowledge when the authentic tasks include both conceptual and procedural instruction. This review examines a variety of current scholarly and related educational resources on mathematics instruction in Kindergarten to Grade Three inquiry-based schools to determine how children develop a deep foundational knowledge of mathematical thinking. A description of themes emerging from the data and an analysis of these themes to determine which strategies most successfully support teachers in planning for,
promoting and extending mathematical thinking in daily instruction will follow. Possible implications will be discussed.

Over the past seven years the Alberta government has been redesigning the provincial education system. After consultation with a diverse number of Albertans a document entitled *Inspiring Education* was produced summarizing the desired attributes and competencies of the graduates of 2030 (Alberta Education, 2010). Literacy and numeracy were the cornerstones to achieving these attributes and competencies. There was also the recommendation that teachers “move education to a process of inquiry and discovery – not just the dissemination of information and the recall of facts” (Alberta Education, 2010, p. 7). In 2013, guided by the *Inspiring Education* document the government issued a Student Learning Ministerial Order mandating these new educational goals and standards in Alberta (Alberta Education, 2013).

Although now mandated to do so, educational systems across Alberta have been moving towards inquiry-based learning for quite some time. Inquiry-based pedagogy provides opportunities for learners to invest cognitively and emotionally in their learning and through these opportunities, students are more likely to engage in and identify with schooling outcomes (Willms, Friesen & Milton, 2009). With the support of educational organizations and networks, researchers, professional development educators and authors at local conferences teachers are intentionally designing rigorous inquiry-based explorations of content.

This inquiry pedagogy includes the discipline of mathematics; as Twomey Fosnot (2007) states, “mathematicians solve problems but they also pose problems. They inquire. They explore relations, investigate interesting patterns, and craft proofs” (p. 8). Teachers report that students are much more engaged in mathematics and using personal methods of problem solving has enabled students to demonstrate a deeper understanding of the concepts being taught.
However, declining results from both provincial and international standardized math tests completed during this time of redesign have caused concern among many parents, business people, politicians and even some teachers in Alberta. Grade Three Provincial Achievement Test data from 2010-2013 demonstrates a 3 to 4% decrease as compared to the test results from the 2008-9 school year (Alberta Education, 2013). Programme for International Student Assessment (PISA) tests (for 15 year old students) written in 2012 demonstrated an increased failure rate of 15.1% in 2012 up from 7.3% in 2003 (Wente, 2014). From this, these groups postulate that children are not developing the basic skills of math facts and algorithms and have a deficit in their understanding of mathematics. They are demanding a return to a mathematical education with a focus on standard procedures and algorithms.

Armed with this information, these concerned individuals joined forces to pressure the government into reversing some of the redesign decisions, and have in fact been partially successful. In late June 2014 former Minister Jeff Johnson stated:

The curriculum will be amended in time for the fall semester to make it “explicit” that memorization of the mathematics times tables is still expected and that instructors can teach the strategies for solving equations they believe are best suited to the student. Language will also be removed that some believe discourages rote learning. (Nolais, 2014)

As teachers move forward with this revised direction, the question remains, can students develop a deep mathematical understanding through inquiry-based learning?

**Researcher’s Role**

Mathematics became an interest of mine about ten years ago. At that time, the school I was working at became involved with the International Baccalaureate Primary Years Program taking up inquiry-based learning. I then moved to another school doing inquiry-based learning
guided by the Galileo network. Throughout this time the work in both schools moved increasingly towards a single focus – inquiry; as much as possible everything, including mathematics was taught including under the umbrella of the inquiry.

In engaging in this work, however, it has become apparent to me that while a richer understanding of mathematics can be developed through inquiry, not all students are developing an understanding of and mastering the basic facts and algorithms. Feedback from teachers and parents continues to indicate that a significant number of students are not advancing to their next grades with the foundational mathematical understandings that are needed to complete the expected work at that level.

**Research Purpose**

The purpose of this study is to determine effective instructional strategies that enable Kindergarten to Grade Three children to develop deep foundational mathematical knowledge in an inquiry based setting.

The study will be guided by the following questions:

1. What classroom practices in inquiry-based schools prove most effective in ensuring children develop a meaningful understanding of higher-level mathematical thinking?
2. What classroom practices in inquiry-based schools prove most effective in ensuring children develop meaningful understandings of standard procedures and algorithms?
3. How do teachers assess for student understanding?
4. What strategies do effective teachers use when students are not able to demonstrate understanding?
5. What strategies do effective teachers use when students are ready for enrichment?

**Methodology**
In order to determine the ways Kindergarten to Grade Three students come to understand mathematics in an inquiry-based setting I conducted a qualitative literature review to gather a broad section of information. Sources for the literature review were gathered from academic and publically accessible databases initially using the key terms: mathematics, inquiry-based learning and elementary and included: peer reviewed articles, government documents, blogs, professional math books and other relevant educational material. I examined each for evidence of effective mathematical instructional strategies within Kindergarten to Grade Three inquiry-based classrooms.

When analyzing the literature, I looked for terms and practices that denoted emerging trends and patterns to establish the current, most successful instructional strategies in Kindergarten to Grade Three mathematics education. I was also interested in determining what assessment criteria teachers used to measure the success of each strategy, particularly evidence of student learning as well as note other relevant information.

Using this analysis in conjunction with the number of references within the material I grouped then regrouped the data according to common traits to determine what strategies were employed, ranked them in order of effectiveness in improving student understanding and mastery of foundational mathematics then made recommendations as to how to implement them within Kindergarten to Grade Three inquiry-based settings.

My search revealed that research for this age group is limited. Scholarly databases, blogs, social media and newspaper articles focused on a variety of ages and current government testing information was based on Grade Six, Nine and Twelve students while the PISA data focused on 15 year olds. Therefore I had to broaden my search to include inquiry-based educational articles related to older students that seemed to have universal applications. I limited my articles to the
last ten years with the exception of one controlled study from 1990 I felt was relevant to this topic.

**Literature Review**

While public interest has brought the topic of mathematics instruction to the forefront locally, it has been a growing topic of interest across many school districts in Canada and beyond for many years. Friesen, 2005, 2008; Gavin & Moylan, 2012; Makar, 2007; National Council of Teachers of Mathematics (NCTM), 2014 and Towers, 2010 have all researched and written about in it the academic educational literature. Examining these sources provided a more thorough sampling of best practices around mathematical instruction and inquiry-based learning.

**Major Themes**

Four teacher competencies and classroom practices repeatedly appeared in the scholarly literature and educational material that have a significant impact on student learning. They are: the necessity to have a deep knowledge of the discipline, the ability to provide rich open-ended problem-based tasks, skill in probing student ideas and thinking, and strong pedagogical knowledge of how children learn. Though these competencies and practices are closely connected and interwoven they will be discussed as discrete entities.

**Deep discipline knowledge.** Research is demonstrating that teaching mathematics in an inquiry-based setting requires deep discipline knowledge (Friesen, 2005, 2008; Gavin & Moylan, 2012; Makar, 2007; Towers, 2010). Teachers need to understand the core mathematical concepts, and how each concept moves from the simple to the increasingly complex. “For teachers, then, it is no longer enough to know mathematics for their own use; creating or finding appropriate representations requires them to know about the discipline in ways that make it accessible to students” (Friesen, 2008, p. 52). Teachers not only have to know their own curriculum, at a minimum they should know the grade ahead and the grade behind. They need to know what
constitutes a basic understanding of a concept and what constitutes an advanced understanding. It is important to note that children do not have to move up to the next grade level skills to demonstrate superior understanding and explore the depth and breadth of the concept they are working on. To truly support students, teachers must ensure they have developed a strong understanding of mathematics themselves.

**Rich open-ended problem-based tasks.** Thoughtful selection or creation of a task is critical in an inquiry-based setting. The task must pose and have children investigate open-ended questions that are broad in nature to ensure all students have a place to begin and rigorous enough to challenge each student to move along in their understanding of the concept (Friesen, 2008; Gavin & Moylan, 2012; Makar, 2007; Marshall, Horton, Igo & Switzer, 2009; NTCM, 2014; Van de Walle, Lovin, Karp & Bay-Williams, 2014). Tasks should also be worthy of a student’s time. “An advanced concept allows teachers many opportunities to differentiate and support students in learning material that is truly new to them” (Gavin & Moylan, 2012, p. 185). Good tasks also give students a chance to “think, reason, and justify their thinking at much higher levels than is often expected of them” (Gavin & Moylan, 2012, p. 185).

**Probing student thinking.** It “is essential to support productive struggle in learning mathematics” (NTCM, 2014). “Teachers must help students navigate several simultaneous tasks, from brainstorming initial ideas, to gathering and applying information, to ultimately explaining results” (Marshall et al, 2009, p. 576-7). The ability to probe a student’s thinking has been established as key in uncovering any misconceptions held by children as well as to determine next steps (Alberta Education, 2007; Bailey, 2007; NTCM, 2014; Tower, 2010). One way these researchers and mathematicians advocate for this to be accomplished is through ongoing dialogue. Another effective practice is posing “purposeful questions to assess and advance students’ reasoning and sense making about important mathematical ideas and relationships”
(NTCM, 2014). Wentworth & Monroe (2011) also note that teachers must thoughtfully select what student work is presented in order to carefully structure the learning of the whole group. Teachers actively seeking to understand student thinking is paramount in ensuring they are developing the appropriate understandings of the concepts being taught.

**Pedagogical knowledge.** Friesen (2005) states, “improving [teachers’] knowledge of how students learn particular concepts and topics” will positively impact the quality of their teaching (p. 9). In mathematics it is necessary for teachers to know how to “proceed from the simple to the complex and from the concrete to the abstract” (Alberta Education, 2007, p.1), to “use and connect mathematical representations” (NTCM, 2014) and to have fluency in utilizing a variety of manipulatives to support the learning (Towers, 2010). Towers (2010) also discusses the importance of practical wisdom, “what is best to do for these students, in this context, with this subject matter” (p. 245). Strong pedagogical knowledge ensures that teachers know how to scaffold learning to promote understanding and ensure that children will develop deep foundational mathematical understandings and be able to utilize these understandings in new and novel situations.

**Minor Themes**

In addition to the above four major themes, five minor themes emerged as helpful in supporting teachers develop their competencies and improve instructional practice. They were: the importance of promoting procedural understanding, accessing professional development, having personal experience in inquiry-based learning, having supportive colleagues and administration and good assessment practices.

**Promoting procedural understanding.** “Direct instructional guidance is defined as providing information that fully explains the concepts and procedures that students are required to learn as well as [provide] learning strategy support” (Kirschner et al, 2006, p. 77). Craigen
(2014), Friesen (2008), Kirschner et al (2006), Thornton (1990), and Van de Walle et al (2014) concluded that students require direct teacher instruction to develop fluency in mathematical procedures and algorithms. Alberta Education (2007) mandates “mastery of number facts” and further states, “this mastery allows for application of number facts and facility with more complex computations.” (p. 1). It is important then that teachers attend to providing direct instruction of foundational mathematical understandings and they facilitate the opportunity to develop mastery of these procedures. Van de Walle et al (2014) caution however, “a teacher who is striving to teach for understanding can share information via direct instruction as long as that instruction does not remove the need for children to reflect on and productively struggle with the situation at hand” (p. 10).

**Professional development.** To successfully develop the competencies and classroom practices and impact student learning Makar (2007) and Friesen (2005) assert that professional development opportunities are the cornerstone to sustained change in quality teacher practice. These experiences need to be ongoing rather than one time only, build on previous work and help address the needs that individual teachers are encountering. The relevance of professional development to the day-to-day work is crucial as is time and support for reflection and reexamination of practice. (Makar (2007). As professional development needs are unique to each individual, it is incumbent upon teachers to take agency and search out those opportunities that will enhance their practice.

**Inquiry experience as a learner.** “One of the most compelling experiences for the teachers in learning to teach using inquiry was having the opportunity to work through inquiry problems themselves” (Makar, 2007, p. 57). “Teachers need to have wrestled with the same problems themselves and be familiar with the range of mathematical possibilities and conceptual connections that each problem might elicit” (Bailey, 2014, para. 9). Having recently been in a
situation where I had to work through inquiry problems, I can attest to how accurate this statement is. During a math professional development activity a group of teachers worked their way through an open-ended, problem-based task. The insights and conversation that accompanied the work really focused the teachers on knowing what the students would face if completing this task and how they would adjust elements within the task to support particular learners. This experience as an inquiry-based learner highlighted some of the processes that our young learners go through and provided much more information than just becoming familiar with a good open-ended problem-based task.

**Support from colleagues and administrators.** It is imperative not to underestimate the value of a collegial environment as teachers attempt to refine their practice. Conversation strengthens voice; improves communication and challenges people to think critically. As noted by Makar (2007) “teachers relied on one another…and expressed how important it was for them to spend time together, interacting, sharing ideas and concerns, and developing a community together” as they worked through a year-long project of initiating mathematical inquiry (p. 65). This accountability also assisted in helping teachers persevere when they experienced challenges (Makar, 2007).

Towers (2012) concluded that when teachers are moving forward with inquiry-based instructional practices no matter what teacher training was received, math instruction has the tendency to revert back to traditional practices without the support of administration. In a profession that is often enacted in solitude, it appears that having a supportive team has a huge positive impact in the successful adjustment of teaching practices.

**Assessment.** It is important for teachers to establish well thought out assessment strategies. While summative assessments are used to provide a snapshot of the cumulative understanding to that point, it is the daily formative assessments that assist students in knowing
where they are and where they need to go and “teachers [in] adjust[ing] their instruction “in
time” to correct misconceptions and promote developing understanding” (Gavin & Moylan,
2012). These strategies can include teacher questions and observations, student written and oral self-assessments and utilizing rubrics designed for the task. “Well-designed, embedded, dynamic assessment practices have the potential to remove many of the current barriers to learning in the mathematics classroom” (Friesen, 2008, p. 53). Meaningful assessment will always inform all stakeholders (students, parents and others) as to what the student has achieved at any particular point and guide next steps.

Concerns

Some mathematicians and researchers (Craigen, 2014; Kirschner, Sweller & Clark, 2006) question whether inquiry-based learning provides students with enough support before engaging in open-ended tasks. Without direct instruction prior to beginning Craigen (2014) states, “a student’s toolbox for such problems is rather empty. It seems that “inquiry” is code for requiring students to solve problems for which they have not yet been exposed to appropriate methods” (2014). Kirschner et al (2006) also note that when students are given inquiry-based tasks that they have little to no background with, teachers “end up providing students with considerable guidance” (p. 79) in the form of direct instruction anyway. Their research also demonstrates that with limited guidance student “confusion can lead to misconceptions…and false starts are common in such learning situations, [causing] unguided discovery [to be] most often inefficient” (Kirschner et al, 2006, p. 79).

Findings

The findings of the literature review demonstrate a positive relationship between many inquiry-based instructional practices and the ability of students to develop deep foundational understanding of mathematics. These findings also contribute to this body of knowledge by
identifying the most effective instructional practices that enable teachers to successfully teach mathematics.

**Developing a Meaningful Understanding of Higher-Level Mathematical Thinking**

The trends in the data indicate four effective classroom practices that have demonstrated effectiveness in ensuring children develop a meaningful understanding of higher-level mathematical thinking. These are: providing open-ended concept-based tasks, pedagogical knowledge of acquisition of mathematical skills and concepts, the ability to probe student thinking, and formative assessment to guide next steps in learning. Utilizing these instructional practices on regular basis will enable teachers to stretch a child’s thinking and allow them to experience the richness of the math curriculum with an increasingly deepening understanding. In order to successfully implement these practices, research shows that teachers require deep, discipline knowledge, opportunities for professional development and supportive colleagues and administration.

**Developing Meaningful Understandings of Standard Procedures and Algorithms**

The same classroom practices and competencies that ensure that children develop higher-level mathematical thinking also demonstrate effectiveness in ensuring children develop meaningful understandings of standard procedures and algorithms. In addition “when relationships between facts, procedure, concepts and problem solving are attended to and made explicit in the mathematics classroom, student achievement increases” (Friesen, 2005, p. 9 citing Hiebert, 2005). Research data shows that intentional instruction and practice embedded within open-ended concept-based tasks lead to greater understanding and mastery.

**Assessing for Student Understanding**

Data indicates that formative assessment has the biggest impact on determining what students know and can do. Daily conversations, oral and written student reflections, justifications
and skillful questioning assist in “analyzing student understanding before the final assessment allow[ing] teachers to adjust their instruction “in time” to correct misconceptions and promote developing understanding” (Gavin & Moylan, 2012, p. 189).

**Responding When Students Don’t Understand**

Task design is the biggest factor in ensuring success for all students. By designing explorations that begin with the most basic understanding of the concepts all children will have an entry point (Gavin & Moylan, 2012). It is also important to consider “the difficulties that students [may] encounter when learning the concept and how you might nudge their thinking” (Gavin & Moylan, 2012, p. 188). Providing individual coaching and guiding, scaffolding using ‘hint cards’ (Gavin & Moylan, 2012), reviewing and creating opportunities to participate in group conversations where other students’ thinking can be made visible, discussed, and debated, can support learners emerging understanding. Teachers need to know about the discipline deeply in order to find ways that “make it accessible to students” (Friesen, 2008, p. 52). It is important to avoid repeating “approaches to the teaching of mathematics … for whom such practices did not work in the first place” (Friesen, 2008, p. 51).

**Effectively Supporting Students Ready for Enrichment**

Open-ended tasks provide many opportunities for students to delve more deeply into a concept. By considering the progression of concept development teachers can develop challenges for students to extend their understanding. Gavin & Moylan (2012) found that one effective way to do this was by creating extension task cards that modified existing tasks in a way that require higher-level thinking. Placing these cards in an accessible location allows all students an opportunity to push their thinking and stretch their minds (Gavin & Moylan, 2012).

**Discussion**
Burns (2014) writes about uncovering the math curriculum. As she discusses best practices, she states, “too often mathematics instruction gives students the erroneous notion that learning math is all about learning procedures, rather than making sense of the ideas” (Burns, 2014, p. 64). This is true for most adults as well. Except for a brief time period, mathematics was often taught through a procedural lens. That is something we all know and understand even if we can’t explain the ‘why’ behind those procedures. These procedures have served us well in most aspects of our adult lives. However, this type of mathematical learning has also left many of us with a feeling of incompetence around mathematics. Once we have forgotten the procedures we are unable to reason our way through the problem. On the other hand to many outside the classroom, discovery-based math doesn’t seem to provide students with any structure at all. It appears children are left to explore and determine how to best answer questions without developing skills in what has already been determined to be effective ways to solve mathematical problems. Based upon the literature examined however, while there has been criticism of inquiry-based learning this may not reflect the potential of the instructional practice and the call for a ‘return to the basics’ in mathematics education in Alberta will likely not meet the needs of our 21st century learners.

Teachers need to acquire deep discipline knowledge, utilize effective classroom practices that include both inquiry and direct instruction components, and be supported in their work through professional development and by colleagues and administration in order to successfully move student learning forward. To really ensure that students develop deep conceptual understanding, mathematics has to be explored independently as well as within project-based work. As Friesen (2008) stated, “The type of practice required to promote mathematical proficiency stands in sharp contrast to both transmission-type pedagogies and discovery-type pedagogies. Teaching practices that help students build mathematical proficiency combine
concept formation with procedural fluency.” (p. 52). As expected, while current research and influential mathematics organizations are promoting inquiry-based learning, this must be taken up in a thoughtful way to ensure deep procedural knowledge and understanding occurs.

**Conclusion**

In a time when mathematics instruction is being analyzed and questioned by many different individuals and groups in Alberta and beyond, this literature review highlights the teacher competencies and instructional strategies that can enable Kindergarten to Grade Three students in inquiry-based classrooms to successfully achieve mathematics outcomes. It can inform teachers on current best practice, policy makers on curriculum redesign and researchers on new questions to examine.

Teachers in inquiry-based classrooms must have deep discipline knowledge, solid pedagogical knowledge and the ability to probe student learning to enable them to successfully utilize open-ended problem-based tasks. These tasks must be open-ended to allow all students a place of entry and methodically push them to deepen their understanding and skill development. Students must participate in discovery-based learning as well as receiving direct instruction. There are additional strategies and supports that need to be in place to enable teachers to follow through on their development of these competencies and utilization of these strategies. Without relevant profession development and a strong community of collegial and administrative support it is difficult to sustain new skills long term. This review also cautions that while inquiry and problem-solving activities are highly desirable methods of conceptual learning, direct procedural instruction is also required.

Alberta’s policy makers and other concerned individuals are apprised of ways mathematics education can be supported or redesigned to move student understanding and skills forward. Additionally decision makers and advocates must also be aware of the how they are
using the data story, is it possible that additional factors other than inquiry-based learning are also contributing to these results?

The lack of scholarly research related to Kindergarten to Grade Three students demonstrates the need for further investigation in this area. These children represent a group of learners who are just beginning their formalized journey into mathematics. Their needs could be unique and require alternative instructional methods to ensure strong foundational learning takes place.

Years of mathematical research has demonstrated that inquiry-based, problem-solving learning is very effective in ensuring that students acquire deep conceptual understanding in mathematics however decreasing test scores remind us that procedural knowledge and fluency with these procedures also need to be part of a balanced mathematics program. Teachers will need to demonstrate proficiency in a variety of competencies and instructional practices to ensure that students are developing both the conceptual and procedural understandings required to be successful in the 21 century.

SPEED UP YOUNG CHILDREN (SPEED Learning Activities: Smart/Multiple Intelligence, Play, Environment, Ethics, and Developmentally Appropriate Approach/ DAP)

Abstract

The purpose of this study is to investigate SPEED Learning Activities (Smart/Intelligence, Play, Environment, Ethics, and Developmentally Appropriate Approach or DAP) effecting kindergarten students on their developmental areas, ethics and problem solving skills. The sample group was Fifty-five kindergarten students taken by random from 220 students at Srinakharinwirot University Demonstration School (Elementary), Bangkok, Thailand in the second semester of 2013 (November, 2013-February, 2014). This study used pretest-posttest to collect data on ethics and problem solving. The researcher used the DAP as a guideline to prepare environment, teaching and an observation recording (adapted). The results showed that students with SPEED Learning Activities increased in ethics and problem solving skills higher than a control group. In addition, the experimental group had better physical development than a control group. Limitations of the study were the number of students in the classroom and the ratio between teachers and students.

1. Introduction

Research stated the importance of early experiences; inherence and highly active experiences help young children to develop their brains and behaviors. During the early years of life, young children develop their most powerful capabilities, complex emotions, and essential socials skills (National Research Council Institute of Medicine, 2000, pp. 1-2). Froebel, who was seen as a father of kindergarten, established the first kindergarten in Germany between 1782-1852 for children less than six years of age. He viewed children as being educated in close harmony with their own nature and the nature of the universe. (Morrison, 2004). Heroman and Copple (2014, pp. 5) said that kindergarten years tend to be a wonderful time because it is their first experience in school, and it is a bridge for children to cross from preschool to a big school or first grade. High quality early childhood programs offer safe and nurturing environments that support the physical, social, emotional, and cognitive development of young children while responding to the needs of families (Bredekamp & Copple, 2010). The National Association for the Education of Young Children (2005) describes kindergarten programs at their best as including: 1) Working with community early childhood programs to create a smooth and effective transition for kindergarten children and their families, 2) Providing for the learning of all children regardless of their earlier experiences with environments, cultures, languages, abilities, or disabilities, 3) Having staff composed of degreed, certified educators who have high quality professional preparation, and relevant training experience in the developmental and educational needs of young children, 4) Using guidelines of early learning standards that emphasize the concepts and skills appropriate to and important for the kindergarten year, 5) Continuing class sizes sufficient to facilitate high-quality teaching, 6) Employing a coherent, research-based curriculum delivered through teaching practices that combine adult-guided and child-initiated experiences, physical activity, and social interaction, 7) Systematically accessing...
children’s strengths, needs, and improving weaknesses with methods that are
developmentally, culturally, and linguistically appropriate; analyze the results of this data
to direct teaching. 8) Providing respectful relationships with families to support
children’s learning as staff works with families to help identify comprehensive services
needed to promote kindergartners’ positive development and learning styles as well as
developmental characteristics of children in their kindergarten year.

Providing a quality program can enhance child development areas and learning.
SPEED Learning Activities is a teaching approach for kindergarten that consists of
necessary skills for developing young children at their highest levels with principles of
early childhood education. SPEED Learning Activities includes S-Smart/Intelligences, P-
Play, E-Environment, E-Ethics, and D-Developmentally Appropriate Approach. S means
smart or intelligences. This approach creates activities that help children to grow in
multiple intelligences for the whole week. For example, children learn how to grow
plants helps them in the area of the Natural intelligence and the Body-kinesthetc
intelligence. When they count seeds to plant, it is related to their spatial intelligences
area. A teacher creates activities that are meaningful and support young children to
explore their world. Children invent objects and experiment with them actively. Play is a
vital for young children development. Children always play in their classroom with
meaning. Before children play, they plan to play with objects and friends. During play,
they record what they do by drawing every week. Teachers understand their student’s
play. Environment, Ethics and the DAP should be provided for teaching young children.
Before teaching, a teacher provides the physical environment for young children. A
teacher creates learning areas and provides varieties of materials that are appropriate to
her children’s needs, interests and ages. In the classroom, a teacher interacts with children
by using a variety of instructional strategies such as encouraging, modeling, supporting,
or facilitating; and using a variety of leaning context such as a whole group, a small
group, learning centers, and daily routines. As Thailand is a Buddhist country, children
need to grow ethics from very young ages. It is necessary for the country to teach young
children to be a good citizen in the future.

Last, DAP and kindergarten, children change, challenge, and have opportunity
during the kindergarten year. Kindergarten is between a preschool and a primary grade.
When children are five and six years old, their intelligent development grows fast. They
learn through personal responsibility, self-direction and logical thinking. Their domains
also develop across physical, social, emotional, cognitive domains. Kindergarten shapes a
young child as a whole child, and he becomes a long life learner (NAEYC, 2014a).

2. Theoretical Framework

SPEED means fast. It means children at early childhood ages are able to learn faster than
other ages. “S” means smart or intelligence according to Howard Gardner’s Theory.
Gardner studied intelligence and found that humans have eight different areas of
intelligence. His book in 1983, “the Frame of Mine”, revealed seven areas of
intelligences as follows: Logical mathematical, Linguistics, Musical, Spatial, Body
kinesthetic, Interpersonal, and Intrapersonal. Then he added another intelligent area,
which is called the Naturalist intelligence. Gardner described that children between five
and six years of age have developed robust senses of three overlapping realms. First, they
have developed a theory of matter in the world of physical objects. Second, they have developed a theory of life in the world of living organisms. Last, they have developed a theory of mind that incorporates a theory of the self in the world of human beings. In 1995 he divided intelligence in 3 stages: 1) a symbol system means all language that children express such as sentences and story, songs, drawings, and gesture or dance. Children express their abilities through the various symbol systems, 2) a notational system means presenting the symbol through mathematics, mapping, reading, and music notion. When children progress, the symbol system and notional system merge together, and 3) a vocational or vocational pursuit occurs during adulthood and adolescence. When children gather any intelligence when they are young, its will predict their roles in the future (Gardner, 1991, 1993, 1995, 1997, & 1999).

“P” means play, which means young children are working and learning according to Piaget. Play is an essential thing for young children’s life. Young children need to play everyday as they learn about everything through playing. When children are very young, their intrinsic motivation to learn includes curiosity, hands-on investigation, and creative self-expression (Cross, 2010, pp. 5). Sheridan (2011) described the meaning of play including behavior and an approach to tasks. When children play, they increase four fundamental developments including social, emotional, cognitive and physical development. For example, children interact with surrounded objects and other children when they play. Their social and emotional, language and intelligence are growing. They learn how to deal and to communicate with others. When they interact with others, they use their intelligence to think about what they want to create. They use their small motor skills to manipulate things. Freer (2011) studied a cultural-historical theory of play with problem solving, and the children showed learning positive outcomes on concepts during imaginative and investigative play. It is discussed how teachers increase cognitive outcomes for their children during play.

“E” means ethics or character of education that is important for Thai traditional learning because it is a guideline to live his/her life with his/her morals. Ethics are related to how a person decides to do right or wrong, and good and bad things based on morals and values. To do the right thing is the main goal of ethics. The Department of Religious Affairs (2014) stated guidelines of ethics include: gratitude, kindness, discipline, unity, self, honesty, humble reverence or gentility, and religion and loyalty to the king and the nation. In addition, the Department of Education (2550) describes the eight basic ethics for children as follows: integrity, economics, honesty, discipline, gentility, unity, cleanliness, and kindness. It is important to start ethics when children are very young.

Kindergarten children are egocentric. They will understand morals when they are in elementary years. Piaget distinguished the moral thinking of elementary grades into two stages: heteronomy and autonomous. Heteronomy means, “Children are governed by others regarding right and wrong” but autonomous means, “Children are governed by themselves regarding right and wrong” (Morrison, 2014). The goal is to teach young children to focus on ethics and have good morals to support them to govern by themselves regarding right and wrong.

E means an environment that children learn best in an enriched environment. High quality early childhood programs offer safe and nurturing environments that support the physical, social, emotional, and cognitive development of young children while responding to the needs of families (Bredekamp & Copple, 1997). The study of the
relation of the kindergarten classroom environment to the teacher, family, and school characteristics and child outcomes found that classroom quality was related to teacher-child ratio and family income, not to the teacher’s level of education. (La Paro, K.M., Kraft-Sayre, M. & Pinata, R.C., 2003). Teachers create effective classrooms by providing caring and safe environments for young children, welcoming all children, working with them individually and in small groups, and helping all children develop skills necessary for success in school as well as life (U.S. Department of Education & U.S. Department of Education of Health and Human Services, 2002).

“D” means DAP or the Developmentally Appropriate Practice that is used as a guideline for early childhood teachers to teach their students. DAP is a way to teach young children that meets a child’s individual needs and to support a child’s development and learning with achievable goals (Phillips & Scrini, 2014). The four fundamentals of child development areas are social and emotional development, physical development and cognitive development (language and literacy). The NAEYC announced 12 principles of child development and learning as follows; “1) all areas of development and learning are important. 2) Learning and development follow sequences, 3) Development and learning proceed at varying rates. 4) Development and learning result from an interaction of maturation and experience. 5) Early experiences have profound effects on development and learning. 6) Development proceeds toward greater complexity, self-regulation, and symbolic or representational capacities. 7) Children develop best when they have secure relationships. 8) Development and learning occur in and are influenced by multiple social and cultural contexts. 9) Children learn in a variety of ways. 10) Play is an important vehicle for developing self-regulation and promoting language, cognition, and social competence. 11) Development and learning advance when children are challenged. 12) Children’s experiences shape their motivation and approaches to learning” (NAEYC, 2014). Three main ideas of DAP are based on an individual child’s experience with development and learning, interests and needs, and social and cultural contexts. Teachers are the key to provide enrichment experience for young children by concentrating on the DAP guidelines. DAP suggests what teachers should and should not do on issues that teachers should concerned with to provide effective teaching. Effective teaching includes: creating a caring community of learning, teaching to enhance development and learning, planning curriculum to achieve important goals, assessing children’s development and learning, and establishing reciprocal relationships with family (Copple, Bredekamp, Koralek, & Charner, 2014). The DAP has been a critical issue for decades. Dr. Copple Bredekamp and her team have worked for The National Association For Education of Young Children (NAEYC), established the DAP in 1983. Educators in the US and around the world have studied the DAP’s beliefs and teaching. Saifah (2012) studied 335 Thai teachers on beliefs and teaching with the DAP. He found that there was a significant difference of the teachers' developmentally appropriate beliefs, but there was no significant difference of the teachers' developmentally appropriate teaching practices. The findings also suggested that there was a low positive correlation between the teachers' self-reported developmentally appropriate beliefs and teaching practices.
3. Purposes of the Study

As the SPEED Learning Activities is consisted on early childhood education theories and teaching. The purposes of this study were: 1) to create the SPEED Learning Activities, 2) to study how children in an experimental group express their four fundamental developments before and after the experiment, 3) to investigate how children from an experiment group show their problem solving skills comparing with the control group, and 4) to study how children from an experiment group show their problem solving skills comparing with the control group.

4. Method and Procedures

4.1 Population and Sample

The population from this study was a kindergarten level of Srinakharinwirot University Demonstration School (Elementary) in the second semester (November to February) of the 2013 academic year. The students were between five to six years old. 218 students had different levels of abilities. Kindergarten students were divided into four groups or four classrooms, and each group had 54-55 students. This study used simple random sampling research method to get the sample group. There were 54 students that included 27 boys and 27 girls in the sample group. Children attended the SPEED learning Activities 160 days in the second semester.

4.2 Measures

The SPEED Learning Activities was applied for teaching a classroom of 54 kindergarten students. The assessment used to evaluate kindergarten students consisted of: 1) the Kindergarten Problem Solving Assessment, 2) the Kindergarten Ethical Assessment and 3) the Developmentally Appropriate Assessment.

4.2.1 SPEED Learning Activities

The SPEED Learning Activities is related to Early Childhood Education Act 2546 and the Basic Education Act 2551 that attributes on child development areas, preschool performance issues, learning contents, learning standards and indicators of learning. Moreover, the researcher studied research, theory and documents on early childhood that were involved in environment, play, ethics, problem solving skills and child development areas to design the SPEED Learning Activities. Then three experts of early childhood education revised the SPEED Learning Activities. After Improving the SPEED Learning Activities, the researcher experimented teaching with a group of nine kindergarten students that was not either a study group or a control group.

4.2.2 The Kindergarten Ethical Assessment

156 of 218 parents of kindergarten children chosed five of eight ethics created by the Department of Religious Affairs on what they wanted their children to have. The eight
basic ethics for children included: gratitude, kindness, discipline, unity, self, honesty, gentility, and religion and loyalty to the king and the nation. The researcher used five items of ethics that parents preferred their children to have to as follows: honesty, gratitude, discipline, kindness and gentility. The researcher created the assessment. Then three experts of early childhood education investigated the Kindergarten Ethical Assessment on the content validity on questions, contents and language with the IOC (the Index of item objective congruence). After the researcher revised the assessment, the researcher used the assessment to try out with 28 kindergarten students that were not in a study group or a control group. Then an expert analyzed the data with a formula KR-20 and got 20 items of questions. The researcher used pre-test and post-test to collect the data.

4.2.3 The Kindergarten Problem Solving Assessment
After studying documents on early childhood education, the researcher created the Assessment of Kindergarten’s Problem Solving and asked three experts of early childhood education to evaluate the assessment, and the assessment is analyzed the content validity. Then the researcher revised the assessment and tried out with a group of 28 kindergarten students that was not either a sample group or a control group. The expert analyzed the data with the Formula KR-20 to find reliability, and the researcher revised 20 items of questions from the assessment and used pre-test and post-test to collect the data.

4.2.4 Kindergarten’s Developmental Appropriate Practice of Observation (Adapted)
The researcher used the Developmentally Appropriate Practice as a guideline to create the DAP observation. The DAP observation was included social development and emotional development, cognitive and language development, and physical development. Three experts of early childhood education evaluated the content validity. The

4.3 Procedures
Before the school started, the researcher studied the DAP to prepare the environment and teaching. The school-age care environment rating scale by Harms, Jacobs and White was also used to prepare the learning environment. This rating scale contained as follows: space-furnishings, health and safety, activities, interactions, program structure, and stuff development. This experiment research used randomized one group pretest-posttest design to collect the data. In the second week of November kindergarten students both the sample group and the control group did pretest of the Kindergarten Ethical Assessment and the Kindergarten Problem Solving Assessment. Each group had 54 students both boys and girls between five to six years old. The researchers also observed four fundamental developments of the sample group in the second and third week, too. To prepare the SPEED Learning Activities and lesson plans, the researcher studied as follows Early Childhood Education Act 2546, the Basic Education Act 2551, theory and documents on early childhood. Students from the sample group learned with SPEED Learning Activities 160 times for 16 weeks. At the last two week of the semester, the researcher used posttest to collect the data.

4.4 Statistical Analyze
The Statistic for analyzing the assessments included basic statistic (Saiyod& Saiyod, 2539), Index of Consistency or (Saiyod& Saiyod, 2539) followed by K-R20 (Kuder Richardson). Data were analyzed using descriptive statistics. Independent T-test and analyze of variance were used to determine how kindergarten students with the SPEED Learning Activities.

5. Results
This study aimed to implement lesson plans and manual of the SPEED Learning Activities based on the Multiples Intelligences and to study kindergarten students with the four fundamental development skills, the Problem Solving Assessment, and the Ethical Assessment. The study is divided into 4 sections as follows:
1. Creating lesson plans on SPEED Learning Activities and assessments on ethics and problem solving.
1.1 SPEED Learning Activities
The researcher used random to choose a lesson plan to teach nine students who did not related to the sample group or the control group. The study showed the appropriate using a lesson plan of the SPEED Learning Activities for nine kindergarten children. The researcher was able to use lesson plans of SPEED Learning Activities.
1.2 The Kindergarten Ethical Assessment
The Finding of try out with 28 kindergarten children who were not either in the sample group and the control group was:

Finding from table 3 showed that 20 items of the Assessment met the requirement were 1, 2, 3, 4, 5, 6, 8, 9, 11, 13, 14, 15, 16, 17, 19, 20, 24, 25, 27 and 29. The reliability of this study was .819.

2. The findings from the four developmental areas of students with the SPEED Activities
   This study used an Experiment Research. The researcher provided Randomized One Group Pretest-Posttest Design for kindergarten students at Srinakharinwirot University Demonstration School in the second semester 2556 academic year. The sample group was 55 students selected by Simple Random Sampling. Table 3: the results of this study showed four fundamental development areas before and after students learning with the SPEED Learning Activities.

6. Discussion
*SPEED Learning Activities*: SPEED Activities is consisted of Multiple Intelligences (MI) /nine intelligences), Play, Environment, Ethics and Developmentally appropriate practices. Moreover activities on MI, ethics, and problem solving were put in lesson plans of SPEED. Before teaching, the researcher set up environment and teaching according to DAP’s guideline. This study showed that the Multiple Intelligences have led to positive outcomes with children. Children learned with variety activities that supported their intelligences especially problem solving. The sample group showed their intelligent ability on problem solving significant higher than the control group. Gardner (1991) described the meaning of intelligences as “the ability to solve problems or fashion products that are of consequence in a particular cultural setting or community”. Problem solving is an essential skill for citizen in the 21 century (P21. Org). If young children know how to solve problems, they will be able to solve problems in their future. Moreover other MI studies states that students with MI had better outcomes more than other groups. For example, a study of a teaching Taiwanese students from a polytechnic university revealed that students with MI performed significantly better than students in the control group on an actual hands-on design project assignment (XIE & Lin, 2009).

This research study was used storytelling to teach young children on ethics and MI. It showed that students presented significantly better than students in the control group on ethics. The study related to the study of Ugsrisuporn (2011) on MI and storytelling for preschool. Her study showed that students with MI had higher abilities on eight’s MI than a control group except physical intelligence. And Priyawatee (2008) studied on storytelling with ethics on kindergarten students. Her finding stated that students showed better significantly on ethics that control group. Storytelling is a teaching tool for enhancing young children’s learning. Children learn about their world
through storytelling’s. In addition, playing with meaningful was provided in classroom, every week children planned, recorded and described their playing with the researcher. Children learned problem solving and thinking when they were playing. They also learned problem solving when they had field trips. For example children went to a bargain market near their school with limited money. They had to use money with limited amount and recorded what they bought. Many students showed their abilities of problem solving by decision making, bargaining things and using mathematics.

As four fundamental developments are guidelines to teach young children, Teachers should help their students to development skills on physical, emotional, social and cognitive. The sample group had extra activities once a week to play outside classroom. They had group games, Thai traditional games and free playing. Their physical development increased than students in the control group.

7. Conclusion

This study presented that SPEED Activities was an appropriate approach to kindergarten students because these have applied important areas for developing young children. The future study should provide teaching in the bigger size of the sample group to state the use of SPEED activities. Moreover, the study of Multiple Intelligences may be used which Multiple intelligent ‘s areas of students with the SPEED activities will present. Limitations of the study were the number of students in the classroom and the ratio between teachers and students (two teachers: 55 students).

Design and evaluation of a workshop to teach integrated skills

Rieko INABA
Department of Computer Science, Tsuda College, JAPAN
inaba@tsuda.ac.jp

Abstract: This study consists of the design and evaluation of a workshop aimed at teaching integrated skills such as media literacy and career education at a women’s university. The class used Project Based Learning (PBL) and consisted of the planning and management of lecture presentations and interviews, as well as the production of an e-book on working women who served as role models for the students. This presentation gives an overview of these efforts and reports on the evaluation of students’ learning.

Introduction
The phrase “21st century skills” is one of the most ubiquitous terms in today’s education (Bernie, 2009). It highlights the need for the next generation of university students and workers to be independent thinkers, problem solvers, and decision makers. There are many projects to this end, such as Project Based Learning (PBL), which has the three goals of “developing independence,” “knowing the actual society,” and “knowing the necessary skills.” In addition, various workshops are offered to teach students integrated skills.

The authors designed and implemented a class with a workshop format at Tsuda College, with the aim of helping students acquire comprehensive skills. In this paper, we report on the class outcomes and evaluation, focusing on the effects of career education through the e-book production.

Design of the Workshop
In this class, rather than being the recipients of media, students stand in a position to create their own media. On its axis, there are the elements of media literacy education and career education. Figure 1 show the class outline. The final challenge of the class is to produce an e-book on working women who serve as role models for the students. The purpose of this is to give students who are looking for a job the opportunity to think about possible career paths. Moreover, it is said that in order to perform career design, students must know the reality of job situations. Then, if they cannot integrate their skills into the career, it is difficult to envision the career design. Role models can facilitate this integration. Furthermore, role models provide inspiration to individuals, and this motivates the individuals to emulate aspects of the role models’ behavior or style (Speizer, 1981). In this view, role models are exemplary figures offering essential clues to identity and career achievement (Gibson, 2004). For these reasons, we selected the production of an e-book on role models as the final class project.

The course was a compulsory, cross-department Media Studies course taught by one faculty member and one teaching assistant. Each group consisted of 3–5 students. At this time, we divided the students into groups on the basis their future careers. First, each group selected graduates who would become role models and called them to talk. The students were responsible for all aspects of the lecture such as planning, management, public relations, and so on. In order to use their skills to produce an e-book, they had to face two challenges. One was a “pair interview” for which they needed to learn how to interview and how to write. The other was the “30 seconds My Promotion
“Video” to learn how to develop a video. In other words, the class was configured for students to learn writing and image expression.

![Diagram](image)

**Figure 1**: Concept of the class.

### Lessons Learned in the Workshop

A questionnaire was distributed to the class to investigate the students’ learning. The questionnaire consisted of the following three sections: “planning and management of lectures and interviews,” “production of the role model e-book,” and “group work.” It elicited the students’ opinions on each item.

1) **Planning and Management of Lectures and Interviews**
   - We have realized the importance of “report,” “contact,” and “consultation.”
   - We understand that we need a lot of preparation to do these things.
   - Without imagination, it is not possible to manage the whole.

2) **Production of the Role Model E-book**
   - We gained an image of what it will be like when we work in society.
   - We learned that it is important to continue to believe in ourselves with confidence.
   - By talking with graduates, we gained specific advice.
   - Hearing about the struggles and challenges of doing the job changed our mental attitude toward job hunting.

3) **Group Work**
   - We learned to think for ourselves about what we can do for the group.
   - We learned the importance of assigning roles that are appropriate for each group member and drawing on each person’s individual strengths.
   - It was not transmitted well even when opinions were exchanged in LINE\(^1\).
   - We thought the difficulty of group activities because the amount of work was unequal.
   - Although it was hard to distribute the work moderately, our group was lucky.

---

\(^1\) "LINE" is a proprietary application for instant communications on electronic devices such as smartphones, tablet computers and personal computers.
Based on the questionnaire results, we concluded that the students learned the importance of independence and communication through their management of the lectures and interviews. Moreover, we found that they had opportunities to think about their career design by listening to graduates who served as role models.

Conclusions
We designed and taught a workshop-style course that supports career design. Through the course, students improved their basic social skills and had the opportunity to think about their careers by planning and managing lectures and interviews with role models. Furthermore, the students’ learning could be observed. For example, students commented, “There was a lot of learning from others” and “I was able to reflect on myself.” Such comments confirmed that the course supports career education.

References
Teaching Science, Technology, Engineering, and Math (STEM) to English Learners (ELs) includes learning centers, instructional games, and techniques to develop conversational language, academic language, scaffolding, concrete materials, and visual learning. Teachers can use these techniques to provide best practices in math and science instruction integrated with modifications to teach ELs. These strategies utilize technology as well as the science, math, and problem solving of engineering to improve the education of English learners.

Mathematics Teaching Strategies for EL Students

Developing Conversational Language in the Mathematics Classroom. Conversational language is an essential learning component in the mathematics and science classroom. “Conversational language” is sometimes referred to as “everyday language”, “natural language”, or “social communication.” It is often the first type of language acquired by second language learners (Cummins, 2000). Teachers of English learners are now realizing the importance of conversational language, especially in the mathematics and science classroom (Harrell & Jordan, 2004).

Developing Academic Language. Mathematics and science are academic disciplines that contains a language that includes specialized words and phrases related to content, procedures, and expressions (Echevarria, Vogt, & Short, 2004). Cummins’ (2000) Cognitive Academic Language Proficiency (CALP) is the “abstract language abilities required for academic work”. In order for EL students to be successful, they must experience multiple exposures to new terms through meaningful activities (Bielenberg & Wong Fillmore, 2005).
Scaffolding Provides Support for Mathematics, Science, and Language Learning. Vygotsky (1978) emphasized the importance for a child’s learning to be guided thoughtfully by a knowledgeable adult or capable peer. This type of guidance is often called “scaffolding” (Wood, Bruner, & Ross, 1976). Echevarria, Vogt, and Short (2004) point out that three types of scaffolding are especially important for English learners: verbal scaffolding, procedural scaffolding, and instructional scaffolding.

Concrete Materials. Students need to actively use concrete materials as they investigate new mathematical ideas and concepts. The goal of all instruction should be to help students develop mathematical and scientific proficiency and understanding that can be applied in new and varied situations (NCTM, 2000 and National Research Council, 2001). Concrete materials are important to vocabulary and language development, which is particularly beneficial for English learners. Words are easier to remember when they can be associated with something to touch (Garrison & Mora, 2005).

Visual Learning. Visual learning provides organizational representations as a regular component of instruction. Visual learning strategies are especially important for English learners as they support understanding and communicating about ideas and processes. Diagrams, charts, and tables can be used to organize new information and cue memory. Gerlic and Jausovec (1999) found a correlation between increased activity in the brain and the creation of nonlinguistic representations. Helping students discuss visual tools can enable students to more deeply understand and to recall information (Levine, 2002). Ability to visualize a situation, to generate mental pictures promotes learning (Hembree, 1992; Shigematsu & Sowder, 1994; and Mendieta, 2005). Student created representations provide insight into students’ understanding and level of generalization (Smith, 2003). English learners’ gestures may also provide important information on students’ reasoning and level of knowledge (Domingues, 2005).

Science Strategies for ELL Students with Disabilities

Today’s science teachers must be prepared to teach students whose first language is not English. The Institute of Education Sciences of the United States Department of Education defines English language learners (ELL) as: English learners who are students with a primary language other than English who have a limited range of speaking, reading, writing, and listening skills in English. Individuals who (1) were not born in the United States or whose native language is a language other than English; or (2) come from environments where a language other than English is dominant; or (3) are American Indians and Alaskan Natives and who come from environments where a language other than English has had a significant impact on their level of English proficiency; and who, by reason thereof, have sufficient difficulty speaking, reading, writing, or understanding the English language (IES, 2007).
Herr (2007) maintains that science vocabularies are complex and can be difficult even for native English speakers to learn. EL teachers should understand that a student’s difficulty in learning English should not be confused with an inability to think scientifically. EL teachers should also be aware that some of the methods that are useful for English language learners are effective for designing instruction for other students as well. In instruction try a variety of methods to see which is most effective for your teaching style and students. Speak slowly, distinctly, and write down key terms so students can see them and connect them to the spoken word.

Anyone who has recently learned a foreign language, and then traveled to a country where the language is spoken, has probably found that it is difficult to understand natives because they seem to talk fast. What is normal speed to the native speaker can be extremely fast to a language learner or to a student with a hearing impairment Herr (2007).

Herr (2007) suggests the follow strategies for teaching EL students.

Closed Captioning – When showing videos, Turn on the closed captioning so students can see what narrators and actors are saying. This helps ELL students to correlate written and spoken English, and models spelling and sentence construction. Closed captioning also helps the hearing impaired student.

Manual Video Control. Science videos often introduce new terms and concepts that can be challenging even for native speakers to remember. Herr (2007) suggests that teachers pause the video to discuss key concepts and use the bookmark and video clip features to return to precise sequences for review. Use the step-frame, slow motion, and replay features as needed.

Emphasize visual literacy - Visual literacy, the ability to evaluate, apply, and/or create conceptual visual representation, is relatively independent of language. Math and music are regarded as universal languages, i.e., can be read regardless of one’s primary language. For example, an American musician can play a score drafted by a German composer. Also, regardless of linguistic background or nationality people around the globe can interpret mathematical equations and musical scores. Science and math students can also interpret pictures and symbols, and with minimal linguistic skills, can interpret charts and graphs. Herr (2007) suggests that vector diagrams, scientific diagrams, pictorial riddles, photographic analysis, movie analysis, and map development and analysis, are a few of the activities and methods that can be utilized to facilitate visual literacy.

Graphic Organizers – Graphic organizers communicate concepts with minimal use of spoken or written language and introduce and assess concepts in
a manner that assists meaningful learning. Such diagrams or maps that show relationships facilitate integration of new and familiar ideas. Graphic organizers require minimal language. They include Conceptual grids, Venn diagrams, flow charts, mind maps, and concept maps, as well as, scatter and line graphs, column and bar charts, pie and area graphs, and high-low, combination and log plots.

**Group projects & Cooperative Learning.** These activities provide opportunities for students to discuss, write, and present ideas in a manor that facilitates understanding and retention.

**Partner English Learners with Strong English Speakers.** Teachers are aware that the best way to learn something is to teach it. Partner English learners with strong English speakers and both students will benefit from their interaction.

**Think/Pair/Share.** English learners like to share their ideas using their new language with their peers. The think/pair/share strategy provides students with opportunities to practice English by explaining science concepts.

**Encourage Participation.** Requiring English learners to speak in front of class may cause great anxiety. Encourage students to express themselves, but don’t force them to the front of the class prematurely.

**Road map to science.** English learners benefit greatly from a “road map” that shows where they are in the science curriculum. Provide students with a copy of your lectures and discussions. This helps EL students to know where they are, and where they are going.

**Scaffolding.** Relate to prior knowledge to the students' background knowledge of science concepts. Use pre-assessments to discover what your students already know about a given topic and design lessons accordingly.

**Science Laboratory.** Hands-on activities provide an excellent learning environment for English language learners.

**Demonstrate and Model Laboratory Activities.** Provide clear, procedural steps. Use a pre-lab demonstration to present procedures clearly using flow charts, pictures, and outlines. Demonstrate procedures prior to doing the activity to ensure that English language learners can see the procedures before engaging in an activity.

**Pictorial Guide.** Similar to international symbols pictorial guides provide a visual reference to glassware and other materials used in experiments and activities. Review safety symbols and post them in the room and in the lab handout.
Journaling. Effective writing requires practice. Require English language learners to keep science journals to record lecture notes, new terms, new concepts.

Science reading comprehension activities. Cloze and jigsaw are effective methods for developing and assessing reading comprehension. They can be used for formative and summative assessments of language and science learning.

Wait time. English learners must translate terms and simultaneously formulate an explanation. Provide wait-time sufficient for the majority to develop an answer before calling on any individual.

Analogies. Analogies are an effective method of relating new concepts to previously learned concepts.

EL: Vocabulary. Language-based science games such as Science Bing and crossword puzzles reinforce vocabulary and concepts and require minimal spoken language.

Picture glossary. Pictorial flash cards with a picture of the science concept on one side while the term (in the language to be learned) is on the reverse. This method helps students to correlate concepts directly with words and eliminates the need for translation.

Root words. Teach the Greek and Latin prefixes, suffixes, and roots. Approximately 50% of all words in English have Latin roots that are shared with Spanish, French, Portuguese and Italian. A knowledge of scientific root words will facilitate understand the vocabulary of a variety of languages, particularly English.

Word wall. Post new vocabulary terms on the wall in an organized, grouped according to their level of organization and/or relationships, e.g., cell, tissue, organ, etc. Herr (2007).

**Abstract**

*We are all, at heart, gradualists, our expectations set by the steady passage of time. The world of the Tipping Point is a place where the unexpected becomes expected, where radical change is more than possibility. It is— contrary to all our expectations—a certainty.*

— *Malcolm Gladwell, The Tipping Point*

Faced with a seemingly insurmountable achievement gap, school staffs have been searching for the magic bullet to fix education since the landmark “A Nation at Risk” (1983). However, success has more to do with the knowledge and skill of the staff and level of implementation than a particular program. The link among the quality of leaders, caliber of teaching, and levels of student achievement is a tight one.

Reaching beyond test scores analysis, teachers must address the increasing diversity and family engagement, ensure that schools are safe and free from bullying, engage parents in their children’s education, and support culturally responsive schools and classrooms. Educators must learn about, test, and profit from successful models (Auerbach, 2009). Studies identified several school programs, factors, and remedies to improve schools. It’s estimated that anyone attempting to research what's known about depression would have to read over 100,000 studies on the subject. So the first task is deciding which studies have produced reliable results. The question then becomes how to test, prove, and advocate for programs that will be successful in specific context...your school and with your students. Teachers and administrators must become informed consumers of educational research when selecting both the content and professional learning processes of staff development efforts. (NSDC, 2004). Quality professional development builds on prior and current learning experiences and should be ongoing, career-staged, and seamless (Peterson, 2002).

Conducting original classroom research and using data systematically to ask questions and obtain insight about student progress is a logical way to monitor continuous improvement and tailor instruction to the needs of students. (Wested, 2009). However, making sense of data requires concepts, theories, and interpretive frames of reference. (Knapp et al., 2006). School leaders and teachers should engage in an Evidence-Based Decision (EBD) process in order to
isolate those practices that are most effective for them and for their students. Teachers and principals learn best from embedded opportunities reflecting relevance and prompting collaborative problem solving (SEDL, 1997). Although merely examining student achievement outcomes does not provide over-time relevant information regarding the programs or processes that need to be modified or abandoned to get better results. Feedback systems are essential for developing organizations that can learn from prior practices and intentionally shape practice to achieve anticipated ends (Senge, 1990; Senge, et. al. 2000). Comprehensive measures, used together and over time, provide much richer information. With this intersection, we can answer a key question, “Are our schools making a difference for students and families?” (Student Learning by Demographics by Perceptions by School Processes, Bernhardt, 1998).

Effective schools address multiple key correlates of excellence such as ensuring a safe school, promoting meaningful parent involvement, use of frequent monitoring, data-driven decision-making, culturally responsive education, and high-effective staff (Lezotte, 2009, Reeves, 2001, Gay, 2001; 2002). Schools making a difference measure multiple, key performance leading, coincident, and lagging indicators against internal and external benchmarks, ensuring that both the people and the operations are optimized to improve outcomes. Identifying, releasing, and publicizing common performance measures enables educators to pinpoint a significant success or failure (Hanuchek & Raymond, 2003). Conducting Evidence-Based Decision through a distributive leadership and community of practice process propels student learning. There is ample research to support the involvement of the entire staff or faculty in the use of data to improve student achievement. (Wayman, 2006). Good teachers perpetually look for ways to improve their effectiveness (Farr, 2010)

This session addresses and explores evidence-based decision-making methods aimed at creating a culture of continuous school improvement, including (1) the collection, analysis, and interpretation of multiple measures (2) the inter-relationships between evidence-based interventions and educational outcomes; (3) commonly used analytic strategies and processes; (4) a step-by-step approach to evidence-based decisions; (5) keys to when action is warranted; and (6) opportunities for widespread implementation of evidence-based decision-making through distributed leadership and communities of practice.

**Abstract:**

Straight To The Source: The Voice of Students About Being ELLs

Students who are designated as English language learners (ELL) participate in programs of
English language assistance, high-intensity literacy support, and academic language acquisition.
ELLs are among the fastest-growing student demographic group in nearly every state across the
country. While states reported over 400 languages spoken by ELLs nationwide, Spanish and
Asian languages are the most common. Data submitted by states to the federal department of
education indicate that the great majority of ELL students claimed Spanish (79 percent) as their
native language, followed by Vietnamese (2.0 percent), Hmong (1.6 percent), Cantonese (1.0
percent), Korean (1.0 percent), and other (15.4 percent). The percentage of United States
public school students who were ELLs was significantly higher in 2011–12 (9.1 percent, or an
estimated 4.4 million students) than in 2002–03 (8.7 percent, or an estimated 4.1 million
students). In 2011–12, eight states with the largest percentages of ELL students in their public
schools were in the west: Alaska, California, Colorado, Hawaii, Nevada, New Mexico, Oregon,
and Texas. Also in 2011–12, ELL students living in cities comprised an average of 14.2 percent of
total public school enrollment, ranging from 10.9 percent in small cities to 16.7 percent in large
cities. All organizations agree that ELL student enrollment has increased substantially over the
years.
Across the United States and the world, there is widespread concern regarding successfully educating the growing number of non-native language speakers. A result of population growth, population migration, and a rise in linguistic diversity, many schools have increasing numbers of non-native language speakers. These students struggle academically at the elementary, middle, and high school levels demonstrating lower educational success as compared to their English-speaking counterparts. ELLs lag behind native English speakers in academic progress (Massachusetts Department of Elementary and Secondary Education, 2012; Olsen, 2010). This is due, in large part, to the need of ELL students to simultaneously learn English and content knowledge (Genesee, Lindholm-Leary, Saunders, & Christian, 2005). Compounding this challenge is the lack of teachers skilled in language acquisition strategies. As the numbers of ELLs in pre-K-12 classrooms continue to grow, so does the need for effective and trained educators to work with this diverse population. Nationwide, approximately 2.5 percent of teachers who instruct ELLs possess a degree in English as a Second Language or bilingual education (National Center for Education Statistics, 1997). In California, only one-third of ELLs had a teacher who had received a credential of any kind (Gándara & Maxwell-Jolly, 1999).

After inspecting published reports, the need to invest in and complete primary research regarding the quantity and quality of the services and support for ELLs was recognized. Designed as an initial step in the development of the Master Plan for ELLs, the English Language Acquisition Discovery Process sought to obtain both quantitative and qualitative information through a series of focus groups and surveys. Research gathered through a combination of quantitative and qualitative processes is a powerful tool for understanding school needs.

Instruments used during the study included a structured questionnaire and semi-structured focus group questions. Schools’ students, parents, and staffs opted to participate in the focus groups by responding to an email invitation. Similarly, all individual respondents volunteered to be included in the focus group activities. Participants were requested to complete and return a brief survey prior to leaving the focus group sessions. Of the 217 surveys distributed, 216 were
Straight To The Source: The Voice of Students About Being ELLs
R. Karlene McCormick Lee, Ed.D.
HICE 2016 – Proceedings Submissions

returned completed. Instruments used during the study included a structured questionnaire and semi-structured focus group questions. The surveys assumed that respondents have explicit knowledge, are aware of their perceptions, and know how they feel. Often listening to others’ opinions in a familiar, accepting, and safe environment of a focus group allows respondents to clarify and form cogent thoughts and opinions. The focus groups revealed a wealth of detailed information, deep insight, and ideas. Responding in their own words while adding meaning and emphasis, focus group participants were thoughtful in their answers and shared concerns for ELLs and struggling students. Surveys were valuable in collecting consistent information about respondents’ experience, perceptions, attitudes, and skills. Therefore the combination of an initial focus group and survey was well suited for this study. For both the discussions and the survey, respondents were asked to provide unvarnished, realistic descriptions of the services and programs available to support academic language acquisition and ELLs. The findings, and recommendations included in this session are informed first impressions and should be used to raise questions for further research and considered in the development of planning documents. The theory of discovery was to begin the strategic planning process with as much knowledge as possible and to give a voice to those most directly impacted.

Current Status and Issues in Teaching English to Students with Specific Learning Disorders in High Schools in Japan
- from the Results of Interview and Class Observations -

Ryoko Sato
Tsuda College (Doctoral student)
e15rsato@gm.tsuda.ac.jp

Abstract

This study examines whether multi-sensory approaches can help teaching English to L2 learners with specific disorders (LD) in “regular classes”. As the first step, the researcher investigates the actual condition, for instance teachers’ current approaches to support LD learners and the major factors when their instructions do not work, in some high schools through interviews with teachers and class observations by the researcher.

Japanese SNE has been revised since the Act on Support for Persons with Neurodevelopmental Disabilities was enforced in 2005. A part of the School Education Act also was changed and all schools have to provide SNE to support students with neurodevelopmental disorders. Children with those disorders are included as the objects of SNE in “regular” classes for the first time in the country. Teachers have better knowledge about neurodevelopmental disorders than before, but many of them are facing an uphill struggle to teach the students by trial and error (Fukushima & Masataka, 2010). Some researchers have examined effective teaching approaches in English education, but more studies and concrete examples are needed to find better ways of teaching English to Japanese LD students.

This study focuses on “regular classes” in high schools for the following two reasons. First, most studies focused on individualized instruction in special-need classes, but teachers want to know how to teach and support LD students in their classes. Second, it is said that Japanese special needs education (SNE) in high schools are behind elementary schools and junior high schools. One investigation shows that about 2.2% of high school students are suspected to have neurodevelopmental disorders (Central Education Council Special Education Committee, 2009). Teachers should make various efforts in regular classes such as instruction in small groups, team-teaching, instruction according to different achievement levels and the use of support assistants.
The biggest issues for high school English teachers might be instruction in school courses. The words “universal design (UD) lessons” are becoming common and UD lessons are promoted these days, but it is doubtful teachers comprehend the essence and principles properly. They also do not have adequately guidelines or examples. How do they design their classes now under these circumstances? Interviews are given to some English teachers in two public high schools in Japan that have teaching difficulties, to describe what they know about UD. In addition, the researcher observes their classes to grasp how they help students’ learning at the present moment.

Key words: EFL/ESL, special needs education, specific learning disorders

**Further Study** (plan of this study)

This study is going to assess students’ characteristics with reading-span test, vocabulary tests, questionnaires, and interviews. Then the researcher will design UD lessons using multi-sensory approach integrating visual, auditory, tactile (touch) and kinesthetic (movement) learning elements and examine the effectiveness to suggest some example UD teaching approaches.

Charter Schools in the Aloha State, an Update

Stephanie Hauki Kamai
Division of Education, University of Hawaiʻi, West O’ahu
91-1001 Farrington Highway
Kapolei, HI 96707
shkamai@hawaii.edu
Abstract

In 2005 I published my dissertation which was a qualitative study on the legislative parameters and fiscal incentives and disincentives that helped or hindered the growth of charter schools in Hawai‘i. Themes emerged from the perspective of people who started charter schools. Findings revealed several disincentives embedded both in legislative and financial aspects of charter school reform. Since then significant events have occurred. Legislators created a Hawai‘i State Public Charter School Commission which provides real oversight of charter schools, beginning with the charter school application process. In this paper I trace the changes in the charter school landscape in Hawai‘i and discuss how the changes have helped or hindered the development of Hawaiian-centered charter schools. Of the 33 charter schools in Hawai‘i there are the 17 Hawaiian-centered charter schools whose focus is on Native Hawaiian cultural value. I discuss the expectations for non-Hawaiian-centered charter schools. Specifically, how is student learning defined in Hawaiian-centered charter schools?
Statewide Special Education Practices to Improve the Quality of IFSP Outcomes

Topic Area: Special Education
Presentation Format: Poster Session

Description of Presentation: This poster session is a descriptive study of one state’s use of a Part C early intervention special education accountability tool and professional development to increase the quality of functional outcomes. The study will describe the use of an accountability tool over seven years and the process used to aid early interventionists and families in writing functional IFSP outcomes during team meetings. Recommendations are given for state special education systems, preservice education, and early interventionists.

Abstract

The outcomes are the foundation for services within the Individualized Family Service Plan (IFSP) in early intervention and serve a vital role in meeting the needs of the child. Every child eligible for Part C services in special education must have an IFSP based on their strengths and challenges, including outcomes outlining the goals of the upcoming year according to IDEA 2004. Early interventionists work with families to write outcomes based on the needs of the child and family. Early interventionists often struggle to create quality outcomes on a consistent basis.

This study is a description of the process one Midwestern state used to increase the quality of functional outcomes in IFSPs. The state used their monitoring process with the creation of a quantitative tool to merge professional development, technical assistance, and accountability systems to comply with federal regulations and increase the quality of IFSP outcomes. Over time, families and early interventionists used state and nationally developed materials to promote the understanding of how to write functional outcomes as a team. Description of the process includes the varied approached used to increase the overall quality of the IFSP as well as the outcomes including prompts within the IFSP, monitoring processes, development of an accountability tool, and professional development. The study describes the process over seven years.

The study highlights the need to develop and implement meaningful professional development for outcome development at the state level by reviewing the process that evolved in the state. The study also focuses on further investigating performance competencies in writing outcomes for professionals in early intervention and using a mechanism to evaluate the quality of functional outcomes. Recommendations are given for state Part C systems, preservice education, and early interventionists.
Introduction

The outcomes are the foundation for services within the Individualized Family Service Plan (IFSP) in early intervention and serve a vital role in meeting the needs of the child. Every child eligible for Part C services in special education must have an IFSP based on their strengths and challenges, including outcomes outlining the goals of the upcoming year according to IDEA 2004. Early interventionists work with families to write outcomes based on the needs of the child and family. Early interventionists often struggle to create quality outcomes on a consistent basis (NECTAC, 2008). Early interventionists continually struggle to write quality IFSP’s with functional and measurable outcomes, although early interventionists have been exposed to many training events on the topic (Jung, 2010; McWilliam, 2010).

Purpose of the Study

This is a descriptive study of the eight-year process used to develop and implement meaningful professional development for Early Intervention (EI) staff in the area of functional outcome development in IFSPs. This study reviews the functional outcome process that evolved in one, Midwestern state. The study also focuses on further investigating performance competencies in writing outcomes for professionals in early intervention and using a mechanism to evaluate the quality of functional outcomes.

Description of Process

This study is a description of the process one Midwestern state used to increase the quality of functional outcomes in IFSPs over an eight year period by merging professional development, technical assistance, IFSP prompts, and accountability systems to increase the quality of IFSP outcomes. Over time, families and early interventionists used state and nationally developed materials to promote the understanding of how to write functional outcomes as a team.

The process included varied approaches used to increase the overall quality of the IFSP, as well as the outcomes including prompts within the IFSP, monitoring processes, development of an accountability tool, and professional development. During the first three years of the state process, a new accountability tool called the Case Review Tool (CRT) (Johnson & Votava, 2007) was developed to rate compliance measures in IFSP’s, and the state required the tool to be used once a year for compliance monitoring (Votava, Johnson & Chiasson, 2011). The tool was based on the Missouri First Steps IFSP Quality Indicator Rating Scale (QIRS) developed in 2005 to train staff about quality indicators in IFSPs, and it contained three measures for functional outcomes including (a) outcomes that correlate with family priorities and concerns, (b) child outcomes that are functional, measurable, and related to everyday routines, and (c) outcomes that are developmentally appropriate. The state developed face-to-face training events to train EI staff in use of the tool with the goal of integrating professional development, accountability, and technical assistance systems of the state to improve child and family outcomes.

A 2011 study documented the use of the CRT, comparing outcomes written by EI staff before and after use of the three CRT functional outcome ratings and associated trainings. Votava et al. (2011) stated, “IFSP’s in this study included more outcomes that met the criteria for (b) child outcomes that are functional, measurable, and related to everyday routines. No change was noted in (a) outcomes that correlate with family priorities and concerns and (c) outcomes
that are developmentally appropriate” The study also noted that when five or more outcomes were included on an IFSP, the measurable and functional components increased (Votava et al., 2011).

During year four to six, EI staff had the opportunity to attend face-to-face training events on the topics of Routines-Based Interview (RBI) Family Assessment and Family-Guided Routines-Based Intervention (FGRBI), as well as regional state technical assistance. Over this time, the CRT (Votava & Johnson, 2013) was also revised to include six criteria for functional outcomes. The six criteria were based on a training package developed collaboratively from staff of the Early Childhood Technical Assistance Center (ECTA) and the Western Regional Resource Center (WRRC). The training package includes a set of six criteria that can be used to understand how to develop high quality, participation-based outcomes. Following are the six criteria (Lucas, Gillaspy & Peters, 2012):

- The outcome is necessary and functional for the child’s and family’s life.
- The outcome reflects real-life situations
- The outcome crosses developmental domains and is discipline-free.
- The outcome is jargon-free, clear and simple.
- The outcome emphasizes the positive, not the negative.
- The outcome uses active words rather than passive.

Using the CRT-revised, the state IFSP was integrated into a web-based system, and IFSP prompts from the CRT-revised were included in the IFSP to aid early interventionists in the writing of the family assessment and outcomes. During year eight, the state announced a year-long focus on writing functional outcomes, ending with a year of random, qualitative monitoring of functional outcomes. At the same time, a placemat was developed, based on the ECTA and WRRC training package, which included the six criteria, examples of what the criteria do and don’t look like, and definitions of the criteria. The placemat was given to EI staff as a resource to bring to IFSP meetings while developing outcomes with families.

**Discussion**

Over eight years, the state developed an evolving and multi-faceted approach to increase the quality of functional outcomes in IFSPs. The approach changed over time as it began with the use of an accountability tool, professional development, a revised tool, IFSP prompts, a team placemat resource, and finally accountability through qualitative monitoring. This varied and flexible professional development system helped EI staff develop skills in areas where increased skills were needed, although the goal was initially increasing the quality of functional outcomes. Through the process, the following three areas were highlighted as areas for professional development: 1) Interview skills, 2) Embracing routines within typical family activities, and 3) Lack of understanding in the foundation of evidence-based practices (EBP).

As EI staff worked to increase skills in writing functional outcomes, the value of high quality family assessment became more evident. McWilliams, Casey, Ashley, Fielder, Rowley, DeJong, Mickel, Stricklin & Votava (2011) noted that EI staff “need to conduct a much more in-depth assessment of needs than simply asking families about main concerns” (p. 50), and this requires an increased emphasis on teaching interview skills. The knowledge gained in the family assessment through the use of interview provides valuable information to increase the quality of the outcomes.
In the second area, EI staff failed to include routines within typical family activities when writing outcomes with the family. By contriving situations for outcomes that were not everyday occurrences, outcomes were not written functionally. Jung & McWilliam (2005) noted that early interventionists often paint themselves in a corner by asking families superficial questions, which result in just two or three low quality outcomes. Outcomes that are high-quality need to develop from the family assessment. Detailed information gained from the family assessment aids the team in developing outcomes that are family-centered and within the family’s typical activities. Brown & Woods (2015) state “Further examination is needed to align high-quality coaching practices, intervention strategies, and relevant child outcomes with the context in which services are delivered” (p. 63). EI staff need to develop the knowledge and skills that value family-centered practice within the context of EBP practices.

Overall, a lack of understanding of the foundation of EBP in early intervention contributed to decreased skills in writing high-quality functional outcomes. The field of early intervention is often not the focus of preservice education programs. This results in a workforce that is learning on the job. Inexperienced early interventionists with an educational experience that had little focus in EI work to apply what has been learned about older children to the birth to three population. McWilliam et al. (2011) notes that EI professionals often conduct assessments with very little or no training. EI staff are often trained on the job or through mentorship over time.

Recommendations

Recommendations for state special education systems
1. States should design professional development systems for early intervention personnel that include a focus on family assessment and functional outcomes utilizing the infrastructure of resources within the state and federal system.
2. Family assessment and high-quality outcomes professional development for early interventionists needs to build from a foundation of knowledge for staff and include the opportunity to apply the learning and then reflect on performance with mentors within programs.
3. Performance competencies for early intervention personnel need to be developed for family assessment and functional outcomes utilizing the infrastructure of resources within the state system.

Recommendations for preservice education
1. Preservice education should include a foundation of Part C philosophy and EBP including the understanding of family-centered practice within typical routines.
2. Early intervention certificates should be developed as an opportunity for professionals to gain skills in EBP in the area.
**Recommendations for early interventionists**

1. Early interventionists should encourage state systems and local early intervention providers to include training within their professional development systems in family assessment and functional outcomes through a coaching model available.
2. Early interventionists need to pair with colleagues who are skilled in family assessment and the development of high-quality outcomes in a mentorship relationship.
3. Early interventionists need to engage in reflection of their practice and seek out opportunities to increase their skills in family assessment and writing high-quality functional outcomes.

Abstract

Language loss is occurring globally and every day a language is slowly disappearing and for every language that is lost, a piece of knowledge is destroyed and it is taken away. Efforts for language revitalization are present in different communities and are successful in restoring their knowledges and languages such as the Maori and Hawaiian people (Warner, 2001; Wilson & Kamana, 2001). Although their efforts are strong, it is a long and difficult process to reverse language shift.

The objective of this paper is to present an auto-ethnographic study of language reclamation within a family. The author describes language learning and revitalization while negotiating her positionality within her family and personal life. Her parents are native speakers of Nahuatl often refer to Mexicano (Hill & Hill, 1986). Although her parents are fluent speakers of the language they deliberately chose not transfer the language to their children (Kroskrity & Field, 2009) due to passed down language ideologies (Spolsky, 2004). The author critically reflects and unravels years of internal colonization to reclaim her language through a sociocultural and auto-ethnographic lens. The author further discussed language learning outside a traditional educational institution, by native speakers (parents) at the center to language learning in a home. Drawing on Ancestral Knowledge Systems (AKS) (Sandoval, Lagunas, Montelongo, Diaz, under review) conceptual framework through a sociocultural perspective (McCarty, 2011) and auto-ethnographic lens of language planning this study examines language reclamation while the researcher’s positionality and reflexivity is at the center. The analysis is broken into three parts: researcher’s positionality, language learning through meaningful sociocultural practices (Hinton, 2001) and decolonizing language ideologies.

The central question of the paper is What are the past down language ideologies within and across generations in this family setting and how does language shift and language revitalization come into play? The author used auto-ethnography and critical reflexivity along her study and journey to reclaim her language. The author collected a year-long of fieldnotes and audio recordings from their weekly language class, along with her personal reflection journal and informal interviews/conversations with her parents. The researcher peeled layers of passed down generational language ideologies and internal colonization within her personal life as well as it pertains to her relationship with her parents. The weekly language class provided insightful
learning and re-discovering and re-negotiating one’s identity. Hidden internalized colonization ideologies surfaced amongst the author’s family as they continued language learning and teaching. Thus sparked dialogue on how to preserve ancestral language and knowledges within the home. This study contributes to the larger field of language revitalization and education. It demonstrates the importance of language learning in the homes. Hinton & Hale (2001) shares three characteristics in order to make a language revitalization program successful: persistence, sustainability, and honesty. Through socio-cultural practices language is transferred along with ancestral knowledge learning. The study suggests the need of native speakers to transfer their language in everyday practices within their homes.
Title of Submission: iTeach ELLs: Efforts in Closing the Achievement Gap

To answer questions about effective teacher preparation for pre-service teachers this paper draws upon data sources from a specialized group within Arizona State University. This research examines how a college wide initiative (promoting a culture of change) will help prepare all students to work with ELLs. Recent data indicate an imperative to prepare teachers who can face the ongoing issues of ELL education in Arizona. For example, only 25% of ELLs graduate from Arizona high schools, a figure that is well below the 60% graduation rate defined by the U.S. Department of Education, (Stetser & Stillwell, 2014).

The efforts are built on a Teacher Quality Partnership grant that is in year one of its five year duration. Data collected for the discussion involve syllabi enhancements, problem based learning (PBL) lessons, feedback from a program enhancement team (of math and science faculty) as well as discussions from partner school districts.

This research has several implications for both higher education as well as PreK-8 teaching. This comprehensive program is designed to raise student achievement for ELLs through curriculum reforms and enhancements which will prepare our graduates to address the education needs of ELLs with integrated, project-based lessons, that support science and math content acquisition as well as addressing language and literacy skill development for this unique population.

It helps diffuse barriers and segmented thinking of teachers by preparing all pre-service teachers in evidence-based practices for ELLs. The program reforms and enhancements discussed will prepare our PreK-8 teacher preparation graduates to be equipped with the skills, knowledge, and dispositions to teach ELLs with special focus on STEM content areas of math
A goal of teacher preparation programs is to prepare excellent teachers and positively impact the lives of the students they will serve. The research discussed in this poster presentation helps bring proven best practices to the discussion and further link theory and practice on this vital topic.
Title: Individual Paths to Literacy Engagement: Three Narratives Revisited

Name of Author: Dr. Tara-Lynn Scheffel

Affiliation: Schulich School of Education, Nipissing University, Canada

Address: 100 College Drive, Box 5002, North Bay, Ontario P1B 8L7

Email: taralyns@nipissingu.ca

Abstract: Student engagement has become a popular topic in Canadian schools and world-wide, especially with such research surveys as The Programme for International Student Assessment (PISA) and the National Survey of Student Engagement (NSSE). Yet, what does it mean to be engaged, especially when it comes to literacy learning? It is this question that drove my doctoral research in 2007, as I became a participant observer in a grade two classroom with the goal of making the everyday visible while sharing a greater understanding of classroom life in relation to engagement. Six years later, I returned to the original school when the students were in grade eight for the purposes of revisiting and expanding upon student understandings of what leads to successful engagement in learning during literacy-related activities. As part of the original study, three portraits were developed to discuss differing and individual paths towards literacy engagement. In this paper session, I revisit the narratives of Spike, Jasper and Avery to consider themes of change and continuity, including ways in which initial success and struggle appeared to influence their journey over time.

Using a mixed-methods approach, data sources include workshop discussions, digital photographs, one-on-one interviews, and the use of graphic organizers to highlight engagement understandings. More specifically, the follow-up study was centered around a classroom workshop as a way of re-introducing myself to the original participants as well as to involve all the grade eights regardless of their original participation. The workshop began with individual and group brainstorming of what engagement meant to them as learners, followed by the completion of a graphic organizer/rating scale (developed from the original study). The final portion of the workshop drew on the use of digital cameras to capture moments that signified engagement. In comparison to the original study, a key finding to be discussed is a greater recognition of engagement as more than visual participation (e.g. hands raised and body posture). In addition to the workshop, the original participants, including Spike, Jasper, and Avery, were invited to participate in a follow-up individual interview to consider their engagement journeys then and now.

The session’s goal is to not only expand discussions about the complexity of engagement, but to continue to put students’ understandings at the forefront of educational discussions about engagement. Implications for classrooms will be discussed.
Concierge EFL teaching, “mentoring,” is a concept that the author introduced to the Hirosaki “English Lounge” (EL) language center in 2013. All university English students in Japan are at the false beginner or higher level. Most of them fall in an area where they possess most of a base and, consequently, do not experience the joy of going from nothing to something that students new to a language may feel.

In the first phase of the project, the EL mentoring program was open to the student body. A very small number of students took advantage of the opportunity, but the interactions were quite pleasant and may have changed said students’ attitudes toward studying English. The obvious flaw with individual mentoring is that there are a limited number of hours a fulltime faculty member can spare for such efforts and many students who could potentially benefit from this sort of personal attention.

In 2015, the author decided to create a new tier of mentoring for students in an honor’s program that had already shown more than significant motivation. Entitled English Superstars, this program began as next-level assistance with three highly motivated students that were experiencing some frustration and/or stall in the progress of their English abilities. In addition to special assignments and individual counseling, the author arranged for semimonthly video conference classes with the three students.

In the second phase of the project, students will be asked to clarify their learning goals and keep a learning journal, c.f. “My English Communications Goals for the Month of November 2015” sample form below. They will also become involved as either mentor or mentee in what USC sources refer to as “frientoring,” where they will have an opportunity to work closely with another student in the honor’s program.

One of the expected outcomes of this program is for students to feel they have a better sense of their own progress. They will also have a journal to look back on and realize that they have invested quite a bit in the learning process. During the video conferences and the personal sessions, they will be allowed to voice their issues and challenges, as well as mention accomplishments and breakthroughs. The hope is that the sensation of being “stalled” will fade and they will enter a new phase in the lifelong mission that is foreign language learning.
CASE STUDIES:

Progress Report 1
There have been three video conferences in the past two months. M. K. was not able to attend the first two. A group learning management system (LMS), Moodle page was established and all three students have posted to it.

R. O.
Every English teacher’s dream student, she is beginning to lose a bit of her spunk and sparkle due to various factors, especially with regard to her reaction to less interest in the program among other honor’s college students. She is self-motivated and interested in doing better on the standardized tests that will eventually decide whether she gets a completion certificate in the honor’s college. In addition to her participation in the video conferences and other general work, she has been directed to short academic articles in a variety of subjects, which should help her with the upcoming IPT TOEFL examination.

Y. T.
She is perhaps at the lowest English level of the three, but she is very eager to learn and personable. She has trouble jumping into a conversation, so she needs to review those strategies. Even in a conversation group in the EL, where many students have lower levels of English than she does, she tends to hang back a bit. She has a very specific issue with R/L and the author advised her to work on it through a YouTube pronunciation course. In the future, the author intends to review conversational gambits that will help her become part of the conversation.

M. K.
She is in the same year as the other two in the university, but she was accepted to the honor’s college a year after they were. She is the first sophomore to be admitted to the honor’s college in its three-year history and is very excited about the program. She reached out to get some assistance with academic writing, which is taught in the second year of the honor’s college. She wants to get ahead of it, because one of the classes she is taking requires that she do her final paper in English.
**MY GOALS**

I want to work on my reading and vocabulary to improve my TOEFL score. I want to spend more time reading articles and watching English dramas and comedies.

**A. Skill-based Practice**

- **Reading**
  - 40 pages for my psychology class; 11/3; English comic; 11/15; two articles to practice for the TOEFL; 11/20; TOEFL reading practice; 11/25; Academic reading practice; 11/29

- **Writing**
  - Essay for writing class; 11/8; Essay 11/15; Written homework; 11/12

- **Speaking**
  - English Lounge: Week of Nov. 2: 6 times; Week of Nov. 9: 4 times; Semimonthly meeting with Shani; 11/14, 11/28; went out with English-speaking friends; Nov 21; Practiced pronunciation on YouTube: Rachel’s English

- **Listening**
  - Watched 5 episodes of Elementary; Listened to mock TOEFL tests; watched movie: The Graduate

- **Vocabulary**
  - Used Word Engine 12 times; made model sentences with new vocab from psych class

- **Grammar**
  - Played grammar games on www.mangthings.org

The most beneficial thing I did was: watch The Graduate and discuss it with international students.

The most fun was: Going out and speaking English with friends.

**B. Interpersonal Encounters**

I met a new international student from India and we discussed some interesting things about gender roles in different countries.

**C. Personalized Advice**

Shani suggested that I do some simple academic reading. I found interesting articles online and picked up some scientific vocabulary.

6. Abstract and paper

Abstract

Many researchers and teachers have focused on positive effects of undergraduate seminars. These are one of the inquiry-based and communal learning environments, affectionately called “Zemi” in Japan. However, there are little studies exploring what students learn in seminars with their self-reflection. The purpose of this study is to investigate seminar activities that occur in and outside of class, and then consider their effects on learning outcomes, including skills, perspectives and confidences. I conducted a retrospective interview with seven graduate students who participated in undergraduate seminars one or two years ago. The result showed that students have the following perceptions about their learning outcomes: (a) acquiring basic and transferable skills, (b) building curiosity in academic discipline, (c) learning practical approach in specific fields, (d) creating social connections, and (e) developing confidences of overcoming difficulties.

Introduction

In response to the question of what learning should take place for an unknown future (Barnett, 2004), we must consider what kind of education provided by universities would be appropriate for students. As we transition to a knowledge-based society, there is a strong demand for individuals who have the ability to respond to an unexpected future, and generic skills have attracted attention as the key to surviving in an age of rapid change. Generic skills are abilities and attributes that should be cultivated in a four-year bachelor’s program and include thinking critically, solving problems, using information, engaging in teamwork, and employing self-management. Interactive education and active learning play a significant role in acquiring these skills, and undergraduate seminars affectionately called “Zemi” are considered to be effective because they involve students engaging in interpersonal relationships, solving problems, and demonstrating knowledge and skills.

Seminars were born in the nineteenth century in Germany under the idea of “education through research”, and were introduced to the United States or Japan in the twentieth century (Ushiogi, 1997). Seminars are defined in two ways in the context of Japanese higher education: (a) an educational method in which presentation and discussion are the center of activity for a faculty and a small group of students, and (b) a community which is comprised of a faculty and students (Mouri, 2006). The Oxford Advanced Learner’s Dictionary states that a “seminar is a class at university or college when a small group of students and a teacher discuss or study a particular topic.” Oberst et al. (2009) state that “the seminar represents a methodology focused on the acquisition of competences and reflective skills and abilities.” Most faculties and researchers consider seminars as a learning community which includes relationships based on mutual understanding and trust.

Seminars are held for a small number of students, and faculties are able to provide more individual, careful, and polite instruction for students than in a regular classroom. A popular seminar format is one in which an faculty and about 20 students participate in a meeting intended to help the students gain further understanding of their research project, and the students receive the advice of the faculty and other students about the state of progress and the problems with their research in a specific domain of expertise. Being an important teaching method, along with lectures in university education, seminars also represent research-oriented and dialogue-based communities of the faculty and students. They offer students the opportunity for close interaction with the faculty and help develop new
relationships; it is possible for students to absorb ideas and tacit knowledge of specialized fields through daily communication.

In other words, the value of learning in seminars is supported by both formal learning pursuits and informal activities outside of class. For example, there are various activities that are relevant to seminars: camps, drinking parties, competition among seminars, and networking with other universities’ students. Such extracurricular activities complement and strengthen the learning and the atmosphere in class. In light of the positive effects of informal learning on students’ achievements of various abilities, activities outside of class seem to promote the growth of generic skills. Additionally, students feel that seminars are a home and a place where they belong. Yet, it has not been fully discussed in previous studies that what kind of informal activities are conducted, and how students learn through these activities outside of class. Therefore, the present study investigated seminar activities that occur in and outside of class, and then considered their effects on learning outcomes, including skills, perspectives and confidences.

Methods
Perspectives

The activities in seminars are shown in Fig. 1. As previously mentioned, I recognize that informal activities outside of class play a role as significant as formal learning activities in seminars. In regard to many types of formal learning activities in class, there would be writing thesis, reading books and articles, planning some sort of events or workshop. All these activities are considered to be effective for students in generating motivation, acquiring generic skills, and achieving a sense of satisfaction by many researchers. This study focused on the exploration of students’ perceptions about learning through informal seminar activities outside of class, and the following research question was posed: what do students learn from their informal experiences in seminars.

![Figure 1. A framework of “learning in seminars” including formal and informal activities](image-url)
Procedures of data collection

A retrospective interview (45-60 min) was conducted with seven graduate students who participated in different undergraduate seminars one or two years ago. Table 1 shows respondents to this survey.

<table>
<thead>
<tr>
<th>Gender</th>
<th>Age</th>
<th>Theme of a seminar</th>

</table>

I asked students the following questions: (a) what kind of activities did you participate in outside of class? (b) how were seminar activities promoted outside of class? (c) what kind of instruction and advice did the faculty provide? (d) what experiences did you have through these activities and how did you evaluate them? and (e) what kind of knowledge, skills, and attitudes did you acquire? I transcribed taped interviews and divided each document into coherent semantic units, coded these units, and classified codes from the bottom up, based on a qualitative analysis.

Results and Discussion

From the interview, I found that students engaged in several types of activities outside of class hours. The informal seminar activities are shown in Table 2.

Note. Black circles show that students participated in each activity.
The result showed that students have the following perceptions about their learning outcomes through seminar experiences including the informal activities: (a) acquiring basic and transferable skills, (b) building curiosity in academic discipline, (c) learning practical approach in specific fields, (d) creating social connections, and (e) developing confidences of overcoming difficulties. This indicated that students in seminars are encouraged to think and act on their own initiative by the informal activities. We will conduct further interview surveys for undergraduate students to study more details about the influence of extracurricular seminar activities on students’ learning outcomes.

Analysis of Students’ Various Reasoning in Mathematics and Science Convergence Instruction

Kim, Sun Hee (Kangwon National University)
Bang, Dami (The Catholic University of Korea)
Kim, Jiyoun (Doonchon Middle School)

This study has analyzed Korean middle school students’ reasoning process through which they found a linear function from gas temperature and gas volume in mathematics and science convergence instruction. The analysis was based on Toulmin’ Argumentation Pattern (TAP) and Peirce’s reasoning types. Toulmin identified different types of statement which support a claim C (the conclusion of an argument), data D (facts we use to justify the claim, or minor premise), warrant W (the statement serving as a logical link between data and the claim, or major premise), backing B (further reason to strengthen the warrant), and a qualifier Q. In the same way Krummheuer (2007) analyzed Peirce’s reasoning using TAP, we analyzed the students’ reasoning process. As a result, we have found that students applied various reasoning types of deduction, induction and abduction. More specifically, they used both deduction and induction to draw a graph, and abduction to find a linear function. In other words, deduction was used to confirm whether their model of a linear function is correct to the real situation and induction was employed to experimentally verify whether their reasoning is correct. Meanwhile, abduction was applied to produce a linear function from the relationship of gas temperature and gas volume. Based on the analysis result that students found a linear function through their various reasoning in a scientific context, we have gotten implication for the design and practice of mathematics and science convergence instruction.

Abstract

Background: There is much debate on the best way to educate students on how to generate hypotheses to enhance clinical reasoning in nursing education. To increase opportunities for nursing programs to promote the discovery of accurate and broad-level hypotheses, scholars recommend abductive reasoning which offers an alternative approach to hypothetico-deductive reasoning. Purpose: This study explored the effects of abductive reasoning training on hypothesis generation abilities (accuracy, expertise, breadth) of first and second-year baccalaureate nursing students in a problem-based learning curriculum. Methods: A quasi-experiment with 64 participants (29 control, 35 experimental) was conducted. Based on their allocation, study participants either took part in abductive reasoning training or informal group discussion. Three different test questionnaires, each with a unique care scenario, were used to assess participants’ hypothesis generation abilities at baseline, immediate post-test and one-week follow-up. Content validity for care scenarios and other study materials was obtained from academic experts. Results: Compared to control participants, experimental participants showed significant improvements at follow-up on hypothesis accuracy (p=0.05), expertise (p=0.006), and breadth (p=0.003). While control participants’ hypotheses displayed a superficial understanding of care situations, experimental participants’ hypotheses reflected increased accuracy, expertise
and breadth. **Conclusion:** This study shows that abductive reasoning, as a scaffolding teaching and learning strategy, can allow nursing students to discover underlying salient patterns in order to better understand and explain the complex realities of care situations. Educating nursing students in abductive reasoning could enable them to adapt existing competencies when trying to accurately and holistically understand newer complex care situations. This could lead to a more holistic, person-based approach to care which will allow nursing students to see various health-related issues as integrated rather than separate.
Using an Electronic Portfolio to Translate Theory Into Practice for Field Work In Educational Administration

Presented to
2016 Hawaii International Conference in Education

By
Clifford E. Tyler, Ed. D.
etyler@nu.edu
Professor, Educational Administration
National University Sanford College of Education
San Jose, California

Abstract
The purpose of this paper is to describe the National University Educational Administration Preliminary Credential Portfolio Fieldwork program, translating theory into practice. This paper will also trace the lengthy developmental process from the traditional hardcopy fieldwork portfolio that candidates have traditionally assembled over the past 20 year to the newly-developed E-Portfolio. The E-Portfolio will be described in detail, where candidates post their fieldwork activities and documentation online, which has encouraged more student/faculty interaction throughout the entire fieldwork process, and has provided more consistent instructor grading from a rubric, and more complete data reporting for the university accrediting agencies.

Brief Overview of National University’s Educational Administration Program
National University is headquartered in San Diego, California, and has 28 campuses throughout the state and one in Nevada. It was founded in 1971, so it is a relatively young university. Its mission, then as now, is to serve the needs of the adult learner. Today the University enrolls 27,000 full-time equivalent students, with an average age of 34. Nearly 50 percent of the students are in the School of Education and nearly 1000 each year prepare to become licensed school administrators not only in California but also throughout the United States. There is a small but growing number of students completing their Master of Science degree in Educational Administration while residing in other countries as well. From its beginning, National University developed an instructional delivery format that has students take one course a month for two nights a week, with one Saturday class. This format is replicated in online courses as well. (Hoban and Castle, 2007)

National University, according to statistics provided by the California Commission on Teacher Credentialing (October 24, 2007), which is responsible for overseeing certification in California, has prepared the largest number of certified school leaders/administrators in the state, approximately 300 a year, for the past several years. In 2006, the faculty moved from an administrative/management based curriculum to a leadership/instruction based curriculum to
serve online students. This move came as the result of several years of department discussion, reflection on leadership research, assessing the needs of students, and, above all, responding to the national and international calls as well as new state mandated accreditation directions for developing standards based school leadership preparation programs. (Hoban and Tyler, 2008)

The Field Experience Component---Translating Theory Into Practice

In the National University Educational Administration Preliminary Credential Program, candidates complete 1.) Reflective essay for each of the seven core educational administration course signature assignments, and 2.) Twelve significant administrative activities within six Tier I program learning outcomes for the Educational Administration Credential Program, which align with ISSLIC (Interstate School Licensure Consortium) standards. These activities are designed to apply theoretical concepts studied in core credential classes to practical and realistic settings. Field experiences include both day-to-day functions of administrators and long term policy design and implementation, conducted in schools with a culturally and linguistically diverse student population.

Previously, students submitted a traditional two to four inch hard copy loose leaf portfolio binder, organized into the 22 separate activities, each with documentation, along with the necessary signed field experiences agreement, field experiences plan worksheet, candidate contact log with the university supervisor, candidate self-evaluation, evaluation of candidate, and evaluation of program by candidate. (The E-Portfolio Manual, National University, 2009).

The Traditional Portfolio—Issues and Concerns

While the traditional portfolio (hard copy loose leaf binder) satisfactorily met the fieldwork course outcomes and requirements, it fell short in several areas: 1) inadequate and infrequent contact between the student and university supervisor for providing formative feedback and evaluation of completed activities until the final submission of the portfolio binder at the end of the course, when all of the activities were signed off for completion. 2) Another concern regarding the use of the traditional, hard copy portfolio has been lack of storage space for student-competed multiple loose leaf portfolio binders at the University’s regional academic centers. Often the binders would disappear or get lost over time and were not maintained or properly stored for easy access in the event of accreditation visits. 3) Other concerns included the absence of a rubric for evaluating the quality of the students’ completed activities and inconsistent data collection from the loose leaf binders when preparing internal and external program assessments. This inconsistency occurred because there are a large number of instructors teaching this fieldwork course who submitted incomplete data or no data at all.

Why an Electronic Portfolio for the National University Educational Administration Program: A Rationale
National University’s Educational Administration program, leading to the California and other states’ equivalent preliminary administrative services credentials, has utilized a portfolio to capture student responses to field work experiences for over 20 years. To complete their field work part of the program, students, as noted immediately above, have been required to complete a portfolio that addresses a short reflection for each of the Program Learning Objectives, the complete two activities for each of the 12 administrative competencies which today align with the California Professional School Educational Leadership Standards (CPSELS) and the ISSLIC (Interstate School Licensure Consortium) standards. Students then produce a self-evaluation and request a site mentor/supervisor to evaluate them in terms of these standards. These requirements are summarized and outlined in a published Portfolio Manual.

Over the years, however, this approach to portfolio construction was lacking, with faculty consistently recognizing that the student reflection/evaluation piece, especially, was weak. Students typically dismissed the evaluation component with exceptionally brief and often almost meaningless comments. That motivated faculty to find a better way to address this concern. To start, they began with an examination of the theoretical underpinnings of portfolio development.

The literature regarding the construction of student portfolios is consistent. For the most part, it addresses student teacher portfolios and rarely field work completed by candidates seeking to become school administrators. And what can be usually found for administrative candidates is a portfolio approach that archives student projects from completed courses, not actual field work itself.

Helen Barrett in a keynote address to the Eifel Conference in London, 2009, observes that “reflection is the heart and soul of a portfolio.” Barrett, in another venue, recalls the history of portfolio development when she writes:

“The use of “portfolio assessment” in education emerged in the late 1980s, primarily in college writing classrooms (Belanoff, Elbow, 1991), to address the needs for accountability: the emphasis on portfolio assessment. In K-12 classrooms, the emphasis was more on portfolios as a showcase of learning, as a counterpoint to traditional forms of assessment or to illuminate capabilities not covered by standardized testing. the emphasis on portfolio assessment. According to Kathleen Blake Yancey and Irwin Weiser (1997), those purposes are becoming reversed, with post secondary institutions exploring the wide varieties of purposes for portfolios (learning, advising, employment) and with state departments of educations (Kentucky, Vermont, Connecticut) designing statewide models of student portfolios for statewide assessment.”

It is to this latter aspect of using portfolios—not the archival/showcase process—that educational administration faculty at National University began to turn, especially learning and advising. More specifically, the faculty wanted to
redesign the existing portfolio approach from just documenting student progress in completing field work to providing administrative candidates with greater opportunities to reflect upon and to evaluate their actual work and to explore how the field experience might impact their future career performance. In other words, the portfolio was not to be a volume collecting past history of things done, but an interactive tool to be used with faculty in giving meaning to field work experiences and to consider what the Stanford Center for Innovations in Learning (2002) explored in its Folio Thinking Project, noting that “the reflective practice of creating portfolios enables students to document and track their learning, develop an integrated, coherent picture of their learning experiences, and enhance their self understanding.”

Definitions
E-portfolio or digital portfolio is a collection of electronic evidence compiled and organized by a user, i.e. student. Such electronic evidence may include inputted text, electronic files, images, multimedia, blog entries, and hyperlinks. E-portfolios can be a user’s self-expression or a demonstration of student’s abilities, which is maintained over a period of time. Some e-portfolio applications permit varying degrees of audience access, so the same portfolio might be used for multiple purposes. An e-portfolio can be seen as a type of learning record that provides actual evidence of achievement. Learning records are closely related to an individual student learning plan, an ingenious way for individuals to manage their learning independently.

Students can communicate their learning for understanding to an instructor or others through an electronic portfolio. E-portfolios, like traditional portfolios, can facilitate students' reflection on their own learning and can lead to more awareness of learning strategies and needs. Results of a comparative research between paper based portfolios and electronic portfolios in the same setting, suggest use of an electronic portfolio leads to better learning outcomes.

There are three main types of e-portfolios, although they may be referred to using different terms: developmental (e.g., working), reflective (e.g., learning), and representational (e.g., showcase). A developmental e-portfolio is a record of things that the owner has done over a period of time, and may be directly tied to learner outcomes or rubrics. A reflective e-portfolio includes personal reflection on the content and what it means for the owner's development. A representational e-portfolio shows the owner's achievements in relation to particular work or developmental goals and is, therefore, selective. When it is used for job application it is sometimes called Career portfolio. The three main types may be mixed to achieve different learning, personal, or work-related outcomes with the e-portfolio owner usually being the person who determines access levels (Wikipedia, 2009).
In addition to allowing for administrative candidates to reflect on their field work experiences, moving to an electronic portfolio engages candidates in advancing their own technical skills, something necessary for a school leader these days and well stated in a paper “Applying Learning Pattern Theory to Electronic Portfolio Development: Navigating On-Going Programmatic Evaluation.”

As technology continues to be integrated into schools and classrooms, the principal is viewed as the technology leader (Creighton, 2003). Leadership candidates need to develop sufficient comfort with technology in order to assume the responsibility inherent in the position of principal. An assignment to create an e-folio, thereby, offers leadership candidates the opportunity to develop expertise in multiple software environments. Students’ technological skills are important factors in the construction of efolios and the success of an assessment system (Montgomery and Wiley, 2004).

Another aspect to portfolio development that needed to be considered—the assessment of student work, not only for the student’s benefit but also to meet the needs of state, regional, and national accrediting bodies. For some time National Council Accreditation Teacher Education (NCATE) has required substantive, documented assessment data as it reviews programs. These data are to be from a variety of sources, including signature assignments in courses, comprehensive program exit examination results, candidate evaluations by site supervisors, and assessments of field work by university supervisors.

These data points are also essential in meeting internal University annual program assessments and state accreditation requirements such as those required by the California Commission on Teacher Credentialing (CCTC) and the Western Association of Schools and Colleges (WASC), both accrediting organizations of National University’s educational programs. Capturing these data in the past had been somewhat of a chore, with heavy reliance on individual faculty reporting of scores and affirmation of field work portfolio assessment being indicated by a “Pass—Fail” designation without individualized discrimination regarding the qualitative accomplishment of students on the competencies/standards addressed in the field work. Developing and implementing an electronic portfolio would enable university supervisors not only to assess individual work using a scoring rubric but also would allow for an efficient data collection process to be designed that would not rely on manual tabulation and faculty reporting. This would expedite the assessment process considerably as Wetzel and Strudler, Addis and Luz (March, 2009) discovered in their study of Board of Examiner Reports submitted to NCATE in 2007 which showed that more and more universities were using the electronic format.

**The Journey to an Electronic Portfolio**

While the National University Educational Administration Department introduced the electronic portfolio as a requirement for completing fieldwork in January,
2009, the journey to develop a usable, student and faculty friendly instrument which addressed the concerns noted above was long and hard. The Educational Administration Department faculty began exploring the development of an electronic portfolio almost ten years ago. A first effort began with an outside vendor that had difficulty in conceptualizing what an electronic portfolio was expected to provide, and perhaps, not the clearest directions from the faculty who wanted to have an exact replicate of the hard copy version. And, unfortunately on the part of the external development team, most of the concern was for the technical side of development, with a team being sent from Barcelona, Spain to the University to make a presentation on the technology and the mathematical formulae being used to build an electronic portfolio, which was later abandoned. After another attempt for development with another company, a dispute developed over the costs of development, with actual costs substantively overrunning projected costs.

As an interim measure to move beyond hard copy three ring binders with portfolio write ups and selected artifacts, the department decided to require that all student materials and artifacts, as formatted in the original hardcopy Portfolio Manual, be presented on a CD which then would be reviewed by university field work supervisors and archived for later manual data retrieval for assessment purposes. This approach solved the hard copies storage problem, but did not address the faculty’s interaction with students electronically while building their portfolios during their field work.

In 2006, a faculty committee was formed to develop an electronic portfolio, with attention being given to interaction with students as they were completing their field work. This became more important since the most students were completing the program online, many of whom resided to far from the faculty for in-person visits during the field work experiences. In addition, assessment needs had grown for the university to retrieve data from employers regarding student performance on competencies/standards and dispositions/skills needed to become a school leader, and for graded, qualitative assessment of student field work using a rubric.

The faculty committee met regularly and explored several e-portfolio approaches with a design team from E-College headquarters in Denver, and a local University technology expert affiliated with E-College. Several prototypes were presented and tested and faculty issues being resolved, it was decided to “go live” on January 1, 2009, with all new students and continuing students being required to use the electronic portfolio as they progressed through their field work.

Now that the electronic portfolio for field work is in place, students and faculty are using it with relative success. Some adjunct faculty who served as field work supervisors resigned because they did not want to learn the new technology, even after a number of training sessions led by the in house e-portfolio expert and a colleague from the department who is well versed in this approach.
The Final Product

The latest just revised fieldwork class, EDA 600 (Applications in Leadership), is described as supervised application of theoretical concepts in practical settings. Candidates complete a portfolio of administrative activities demonstrating competency in areas identified in the California Professional Standards for Educational Leaders as sanctioned by the Commission on Teacher Credentialing for awarding of the preliminary administrative services credential. A triad consisting of the University Supervisor, the Site Mentor/Administrator, and the candidate, develops a plan at the onset of the class. This plan ensures that the activities in which the candidate is engaged are aligned in the candidate will take. As the candidate a sequence so that they coincide with the theory learned in the courses has courses scheduled in advance, the triad has advance notice of the course learning outcomes and can plan accordingly. The plan stresses day-to-day administrative functions as well as policy analysis and implementation. This course is the first course in the program and will be taken concurrently with all other program required courses. This course takes 7-12 months to complete. It must be completed within 12 months of being scheduled. This course must be completed in residence.

Credential Program candidates currently complete project field work requiring: 1) Three dispositions that assess the candidate’s strengths and weaknesses: one at beginning, one half way through the course, and the final at the end of the course and 2) Twelve significant administrative activities within six Tier I Program learning outcomes for the Educational Administration Credential Program, which today align with the ISSLIC (Interstate School Licensure Consortium) standards. These activities are designed to apply theoretical concepts studied in core credential classes to practical and realistic settings. Field experiences include both day-to-day functions of administrators and longer term policy design and implementation, and are conducted in schools with a culturally and linguistically diverse student population.

Prior to the current e-portfolio, the traditional portfolio (hard copy loose leaf binder) was lacking for faculty recognition of the student reflection/evaluation piece, and weak effective assessment/evaluation. It also fell short in inadequate and infrequent contact between the student and university supervisor for formative feedback, assessment and evaluation of completed activities until the final submission of the traditional portfolio binder at the end of the course, and inadequate submission of hard data for university accreditation agency purposes.

This current e-portfolio requires more student/instructor interaction time (almost a year) throughout the process rather than an exclusively summative document in the traditional portfolio. Also, the quality of responses and reflections is improving, with current instructor observations that the quality of reflections and responses significantly better than those found in the traditional portfolio. The e-portfolio fieldwork has now become a true learning and reflective process.
Students communicate their learning for understanding to an instructor or others through an electronic portfolio, reflecting their learning, leading to more awareness of learning strategies and needs. The results of a comparative research between traditional portfolios and electronic portfolios suggest use of an electronic portfolio leads to better learning outcomes.

The following is an example response to a category/competency required of the student. For each category there is a template that is completed by the students and submitted to the instructor/university supervisor. As the activity is being completed, the student sends a copy to the instructor who provides feedback. When the final version is ready, the student submits the write-up and the documentation for evaluation. What follows is a sample write up, the rubric, the score, and the final comment of the instructor—in this case short because there was more lengthy commentary provided earlier in the process. It is apparent that the student has thought through the activity and has learned from it—the goal of the field experience activity in the first place. This scoring information, including the site mentor’s evaluation of the student, is automatically entered into the University’s electronic assessment system.

<td>Date Completed: August 1, 2009</td>
</tr>
</tbody>
</table>

Identify the activity:
I will conduct a mock evaluation of a fellow teacher using the union approved evaluation tool. The evaluation will be done on a teacher who agreed to volunteer to let me evaluate them for the purpose of this class. I will hold a post conference just as an administrator would.

Explain the implementation:
I used the union approved evaluation tool to evaluate a fellow teacher just as an administrator would in my district. I observed the teacher for one whole period just as an administrator would during a real evaluation. I tried to conduct myself just as an administrator would for a real evaluation. The teacher who volunteered was aware that I would be coming in to conduct an evaluation, but would only be using the results to fulfill the requirements for this class. The volunteer also agreed to the post conference after the mock evaluation was completed. Examine the process: I have had experience being evaluated with our approved evaluation tool. Four domains are examined during an evaluation in our district:

- Domain A - Organizing Content Knowledge for Student Learning
- Domain B – Creating an Environment for Student Learning
- Domain C – Teaching for Student Learning
- Domain D – Teacher Professionalism

However only two of the domains are used when a teacher is being observed in the classroom: Domain B- Classroom Environment and Domain C- Instruction. The other two domains A and D are discussed towards the end of the year during a summative evaluation along with the three classroom evaluations that were completed during the year.

For the purposes of this class I used the "Teacher Observation Instrument" which focuses on domains B and C. There are 5 performance ratings that are used during a classroom evaluation for each of the subsections in the two domains: U: Unsatisfactory N: Needs Improvement S: Satisfactory E: Excellent N: Not Observed.

As part of our CIP (Continuous Improvement Plan), I had to observe fellow teachers to see if they had an engaging classroom with engaging activities, so when I went to conduct my mock evaluation I was not too nervous. I sat down in the back of the room with my Teacher Observation Instrument and began to take notes. I briefly scanned the 10 items that are to be observed and evaluated.

The classroom I observed was a science class and the teacher's lesson was a water lab. After a while I decided to get up and actively engage myself in the classroom (my administrator does this quite often when he observes). Doing this was the best
thing that I could have done. Walking around and being engaged allowed me to get a better feel for evaluating the classroom environment and instruction. It helped me to reassure myself that the subsections for each domain were being met.

The teacher displayed to me every subsection; all with S or E ratings. I gave an E rating for B5: Making the physical environment as safe and conducive to learning as possible and C4: Monitoring understanding, providing feedback, and adjusting learning activities as the situation demands. These are two very important things that a science teacher must do during a lab. Students seemed to know the lab rules and everyone stayed dry. The teacher also walked around the room giving "teacher checks" as students completed each phase of the lab. I did give an S for C5: Using instructional time effectively, because when the bell rang not all of the students were ready to be dismissed and were still cleaning up. I did not feel that this merited an NI or U since it was a lab and time can sometimes be hard to plan for.

Later that day the teacher came to my administrator's office to meet with me for the post conference. I discussed what I had observed and explained my notes to the teacher. I explained to the teacher how I thought the lesson was a great lesson and pointed out the things that I thought were excellent. Then we discussed ways the teacher would improve even more the next time the lab was done. At the end of the conference both of us signed off on the "Teacher Observation Instrument" and just as an administrator would, I made a copy for the teacher to take back with them. This was a great experience for me. Being on the other end of an evaluation really showed me how thorough only 10 items can be. I not only have gained new respect for my administrator, but also for the union sub-committee that developed the observation tool.

### Student Activity Form

- Comments: I am glad that you had such a successful experience. I thought you would.

### Some Final Thoughts

Now that the e-portfolio for National University’ educational administration has been implemented, there are a number of students who have completed their work using it. While definitive reactions may be pre-mature, some conclusions can be drawn: The e-portfolio does require more student – instructor interaction time than was usually the case when the old portfolio was presented at the end of the process—taking almost a year—as an almost exclusively summative document. The capability of interaction keeps the students and instructors in touch throughout the process. Also, as the sample shows, the quality of responses and reflections is improving, with current instructor observations indicating that the quality of reflections and responses to be significantly better than those found in the older, hard copy/CD approach. The field work has now become a true learning and reflective process and is considerably more than a chronicle of activities. The educational administration faculty is quite pleased with the e-portfolio result and looks forward to continually improving the process and enhancing the learning opportunities for future school leaders.

What did the National University Educational Administration Department learn by its past development mistakes, and would do differently to provide lessons and insights for other institutions to follow, who may want to develop or adopt a
portfolio platform? 1) Work with the same vendor, i.e. Blackboard that develops all of the other university online courses, instead of using different vendors, 2) Seek out clear direction and understanding from the accreditation agency(ies) as to what student evaluative data is needed for accountability records for accreditation, 3) Pilot test the e-portfolio product before fully implemented, and 4) Conduct an external review and evaluation of the student fieldwork e-portfolio for further improvements and updates to reflect accreditation changes, 4) Provide quality training an in-service to faculty members on the use and management of field service e-portfolios to gain full faculty acceptance and understanding, and 5) Research the portfolio platform for introduction to Competency Based Learning (CBE).

Abstract

The purpose of this paper is to provide the results of a university level mentoring program conducted by a Faculty Union at a University in the State University System of Florida. The mentoring program was established to help faculty members in the achievement of the following goals: professional career development; support professional identity formation; and identify and develop successful professional competencies. The mentoring program also facilitated professional learning, socialization and adaptation of new faculty into their professional roles.

*Keywords*: Mentoring, Historically Black Colleges and Universities, Performance Funding.
Introduction

Issues of accountability, cost, quality and effectiveness are constantly being discussed when evaluating HBCUs and their contribution to African Americans’ access to higher education and achievement. In today’s shifting higher education public agenda, concerns about HBCUs and their effectiveness are especially relevant with individual states’ and the federal government’s increased focus on accountability for all higher education institutions. State after state has developed matrices to measure predetermined performance outcomes. HBCUs are now being criticized for their performance on these metrics, as well as for their graduation and retention rates. This criticism ignores the fact that for the past few decades African Americans have made “notable progress” in the area of access to higher education than ever before (Delgado, 2000). However, unfortunately, as a group, HBCUs have failed to obtain the “gold ring” (a college education) for the majority of their constituency. The mentoring program was conceived as a way to improve the professional skills and outcomes at a primarily Black university in Florida.

In August of this year, as President of my union chapter, I proposed a mentoring program for faculty at my University. After thirteen years on the job and a senior professor, I believed that mentoring would aid and assist some of the problems facing my University. The mentoring process is an interpersonal relationship between an experienced faculty member and a novice faculty member who are at different stages in their professional development. In a good mentoring relationship the experienced faculty member takes an active role in the career development of the new faculty member by serving as role model, adviser, and/or guide in various formats that range from highly structured and planned interactions to ad hoc and
informal interactions (Jipson & Paley, 2000). At its core, mentoring as a form of learning and professional development originates from the belief that learning occurs through observing, role modeling and/or apprenticeship, and questioning.

Context of the Investigation

The context of this investigation was a mentoring program established by the local faculty union chapter of Florida Agricultural and Mechanical University (FAMU), the United Faculty of Florida (UFF-FAMU). FAMU is a historically black university located in Tallahassee, Florida and is one of twelve institutions in Florida’s State University System (SUS). FAMU’s enrollment is composed primarily of undergraduate students and the University offers 62 Bachelor’s degrees in 103 majors/tracks, and 36 Master’s degrees.

FAMU was established in 1887, as the State Normal College for Colored Students. It became a Land Grant university in 1891 under the Second Morrill Act, changing its name to State Normal and Industrial College for Colored Students. It became an official institution of higher learning with the 1905 Buckman Act. In 1909, it became the Florida Agricultural and Mechanical College for Negroes, and in 1953 the name was changed to its current name, Florida Agricultural and Mechanical University. FAMU is noted for its College of Pharmacy, College of Journalism, and School of Business and Industry. Currently, FAMU has 620 faculty members.

The faculty union, the United Faculty of Florida (UFF), represents more than 23,000 faculty members at eleven public universities, one private university, nine public colleges, and four K-12 research schools, as well as the graduate assistants at four public universities. The mission of UFF is to protect and support the practice of higher education professionals, including their teaching, research, and service. It does this by means of collective bargaining, as Florida is one of the few states in the south which legislatively allows collective bargaining by state
employees. Collective Bargaining is a bilateral process that, with the weight of law, conveys equal power to unions and administrations to negotiate terms of employment, including salary, benefits, and workload. These contracts acknowledge and legitimize shared governance, and convey power to faculty unions. Often, the collective bargaining system coexists with a faculty or academic senate that provides faculty with structured involvement in the governance of the institution.

The mentoring program was conceived to assist FAMU faculty in cultivating the skills and dispositions to take their students and themselves to the next academic level. The root of the current situation facing FAMU is being ranked dead last in the performance matrices of the (SUS). The Performance Based Funding Model includes 10 metrics that evaluate Florida institutions on a range of issues. These metrics were chosen after reviewing over 40 metrics identified in the University Work Plans. The model has four guiding principles: 1) use metrics that align with SUS Strategic Plan goals, 2) reward Excellence or Improvement, 3) have a few clear, simple metrics, and 4) acknowledge the unique mission of the different institutions. (SUS Webpage) The performance benchmarks for State Universities are determined by:

1) Percent of Bachelor's Graduates Employed Full-time in Florida or Continuing their Education in the U.S. One Year After Graduation

2) Median Wages of Bachelor’s Graduates Employed Full-time in Florida One Year After Graduation

3) Average Cost per Bachelor’s Degree [Instructional Costs to the University – rounded to tens digit]

4) Six-Year Graduation Rate for First-time-in-College (FTIC) Students [includes full- and part-time students]
5) Academic Progress Rate [Second Year Retention Rate with GPA Above 2.0]

6) Bachelor’s Degrees Awarded within Programs of Strategic Emphasis

7) University Access Rate [Percent of Undergraduates with a Pell grant]

8) Graduate Degrees Awarded within Programs of Strategic Emphasis. (Florida State University System Webpage).

FAMU missed out on millions of dollars in performance funding from the state this year after dropping three points on the benchmarks which tied funding to performance. Despite the belief held by many FAMUans that the SUS performance-based funding model is unfair to FAMU, given our long-standing role of providing an education to poorer minority students who might not get accepted elsewhere, the Board of Governors of the State system disagrees. They believe that FAMU needs to address how much of its resources are being directed toward students who are not adequately prepared for a four-year university, and that faculty also need to explore how much heavier teaching loads are taking time away from their research obligations (a topic frequently discussed by this union). Last year, FAMU and the University of North Florida tied for the final spot and FAMU received $10.8 million in performance funding, $5.5 million of which was new. In that year, FAMU scored high enough to have its base level of performance funding restored, which last year totaled $3.6 million (UFF FAMU December Newsletter, 2015).

The faculty union believes that a formal peer mentoring program, will take the faculty to the next level.

Theoretical Foundation of the Program-Mentoring

What is Mentoring?

Although the idea of having a mentor or being a mentor has become very popular these days; there is no single definition of “mentor”. Rather, most of the definitions include the
function of mentors. While many of us use the term quite often, very few know the true model for its use. The term mentor and the model for its use while based in Greek mythology, many of our great leaders participated in a mentor/protégé relationship, including Socrates and Plato, Freud and Jung, Boas and Mead, Sortre and de Beauvoir, Hayden and Beethoven. Although the mentor may serve as a teacher and or sponsor, the mentor’s primary function is to assist the protégé in realizing his or her potential.

The concept of mentoring is very complicated and as with all other concepts, mentoring can be defined broadly or narrowly. When defined narrowly, it can be assumed that mentors have certain characteristics and mentoring occurs in certain of situations. If mentoring is defined very broadly, e.g. mentoring is good pedagogy, the characteristics between the situation and mentors are also much broader. The broader the definition one uses, the more different situations and mentor types can be included in the definition, and the more mentoring exists. If one uses very strict definitions, the less mentoring can assumed to found.

Malderez and Bodoczky (1999) offer a definition of the mentor. They see the mentor as more experienced in comparison to the mentee. Mentoring happens in a one to one relationship. Malderez and Bodoczky present five types of characteristics of mentors to offer a clearer picture of this whole phenomenon. The five types of roles mentors can have are:

- Model
- Acculturator
- Sponsor
- Supporter
- Educator
All these roles have different functions. A mentor can use combination of the roles in different situations. As a model the mentor inspires and demonstrates to the mentee, being an acculturator involves showing the mentee the ropes and helping the mentee adjusting to a new environment. As a sponsor the mentor is opening doors, introducing the mentee to discuss problems or barrier success. As a supporter the mentor focuses on being there when needed, providing opportunities for the mentee to let off steam and to act as a sounding board. As a supporter, the mentor focuses on emotional aspects and on the affective elements of the mentor–mentee relationship, whereas acculturator and sponsor emphasize more practical aspects. The final role, educator, focuses on the learning processes: the mentor encourages mentee’s reflection and articulation of practice and helps the mentee to achieve his learning objectives.

There are two basic types of mentoring relationships – formal and the informal. The formal is organizationally arranged, structured relationships, in which the mentee is matched with a mentor based on pre-arranged criteria (Chaoe & Walz, 1992). The main purpose of formalized mentoring programs is to orient outsiders to the particulars of the inside culture of an organization over a designated period of time. Through these programs, mentors provide accessibility and frequent interaction, allow mentees to work with high-level leaders, insist that mentees receive feedback from mentors, acknowledge successful mentors in the program, and encourage a strong commitment to the mentoring process. All of these factors help to insure that mentees have the opportunity to receive psychosocial benefits that are often associated with formalized mentoring, as well as benefit from career development functions of the mentor (Faison, 1996). In the second form of mentoring, the informal arrangement, mentoring just happens. There are no program, no meetings to attend – just two people whose chemistry is compatible who get together to share ideas and learn with one taking the role of teacher or
mentor, the other the student or protégé. In these situations, there are low expectations and the mentoring is "easier to do", but it is less effective and requires little or no training.

Mentorship promises potential benefits in three areas (Little and Nelson, 1990). Others believe that mentoring is important for induction---to help transition individuals into the work world. Some believe that mentoring is important for career enhancement---to provide an avenue for leadership, public recognition and professional development and program innovation. Finally, having a mentor contributes to overall job satisfaction.

Formal mentoring programs have provided the most significant increase in enrollment and retention of minority students, as well as increased their overall satisfaction with their educational experience. Faison (1996) says that successful mentoring experiences are based on participants sharing common goals, perceptions and worldviews.

The Benefits of Mentoring

The number of mentoring programs has grown dramatically in recent years. This popularity results in part from compelling testimonials by people--youth and adults alike--who have themselves benefited from the positive influence of an older person who helped them endure social, academic, career, or personal crises.

If the mentor/protégé relationship has been beneficial and rewarding to both parties, a long-term friendship may develop; however, the contact and involvement may not be as frequent. The protégé may internalize the admired qualities of the mentor more fully, thereby enriching himself/herself.

Because mentoring is a two-way relationship in which individuals share stories, experiences, and ideas, there are rewards for the protégé/mentee as well. Observing a person grow and learn is an affirmation of the mentor's efforts. The special bond that develops between
mentor and protégé can develop into a career-long friendship. Connections forged through mentoring open the doors to greater opportunities. Most successful professionals can attribute much of their achievement to their mentoring relationships.

Further, organizations of any size can enjoy the benefits of mentoring. The quality and quantity of projects and work related initiatives are directly related to the ability of the organization’s people to work together to surpass their expectations. Nurturing and collaborating through mentoring can only enhance the organization's work. As a corollary benefit, people who feel better about themselves and their work will make a better impression on customers/clients. Customers/ Clients see the positive interactions and, in turn, feel better about the organization's work.

Several disciplines have researched the rewards and benefits of mentoring African Americans. The most notable are the areas of Business and Education (Davidson and Foster-Johnson 2002; Dreher & Cox, 1996, Lee 1999, Leveinson, 1978, Thomas, 1990; Zen 1994). Studies of African American executives show a direct correlation between job growth, promotions and salary increases and having mentors:

- Not having an influential mentor or sponsor was reported as one of the top barriers to advancement of African American female executives, according to Catalyst’s (2002) "Women of Color in Corporate Management Report."
- The study also showed that 69 percent of those with mentors were promoted, compared with 50 percent of those with no mentors.
- According to Korn/Ferry International's study (1998), "Diversity in the Executive Suite: Creating Successful Career Paths and Strategies," formal and informal mentoring and
support from superiors and co-workers are key factors that help place minority executives on the organizational fast track.

- Korn/Ferry International’s study also shows that African American executives who reported having informal mentors at work (73 percent) had faster salary and total compensation growth than those without one.

- The study also showed that 69 percent of those with mentors were promoted, compared with 50 percent of those with no mentors.

Research on organizations has long documented the importance of mentoring in the development of top-level managers. Mentor-protégé relationships provide budding managers with information instrumental to career advancement and also provide "psychosocial support". A major element of the classic mentor-protégé relationship is a high level of rapport and interpersonal chemistry. Research indicates that mentors and sponsors are more likely to choose protégés who are more similar to them in terms of race and gender. To the extent that mentors tend to avoid risk in selecting protégés, stereotypes of African Americans as incompetent pose a substantial barrier to their selection as protégés.

Benefits to Protégé/Mentee

- Development of an interpersonal relationship with a caring, informed, supportive advisor
- Ability to receive constructive feedback
- Direction in defining and achieving career goals
- Acquisition of an objective and credible source of information

Benefits to Mentors

- Satisfaction in helping the mentee/protégé define and achieve career/professional goals and objectives
A sense of pride from observing the mentee/protégé develop

An opportunity to improve interpersonal communication, motivation, coaching, counseling, and leadership skills

Pleasure in knowing the you are contributing to the success of the organization

An opportunity to impart valuable information, expertise, and wisdom to a receptive individual.

Results

Because of political chaos in the institution, the implementation of the mentoring program has been delayed. The faculty was in impasse over the summer 2015 concerning faculty salary negotiations. The impasse was successfully resolved by the beginning of Fall 2015. It is anticipated that the mentoring program will begin the first stage of implementation in the Spring of 2016.

The long-range vision for the mentoring program is to integrate mentoring into the daily operations of the university. It is hoped that the success of the mentoring program will lead to many successes in university functions, including academic, enrollment and retention.

6. Abstract:

   Adult career counseling in a university context is a substantively different process from career counseling with traditional aged students. The session is grounded within the values-based literature of both adult education and career counseling and explains and interprets this difference, paying particular attention to historical, social, contextual, and developmental aspects of this distinction. Shared is a research study using values-based career counseling interventions to help adults in various aspects of their career decision making.
THE ROLE OF THE 18TH CENTURY SHIPBOARD ARTIST IN EDUCATING THE PUBLIC: A COMPARATIVE STUDY OF JAMES WEBBER’S DEPICTION OF HAWAII’S KEALAKEKUA BAY ON CAPTAIN COOK’S THIRD VOYAGE (AND THE FIRST DEPICTION OF SURFING)

By

ROBERT B. KEBRIC
HISTORY DEPARTMENT
UNIVERSITY OF LOUISVILLE
THIRD STREET
LOUISVILLE, KY. 40292
robert.kebric@louisville.edu

ABSTRACT: In the eighteenth century, shipboard artists played a key role in educating both the British Admiralty and public about the far-flung and often exotic locations that explorers such as Captain James Cook visited. They added the visual reinforcement that not only heightened public interest in otherwise straightforward narrative and reports, but also provided the government with illustrations to help determine the benefits of additional exploration of new lands. One such artist was John Webber, who accompanied Captain Cook on his third Pacific expedition (1776-1780) and left memorable artistic renderings of the Hawaii Islands. One of the most famous of these was his depiction of Kealakekua Bay on the Big Island and the first depiction of the Hawaiian pastime of surfing. The accuracy of his art is truly remarkable.

British artist John Webber accompanied Captain Cook on his third expedition to the Pacific from 1776-1780 aboard the HMS Resolution. His job was an educational one. Officially, he was to record what he saw on the voyage through his drawings and paintings to help the British admiralty with its plans for future exploration and expansion, and to add to a growing body of knowledge about unknown parts of the world. Through his efforts, authorities could see rather than only read or hear about what they might expect to encounter on their voyages to remote corners of
the globe. Webber’s illustrations were also distributed for the general edification of the British public to inspire interest and curiosity for a variety of reasons—personal and commercial, altruistic and exploitative. His historically important works are among the earliest visual opportunities to learn about areas on the western coast of North America, Asia, and the Pacific—including Australia, New Zealand, Hawaii, Tahiti, and Tonga. Nothing at the time short of being there could substitute for viewing such places and peoples. Webber’s originals were subsequently engraved and published in England and France. They have since gone through a number of editions.

People have always wanted this type of visual reinforcement for the written word. In fact, it may be said that education begins with pictures. For most of human history, this reinforcement was necessary simply because of the high degree of illiteracy. Artists accompanying monarchs on military expeditions have a long history, which can be demonstrated by depictions of battles going back to the Ancient Near East and Egypt. While the original purpose of these artists was primarily to glorify a leader’s military prowess, as society progressed it was not only rulers who understood the power of the visual image but also ambitious politicians. One wonders, for instance, if illustrations might not have accompanied Caesar’s vivid narrative in his Commentaries, which were largely designed to enhance his position in Roman Republican politics. During the Roman Empire, emperors called upon artists to depict them in glorious poses, as well as feature them in battle. The Columns of the Emperors Trajan and Marcus Aurelius, which may still be viewed in Rome, could only have been based on actual renderings by artists on the battlefield.
Generals and officers celebrated their achievements, too, but in less grandiose scale on private works. One particularly fine example is the Portonaccio Sarcophagus in the Palazzo Massimo at Rome, which depicts the potential occupant, Pompilius, hammering his way through barbarians on the Danube frontier in a mostly realistic rendering by an artist who clearly had witnessed the carnage (see Robert B. Kebric, *Athens Journal of History*, Volume 1, Issue 3, July, 2015, pages 175-194).

As literacy, technology, and the ability to render art improved, so, too, did the production and distribution of that art. Also, as the public came to have more of a role in government spending, elected officials were compelled to take the *vox populi* more seriously. In Great Britain, for example, John Webber’s art had its governmental purpose, but it was also intended for public distribution as encouragement to support future funding for expeditions like Captain Cook’s. It had the desired effect. In today’s society, the public is incessantly bombarded with visual images of politicians, businesses, entertainers, athletes, and everyone else vying for publicity, support, or funding—and through it all, the visual image has provided a powerful (though not always intentional) educational tool.

The question to be examined here, however, is a simpler one. It is not whether art has been used in the past to glorify, mislead, or misinform the public for political and other reasons. Its only purpose is to determine whether or not John Webber did his job—educating both the British Admiralty and public through his artistic renderings. It would have been easy for an artist on such an extended expedition to become careless or fulfill his responsibilities simply by dashing off quick sketches that were acceptable. If the general nature of the subject or landscape was captured,
then that should be good enough. Besides the chance of enlisting a poor or lazy artist, just the grueling wear and tear on someone who was not by nature a seaman, could take its toll on a very good artist on a voyage such as Cook’s. Even the Captain did not survive this one, killed in an unfortunate scuffle with native Hawaiians on Kealakekua Bay, not far from where his ship is shown anchored in Webber’s engraving.

In John Webber’s case, it appears that nothing stopped him from producing the most accurate and reliable drawings and paintings anyone could have made at the time. Webber (1751-1793) was only in his mid-twenties when he was selected to be Captain Cook’s artist. He had been educated in Bern and studied painting in Paris. Obviously, he was already establishing his reputation by 1776, or he would not have been selected for the job. It was not unusual (in fact a regular practice) to select younger men for this kind of task, a grueling voyage from which there was an even chance of not returning. The opportunities for a young artist, however, appear to have outweighed more practical concerns, and Webber became the first European to have the opportunity to depict the Sandwich Islands, as they were called at the time. After he returned to England in 1780, his works were exhibited at the Royal Academy, an honor that certainly helped lead to his election as an associate of the Academy in 1785. Cook’s death on the voyage also attracted unexpected attention to the artist, particularly because of his rendering of “The Death of Captain Cook,” which became the highlight of his engravings when they were published.
In the one example of his Hawaiian art we are discussing--Webber's rendering of Kealakekua Bay on the Big Island--the detail is exceptional. It is fortunate that we can use one of his Hawaiian engravings for a conference paper that is being presented in Hawaii--but even if it were not, the fact remains that John Webber was a brilliant artist. Comparing the original engraving of Webber's rendering of the Bay with photographs I took at the same site last January, readily confirms this impression. I attempted to position myself as closely as possible to Webber's vantage point, using a copy of his engraving as my guide.

There have, of course, been some major changes at Kealakekua Bay over the last two-and-a-quarter centuries. Probably the most traumatic happened only a little more than nine years ago on October 15, 2006, when a 6.7 magnitude earthquake struck the Big Island at 5:07 P.M. It hit the Bay hard, and massive landslides caused a thick cloud of brown dust to cover the entire area. The cloud of debris can still be viewed in a sequence of photos on-line at www.flickr.com, under “Hawaii Earthquake 2006.” Interestingly, I did not know about the earthquake until I returned to my hotel in Kona after going to the Bay to make my comparisons. The car attendant asked where I had been, and I told him what I had been doing, producing my copy of Webber's engraving. I said the comparison was remarkable and about the only thing really different was that the bluffs at the top of the ridge above the Bay were gone. He replied that he lived in the area, and that bluffs were once there, close to what Weber had depicted. He then proceeded to relate some personal details about the 2006 earthquake. His family was having dinner nearby at the exact time the earthquake struck, and the entire wall of earth at the top of the...
bluff had fallen into the sea. The resulting dirt and debris rose high in the air and
did not clear up for some time, as the aforementioned photographs following the
2006 earthquake show. He said he was at the Bay frequently, so he knew exactly
what it had looked like before the quake-- and it was pretty much like Webber had
depicted it in his rendering. My admiration for the artist only increased with this
new knowledge.

Even with the recent changes in the physical landscape of the Bay, it may be seen
by comparing the engraving and my photographs below that they still match up
very well— in fact, the result is amazing. I even ended up using the copy of
Webber’s engraving to discover features of the landscape I would have otherwise
missed because of subsequent overgrowth and changes in topography. In the final
analysis, the most meticulous government officials, the royal navy, universities and
schools, and members of the general public in 18th century Great Britain could have
used Webber’s depiction of Kealakekua Bay with complete confidence.

The result of this one comparison between a Webber engraving and the actual
Hawaiian site he was depicting is almost frightening in its accuracy. I have not
attempted similar experiments at other locations in the Pacific because of obvious
geographical and financial obstacles, but based on this one example, Webber was
the man for the job. That accuracy is reinforced by his ink wash and watercolor in
the Honolulu Museum of Art entitled “Kealakekua Bay and the Village Kowrooa
(1779)” -- where Cook was killed and the Cook monument stands today – which
depicts the far left end of the Bay (mostly obscured by the ships in the engraving).
While erosion has diminished the scale of the bluffs in Webber’s original engraving,
the general line of the landscape of Kealakekua Bay can still be perceived. We can be sure since Cook’s explorations and death on the Bay raised such interest and inspired so much patriotism that this engraving became almost a national treasure for the British.

What Webber depicted as a part of the incidental activity going on at the Bay while he was working on his illustration also includes the first known representation of Hawaiians engaged in their “national” sport of surfing (see last photo below). As a result, it is today an iconic “must-have” for anyone interested in the beginnings of surfing and reproductions (and sometimes an original) are sold all over the islands. Webber was not ignorant in including surfing in the engraving because notes from other members of Cook’s expedition also contained their curious observations about the Hawaiian pastime—which, of course, went on to become an international sporting phenomenon and inspired the Southern California surfing culture that captured the country’s imagination in song, film, and slang in the 1960s.

That is education!

*                                                  *                                                     *

What follows are recent photos of Kealakekua Bay compared to Webber’s original engraving. The 2006 earthquake caused considerable damage to the area, especially loosening the top most cliffs, which not only fell into the sea but also transformed the terrain beneath and changed its configuration. I have looked through hundreds of photos and postcards on-line, attempting to develop some type of visual timeline
of changes to the site but to no avail. It would be fortunate, indeed, if any such record could be pieced together, but it would be too coincidental if artists or photographers over the centuries had just happened to reproduce or take photos of precisely the same panorama. I specifically took my photos of the Bay for this presentation using Webber’s engraving as my guide. Even without such a record, it may be presumed that there have been other earthquakes and shifts in topography that made the heights originally depicted by Webber over two centuries ago look very different today. That is just a part of the natural evolution of all landmasses. Nonetheless, the photographs included here still show many of the same landmarks Webber saw. Despite changes to the landscape, they remain eminently visible-- and confirm Webber’s expert depiction of the Bay.
John Webber’s engraving of Kealakekua Bay.

A recent panoramic photo of the same scene.
Weber’s engraving and same area as it appears today after earthquakes and erosion.
Furthest extent of landmass at Kealakekua Bay and site of Kowrooa village, where Captain Cook was killed (Cook Monument). Ships obscure it in Webber’s engraving.
Recent view of area depicted in Webber’s engraving. Effects of earthquakes and erosion over two centuries show on top, while basic contours below remain.
Recent view of area depicted in Webber's engraving. The dark depressions at center right in the original, cave-like in appearance, can still be seen at left in the photo.
The rock cluster in Webber's original engraving is still visible among the foliage.
The earliest representation of a surfer in Webber's engraving.
A Journey To Calm: Becoming a Trauma Informed School

Abstract

August 2015

The basis of the presentation is to demonstrate the positive effects of making social-emotional learning (SEL) a priority in a school setting. For years, schools focused on how to get students to perform well on standardized tests. The social-emotional wellness of students was not in the forefront of learning. In urban schools, children enter with an array of emotional issues, anger, signs of physical abuse and/or trauma. Many witness violence in their homes or communities. In general educators are not trained to deal with these issues and are often at a loss. When students experience these issues, teaching and learning is at a loss, too. This presentation plots the journey of one elementary school from 2009 – present. During the six-year period, administration and staff used data, student, parent and staff surveys to implement school-wide strategies, and SEL programs. Staff, parents and community members participated in trainings to understand and communicate the need to prioritize social-emotional learning and developing interpersonal relationships. As a result of the journey to calm, the climate of the school improved over time. The environment is conducive to teaching and learning; thus, leading to students growing academically and emotionally.

Meeting the Needs of Diverse Learners

Abstract:

Due to the changing demographics in our public schools, teachers are faced with new challenges. Questions such as, “How can I meet the diverse needs of my students?” are asked. Reform documents such as Science for All Americans (AAAS, 1990) calls for us to meet the needs of all students, not just a select few. We can accomplish this goal by differentiating the instruction we provide for our students. Teachers can differentiate the content, process, and/or product according to students’ readiness, interest, and learning style (Tomlinson, 1999).

Content can be differentiated through a range of instructional strategies. Lessons can be tiered to provide content that is leveled according to the students’ readiness. Gifted and talented students can be provided for with instruction that is compacted.

Teachers can differentiate student products. These products reflect the concepts and/or process students have understood and are able to apply. One way to differentiate the products we assign our students is to design activities according to different learning styles or multiple intelligences (Gardner, 1991). Activities can be designed to provide students with a choice according to their strengths. For example, to provide for the musical intelligence a student might create a rap song. A verbal linguistic activity would engage students in discussion. While a bodily kinesthetic activity would engage students in creating a dance or some movement to illustrate the concept learned.

In this workshop, participants will learn how to differentiate their instruction according to the needs of their students. Then, they will progress through centers to create four tools; a choice board, a tiered activity, varied questions, and contracts, all of which they will be able to use in their classrooms to diversify their instruction to meet the diverse needs of their students.
Proposal #1

a). Title of the submission

The polarization between pro-school and anti-school subcultures in Japanese elementary schools: Investigating the influence of school, family and regional factors

b). Topic area of the submission: Elementary Education

c). Presentation format: Paper session

d). Description:
A literature review in the field of pedagogical research shows that the polarization between pro- and anti-school subcultures in elementary schools is not well known in Japan. The Purpose of this study is to identify the factors facilitating elementary students' adaptation to school.

e). Authors:

Abstract:

This study attempts to identify the factors facilitating elementary students’ adaptation to school. A literature review in the field of pedagogical research shows that the polarization between pro- and anti-school subcultures has been well studied in junior high and high schools, but this phenomenon in elementary schools, particularly its relationship with family and regional factors, is not well known. To fill this gap, survey questionnaire data were gathered from 5656 fifth graders studying in 64 schools in four cities of Japan from July to September in 2013. Statistical analysis of data shows that classroom and regional factors have positive effects on students’ adaptation to school but family factors have negative effects. These results will be discussed in terms of the importance of school and classroom management to promote students’ and local residents’ school involvement.

6. Abstract and/or full paper:

**Children Inspire Glass Project at Emporia State University**

**Abstract**

In the spring of 2013 an interdisciplinary project, *Children Inspire Glass* took place at Emporia State University in Emporia, Kansas. Under the co-direction of Dr. Carol Russell, Professor of Early Childhood Unified, and Fletch Russell, Adjunct Professor of Art, in collaboration with Roberta Eichenberg, Associate Professor of Art, and Dr. Heather Caswell, Assistant Professor of Early Childhood Unified & Early Literacy Consultant, an extraordinary opportunity for children, ages 5 – 10 was provided, to create stories and design creatures to be transformed into glass sculpture. The project was funded by the Kathrine K. White Faculty Incentive Grant & the C. F. Marshall Trust and the pilot project was awarded the 2014 Ervay Family Applied Scholarship Award.

This project celebrated children and their imaginations, in collaboration with instructors and students of various educational disciplines who share this enthusiasm. This pilot project was modeled after the *KIDS DESIGN GLASS* program at The Museum of Glass in Tacoma, WA, stretching it a bit further to incorporate faculty and students from various disciplines: Elementary Education, Children’s Literacy, Art Therapy, Art Education, Early Childhood, and Art ~ Glass. Within the month of May, six children, male and female, ages 5 – 10, created stories and designed creatures to be transformed into glass sculpture. The program consisted of five sessions. The first four sessions were held at the Emporia Art Center. During this time the children were presented with materials for designing a creature in 2D and 3D form, while a composing a story to accompany their creation. When designing their creatures, the color palate of markers and clay was limited to specific colors (primary and secondary, and black and white) to match the color of the glass we ordered, so that we could be as authentic as possible with the children’s designs.

Documentation was a major aspect of our project in hopes of sharing ways to foster creativity for all children. The documentation (photos and DVD) illustrating the process of this educational program has been used as a teaching tool for various ESU courses, such as: Glass, Art Education, Art Therapy, Elementary Education and Early Childhood, will be used in national presentations, and to accompany grants for future funding of the project. Several art shows have showcased the children’s creations, stories, and glassworks produced by ESU glass students at several locations on campus, the community, and in the region. Art shows have included ESU’s Children’s Art Gallery in The Teachers College; ESU’s Art Department - Eppink Gallery, March 10– March 21, 2014; Emporia Arts Center in
January – February, 2015; and Baker University’s Art Gallery in Baldwin City Kansas in November 2 – Dec. 11, 2015. The children’s participation in these art shows has been rewarding and enjoyable.

Dr. Russell shares a personal reflection, “Personally, the Children Inspire Glass Project has presented an abundant amount of effort and coordination, yet has been one of the most joyful, inspiring and collaborative projects of my career. It has demonstrated the power of authentically creative experiences for children, and importance of their genuine ownership in that process. This experience has clearly defined for me, as an Early Childhood Educator, the importance of what we do and HOW we do it! It is amazing how children can be engaged and focused when you foster creativity with an appropriate environment, materials, interactions, and TIME! We tend to structure so much of their young lives and hurry them through processes; rather than slowing down for learning through play, giving them TIME to show us how much they know, allowing TIME for problem solving opportunities, and TIME to create.”
1. Detailed title page of submission

   a. Title of the submission: “Proposed Research: Towards Understanding the Dynamics of Industry – Academe Partnership, Case Studies of Selected Colleges in Metro Manila

   b. Topic area of the submission: Education Policy and Leadership

   c. Presentation format: Paper Session

   d. 2-3 sentence description of your presentation which should not exceed 75 words in total.

      The paper is about some prevailing partnerships between Industry and Academe, specifically in Higher Education, which is always struggling to prove its relevance to the broader society, and more specifically, the requirement of industry. The case studies will investigate, explore and reveal partnership engagements, its motivation, norms practices; and identify potential areas of conflicts as interpreted by stakeholders.

2. Email abstract and/or paper. Receipt of submissions will be acknowledged via email within 48 hours. Please see Abstract in the following page
Abstract

Socio-economic environment challenges compels Colleges to perform their roles as producers of relevant skills and competencies in graduates. Likewise, ASEAN Integration calls for products of academe to better participate in the global economy with the onset of talent mobility across the ASEAN. With the burgeoning and inevitable emergence of partnerships between industry and academe, this study hopes to guide and contribute to the establishment and development of models of collaborations and make judgments about its maturity of purpose and execution. The proposed research will initially focus on two private Colleges in the Philippines, among a total of four (4) Colleges as planned: Asia Pacific College, established by Industry partners to strategically bridge the employment gap; and the College of Saint Benilde, established to address the need for alternative learning system to enable productivity among underserved populations in the country. To examine the factors influencing the goals, development and sustainability of partnerships engaged by the selected Colleges, a case study approach will be employed, an empirical inquiry that will investigate the phenomenon in depth and within real-life context. The paper presentation will reveal results and present to the audience findings and conclusions of the case studies.
The department of Health Education at San Francisco State University engaged in a process of curriculum re-imagining, developing student-learning outcomes, and creating a scaffolded and cohorted undergraduate program. The curriculum is four semesters, and each semester is lead by a sequenced course that builds upon the knowledge, competency and skill our students need to succeed after graduation. This poster session will show the curriculum roadmap, and note increase in our students’ success and time to graduation.

atinas@sfsu.edu
Curriculum Redesign for Increasing Student Success in an Undergraduate Upper Division Degree in Health Education

Across the California State University (CSU) system, the graduation rate average is 13% for four-year completion, and 36% for five-year completion. At San Francisco State University (SFSU), the graduation rate is 15% for four-year completion and 25% for five-year completion. In an effort to help our students successfully complete their Bachelor of Science degree in Health Education (H ED), the department redesigned, sequenced and cohorted its undergraduate curriculum over four semesters. The current department graduation rate average is 29% four-year completion, and 37% for five-year completion (higher than both SFSU and the CSU) and we project to see that percentage.

Our student-learner focused and writing intensive curriculum has been strategically scaffolded to produce both skilled and capable public health educators. This is accomplished while, also, achieving a higher than average time to graduation rate. Our sequenced and cohorted curriculum is aligned both vertically and horizontally, while also keeping within compliance of the competencies and requirements of our governing accreditation body, Council on Education in Public Health (CEPH). The horizontal alignments are the department program learning outcomes, which are threaded through the scaffolded curriculum, with an emphasis on social justice and professionalism. The vertical alignments contain the designated courses by semester, with each course student learning outcomes and signature assignments connected and synced. Since implementing this curriculum redesign in Fall 2013, the current department time to graduation rate is 94% for four-semester/two year completion.

6. Abstract

Business intelligence (BI) solutions have emerged as the top IT related priority in higher education due to the vast positive impacts on data-driven decision making processes (Chen, et al., 2012; Grajek, 2014; Guster and Brown, 2012). The 2014 ECAR report (Grajek, 2014) indicates that a “Business Intelligence Dashboard” is the top IT strategic priority in higher education, and 64% of higher education institutions are estimated to implement BI Dashboards by 2016. Although there are many benefits to BI, literature suggests that implementing BI is challenging, especially in higher education (Blanton 2010; Guster and Brown, 2012).

The purpose of this presentation is to provide an empirical model, focusing on the collaboration efforts and the strategies to implement and adopt BI infrastructure in a higher education institute. In order to support the institution’s mission, a joint task force was constructed consisting of cross-functional leaders, including the institution's data analyst, researchers, database managers, and IT team. The task force team launched a project implementing BI infrastructure as an effective tool to promote students' outcome and teaching success. The BI structure has grown using prototyping and agile approaches (Guster and Brown, 2012), in four major overlapping developmental phases.

The first phase involved establishing a Data Warehouse (DW), which is the central component of the BI system. The DW has been established by the IT department, independently of the current project, at the time of the project, the task force team was able to move on to the next phases. The DW contains integrated data extracted from multiple databases in the institution, mitigates risks associated with the storage of PII, and lays the groundwork for institutional analytics. The DW is refreshed nightly from the source databases using the replication and ETL (Extract, Transform and Load) processes. A BI Reporting system was linked to the DW, in a way to support analytics capacity of data mining, explanatory and predictive models to gain insights on
the institution. The second phase required incorporation of mission-critical institutional knowledge and cross-department collaboration, to develop the institution’s key success indexes (Blanton, 2012). The key success indexes were aggregated, correlated, compared, and summarized by various sub-groups (fiscal years, classes, schools, departments, etc.). This phase enabled the institution’s logics to be adequately incorporated in the BI solution. The third phase was prototyping. The task force team has had regular meetings with the project sponsor and stakeholders at an interval of 2 ~ 4 weeks to extract and refine their requirements and needs. Continuous updates and deployments of working models have been shown to stakeholders, whose feedback has changed the BI system properly. The fourth phase, the current phase, elaborates the security strategy, data governance policy, risk assessment of non-compliance occurrence, and protecting data stakeholders (Guster and Brown, 2012).

Throughout the developmental phases, the task force team has fostered excitement on cross-campus knowledge transfer and institutional collaboration. The BI solutions are currently in beta testing, and employed for the After Class Review model (Hughes, 2015), one of major program evaluation procedures adopted in the institution. When the BI infrastructure is deployed to production, the application will enhance evidence-driven teaching and learning which will result in promoting students’ outcomes.

Crafting teacher-training workshops: What do teachers need?

Anthony Cripps, Richard Miles and Sean O’Connell

Abstract

This paper examines the issue of providing support for English teachers in Japan. The presenters explicate how they are crafting a series of intensive teacher-training workshops that are designed to help improve in-service teacher training. The presenters will outline their plans to provide pedagogical support for Japanese teachers of English in three ways; Creating practical lectures and workshops which will address the teachers’ pedagogical needs; Making an online teacher support center (TSC) which will house teaching videos, audio files, word files, and other support material for teachers to freely access whenever and wherever they like; Publishing practical handbooks based on the lectures and workshops.

Key words: Online material, pedagogical support, teacher-training workshops

Navigating MOOCs: Students’ perspectives

Anthony Cripps and Sean O’Connell

Abstract

Many university students in Japan are unaware of Massive Open Online Courses (MOOCs) and their potential for learning. Two groups of students (n=22) taking a ‘Teaching with Technology’ course at Nanzan University were encouraged to explore online courses provided by platforms such as Coursera, edX, and FutureLearn, as part of a semester-long research project. The aim of the project was to broaden the students’ knowledge of this growing field and they were given free rein to navigate the MOOC terrain in any way they wished. Throughout the project each student kept a diary in which they logged both their MOOC use, and their opinions of the courses. Interviews, diaries, focus groups, reports, and questionnaires all provided rich data. The authors outline the design of the project, before discussing in detail the students’ experiences of mapping the MOOC terrain.

Key words:  MOOCs, online learning, pedagogical innovation
A Comparative Analysis of Test Takers’ Reactions to Direct Testing and Semi-direct Testing

Michi YONEZAKI
Fukuyama University
Sanzo, 1-banchi Gakuen-cho, Fukuyama, Hiroshima 729-0292
michiyonezaki@gmail.com

Speaking tests have become more important in Japan over the past decades with the recent emphasis on communicative language teaching. Many internationally oriented English language speaking proficiency tests have the person-to-machine format, or semi-direct test. At school, this format is also often conducted if facilities such as language laboratory are available. In spite of the popularity of this trend, there is a need to evaluate speaking test formats, in particular, from the test takers' perspectives. The present study compared two speaking testing modes, a direct test and a semi-direct test and analyzed the reactions and perceptions of the test-takers. The results showed that the test-takers favored direct speaking testing and that they felt more nervous when they took a semi-direct test.

BACKGROUND

Speaking tests have become more important over the past decades with the recent emphasis on communicative language teaching in Japan. However, assessing speaking skills is quite difficult in terms of its practicality; in general, it requires teachers to take significant amount of time in order to conduct and score the tests. Because of this tremendous burden on teachers, speaking tests are lower in frequency at schools in Japan although speaking activities are generally frequently conducted in these same schools. As Hirai & Koizumi (2009) argue, "the students may not take speaking activities seriously when there is a wide gap between the frequency of opportunities for speaking activities and their assessment in English class (p.152)."

In order to reduce the issues of the amount of time necessary to conduct speaking tests, semi-direct speaking tests have been developed. An example of a semi-direct test is where test takers respond to audio stimuli or directions written on paper and their own responses are recorded and later
assessed. Many internationally oriented English language proficiency tests, such as TOEFL iBT and TOEIC test, also have a semi-direct speaking test format with the computer-based version. At school, this format is also often conducted if facilities such as a language laboratory are available. Assessing speaking skills with computers or other forms of multimedia technology has been popular in recent years. In spite of the popularity of this trend, there is a need to evaluate speaking test formats, in particular, from the test takers' perspectives.

SPEAKING TEST FORMATS

There are three types of test formats to assess speaking skills: indirect testing, direct testing, and semi-direct testing (Hughes, 2003; O’Loughlin, 2001; Qian, 2009).

Indirect testing is to assess the items that underlie the speaking skill instead of measuring the test taker’s speaking skill directly. For example, Lado (1960) proposed that a pronunciation test could be assessed by indicating one word which is pronounced differently from other printed words. This kind of pronunciation test doesn’t require test takers to actually speak throughout the test. Indirect testing has the advantage that it does not require a large number of test admission officers or teachers. Moreover, normally their burden is not so large. However, indirect tests cannot always accurately measure the test takers' speaking skill, and indirect testing is no longer considered a valid test format.

Direct testing aims to measure test takers’ skills in specific areas that teachers are interested in. Hughes (2003, p.17) says “testing is said to be direct when it requires the candidate to perform precisely the skill that we wish to measure.” In direct speaking test, test takers are required to perform oral tasks which can show their speaking skill and to involve face-to-face communication with one or more interviewers. Direct testing more authentically reflects face-to-face interaction in a daily life. However, interviewers control the interview and "the language elicited in an interview is unlikely to reflect the discourse of real-life conversation (O'Loughlin, 2001, p.6)."

Semi-direct testing elicits test takers' speaking by directions presented on computer screens or printed test paper rather than by directions given by interviewers. Normally, an audio recording of test takers’ speaking is made and later it is assessed. Semi-direct testing can be carried out to a large number of test takers at the same time and within a very short period as long as there are availabilities of facilities, such as language laboratories or
IC recorders, to record test takers' performance. Therefore, the advantage of semi-direct testing is that it is cost-effective and efficient (Qian, 2009). With the development of computer technology, semi-directing test has become more popular (Qian, 2009).

Of these three testing formats, indirect testing is viewed as the least valid measure of speaking ability because test takers are not required to speak (O'Loughlin, 2001). Semi-direct testing and direct testing are generally used as legitimate speaking testing formats. Therefore, this study will focus on direct testing and semi-direct testing as well as the analysis of test takers' reaction to the two testing formats. In this study, direct testing is defined as live, face to face testing where test takers and one or more interviewers are on the spot, while semi-direct testing is defined as tape or digital-recorded testing in which test takers' respond to audio-recorded questions or to the directions on printed paper.

SEMI-DIRECT TESTING VS DIRECT TESTING

In comparing these two speaking testing formats, a number of researches have been conducted by analyzing and comparing the features and structures, testing scores, and test takers' reactions and perceptions of semi-direct tests and direct tests (for example, Brown, 1994; Deguchi, 2013; Hughes, 2003; Luoma, 2004; Nakamura, 2015; O'Loughlin, 2001; Quin, 2009, etc).

</table>
Table 1 shows a list of the results drawn from the literature indicating which speaking test format test takers' prefer. Most studies report direct testing is more preferable, while Brown's (1993) study reports test takers prefer semi-direct testing. Qian (2009) reports that test takers have no particular preference. Some reasons given that test takers prefer direct testing are that they prefer to speak with interlocutors rather than to machines, there is personal interaction between test takers and interviewers, and the testing format is close to the real communication and so on.

Nakamura's (2015) study shows that test takers felt that they prefer the direct test to the semi-direct test and would choose a direct test if they had the choice. However, there is no significant difference on speaking test scores between the test takers' measure of ability.

RESEARCH QUESTIONS

This study is conducted as a follow-up survey of previous research which focused on test takers’ reactions and perceptions to direct testing and semi-direct testing. This study also aims to let teachers know test takers' format preference for further development of speaking tests.

The specific research questions that the study aims to investigate are as follows:

1. How do test takers react to and perceive each of the two test formats, direct testing and semi-direct testing?
2. Which is more preferable to the test takers? What are the particular reasons for test takers’ preferences?

METHOD

Participants

The research participants in this study are 85 Japanese university students who learn English as a foreign language. All of them are freshmen. 49 students (Group 1) major in pharmacy, while 36 students (Group 2) major in biotechnology science. The same curriculum and the same English lessons are given to the both groups, but English lessons are given separately to each group. The average English participants' proficiency levels are the semi-second grade for A.C.E. Placement test which participants took in April, 2015.
Procedures

All the participants took both a direct speaking test and a semi-direct speaking test. As a speaking assessment, the Story Retelling Speaking Test (SRST), developed by Hirai & Koizumi (2009), is employed in this study. In the Story Retelling Speaking Test, participants are required to read a story and retell it. In this study, the participants were required to state their opinion after retelling the story.

In Hirai & Koizumi’s research, the participants were required to read a story which they read for the first time. However, this study asked the participants to read a story which they had already learned in an English lesson and then retell it. This is because the aim of this study is to examine how the participants feel about the direct test and the semi-direct test, not to measure their reading ability.

The participants do not do retelling activities in daily English lessons. Therefore, the participants read the story before, but this was the first time for them to retell the story.

Before the experiment was conducted, the participants recorded their performance on an IC recorder so that they might not be confused about how to use an IC recorder.

Two types of stories (Story A and Story B) were used for the direct test and the semi-direct test. Readability for Flesch reading ease test is 98.3 for Story A and 93.5 for Story B. The level of both stories is elementary and both stories are the same level.

According to a questionnaire conducted before the experiment, about 44% participants said they had never experienced the speaking test at school. Therefore, most of the participants are not used to taking speaking tests and the first speaking test format (either direct or semi-direct test) will make them more nervous than the second speaking test format. In order to make the two test formats equivalent, Group 1 took direct test first with Story A and then took the semi-direct test with Story B. On the other hand, Group 2 took semi-direct test first with Story B and then took direct test with Story A. Table 2 shows the outline of the experiment.

<table>
<thead>
<tr>
<th>Participants</th>
<th>The first test</th>
<th>The second test</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group 1</td>
<td>Direct test</td>
<td>Semi-direct test</td>
</tr>
<tr>
<td>Group 2</td>
<td>Semi-direct test</td>
<td>Direct test</td>
</tr>
</tbody>
</table>

The participants were informed of which stories they were supposed to read and retell beforehand. Therefore, some participants prepared for the
speaking test at home. However, they were not informed of the questions which they would be asked after retelling. The participants were not allowed to bring anything such as pencils, pens, or handouts during the tests. They were not allowed to write and they were told to retell orally.

In the direct test, the interviewer (the author) conducted a face-to-face interview with each test taker. The interviewer gave oral directions to the participants. In the semi-direct test, the participants recorded their performance on IC recorders following the directions written on a paper. The participants were not allowed to record again on the IC recorder.

The questions asked after retelling are as follows. The questions were used in both the direct test and the semi-direct test.

1) Did you like this story? If you like this story, tell me why. If you don't, why not?
2) Which character do you like the best in this story? Tell me the reason.

Questionnaire

To examine the reactions to the semi-direct test and the direct test, a three-part questionnaire was conducted. The first part aims to examine about the participants' affective reactions to each test. The items are as follows:

1) I got nervous during the test (nervousness).
2) I thought that the test was fair (the test fairness).
3) I thought the test was difficult (the test difficulty).
4) I thought that I had the favorableness for the test (the test favorableness).
5) I performed well (the test performance).
6) I thought the test was useful (the test usefulness).
7) I thought the test would make my English improved (English improvement).

The second part inquires about the skills and knowledge necessary for each speaking test; reading skill, speaking skill, communicative skill, pronunciation skill, language knowledge (grammar and vocabulary, etc.).

The third part inquires about the participants' preference of the two test formats. In the first and second part, the participants answered questions using a 5-point Likert scale ranging from 1 (strongly disagree) to 5 (strongly agree). In the third part, they chose either the direct test or the semi-direct test and wrote their opinions freely.
RESULT

Table 3 shows the results of the first questionnaire which aim to examine participants' affective reactions to each test.

* p < .05  ** p < .01

As shown in Table 3, the mean values of the semi-direct test are higher than those of the direct test with the exception of the mean value for measure of test difficulty. Significant differences between the direct test and the semi-direct test are found on nervousness (t (167) = -2.19, p = .03), the test difficulty (t (167) = -2.60, p = .01), the test favorableness (t (167) = 2.50, p = .013), and the test performance (t (167) = 2.91, p = .00). On the other hand, there are not significant differences on the test usefulness (t (167) = 0.52, p = .60) and the English improvement (t (167) = 1.22, p = .23).

</tbody>
</table>

Table 4 summarizes the results of the second part of the questionnaire, which inquires about the skills and knowledge necessary for each speaking test.
As for skills and knowledge necessary for speaking tests, there are not significant differences between the direct test and the semi-direct test. However, a significant difference is found on communicative skill \((t(167) = 2.81, p = .01)\). The participants felt that communicative skill was more required in the direct test.

Finally, the study asked the participants which test format they preferred. Table 5 shows the result.

<table>
<thead>
<tr>
<th>Testing format</th>
<th>n</th>
<th>%</th>
</tr>
</thead>
<tbody>
<tr>
<td>In favor of direct test</td>

<td>45.9</td>
</tr>
<tr>
<td>In favor of semi-direct test</td>
<td>17</td>
<td>20.0</td>
</tr>
<tr>
<td>No opinion about either testing format</td>
<td>29</td>
<td>34.1</td>
</tr>
</tbody>
</table>

The number in favor of the direct test (n=39 or 45.9%) greatly exceeds the number in favor of the semi-direct test (n=17 or 20.0%), which indicates that the results of this study also tends to follow the results drawn from most of the previous research.

However, we should take note that 29 participants or 34.1 % held no opinion about either testing format. In other words, about one-third of the participants do not show a particular preference in terms of the testing format.

Some of the test takers' comments which were in favor of the direct test are as follows:

- I felt more relieved to see the teacher's reaction.
- I felt more encouraged when I talked to the teacher even though I made mistakes.
- The teacher nodded during the test, which made me relieved.
- I enjoyed the speaking test more when I talked to someone who listened to me.
- I like talking to someone, not to an IC recorder.
- When I recorded on an IC recorder, I felt as if I read aloud to a machine.

These comments indicates that test-takers want to have face-to-face interactions with humans, which reflects real life communication.

On the other hand, some of the test takers' comments which were in favor of the semi-direct test are as follows:

- I spoke at my own pace.
- I got nervous in front of the teacher.
- I didn't get nervous because I carried the speaking test out by myself.

Some of neutral opinions are as follows:
Either speaking test was fine.
There were no differences between the two tests.
I got nervous in both tests.

DISCUSSION AND CONCLUSION

This study aims to investigate which speaking test format is preferable for test takers, a direct test and a semi-direct test. This study also aims to examine how the takers react to and perceive each of the test formats.

The analysis of study results found that the test takers preferred the direct test to the semi-direct test. This result tends to follow the same results indicated by most of the previous research. The reason why test takers are more positive toward a direct test is that test takers are more likely to have face-to-face interactions with humans, which reflects real life communication.

According to the Affective Filter Hypothesis proposed by Krashen (1985), the existence of learners' affective feelings influences learners' learning outcome. The affective filter is thought to impact upon language tests. In other words, the emotional reactions of test takers may influence their test results. Therefore, it is important to take note that different formats of speaking test may effect test takers' emotional reactions.

With the development of computer technology, semi-direct tests have become more popular. However, this study as well as most of the previous research found that test takers would view direct testing more favorably than semi-direct testing. If this is also true with the majority of test takers, test developers and teachers need to pay more attention to the test formats with the regard to the test takers' preference and keep in mind why they prefer the direct tests. It would be beneficial to test takers if test developers and teachers bear test takers' preference in mind when creating future tests.

This study employed the STST which was developed by Hirai & Koizumi (2009) as a speaking test. In both speaking tests, the participants thought that employing speaking tests was useful in learning, and that English would improve if they kept on taking such speaking tests. In other words, the participants showed a positive attitude toward the speaking tests. Therefore, in the future, we would like to investigate on the effect of using speaking test on teaching and learning.

Abstract

Academic-Community Partnerships to Promote Public Health in Rural Communities: Preliminary Findings from a New Public Health Program in a Midwestern University.

Authors: Anuli Njoku, DrPH, MPH, Fathima Wakeel, PhD, MPH, Michael Reger, PhD, MPH, Emmanuel Jadhav, DrPH, MHM, Margaret Wan, PhD, MSPH, MS, LLB

Objectives: 1) Describe the development of a new Public Health (PH) program at both the undergraduate and graduate levels at a rurally located university. 2) Share insights on the processes involved in fostering academic-community partnerships in order to increase awareness regarding both public health and health disparities. 3) Finally, to advance health education research and practice agendas, both at the university and within the community.

Methods: A new PH program was developed at Ferris State University in Big Rapids, Michigan. Five doctoral-prepared faculty from diverse cultural, professional, and research backgrounds were hired in August 2014 and charged with the development of the program. Over the course of one year, faculty developed the program goals for both a Bachelor of Science in Public Health (BSPH) and Master of Public Health (MPH), as well as learning outcomes and course curricula. The faculty also individually and collectively reached out to various academic and community members to initiate and develop academic-community partnerships, aiming to help maximize academic and community resources for shared learning, engagement and advancement of PH research and practice. Methods for the establishment of these partnerships included phone calls, face-to-face meetings, emails, attendance of community and academic events, tours of community facilities, event flyers, and in-class health promotion presentations.

Results: The PH faculty developed BSPH and MPH program learning outcomes as well as eight BSPH courses and two MPH courses in the Fall of 2014 and the Spring of 2015. Additionally, through collaboration with academic and community members, the faculty organized a plethora of health education activities in order to increase awareness regarding PH and health disparities, as well as to advance research and practice agendas within the university and community. These events included: 1) PH faculty participation at a Community Health Fair and other university and community networking events; 2) meetings with community healthcare providers and relevant stakeholders; 3) contact with community partners to secure internship opportunities for students; 4) participation on the executive board of a partnership between the university and a research institution; 5) collaboration with local health department staff to speak to PH students; 6) PH information sessions; and 7) health disparities research presentations and panel discussions.

Conclusion/Implications: The implications of the development of these PH programs as well as the community partnerships are still pending as the BSPH and MPH programs at Ferris State University are in the early stages. As the main purpose of public health is to improve the health and well-being of the population, it is the belief of the faculty that the partnerships formed with stakeholders in the community will prove to be vital to the success of the new program and eventually lead to measurable improvements in the health of the surrounding population over time.

Role-playing to prepare for home care nursing
–Student interests and learning–

Kyouko NAITOU¹, Sagami MITAMURA¹

Abstract

Through role-play practice, student interests and learning were examined. In the practice, which was a process that involved activities such as scenario examination, role-playing, and video recording, their creative power and ability to deepen their insight during the training were effectively developed. The role-playing made students aware of the unique aspects of home-visit nursing care. Furthermore, in order to take advantage in the home care nursing practicum, it is necessary to consider the practice configuration targeted learning point to another component of the role-play. In addition, the problem setting that a student can imagine the everyday life of the patient and the family and can think about a feeling is necessary.

Introduction

Japan’s population is aging at a rate unparalleled among countries. To respond to this situation, efforts to build community-based integrated care systems have begun. These efforts seek to move the venue of healthcare from hospitals to the home, and allow people to live in their communities in their characteristic ways their entire lives. Under such social circumstances, the new field of home care nursing was added to Japan’s nursing education curriculum in the 1997 academic year in order to foster nurses who can play active roles in their communities. Furthermore, because of the belief that the healthcare issues under the purview of home care nursing affect all people, in 2010 home care nursing was given the central position in the nursing education system as the subject integrating all nursing fields. Compared with conventional institution-based nursing, the concept of home care nursing emphasizes treating those under care as “consumers” rather than patients. It is anticipated that this approach will develop nurses who are provider of services that increase patients’ quality of life. We therefore investigated educational methods that can more effectively achieve the learning goals of home care nursing. One educational method adopted is role-play practice (RP), which seeks to deepen understanding by allowing students to experience, through simulations, nursing issues and being a nurse (Fujioka 2000). Its educational impact has been reported to include acceptance of others (Ooga 2009) and to be highly effective in enabling imagination of practical training and motivating students (Fujioka 2000). Understanding the characteristics of home care nurses (Uda 2011) and learning bedside manner (Totsuka 2009) have also been reported as effects of the use of RP in home care nursing education in Japan. However, all of these studies focused on the educational effects of training in schools. There are few studies of the educational effects of using
RP before training in clinical settings.

Thus, in this study we investigated the educational methods of RP that can be utilized for clinical training when RP is carried out before the practical training. The RP focused on home care situations encountered during the home care nursing practicum, which has a central place in the home care nursing practicum.

**Purpose of Research**

We sought to study RP teaching methods that can improve learning effectiveness in clinical training by elucidating the effects of home care RP on home care nursing practicum through a survey answered by students after they complete the practicum.

**Research Method**

2. Study period: May 2013 – February 2014
3. RP method

   Home care nursing RP was carried out as part of the first-semester home care nursing course for third-year students. The course is taken directly before students participate in the home care nursing practicum. The RP has the following three goals: (1) understand bedside manner and the necessary ways nurses and studies deal with patients and family members during a home care visit, (2) understand the importance of considering the feelings of care patients and family members, and (3) to imagine home care nursing situations. RP exercises began after the presentation of topics. Roles of the care patient, family members, the home care nurse, and nursing students were assigned, and scenarios that could be performed by each group composed of about seven or eight students for five to six minutes were examined. After several rounds of practice performances, each group’s RP was video-recorded. The entire class viewed the recorded RPs and exchanged views. The presented topics resemble the following:

   **Example of topic**

   The focus of the RP is an elderly care patient suffering permanent damage after a cerebral infarction. His blood pressure is unstable, and there is concern that he may develop difficulty walking. Because he lives with only his elderly wife, home care is a concern. The nurse and student arrive 10 minutes behind the appointed time for the home care visit.

4. Content of survey

   The survey was conducted using a self-administered questionnaire given after all students completed the home care nursing practicum. In the survey, the items “Strongest impressions left by RP”, “Differences between RP and practical training felt by students”, and “What you wish you had experienced before the practical training” asked for free response. The item “Change in awareness of practical training after RP” used a Likert scale for its response. Finally, the question “How was RP
useful for practical training?” was a multiple-choice question with eight answers to select from.

5. Method of analysis

Each free response was broken down into elemental topics; each elemental topic was considered a unit of response and recorded as such. Similar topics were grouped together into categories and examined. Topics were extracted from the textual responses and categorized by several instructors. For questions using the Likert scale or multiple choices, the responses were analyzed by simple tabulation.

6. Ethical considerations

We obtained approval from the research ethics committee of the institution to which we belong. Students were informed orally that cooperation with the survey was their free choice, that there is no disadvantage to not participating, and that the results of the survey may be presented at conferences with their responses anonymized. The survey questionnaire was given to students who agreed to participate in this study.

Results

Of the 132 students who enrolled in the home care nursing practicum, 101 agreed to participate in the study (76.5% response rate). Analysis was performed on their responses.

1. Strongest impressions left by RP

There are 121 free-response comments, of which 113 were analyzed as valid responses. By RP process, “Scenario Examination” had 21 comments, “Group Work” had 18, “Performance” had 30, “Presentation” had 12, and “Video Recording” had 32. “Video Recording” and “Performance” had the most comments. Of the 113 comments, not including “Video Recording” comments about feeling nervous, 89 comments were considered to pertain to students’ learning and concerns and were qualitatively analyzed. They were placed into five categories and ten subcategories (Table 1). In this paper, categories are represented by 【 】, subcategories by 〔 〕 and codes by <  >. (Table 1).

For the category 【Learning with Video Recording】 , the subcategory 〔Using appropriate language and awareness of actions〕 included <Being made aware again of the use of appropriate language and actions as a result of being recorded> and <Being able to view myself objectively as a result of being recorded>. For the category 【Learning from skills devised in performances】 , the subcategory 〔Understanding bedside manner in home care〕 included <Being aware of each action such as taking off shoes> and <I understood bedside manner is important>. Another subcategory, 〔Imagining the home care〕 included <I considered what I could do in the homes of actual care patients> and <It was easy to imagine during the practicum>. Codes such as <I learned to take into account the mental state of care patients> and <I learned what I should say> were included in the subcategory 〔I learned communication techniques〕. In the category 【Learning with Group Work】 , the subcategory 〔Learning effects of group cooperation〕 included <Creating in a group by having much discussion> and <Everyone could find good ways of doing things>. The subcategory 【Learning about human relationships】 included <Being involved with students I didn’t talk with>.
much before>. In the category 【The awareness from the Presentation】 , the subcategory 【Broadening perspectives】 included <I understood that each group’s performance was different and that there are various perspectives> and <I realized different things from how everyone looks at something>. The category 【Learning from skills devised for scenarios】 included the subcategory 【Skills to deal with feelings expressed by the patient and family members】 included <It was difficult to think about how to perform because I was supposed to express how a person thought and her behaviors and attitudes> and <I thought about the different feelings and actions of characters such as nurses, students, care patients, and family members>. The subcategory 【Skills devised deal with issues】 included <How to apologize when arriving late> and <Changing into different socks>.

2. Change in awareness of practical training after RP

Concerning practical training after experiencing RP, 69 (53.1%) students responded that “RP gave me confidence,” 57 students (43.8%) “There was no change,” and 4 students (3.1%) responded “I lost self-confidence.”

3. Differences between RP and practical training felt by students

There were 89 free-response comments. They were divided into six categories: 【Skills in home care nurses’ action and speech and responses】 , 【Extent of practical training that could be practiced】 , 【Diverse family structures and words and actions of family members】 , 【Differences in care patients state】 , 【Different living environments encountered during each visit】 . (Table 2).

For the category 【Skills in home care nurses’ action and speech and responses】 , the subcategory 【Skills in relating to nurses】 included <I explained the care patients’ conditions to the family in front of the patient> and <Nurses did not immediately provide guidance to care patients and family members, but instead considered together a solution plan and gave advice>. The subcategory 【Nurses’ ways of dealing with patients】 included <They entered into the room without reception from family members> and <I felt a relationship of trust from the sense of close distance between the patient and the nurse>. The subcategory 【Questions about basic nursing behavior】 included <Not changing socks during a home care visit> and <At first I didn’t wash my hands>. In the category 【Extent of practical training that could be practiced】 , the subcategory 【Students’ confusion】 included <I didn’t know my place as a student during home care visits> and <I felt more nervous when the situation was real and I could not skillfully talk with the care patient and family members>. The subcategory 【Limits of students’ involvement】 included <Students were not involved with patients much> and <Students almost never spoke>. Under the category 【Diverse family structures and words and actions of family members】 , the subcategory 【Reconfirmation of diverse family structures】 included <The care patient lived alone so there wasn’t a way for family members to respond> and <I did not talk much with family members>. The subcategory 【Family members’ warmth and worries】 included <I was welcomed more than I had expected> and <There were many questions from family members>. In the category 【Different living environments encountered during each visit】 , the subcategory 【Confirmation of environmental differences】 included <Residences were built in ways different from what I imaged>. The subcategory 【Reconfirmation
of individuality of provided nurses) included <Each family’s way of living differed more than imagined, and nursing needs to accommodate that>. In the category 【Differences in care patients state】 , the subcategory 【Diversity of Health condition】 included <There were many patients with a low level of independence> , The subcategory 【Difficulty of communication】 included <I was a little unsure about how to deal with someone who doesn’t speak and with small children>.

4. How was RP useful for practical training? (Table 3)

All subjects responded, and the number of responses per student was 3.12. The items “Bedside manner” (93 students; 70.5%), “Attitude as students” (76 student; 57.6%), and “Imagining home care” (75; 56.8%) were items said to be useful by more than 50 percent of the students. However, “How to communicate with care patients” was mentioned by only 44 students (33.3%) and “How to communicate with family members” was mentioned by 40 students (30.3%). For understanding feelings, RP was useful to less than 25 percent of the students: “Understanding the feelings of care patients” (31 students, 23.5%) and “Understanding the feelings of family members” (26 students, 19.7%).

5. What student wished they had experienced before the practical training

Students stated the necessity of learning etiquette and bedside manner they had not expected, such the proper way to respond when being served tea, basic nursing techniques, and how to communicate concerning topics such as life together with the care patient and family members.

Discussion

Student’s impression of RP for various processes

In students’ responses about what made an impression on them, in “Scenario Examination,” it was thinking about the different feelings and actions of nurses, students, care patients, and family members. For “Video Recording” and “Performance,” the students stated being conscientious about how to phrase sentences when communicating and about their actions, focusing on bedside manner, imagining home care that visualized the actual homes of care patients, and trying to be skillful about communication techniques in conversations that took the feelings of patients into consideration. These comments show that the students’ concerns were stimulated in each RP process, that the experiences of the students were consistent with the learning goals of RP that we expressed, and that RP became learning opportunities. For “Group Work” and “Presentations,” students reported that the effects of group learning, such as everyone participating and creating ideas in the group. Also reported was the broadening of perspective by seeing different performances by other groups. Reports of the learning effects of RP to date have stated that active exchanges between members produce beneficial relationships of mutually dependence from cooperative learning (Nakai 2014), and RP presentations enable one to realize views and ways of thinking different from one’s own and make clear one’s own thinking, and provide opportunities to discover clues in resolving what one could not solve by oneself (Takai 2005).
Thus, we believe we could obtain the effects of fostering the realization of the necessity of thinking about support methods by imagining the home care situation and examining the characteristics of patients, realizing differences in thinking between groups, and fostering creativity, such as by further broadening one’s perspective. Therefore, because each of the processes carried out in RP includes important learning elements, in RP we must focus on abilities strengthened by each of the elements, and present construction of topics that narrow down learning points.

Effect of RP on home care nursing practicum

In this study, the majority of the studies responded that RP was useful for the nursing practicum in the areas of “bedside manner,” “attitude as student,” and “imagining the visit.” These results were similar to those presented by a previous study. By viewing different performances by each group, students had the opportunity to experience simulations on various ways of using appropriate language and acting, on attitudes, and on characteristics of the visit. Bedside manner and attitude as a student are easy to judge visually. We can surmise that because it is relatively easier for those areas to be treated realistically, RP of those areas serve as an educational tool that is useful for practicums. After the RP, the majority of students replied that they had confidence in the participating in the practicum. Thus we believe that participation in RP led to confidence in participating in the practicum.

Meanwhile concerning “How to communicate with care patients and family members” and “Understanding the feelings of care patients and family members,” 20 to 30 percent of students, a small amount, thought RP was useful for the practicum. When examining RP scenarios, the students sought to perform characters while considering the feelings and actions of each member in the scenario. In their performances (including when viewed from the recorded videos), it could be seen that they attempted communication that took into consideration the care patients’ state of mind. We believe that their performances showed that the students sought to discern the feelings of the patients and their family members and attempted communication that took into account their partners. However, for such learning to be useful in practical training, it is necessary to further develop the ability to think on one’s own about the concerns of care patients and family members they encounter during practical training. Therefore, we believe there is a need for measures such as creating educational materials that allow students to further study the feelings of patients and family members and adding group explanation about the performance to the presentations.

Also, students felt that there were differences between the RP and clinical training in a wide range of areas. These include how home care nurses deal with and respond to patients, the actual involvement of students, family conditions and reactions, the diversity of care patients, and differences in family environment. For students with limited life experience who experience home care nursing for the first time, they must perceive and imagine the conditions of the patient at the place of visit and the environment from the content of what they learn in classes. Therefore, what are required are instructional materials that set topics to enable one to imagine the daily life of families (care givers) in RP and recall conditions that do not deviate from the onsite conditions. Also, we
believe that having discussions about daily activities as presented by students and adding explanations by instructors about the diversity of patients and family members could close the gap between RP and clinical training that students feel.

**Conclusion**

1. The RP processes, namely, scenario examination, role-playing, video recording, group work, and presentation, provide diverse learning opportunities based on home care nursing care scenarios. In particular, students were able to think of methods for assistance that are based on an understanding of the patient’s condition, to consider differing opinions within a group setting, and to reflect on their own behavior and performance from a much wider perspective. This indicates that RP should be focused on specific abilities that are reinforced by each part of the process, and specific issues based on particular points of learning should be presented.

2. Since realistic experiences during the home care nursing care practicum enable students to develop a proactive attitude during clinical training, it would be effective to set RP issues that enable students to conceptualize the daily life of the family (caregiver).

3. There is a need to evaluate components of the RP training program, such as by including materials that allow students to understand patients and family members better and providing supplementary explanation from instructors about their diversity and home-care environments, in order to apply what students learn through RP in clinical training. Further, in order to reinforce the effects of learning, it is important to nurture the students’ ability to think on their own and to develop sensitivity towards patients and families they will meet during the training.

Effectiveness of holding student group conferences with process records made by trainees during home healthcare field work

b. topic area of the submission

Other Areas of Education (Nursing Education)

c. presentation format

Poster Session

d. Abstract

Using process records made during home healthcare field work as a resource, students reflected on their experiences as a group. Through analysis of revised material after this reflection, the students realized the importance of non-verbal communication, and, in group discussion, they were able to understand how each other perceived what was spoken to them during the field work differently, effectively fostering their communication abilities and showing the program to be a success.

**Ways to Encourage Students to be Interesting in Learning**

**Description of presentation**: students need to be interesting in learning to learn better that impact their achievement. My research question is what are teachers’ experiences of applying strategies that would encourage students to be interesting in learning?

**Research Question**

My research question is what are teachers’ experiences of applying strategies that could encourage students to be interesting in learning?
I arrive to my question when I observe KG classes and note that students on first class were more interested to learn and more active than students on the second class.

**Qualitative Approach**

I will use Case study. I chose this approach because I want to do a deep examination and understanding of teachers' experiences, teachers who teach in K-G class in elementary school at USA, by applying strategies that could encourage student to be interested in learning.

**Research methods**

I will use the observation, deep face-to-face semi-structured interview, notes to collect data and do a deep Investigation.

**Rigor and Trustworthiness, ethic**

Use triangulation, participant checks, reflexivity, and notes will enhance rigor and Trustworthiness. The participant will know about all their rights before start study and the study will not harm them..

**Data Analysis**

I will use the open coding, themes, axial coding, and iterative coding

Nursing Development in Saudi Arabia

Saudi Arabia is a country that unified as a kingdom in 1932 (Tumulty, 2001). Prior to the discovery of oil, the economy of the country was limited. However, when the oil prospecting and exporting began the status of Saudi Arabia wealth changed dramatically. Investment in human capital has become a top priority for the Saudi government to ensure lasting growth and a knowledge-based economy (Almutari et al., 2014). The healthcare system has gone through significant improvement in a short span of time because of the need for healthcare among the population. Since then, the demand for health care increased in particular the need of professional nurses.

The purpose of this paper is to clarify the systems of gender inequality in Saudi Arabian society and to examine their impact on nursing profession development. I used Youngman’s Framework for social inequality and Education (2003).

**Timeline of Nursing in Saudi Arabia**

Nursing education started in 1948 by an American nurse who gave basic nursing care classes for five males (Adbul-Aziz, 1956). “From this small beginning, nursing in Saudi Arabia really began to grow” (Para. 4) stated by Ibrahim Abdul-Aziz one of the first nurses in Saudi Arabia. The first official training program was when the Ministry of Health (MOH) collaborated with the World Health Organization (WHO) in 1958. Only male students were registered for the program, as women were unable to enroll in any educational institution at that time. After opening the first female nursing school in 1962, the Saudi society viewed nursing as a female-identified profession. For that, the Ministry of Education (MOE) introduced the first Bachelors, Master and PhD programs exclusively for women. The graduate programs admission were limited for females only, but the two years diploma degrees were still offered for males and
females. In 2004, many nursing Bachelor degrees for men were offered by the MOE (Tumulty, 2001; Mebrouk et al., 2008; Jradi et al., 2013; Almutari et al., 2014).

**Historical Development of Gender Relation**

Saudi Arabia is a Muslim country. Islam in Saudi is not only a religious ideology, it guides the moral law of the country and works as a social system embracing every aspect of peoples’ lives. Islam does not prohibit the mixing between men and women as long there is no sexual harassment. There is no evidence from the holy Quran that enforces the segregation of sexes. However, gender separation is socially acceptable in Saudi Arabia (Baki, 2004). The Saudi population believes that the traditions of veiling, seclusion and the strict gender segregation of men and women ensures the continuation of the Muslims’ value system.

The unique cultural history of Saudi Arabia has a great impact affecting the gender equality in the society. In a male-dominated and tribal community the social norms and conservative beliefs have a powerful effect on people’s lives. Indeed, widespread cultural preference for sons is evident in Saudi society, as males are dependable and they carry on their father’s names and legacy. In fact, Saudi Arabian law requires females to have a first degree relative male guardian escort “mahram” who is responsible for all the decisions they make (Miller-Rosses et al., 2006).

**Impact on Education**

In Islam women have the right to equal access to employment and education, although their first priority should be that of the family. Traditional beliefs about gender roles in Saudi Arabia, have shaped and reflect women’s lives. Women’s most important role, according to the society, is a homemaker and mother, while the man’s responsibility is to support and protect the wife and the family (Miller-Rosses et al., 2006). Therefore, Saudi families support male
education more than females. In fact, since the establishment of the MOE in 1954, the education was offered to males only and there were no schools offering education for females until 1960.

The ramifications of the male guardianship system and sex segregation are women unable to seek education without the male relative’s permission (Baki, 2004). This restriction strongly impacts the education of Saudis women. Sex segregation undermines women's right to equality in education, especially when female university and professors are often relegated to unequal facilities with unequal academic opportunities.

The education system reflects and perpetuates women’s subordinate status, while at the same time offering opportunities to challenge this subordinate status. Girls are encouraged to study languages, secretarial skills and arts, while boys are directed toward engineering, physics, chemistry or military studies. The different qualification mean different opportunities in work, which lead, either by force or by system, to gender inequality. Women’s education was perceived as a social revolution encouraging women to leave their homes to go to school on a daily basis; a change which might challenge the prevailing tradition (Elamin et al., 2010).

**How gender inequality challenged through institutions and public practices?**

Traditionally, based on society values the principal role of Saudi women have been as caregivers and housewives. Saudi women have undertaken employment only recently with limited relaxation of cultural beliefs. Women usually engaged in sectors that were woman’s domain, such as female teaching (Miller-Rosses et al., 2006). However, nursing is not considered to be a traditional occupation for women. The values of gender segregation affect the situation of the nursing profession in Saudi Arabia. The problem that merely related to it is whether female nurses can provide care for male patients (Almutari et al., 2014).
Saudi Arabia is a conservative society with strong cultural tradition that severely restricts the participation of women in occupations outside the home. Besides, it is socially unacceptable for women to work late at night. Based on social norms, nursing suffers from a poor image in Saudi society as it is a mixed-gender work environment.

Subject to the community and work pressure, Saudi female nurses often request to work at a day-shift area such as an outpatient clinic that easily integrate with their family responsibilities and are socially more accepted (Felemban et al., 2014). Furthermore, many qualified female Saudi nurses prefer to stay home or take a job position that is not related to nursing. As a result, the demand for nurses in Saudi Arabia increases and the Ministry of Health (MOH) is challenged with growing health care needs and diminishing numbers of nurses.

How gender relations interact with ethnic relation?

The nursing profession in Saudi Arabia is a less desirable career choice for Saudi nationalities compared to other professions (Felemban et al., 2014). The lack of interest in nursing is linked to the prevailing stereotypical images, beliefs, ideas and impressions people have of nurses and the nursing career. Nursing in Saudi Arabia is perceived as an unskilled, low-paid job and often ranks lower than other healthcare professions (Almutari et al., 2014). The lack of knowledge and recognition for nurses’ job is mainly affected by the unhealthy media portrayal of the profession. The perception of nursing work as being similar to that of maids’ was attributed to the mass employment of Asian workers as domestic maids and as nurses.

A study by El-Haddad (2006) stated that the negative public attitude toward nursing contributing to the limited number of Qatari and Emirati nurses respectively. Sharing the same socio-cultural beliefs and coming from the same geographical area, the Arabian Gulf, I would argue that Saudi people have similar perceptions of nursing.
The growing economy and political openness have brought a massive influx of an international workforce with diverse social and cultural backgrounds. Saudi Arabia has relied exclusively on recruiting expatriate registered nurses to serve in the healthcare system (Felemban et al., 2014). They form the large proportion of nursing staff in the Saudi healthcare facilities. Expatriate nurses working in Saudi Arabia have different cultural values, beliefs, and attitudes. Foreign nurses are attracted by the free tax salaries, accommodation and annual vocation with round trip ticket to their home countries.

However, as an outcome of the Gulf War in 1991 (Tumulty, 2001), the repeated terrorist activities since 1995 and the events of September 11th, 2001, recruitment and retention of international qualified nurses has become increasingly difficult. Simultaneously, the global nursing shortage and the political situation in the Middle East continues to pose major challenges for international recruitment particularly from underdeveloped countries.

**What are the consequences of ethnic or racial inequality?**

The salary of nurses in Saudi Arabia varies depending on the Health institution budget and on the country of origin. “The only determining factor in the salary is the passport which the employee is applying for the job with. In fact, not even nationality matters” (Matar, 2012). Saudi Arabia does not pay base wages equally across the board. Base wages are based on the agreement with each country depending on the living cost standards; in other words, cost of living and value of money in each country. Mainly the U.S. and Canadian passport holders get the highest salary and the lowest paid goes to the Asian passport holders.

The government did not develop ethical policies for recruitment and retention to avoid any abuse for nurses who come from poor countries. Nurses travelling from their countries seeking better job opportunities could be abused by low salaries and poor career structure.
Contributing to the Kingdom’s goal of letting Saudi citizen take over the workforce, the government established ‘Saudization Program’ guides qualified Saudis into professional fields (Tumulty, 2001). As a reward for the Saudi men and women, the Minister of Labor (MOL) issued a decision setting the minimum wage of SR 3,000 for Saudis in all public and private sectors. The salary system in Saudi Arabia is unfair. Such a system created inequality and does not provide justice for the local or foreign nurses. This issue must be addressed to ensure equality.

Conclusion

Saudi Arabia has emerged from being an underdeveloped country to one of the wealthiest nations in the world. A tremendous development commenced. The development of industry, education and healthcare services quickly brought the country towards the standard of industrial countries. Despite the advancements in the healthcare system, the nursing profession is still facing a number of challenges in terms of education, practice and workforce.

Women’s education was once perceived as a social revolution challenging the prevailing tradition in Saudi Arabia. Nevertheless, that has gradually transformed in favor of women. The Saudi government is achieving an outstanding advancement in the state of gender inequality in education and employment. Saudi Arabia set a strategic plan aiming to improve the education opportunities for women to boost them in the workplace. However, that raises the question: is the government relaxing its social norms and breaking down barriers for socio-economic reasons, or are the changes related to the international commitment to woman’s right?

   In the United States, “up to 30 million people of all ages and genders suffer from an eating disorder (anorexia, bulimia, and binge eating disorder)” and they are reported to “…have the highest mortality rate of any mental illness,” according to Anad.org (2015). They pose serious systemic health consequences in individuals and can affect an individual’s physical, mental, emotional and social well-being. What has been supported in the literature is that adolescence marks a critical developmental period in the understanding of eating pathology. There is a multitude of studies that focus on eating disorders in the mainstream culture however what remains to be fully understood is the issue of eating disorders in the African American population and their particular impression on African American girls as empirical studies are limited and antecedents may vary. Because race and ethnicity may play powerful roles within the context of eating disorder development in ethnic cultures, this paper seeks to explore the current research of this phenomenon in African American adolescents and identify the socio-cultural variables and other risk factors that may possibly contribute to this affliction.
Abstract

Numerous researchers and educators worldwide have supported the notion of school-based enhancement of social and emotional development of all children throughout their school years. This has resulted in the emergence of a great deal of school-based social and emotional learning (SEL) initiatives around the world. The majority of these SEL programs are based on the Collaborative for Academic, Social, and Emotional Learning (CASEL) conceptual framework that comprises the following five sets of social and emotional competencies: self-awareness, self-management, responsible decision making, social awareness and relationship skills. Whilst the CASEL framework is the most globally recognized conceptualization for raising children’s social and emotional skills, there is another framework with an emphasis on SEL which is worthy of consideration, and that is the Head Start Child Development and the Early Learning Framework. The Head Start Framework addresses not only children’s social and emotional competences, but also includes individual’s distinct personal features, such as self-concept and self-efficacy. In light of the current research evidence, this presentation aims to propose an expansion of the existing CASEL framework by taking into consideration each child’s social, emotional and personal attributes.

Abstract and/or full paper

Families are the hidden victims of drug addiction suffered by a family member. The disease affects all members of a family as the family becomes organized by their behavioral and emotional reactions around the drug addict family member. The drug addiction becomes the central organizing principle of the family system, controlling and dictating family members’ assigned family rules and family roles. The aims of this two-phase presentation are to provide workshop participants with a practical understanding of the impact of drug addiction on the family and to conduct group interactive activities (through Structural Family Therapy) to demonstrate two family interventions for working with families.

This presentation provides both a conceptual model (Phase I) and skills approach model (Phase II) to understanding the impact drug addiction has on families and family systems. The presentation will be conducted in two phases: During Phase I, workshop participants will be provided with an understanding of the theoretical overview and characteristics associated with drug addiction in the family. During Phase II, the presenter will demonstrate the use of two family interventions (through Structural Family Therapy) used to treat families impacted by drug addiction.
The first intervention will be the use of a modeled initial session to highlight the techniques and skills in order to conduct an assessment, address typical issues that family members bring into therapy as a result of the impact of addiction on their family and help family members and the addict engage in reparative work on their relationship. Participants will have an opportunity to practice and experience some of the interventions introduced in this presentation.
Title of the submission;

*An Analysis of the Sex Role Traits and Changes in Korean Children*

Topic area of the submission; **Elementary Education**

Presentation format: **Poster Session**

Description of the presentation;

*Korean had stereo type of sex role for a long time because of mono-culture. But nowadays, Korea has changed into multi-cultural society rapidly. This study investigated the change and traits of sex role which are associated with development in Korean children.*

Paper author(s);

- **Hyunwook Kim. Ph.D**

- Sangji University (124, Sangjidae-gil, Wonju-si, Kangwon, 220-702, Republic of Korea)
- E-mail: tasalee68@gmail.com
**The aims.** There is a great deal of information available about the development of sex role concepts and identity in youth, few investigations have extended to sex role developmental changes. This study investigates the changes of sex role which are associated with development in Korean children.

**Subjects and Instrument.** Subjects for this study consisted of 42 elementary school children (1st, 2nd grade) and 32 nursery school children (5-6 years old) who live in GyeongGi and ChungBuk provinces. Bem(1974) developed the Bem Sex Role Inventory as a method of assessing a person's sex role identity. The inventory consists of 10 masculine adjectives, 10 feminine adjectives, and 10 neutral adjectives, each of which is rated on a scale of 1 to 7 (from never or almost never true to always or almost always true), reflecting each of these adjectives is characteristic of how the subject feels about himself or herself.

**Result and Discussion.** There were significant differences between the gender groups. The male children means (5.13) were higher than female children means (2.90) in masculine aspect and the difference has significance, t\(_{(97)}\)=11.98, p< .001. The female children means(5.65) were higher than male children means(2.67) in feminine aspect and the difference has significance, t\(_{(97)}\)=-15.54, p< .001. There was a significant difference between the age groups. Especially, result shows the significant difference between 5 year old children and 6 year old children for the neutral scores, F\(_{(3, 95)}\)= 5.313, p< .01. Younger children have more neutral tendency than older children. Traditional sex role orientation is based on the premise that family responsibility is a woman’s first priority. Younger children with working parents should be less sex role stereotyped, since these mothers serve as models who are themselves less stereotyped.
A. Title: A Study on Korean Children’s Mental Model of Media Environment and the Media Use

B. Topic area of the submission: Other areas of education

C. Representation format: Paper Session

D. Description: This paper shows Korean children’s mental model of media environment and the media use. For this, this study conducted several qualitative methods with 7 elementary school students. With the results, some educational implications were suggested.

E. Paper author(s):

Ran Lee
Department of Child and adolescents’ education and psychology
Sungkyunkwan University
Iran370@hanmail.net

Eunja Hyun
Department of Child and adolescents’ education and psychology
Sungkyunkwan University
hyunej1@skku.edu
The purpose of this study is to analyze Korean children’s mental model of media environment and the media use under the hypothesis that the children’s mental model on media strongly affects children’s practical media use. For this purpose, seven Korean parents of fourth-graders sampled in elementary schools were interviewed with four activities such as a word-association experiment, a sentence completion task, picture drawing and an in-depth interview. A qualitative analysis on the data collected from these activities above shows that firstly, the children possess a positive media mental model in which there are competence, usability, and pleasure of communication while they have a sense of fear about addiction as well. Secondly, the children show an ambivalent understanding on media use in terms of the negative and positive effects and long for a way to control the strong desire for the excessive use. Another finding is the fact that the Korean children understand digital media as a representation of both connection and disconnection with others. Also, the children tend to recognize media as a kind of cause of conflict and as a place for reconciliation as well. Finally, it is showed that if modern media includes books, they would better take such books as an alternative rather than electronic media. Based on these findings, some educational implications are provided based on Meyrowitz(1998; 1999)”s three perspectives on media.

Keyword: media mental model, media environment, children’s media use, qualitative analysis.

6. Abstract and/or full paper.
   State authorization is a recipe of equal parts. Part 1: understanding state regulations. Part 2: understanding your institution’s out-of-state footprint. One without the other is a map with no legend. The ability to know the location of your students and track when they move or go to another state to complete a portion of their studies is not an easy task. When the option of tagging students ears with implantable tracking devices is an unacceptable practice, alternative options must be explored. In this case study of New York University, we will explore why knowing your institution’s footprint is important, how to get a handle on it, best practices on the initial ‘mapping’ of your institution and maintenance tools for a well-kept institutional footprint map. NYU’s Office of Academic Program Review has successfully implemented three similar systems to track where their distance education students are located and where their traditional students are physically going to complete non-classroom experiences like internships, clinicals, etc. The impermanent landscapes of regulatory policies related to state authorization compliance make tracking where students are and what they are doing more important than such tracking has ever been before.
1. **Title of the submission:** Lessons learned: Connecting the arts with agriculture to reach and teach across the curriculum in grades 3 through 5
2. **Name of the author:** Dr. Browning Neddeau, M.A., Ed.D.
3. **Affiliation of the author:** California State University, Monterey Bay
4. **Address of the author:** 100 Campus Center, Seaside, CA 93955-8001
5. **Email address of the author:** bneddeau@csumb.edu
6. **Abstract and/or full paper:** see below

**Abstract**

As states adopt the Common Core State Standards in English Language Arts and Mathematics, pedagogical shifts must be made in K-12 classrooms. The pedagogical shifts provide teachers an opportunity to embrace creativity in the curriculum in new and innovative ways. The marriage of the arts and agriculture permits teachers to reach across the curriculum to engage students in meaningful learning experiences. Using the Studio Habits of Mind as the theoretical underpinning, the aim of the workshop is to provide teachers with field-tested, Common Core State Standards-aligned lessons that can be used in the classroom. These lessons promote the Four Cs of the standards (i.e., collaboration, communication, critical thinking, and creativity/innovation) through integration of the arts and agriculture in grades 3 through 5. Findings from the field tests suggest an increase in student interest and a nonthreatening way to engage English learners in text-dependent inquiries. In the workshop, participants will engage in the field-tested lessons.
Cross-Cultural Experiential Learning Excursion: The story of Awakening and Awareness: A Case Study

Article title:

Cross-Cultural Experiential Learning Excursion: How Experiences Influence Learning and Creates Awareness: A Phenomenological Study,

Author Information:

Dr. Gary Cheeseman, Associate Professor
The University of South Dakota,
School of Education
Division of Curriculum and Instruction
414 East Clark Street
Vermillion, SD 57069

Author Biography:

Dr. Gary W. Cheeseman is an Associate Professor in the Division of Curriculum and Instruction, within the School of Education, at The University of South Dakota. Dr. Cheeseman specializes in American Indian Education, Critical and Diverse Pedagogies and Storytelling. Dr. Cheeseman is also the founder and Curator of the South Dakota Storytelling and Critical Pedagogy Resource Center.

Abstract:

Despite the success of some universities many are still struggling to identify the characteristics of a healthy diversified campus as evidenced by the constant scrutiny of higher education accreditation bodies. The scrutiny stems from a wide range of issues including: aspects of institutional life, student enrollment and retention, faculty engagement, curriculum development and institutional outcomes. Perhaps the most important challenge facing many universities is the need to improve the effectiveness of their diversity initiatives. In fact, many universities are feeling a heightened sense of urgency to improve their initiatives as well as generate positive diversity outcomes. The Cross-Cultural Experiential Learning Excursion (C-CELE) is not an initiative designed to improve student recruitment; it is an initiative that provides a profound experience that places agents of change throughout the institution and around key faculties.

Keywords

Diversity, Experiential Learning, Pedagogy, Higher Education, Diversity Initiatives, Education, Inclusivity
Introduction

There is a broad assumption that heightened levels of awareness might perpetuate cultural understanding across a university campus; however, many educational institutions still struggle with the diversity goals of higher education accreditation bodies and governmental policy that advocates change toward more inclusive environments (Boyd & Owens, 2012).

American colleges and universities ought to be multilayered culturally sophisticated institutions that propagate critical thought and emotional reflection knowing that critical thought and emotional reflection will lead to positive relationships and enhanced awareness (Antonio et al., 2004) and that enhanced awareness might lead to change.

The assumption that drove this study is that critical thought and emotional reflection within the larger context of experiential learning might influence the establishment and maintenance of positive relationships and lead to increased awareness between diverse people at the university.

Unfortunately critical thought and emotional reflection may not always translate into positive relationships across campus, but it does challenge traditional assumptions by creating a learning community that fosters discourse (Giroux, 2003). Consequently universities ought to invest in something that creates discourse.

The question that encouraged this study is, “Can a three day Cross-Cultural Experiential Learning Excursion (C-CELE), focused on American Indian culture,
challenge traditional assumptions and help inspire the cultural awareness of its participants?” In addition, “what happens to self in the context of increased awareness?”

The researcher gathered formal data from 2 focus groups, conversations with participants and informal data from question and answer periods and classroom discussion. Feedback was collected, analyzed, coded, categorized and put into a comprehensive narrative that could become part of a larger body of research that might creatively enhance cultural awareness.

**Cross-Cultural Experiential Learning Excursion**

Participants volunteered to partake in a 3-day, facilitator led bus excursion (rolling classroom) through American Indian reservations and other historically, culturally, politically, and spiritually significant sites in South Dakota, Nebraska and Wyoming. The C-CELE was designed to intellectually, emotionally and spiritually challenge participants by exposing them to some of the complicated realizations of American Indian culture and circumstance. Participants were asked to gauge their levels of awareness when they started the excursion, compare it with their levels of awareness at various points during the C-CELE, and report on the findings through focus group discussions that were held during the C-CELE.

The C-CELE was designed to focus strictly on building awareness. An important objective was to avoid having the C-CELE devolve into an anthropological fishbowl thus; participants were constantly reminded to utilize experiential learning techniques, critical thinking and reflective thought to foster transformative learning (Duffy & Jonassen, 1992).
Facilitator

The facilitator was acutely aware of the C-CELE’s sensitive nature. He was not an “Indian guru” but a culturally traditional Native man who teaches a variety of American Indian and Social Justice courses using experiential, critical and Indigenous pedagogies.

A successful learning experience was contingent on the facilitator’s ability to effectively transform experience using diverse pedagogies and relevant content (Atkinson & Murrell, 1988; Itin, 1999; Kayes, 2002; Kolb, 1984; Piaget, 1962; Stutsky & Laschinger, 1999). The facilitator consistently used informal assessment techniques to gather the data necessary in understanding the learning challenges of the participants. The feedback allowed the participants and facilitator to collaborate in the creation of a communicative process that enhanced understanding and the foundation of a critical learning environment.

It was the facilitator’s responsibility to encourage the participants to think critically about their dissonance and other emotional states of being. The facilitator needed the participants to “think about what they were thinking about” and then ask themselves “why am I thinking this way.”

Literature review

Diversity is complex and defining it is challenging. This study broadly defined and based its definition on the critical thinking theories rooted in the concepts of social equality. A broad definition of diversity is necessary when teaching about cultural difference because it ought to allow for the explorative examination of inequality, in
depth discussion, and multiple perspectives. This definition is consistent with educational definitions found in several similar studies (Bowen & Hackett, 2010; Watts, 2010).

Campus diversity enhances student success (Jayakumar, 2008) and disseminates cultural engagement and critical thought by challenging people to move beyond cultural isolation (Jarvis, 2006). In short, educational diversification is designed to perpetuate a philosophy of equal opportunity (Antonio, Chang, Hakuta, Kenny, Levin, & Milem, 2004; Bourdieu, 1999).

A well-documented higher education objective is to create a critical mass of underrepresented people to attain and retain a healthy interchange of ideas (Smith, 2009) that ensure the civic mission of the country (Brown & Bell, 2008), an objective that many campuses are unable to achieve (Solorzano, Ceja, & Yosso, 2000). Consequently, many diverse students, faculty and staff find themselves in an unbearable environment filled with social alienation, academic disengagement and self-doubt that could lead to poor performance (Giroux, 2003).

There have been many attempts to use a variety of techniques to diversify colleges and universities in the United States (Laird, Engberg, & Hurtado, 2005). Some attempts have been interactive, others comprehensive, and others critically reflective (LaNasa, et al., 2007). Interactive initiatives occasionally referred to as “low hanging fruit” are (Nelson- Lairad, 2005) culturally scripted informational, academic and social events designed to congregate culturally diverse people. They are generally well suited for settings where people work with others of even standing (Antonio, 2001; Bocian, 1997).
A second more comprehensive level of diversity initiative introduces students to social actualities such as privilege, power, empathy and equality (Brooks & Ward, 2007; Delgado & Stefancic, 2001; Hytten, & Warren, J., 2003). This level could incite higher levels of cognitive dissonance because it address sensitive issues that assign culpability. Educators at this level may encounter complex classroom situations, guilt and cognitive dissonance (Hytten, & Warren, J., 2003). A third level, critical reflection, helps students recognize the divergent relationship between privilege and underrepresentation by illuminating the signs, symbols and processes associated with the dominions of oppression. Critical reflection enables students the opportunity to test and apply theoretical perspectives that scrutinize those dominions (Wenger, 1998) by exposing the inequitable aspects of the student’s own cultural icons. Students might gain a deeper understanding of how oppression affects the disenfranchised across society in a variety of ways.

**Learning Through Experience**

The supporting assumptions of this study are that people learn better from experience and that teachers ought to create an environment in which better learning can occur (Dewey, 1938; Wurdinger, 2005).

Experiential learning is rooted in the discipline of social psychology and the theories of experiential philosophy and cognitive pragmatism. This study emphasized the theoretical constructs of Joplin (2008) and Kolb (1984), both of whom believe that much of what we learn occurs through environmental change. Both Joplin, (2008) and Kolb
Cross-Cultural Experiential Learning Excursion: The story of Awakening and Awareness: A Case Study

(1984) argue that experiential learning is about using the physical presence to holistically enhance the learning process and recognize the cognitive process of transforming experience into knowledge.

The transformation of experience into knowledge is an important part of understanding and doing anything well. Experiential learning is pragmatic in nature and a necessary component of the learning process (Kolb, et al., 2007). Kolb (1984) described experiential learning as a series of steps within a process that ultimately forms a learning cycle and that learners can enter the cycle at any step. Kolb (1984) broke down the steps into two paradigms. Kolb called the first paradigm concrete experience and abstract conceptualization, which occurs after learners understand the experience. Kolb (1984) called the Second paradigm reflective observation and active experimentation, which enables the learner to convert an experience into knowledge.

Experiential learning, in its most basic form is described in two ways. The first is informal and the other is when the learner is formally exposed to a particular set of circumstances. The second type of experiential learning is that in which the C-CELE is patterned. However both are present and allowed to flourish.

Experiential learning is cumulative and over time allows for enhanced interaction and reflective understanding (Rea, 2006). In addition research shows that experiential learning enhances cognitive recall (Vygotsky, 1978), fosters powerful learning transmissions (Piaget, 1962) and inspires reflection and peer-to-peer communication, something often missing within the classroom. In other words, experiential learning allows for the formulation of one’s own story.
Storytelling

Stories allow people to awaken their natural curiosity and desire for information and experience personal images, descriptions and feelings. Stories provide an opportunity to build personal relationships across diverse domains and to build and retain the meaning of community, truth and purpose. Stories are universally told and allow access to the future and the past as they assist in the process of enjoying life.

In this study the researcher wanted to reveal the true essence of how the participants felt throughout the C-CELE. The qualitative nature of storytelling allows for opportunities to articulate sophisticated interpretations of experiential events in personal ways.

Qualitative Analysis

Storytelling is closely associated with the theories of qualitative research. The theoretical perspectives associated with qualitative research are: Constructivist, Critical, Post-positivist, Postmodern and Feminism (Creswell, 2008) all of which examine the human experience through indiscriminate, subjective, multifaceted methods of analysis (Borbasi and Jackson 2012); all of which extract data from the human experience as it is articulated through story. Qualitative analysis is behavior based and supports human understanding (Borbasi and Jackson 2012) by producing data that helps understand the complexities of diversity through discussion. Qualitative analysis does not over simplify or diminish data into a number (Creswell, 2008). Within this study the researcher used
Cross-Cultural Experiential Learning Excursion: The story of Awakening and Awareness: A Case Study

qualitative exploration to follow a subjective pathway (storytelling) through a particular methodology (case study) (Creswell, 2008).

Case Study

The researcher used a “Social Case Study” method to guide the research process. A case study refers to the collection of detailed information (Creswell, 2008) in this case the study of data extracted from a small group of people that participated in a diversity initiative. This case study looked closely at conclusions that only apply to a specific context; in this case did participation in the C-CELE increase awareness. This research did not concentrate on the discovery of a comprehensive actuality and it was not seeking to discover cause-effect relationships. This study was designed to formulate an explorative description of heightened awareness.

Case studies are ideal when the researcher is asking questions that cannot be explained by a chart or table. It is also preferred when the researcher’s focus is within the context of real life. Case studies use inductive logic and require a question that seeks out a holistic interpretation of a particular event or condition.

Research Design

Participants

This study consisted of 14 female and 10 male participants. Of the 14 females; 7 had terminal degrees, 2 were master students and two had undergraduate degrees. Of the females with terminal degrees; 3 were professors, 2 were librarians and 2 were university administrators. Of the 10 males 7 had terminal degrees; 2 had master degrees, and 1 had
Cross-Cultural Experiential Learning Excursion: The story of Awakening and Awareness: A Case Study

an undergraduate degree. Of the 7 males with terminal degrees, 4 were professors and 3 were administrators. The average female age was 39 with an average 8 year higher education tenure. The average male age was 40 with an average 13 year higher education tenure. Of the female participants 13 identified as “Caucasian” and 1 as African American. Of the 10 male participants; 7 identified as “Caucasian,” 1 as African, one as African American, and 1 as Latina.

The questions were designed to extract the profound meaning of the participant’s experiences. The researcher was interested in particular comments that might signify changes in opinion or challenges to traditional beliefs.

Data collection questions

The following are the questions and statements used within the focus groups: 1) Speak about any aspect of the excursion that may have physically, intellectually, emotionally, or spiritually stimulated you either negatively or positively. 2) Explain why you may or may not have been stimulated by particular events. 3) Describe the educational value of the excursion. 4) Speak about your own personal learning experiences. 5) Is there anything else you want to say about your C-CELE experience?

Data Collection

Bracketing

The researcher was extremely conscious of personal bias. Bracketing helped the researcher avoid personal prejudices throughout the process of data collection and analysis (Creswell, 2008; Moustakas, 1994).
Focus Groups

Focus Group Facilitator

Creswell (2008) suggests that effective, experienced facilitators enable participants to tell their own often-intimate story within the context of the research theme. The focus group facilitator has conducted more than 35 focus groups sessions and is a professional mediator. He met the group at both locations to conduct the focus group sessions. The facilitator guided the conversation and observed the verbal and non-verbal behaviors of the participants.

Focus group method and procedure

Focus groups capture unique perspectives by converging on important data and is often more comprehensive and consequential than other methodologies (Morgan & Krueger 1998). Focus groups suit the phenomenological theory well because they inspire participants to tell their story.

The facilitator explained the objectives of the focus groups. Participants indicated that they understood and were eager to share their perspectives. Participants sat in a circle for both focus groups each of which lasted about 75 minutes. Both focus groups were recorded for accuracy.

Data

Analysis
To ensure reliability the researcher transcribed every statement twice. Discrepancies were analyzed and corrected and then matched against a third transcription to ensure accuracy. Next, the transcribed data were analyzed for relevant themes; the process was then repeated to ensure accuracy. The researcher then began the tenuous coding process. After the data was coded, the researcher set it aside for several days and then repeated the process to ensure reliability. The coding revealed potential categories and after a great deal of consideration and analysis, thematic categories began to take shape. The researcher repeated the process and reexamined discrepancies before beginning to develop an objective summary using the learner’s exact words (individual textual descriptions). The researcher developed two types of interpretative summative descriptions – the first for the individual participant, which evolved into the second across the experiences of all participants. The researcher interpreted the meanings of the experience (Moustakas, 1994) and summarized the experiences of the study’s participants.

**Data revealed**

The data revealed that participant responses were rooted primarily in emotional descriptors. For the purposes of accuracy and reliability, the researcher categorized the data using the participants’ own descriptors.

**Guilt.** This participant’s response was indicative of five others. “I always seem to go to the same place; I know I feel guilty and I wish they [Natives] could have all the privileges that I have, but I feel as if I am still looking at it through my Western eyes.”
Other participants used synonyms like “regretful,” “ashamed,” and “humble” to describe their feelings of guilt.

This participant seemed sympathetic to Natives as he spoke about the divergence of two cultural perspectives; “I am not walking in the same shoes and not seeing [life] in the same way as Indian people. I am seeing what I saw for the past two days from my point of view; you know how to fix those that were wronged. I feel very regretful.”

This participant resorted to his instincts; interestingly he seemed to recognize what those instincts were. “I want to see the loose ends tied up, but I also know after seeing what I saw on this trip, I know that white people are not going to fix the complications. I am ashamed to think that white people feel that they can fix the world’s problems.”

**Upset.** Some participants were upset with what they saw. This participant and nine others saw unexpected levels of poverty. “I was upset with the general poverty and the lack of infrastructure; I had heard that it was bad but didn’t expect it to be that bad.”

Other participants used emotionally identifying words like “ashamed,” “unhappy,” “sad,” and “helpless” to align themselves with feelings of being upset.

The C-CELE exposed participants to the issues of absolute poverty, causing many to think about being more conscientious while others felt helpless. This participant struggled with the complex ramifications of poverty and the effects it has on the Native population. “I saw something different…the different side-effects of poverty on the reservations like how it all mixes with cultural issues; things like wanting to stay with the
families. I don’t know if there is a way to escape it as you can in some other cultures. It makes me unhappy.

Other participants, familiar with the effects of poverty indicated that they came from poverty and were surprised that they saw it in the middle of America. This participant spoke about his experience: “I was born and raised in Texas about ten miles from the Mexican border; the neighborhoods that we saw today were not a surprise because I grew up in that kind of poverty. I am sad that I feel so helpless and that we allow this to exist.”

This participant expressed the feelings of others, “I guess what is most bothersome is this feeling of helplessness. It’s one thing to know about the reality of other places in the world but what we saw today, sheer poverty, is hard to swallow.”

This participant expanded, “I believe that we come from the most advanced culture and the poverty, the extreme poverty, is right here and I feel helpless.”

This participant also expressed feelings of helplessness, “I was thinking about this notion of helplessness because I know that I am helpless in terms of putting myself in [American Indians’] position; I am not Native.”

Other participants indicated the same feelings, “I don’t know how to resolve these feelings of helplessness… I feel sad… I want to understand.”

This participant worked with Native Elders in various addiction programs on the reservation. Seeing White Clay reminded her of those experiences. “I was saddened by what I saw but I am glad that I saw it. With time you tend to forget and this experience enabled me to refresh what I should have been thinking about for a while.”
This participant worked with Native children for a summer and explained her unique perspective:

I worked with a lot of native students last summer and spent a lot of time getting to know a lot of people on the reservation. I saw some kids that were in trouble and that’s their reality; just like what we live is our reality and some of the things that they had to deal with were heart breaking.

Seeing White Clay tugged at me at a very emotional level.

Anger. Seven of the participants were feeling angry by what they saw. Some phraseology associated with anger included “outrage” and “irritation.” This participant reiterated what others said:

I am still having a hard time processing all my thoughts; White Clay had such an impact because I have studied the poverty of the world; especially in other countries but I don’t think I have ever seen poverty so severely compounded by all the other issues on the reservations. It’s an outrage.

With tears in his eyes this participant spoke about his reaction to White clay, Nebraska:

The thing that affected me most and irritates me most is still affecting me is, I began to realize how we as human beings prey on other people’s misfortune. I saw on one side of the street how two people were drinking out of brown paper bags and on the other side of the street I saw this middle aged man laying down in front of a building in broad daylight, clearly intoxicated. I could only extrapolate that he is just a young man
and that ten years down the line he will be in an even more difficult situation.

This participant elaborated on his feelings about the Wounded Knee Memorial in Wounded Knee, South Dakota, “The thing that irritated me the most after talking to [Native people at Wounded Knee] was that they seem to be in a constant struggle, and they were so nice.”

Inadequateness. Many of the participants questioned the effort to improve conditions on the reservations; six participants spoke about struggles using identifying words such as “inferior,” “ineffective,” and “useless.” This participant summed up what several others said, “It seems to me that there have been plans that have been [on the reservation] for a while; some of which should have succeeded by now. Something about the whole thing seems incomplete.”

This participant measured what he saw based on solidified pre-conceived notions and not hearing about the many success stories on the reservations.

I thought I would see all kinds of success stories there and I know there is, but there should be more. It seems that there has been plenty of time. If people keep trying, well if they are like me, it would make the effort feel like a waste of time; it would all be useless.

This participant spoke about cultural paternalism, “Historically we haven’t been very effective and we are responsible for messing up [American Indian] culture. We have been trying to help out Native people ever since we arrived on the Mayflower, and it seems like we haven’t done anything right.”
**Caring.** Participants were emotional throughout the C-CELE. Seven participants exposed dichotomous perspectives and used phraseology such as “sympathy,” “respect,” and “beauty.” This participant spoke about his personal feelings, “If you look around at the beauty of the land…it made me feel at peace, but… it was also emotionally trying.”

Fighting tears, this participant attempted to explain his anxiety, “The unrest that I know exists there and the extreme poverty class with…I mean I have such respect for [American Indians] and their culture but it brings up more questions than can be answered; I don’t think we white people have the answers anyway.”

This participant, like many others who spoke about life on the reservations, wanted to help, “I wish there was something I could do to help out and make life on the reservation better. It seemed to me that the people that I talked to were happy and very grateful.”

**Confusion.** Many participants were confused throughout the C-CELE and expressed it during the focus groups. Some of the statements contained key words and phrases such as “wondering,” “taken aback,” and “confused.” This participant was hearing information that he did not expect:

I am a veteran and actually standing in the Wounded Knee graveyard was saddening. I am wondering how or why someone from the Indian community would ever participate in the armed services. I am wondering if American Indian people believe in service to their country especially after the political turmoil that this government has caused Indian people.
This participant wanted to share what she knows about military service and her experience in Indian country:

If you go to Indian powwows they spend an immense amount of time celebrating the veterans. They spend time honoring people that have gone to war so think about their ability to overcome and how unwilling we are to overcome. Participating in the ceremony at Wounded Knee reminded me of how much Natives have overcome and how much they still celebrate life. I will be forever thankful.

This participant was confounded by one of the elder looking people at Wounded Knee:

What really hit me was when the gentleman was talking right before the ceremony that we did at Wounded Knee. He spoke about the issue of identity and he used the term “strongman.” He asked me if I was a strongman and I was really taken aback. He asked me if I ever got a passport. I told him I had and then the man asked me if I knew who I was based on the fact that I was able to get a passport. Then the man looked at me and asked, "But what are you? I am Lakota I remember who I am, what are you?" That sense of indifference or identity is one sense I sort of feel as I looked at the Wounded Knee memorial. It seems to be one of those things that the U.S. doesn’t want to remember.
Another participant spoke about the issue of identity and self-validity, “Being a white person I don’t often understand the reason for clinging to identity; I know that Natives know the reason.”

Grateful. The final emotion that emerged from the C-CELE was that participants felt fortunate to have had the learning opportunity.

This participant’s statement was profound because she realized that being on the C-CELE helped her understand herself, “Being white is hard [at Wounded Knee]. Standing in the graveyard made me think about my own identity, something I never think about. I suppose because I don’t really have to.”

This participant and six others spoke about seeing things from a different perspective. The researcher is not convinced that all of the learners reached levels of empathy, but many seem more sympathetic to or aware of the issues of American Indian people.

I think I am at a place where I think I am seeing things a little different. Kind of from another culture’s perspective thanks to this experience; but that barrier is still there and I think that education, especially this type of education, is the key, and I wish that this sort of thing [C-CELE] could be expanded in a way that more people can experience other cultures and start opening the door so more people can feel the kind of emotion that we are feeling and see beyond the way they still see things.

This participant along with three others emphasized the need to see it (Native culture) in order to understand this culture and truly understand empathy.
For me it is about not being so theoretical when we are in the classroom where it’s about statistics and formulated conjecture, where we might have a couple of slides or a PowerPoint or be made to take the class online and get nothing out of it or see some pictures of what it could be and stuff, but right now we are actually seeing it and it is helping me relate and I am for one very grateful.

This participant and one other spoke from a more pragmatic perspective: Maybe we need more practicality. Maybe we need to see it and that is where the change comes from and that is really nice for me because I am a really tactile and visual learner.

This participant and three others on the C-CELE spoke about how they need to interact with students better. They feel as if they gained some tools that will enable them to better meet their students’ needs:

I am happy that I have a better context of what is happening out there, and I feel as if I have a better understanding of the Native students that I deal with. Sometimes they have to leave because they know someone who committed suicide or there may be problems with the family and they have to leave. I have seen one Native female with a full ride. She had to go home and ended up losing her ride, so there you go; we are struggling trying to keep our Native students; that makes this a great thing.

This learner added, “The emotion we are all feeling is interesting. I don’t think I have ever thought at such a deep level; I am glad I had the opportunity to participate.”
Discussion

The C-CELE is a learning community (Lave & Wenger, 1991) invested in the acquisition of knowledge (Gray & Gibbons, 2002; Rocha, 2007) using diverse pedagogies such as storytelling, demonstration, critical analysis and location (Eraut, 1994).

According to the data, participants indicated that they were heavily engaged and motivated by experiential epistemology. Their exchange of stories and ideas shaped the larger narrative and become the story of the excursion. The melding of their stories created ownership of the process and deep learning.

The participants indicated that critical thinking promoted inquisitive learning throughout the process. The C-CELE emphasized four criterion: recognizing and investigating assumptions, seeking multiple perspectives on a given subject, building rapport through communication, and fostering active involvement. The participants indicated that when they focused on these principles they began to incorporate and synthesize information through critique.

Participants were asked to continuously reflect on the learning process, an important goal of the C-CELE (Loughran, 2002). The concept of reflection is popular in education and a necessary aspect of the C-CELE. Participants were reminded that reflecting on the experience is what leads to profound levels of learning (Loughran, 2002). The facilitator was constantly reminding the participants to think reflectively and informally discuss their feelings with him. It was through informal discussion that 4
important factors were identified as important to the learning and imperative to the acquisition of awareness.

**Factor 1.** The rolling classroom as well as the sites provided a theater were a wealth of information was easily accessible. Participants were able to effectively use the plentiful learning spaces and allow the experiences to occur. It was at the point of occurrence were participants indicated that they felt “awake” to the issues at hand.

**Factor 2.** The participants indicated that they always felt safe and included and that the establishment of an affective learning community would not have been possible without feeling safe. Many of the participants indicated that becoming aware could only be possible in an environment in which they felt “safe enough” to internally explore.

**Factor 3.** Most of the participants indicated that they appreciated the space to think for themselves. It was important that the learning environment encouraged critical thinking skills and individual analysis. Nearly every participant spoke about how important it was to step out of his or her comfort zone and think critically about the issues at hand. A few indicated that they never thought about thinking before and that thinking about issues is what made them aware.

**Factor 4.** Participants needed to have fun in the process. Nearly every participant commented on the C-CELE’s wide variety of experiences and that even though the days were long and extremely emotional at times, they were able to keep the learning process meaningful and in context. It was important that the participants had the opportunity to laugh. Many indicated that the C-CELE would be far too intense without the laughter.
Scholars like to think of universities as institutions that inspire free thinking and critical thought. Historically universities have led the charge toward social change in the United States; however, many still struggle with the remnants of preservationist ideologies that inhibit healthy progressive deliberation and social inspiration.

This study originated in a state with little diversity but a significant American Indian population. The university at the center of this study (The U) has little diversity and few American Indian students.

The U has struggled to sustain successful diversity initiatives. Designed to be both innovative and profound, the C-CELE was an attempt to investigate whether a progressive approach would work to dispel the barriers that restrict awareness by bringing participants face to face with what they do not know or perhaps with what they fear.

Revealing data emerged from the focus groups. Most poignantly the data indicated that the participants were cognizant and emotionally engaged in the phenomenon and nearly every participant perceived a heightened sense of emotional vigilance; which according to their testimony, enhanced their levels of cultural awareness. Participants also indicated that they better understood American Indian people. Nearly all of the participants denoted that the experience was more than a personal struggle or epistemological diversion. For some, the C-CELE reshaped their sociocultural context.

This study’s findings correlated with Baer, Smith, and Allen (2004), who revealed that experiential situations heighten emotional reaction and that emotional reaction
toward content in association with experience generated profound levels of knowledge acquisition, which, according to the data from this study, had positive repercussions that transferred into awareness.

**Conclusion**

In the end, this study is just the beginning. The C-CELE is an awakening but merely a snapshot of a particular event at a particular time. There is much work to be done. For example, research on the concept of emotional learning and research on the pedagogical processes of experiential learning, both would be logical extensions of this project.

Although the research from this study is not transferable, it does point out that new initiatives can have a profound affect on understanding that might lead to awareness.

The other prevalent issue is that participants volunteered to participate in the C-CELE; it would be interesting to facilitate a group who were mandated to partake. The research plan is to follow-up on the different phases with a longitudinal study to investigate how the case study affected participants over time as well as changes to the campus climate.

Abstract: Many educators are beginning to realize that Social and Emotional Learning, the process of learning fundamental life skills such as self-awareness, self-management, social awareness, responsible decision making, and relationship skills, is a catalyst to the missing link of the education with our youth, especially our inner city youth. There is a plethora of research that supports the premise that Social and Emotional learning has been linked to students having enhanced academic performance, empathy, grit, and overall a better well-being and self-efficacy. Additionally, there is extensive research that posits that culturally responsive, analytic teaching and learning is a major vehicle for generating the pillars of social and emotional learning; enhanced self-esteem, empathy, self-awareness and social awareness. As a result, students are empowered with an intrinsic motivation to learn. Social and Emotional Learning, which includes, Emotional Literacy, being able to perceive, understand, manage, and use your emotions, was the catalyst for the development of Miss Congeniality Girls (MCG), a comprehensive, culturally responsive, social and emotional literacy program, for girls of color. Understanding that there are often times a cultural divide, particularly with inner city youth, Miss Congeniality Girls affords the girls an opportunity to connect on a socio-cultural level. This experience is fostered by incorporating a culturally relevant, pedagogical approach that is sensitive to those cultural nuances that exist with girls of color, thus allowing Miss Congeniality Girls to better “connect” with the girls.

This article reports on baseline research to support the variables associated with the development and application of a Miss Congeniality Girls program in an inner city school in Chicago. The challenges and successes with Miss Congeniality Girls, as it relates to analytic culturally responsive Social and Emotional Literacy Learning, will be highlighted. Topics to be addressed on during the poster presentation will include the problem statement, overview of MCG, culturally responsive curriculum development, fitting the program into the school culture, observations, where MCG stands today.
Social and Emotional Learning, the process of learning fundamental life skills such as self-awareness, self-management, social awareness, responsible decision making, and relationship skills, embraces emotional literacy (being able to perceive, understand, manage, and use your emotions). When we think of literacy, we tend to think of it in a traditional sense of acquiring and applying knowledge via language acquisition and application by reading, writing, thinking, viewing and communication. However, literacy also includes the acquisition and application of knowledge about our own selves. (Figueroa-Sanchez 2008).

**Problem Statement**

Being an educator (teacher, administrator, literacy coach and university professor) for over 20 years in Chicago, has given me many “eye openers” and “aha moments”. I began to see a trend of perfectly, capable and willing to learn children who were socially and emotionally weak from collateral correlates, environment, personal, home, and community factors that hinder literacy acquisition, thus PARALYZING them from going from good to GREAT!!

Consequently, students were ill-equipped to deal with the challenges of life; they lacked critical strategies to recognize and manage their emotions which became an eye opener. As a result, I witnessed students who were obese, relational aggressive and lacking abilities to think, reason, and make responsible decisions. They also lacked soft-skills and etiquette sophistication, and many times exhibited an overall low self-worth and self-efficacy, a real “aha” moment.

Many researchers postulate that the social and well-being development in a child has a direct correlation in their academic learning success. Research conducted by Durlak, Dymnicki, Taylor, & Schellinger, (2011), state:

Teaching and learning in schools have strong social, emotional, and academic components. Students typically do not learn alone but rather in collaboration with their teachers, in the
company of their peers, and with the encouragement of their families. Emotions can facilitate or impede children’s academic engagement, work ethic, commitment, and ultimate school success. Because relationships and emotional processes affect how and what we learn, schools and families must effectively address these aspects of the educational process for the benefit of all students (p. 1).

The first mission to answer this call was opening a children’s fitness center. I had a small clientele with a great number of referrals from pediatricians since obesity was on the rise with our youth. However, I felt there was still something missing that was needed; something more focused; something more for girls.

**The Missing Link**

With the demands on high stakes testing and to be “book smart”, our students, what Abraham Maslow refers to as our deficiency needs are overlooked. These include love, safety, health, self-esteem, and mutual respect, what I consider to be the missing links. According to Maslow Hierarchy of Needs, if the deficiency needs are not met, then one may never yearn the second level or higher order needs, such as personal and professional attainment, things that better ourselves and allow us to reach our full potential. Many educators are beginning to realize that Social and Emotional Learning is a catalyst to the missing link of the education with our youth, especially our inner city youth. Masari (2011) clearly states:

Recognizing that our schools need a more intrinsic change, where individuals innately prefer to engage in peaceful interactions and where all students find bullying unacceptable, researchers are doing more to get to the heart of the matter. According to SEL theory, culture not only creates, but also often condones. Many concerned stakeholders are beginning to assert that schools can, and must, be doing more. Among those carrying the torch is Education Secretary Arne Duncan, who embraced SEL as a top priority toward helping schools meet the challenge (p 2).

The premise that educational institutions are becoming aware that Social and Emotional Learning (SEL) is a necessity for the well-being of students is furthered supported by Kress
(2006) in stating that learning is a process closely linked to students’ social and emotional needs and that SEL strengthens students’ preparedness for learning and promotes the development of pro-social attitudes and behavior that mediate school performance.

To answer the call of some of these problems, I was given a vision and a mission to push the boundaries and offer social and emotional learning (SEL) with a twist and hence, Miss Congeniality Girls was born (MCG).

Overview of MCG

Miss Congeniality Girls (MCG) is a present-day approach to social and emotional learning (SEL) of branded programs and products, with a focus on girls of Color. Research suggests that adolescents of color, in particular, are challenged by contextual stressors that put them at risk for poor psychological and behavioral health outcomes. (Thomas, Davidson, & McAdoo, 2008). Moreover, African-American adolescent girls are challenged with additional stressors. African-American girls have to manage and negotiate racial injustices, issues resulting from poor economic scarcity, neighborhoods and school systems, while navigating through adolescence marked by incredible challenges and changes such as puberty, cognitive maturation, identity formation, and role negotiation in family (Thomas, et al., 2008).

Understanding that there are often times a cultural divide, particularly with inner city girls of color adolescents, MCG affords these girls an opportunity to connect on a socio-cultural level. This experience is further enriched by incorporating a culturally, relevant, pedagogical approach that is sensitive to those cultural nuances that exist with girls of color thus allowing MCG to better “connect” with the girls.
Thomas et al., (2008) research supports youth development programs that are culturally relevant by being sensitive to ethnic identity, awareness to racism, collectivism, and liberatory youth activism can be a catalyst through which resiliency is cultivated in adolescents by helping them to develop psychological, behavioral, and social competence to resist adversity and preparing them for environmental and psychosocial stressors.

According to Masari (2011), students that benefit from intentional social and emotional stands out in that they have the ability to empathize, solve problems, exhibit grit and resiliency in adversity, communicate more effectively, set and achieve goals and overall make get better grades and do better on standardized test compared to their peers that have not benefited from social and emotional learning.

With this in mind, Miss Congeniality Girls represents the face of the rising “lotus flower” whose congenial spirits, personalities, traits and behaviors have not blossomed and still trying to rise above the muddy stream just like the “lotus flower”. MCG’s mission is to emerge these flowers to “rise above” so that they become budding flowers and spread their precious and vibrant petals that will add beauty and balance for themselves and the world.

We wanted our program to be different and a game changer to what a more common or traditional social and emotional programs offer. Therefore, in addition to social and emotional learning, we added etiquette comportment and soft skill refinement, yoga and mindfulness awareness, nutritional culinary and financial literacy via social entrepreneurship. We believe by integrating these elements with social and emotional learning as the premise, the girls will have the tools needed to be better socially and emotionally balanced for themselves and the world.

Realizing that using current trends to connect with children is paramount, Miss Congeniality Girls has embraced the phrase “keep calm”, modeled after the iconic catchphrase “stay calm”. The rationale for
adopting the “keep calm” theory is to remind girls to calmly think and react in everyday life’s moments. As a result, we created a full line of “Stay Calm” services, programs, and products.

Stay Calm and Stride On is suggested as Phase I in the Miss Congeniality Girls Stay Calm Series and focuses on social and emotional learning. Girls learn to perceive and manage their emotions, learn empathy and social awareness and acceptance, responsible decision making, delay gratification, and develop grit and self-esteem/efficacy, and relationship skills.

This program is especially beneficial for girls who are relational aggressive (bullying and "mean girl" syndrome), exhibit low self-esteem and self-efficacy, anxious, disruptive, exhibit overwhelming emotions and lack academic motivation. Many researchers support the notion that effective mastery of social and emotional competencies is associated with greater well-being and better school performance whereas the failure to achieve competence in these areas can lead to a variety of personal, social, and academic difficulties (Durlak, Weissberg, Dymnicki, Taylor, Schellinger, 2011).

Stay Calm and Be Mindful is suggested as Phase II in the Miss Congeniality Girls Stay Calm Series. With yoga as a catalyst, Miss Congeniality Girls calming and mindfulness techniques are explored and applied in this program; as they learn to stay calm and respond to situations as opposed to react to them. This innovative program reinforces social and emotional learning by helping the girls to center and connect the body and mind for maximum balance and harmony; it gives them a deeper sense of awareness, inner peace and taps into their creative abilities.

Research supports yoga and mindfulness in urban schools to be a factor to release stress associated with urban settings and transform education. Mendelson, et al., 2010 postulate that
urban schools are confronted with difficult challenges such as teacher attrition and mobility, student behavior problems, overall all poor academic outcomes. Menelson et al., goes on to say:

Mindfulness based programs are one potentially promising approach to help buffer effects of chronic stress exposure and improve the interpersonal learning environments in urban schools serving disadvantaged youth. The few research studies on mindfulness-based programs targeting urban youth have found positive effects on hostility, interpersonal relationships, school achievement and physical health as well as emotion-regulatory outcomes (p. 2).

Stay Calm and Cook Healthy is suggested as Phase III in the Miss Congeniality Girls Stay Calm Series; it is another step as they start to become balanced and complete. Yoga and healthy cooking choices maximize their potential, for ultimate wellness. This puts them on track for a life-long health and wellness habit.

This is a hands-on cooking class that fosters cultural diversity, healthy cooking choices, dining etiquette and an overall appreciation for culinary. Opportunities for parents to co-cook with the students are encouraged to strengthen family involvement, engagement, and bonding. The curriculum supports interdisciplinary learning in literacy, math, geography, music, art, and nutrition; while gaining a deeper understanding of world diversity. Stay Calm and Cook Healthy includes a variety of culinary themes, each fashioned so that the girls will experience a culturally and socially relevant experience, complete with our yoga and mindfulness awareness component.

Social and emotional learning is supported as students learn to become more socially-aware about cultural and global etiquette, dining and cuisine. They learn to strengthen healthy relationships with family, co-chefs and tapping into the art of cuisine to build relationships. They learn to make responsible decisions as it relates healthy food choices and understanding the connections in eating healthy and being well and complete. They learn to be in tune with self to
know and be aware of emotions that triggers unhealthy eating disorders and patterns such as binge and stress eating and how to manage them.

The idea students become more socially aware about themselves and others throughout the social interaction and exposure of food is supported in Mann’s (2008) dissertation. Mann asserts that using IV in the Miss Congeniality Girls Stay Calm Series; it is the last step to polish and have their petals bloom as we send them off into the world.

Social and Emotional Well-Being is just the beginning of being a Miss Congeniality Girl. world cuisine cooking classes removes layers of intolerance while contributing to one’s cultural background. Bayless (2004) states:

"the soul of a culture is revealed in its flavor. When you have the opportunity to share these flavors with the folks who created them, there's potential for real understanding" (p. 157). Stay Calm and Dazzle our Etiquette Comportment and soft skill refinement series and is suggested as Phase. Once you know how to perceive and manage your emotions, make responsible choices, build healthy relationships and respect and care for others, now what? Why empower them with inner strength and they do not know how to properly display it to the world? Those emotional intelligence skills need to be transformed into etiquette protocol (social graces) and soft-skills refinement. This is as simple as saying "please" and "thank you". These skills are not only pertinent to display in public but they are indispensable to compete in a global society. This etiquette and soft-skill decorum series is critical when it comes to daily discourse and will give Miss Congeniality Girls the competing edge.

There is a plethora of research that argue that social and business etiquette and soft skills are pertinent for the 21\textsuperscript{st} century and puts students at the forefront to compete in a global market. The National Business Education Association (NBEA) stated that the shortage of skills confronting today’s dynamic workforce goes beyond academic and hands-on occupational skills
(Mitchell, Skinner, & White 2010). They go on to say that found that soft skills are so important that employers identify them as “the number one differentiator” for job applicants in all types of industries.

Our Stay Calm and Innovate program aims to teach children about world issues, and how they can make a difference. This program is the last phase of the series, giving the students an opportunity for application, from the other programs, by empowering them to become social entrepreneurs, making a difference for themselves and the world.

The "Stay Calm and Innovate" Curriculum requires the students to identify real social issues, develop a business to either directly or indirectly address it, and then partner with a local organization to donate a portion of the proceeds. What better way to instill social and emotional competencies, such as empathy and responsible decision making. The students learn what it is like to become a global citizen, by instilling values of financial responsibility, personal initiative, global awareness, and giving back. Philanthropic and Social Awareness skills are instilled, cultivated, and applied in this engaging and innovative series. This unique curriculum allows the students to be creative and use ingenuity to solve real life issues.

Researchers postulate that one of the main distinguishing factors of traditional entrepreneurs and social entrepreneurs is “innovation”. Researchers Shaw and Carter( 2007) states the following:

Social entrepreneurs identify under-utilized resources – people, buildings, equipment, and find ways of putting them to use to satisfy unmet social needs. They innovate new welfare services and new ways of delivering existing services (p. 422).

Miss Congeniality Girls offers several products, which are incorporated in the programs that support emotional literacy and are culturally relevant. These products assist girls with empathy, and knowing and managing emotions, and expressing feelings appropriately as an option to relational aggressive behavior and language.
Intrinsic motivation is a direct correlate in literacy and learning. Using high quality, authentic images on our products builds self-esteem and have the power for the girls to transform their vision of themselves and their culture and therefore provide additional opportunities for intrinsic motivation. McClellan and Fields (2004) speaks on the importance of authenticity, when it comes to images and context, in children’s literature. They posit that the curriculum used in our schools will be more effective and engaging when the experience of African-American children is reflected in the materials.

Additionally, when it is antithetic, the use of stereotypical images and text are eliminated. With this in mind, Miss Congeniality Girls products embrace today’s girl of color with images, circumstances, and popular expressions that are culturally relevant, and yet relatable, for this generation of savvy girls. Depicting images that are free of stereotypes and misrepresentations is further supported in McClellan and Fields (2004) suggested questions to reflect upon when determining the authenticity of African-American literacy products to teach literacy. Two of the criteria to ponder are: 1). Do the books actually depict the real experiences of African-Americans or are the stories only about European Americans with the characters colored black? 2). Are the illustrations subtly stereotypical? For example, the drawings of African-American children should depict recognizable unique individuals and who all have the same stereotypical Negroid features.

Journal Writing and Emotional Literacy

Journal Writing is used for many reasons, such as to gather, process, and organize thoughts. The self-awareness reflection journals used in the Miss Congeniality Girls program was used to not only gather, process, and organize thoughts, but as a means to have cathartic release. In the
Stay Calm and Stride on program, the SEL curriculum, the girls used the journal before, during, and after lessons. They journals are visually stimulating, depicting authentic girls of color and incorporate bright colors that research shows girls are typically drawn. The journals are fashioned in such a way to allow the girls to become self-aware by capturing and connecting with the present moment’s thoughts, feelings, challenges, ideas, fears, passions, strengths, confidence and values through writing. Wood (2014) describes gives states:

Self-reflection can be described as an ongoing process of regular, deliberate investigation into issues that arise from experience. Self-reflection is ongoing and the purpose is to explore the inner motivations, attitudes, beliefs or assumptions in order to increase self-knowledge and make appropriate changes for the future. Honest self-reflection leads to self-improvement, which enhances both professional and personal life (p. 59).

Furthermore, Stevens & Coopers (2009) research on Bob Kegans Constructive Developmental Theory, asserts:

People (adults) construct reality by making meaning of their experience. He argues that cognition and emotion are inextricably tied to each other and when there is developmental change, there is tension and frustration trying to balance subject and objects, and self and others, to name a few. Since his theory ties individuals to being social beings, it the balancing of cognition and emotion which ties us to “self”. Journal writing is a strategy to assist individuals in the balancing act of identifying these two parts as well as seeking balance and handling the tensions inherent in development (p. 35).

Providing the girls with opportunities to reflect in their journals before, during, and after curriculum and yoga lessons offered a powerful a lens to look within, thus enhancing self-awareness. Wood (2014) contends that reflection can take place before, during or after action. With reflection before the event, options are considered and plans are made; during the event, minor or major adjustments are continuously made in relation to what is perceived; and afterwards there is a process of looking back and learning from the event.
Conclusion

In Short, there is a plethora of research that supports the need for social and emotionally literacy learning and educators are responding to the call. However, if we are going to reach all children with their social and emotional literacy learning, then analytic culturally responsive curriculum and pedagogy must be considered. We must recognize that gender, race, and class level play a major role when selecting strategies, curriculum, and pedagogy to reach adolescents.

When making the choice to teach social and emotional literacy learning for girls of color, keep in mind the following: 1). Curriculum that considers correct cultural context and ethnic identity, 2). Images and illustrations that are authentic and free from stereotypes and depict recognizable unique individuals, 3). Collectivism, and 4). Culturally relevant reflection journals to enhance self-awareness and self-pride.

Miss Congeniality Girls gives girls an opportunity to explore what it means to transition from a girl to a confident young woman. Through yoga, mindfulness awareness teaching, discussions and themed activities, Miss Congeniality Girls acquire the confidence, poise, resiliency and introspection on the journey to becoming emotionally and socially well-balanced and to becoming a Miss Congeniality Girl.

Abstract: This doctoral dissertation summary explores how multilingual middle school students make connections with academic language and content through affordances for Language Awareness. Affordances for Language Awareness represent possibilities available to students for accessing relevant information to make meaning of language within a classroom. As an ecologically inspired account, the goals of this study explored how students construct meaning, what resources they draw on, and what external policy measures influence language choices in the classroom.

This study is an investigation of language learning in a California middle school. The policy context, when the study was initiated, had been described as a “perfect storm,” (Gándara & Baca, 2008) in which students deemed to be English learners experienced limited opportunities to learn. Due to a convergence of restrictive policy initiatives, schools had become places where children could not access their multiple language resources for learning. California’s Proposition 227, which passed in 1998, had eliminated bilingual education as an instructional option available to the vast majority of California’s school-age population. Plus features of the federal government’s “No Child Left Behind” (NCLB), enacted in 2001, had further constrained children’s opportunities to use their native languages in instructional settings.
The social environment of California’s rich multilingual and multicultural communities seemed at odds with the language education policies which were all aimed to enforce a mono-lingual policy context (Gándara & Baca, 2008).

As an educational linguist and researcher, I sought to investigate an apparent dichotomy: Given that children are using and developing a range of language resources within their communities to make meaning outside of schooling, what is happening within the school context where they are limited to using one language: English? How are these multilingual children making meaningful connections with language when restricted by the monolingual climate in California schools? To examine these questions, I turned to the work of the late Leo van Lier (1944-2012) whose sociocultural approach to language awareness provides a lens for understanding the opportunities available to children for language learning.

**Why language awareness?**

Van Lier’s (1995) book, *Introducing Language Awareness*, built on a movement, which had begun in the United Kingdom in the 1960s and 1970s. The Language Awareness movement sought to address a growing concern among linguists and teachers (both foreign and English language) that students need to engage more deeply in language and develop “…a conscious awareness of how language is used in human life” (Svalberg, 2007, p. 278). The language awareness movement centered on three principle concerns: 1. To engage students in a conversation about how language use is symbolic in power relationships and class conflict in society. 2. To engage students in literacy as a means of navigating social structures. 3. To engage students in language study as a means of developing cross-cultural communication (Svalberg, 2007). Since that time, language awareness as a theoretical construct has taken many directions
influencing both form focused language instruction, and cognitivist perspectives on language learning in the 1990s. However, van Lier, drawing on Bronfenbrenner’s (1979) ecological theory of human development, presented a sociocultural perspective, considering the various language ecologies, which might provide affordances for language awareness. Recognizing that making connections with language occurs through language activity or “action”, he argued that cognitivist views of language awareness had “sidestep[ed] the basic question of how language perception develops, how it intertwines with action, and how it is internalized” (van Lier, 2007, p. 55). In van Lier’s ecological account, the aim is to consider interaction in its totality; the researcher focuses upon the actions of emerging learning, “the location of learning opportunities, the pedagogical value of various interactional contexts, the processes and the effectiveness of the pedagogical strategies” (2000, p. 250). van Lier’s ecological perspective on language learning calls for a necessarily situated and socio-cultural account of language awareness.

The current study aims to operationalize affordances for language awareness, i.e. affordances or possibilities available to students for accessing relevant information to make meaning of language within a classroom. This lens allows me to examine how students use and learn language in classroom settings. At the same time, this ecologically inspired account also examines how the macro level language education policy contexts, within which a community and school operate, influence everyday micro level interaction within the language classroom. The research questions in this study focus on how affordances for language awareness are constructed within the school context by multi-competent first and second language users. A second goal of this study is to understand what factors mediate potential affordances for language awareness. A third goal of this study is to consider how the broader ecology of the school, district, state, and federal government language education policy influence classroom
language learning. To achieve these goals, I elected to study a middle school English Language Arts classroom, where eighth grade students, in 2010, had experienced the totality of their education within a policy context of both California’s Proposition 227 and the Federal Government’s No Child Left Behind.

**Context and design of the study**

The site of this study was a California middle school where nearly 80% of the students receive Free/Reduced Price Meals (a general marker for the relative poverty within a school). The demographic make-up of the school in 2010 was roughly 70% Hispanic or Latino, fewer than 10% African American and Caucasian respectively, and the remaining 10% of the student population comprised students of Filipino, Native Hawaiian, Pacific Islander and Asian or mixed race descent. The multilingual community within which the school serves is reflected in the designation of 35% of the students identified as English language learners, and 33% as Re-designated Fully English proficient (Ed-Data, 2013). Thus roughly 68% of the students appear to have some exposure to languages other than English.

The study concentrates on classroom language exchanges in a transitional English Language Arts class where 2/3 of the students were designated English Learners (EL) according to the California English Language Test (CELT) (California Department of Education, 2013). The make-up of the other 1/3 of the class was mostly Re-designated Fully English Proficient (RFEP), two identified as Initially English Proficient (IFEP), and two English Only (EO) (Ed-Data, 2013). This class was particularly interesting to study because success in the transitional English class would grant students the opportunity to take core English in high school, as well as access to college preparation courses (California State University, 2013). Secondly, the
instructor in the study who has a Masters degree in Teaching English to Speakers of Other Languages (TESOL) and speaks several languages, drew on her diverse language resources and presented unique language awareness herself (Gage-Serio, 2014).

To examine the language exchanges constituting affordances for language awareness, I employed a qualitative design, collecting data in two phases over a six-month period. In the first phase, I spent approximately 3 months drawing on ethnographic methods, recording language exchanges during whole class dialogs. In the second phase, I narrowed my focus examining the practices of six case study students for two months. The unit of analysis in this study is Language Awareness Related Episodes (LAREs), defined as episodes of conversational exchanges containing ideas contributing to students’ language awareness in the construction of meaning. The LAREs were inductively coded, revealing four emerging categories. Evaluation of the contexts within which LAREs occur provide insights which address the research questions.

**Finding affordances for language awareness**

The first and most frequently occurring LARE category is metalinguistic awareness, or talk related to polysemy, morphology, and cross-linguistic awareness. In these LARE exchanges, the students and their teacher discussed multiple meanings in language. Interestingly, LAREs dealing with polysemy often constituted meanings, which students may have erroneously misapplied, thus creating confusion. For instance, when the instructor discussed the need for students to visit the “guidance counselor” to identify classes for high school, a student asked, “I thought a counselor helps you with your problems.” This classroom exchange created an affordance for metalinguistic awareness in which the polysemic meaning of “counselor” was extended and refined for the potential benefit of the entire class. Furthermore, several examples
drew from morphology where students and their teacher made comparisons between English and Latinate morphemes. In this way, the instructor frequently wove cross-linguistic comparisons between English and Spanish into the conversations encouraging students to, “flex their bilingual biceps”, by drawing on their multiple language resources (Gage-Serio, 2014). In particular, one of the case study students, who was a more recent immigrant, often distinguished his ability to make cross-linguistic connections, and in doing so, made rich contributions to class discussions.

The second LARE category is affordances for anaphoric awareness or co-constructed “flashbacks” connecting meaning to a prior experience. Anaphoric reference relies on shared experience to enter into an affordance for language awareness (van Lier, 2004). Affordances for anaphoric awareness distinguish a specific type of scaffolding in which a connection to meaning is made by drawing on shared experiences. In particular, one example from the data centered around a discussion of the school’s mural as an example of a “façade.” Affordances for anaphoric awareness created a bridge between the class’s shared knowledge of a school mural and a new term “façade within the text.

The third LARE category is affordances for proleptic awareness. Affordances for proleptic awareness occurred within scaffolding which differed from affordances for analeptic awareness. Affordances for proleptic awareness demanded greater intellectual reach than simply a shared experience. In these instances, interlocutors co-constructed opportunities for understanding inference by inviting the learners to “stepping into” shared meaning space (van Lier, 2004). Affordances for proleptic awareness often occurred as hints in meaning or small puzzles presented by the instructor and guessed at by the students. For example, in analyzing highly metaphoric text language such as, *born on the wind*, the instructor provided a paraphrase, “…you can barely hear it, it was…”, to which a student responded with a synonym, “soft”.

Affordances for proleptic awareness were opportunities in which students with the instructor drew on analogy to interpret inferences.

Finally, the forth LARE category is affordances for awareness of register shift in which students shifted register to achieve different norms of language use for different audiences and purposes. Affordances for awareness of register shift appeared in two contexts in the data: One was a more formulaic shift in register through the production of sentence frame exercises of “academic language” as recommended by an outside consultant. These activities were implemented as required for English Language Development within the district; yet, both the students and instructor found the exercises tedious. The instructor complained that the exercises were thematically unrelated to the grade level anthology readings adopted by the State, and as such, did not engage students’ interest. While the instructor complied with the district demand to incorporate the consultant’s activities into her class, she did so by leveraging student buy-in through the promise of reading novels thematically related to the text anthologies. In particular, the instructor had developed a rich unit which began with the play, *The Secret Annex*, and extended to a study of World War II and its impact on Europe. Students’ interest in exploring themes related to World War II created the buy-in to work through the tedious academic language sentence frame manipulation required by the district.

Another example of affordances for awareness of register shift occurred when students would interject opinions, taking on both the gestural posture and language used by the instructor. In essence, students would imitate the instructor—although not in mockery, but by appropriating a stance of authority when putting forth a conjecture. For example, a student offered, “I can infer that she was a happy lady” said with lowered voiced and authoritative stance. This affordance
for awareness of register shift occurred more frequently with one of the case study students who had been with the instructor for two consecutive years.

In total, findings of this study are intriguing: First, the LAREs episodes reveal that both students AND teachers are resources for affordances for language awareness. Students contribute to co-constructing meaning for themselves and their peers. An essential role of the instructor is in listening to students understanding and using a variety of mediating factors to both contextualize and connecting meaning to language practices. Secondly, students’ heritage languages are respected and heritage language knowledge is one vehicle around which students engage in affordances for language awareness. Both the instructor’s willingness to listen to students and her own knowledge of and respect for language diversity in the classroom contribute to affordances for language awareness. Finally, in this middle school classroom narrative text is a resource in exploring meaning in context.

Connections with language and areas of future research

The analysis presented in this study showed that affordances for language awareness were bidirectional semiotic activities; both students and their instructor contributed connections with classroom language. There were several mediating factors connecting meaning to language: 1. The students’ own contributions or responses to their experiences, while engaged in the process of reading text, mediated connections with language. 2. The instructor’s purposeful extension of these experiences, by adding thematically related realia and inviting feedback from the students, also mediated connections with language. 3. The instructor’s commitment to listening to students’ responses, musings, and other feedback was essential in her ability to
formulate the responses to students’ needs. For example, she asked questions which revealed
students’ metalinguistic and cross-linguistic awareness; she asked questions relating information
to commonly understood or analeptic discourse; and she paused or asked questions which
allowed students to fill in the space to determine their understanding of implied or proleptic
awareness.

Although this study provided insights into students’ connections with language, it also
had limitations. As a qualitative study, the findings provide insights but cannot be extended to
other classrooms, age groups, or teachers. While qualitative research does not have the
explanatory power to examine and compare large data sets or make large generalizations, it does
provide the researcher the tools to look more deeply at the social contexts of generalizations
made by large quantitative data sets. As California schools have become increasingly segregated
(Noguchi, 2014), the ideological underpinnings of policies like NCLB and Prop 227 which
stigmatize the use of languages other than English, are not without impact. Teachers, such as the
one in the study, who possess multilingual abilities to facilitate students’ connections with
language, must identify ways to resist the discriminatory ideological message of English-only
policies. It is noteworthy to consider that the ideological underpinnings of NCLB had been in
effect for 7 years prior to this study (and throughout the school experience of these 8th graders).
This teacher sought to defend and encourage students’ multilingual abilities; however, the impact
of her effort in contrast to the larger policy message is beyond the scope of this study.

In closing, this study presents a novel approach to the study of classroom language
learning and suggests many other areas for future investigation. What other affordances for
language awareness might be identified beyond those identified in this study? What do
affordances for language awareness look like at other developmental levels?
affordances for language awareness look like in elementary, secondary or post-secondary schools? Would more cross-linguistic learning environments, such as immersion schools, provide greater access for affordances for language awareness to occur?

In closing, this portrait provides some insights around what an affordance for language awareness might look like within the context of a language classroom and some of the factors which contribute to affordances for Language Awareness so that others may draw on this work.

Parental Perceptions of Chromosomal Microarray Genetic Testing for Autism Spectrum Disorders: Cultural Views

ABSTRACT:
Chromosomal Microarray Testing is increasingly utilized to detect copy number variants among children and families affected with autism spectrum disorders and a few other developmental anomalies. However, CMA is controversial due to the test characteristics, for instance, the ambiguous test findings, the uncertain clinical implications and the inability to test severity level. There is an urgent need of providing pre-test counseling and education to parents of children with ASD, to help parents of children with ASD to make informed decisions about taking their children to undergo CMA. This study contributes to the understanding of the ELSI aspects and cultural influences towards adoption of genetic testing for ASD in clinical practice. Genetic education can help ensure more informed decision making related to autism genetic testing and reproductive decision making.

Individual, face-to-face interviews were used to identify parental perceptions of CMA genetic testing. Participants (n=45) were parents of children with at least one child diagnosed with ASD who resided in North Eastern part of North Carolina. Participants represented both English and Hispanic residents. Results were generated across five major themes. Most parents were not aware of the CMA test however the majority postulated positive attitudes toward it. Parents’ interest in the test can be attributed to the following reasons: early intervention, better preparation for having another affected child and help with autism research. Parents perceived barriers include: cost, confidentiality and no perceived value. Results will be shared.
Title: Multigenre Literacy Autobiography & Multimodal Self-Portrait: The role of art integration in transforming complex and critical thinking in secondary English/Language Arts classrooms

Topic area/s: Secondary Education and Teacher Education

Presentation format: Workshop

Description: Participants in this workshop session will explore the power of integrating art into English/language arts curriculum by creating their own multigenre and multimodal artifacts. Participants will write about their personal literacy practices and create an artistic representation of those practices. The three presenters will share how the instructional engagements were implemented in their individual high school and university classrooms, and how the engagements influenced teacher and adolescent literacy identity transformation, and complex/critical thinking development.

Multigenre Literacy Autobiography & Multimodal Self-Portrait: 
The role of art integration in transforming complex and critical thinking in secondary 
English/Language Arts classrooms

“The symbolic systems that individuals [use] in constructing meaning [are] systems that 
were already in place, already ‘there,’ deeply entrenched in culture and language. They 
constitute a very special kind of communal tool kit whose tools, once used, made the user 
a reflection of the community” (Bruner, 1990, p. 11).

PURPOSE

The purpose of this workshop session is to involve participants in multigenre and 
multimodal instructional engagements (Short, Harste, & Burke, 1996) that open space for 
an autobiographical exploration of literacy [reading, writing, speaking, visually 
representing] practices (Moje, 2000) paired with a multimodal [artistic and symbolic] 
representation of those practices. Writing and art materials will be provided by the 
presenters. The writing and creating portion of the session will be followed by 
participants sharing their autobiographies and self-portraits, and the three presenters 
sharing Presenters will provide participants with handouts of the instructional 
engagements, illustrating the differences in the implementation in the three classrooms.

Art, perceived as a cultural/social artifact for meaning making and communication, is 
also viewed as a mediating tool (Vygotsky, 1978) for literacy identity and critical 
thinking transformation, and for constructing learning communities of practice that 
establish and nurture equitable access to literacy development. Multimodal texts, or 
multiple forms of representation, are symbolic systems (Bruner, 1990) and cultural 
artifacts that are produced by a society to make sense of and illustrate the world. The 
creation of multigenre and multimodal texts in secondary and university 
English/language arts classrooms provide a canvas to extend understandings of the 
academic language/topic under study, and are crucial aspects of learning in the 21st 
century. When used in learning spaces organized and orchestrated to support literacy 
identity and critical thinking transformation, this power of creation can guide an 
analytical deconstruction of a subject providing critical insight into a view of self, 
developing and supporting complex thinking, literacy development, and a rich analysis of 
academic content that would not exist in the absence of such opportunities. In essence, 
autobiographical and artistic engagements emerge as influential for both teacher and 
adolescent literacy identity transformation, and for complex and critical thinking 
development.

Critical thinking is a concept widely used to describe how students should learn to think, 
as well as an instructional goal throughout a student’s educational journey. However, “if 
we are charged with teaching students to think critically, then we need to clarify the 
concept; otherwise we will be shooting arrows at a target that we cannot see” (Mulnix, 
2013, p. 464). Moreover, critical thinking encourages important dialogues within social
and cultural learning spaces, and is grounded in metacognition, or “making thinking visible...to help people learn about the cognitive processes that underlie their own abilities to learn and solve problems” (Bransford, Derry, Berliner, Hammerness, & Beckett, 2005, p. 57).

The research project described here begins with recognizing critical thinking as a concept with specific critical attributes that serve as both qualifiers of its construction, and a process adolescents and secondary teachers must traverse on the path of literacy development, and the role art plays when designing and facilitating critical thinking engagements in two high school and one university English/language arts classrooms. The parameters of our researched focused on: (1) the role of multigenre composition and artistic representation as a symbolic system for representing “authoring” (meaning making) practices and the influences of those engagements on complex academic understandings, (2) an exploration of critical thinking as a construct, and the cognitive process of constructing critical thinking consciously, and (3) an exploration of two secondary ELA teachers’ and adolescents’ understandings/definitions of critical thinking as a construct with specific attributes and processes, and the transformation of those understandings.

The research questions for our inquiry of critical thinking consciousness and the role of art for literacy development include:

1. What are ELA secondary teachers’ and adolescents’ understandings of the concept critical thinking, its critical components and the process of critical thinking before, during and after literacy instruction designed to support and guide critical thinking consciousness and transformation?
2. How does the specific design and implementation of a multigenre composition and a multimodal artistic representation support adolescents’ transforming critical thinking consciousness, confidence and literacy development?

METHODS AND/OR TECHNIQUES

Formative experiment methodology (Reinking & Bradley, 2008) was carefully selected to guide the collaboration between a university professor and two secondary English/language arts classroom teachers as it is “uniquely suited to the ultimate goals of education research, particularly to reducing the gap between research and practice” (p. 1), and is “aimed at discovering workable instruction and relevant theory in the real world” (p. 8). The theory to practice attribute of formative experiment methods are powerfully supported by the two classroom teachers who are partners (not participants or agents) in the research, and are honored as “valued informants and team members” (p. 26). Retrospective analysis utilizing the constant comparative method (Bogdan & Biklen, 2007) provides the framework for the researchers to draw conclusions from the various data sources and make practical recommendations.
DATA SOURCES

The data sources are designed to “produce rich explanatory descriptions that link interdependent variables in an authentic educational context to pedagogical outcomes in ways that inform theory” (Reinking & Bradley, 2008, p. 46). The sources include:

- Written pre- and post-assessments [student and teacher] definitions of critical thinking as a concept, and the process and critical attributes of critical thinking;
- Metacognitive reflection writing [student and teacher] exploring the role of multigenre composition and multimodal artistic engagements;
- Interviews of each classroom teacher conducted by university professor regarding implementation of art integration and critical thinking instruction;
- Field notes during classroom observations, and debriefing meetings with the teachers.

PERSPECTIVES OR THEORETICAL FRAMEWORK

Eisner (2002) argues, “Work in the arts…is a way of creating our lives by expanding our consciousness, shaping our dispositions, satisfying our quest for meaning, establishing contact with others, and sharing a culture” (p. 3). Pedagogical practices incorporating art as a mediating tool (Vygotsky, 1978) to establish and build communities of practice (Lave & Wenger, 1991) can directly guide and extend the thinking of cultural and social membership—powerfully supporting the transformation of critically literate people.

Further, Sanders and Albers (2010) posit that “within multimodality inherently lies a critical perspective enacted when examining the textmaker’s choices regarding the materials used, how those materials are framed and designed and how such decisions are realized and situated within the creator’s beliefs” (p. 9). We assert that literacy instruction that incorporates an art component is a potent opportunity for critical thinking consciousness and transformation (Kress, 2003, 2006), one that powerfully supports the ways teachers (pre- and inservice) and students read the word and the world (Freire & Macedo, 1987).

EDUCATIONAL IMPORTANCE

Langer (2011) asks, “What is knowledge? How do we gain it? How do we teach it?” (p. 1). She answers with the assertion that “knowledge is crafted and honed. It requires an understanding of social and disciplinary conventions surrounding the ideas. What we think about, and the ways we think” (p. 1). More detailed explanations can be discovered when the focus falls on critical thinking as a concept with specific attributes and processes, and is deconstructed, critically analyzed, and studied as a framework for learning in explicit ways and that support literacy development. Explicit and conscious literacy instruction in support of critical thinking, which includes art integration and metacognitive processes can become the norms in educational spaces “in order to help (students) learn about the cognitive processes that underlie their own abilities to learn and solve problems” (Bransford, Derry, Berliner, Hammerness & Beckett, 2005, p. 57).
Gee (2003, 2008) and others (e.g., Dewey, 1934; Eisner, 2002; Kress & van Leeuwen, 2006, 2007) explain that multimodal texts, or multiple forms of representation, are cultural artifacts that are produced by a society to make sense of and illustrate the world. As the learner re-presents her or himself, and/or English/language arts ideas framed in multimodality, new and subtle understandings and complexities emerge. Furthermore, Vygotsky explained, “Art is the social technique of emotion, a tool of society which brings the most intimate and personal aspects of our being into the circle of social life” (as cited in Moran & John-Steiner, 2003, p. 62).

INTEREST/CONNECTION TO THE AUDIENCE

This study strives to make an important contribution to the conversation surrounding critical thinking as more than a concept to be generically used, with metacognition as a critical attribute of that higher order thinking, and the artful instructional strategies and processes in which secondary teachers and adolescents can engage to meet those significant goals. Educators must strive to provide students with significant and transformative learning opportunities in support of rich classroom spaces that provide authentic and artistic explorations of English/language arts content, and art should be viewed as a powerful tool to support and guide this process. We assert that the process of multigenre composition and multimodal artistic creation are instrumental for developing and supporting complex thinking, literacy development, and a rich analysis of self and academic content that would not exist in the absence of such opportunities (Eisner, 2002; Moje, 2000).

REFERENCES

Description: This mixed methods study was designed to determine what factors characterize adequate support and preparation for Master’s level students for both native English speakers and second-language learners. The study measured perceptions of graduate level success in the areas of support, study and research skills, undergraduate preparation, and the role of mentoring and advising. The purpose of this research was to strengthen Master’s level programs in the social sciences to increase overall student success.
Setting the Stage for Master’s Level Success

By Donna Roberts, Ed.D.,
Department Chair of Graduate Studies at Humphreys College

_Donna Roberts is the Department Chair of Graduate Studies at Humphreys College in Stockton, California. She has spent several years working as an educator and administrator in the P-12 system as well as in higher education. She is dedicated to supporting student success for all learners, including second-language learners. The following text is a summary of her 2015 dissertation. It was defended at CSU Stanislaus in April 2015._

**Introduction**

Comprehensive reading, writing, research, and study skills play a critical role in a graduate student’s success and ability to contribute to a field of study effectively. How well are students being prepared to transition from baccalaureate to Master’s level programs? _Summer Bridge_ programs are often found in place and well supported in colleges to transition high school students successfully to the college world. There are also often steps put in place by a four year university to support an incoming transfer student. However, it is rare to see a program in place that bridges baccalaureate students to graduate studies. Many assume that after four or more years of study for a Bachelor’s degree, a student is fully prepared and skilled to handle a graduate world filled with research, time-management, and the ability to be an analytic thinker as well as a proficient writer.

The landscape of graduate education continues to become increasingly diverse. This creates a challenge for instructors to support a diverse population of students effectively in graduate courses that maximize student performance and contribute towards fostering equitable learning experiences for each student. For instance, Hoffer, et.al (2003) noted that first-generation graduate students are more likely to be female, individuals of color, report debt upon degree completion, and have attended a community college at some point during their academic career. This is a very different type of demographic than of graduate students decades ago. Furthermore, ethnic diversity is also increasing in graduate education. Research indicated that the number of first-generation Hispanic graduate level students is growing; however, Hispanic
students earned only 5.9% of the total 625,023 master’s degrees awarded in the United States in the academic year 2007-2008 (U.S. Department of Education, 2010). Are needs being met for the full range of learners including those who are native English speakers and those that are second-language learners at the Master’s level?

The world of baccalaureate studies and graduate studies are very different from one another. At the master’s level, student are expected to build relationships with their professors, actively engage in and contribute to critical discussion, fieldwork, and research and to fluently be independent learners, presenters, and proficient writers. Cohen and Brawer (2013) noted that this compounds even further for a second language learner whose barriers can include but are not limited to language issues, not having a network of support within or outside the college, and/or being a first generation college student unsure of how to navigate the system.

Too often, there is no mentoring system in place to reduce these obstacles. These gaps need to be closed. Support mechanisms need to be put in place to ensure academic success and to build confidence for all students. The purpose of this Mixed Methods study was to determine what factors characterize adequate preparation and support for success in Master’s level programs for all students, in an effort to expand their educational experiences and achieve success in graduate-level education.

**Definition of Terms**

For purposes of this article, the following terms are defined:

*Graduate level success.* The fulfillment of requirements that leads to a Master’s degree in the field of education or the social sciences.

*Perceived Graduate-level success.* Student perceptions of a myriad of factors including support, mentoring, levels of confidence, and feelings of connectedness within a graduate-level experience.

*Mentoring.* The act of a person taking on the role of coaching, giving advice, or serving as a guide to someone who is less experienced.

*Second-Language Learner.* A Master’s level student who receives instruction in English but is still in the process of fine-tuning his or her reading, writing, speaking, listening, and/or other
communication skills in English. He or she may or may not be fluent in reading, writing, and speaking in the primary language.

**Research Questions**

The following research question emerged as a result of reflection on the research: What factors characterize adequate preparation and support for success in Master’s level programs?

1a. What is the impact of mentoring on native English speakers and second-language learners regarding perceptions of confidence and academic performance in Master’s level programs?

1b. How do second-language learner (EL) experiences compare with those of native speakers in Master’s level programs?

**Transformational Learning Framework**

The framework of transformational learning serves as a foundation to this study. Transformative learning is defined as “the process by which people examine problematic frames of reference to make them more inclusive, discriminating, open, reflective, and emotionally able to change” (Cranton, 2006, p. 36). These experiences are the keys to fostering social justice, equity, and change in the educational system. Only through collaborative dialogue and critical reflection, in the setting of problem-posed learning, can one come to put meaning to his or her words through this organic process. This can only happen through dialogue, and without this present, there is no communication or education. For dialogue, Freire (2012) noted that there must be love, humility, intense faith in humankind, hope, and critical thinking. It is essential that an instructor not present his or her perceptions of reality and instead let students investigate their own “thematic universe--the complex of their generative themes--inaugurates the dialogues of education as the practice of freedom” (Freire, 2012, p. 96).

Mezirow (1997) noted, “transformative learning is the process of effecting change in a frame of reference. Adults have acquired a coherent body of experience- associations, concepts, values, feelings, conditioned responses- frames of references that define their life world” (p. 5). Technical knowledge in relation to the Master’s level experience occurs when students learn how to conduct and read graduate-level writing and research as well as understand roles, expectations,
and workload. This includes the technical skills that are needed to be a highly qualified and successful practitioner in one’s field. Students often feel challenged during this period of learning and question if this is a goal in their lives that can be achieved.

Practical or communicative knowledge is constructivist-based and focuses in on the deep understanding and meaning to one’s pursuit. In relation to the graduate level experience, students come to terms with why they need to perform at such a high level meeting rigorous demands and expectations. Time management and study skills often strengthen during this phase and content reading for understanding is pursued. It becomes a time where students often thrive on group consensus and shared interpretation (Cranton, 2006). She also noted that “leadership training, interpersonal skills, teamwork, conflict resolution, communication skills, and the new emphasis on emotional intelligence illustrate the importance of communicative learning in these settings” (Cranton, 2006, p. 12).

Finally, emancipatory learning allows Master’s level students to do something with their learning such as applied project or thesis. There is an emerging openness to ideas as well as the desire to help others through one’s field of study. Students are acting in a different way because they see themselves in a different way from when they started the program experience. They are now contributing to their field, engaging in self-reflection, self-determination, and personal growth. Habermas’s idea of emancipatory knowledge stated,

The goal of adult education is to help adult learners become more critically reflective, participate more fully and freely in rational discourse and action, and advance developmentally by moving toward meaning perspectives that are more inclusive, discriminating, permeable, and integrative of experience. (1984, p. 224-225)

**Brief Review of the Literature**

Preparing students for proficiency in contributing to educational research as well as academic achievement through carefully articulated preparation and ongoing support can help ensure that a college’s goals of student successful performance are met. Additionally, over the past decade, the number of nonnative English speakers enrolled in higher education continues to climb in all levels of education. In an ever-changing and diverse educational field, including that of higher-education, it is imperative to examine how instructors and institutions can provide continued support in academics as well as from the social-emotional perspective, which ensures the success of all students.
Kuh, Kinzie, Schuh, Whitt, and Associates (2005) noted that based on the Documenting Effective Educational Practice (DEEP) project from the Center for Postsecondary Research at Indiana University, keys to promoting high levels of achievement in all levels of college are fostered by setting high expectations and emphasizing the importance of academic effort. Kuh, et al. (2005) affirmed that:

colleges and universities have demonstrated high rates of student success by emphasizing the following: informing students of high expectations from the beginning, expecting significant time-on-task for writing, reading and class preparation, collaborative learning opportunities, and encouraging student to share the results of their work through various forms of scholarship celebration activities, capstone assignments, and rigorous summative experiences such as a comprehensive examination. (p. 192-193)

Graduate-level instructors are then challenged to develop courses in a manner which excel student performance while fostering deep motivation and engagement.

Recommendations were made for policy and practice reform that included having administrators, instructors, and counselors trained and made aware of the specific needs of first-generation students through professional developments. Using hierarchal regression analysis, Tate, Fouad, Marks, Young, Guzman, and Williams (2014) surveyed 170 low-income, first-generations college students in graduate education with five assessment instruments (Graduate Education Self-Efficacy Scale, Family Influence Scale, Perceptions of Barriers Scale, Coping with Barriers, and Indicators of Intent to Attend Graduate School) which resulted in one sub-construct of graduate school self-efficacy (research self-efficacy) and family influences (family values) to be predictive of students’ pursuit of graduate education. The researchers explained,

When family influence was introduced in the second step, an additional 8% of the variance was accounted for, with a significant change in variance ($p = .30$). A large, statistically significant jump in variance accounted for was found when graduate school self-efficacy was entered in the third step (additional 14% variance explained), where there was significant change in variance ($p = .00$), and the model was significant overall ($p = .00$). (Tate, et. al., p. 9)

As a result, when students’ self-efficacy for conducting graduate-level research increased, so did his or her active pursuit of graduate school.
Sinacore, Park-Saltzman, Mikhail, and Wada (2011) conducted a qualitative study in an effort to document immigrant and second-language learner graduate students’ experiences in higher education and how these influence cultural transitioning and social integration. Data collection resulted in 600 pages of interview data where major and minor themes were determined and peer reviewed. They found that a strong mentor fosters success in graduate programs and indicated the extreme importance that a mentor plays for supporting second-language and immigrant graduate students. When a good mentor could not be found, second-language learner students in the study, including international students, would often rely on colleagues for support. Those who received no mentoring were extremely frustrated with their academic experience. They were found to be academically struggling with how to succeed. The interviews also identified that there was a general lack of supportive individuals on campus to help learn the “unwritten rules.” Therefore, negotiating the university system became the greatest challenge (Sinacore, et al., 2011).

**Sample Population and Methodology**

An Explanatory Sequential Design was utilized which included two phases: (1) a collection of quantitative data using a Qualtrics survey and SPSS analysis; and (2) a second collection of qualitative data using semi-structured interviews and Dedoose software.

This study used convenience sampling and included three institutions that offer Master’s level education including a California State University campus, a University of California campus, and a private college in the Northern Central Valley of California in the fields of education, sociology, and social work.

Over 140 Master’s level students participated in the questionnaire that measured perceptions of master’s level success in the areas of support, study and research skills, levels of preparation from the Bachelor’s Degree work, the role of mentoring and counseling, and overall perceptions of student success. After expert review, the questionnaire was sent using Qualtrics to Master’s level students to measure their perceived levels of preparation and support for success in their current graduate programs. Data were collected for approximately two months and then imported into SPSS for analysis. Table 1 and Table 2 summarize demographic data on the participants who completed the Master’s Level Success questionnaire.

**Table 1**

*Summary of Participant Demographics Regarding Type of Institution, Program, and Units Completed*
Table 2
Summary of Participant Demographics Regarding Gender and Student Workload

The participants for the interview portion of the study included three Master’s level students who were native English speakers and three Master’s level students who were second-language learners. Two participants who completed the questionnaire were selected from each institution in order to provide a representative sample of Master’s level programs in the Central Valley of California. Criterion for selection included: (1) the participant marked the box that indicated he or she was willing to participate in an additional interview regarding perceptions of
graduate level success and (2) contact information was provided. If there were more than two students willing to participate from each institution, then the possible participants were numbered separately by college or university and randomly drawn from a box for the opportunity to interview. These students participated in semi-structured interviews that indicated their perceptions of support and the role of mentoring in their graduate level experiences.

**Quantitative Analysis**

Confirmatory Factor analysis with principal axis factoring was used in this study to find patterns in correlations among the 30 questionnaire items related to adequate preparation and support for success in Master’s level programs. Three key factors resulted. The first factor, The Need for Sustained Support, accounted for 25% of the item variance. The second factor, Importance of Purposeful Advising and Mentoring, contributed an additional 11%. The third factor, Importance of Strong Undergraduate Preparation in Master’s Level Success, contributed an additional 8%. Values for which factor loads were greater than .40 were included in the determination of factors.

A 2 X 5 contingency table was run on each Master’s Level Success Questionnaire item that was a significant contributor according to the Factor Analysis. The chi-square test of independence was used to determine if the level of agreeability (strongly agree, agree, neutral, disagree, and strongly disagree) varied based on whether the Master’s level student was a Native English speaker or second-language learner. The results of the analysis indicated that there was a statistically significant difference in the observed proportions of seven responses based on being a native English speaker or a second-language learner in a Master’s level program in the areas of education, sociology, or social work.

Table 3 displayed the overall means for significant items in the first factor, Need for Sustained Support, were higher for second-language learners at the Master’s level with a range of 3.34 to 3.80 on the following: (1) Having instructors provide more language support with writing (2) Benefiting from more writing support in one’s graduate program, (3) Providing more language support with other language communication skills such as speaking and comprehension, and (4) Benefitting from more research skill support in the program.

In contrast, native English speakers had higher perceptions than second-language learners on overall means for the following significant items in the first factor, The Need for Sustained Support: (1) Perceptions of excellent reading and writing skills and (2) Perceptions of excellent
speaking and communication skills. However, all students had stronger-than-weak perceptions of themselves as proficient readers, writers, and researchers.

Furthermore, the overall mean for the significant item in the third factor, Importance of Strong Undergraduate Preparation in Master’s Level Success, was stronger for native English speakers at the Master’s level on the following: If I do not understand the content in a graduate level course, I seek help from instructors, support centers, or tutors to help me ($M_{\text{NativeEng}} = 4.0$, $M_{\text{ELs}} = 3.58$).

Qualitative Analysis
During Phase II, semi-structured interview questions were developed as a result of the
descriptive data from the quantitative portion of the study and a subset of those Master’s students
from each institution, including those who are English learners, participated in interviews to
describe their perceptions of preparation and experiences in graduate studies.

The coding process was approached in a systematic way by creating a spreadsheet of
descriptors that signified key demographics among the participants such as educational
background, work status, English Language Development (ELD) experiences, among others.
Next, codes were identified that were designated as a topic from the interview transcription text
and that appeared more than once throughout the data set. The coded excerpts produced a
categorization of the shared topics that contributed to the development of thematic framework.
The next phase of the process focused on the development of a code tree. Some codes were
designated as singletons, some were codes with children, while others were weighted on a scale
of 0 to 2 to indicate the degree in which a code had a negative (0), neutral (1), or positive (2)
impact on the participant. The goal was to have each code contribute to the creation of an
overarching thematic framework.

Once the code tree was uploaded to Dedoose, an inter-coder reliability test was applied
using over ten excerpts from the data with another expert knowledgeable in the field and not
involved in the study. The purpose was to establish reliability and trustworthiness of the coding
process by demonstrating the goodness of fit of the code tree to say that there were a reasonable
selection of topics that could be applied by people with similar backgrounds. Miles and
Huberman (1994) suggest that inter-rater reliability should approach .90. Thus, for this research
project, an acceptable score was determined to be 0.80 or above on the Cohen’s Kappa.
Completing this process resulted in confidence with a score of 0.90 on the Cohen’s Kappa.

**Qualitative Results: Top influences on Master’s level students included**

The researcher identified the top six codes or factors that influenced Master’s Level
students in this study: adjusting to Master’s level expectations, areas of frustration and struggle,
perceived keys to success, faculty influence, areas of accomplishment, and peer support (see
Table 4).

Table 4

</tbody>
</table>

Both native English speakers and second-language learners have similar influences that impact their success as a Master’s level student. According to the Code Application table (see Table 4), adjusting to Master’s level expectations proved most challenging and frustrating, but was mediated by the support and influence of faculty and peers. Also, a well-kept alignment between perceived keys to success and reflecting on areas of accomplishment helped to motivate Master’s level students to persevere. For example, one participant from a private institution noted, “In the Master's program, there is a lot more demanding reading, conversation, and giving of feedback to the students. Students have to participate in the class through class discussion. I think this is good. You have to do a lot more revisions on your work.” Another student from a U.C. explained, “It’s completely different! Bachelor’s work is about studying, listening, and regurgitating information on a mid-term or final. Graduate work is discussion-oriented; taking the information and critiquing it.”

Presentation of Code Co-Occurrences

Utilizing Dedoose software, six code co-occurrences resulted based on the participants’ responses during the interview portion of the study. Code co-occurrence transpires when two or more codes were applied in the same excerpt. The researcher also examined all the excerpts to identify themes that apply to both native English speakers and second-language learners at the Master’s level in the areas of education, social work, and sociology.
The six code co-occurrences were (1) adjusting to Master’s level expectations and cultural norms, (2) adjusting to Master’s level expectations and navigation, (3) peer support and perceptions of social support, (4) areas of frustration and struggle and Master’s level expectations, (5) areas of accomplishment and perceived keys to success, and (6) adjusting to Master’s level expectations and academics.

Success in academics, time management, and personal growth were repeatedly identified as significant experiences at the Master’s level. The six code co-occurrences provided evidence as to how students viewed their interactions with their Master’s level experience in the areas of education, social work, or sociology in the Central Valley of California. For instance, one participant from the U.C. commented, “The Master’s level programs across the various universities and even departments are very different. This is also the case for graduate and undergraduate in expectations. There is much more of a culture of "you better take care of it yourself." Another participant at the private college talked about the cohort model, and even though they are a diverse group, they have become friends. They communicate regularly through Facebook and other means, and they support each other every step of the way.

**Overarching Themes that Support Master’s Level Success**

The researcher analyzed the interview data of six Master’s level students in overall code application and thematic findings. Three themes that applied to both native English speakers and second-language learners at the Master’s level resulted: (1) more graduate level language and
writing support, (2) the need for mentoring, and (3) utilizing the influence of faculty on Master’s level student success.

Table 6

Overarching Themes for Both Native English Speakers and Second-Language Learners at the Master’s Level

<table>
<thead>
<tr>
<th>Rank Order</th>
<th>Overarching Themes</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>More Graduate Level Language and Writing Support</td>
</tr>
<tr>
<td>2</td>
<td>Need for Mentoring</td>
</tr>
<tr>
<td>3</td>
<td>Utilizing the Influence of Faculty on Master’s level Student Success</td>
</tr>
</tbody>
</table>

More graduate-level language and writing support is needed from peer tutors who have been educated at the Master’s level or above. There was strong feeling that support personnel who were at the Bachelor’s level couldn’t understand or support them with master’s level writing expectations and that much of the writing support was not in alignment with their program or respective field. Additionally, EL’s requested language and writing workshops be customized just for them that build language skills in the discipline area. Several discussed the need for embedding language and writing skills, particularly research writing using the APA format, within the context of the courses themselves.

Next, there was a need for mentoring, especially for English Learners. Many of the EL’s in this study continue to do just everything on their own and try to find their way through the process.

Finally, institutions must utilize that strong influence of faculty on Master’s level success. Master’s level students repeatedly referred to the one instructor who was an advocate who made all the difference for them.

Conclusions and Further Research

As students openly talked about the process through their Master’s level program, it became evident that they had changed. As reported by students, they experienced cognitive (i.e. approaches to learning and understanding), social, and psychological changes. This is in alignment with the transformational learning framework where students move through stages as
they seek three types of knowledge which result from learning: (1) technical knowledge or instrumental learning which allows people to manipulate and control their environment through principles and skills, (2) practical or communicative knowledge which allows people to understand and interact through language, and (3) emancipatory knowledge in which people are seeking self-knowledge, growth, personal development, and freedom (Cranton, 2006).

As Cranton affirms (2006), education, including that of graduate level, has the power to be taught in a way as to develop and emancipate an individual. Instructors can engage in deliberate actions to disconnect students from status quo thinking and reformat them to develop new characteristics, attributes, behaviors, and perspectives that become new habits of mind. Additionally, students become critical thinkers and skilled practitioners or researchers in their field that contribute to the positive development of society.

**Recommendations for Current Practice**

After examining the results of this study, institutions of higher education that offer Master’s level programs in education and the social sciences need to reflect on current policy and practice in supporting student success. Are the needs of the full range of learners at the Master’s level being met? The informal role of faculty as advocate and mentor needs exploration as well as the levels of language and writing support embedded within program courses. Support services should be evaluated for highly qualified personnel, personalized services based on field of study, as well as services that target the specific needs of both native English and second-language learners at the graduate level. The addition of student success seminars at all levels of the program experience need consideration. Additionally, advisors need to work closely with students to develop clear education plans, to disclose the educational experience to increase transparency and ease of navigation, and to regularly meet with the student to support success every step of the way. Finally, it is recommended that students further along in the program be paired up with incoming students to serve as a peer mentor with shared experiences and valuable advice for program success.

Given the disparities in equality and access for an ever diversifying population of post-baccalaureate students, institutions must seek to continually assess and strengthen their programs to meet the full range of learners and to support students to degree completion. It is the hope of this researcher that the findings from this study will be used to help strengthen the Master’s level
experience for all students.

Abstract
The purpose of the study was to determine factors that influence and shape early childhood educators decision to choose early childhood education as a profession, and also to determine their level of job satisfaction and intention to stay at their jobs. As part of the aims of the study, recruitment processes prevalent at the study area with regards to early childhood education was investigated. Random sampling was used where 143 early childhood educators from public and private early childhood centers volunteered to participate in the study. Using a quantitative research method of the survey type, questionnaires were administered to participants. In all, four research questions guided the study with participants in their response ranking love of teaching at the early childhood level and teaching in general as the most important reasons for choosing early childhood as a career, and good salary and job security been the lest of the factors influencing career choice. Also, overall responses by participants reflected job satisfaction though most participants had intentions to leave their jobs. With regards to recruitment processes, ‘word of mouth’ and ‘walk-in’ as opposed to public advertisements served as the most used channel of job advertisement. The need for periodic evaluation of how early childhood educators feel about their jobs, and formal advertisement as procedures for recruitment of early childhood educators were among recommendations of this study.
Title: Exploring the Potential of Employing Metacognitive Strategies and Multi-Media Tools in Flipped, Blended Classrooms

Introduction of Purpose

“Education, then, beyond all other devices of human origin, is the great equalizer of the conditions of men, — the balance-wheel of the social machinery…The greatest of all the arts in a political economy is to change a consumer into a producer” (Mann, 1848). Well over a century after Senator Mann’s report to the Massachusetts School Board this fundamental need for learning that produces individual empowerment and collective productivity still resonates, but 167 years have had a tremendous impact on our educational culture and our students. Millennials (1982-2002), or digital natives (Prensky, 2001) are no longer a minor novelty in today’s classroom as 2015 marks the year that they became this nation’s largest generation (Fry, 2015) (Figure 1)

![Projected Population by Generation](image)

**Figure 1: Growth of Generations**

This Millennial generation has been reared on rapidly evolving technologies and prefer environments that support multitasking, group activities and multimedia social learning opportunities (McMahon & Pospisil, 2005; Wilson & Gerber, 2008) as they thrive on variety and change (Prensky, 2010). Leveraging the incredible potential of this digital generation lies in empowering their individual learning potential and inspiring their collective development into
ethical sound, civically minded, self-regulated producers for today’s diverse, democratic society. Therefore, the purpose of this study was to examine the effects of employing various multimedia tools in a flipped classroom environment on pre-service teachers’ metacognitive abilities.

**Theoretical Framework**

**Metacognition and Self-Efficacy**

Most researchers have identified metacognitive skills in terms of self-regulated learning, metacognitive knowledge or both (Ellis, Bond, & Denton, 2012; Lenz & Hughes, 1990). Researchers have found that students’ self-efficacy (Bandura, 1997) is closely linked to their self-regulated learning skills because they are more likely to plan, monitor, and regulate (Figure 2) their academic work (Linnenbrink & Pintrich, 2003; Pintrich, 2004; Seifert, 2004) and many studies have found that students’ self-efficacy has a profound impact on their academic achievements (Ferla, Valcke, & Schuyten, 2008; Walker, Greene, & Mansell, 2006).

![Figure 2: Metacognitive Process (Lovett, 2008)](image)

**Flipped Classrooms**

The flipped classroom teaching strategy stems from a large body of literature on student-centered learning such as Piaget’ work (1968) on constructivism and collaborative learning and Vygotsky (1978) on cooperative learning. The flipped classroom model enables students to
acquire information outside the classroom through a wide variety of formats (text book, asynchronous video lectures, online learning modules, etc.) and then apply their acquisition of new knowledge through active, group based, innovative problem solving activities in the classroom. Being able to receive immediate feedback from their peers and instructor enables students’ to learn to re-adjust misconceptions and re-organize the new knowledge for future application (Bergmann & Sams, 2012; Bishop & Verlerger, 2013; Stayer, 2007).

Multimedia in Learning

Recent studies have shown that our brains working memory contains several channels, the visual typically handling less information than the auditory, but when the information is present through both channels the overall cognitive processing capabilities increase (Sweller, 2005). Along these same lines, Mayer (2005) has found that effective multimedia presentations introduce new information in such a way as to utilize students’ existing schemas so as to assist them in incorporating new information into their long-term memory (Figure 3). Research also suggests that activating prior knowledge (Kalyuga, 2005), student directed pacing (Mayer, Dow & Mayer, 2003), visualizing complex information (animation) (Mayer & Chandler, 2001), formal and informal feedback (Gee, 2005) and active engagement with the material (Mayer, 2005) all contribute to improving the effects of multimedia on student learning.

Figure 3: Cognitive Theory of Multimedia Learning (Mayer, 2005)
Research questions

The purpose of this research was to examine the effects of employing various multimedia tools in a flipped classroom on pre-service teachers’ metacognitive abilities. Following a thorough review of the literature on flipped classrooms, metacognition and multi-media this study was guided by three overarching questions:

1. Is there correlation between preservice teachers’ planning and their self-efficacy in a flipped class?
2. Will preservice teachers’ metacognitive skills be influenced through consistent self-reflection?
3. Will the use of the flipped classroom model, as an interactive, student centered learning framework, improve students’ use of metacognitive skills through multimedia instructional tools?

Research Methods

This mixed methods study intentionally integrated two diverse modes of inquiry. Utilizing multiple methodologies increased the researchers’ opportunities to comprehensively explore their study’s constructs through divergent modes of analysis and expand current understandings through transformative dialectical discovery. The quantitative components of this study employed a within-subject design to examine the relationship between pre-service teachers' metacognitive abilities and their application of course information through multi-media tools. The qualitative components utilized case study methodology to emphasize the unique voices of the study participants. The primary source of data collection was weekly reflections, and the secondary sources included: in-depth group discussions, observations, various multi-media, performance based projects and weekly quiz scores.

Participants
The participants were 80 pre-service teachers at a Midwestern university, 44 (29 undergraduates, 15 graduates), were enrolled in a blended (hybrid) technology integration course and 36 (all undergraduates) were enrolled in a language and literacy course.

**Instructional Design (Course Materials)**

Participants received instruction through two different teaching methods: traditional lecture-based method (Phase 1) and a flipped classroom method (Phase 2) over a two month time frame (Table 1).

</tbody>
</table>

**Table 1: Course Materials for Study**

**Research Instruments**

**Metacognitive Awareness Inventory (MAI) (Pre):**

The investigators utilized the MAI (Table 2) adopted from Schraw and Dennison (1994) to collect students’ perception regarding their metacognitive knowledge and metacognitive
regulation (Hammann & Stevens, 1998; Sperling et al., 2004) and it was administered at the beginning of the study. The MAI consists of 52-true or false statements with number one (true) or zero (false). The MAI instrument represents eight component categories of metacognition and were divided as follows: eight declarative questions, four procedural, eight conditional, six evaluation, ten information management strategies, seven comprehension monitoring, five debugging strategies and seven questions in planning strategy. Mean for the total sample M = 41.67, SD = 8.09, range = 32.

Self-Efficacy Questionnaire (Pre and Post):

The self-efficacy questionnaire was designed with 11-point scale ranges from "Cannot do at all" at zero to “Highly certain can do" at 100. The investigators developed the self-efficacy measure based on Bandura’s “Guide to the construction of self-efficacy scales” in Pajares & Urdan (2006).

Metacognitive Reflections (Post):

![Figure 4: Metacognitive Reflection Questions](image-url)
Using the MAI pre-assessment data in Table 4 the instructors designed three specific reflection questions (Figure 4) that would provide opportunities for students to critically reflect on their own learning over the course of the week using WordPress. These metacognitive reflections enabled the students to consistently contemplate their own learning in a specific area that they self-reported as being their weakest (Question #50 – Table 4).

**Study Results**

*Quantitative*

To answer the question, “Is there correlation between students’ metacognitive skills and their test scores in a flipped class” the investigators conducted a Pearson product-moment correlation coefficient to assess the relationship between students’ metacognitive skills and test scores in a flipped class. The results showed that there was no correlation between the two variables, \( r = 0.20, n = 20, p = 0.05 \). Overall, there was no correlation between students’ metacognitive skills and test scores in a flipped class. Table 3 summarizes the correlation analysis.

<table>
<thead>
<tr>

</tr>
<tr>
<td>Sig. (2-tailed)</td>
<td></td>
</tr>
<tr>
<td>N</td>
<td>20</td>
</tr>
</tbody>
</table>

*Note:* Correlation is significant at the 0.05 level (2-tailed).

The findings regarding students’ metacognitive skills and their academic achievement indicate that students’ metacognitive skills do not correlate with students’ test scores in the flipped class setting. A possible interpretation of these results is that students in the flipped class had the
opportunity to learn in a diverse learning environment where they engaged in hands-on learning activities and participated in collaborative learning. Consequently, students had the chance to adjust their learning strategies to match their metacognitive skills and therefore the academic gap between students based on the class projects assessment were minimized or disappeared.

Table 4: MAI Results

Qualitative

The role of metacognition in improving student outcomes emerged from the literature as one way to influence learning (Schraw, Crippen, & Hartley, 2006; Tanner, 2012), a theory that was supported in the study findings. The findings were as varied as the students themselves, but there were also overarching themes. One common theme that emerged regarding how they learn (Questions #1) was the understanding that it does in fact help to read the chapter before class. In their own words, Student #34 found that, “One thing I have learned is that if I read the chapter well before we start in class I learn the material better…I need to make sure I read the entire chapter and not just read half of it and skim the rest as I have in the past.”

Another common theme regarding how they would improve their learning in the future (Question #3) was to interact with the material in other ways such as “discussing the chapter with a classmate” (Student #3) or “making their own study guide or quiz” (Student #24). Student #12 stated, “I found that sharing in class really helped me understand how to use the strategies…I’m glad that I shared. I feel I got more out of the activity this way…I was more involved in my own learning.”
With regards to student driven, versus teacher directed learning that extends beyond the classroom (#4) what was unexpected was the surprising ingenuity and inspiration that emerged when students realized that they could directly influence their own learning in meaningful and measurable ways. Student #23 found that, “Through my metacognitive tests and reflections I have learned many ways for me to enhance my learning and I do a plethora of things now that I have never done before. I think that for the last couple of chapters this semester I am going to do an experiment. I am going to try to play a certain type of music and chew a certain type of gum every time that I am doing something involving the chapter. I want to see if I can make a stronger connection in my brain.”

The final theme that emerged from the study findings and that concurred with the literature review was the important role multimedia played in providing students opportunities for exploration and expression (Baddeley, 1992; Mayer, 2005; Miler, 2005). Many of the students commented on how much they enjoyed working with their groups to explore the new tools like Socratic and Gizmos how much more interactive and meaningful the class sessions. Nearly a 100% of the students preferred the self-paced opportunities (Mayer, Dow & Mayer, 2003) that Quizlet provided to review the course material and preferred using WordPress to just writing regular journal entries.

Student #31, who had given herself a 6 on the Phase 1 self-efficacy pre-test and an 8 on the post-test earning a 77% on the summative quiz went up to a 7 on the pre-test during Phase 2 and a 9 on the post-test and a 100% on the summative quiz. In her post comments she stated that being able to utilize the multimedia tools, especially Voicethread, “…made the information come alive, I really felt like I could understand the problem more by being able to see and hear the teacher describing it. I loved using this program!”
**Scholarly Significance**

The main conclusion that emerged from the researchers’ interpretation of the study’s findings and their conclusions regarding the relationships to the literature was that student’s metacognitive abilities could be influenced through consistent, critical reflection and that students were more engaged in their own learning when multimedia tools were used in a flipped classroom setting. Two new question that could be analyzed in future studies might include: 1) Which multimedia tools have the greatest influence on student’s metacognition in flipped classrooms and 2) which multimedia tools enable the greatest opportunities to translate metacognitive reflection into meaningful action? (Argyris & Schön, 1997) This research addressed a gap in the literature in identifying how the flipped classroom model is defined, introduced, and employed in conjunction with specific experiential, multimedia learning activities and metacognitive reflective practices. Even though the method and sampling procedures restrict a broad based, general application, the explanatory framework could be conceptually generalizable to a wider audience.

Title of Submission

Attitudes and Beliefs Held by White Female Teachers and the Impact on Students of Color

Topic Area

Education Policy and Leadership

Presentation Format

Paper Session

Description of Presentation

It becomes imperative to examine all possible avenues that may assist educators in improving student outcomes and advancing current educational practices to better meet the needs of students, particularly students of color. This presentation takes a critical look at the attitudes and beliefs held by White female teachers toward students of color, specifically African American and Latino males, which may be the linchpin in minimizing the disparities in student outcomes between White students and students of color.

ATTITUDES AND BELIEFS OF WHITE FEMALE TEACHERS

AND THE IMPACT ON STUDENTS OF COLOR

Abstract

The academic disparity between White students and students of color has existed for decades. As a product of White privilege and societal structures, one factor contributing to the disproportionality may be that the attitudes and beliefs held by White female teachers toward students of color, specifically African American and Latino males, may impede building positive relationships between them; and as a result, student academic achievement, social, and emotional growth may be impaired. Through the lens of Critical Whiteness Theory and the methodology of mixed-methods research, a deeper understanding of the cross-cultural teacher-student relationships and the effects on student outcomes are explored.
OBJECTIVE: At high schools in Japan, many young people have been participating in extracurricular sports activities. They can cultivate a foundation for their lifelong health through extracurricular sports activities, under instruction from coaches who are also teachers at their high school. Coaches are regarded as one of the most important human factors affecting students’ adaptation to sports club activities. Shibukura and Sasaki (2014) reported that there were specific factors, such as worries and burdens, that teachers who were engaged in extracurricular sports activities experienced in their daily lives. The purpose of this study was to develop the Burden Scale for high school teachers who are engaged in extracurricular sports activities.

METHOD: Subjects were 430 high school teachers (329 male and 101 female). They were required to complete a questionnaire that consisted of items concerning the burdens of high school teachers who engage in extracurricular sports activities and their stress response.

RESULTS: First, as a result of an exploratory factor analysis, seven factors were extracted: time-dependent burdens, motivations and abilities of the members, lack of leadership abilities, pressure of school work, expectations of others, lack of facilities and equipment, and financial burdens. In this way, the Burden Scale for high school teachers who are engaged in extracurricular sports activities was constructed. Second, the reliability of the scale was examined through the split-half method ($\alpha = .73 - .90$). Finally, correlation analyses were conducted in order to examine the relationship between the teacher’s burdens and their stress response. Results showed a relationship between Burden Scale scores and stress responses, providing support for the scale’s construct validity.

CONCLUSION: The Burden Scale was developed for high school teachers who are engaged in extracurricular sports activities. The measure can be used to increase understanding of the psychological stress involved and the effective management of stress when high school teachers are engaged in extracurricular sports activities.
Title of the submission: Tasks designed as employed by a pre-service elementary school teacher

Topic area of the submission: Mathematics Education

Presentation format: Poster Session
The objective of this study was to explore how a pre-service elementary school teacher learned to tasks designed training and in the process improved her professional knowledge and skills.

Tasks designed as employed by a pre-service elementary school teacher

The objective of this study was to explore how a pre-service elementary school teacher learned to tasks designed training and in the process improved her professional knowledge and skills. The research questions include the following: What teaching objectives did she set using task design for teaching multiplication of decimals? What learning trajectories did she conjecture and what mathematical concepts did she analyze? What representations did she employ? How did she conjecture and explain the problem-solving strategies that students adopt using task design for multiplication of decimals? This study obtained the following findings:

1. The teaching objectives set by the pre-service teacher were based on the textbook and capacity indices. They included the following: converting fractions to decimals and decimals to fractions, knowing and estimating the location of decimal points in decimal products, simplifying complex calculations, and providing effective techniques for multiplication of decimals.

2. The learning trajectories conjectured included five learning tasks: measuring and calculating the ratios of integers and decimals, understanding the factors of decimals, understanding the meaning and vertical method of multiplication of integers, understanding the meaning and decimal location changes in multiplication of decimals, multiplying decimals and applying mathematical laws.

3. The pre-service teacher incorporated area, line segments, and numbers into the task design for multiplication of decimals and employed visual representations to present the required concepts and assist students in learning.

4. The pre-service teacher assigned problem-solving activities such as clarifying concepts related to decimals, estimating the location of decimal points, and applying the distributive and associative laws.

Suggestions are presented based on the research findings for future reference in research and teacher education.
1. **Title:** Possibilities of History of Science as a subject of integrated environmental education  
2. **Name of the author(s):** JiHee Lee, Donghee Shin  
3. **Affiliation(s) of the author(s):** Ewha Womans University

5. **Abstract**

   History of science (HOS) is suitable for integrated science education because it has connected the knowledge of science, history, technology, sociology, culturology, etc and it has showed the relevance of theme in environmental education. Therefore, we need to investigate the HOS case for integrated environmental education and to explore how to organize it on educational aspect. This study explored the possibilities of HOS as a subject of integrated environmental education. We analyzed integration types of the HOS case and developed education programs with 3 units of HOS. The units include 7 classes of three topics.

   The results showed that we found 3 types of integration on the HOS case (Figure 1). The first is ‘Integrated knowledge creation’, the second is ‘Application of integrated knowledge’, the third is ‘Integration by time’. ‘Integrated knowledge creation’ signifies that new knowledge is formed by diversity of knowledges. ‘Application of integrated knowledge’ signifies that a science knowledge and theory merged into a wide range of disciplines. ‘Knowledge integration by time’ signifies that knowledge interact with other fields of study.

   ![Figure 1: 3 types of integration on the HOS case](image)

Environmental education programs include 7 classes of three topics such as Darwin, science in literature, and climate change (Table 1). The first unit is “Darwin” that consists of two classes named “The Voyage of the Beagle” and “Special issue about Darwin”. Students can learn that Darwin’s evolution theory is a result
of various kinds of fields. By making newspaper, students understand that Darwin’s theory of evolution makes an impact on synthetic theory, Art, Economy, Politics, Environment. The second unit is “Literature and science”. We selected “Jurassic Park” as a textbook. We hope that students can understand scientific facts in this novel and find some examples that have been realized from imagination to real thing. Also there will be a class on writing scenario with scientific imagination. The third unit is "Climate Change". Students can learn about the effect of climate change on civilization by studying and playing TGT game. The results could help us understand the concreteness and organization of integrated case on HOS for integrated environmental education in school.

Title: Giving Thanks for Gifting Yourself Enjoyable Holidays and Beyond.

walker@lvc.edu
Abstract for: Giving Thanks for Gifting Yourself Enjoyable Holidays and Beyond

A question that made me stop short and rethink my course syllabi was, “What other profession expects you to give up your holidays, especially from Thanksgiving to Christmas?” Having the bulk of final assignments due at the end of the semester, students often are unable to give it their best, a frustration for everyone. Given the high number of final assignments submitted at the end of the semester, allotting quality time to each is often an impossibility. This creates high stress and exhaustion, especially for professors.

Based on the work of Susan Robison, I restructured my courses dramatically. Having revised due dates, students have thanked me, especially at the end of the semester. They have expressed they were able to give the project their all. In this session participants will: 1) examine how their course assignments are structured so they get the best from students; 2) discuss ways in which, with some assignment modifications, they can gift themselves more time and less stress; 3) share ideas about assignment revisions with participants; and 4) plan for their future, feeling like they are in control of their schedule. Professors’ lives are often out of balance. Moving one’s assignments so that they are submitted at times other than the end of the semester can be quite liberating.

Panel Abstract
Teacher educators bring their positionality into the classroom.

Acknowledging the social identities and lived experiences that come to shape positionality are crucial in order to consciously bring theoretical frameworks to bear on both curriculum and pedagogy. In this session, the panelists discussed their unique positionality as women of color and teacher educators, who integrate their epistemological stances into their teaching practice. Specifically, Yvonne El Ashmawi discussed how she has incorporated her positionality as a Muslim feminist of color into both her Multicultural Education courses and her Secondary English Methods course. She has used it to foundation feminist pedagogical practices such as reflexivity and reciprocity. Additionally, she provided examples of learning activities that support students in developing their own theory of the flesh (Moraga, 1983) that will inform their own teaching practices. Xeturah Woodley discussed how she designs online curriculum that challenges existing masculinized models of course design with the use of gynocentric and culturally responsive curriculum design. She provided examples of this framework by sharing from her Social Justice in Education course. This form of course design represents new ways of constructing online education that are both womanist and culturally responsive.

Abstract—This paper demonstrates the effectiveness of ensemble machine learning algorithms over the conventional multivariable linear regression models including Ordinary Least Squares, Robust Linear Model, and Lasso Model. The ensemble machine learning algorithms include Adaboost, Random-Forest, Bagging, Extremely Randomized Trees, Gradient Boosting, and Extra Trees Regressor. With the progress of open sources, a variety of algorithms are available and they can be easily compared by using open source Python libraries from the viewpoint of prediction accuracies using R-squared.

Keywords—big data, ensemble machine learning, OLS, RLM, Lasso

I. INTRODUCTION

A variety of algorithms have been proposed for predicting the correlations between input and output. The conventional multivariable linear regression models have been used for predicting output, for example, sales, with several parameters (input) where the examined models include an Ordinary Least Squares (OLS), a Robust Linear Model (RLM), and a Lasso model from open sources (statsmodels) [1]. With the rapid progress of open source machine learning (sklearn:scikit-learn) [2], ensemble machine learning algorithms including Adaboost, Random-Forest, Bagging, Extremely Randomized Trees, Gradient Boosting, and Extra Trees Regressor can be applied to the input/output correlation problems.

This paper demonstrates the effectiveness of ensemble machine learning algorithms by comparing the conventional multivariable linear regression models using R-squared. In order to evaluate the quality of the algorithms, R-squared is used in this paper to measure goodness-of-fit in regression.

A given problem in this paper is to predict the ice-cream sales by the temperature and the number of pedestrians in the street. The more number of pedestrians, the ice-cream sales increase. The temperature is one of important factors for ice-cream sales. Based on the latest research [3], the ice-cream is the most seasonable food for summer and there is a strong correlation between the ice-cream sales and the temperature. At 18 degrees Celsius, sales soar.

Without such pre-knowledge about the ice-cream sales, the ensemble machine learning models outperform the existing multivariable linear regression models. The data of the ice-cream sales, the number of pedestrians, the temperature are downloadable from:

http://xica-inc.com/adelie/sample/data/ice.zip
or
http://web.sfc.keio.ac.jp/~takefuji/ice.csv

II. MULTIVARIABLE LINEAR REGRESSION MODELS

A. Ordinary Least Squares (OLS)

Ordinary Least Squares (OLS) model is a classical multivariable linear regression model. OLS is a statistical method which attempts to find the function which most closely approximates the data, so called a best fit. The Least Squares method is used to fit a straight line through a set of data-points, so that the sum of the squared vertical distances from the actual data-points is minimized. Open source Python library, "statsmodels" is used in this paper.

Downloaded ice.csv data is composed of the ice sales data['ice'], data['temp'] for temperature, and data['street'] for the number of pedestrians. The following important source codes (imported library name, x:input, y:output, p:predicted output) describe the OLS regression Python program where "tem" variable and "st" variable indicate the coefficient of the temperature and that of the number of pedestrians respectively. The pandas library is used for data manipulations.

```python
import statsmodels.api, pandas
data=pandas.read_csv('ice.csv')
x=data[['temp','street']]
x= statsmodels.api.add_constant(x)
y=data['ice']
est=statsmodels.api.OLS(y,x).fit()
const,tem,st=est.params
p= tem*data['temp'] + st*data['street'] + const
```

Fig.1 shows the result of real ice sales (y: dotted line) and OLS predicted sales (p: solid line). The vertical axis indicates the ice-cream sales (Japanese Yen) while the horizontal axis means experimented 31 days for summer. Computed R-squared is 0.45 which shows no-good-fitting. R-squared
indicates a measure of goodness-of-fit in regressions within a range of 0 to 1 where the higher, the better.

The maximum R-squared is 0.45 in examined linear_model methods.

Adaboost with DecisionTree, Random-Forest, Extremely Randomized Trees, Bagging, Gradient Boosting, and Extra-Trees-Regressor were investigated in this paper [4].

Each ensemble machine learning method uses multiple learning algorithms to obtain better predictive performance than could be obtained from any of the constituent learning algorithms.

In this Section, important codes [imported library name, clf:classifier, p:predicted output, clf.score(x,y): R-squared] of each ensemble machine learning are only shown by the followings:

Adaboost with DecisionTree:
```python
from sklearn.tree import DecisionTreeRegressor
from sklearn.ensemble import AdaBoostRegressor
clf1=DecisionTreeRegressor(max_depth=4)
clf2=AdaBoostRegressor(DecisionTreeRegressor(max_depth=4),n_estimators=300,random_state=rng)
cf1.fit(x,y)
cf2.fit(x,y)
p1=clf1.predict(x)
p2=clf2.predict(x)
print clf1.score(x,y)
print clf2.score(x,y)
```

Random Forest:
```python
from sklearn.ensemble import RandomForestRegressor
clf=RandomForestRegressor(n_estimators=200,
min_samples_split=1)
cf.fit(x,y)
p=clf.predict(x)
print clf.score(x,y)
```

Extremely Randomized Tree:
```python
from sklearn.ensemble import ExtraTreesClassifier
clf = ExtraTreesClassifier(n_estimators=100,
max_depth=None,min_samples_split=1, random_state=0)
cf.fit(x,y)
p=clf.predict(x)
print clf.score(x,y)
```

Bagging with KNeighbors:
```python
from sklearn.ensemble import BaggingClassifier
from sklearn.neighbors import KNeighborsClassifier
cf=BaggingClassifier(KNeighborsClassifier()
n_estimators=1000,max_samples=0.8, max_features=0.5)
cf.fit(x,y)
p=clf.predict(x)
print clf.score(x,y)
```

Gradient Boosting codes:
```python
from sklearn.ensemble import GradientBoostingRegressor
clf=GradientBoostingRegressor(n_estimators=1000,
learning_rate=1.2,max_depth=1, random_state=0)
cf.fit(x,y)
p=clf.predict(x)
print clf.score(x,y)
```

Extra-Trees-Regressor codes:
```python
from sklearn.ensemble import ExtraTreesRegressor
clf=ExtraTreesRegressor()
cf.fit(x,y)
p=clf.predict(x)
print clf.score(x,y)
```

Fig. 2 shows the result of Gradient boosting over the real sales data where both lines are almost fitted with R-squared=0.985.
Computed R-squared data of DecisionTree, Adaboot with DecisionTree, RandomForestRegressor, Bagging with KNeighborsClassifier, Extremely Randomized Tree, Gradient Boosting, and ExtraTreeRegressor are described respectively as shown in Table-3.

All ensemble machine learning algorithms can significantly improve the R-squared data over the conventional linear regression algorithms with R-squared=0.45. Table-3 shows that Gradient Boosting and ExtraTreeRegressor are the best algorithms among all algorithms with R-squared=0.985.

A. Implemented Python program

The Python full program for Adaboot with DecisionTree is described in Fig. 4.

```python
import pandas as pd
import numpy as np
import statsmodels.api as sm
from sklearn.tree import DecisionTreeRegressor
from sklearn.ensemble import AdaBoostRegressor
import matplotlib.pyplot as plt

data = pd.read_csv('ice.csv')
x = data[['temp', 'street']]
y = data['ice']
 rng = np.random.RandomState(1)
clf1 = DecisionTreeRegressor(max_depth=4)
clf2 = AdaBoostRegressor(DecisionTreeRegressor(max_depth=4), n_estimators=300, random_state=rng)
clf1.fit(x, y)
clf2.fit(x, y)
p1 = clf1.predict(x)
p2 = clf2.predict(x)
print clf1.score(x, y)
pdf2.score(x, y)
t = np.arange(0.0, 31.0)
plt.plot(t, data['ice'], '--b')
plt.plot(t, p1, ':b')
plt.plot(t, p2, '-b')
plt.legend(('real', 'dtree', 'adaB'))
plt.show()
```

Fig. 4 adaboost.py

B. How to install statsmodels and sklearn libraries on Windows and Linux

This Section shows how to install statsmodels and sklearn Python libraries.

After installing Python on your system, run the following commands in the super user mode:

```
# easily_install statsmodels
```

In order to install sklearn on Windows:

```
# pip install -U scikit-learn
```
or

```
download *.whl from http://www.lfd.uci.edu/~gohlke/pythonlibs/#scikit-learn
# pip install xxx.whl
```

On Linux:

```
# apt-get install build-essential python-dev python-setuptools
python-numpy python-scipy libatlas-dev libatlas3gf-base
```

IV. FUTURE WORKS

There are a variety number of combinations using ensemble machine learning. We should further investigate what combinations will give us the best performance.

V. CONCLUSIONS

We have investigated the performance of ensemble machine learning algorithms over the conventional linear regressions. Ensemble machine learning algorithms including Gradient-Boosting and Extra-Tree-Regressor have generated
the best performance with R-squared=0.985 while the conventional linear regression algorithms have R-squared=0.45.

The ensemble machine learning can significantly improve R-squared, goodness-of-fit in regressions over the existing linear regression algorithms.

<table>
<thead>
<tr>
<th>How could ‘Education for Sustainable Development (ESD)’ be practiced in South Korea? : Survey and Instructional Model Development</th>
</tr>
</thead>
</table>

Since the time the concept of ‘sustainable development’ was first brought up at the UN Conference on Human and Environment in 1972 and endorsed at the UN General Assembly in 1987, it became apparent that education is the key to achieving sustainable development and education should be reoriented for sustainable future of the Earth. For this, it is important for teachers to embrace the need for ‘Education for Sustainable Development (ESD)’ and to be given training and support including ESD instructional models.

The purposes of this research were to find out teachers’ and school administrators’ perceptions on ‘Education for Sustainable Development (ESD)’ and to design ‘Social Problem Solving ESD (SPS-ESD) Instructional Models’ that lays special emphasis on
experiential learning and addresses community-based contemporary social problems and issues.

The survey research involved 255 teachers and 108 school administrators (i.e., principals & vice-principals) of elementary and secondary schools in the whole country. The survey questionnaire was consisted of four subcategories: necessity of ESD, willingness to implement ESD, educational effects and condition of ESD, and the role of ESD in overcoming limitations of public education. Statistical analyses were performed to find out followings: First, the influence of ESD in-service teacher training and teaching practice on teachers’ ESD perceptions was analyzed. Second, the correlation between ESD related condition (e.g., school policies, culture, curriculum, environment, and support) and teachers’ and school administrators’ perceptions was analyzed. Third, difficulties in and educational effects of implementing ESD were analyzed from responses of teachers who had experience of practicing ESD at schools. Based on the survey and literature review, SPS-ESD instructional models were developed. The experts with different backgrounds from different areas were involved in the process of development including six university professors, seventeen elementary and secondary school teachers and one school inspector. As a result, one-hundred SPS-ESD instructional models were developed, which addressed over fifty ESD topics such as ethical consumerism, global warming, local governance, future energy, and appropriate technology. This research can contribute to educational practice of ESD in schools and ultimately to develop core competencies of elementary, middle, and high school students for sustainable future.

* We acknowledge a valuable contribution of many other teachers who participated in developing, implementing and evaluating the ESD instructional models, although we could not include all of them as authors of this paper. This research was funded by Korea Foundation for the Advancement of Science and Creativity in 2014.

Radical love as Commitment to Comradery: Revolutionary Organic Writing in the Borderland.

The purpose of this presentation is to introduce the concept of organic writing as a powerful tool that can be used for teachers and students to awake their radical love. Based on a case study, this proposal seeks to examine how teachers are motivated to be empowered using their literacy skills to create organic writing and to build a matriachial library in their classroom and communities. This presentation will also discuss how radical love, when implemented properly, has the power to change minds, hearts, and communities. The focus of this study covers various perspectives: trust, literacy, organic writing, teachers as transformative intellectuals and leaders, love as a creative force directed to organic writing, love as a new political/citizen identity, action research for reflection and action: a tool to reduce violence, cruel immigration, and racism.

Love as a radical theory/practice will cause change in our educational and community systems. What happens to a society when war is declared in the name of peace? What happens to its citizens when they live in constant fear, what if matriachy practices can be part of the solution? During 2008-2012 the border town of Ciudad Juarez/El Paso suffered the worst violence of its history. How are its citizens surviving and what is the role of love, writers and educators during and after violent times?
**Trust.** Trust is fundamental to manifest love and construct solid networks with members of a community. Most classrooms and teacher preparation programs, nation wide and in the borderland of Mexico/US, faced challenging circumstances.

**Literacy: Teachers as transformative intellectual leaders.** Teachers as transformative intellectual leaders can be insightful about community struggles as well as aspirations, someone who can think with the local community and is recognized by it as a visionary. *Mujeres Cósmicas* by Sotelo (2011) is one example of empowerment for educators during war time in the borderland. Sotelo wrote it from the trenches of a hostile environment where neither the state, nor educational systems were interested in legitimizing Mexican borderlands creative voices. Sotelo opens her heart to say other women stories and her own, she uses the same words but changed Spanish syntaxes and grammar, to create different approaches to concepts such as feminism, homosexuality, lesbianism, activism, motherhood, marriage, religion, and indigenous knowledge. Being a daughter of a farmer worker, she uses her literacy social capital to honor her heritage in her native language.

**Organic Writing.** Organic Writing a derivative of organic intellectuals, is a pedagogical approach that allows students and teachers to use their own knowledge as well as the community to generate new knowledge about the world and at the same time deconstruct it, redefine it, and reconstruct it rather than simply reproducing it.

**Matriarchal library.** Teachers and community members work together to build walking library using matriarchal approach; serious books that address the issue of racism, violence, sexual diversity and gender equity.

ABSTRACT

ArtsNow: Teaching and Learning Across the Curriculum is an Atlanta-based organization dedicated to improving education by equipping teachers with professional development and resources to bring creativity and the arts into daily instruction so all students succeed academically, socially, and artistically. ArtsNow and its collaborating partners, work as a strategic partner with schools and school systems to support and advance arts in education in direct alignment with district and local school priorities. Having served schools in 21 different school districts across Georgia, one of the most unique and impactful district-wide partnerships is with Clayton County Public Schools.

Clayton County Public Schools is the fifth largest school district in Georgia. The district provides educational services to its students in the following manner: 36 elementary schools, 14 middle schools, a K-8 academy, a 6-12 public charter academy, 10 high schools, 1 alternative school/technical center, and three special education program schools. Clayton County Public Schools serves approximately 54,000 students where 100% of the students enrolled are eligible for the free/reduced lunch program. Jackson Elementary and M.D. Roberts Middle School operate as a school within a school; both schools have a traditional setting along with a fine arts magnet program. M. E. Stilwell School of the arts is a whole school magnet school serving grades nine through twelve.

Clayton County Public Schools, in partnership with ArtsNow, has strategically approached the advancement of the arts in local schools, within a K-12 magnet continuum, and at a system-wide level. Using arts integration as best practice, students have the opportunity to demonstrate mastery of specific learning targets and objectives. The three magnet schools have visionary leaders and teacher leaders that effectively transform the teaching and learning environment through the arts to improve student achievement.

The intentional collaboration, across schools with ArtsNow, supports and enhances student achievement, teacher efficacy, leadership development and school-wide transformation. Arts integration has supported school improvement efforts and the approach in selecting master teachers and leaders for the arts. The K-12 continuum is currently in its second year, and does not have sufficient data to report. Reliable data will be reported and analyze within the next two years. The school district will use 2014-2015 school year as a baseline, and begin reviewing and analyzing data to track increases in student achievement from 5th to 6th grade and 8th to 9th grades. The high school SAT, ACT, and AP scores will also be analyzed to hopefully show increases in students’ college readiness. However, while the district continues to collect valid and reliable data, the three magnet programs continue to outperform other schools within the district on the state, national and international assessments. M.E. Stilwell School of the Arts boasts a 100% graduation rate.

It is the K-12 strategic planning process that has given the district the opportunity to advance arts programming and professional learning opportunities with local school and system-wide priorities. Although there is need for further research in the efforts of the district, the
district continues to effectively facilitate K-12 collaborative planning of school reform with the arts. Reliable data will be reported and analyze within the next two years.
ABSTRACT

Public schools across the country are facing a critical shortage of licensed special education teachers. For many reasons, paraeducators have been considered strong teacher candidates and have been recruited into the teaching profession intermittently for decades. Paraeducators who decide to obtain their teaching license often experience obstacles to this endeavor: money, time, family obligations, navigating the university system, and academics.

This research study examined and analyzed Minnesota paraeducators’ perceptions of the barriers to obtaining their special education teaching license. It also assessed the perceptual differences between Minnesota paraeducators who have completed at least a bachelor’s degree and those who have not. In addition, the study sought to determine a relationship between the paraeducators’ demographic information and their perceptions to the barriers of obtaining their special education teaching license. The findings of this study revealed that Minnesota paraeducators perceived the barrier of time to be the most problematic, followed by the money barrier. The barrier of academics was the least concerning to them. Quantitative analyses indicated there was no evidence of a difference between those with at least their bachelor’s degree and those without, in terms of their perceptions of the barriers. In addition, none of the demographic variables was a strong predictor of the barrier index, although the standardized coefficients were found to be higher for several of the factors.

Based on the findings, two broad-based conclusions were made. First, paraeducators in Minnesota are a strong potential source of future special education
Burris

teachers. Second, paraeducators face several significant barriers while on their pathway to obtaining their special education teaching license.
Title: Evaluating Internet Resources for Faculty and Student Researchers to Identify Valid and Reliable Humanities Resources.

Author: Dr. Eileen McElrath

Affiliation of the author and address of the author:
School of Library and Information Studies – Texas Woman’s University
PO Box 425438
Denton, Texas 76204
Email: rmcelrath@mail.twu.edu

Abstract: C. P. Snow maintained in 1959 that the division between the two cultures, science and the humanities, involving subject matter, methodology, temperament, social attitudes and politics seemed unbridgeable (Snow, 1993). Many changes have occurred since 1959 that have narrowed the division between the two cultures. The differing cultures’ research needs and information seeking behaviors, does create competition for different types of resources. Differences do exist still but Humanities teachers, students, and scholars increasingly use information and material from electronic mediums that include Internet websites. Gary Olson asserts that, “We need a process to certify sites so that we all can distinguish between one that contains reliable material and one that may have been slapped together by a dilettante. We need to be able to ascertain if we can rely on a site for our own scholarship and whether we should give credit toward a colleague’s tenure and promotion for a given site. Internet sites, in contrast, have no such mechanism to quality control, and that is precisely why some kind of official recognition is necessary” (Chronicle 2008). Websites included in this article were evaluated for their value for Humanities faculty, student, and scholars. They were identified by replicating a model described by the author in 2008. Descriptions of the websites are included.

Evaluating Internet Resources for Faculty and Student Researchers to Identify Valid and Reliable Humanities Resources.

By Eileen McElrath

Introduction:

C. P. Snow maintained in 1959 that the division between the two cultures, science and the humanities, involving subject matter, methodology, temperament, social attitudes and politics seemed unbridgeable (Snow, 1993). Many changes have occurred since 1959 that have narrowed the division between the two cultures. The differing cultures’ research needs and information seeking behaviors, does create competition for different types of resources. Humanities researchers are more likely to prefer print sources because it is the text and the images that provide the basis of their studies. And, some find it a disadvantage to read text on a screen and are unable to take notes or annotate using electronic medium (Kachaluba, et al, 2014, 94). It is the difference in research methodologies that have an impact on choice of mediums. Dr. Ronald Blazek and Dr. Elizabeth Aversa tell us in their book, The Humanities-A Selective Guide to Information Resources, that Humanities’ scholars conduct research differently from other researchers, including researchers in the Social Sciences and especially the Science and Technology scholars (4-5). Stephen Wiberley shares the view in his 2009 article, “Humanities Literatures and Their Users, that “all scholarship is a continuum from the sciences to the social sciences to the humanities. There is overlap between the social sciences and humanities but clear differences between the core of each area” (2198). Differences do exist still but Humanities teachers, students, and scholars increasingly use information and material from electronic mediums that include Internet websites.
Importance of the Study

Technology and the Internet has developed since their beginnings resulting in information resources with tremendous value that are freely available on the Internet. Humanities students, scholars, and teachers partake of the incredible buffet of selections to inform their work. Unfortunately, there is not a valid system to review Internet resources similar to what exists for books and journal articles. The result is that it is up to the user to determine if a website, for example, is reliable with valid information and material. Often, tens of thousands of websites are returned from a simple Internet search. Just “Googling it” does not help much to find the true website diamonds. Gary Olson says this best when he tells us, “The digital revolution has substantially improved scholarly work, but it has also brought challenges to those of us charged with overseeing our institution’s tenure, promotion, and rewards processes. While several electronic forms compete for legitimacy, the two most prominent are journals published exclusively online, and Web sites devoted to scholarly subjects. As more and more electronic journals adopt peer-review processes that replicate the rigorous ones employed by established print journals, many e-journals are acquiring reputations for comparable rigor. “Scholarly Web sites, however, present a unique set of challenges for college administrators.” Olson asserts that, “We need a process to certify sites so that we all can distinguish between one that contains reliable material and one that may have been slapped together by a dilettante. We need to be able to ascertain if we can rely on a site for our own scholarship and whether we should give credit toward a colleague’s tenure and promotion for a given site. Internet sites, in contrast, have no such mechanism to quality control, and that is precisely why some kind of official recognition is necessary” (Chronicle 2008).

Section (MARS) of the Reference and User Services Association (RUSA) of the American Library Association (ALA) developed a method of recognizing outstanding free reference sites on the World Wide Web. Twenty-five sites were nominated, annotated, and voted on by a task force of 13 practicing reference librarians representing academic, public, special and government libraries” (Larson 2008).

*Reference and User Services Quarterly* provides a list of the Best Free Reference Web Sites each fall. These websites include a broad span of interests and are assessed using the following criteria to evaluate the websites:

- Quality, depth, and usefulness of the content
- Ready Reference
- Uniqueness of content
- Currency of content
- Ease of use
- Authority of producer
- Customer service
- Efficiency
- Appropriate use of the web as a medium

Because of the need for a mechanism to determine value for Internet websites for teachers, students, and scholars in the Humanities, this author proposed a model in 2008 to identify websites of value for Humanities teachers, students, and other researchers (McElrath 2008). This current study will replicate the proposed model to select free websites for the Humanities.
Procedure

A content analysis of the annotated lists of best websites that are published in *Reference & User Services Quarterly* from 2010 to 2014 was conducted. Each of the websites included here was originally evaluated and listed in the journal in 2010, 2011, 2012, 2013, or 2014. Websites included in this article were evaluated for their value for Humanities faculty, student, and scholars. They were evaluated by the researcher based on her educational qualifications (MA in English) and her experience teaching a graduate level course, *Information Sources & Services in the Humanities*. For the purposes of this study, fields in the humanities are philosophy, religion, the visual arts, the performing arts, language and literature, and history. Sites were designated as having value for humanities researchers if they provide primary sources, secondary sources, or can be used to answer questions during humanities research. Of the 121 websites listed in during the five year period, 25 were found to be of value to humanities researchers using this study's criteria.

Humanities Websites Selected

**Purpose:** “provides statistics on religious bodies—both in the United States and internationally. Figures for denominations in the United States can be had at the state, county, and zip code level for 1980, 1990, and 2000, while profiles for the entire denomination can include more historic data. GIS Maps are available, and it is possible to cross-reference geographies with practices. A research-oriented site.”

**Resource type:** Secondary and answer questions

**Audience:** High school, College students, teachers, researchers, general public

**Navigation:** Easy

**Author/Creator:** Association of Religion Data Archives, Department of Sociology, The Pennsylvania State University

**Purpose:** “a repository for the archiving and sharing of digitized collections, which can range from nineteenth-century periodicals to historical bicycling to war to hard-to-find government documents and congressional materials. The site's main page allows for general
catalog searching as well as browsing collections or searching within the full text of collections. A limit to ‘Full View Only’ retrieves items freely available online. Result lists can be narrowed by many options including subjects, language, and date, while full records include hotlinks on the author and subject and for similar items.”

**Resource type:** Secondary, Answer questions  
**Audience:** High school, College students Teachers, Researchers  
**Navigation:** Easy to use  
**Author/Creator:** Hathi Trust; A collaboration between the members of the Committee on Institutional Cooperation and institutions in the University of California system

**Purpose:** “a collaborative virtual library of public domain music scores (free music). It currently includes more than twenty thousand works from three thousand composers, with new works added every month. The site boasts the complete works of Johann Sebastian Bach in the Bach-Gesellschaft Ausgabe (1851–99), Ludwig van Beethoven, Frédéric Chopin, Johannes Brahms, Corelli, Faure, Sibelius, Schumann, and a large percentage of Franz Liszt, among others. General keyword and composer name searching is available, as well as browsing by time period, genre, instrumentation, and nationality.”

**Resource type:** Primary, secondary  
**Audience:** Middle school, high school, College students, Teachers, Public  
**Navigation:** Fairly easy; General keyword and composer name searching is available, as well as browsing by time period, genre, instrumentation, and nationality.  
**Author/Creator:** Project Petrucci

**Purpose:** “is much more than an interactive online dictionary of English. Gives definitions from the 2008 American Heritage Dictionary of the English Language and other sources, Provides example sentences showing words in context, information about words’ frequency and use patterns, related words, and more. It allows users to contribute information, such as recorded pronunciations, tags, and suggestions for new words. Flickr images are used to illustrate some words. This is definitely a site for “anyone who wants to know more about a word than they can find out in a traditional dictionary.”

**Resource type:** Answer questions  
**Audience:** Middle school, High school, College students, Teachers, Researchers  
**Navigation:** Easy to use  
**Author/Creator:** CEO and co-founder is Erin McKean, previously editor in chief for American Dictionaries at Oxford University Press.

**Purpose:** “an excellent resource for finding poems in full text and finding articles about poetry and poets. Can be searched or browsed by category, occasion, geographic area, first line, time period, or popularity of a poem. There are articles, hundreds of podcasts, as well as audio versions of poems sometimes read by the author of the poem. College and high school students will find a wealth of information quickly and efficiently.”

**Resource type:** Primary, Answer questions

**Purpose:** “a teaching and research tool for linguists, ESL teachers, and anyone interested in the accents of various English speakers. Provides short audio recordings of native and non-native speakers of English saying the same English paragraph. Basic demographic information, such as age, place of birth, and languages spoken, are provided for each speaker. Phonetic transcriptions and linguistic analysis of the recordings are available.”

**Resource type:** Answer questions

**Audience:** Linguists, ESL teachers, High school, College, Teachers

**Navigation:** Easy. Users need to download a free Apple QuickTime plug-in to hear the recordings.

**Author/Creator:** Steven H. Weinberger, Associate Professor and Director of Linguistics in the Department of English at George Mason University. A project of the Linguistics Program in the Department of English, the College of Arts and Science’s Technology across the Curriculum Program, and the Center for History and New Media at George Mason University.

**Purpose:** “provides cultural treasures from around the world on one site, in a variety of ways. These cultural treasures include, but are not limited to, manuscripts, maps, rare books, musical scores, recordings, films, prints, photographs, and architectural drawings. After selecting a region the user is able to narrow the documents by time period, country, topic, type of item, or institution.”

**Resource type:** Primary

**Audience:** Middle school, High school, College, Teachers, Researchers

**Navigation:** Ease of use encourages exploration.

**Author/Creator:** Hosted by the Library of Congress with the Support of the United Nations Education, Scientific and Cultural Organization (UNESCO).

**Purpose:** “dedicated to providing information to the general public on African American history in the United States and on the history of the more than one billion people of African ancestry around the world.” Over 1,500 encyclopedia entries—written by historians, independent re-searchers, and students—chronicle significant events, places, and people. Other resources include full-text transcripts of speeches and primary source documents, dating back to the 18th century; bibliographies, accompanied by links out to Amazon; and links to digital archives, museums, and other websites about African American and global African history.”

**Resource type:** Primary

**Audience:** Middle school, High school, College, Teachers, Researchers

**Navigation:** the lack of a consistent sidebar can make navigation a little confusing

**Author/Creator:** BlackPast.org

**Purpose:** “offers unfettered, intuitive access to reliable texts, accurate and exhaustive notes, and
the most recently discovered letters and documents. **Conclusion**

The described and replicated model to evaluate Humanities websites to find ones that are valid and reliable is one method to do this. It allows us to identify those websites that are free to
all on the Internet. The present study identified 25 websites that meet the criteria as valid and reliable. Use of Internet sites for Humanities research will drive further acceptance of websites for serious research. Future research about evaluating websites that can validate the method used in the study as well as lead to the development of additional methods.

Goal Orientation, Learning Beliefs, Attribution of Success and Study Habits of High-Achieving Chinese-Filipino Secondary Students

By Grace Shangkuan Koo, PhD
Professor of Educational Psychology
University of the Philippines

Abstract: This study looks at what make high-achieving Chinese Filipino students tick. Through a series of survey questionnaires and focus group discussions conducted among 175 honor students and their parents, the students' goal orientation factors, learning beliefs, attribution of success and study habits were investigated. The findings show that high motivation + adaptive learning beliefs + self-disciplined study habits + positive parents’ influence = academic success.

PAPER PRESENTATION:

The Chinese in the Philippines, even two generations after their ancestors migrated from China to the Philippines, are still very much influenced by the Confucian teachings which emphasize filial piety in the family and hard work in school and work.

Many schools run by Chinese-Filipinos are thriving because they produce quality graduates who continue to achieve excellence in the universities and further on to employment or graduate schools. Chinese-Filipino schools are strict in discipline, requiring students to achieve high performance not only in the Philippine curriculum, but also in the Chinese subjects. Parents value education highly and are involved in the day-to-day activities in schools. Students imbibe the values in authoritative parenting

Purposes and Methodology

This research is a case study of 175 secondary students in a well-known private Chinese-Filipino school (60% female, 40% male) who are classified “honor students” (i.e. maintaining at least a GPA of 92% and above in the report card each semester). Ninety-one percent of these students are of Chinese ethnicity and 70% of them speak Chinese (Hokkien) at home.

The study is conducted primarily to find out about their motivation in studies – in terms of their goal orientation, learning beliefs, attribution of success, and study habits; and secondarily, on their parents’ motivational and aspirational influences.

It is a blended quantitative- qualitative study. Four sets of survey questionnaires were conducted, two of which with the honor students (1. Learning and motivational beliefs; 2. Study habits;) and the remaining two, with the parents of the honor students (3. Parenting Goals; 4. Chinese Value Survey). Furthermore, two focus group discussions were held separately, one with selected students, and one with selected parents.
Findings

Attribution

While Western students attribute ability as most important to academic success, the results of this study show that 70% of the Chinese students believe in effort as the main reason for their success, while only 13% attributes success to ability, 11% to task, and 6% to luck respectively, as most important.

This strong attribution to effort is translated to daily discipline with about 20% of the sample putting between 3 to 4 hours of work daily to their homework and another 23% putting in between 2-3 hours of daily homework.

Learning Beliefs and Goal Orientation

The students’ learning beliefs are in some ways sophisticated – i.e. believing that ability could be improved, that knowledge is complex and can be acquired gradually, but at the same time, naïve in that they believe that knowledge is certain and can be learned from authority.

As to goal orientation, the study shows the students holding to mastery goal-orientation rather than performance goal-orientation. Among those having performance goal-orientation, there are more girls than boys. The senior class also demonstrated deeper learning strategies than superficial learning strategies.

Parental Factors

Eighty-nine percent of the students believe that their parents motivate them well. The majority of the parents motivate by merely giving encouragements, but at least 30% of them is strict with their children’s use of internet and television, and 15% actually supervise their homework. The concept of “guan” (control) has a positive connotation of “to care, to love, to govern”, such that in this sample, 27% does not watch television on weekdays and 55% doesn’t use the internet for non-academic purposes.

Academic Aspirations

Both students and their parents have high expectations. The parents will be satisfied if the students achieve 94% for Math and English, and 92% in Chinese. The students aim higher. They will be satisfied when they achieve 96% in Math and English, and 94% in Chinese. The Chinese subject is the most difficult for most students who put in the most time reviewing it at home.

The parents’ profile shows that about 40% of the students had both parents who were themselves honor students, and additional 25% who had at least one parent (mostly mothers) who was an honor student. The parents’ high aspiration for their children came from their own high self-aspirations. This high self-expectation is translated to higher academic aspiration in this sample where 39% hopes to get a doctoral degree and 35% at least a master’s degree.
Cultural Values

Parents of these students expect respect and obedience from their children and this is also reflected in the school that has for its administrators ethnic Chinese. For the parents, the top five characteristics of an ideal child are to be respectful, intelligent, obedient, God-fearing and hardworking.

Conclusion

This study reiterates findings of many studies conducted among the Chinese in the Diaspora. The “learning gap” between Americans and Asians and the “Asian ideal student” is not without reason. Discipline and hard work makes one “gifted”. 
Proposal to speak at the Hawaii International Conference  
January 3 – 6th, 2016

Title of my workshop: Maximizing the Development of Teacher Preparation Through Embedded Instruction

Topic this workshop relates to: Higher Education/Teacher Education

Presentation format: Workshop

Description of workshop
When challenged to evaluate the effectiveness of our Early Childhood and Elementary teacher prep programs, a model of embedded instruction and on site supervision proved to greatly enhance student teacher confidence and skill set. School administrators and cooperating teachers reported significant differences in the implementation of our new teacher preparation model. This university model for enriching student preparation can also be applied to school environments working with new teachers.

Author:
Dr. Valerie Ritland
School of Teaching and Learning
Minnesota State University Moorhead
ritland@mnstate.edu

Abstract
Approximately six years ago Minnesota State University Moorhead closely examined the teacher preparation program for early childhood and elementary students. The intention was to look for ways to evaluate and ensure that courses were adequately preparing students to teach in twenty-first century classrooms. Partnering with two other universities in the surrounding community the three universities submitted and received a 10 million grant from the Bush Foundation. The focus of the grant was to research and implement new strategies addressing recent changes in classroom and school environments. University faculty worked with local school district administrators and teachers to gather their input in targeting the new skills and the new content knowledge necessary for effective teaching.

This workshop presentation will highlight for the audience what changes were made in the Minnesota State University Moorhead teacher preparation programs that resulted in more confident and more competent teacher candidates. Changes highlighted will address embedded coursework and the use of university liaisons assigned to each school where student teacher candidates are assigned.

This successful university teacher preparation model, can also be adapted to work effectively in building the confidence and skills in newly hired teachers in early childhood and elementary level classrooms. The workshop will share with the audience how to use the university principles and practices in school settings to develop highly competent teachers.
Proposal to speak at the Hawaii International Conference on Education  
January 3 – 6th, 2016

Title of Submission: Partnering with Parents to Maximize Student Outcomes

Topic Areas: Early Childhood; Elementary Education; Teacher Education

Presentation format: Workshop

Description of presentation: When parents are involved in their child’s education, research has confirmed that children will do better academically and socially. This knowledge should prompt all educators to be intentional and persistent in our efforts to partner with parents. This workshop session will highlight strategies in building effective partnerships with parents and prepare participants to work through the challenges and conflicts that can arise in our relationships with parents.

Author:
Dr. Valerie Ritland  
School of Teaching and Learning  
Minnesota State University Moorhead  
ritland@mnstate.edu

This presentation is a report on issues relating to teaching. Additional summary:  
With thirty four years of direct service experience as a special education teacher, a Head Start program specialist, and an elementary school principal, the author has collected a wide array of effective strategies that work to build a meaningful relationship with parents. This presentation will present the distinct differences between parent involvement and parent partnership relationships and why building partnerships is what increases our chances of maximizing student academic and social outcomes. The workshop will also present tools for building the parent/teacher relationship; ideas for partnering with parents addressing Joyce Epstein’s six different levels of involvement, and how to manage the issues when a parent teacher partnership becomes a power struggle.

To add additional credibility to the impact of parent partnerships, a number of schools were recently surveyed to collect data on the ways in which parents are involved with teachers or as volunteers in the school environment. The survey was presented to administrators from a variety of different schools, including Montessori schools, preschool centers, and elementary schools. An effort was made to contrast and compare the level of involvement in small schools, large schools, as well as private and public schools. The workshop will share the interesting findings, and challenge participants to shift from a philosophy of parent involvement to a culture of parent partnerships.

*I hope that I have adequately addressed the expectations for the type of presentation that I am offering to your conference and that you find the topic interesting and relevant to your conference.
Title of Workshop: Using Graphic Novels Teaching with All Types of Students

Authors:
Dr. Felicia Lincoln     Dr. Donna R. White

Affiliation:
University of Arkansas     Arkansas Tech University

Addresses:
Dept. of Curriculum and Instruction     Dept. of English and World Languages
PEAH 121     Witherspoon 154
University of Arkansas     Arkansas Tech University
Fayetteville, AR 72701     Russellville, AR 72801

Email:
flincoln@uark.edu     dwhite@atu.edu

Abstract:
Professors from two universities describe the multiple uses of graphic novels in classrooms of all kinds. Graphic novels can be used at any age level and most ability levels and in almost any content area instruction. The presenters will give a brief history and overview of graphic novels and provide examples of types of graphic novels. One professor will describe how she has been using the medium in the teaching of a college level literature class. The other presenter will demonstrate the use of graphic novels to enhance the content of a TESOL course entitled “Teaching People of Other Cultures.”

Graphic novels offer opportunities to provide age appropriate content for learners who may need challenging themes or topics but can benefit from having the burden of text reduced. The presenters discuss the use of this medium in the classroom with special attention to the effectiveness of graphic novels in differentiating for all types of learners, including special education, gifted and talented, and English language learners. The presenters will offer multiple ways of differentiating instruction for all types of learners. Attendees will leave with a resource list, a bibliography, and a variety of teaching ideas.
Digital Racism: A Quantitative Analysis of to What Extent Does Perceptions of Student Race Influence Instructors Scoring of Online Posts?

Gina Haughton, PhD
Teacher Education Division
Cardinal Stritch University
6801 N Yates Road #435
Milwaukee, Wi 53217
gmhaughton@stritch.edu
Digital Racism: A Quantitative Analysis of to What Extent Does Perceptions of Student Race Influence Instructors Scoring of Online Posts?

Distance Education Workshop

As online courses become more prevalent, online instructors need to be aware of proper planning, instruction and assessment techniques. This presentation shares information on a dissertation research project about digital racism in which the study compares two students’ online post submissions and shares the surprising results of how the same online student submission was scored differently solely based on the student’s name.

Dr, Gina Haughton, PhD
Teacher Education Division
Cardinal Stritch University

gmhaughton@stritch.edu

Abstract

The purpose of the research was to investigate the extent in that racism exists or is present in higher education online courses when scoring online posts. The research question was: Digital racism: A quantitative analysis of to what extent does perceptions of student race influence instructors scoring of online posts? The related research sub questions were:
1. Was there a difference in how the student online posts were scored?

2. Were there differences in how the participants in the scoring groups scored?

3. Were there differences in scores based on the name assigned to an online post?

The researcher utilized a quantitative research methodology that employed a 3 x 2 factorial design which incorporated two student online postings, a modified version of the 6+1 Traits Rubric® across three different scoring groups.

The findings of the research suggested that regardless of the sample that scored the student an online post, the same online post was always scored higher regardless of the student name that was assigned to the post. However, each time an online post was assigned the name DeShawn, the online post was scored higher. There was a statistically significant difference. This finding suggests that perhaps instructors have lower expectations for a student of color when assessing student work online. The implications for online scoring are to ensure that all instructors are well informed on best practices in multiculturalism and that instructors create high expectations for all students.
Teacher, nurse or both: How to plan, instruct and assess an education course for nursing students.

Teacher, nurse or both: How to plan, instruct and assess an education course for nursing students.

Health Education

Workshop

This presentation is designed for nursing instructors who work in higher education who are interested in creating an education course for nurses that incorporates an interdisciplinary approach to planning, instruction and assessment. The course created addresses the conceptual framework that guides the art and science of teaching as it relates to nursing content.

Dr. Gina Haughton, PhD
Teacher Education Division
Cardinal Stritch University

gmhaughton@stritch.edu
Research Paper

What is the value of interdisciplinary planning, teaching, and assessment? Too often colleges and the programs within the colleges, focus their time and efforts on their own respective work. While this is important for the viability of the programs, it does not allow for learning to fully develop nor does it lend itself well to providing rich learning experiences for students. According to Jacobs (2009) in 2007 the University of Michigan at Ann Arbor has intentions of hiring 100 faculty members all of whom had experience in areas that advance interdisciplinary teaching and research. This paper outlines the way in which an interdisciplinary course was created to meet the teaching needs of nursing students.

The initial step in creating the course was to planning for student learning. This course was first created by examining the content in the nursing program and attempt to identify gaps. Data was also gathered from students in the program to ascertain how prepared students felt in terms of teaching patients during consolations. After the data was analyzed, course outcomes were developed and faculty from both the college of educational leadership and the college of nursing engaged in strategic conversations to discover the similarities in the content and program outcomes that were currently being delivered to students. This process allowed faculty to examine cross-curriculum to pinpoint where concepts were being taught or not. The course could then be written and offered to students.

While it may seem as though teaching the content created is the easy part because we teach all the time, but there are challenges when teaching in interdisciplinary courses. Because interdisciplinary teaching is not necessarily team teaching, faculty may be teaching the course without the physical support of the faculty in the dominant course content. The lack of being a content expert can be difficult when instructors are unable to provide clear examples and build
upon students prior and background knowledge in the students’ specific content area. Asking for
the content experts to remain involved in the pedagogy after the initial course planning has been
completed will help eliminate potential pitfalls. Frequent check-ins between the faculty should
continue even after the course has begun.
Likewise, while planning and instruction continue throughout the process of creating an
interdisciplinary course, assessment should follow suit. Contrary to popular belief, assessment
should not only be implemented at the end of the course. In the nursing interdisciplinary course
that was created last year (2014), a research study is in the process of being completed to
examine student perception of learning that occurred, as well as measuring the cultural
competency of the students. The study will include a student focus group to discuss additional
themes and student perceptions. The study is in hopes of creating an assessment tool which will
aid in faculty in interdisciplinary planning, instruction, and assessment.
Cross-disciplinary Pilot Project with Organizational Psychology and Art Therapy: “Lunch and Learns”

Megan Pinfield MA Duanita G Eleniak PhD Patrick O’Neill PhD
Adler University, Vancouver BC Canada # 1116
mpinfield@adler.edu deleniak@adler.edu poneill@adler.edu

Abstract: A pilot project of “Lunch and Learns” at Adler University, Vancouver BC Canada demonstrates the effectiveness of cross-disciplinary graduate education for MA Organizational Psychology and Master of Counseling: Art Therapy students. In this leading edge educational initiative, students provided onsite interactive learning events to organizations and presented business professionals with practical take-aways, tools and techniques for enhancing well-being and performance at work. Including graphic recording as part of the presentations provided businesses exposure to innovative visual ways to enhance imagination, creativity and productivity in the workplace. The pilot project, its background and rationale are described in the paper, as are first pilot-testing and evaluation results regarding its benefits and improvement needs. We conclude the paper by outlining future implications particularly for education in organizational psychology and art therapy-based organizational consultancy.

INTRODUCTION

The basis of this pilot project conducted at Adler University, Vancouver, Canada was to provide a cross-disciplinary educational experience for students in the Master of Arts in Organizational Psychology (MAOP) program and the Master of Counselling: Art Therapy Program (MCP:AT). The intent was to operationalize the Adlerian value of community by giving students from the different programs a project to partner on in order to foster communication and connections on campus. Alfred Adler wrote about people maintaining healthy functioning as centering around the ideas that fundamentally humans all have a need to belong (Ferguson, 2010) and that a sense of cohesive community is crucial to Well-Being (King & Shelley, 2008). Thus the importance of a positive community atmosphere on campus and creating living connections between students in different programs has always been valued at Adler University.

The students were linked through a “Lunch and Learn” project which provided onsite interactive learning events to organizations and presented business professionals with practical take-aways, tools and techniques for enhancing well-being and performance at work. Including graphic recording as part of the presentations provided businesses exposure to innovative visual ways to enhance imagination, creativity and productivity in the workplace. The need for 21st century organizations to open to innovative
strategies as a way of engaging employees and exploring new ways of thinking (Adler, 2006) made graphic recording the ideal link between the disciplines. The student teams learned how to join knowledge in their fields into a creative combination that meets the need for change in the way organizational consultancy is delivered.

**Connections to the Research:** Education for organizational psychology and counseling/art therapy students at this time in history when there are dramatic and constant changes in the economy, technology and our way of life requires a forward looking vision which includes the decompartmentalization of our graduate education structure.

Research is showing that an increasing number of companies are including creative processes in their strategies for management (Adler, 2006) in order to increase engagement and effectiveness in meetings and workplace wellness (Smith, 2014). The effectiveness of working with visual techniques to deliver engaging and memorable training and developmental experiences for employees is also being increasingly recognized (Bailey, 2011).

Hands-on, experiential learning with particular attention to the visual component is being worked with as a tool to enhance visioning (Sibbet, 2012) and transform productivity in the workplace (Sibbet, 2010). As art therapy-based organizational consultancy becomes more recognized (Huet, 2011) the need for cross-program education to meet the unique training requirements becomes more vital than ever.

**PROJECT DESCRIPTION**

**Who:** Graduate students in the MAOP and MCP: AT programs were crossed trained by Program Directors and faculty in each department. Consultants were invited into the training process to bring in the community perspective.

**Educational Objective:** Program Directors wanted to increase “workplace wellness” within the organization of the University by aligning with Adlerian values of community in order to create for students a “sense of belonging” to a greater community than just their individual program of study. It was recognized that such an atmosphere of increased connection and conversation could give rise to innovative and creative educational
experiences. The experience was “made real” by including the local business community who also served our educational mission of training socially responsible practitioners.

**Initial Training Workshop:** MAOP and MCP: AT students came together for the first time in a 3 hour workshop to train in: a) the basic skills of graphic recording; b) dynamic presentation skills; and c) professionalism.

**Student Involvement:** Students from the MAOP and MCP: AT programs were engaged to deliver a majority of the Initial Training Workshop in order to maximize their feeling of ownership of the project. A senior MAOP student prepared a PowerPoint presentation to teach her peers the following information:

- a) an overview of the project;
- b) how to make and deliver effective presentations;
- c) an introduction to graphic recording;
- d) an introduction to the topics that would be the focus of the presentations.

Four MCP: AT students were engaged to graphically record the Initial Training Workshop in real time, as a live demonstration of what would be taking place when the students presented the Lunch and Learns to different community organizations.

The four graphic recorder students were situated at the front of the room alongside the MAOP student presenter. Each recorder worked in his/her own artistic style to create a visual image of the content of the presentation. The MAOP student presented the pilot project concept, the outline of what the students would be expected to do and the basic framework for a powerful presentation to a company while the graphic recorders worked to highlight specific facts, concepts and ideas using visual images drawn on an easel. This innovative and engaging learning experience provided the foundation for what was to come for the students over the next few weeks.

**Topic Creation:** MAOP students were asked to generate presentation topics that: a) they were most passionate about; b) would be most relevant to business leaders and working professionals; and c) they saw as a potential niche area in their field. This initial list was presented to organizations who
were asked to choose topics immediately relevant to their organization and directly applicable to the work the company performs.

Companies were allowed to choose from the following list of topic ideas:

• The 21 day happiness challenge: Building the five pillars of well-being at work
• Job crafting: Shaping the future of your work
• Finding “Flow”: The art and science of mindfulness
• Building high-performing work teams
• Leading from the field: Navigating the collective emotions of a room
• Gratitude and Appreciative Inquiry: Creating an upward spiral
• Creating and sustaining positive habits: Bridging science and practice
• A leader’s guide to Co-Active coaching
• Developing a blended value proposition: People, planet and profit
• Transforming your survey data into sustainable change
• Design thinking and practice: Innovating in a corporate context
• Investing in strengths: Leveraging your signature strengths at work
• Resilience at work: Building resilience in the face of change and uncertainty
• Creating from conflict: Finding the eye of the storm
• The envisioning lab: Creating and living into a shared vision

**Positive Psychology:** The topics chosen were all in line with the current trend towards incorporating positive psychology concepts and practices within the workplace to promote wellness and productivity. Positive psychology is defined here as “a science of positive subjective experience, positive individual traits and positive institutions” (Seligman & Csikszentmihalyi, 2000, p. 5). Positive psychology seeks to compliment, rather than displace, the historical focus of clinical psychology on mental illness by emphasizing “states of optimal human functioning and fulfilment, and the facilitation and promotion of well-being” (Emmons, 2006, p. 3).

The most popular topic requested by almost every organization was the “21 day happiness challenge”, which is in line with the positive psychology movement. The students ended up presenting on "Resilience at work”, "Job crafting", "Gratitude and Appreciative Inquiry”, "Creating from Conflict", "Finding Flow” and "Investing in Strengths”.
**Team Selection Process:** After the Initial Training Workshop students from each program were asked to team up so that there were two MAOP presenters paired with one MCP: AT student who would be their graphic recorder. Many students chose to pair up based on mutual interest in a particular presentation topic. Others paired up based on what they thought would be a good organic fit between personalities. The team selection process was a learning experience for the students from both programs since building effective teams and working with different personalities was a major part of this project. Students in the MCP: AT program learned how to speak the “MAOP language” of Organizational Psychology and the MAOP students learned to speak in metaphors and symbols – a more “artistic visual language”. Both groups of students ultimately had to adjust and adapt their styles to create a new presentation together for the benefit of the organization they would present to.

**Preparation of the Presentations:** Once the teams were formed, the students were responsible for meeting and practicing their presentations. Areas for evaluating their performance were provided and each team was instructed to ensure that their presentation met all criteria. For the pilot project, the students were given one week to put their presentations together and polish their performances before presenting to a team of evaluators at the Dress Rehearsals.

**Dress Rehearsals:** The Dress Rehearsals were conducted at the Adler University campus in several different rooms. Each room had a team of evaluators consisting of a Community Consultant, one MAOP and one MCP: AT faculty member who provided written and verbal feedback to the students immediately after their presentations. An evaluation form was created that included feedback on the content of the presentation, the style of the presenters, the presenter characteristics and the use of graphic recording to enhance the experience. Students were expected to come to the Dress Rehearsal fully prepared and appropriately dressed “as if” they were presenting to their actual organization.

Many of the teams struggled through the Dress Rehearsal. This was due to: a) the lack of practice time; b) unfamiliarity with subject matter; and c) teammates working in differing modalities. However, the Dress Rehearsals were an enormous part of the learning experience for everyone involved in the project. The students learned how to work under ‘real life’ pressure and discovered what it takes to be mindfully prepared to present in the moment.
The project coordinators learned valuable lessons about coaching students and giving effective feedback.

**Delivery in the Community:** After the Dress Rehearsals students were asked to polish their performances before going out to present to the business community. The students then delivered their presentations as onsite learning events through complimentary “Lunch and Learn” sessions. These sessions were interactive and engaging, presenting business professionals with practical take-aways, tools and techniques for enhancing well-being and performance at work.

The organizations themselves represented a heterogeneous sample of for profit and non-profit organizations throughout the lower mainland. Teams were responsible for tailoring their presentations to the individual organization that they were presenting to. Despite the short notice to the participating organizations, there was overwhelming demand for student teams to present and each team was eventually matched to two different organizations.

**The Organizations:** The organizations covered a range of industries, including business consulting, banking, professional sport, health care, social enterprise, and the public service. Marketing for the event was minimal. Within a week of sending out our invitation to the British Columbia Organizational Development Network and our practicum partners more than enough participating organizations were identified for each pair of students to be matched to two organizations. In order to meet the demand, we needed to recruit Alumni to present as well.

The participating organizations are listed below:

- HiVE Society
- Homewood Health
- Parkgate Community Services Society
- Blue Shore Financial
- The Vancouver Whitecaps
- The City of Vancouver
- Whitewater West Ltd.
- South Granville Senior’s Centre
- Health Services BC
- Spark Expansion Consulting
Evaluation: Each participating organization was provided with a Lunch and Learn Workshop Evaluation Form (See Appendix A) to supply the students, faculty and organization feedback about the experience. Each team received the written feedback from their site and this feedback was collected and analyzed by the project coordinators. Both quantitative and qualitative evaluations of student performance were gathered from the perspective of participants.

Participant Evaluation Measure: A 26-item Deeper Learning Assessment Instrument (DLAI) was developed to measure the extent to which the intended objective of creating a contextually-based, experientially driven, transformative learning experience was achieved from the perspective of participants (see Appendix A). Participants were first asked to assess each of the items on a five point Likert scale from “strongly disagree” to “strongly agree” followed by a series of open ended questions where participants could provide feedback on the strengths and developmental areas of each co-facilitator. The instrument was derived from the grading guide provided to students to guide their preparation (see Appendix B).

Results: An analysis of descriptive statistics for the DLAI and qualitative comments from participants for the first and second learning event was conducted to determine student performance on each of the learning criteria, identify strengths and opportunities for development, and ascertain whether performance improved between the first and second workshop.

Average scores on overall satisfaction (4.5) indicate that participants were generally satisfied with the learning experience. Results further indicated that in all of the pairs, mean scores for each of the learning criteria increased between the first and second learning event. Students attributed this increase to a “practice effect” noting an increase in confidence both with the content and facilitation skills (e.g., powerful questions, active listening), a willingness to rely less on notes and slides, incorporate more of their own authentic personality into the learning experience, and adapt their content and process to meet the needs of participants.

Contextually based: An average score of 4.3 for the contextually based learning scale indicates that participants found the learning event to be tailored to the needs of participants (4.6), meaningful, and relevant to the
working lives of participants (4.5), and walked away from the experience with new knowledge (3.8) and valuable resources (4.3) they could immediately put into practice. Several participants reported a deeper level of self awareness, which was reinforced in some cases by self assessments of, for instance, personal resilience and work related well-being. An expanded awareness of the organization’s collective capacity was also reported by participants.

Examples of practical resources students developed for participants included a USB key with videos, websites, PowerPoint slides, publically available articles and a bibliography of additional references. Other pairs of students prepared websites or blogs where participants could go to access additional resources and participate in discussion threads to continue the dialogue and expand their learning community. Several participants expressed a desire to keep the graphic representation of the group’s learning experience on display as a “practical resource to remind us of our creative capacity”, “an anchor we can always return to” and a “symbol of our community”.

**Experientially Driven:** Results indicated that, overall, participants were emotionally and intellectually engaged by the learning events (4.1) and felt that the students reached an appropriate balance between the presentation and experiential components (4.3). While participants expressed an appreciation for the research findings and conceptual frameworks presented, the majority of the comments focused on the value gained from the experiential activities such as a mindfulness meditation, the “opportunity to share with and learn from co-workers and others”.

A common theme that emerged across host organizations was a desire to engage in “open and authentic discussion rather than a lecture”. The opportunity to engage in open discussion combined with personal reflection enabled a realization among participants that “I know more than I thought on [the topic] and there are others who care about it as much as I do”. A number of participants expressed a felt sense of community that stemmed from “knowing that others struggle with the same challenges I face with this topic [resilience]”.

Opportunities for development focused on a similar theme where participants felt that some workshops would have benefited from more experiential exercises and collaboration among participants. Additional feedback suggested that the time constraints prevented the group from
engaging in a deeper, more meaningful discussion and application of the topic to their working lives. Participants further reported that students could develop their skills in debriefing experiential activities to internalize the principles and tactics covered, explore potential action steps, uncover opportunities and challenges participants may encounter, and come up with collective strategies to overcome them.

**Transformative:** The average score on the transformative learning scale for the first (3.4) and second (3.9) events with a high standard deviation (2.4; 2.1, respectively) suggests that participants were varied in the extent to which they experienced a significant shift in their beliefs, values and/or assumptions about the topic (3.5) and left the workshop committing to a meaningful change in some aspect of their lives (3.8). Below is a representative sample of comments that indicate a significant shift took place in beliefs, values and assumptions and commitment to action.

“I’m leaving with a new definition of resilience I can own.”

“I’m determined to use the information from positive psychology to improve my day to day working life.”

“I leave with a renewed appreciation of my own strengths and the strengths of this organization.”

Interestingly, these comments came from workshops where there was a closing activity requiring participants to commit to taking a meaningful action step following the workshop to improve their personal or professional lives. They were then asked to follow up with the presenters letting them know what step they took and any impact this new behaviour had on themselves and others in their lives. Some students chose to set up an exclusive online discussion thread for participants and co-facilitators where they can share their action steps and support each other as they face current and future transitions.

**Co-facilitation:** Average scores on co-facilitation for the first (3.8) and second (4.3) learning event suggest that the students demonstrated the competencies covered in rehearsal and that these skills improved with practice. The highest rated competencies for both events were demonstrating curious inquiry, powerful questions and active listening (4.5) and complimenting each other’s presentation style presenting in a complimentary, cohesive and mutually supportive partnership (4.3). While
recognizing and shifting the emotional energy of the group (3.4) and adapting the presentation content and process (3.7) to achieve the desired learning objectives were the lowest rated competencies for the first event, notable improvements were made in the second event (3.7 and 4.2, respectively). The following comments highlight the competency strengths of the co-facilitators from the perspective of participants:

“The flow of the presenters conducting workshop was excellent.”
“Both facilitators were great listeners and encouraged participants to speak up.”
“Excellent job bringing everyone into discussion - listening and reforming answers and respecting the participants.”
“Facilitators created an open-minded environment where it was easy to learn.”

Participants also highlighted opportunities to improve the co-facilitation by “engaging the audience more”, “relaxing, breathing and pausing”, and “providing more specific examples relevant to the working context rather than high level examples.”

**Presentation:** With respect to the presentation style, participants strongly agreed that visual aids were well prepared, informative, engaging and not distracting (4.2) and that the co-leaders brought their authentic personality, artistry and creativity (4.4). These scores were fairly consistent across the two learning events (4.0 and 4.5, respectively). Evidence of authentic expression can be found in qualitative comments where participants noted the unique qualities of the facilitators, such as “a good sense of humour”, “great story teller”, “talking from personal experience”, and a “calm demeanor”.

Participant comments related to student creativity and artistry highlighted the impact of graphic facilitation on participant learning:

“The image capture piece was really creative and compelling. I've never seen that before and the visual/spatial element brought the words to life. So much better than just plain text.”

“The graphic display created an accessible and imaginative aspect that pulled all components together.”
“The visual images helped get us out of our heads”.

For the most highly rated graphic facilitators, participants noted the importance of “explaining the purpose of the graphic facilitator and ongoing explanation of imagery rather than silent participation.” For a number of events, participants would have wanted “a more thorough debrief and explanation of the graphics” in order to fully appreciate its value. To the extent that these elements were missing from the workshop, graphic facilitation was more likely to be seen to distract rather than contribute to participant learning.

**Debrief Meeting:** Students were invited to attend a Debrief Meeting after each team had presented to their chosen organization and after the evaluations were done. In these meetings teams shared their experiences about what worked and what did not with each other and staff at Adler University.

Many interesting insights came out of the Debrief Meetings. For example, several teams shared that the graphic recording during the actual presentation was distracting for participants and therefore they chose to move their graphic recorder to the back of the presentation room thereby minimizing the distraction. For these teams the graphic recorder presented the organization with the completed visual image at the end of the presentation. Other teams decided to keep their graphic recorder front and center but have him/her focus on highlighting just a few key points they wanted to make.

In order for these insights to come to light teams had to experiment, take some intellectual risks and learn to communicate openly and honestly with each other throughout the project. The Debrief Meetings also served as informal celebrations of the hard work and effort that went into the project. Students left the session feeling a sense of accomplishment and knowing that they had some very valuable presentation skills and connections with other professionals that they did not have prior to participating.

**IMPLICATIONS**

This pilot project has implications for the field of education, the Adler students, Adler University and the organizations involved.
Implication for the Field of Education:
For both the field of art therapy education and organizational psychology the need to develop and research the impact of cross-disciplinary training specific to art therapy-based organizational consultancy is indicated particularly given current challenges in graduate education. Innovative organizational explorations are indicated with regard to working with art therapy to strengthen the other half of our brains and bring the practice of psychology back into alignment with the origins of our field – the psyche or “animated spirit”.

Implication for the Participating Students: There are research implications with regard to students expanding their social and professional network and profile to differentiate themselves in a competitive labour market emphasizing professional experience. This project provided a “real life” opportunity for the students to not only learn from the faculty and staff but from each other across departments. MCP: AT students became familiar with how their skills could be utilized in the business world and MOAP students gained more insight into how the world of visual representation can make the “invisible visible” in a way that connects ideas and people. The seeds of new opportunities have been sown in the students through gaining experience of how it feels to partner with people in other fields of knowledge in order to engage in socially responsible practice.

Implication for Adler University: Areas for further research include the impact the lunch and learns have had on program enrolment and local recognition of the University and participating programs.

Adler University with its emphasis on community values and training socially responsible practitioners is in a unique position to provide cross-program education which spurs the training of a whole new breed of professionals equipped to meet the needs of the working world. As long as the University continues to “walk its talk” and operationalize the values of community and connection on campus in order to achieve the ideal of optimal functioning for students, creative and leading edge Alumni will continue to graduate and make a real difference in the world.

The Lunch and Learn project created an atmosphere of collaboration and community that has stayed with the student population at Adler University long since the project itself finished. Many of the MCP:AT – MOAP students have continued to work together on other school initiatives and
projects. Several teams have forged meaningful collegial partnerships that will see them through the rest of their education at Adler University and into their careers after. The project fostered a true spirit of team work among all who participated including the faculty members who have continued to collaborate and develop this project for the future.

It is creative intersections like these that contribute to the public perception of Adler University as a dynamic and student centered institution that provides outstanding educational experiences for its students, staff, faculty, Alumni and Community Partners.

**Implication for the Organizations:** Future research is needed with regard to bringing the science and principles of psychology to the organizations and the broader community in a way that is compelling, accessible, and of immediate use. A community partnership with a University who keeps up with the leading edge of thought and research is a powerful alliance for any business organization with a vision to keep up with the constantly changing times.

**Implications for Future Projects:** For future projects of this nature the following is recommended:

1. That suggestions from participants on future topics of interest be incorporated to maintain the relevance of the content.
2. That consideration is given to making online discussion threads on the organization’s intranet a standard offering to deepen the learning, create a community of support, and forward action on participant goals.
3. That a Deeper Learning Assessment Instrument be developed including action to:
   a) Establish the validity and reliability of our participant evaluation form as a student thesis project.
   b) Re-administer the transformative scale to participants to determine whether personal and organizational change has been sustained over time.
   c) Have co-facilitators self rate their own performance using the instrument to compare their perceptions with those of participants.
4. That the Debrief Meetings be kept and **amplified** particularly because of the need to identify subtleties due to the newness of the experience.

5. That the Project be incorporated into credit courses. The MCP: AT students could be offered instruction on the basics of Graphic Recording and Graphic Facilitation (two separate but similar disciplines) where they could be taught graphic recording skills such as developing a visual short hand specifically for common terms in the business world. Specific emphasis would be on provision of graphic recording within the context of a lunch and learn designed to enhance the learning experience.

6. That more time be devoted to practice sessions for the teams so that the dress rehearsal portion of the project is a much more professional presentation experience for the students. Specific attention would be paid to teaching:
   a) Facilitating debriefs;
   b) Recognizing and shifting the emotional energy of a group;
   c) Adapting presentation content and process in real time (i.e., “dancing in the moment”);
   d) Designing an alliance between co-facilitators;
   e) “getting present” prior to the event;
   f) Reducing the content covered to allow more time for group interaction and discussion.

7. That with regard to marketing:
   a) More time be given to market the joint venture;
   b) That the contact person be someone who is involved in the event so that potential participants can get answers to their questions immediately. (Vezina, M.)

8. That the University ensures enough students to cover interest and high demand.

9. That the “Star Framework” (O’Neill & Eleniak, 2015) for co-active facilitation continued to be developed as an educational tool for other educators interested in cross-disciplinary training.

CONCLUSION
Choosing to visually represent the group dynamics that happened during presentations at the “Lunch and Learns” was an innovative, cross-disciplinary addition which contributed significantly to providing memorable workshops for the business community and forging relationships between them and the University, connections which will serve everyone well into the future. The results of this pilot project indicate the need for continued exploration into crossing the educational fields of art therapy and organizational psychology in order to train dynamically effective teams of art therapy-based organizational consultants. It is this “new breed” of graduates who can meet the increasingly recognized need for creative, innovative and imaginative practices in organizations for the optimization of productivity and workplace wellness.

5. Email: rkuioka@hawaii.edu
   Email: claref@hawaii.edu

6. Abstract

   The purpose of this poster presentation is to provide a model of how two professional colleges introduced and utilized online advising management tools in response to increasing inquiries, applications, and enrollment.

   To help better serve the student population as well as the staff, the Shidler College of Business responded by devising an efficient, cost-effective approach, which utilized the combination of a Microsoft Access database and an online application website. This resulted in a streamlined admissions process and easier data accessibility for the college when evaluating, notifying, and advising prospective and current students.

   In response to accepting direct admission of students, the College of Education developed and employed an online admissions website. This approach provided the college with a much needed system to differentiate between pre-education students and students applying for teacher licensure. This online database allowed college advisors to be kept apprised of student records and enabled them to provide information to students in an online environment.

   As a result of utilizing online management tools, both colleges are better prepared to respond to student inquiries. The creation of an online database provides the first step to better organization and easier access to a student’s status, as well as, verifying any completed or missing requirements for admission and graduation. Advisors spend less time logging in data and generating reports, and it allows them to provide consistent advising to all student inquiries. The online databases collect student admissions data, while also connecting students’ records to their course equivalency petitions and contributes to the mandatory advising policy at our institution. This enables advisors to access up-to-date information and properly advise students if they have any missing requirements. Additionally, the online
application enables students to easily apply from anywhere, and eliminates the time and effort of data entry for staff. This allows the advisors to evaluate applications and records quickly, thus creating a faster turnaround time in responding to students.

The learning objectives of this poster presentation are:
1. To provide background about the colleges’ shift towards online advising management;
2. To share challenges and successes of employing online database tools; and
3. To share future objectives and the plan to develop the use of the online databases.
The Effects of Mentorship on Recruitment & Retention

Abstract

Retention can be defined as the act of keeping someone or something; in this case, it is the act of keeping someone (mostly incoming first, full time freshman) in school for all four years. According to past literature, there are a variety of tools useful for increasing retention (e.g., Jamelske, 2009; Gold & Albert, 2013; The Vindicator, ND). Retention and recruitment are related to one another as the competition for the most qualified students has increased in recent times (Jamelske, 2009). The current paper aims to assess the effects of student ambassadors and faculty mentoring on retention rates.

Retention.

There are many factors that affect retention (e.g., Rickinson & Rutherford, 1995; Wetzel, O’Toole, & Peterson, 1999; Friedman & Mandel, 2011; Roderick, Coca, & Nagaoka, 2011; Gold & Albert, 2013), such as full time status, academic preparation, income, race and ethnicity, feeling unprepared academically and emotionally, degree of loyalty to the institution, and poor academic performance. These factors are consistently tracked and updated to give a better picture of what retention at an institution is. Jamelske (2009) noted that having a college degree has become a necessity for young adults, in order to be competitive in the job market.

Previous research finds that prior to a student’s senior year of high school, the aspirations of the student are influenced primarily by their parents, but during the senior year, the student is primarily influenced by their peers, teachers, and counselors during the application and school decision process (Bell, Rowan-Kenyon, and Perna, 2009; Hossler et al., 1999). Wetzel, O’Toole, and Peterson (1999) suggested that retention could be influenced by the development of an explicit five year program that restricted a student’s course load to 12-credit hours, unless the student could 1) demonstrate superior background prior to enrollment or 2) demonstrate superior
academic performance such as at least a 2.5 or better GPA. Further, Gold and Albert (2013) stated that 9 states have actually found a way to improve performance in areas of retention and completion by providing financial incentives for colleges and universities. Specifically, Tennessee provides opportunities to earn a financial supplement of 5.45% of education/general budget. In order to earn this supplement, the institution must 1) obtain accreditation; 2) test graduating students in their major fields, in their general education content, and demonstrate that student performance is at or above national averages on these standardized tests; 3) conduct multiple satisfaction surveys; 4) peer review their academic programs; and 5) implement successful assessment activities for students.

**Approaches.**

As previously mentioned, there are a variety of ways to recruit and retain students. A study by Wilson, Mason, and Ewing (1997) showed that 561 Iowa State students receiving psychological counseling had a 14% higher retention advantage over their non-counseled counterparts. Jamelske (2009) conducted a study which advocated for a first year experience (FYE) program, which was designed to strengthen the connection between the university and student, by providing opportunities for students to interact with a small group of peers. The primary focus of the study was to assess the degree to which the FYE program positively impacted student retention and GPA after 1 year, while controlling for factors related to retention and academic performance. The results showed that having a higher high school rank, entering college with existing credits, living on campus, and being a male increased the probability of retention, whereas having an undeclared major, being a first generation college student, and being an older student were associated with a lower likelihood of returning after the first year.
UNC Charlotte recommended creating mentoring programs to increase peer relationships to increase retention. Mentoring programs could link upperclassmen and freshmen and new transfers. *On Point for College* suggested using successful college students to lead campus tours for prospective students. *50 Creative Ways Colleges Are Recruiting Students Today* stated that student ambassadors and showcasing activities are useful tools to reach out to recruits and to impact retention. Crosby (2008) further established this claim by suggesting peer mentors play a major role in programs, with the mentors working up to 12 hours per week with students (e.g., taking them to social or athletic events, study sessions, etc.) The Vindicator (2014) even presented Lee College’s use of showcasing programs. Lee College used hands-on demonstrations, exhibits, and one-on-one conversations with instructors to help students learn about the wide variety of programs available at the college.

**So what’s the Common Denominator?**

Mentorship is a common factor within the above models of recruitment and retention. This proposed study will look at mentorship for both an undergraduate face to face program and an online master’s program. The face to face program utilizes student ambassadors for retention and the online program utilizes faculty mentoring for retention.

According to Rhodes, Sherwin, and Smith (2006), student ambassadors act as good role models, are mature and successful, and can recite their own experiences to potential recruits and colleagues. This study will look at a student ambassadors program and a faculty “care” program that has been established at two different institutions, and evaluate if these methods have had an impact on students relative to recruitment or retention.
**Student and Faculty Mentoring**

The purpose of a student ambassador program that will be evaluated in this study is to promote the school through various recruiting/retention activities. In order to become a student ambassador, students must have completed their first semester, attend a training session at beginning of each semester, attend 1 of 2 Showcase meetings where external parties come to view the campus, attend an Advisory Board Meeting (so students are familiar with external advisory board members), attend Convocation, attend a student forum, set up a meeting with admissions to go through overall campus tours, sign up for two Fridays a year to be available to conduct tours of the school and be available for other events hosted by the school. The student ambassador program is promoted to develop a student ambassador’s recognition, networking-skills, development of interpersonal skills, and improve their job potential.

The faculty mentoring that will be evaluated in this study includes an 1) online orientation, 2) an acceptance packet sent to students that includes friendly items to perk students’ interest such as an eraser (for making mistakes), a rubber band (to help remember to be flexible) etc., 3) virtual participation in an honors assembly with faculty, and 3) a regular school newsletter as well as 4) continual communication to students from faculty and directors.

**Limitations**

While faculty mentoring and the use of ambassadors are helpful in obtaining higher retention rates, there are still situations that are unavoidable. Lau (2003) stated that freshmen might be overwhelmed with the transition from high school to college life. They can become so overly stressed by the dramatic changes that they may not finish their first year of college. In a study by Rickinson and Rutherford (1995), the researchers found that homesickness was a primary issue that blocked the student’s ability to make a commitment to the new environment
(institution), which in turn affected the retention and completion rates. There is even the possibility of having poor ambassadors. In Chimes and Gordon’s study (2008), the student ambassador at Gill St. Bernard’s School noted that many of the guides he encountered were unpolished, misinformed, somewhat socially inept and not particularly persuasive.

Disadvantages related to faculty mentoring can include overdependence on the mentor by students or negative halo from the faculty mentor who fails. In addition, mentoring requires a time and energy commitment and there can also be a negative halo effect from a student who fails (APA, 2015).

**Practicality**

Ashburn (2007) stated that fewer than 10% of high school students used Facebook, or YouTube, to gather information about colleges; 84% of high school graduates used college websites and 64% of high school students used campus visits most heavily in their research. Seventy one percent (71%) of those students believed the campus visit to be the most trusted source. Additionally, the report suggested colleges should design recruitment materials and campus tours to be more catered to a student’s expected field. It would stand to reason that by implementing a student ambassador program, retention rates could be increased. And, by implementing a targeted faculty mentoring program retention rates could be increased.

This study will survey existing students to see if either the ambassador (with face to face college students) or faculty mentoring (with on line college students) does indeed have an impact on retention.

Title of Submission:

A CLASSIC GROUNDED THEORY STUDY
ON THE LEADERSHIP-SPIRITUALITY CONNECTION
AMONG ACADEMIC LEADERS OF DE LA SALLE UNIVERSITY- PHILIPPINES

Paper Author:

Name: Dominador F. Bombongan, Jr.

Department: Educational Leadership and Management Department

Bro. Andrew Gonzalez College of Education

University: De La Salle University

2401 Taft Avenue, Manila 1004, Philippines

dominador.bombongan@dlsu.edu.ph

Abstract

The proposed topic for presentation draws from a dissertation project which is still a work in progress. It is about the academic leaders of De La Salle University (DLSU) - Manila, a premier Catholic institute of higher learning in the Philippines, and how spirituality interfaces with their leadership roles and functions. Considered the engines of growth for DLSU, they are responsible for academic innovations and reforms that keep DLSU in the forefronts of the academic endeavor. Using the grounded theory methodology, the study will specifically look at the contribution of spirituality in the exercise of their roles and functions and how it enhances the leadership knowledge, skills and competence they already possess. The paper presentation will then have a three-fold foci (1) a sharing of experience about the process of investigation of the study; (2) the challenges encountered by the dissertation writer and; (3) the initial findings regarding the leadership-spirituality nexus among DLSU academic leaders.
Abstract

Finnish education has been a widely discussed topic in recent years due to the country’s high scores in reading, mathematics, and science on international standardized assessments. Using narrative inquiry as a research method, this study goes beyond the existing quantitative data to explore Finnish education through the personal narratives of six Finnish educators. Participants’ lived experiences in connection with the University of Helsinki’s elementary teacher education program highlight the importance and reality of research-based approaches.
Abstract

Throughout the past decade, Finland’s educational system has been in the international limelight due to its consistently high scores on standardized assessments, such as the Program for International Student Assessment (PISA), Trends in International Mathematics and Science Study (TIMSS) and the Progress in International Reading Literacy (PIRLS). The plethora of quantitative information about Finnish students’ achievement in reading, mathematics and science such assessments provide contributes to the perception that we know a lot about Finnish education. A deeper look into the country’s educational system, however, reveals that teacher education programs focus heavily on research-based approaches (Lauriala, 2013; Toom et al., 2010; Westbury, Hansén, Kansanen, & Björkvist, 2005; Jyrhämä et al., 2008; Sahlberg, 2011; Jakku-Sihvonen, Tissari, Ots, & Uusiautti, 2012), and Finns have a different perspective on “quality teaching” compared to Americans (Rice, 2003; Goldhaber, Liddle, & Theobald, 2013; Parpala & Lindblom-Ylänne, 2007). The purpose of this study is to burrow into Finnish educators’ personal narratives to ultimately discover the Finnish educational system—including specifically how elementary educators are prepared—from their unique perspectives and in their own words. Through this narrative inquiry research, professors, preservice teachers, and classroom teachers share their lived experiences to shed light on the existing quantitative data.

Research Objectives

The primary focus of this study is to gain insight into how Finland trains its elementary teachers. To better understand Finnish teacher education, we burrow into the
nuances of how its programs are structured as well as how Finnish educators perceive assessment. Additionally, because teacher quality and research-based approaches are presumed to be quite different in Finland and the United States, these issues are addressed with the participants.

Figure 1. Primary and secondary research questions.

Methodology

Connelly and Clandinin’s (2000) commonplaces provide the theoretical framework for this narrative inquiry. The temporality involves the past, present, and future of participants’ lives, as well as the University of Helsinki’s Department of Behavioral Sciences. Participants’ internal conditions and relationships among participants and the researcher form the sociality. The University of Helsinki, nestled in Helsinki, Finland, comprises the place of this narrative.
Figure 2. Commonplaces in narrative inquiry.

Using the story constellations (Craig, 2007) approach to narrative inquiry (Clandinin & Connelly, 2000), this study draws upon the experiences of educators from the University of Helsinki’s Department of Teacher Education. Both classroom teachers, both professors, and one of the preservice teachers are female; all six participants are Caucasian and Finnish citizens. With these individuals, this study contains a female to male ratio of 5:1 or 83%, which is similar to the actual female to male ratio of 79% of teachers in primary schools in Finland (Corselli-Nordblad, 2013; Deretchin & Craig, 2007). The participants shared their stories of experience (Connelly & Clandinin, 1990) through electronic email during the fall of 2014 and the spring of 2015, as well as a focus
group, interviews, and shadowing experiences that took place during February 2015 in Helsinki.

In Figure 3, below, the circle represents a community, and each star represents an individual educator and his or her narrative. My task as the narrative inquirer was to interpret and re-interpret participants’ stories alongside them. Narratives were then burrowed into within the broader context of Finland’s outstanding performance on international assessments. Part of the distinctiveness of this narrative inquiry is that it seeks to share the stories of individuals, juxtaposed in a unique period of time when there is much debate surrounding the topic of international assessments.
Figure 3. Story constellation.
Outcomes and Implications

The analysis of the constellation of participant narratives highlights how the University of Helsinki’s elementary teacher education program is structured, how it employs research-based methods, and what Finnish educators have come to believe about quality teaching and assessment.

An in-depth, comprehensive curriculum, limited practicum experiences, and research-based approaches emerged as a few of the commonalities among narratives. The narrow gap between theory and practice is evident through Finland’s teacher training schools and emphasis on research at the undergraduate and graduate levels. Varying views on assessment are an example of how narratives diverge. International standardized assessments do not impact educators’ daily lives; however, some elementary educators value formative classroom assessments more than others do.

Ultimately, some aspects of the existing literature are confirmed. This includes how research-based approaches are a critical component of elementary teacher education programs (Lauriala, 2013; Toom et al., 2010; Westbury, Hansén, Kansanen, & Björkvist, 2005; Jyrhämä et al., 2008; Sahlberg, 2011; Jakku-Sihvonen, Tissari, Ots, & Uusiautti, 2012), and how, generally speaking, the alignment between teaching and assessment are viewed as quality teaching (Parpala & Lindblom-Ylänne, 2007). Other areas, though—both strengths and challenges—are disconfirmed through the unfurling of participants’ narratives of experiences in the University of Helsinki’s elementary teacher education program. For example, increasing preservice teachers’ practicum experiences would be a much-welcomed change.
This study allowed me to experience Finnish teacher education programs firsthand, which is quite different from learning from a distance. There was no better way to learn about education in Finland than through developing meaningful, personal relationships with those who have lived it firsthand. Conducting this research also allowed me to reflect upon and better understand our American educational system and my own experiences within it.

In terms of the social implications for this research, what we learn from this research will have some degree of portability. While no educational system should be grafted onto another due to the complex cultural minutia, a study of Finland’s teacher education programs through the eyes of six educators certainly provides insight. Lastly, much of our knowledge about Finnish education comes from experienced educators, professors and researchers, and policy advisers. This study gives voice to often underrepresented teachers.

   Development of science education program by using natural heritage

   In Korea, highly-valued animals, plants, their habitats and geological heritages have been designated as natural monuments and protected by law. Beside their natural and environmental values, they also have a value as a part of Korean culture with history and lives. Subject of natural heritage as natural objects with given value has its educational meaning in terms of seeking sustainability of life and the environment. This study develops integrated education programs by using natural monuments, thus expanding the contents of science education and exploring possibility of popular science culture.

   First, “Is it possible that limestone cave looks like this can exist in the real world?” program is developed for more ‘authentic’ understanding on creating process of limestone cave. In this program, students compare geological elements of exhibits (model of limestone cave) with the real limestone caves. Then, they relate the reasons why models and real limestone caves are different in the context of creation of limestone cave. By doing this, students can elaborate scientific concept more contextually.

   Second, ‘Click! All about Jindogae and Sapsalgae’ program aims to improve convergence literacy about ‘Dog=Gae’, having a value as natural heritage, by inquiring the scientific, historical significance of Jindogae and Sapsalgae in depth which are indigenous dogs of South Korea. In this program, students explore the historical/cultural values of two indigenous dogs in comparison through the origin of name, nickname, related anecdotes about Jindogae and Sapsalgae. And students also can study the biological characteristics of Jindogae and Sapsalgae by doing students-directed game activities that can utilize the basic inquiry skills such as observation, measurement, reasoning, expectations, and communication.

   Third, “Future of extinction, the present of mammoth” program’s subject is an animal character-now an extincted but existed animal: fossil-mammoth. It is a story about mammoth restored by de-extinction technology. She manages to return to her ancestor’s homeland-Siberia with the help of
human friends and a baby elephant. Through joining this story, students can understand the value of sustainability related to human and nature as well as the concepts of climate change, life evolution and adaption, and science technology today.

Fourth, goal of 'The Culture and Map of Jeju Island through Miniature' program is for the students to learn about the beautiful landscapes of Jeju Island and the culture behind them. Also, students will use the information to interpret and create their own maps. By these activities, students will study the concepts of map, such as bearing, coordinate, scale and the ability to transform the data.

Fifth, clues for finding geologic events: the Orbicular Granite Gneiss program is for students to observe the Orbicular Granite Gneiss and based on their observed data, they explain the geological events of the Korean Peninsula at the period of Precambrian. Since the abductive learning has characteristics of basic scientific observation and reasoning, not only geological knowledge but students can also develop scientific literacy which is the goal of science education.

All developed programs are based on subject of natural monuments. Educational programs with natural heritage are significant since they broaden the horizons of science education by relating their value.
ABSTRACT

Teaching in the maritime sector is distinctive to other industries across the globe because it enjoys an international nature as most of the maritime activities lay outside the normal jurisdictions of countries. To create global harmony and prevent chaos, there are international standards for different sectors of this domain, which includes education, training, and certification systems. Specifically, maritime teaching across the world is governed and regulated by the Standards of Training, Certification, and Watchkeeping (STCW), an international code that defines and describes the minimum mandatory requirements for the “training and education of seafarers throughout the world by placing an emphasis on quality control and competence-based training.

In the Philippine context, maritime education consists of four-year baccalaureate programs that lead to a career as merchant marine officers. The Bachelor of Science in Marine Transportation (BSMT) is a four-year diploma course leading to a career as a Marine Deck Officer (i.e., Third Officer, Second Officer, Chief Officer and finally, Master Mariner or Captain). On the other hand, the Bachelor of Science in Marine Engineering (BSMarE) is for those who wish to become a Marine Engine Officer (i.e., Fourth Engineer, Third Engineer, Second Engineer, and finally, Chief Engineer).
The Commission on Higher Education (CHED), the government agency that monitors and regulates the conduct of tertiary education in the country including the maritime course programs, describes the country’s maritime education as a program that produce Filipino graduates that possess and demonstrate the “knowledge, skills, and attitudes” as specified by the STCW Code and other international laws, and conventions (Sections 3 and 4, CMO 51 series 1997).

Despite the growing number of studies about on maritime education in the Philippines, experiences of maritime faculty have only been minimally examined. The researcher believes that having a deeper understanding on this aspect; maritime faculty can be more effectively prepared, precepted, and mentored. Educational leaders and managers who make decisions in MHEIs will have greater understanding on the educational process distinct to the maritime domain. As a result, the quality of the quality of teaching and learning for students and faculty will increase.

This study on the experiences of maritime faculty is a qualitative research that will employ descriptive phenomenology. The researcher will explore, describe, and reflect on the lived experiences of active merchant mariners while teaching in MHEIs. It also hoped that the teachers’ narratives will provide an understanding of the relationships between the maritime faculty and their students, colleagues, parents, and the evolving sense of self that occurs during the teaching stint.

This study analyzes the data that will be gathered through the Van Kaam method which is a “detailed, specific approach to phenomenological analysis” that guides the researcher through the process of phenomenological inquiry and reduction through a rigorous systematic method (Smith, 2009).
The Influence of Family Engagement on Hispanic Youth Science Education

Melinda A. Hamilton and Jacqueline Maximillian

1College of Education, University of Idaho, United States, mhamilton@uidaho.edu
2College of Natural Resources, University of Idaho, United States, jackiem@uidaho.edu

Abstract
As with many rural and western states in the U.S., Idaho is seeing a dramatic increase in Hispanic youth in the schools, in fact, Hispanic students are the fastest growing demographic in Idaho’s school system. Between the years 2000 and 2001, K-12 public schools in Idaho saw a 75% growth in enrollment by Hispanic students compared to only 8% growth in non-Hispanic students. However, results from the annual Idaho Standards and Achievement Test for 2013 demonstrate lower proficiency among Hispanic students in all subjects, especially science. The University of Idaho, with a generous gift from the Micron Foundation, conducted a 5 year study to investigate the attitudes and perceptions of parents, teachers, and elementary and secondary students with respect to science and STEM education. The research revealed significant differences in attitudes toward science and math between Hispanic and non-Hispanic participants, which provides insight into possible contributors to poor student achievement in science, as well as potential approaches to intervention. Research showed that Hispanic community members had a high level of distrust for scientists and found it difficult to navigate the educational system. Since family engagement appears to be essential to the interest and pursuit of science education, and early engagement of children may help overcome many barriers, a pilot program offering a bilingual pre-school STEM camp to Hispanic children and their parents was conducted and assessed. This program highlighted the importance of family involvement in student learning and has led to the development of future lines of investigation of the interaction between cultural diversity and student engagement. This paper will describe the research that was conducted investigating participants’ attitudes, the results for Hispanic participants, and the pilot intervention and assessment, and will pose hypotheses for future research.

Keywords
Hispanic students, family involvement, STEM interest and engagement, first-generation students,

Introduction and Background
Hispanic students are the fastest growing demographic in Idaho’s public school system. Southern Idaho, in particular, has a relatively large Hispanic population due to the migrant and seasonal farm workers. The 2014 census reported Idaho’s population just over 1.6 million, with 12% Hispanic or Latino. However, Northern Idaho includes only 5% and Southern Idaho maintains 16% of the Hispanic population. Some counties, such as Jerome (34%), have three times more Hispanic population compared to the Idaho’s average. In addition, the Hispanic population is characteristically young. For example, in Jerome County the median age is 22 years (Idaho 35) (Pew Research Center, 2015), suggesting a future increase in the Hispanic population. Although the number is increasing, the unemployment and poverty levels are also higher. Pew Research Center (2015) put Hispanic poverty rate at 40% and a median income close to three times lower than the Idaho average. Research shows that poverty had a negative influence on STEM performance, especially among underrepresented minorities (Capra, 2009; Laorenza, Pacheco, and Hardeek, 2012), and can also be an impediment to educational reforms (Capra, 2009).

In spite of the economic downturn, in Idaho STEM skills have stayed in demand. Change the Equation reports that in 2011 there were 3.7 unemployed people for every 1 non-STEM job while there were 2.4 STEM jobs for every 1 unemployed person. However, low completion rates for post-secondary education remain a hurdle in Idaho. For low-income and Hispanic communities, failure to complete high school contributes to this low postsecondary completion rate. Approximately sixty percent (60%) of Hispanic students leave high school early (Northern Idaho Agency, Bureau of Indian Affairs, 2009).
Education is clearly linked to economic prosperity. Unemployment has spiked in Idaho’s rural areas, exceeding 10% for those over 25 years of age as compared to the U.S. rate of 8.9% (Bureau of Labor Statistics – Local Area Unemployment Statistics, February 2011 – January 2012 Averages). The Idaho Department of Employment reports that 63% of those applying for unemployment lack higher education experience. Severe underemployment and unemployment throughout the region, low educational achievement (U.S. Census, 2009), and limited access/exposure to technology characterize much of the workforce. For many Latinos, such as those living in the Jerome region, language and cultural barriers create additional impediments to educational and economic achievement. This growing and challenged population continues to underperform academically, particularly in science and math.

There is an urgency to better understand the factors that contribute to this educational crisis among the Hispanic community, and the ones that may help solve it. The 2011 report from the National Research Council notes that current STEM education research lacks a focus on cultural and contextual factors that shape youth experiences and opportunities even with the abundance of evidence that early childhood experiences are linked to learning. For example, research shows that critical aspects of brain architecture are shaped by experiences in the first few years of life and taking advantage of these early stages can help develop children’s learning capacities (National Scientific Council on the Developing Child, 2007). This is because between ages 1 and 4, the brain seems to be particularly receptive to learning math and logic (National Association of Child Care Resource and Referral Agencies, 1998). While inquiry and exploration are known to be the foundations for math and science, they have also been shown to be the foundations of early learning (Massachusetts Department of Early Education and Care, 2003). Such findings suggest a need to better understand key cultural dimensions that serve as important contexts for understanding students’ experiences and attitudes towards science, STEM education, and education in general.

The University of Idaho, with a grant from the Micron Foundation, undertook the UI-Micron STEM Education Research Initiative, a five-year study designed to investigate the complexity of cultural dimensions that shape STEM educational outcomes in Idaho with a focus on local contexts. The study explores STEM attitudes, scientific literacy, and educational aspirations.

Two aspects of cultural complexity of particular interest when looking at STEM education for Hispanic students are the attitudes of Hispanic adults regarding science and education and the role of the primary caregiver in early education. We suggest that the attitudes and perceptions of family and community members, particularly with respect to science and STEM education influence student interest in and achievement in STEM education. Apart from K-12 academic experiences, Crisp & Nora (2012) found that cognitive factors and socio-cultural factors influence Hispanic students’ decisions to pursue STEM in college. Further, it is likely that cultural factors impact the adult’s role in their student’s education and may contribute to their students’ attitudes, aspirations, and achievement. There is sufficient research to demonstrate that parents and teachers are both fundamental parts of the students’ learning environment as they play a vital role in their educational achievement and success (LaRocque et al., 2011). If addressed early, interventions may have a long term positive impact on educational achievement and interest in science. Research has demonstrated that low-income children who attended high-quality early education programs on average outperformed those who did not on mathematics tests throughout childhood and young adulthood (Campbell et al, 2002). A New Jersey preschool program has shown significant effects on children’s science and math outcomes through fourth grade and fifth grade, respectively (science test only administered in 4th grade). Effects are strongest for children who experienced two years of preschool, and are the equivalent of closing 20-40% of the achievement gap between white and minority students (Barnett et. al, 2014). Based on the results of the UI-Micron STEM Education Research Initiative findings, a University of Idaho (UI) team composed of Spanish and Environmental Science instructors and faculty conducted a pilot study to investigate the impact of preschool STEM education and parent involvement on Hispanic student achievement in math in science.

**Methods**

**Statewide and Community Surveys:**
Thirty nine focus groups comprised of parents, teachers, and community members were conducted in 12 communities across the state of Idaho in order to provide an understanding of local context for STEM education.
Twelve communities from different counties in Idaho were selected to provide data given the regional differences in economic base, geography, and population demographics. This was followed by a statewide survey in which these 12 counties were oversampled in order to measure STEM attitudes, experiences and science orientations. The results reported here are based on two survey samples.

The first survey sample was drawn from the entire state of Idaho through random selection of phone numbers, both from landlines and wireless phones. We randomly sampled 900 household landlines and 1,500 wireless phone numbers. Out of these sampled phone numbers, we completed a total of 407 telephone interviews across the state, for a response rate of 22.5 percent. The second survey sample was drawn from Idahoans with phone numbers (either landlines or wireless phones) from the counties of the twelve communities selected to participate in this study (Storrs et.al, 2012).

In 2013, more detailed surveys were administered to students, their parents, and teachers in the 12 communities. Surveys were conducted by the research team in each of the twelve districts with children in grades four, seven, and ten. Within each school district, a nested cluster sample design was used. To select schools (the first level of the cluster sample), we randomly selected a high school in each district from the available mainstream/non-charter schools. Next, a middle school/junior high which was a feeder school to the selected high school was randomly selected from the available feeder schools for the seventh grade sample. Finally, we selected an elementary school from the available feeder schools for that middle school for the fourth grade sample. Some districts have only one school at each level, in which case that school was selected by default. Once the schools were selected, the second level of cluster sampling were classrooms within schools. In order to facilitate survey administration logistics, this level of selection was not purely random. In the smaller districts (with less than 250 students), the survey was administered to all the students in the three grade levels that consented and were present. In the larger districts, surveys were administered during classes that were required of all students in that grade level. Parents of these students were contacted by phone and Spanish speaking calls were also made. To increase response rate, hard copy surveys were mailed to those that did not respond to the phone surveys. The final sample size was 1559 complete surveys for a response rate of 62 percent. Teachers in the 12 counties were surveyed by phone and follow-up mail surveys as well. A sampling frame of potential Idaho teachers was obtained through LIte (Low Incidence Targeting), with a total of 3,183 names. Retired teachers, college professors, and preschool teachers as well as individuals who were never teachers that responded to the survey were considered ineligible. Due to the unusually high proportion of eligibles, as a result of frame limitations, and the high amount of non-responses, the best representation of the final disposition rates includes an estimation of the proportion of cases of unknown eligibility that are eligible. This estimate is based on the proportion of eligible units among all units in the sample for which a definitive determination of status was obtained (a conservative estimate). In this case our estimated proportion of cases of unknown eligibility is 17.7 percent. The final response rate including this estimation was 47.5 percent.

Pilot Intervention:
Based on the results from Hispanic respondents in the statewide surveys, a pilot intervention was developed and conducted in Jerome, Idaho located in Jerome County. Hispanics comprise 34.3% of the total population in Jerome County, which has increased by 40% from 2000 (U.S. Census Website). Jerome is located in the Magic Valley that comprises almost half of the Hispanic population in the Southern Idaho (Map 1). This significant change to the city’s ethnic composition has been coupled with a lowering of the median age, a trend that adds complexity to understanding cultural factors in youth STEM education experiences. This project’s purpose was to increase...
the participation of the Hispanic population in STEM education by introducing bilingual (English and Spanish) math and science hands-on activities to Head Start children through a three-day summer camp in Jerome County, Idaho, and including parents and other caregivers in the activities. Project leaders hypothesized that introducing STEM education at an early age and involving parents would enable school age children as well as community members to view science and math as integral parts of their natural lives rather than the seemingly complex subjects and prerogative fields of study that conflict with their beliefs and values.

The UI team developed the curriculum that was used in the camp. This involved researching practical and relatable best-practices, modifying, and developing new ones. To ensure full immersion, avoid confusion, and enhance understanding of mathematical and science concepts, the curriculum was developed around three themes: measurements, germs, and experimentation. On each day of the camp, the children learned different concepts surrounding these themes. The end product was 27 hands-on activities, nine activities per theme. The activities were planned so the children would be able to think, experiment, and find their own solutions. The hands-on activities allowed the children to actively explore and interact, and at the same time understand the targeted concept. Additional activities were given to parents to do at home with their children.

The team used a mixture of direct observation, child interviews, surveys, and external assessment to assess the effectiveness of the project during and immediately after the camp, followed by another assessment one year later with the Head Start teachers of the participants. The project assessed the children’s interest and engagement in the hands-on activities and parents’ confidence in participating in their children’s education and their experience with the camp.

Results

Statewide and Community Surveys:
In the statewide survey we found that the level of educational attainment among Hispanic parents was significantly lower than the other two racial-ethnic groups considered in the study regardless of gender (Figures 1 and 2). Not surprisingly, a much larger percentage of Hispanic parents reported income below the poverty level (63%) compared to white parents (Figure 3). It is important to consider how these factors may impact parental influence and student career and educational choices.

Figure 1: Male parents' educational attainment by racial-ethnic group
However, when all parents of 10th grade students were asked about their aspirations for their student’s future, regardless of their educational attainment, 90% of the respondents wanted at least a 4-year degree for their students (Figure 4). Aspirations, however, did not necessarily translate into parents’ ability to help students reach those goals. Parents, both male and female, with lower educational attainment, felt they would like

Figure 2: Female Parents’ Educational Attainment by Racial-Ethnic Group

Figure 3: Percent of households earning below-poverty incomes
Figure 4: 10th graders’ parents’ educational attainment and level of attainment they would like their child to have more time to be involved in their student’s education (Figure 5.) Parents experiencing poverty were significantly more likely to feel their financial situation constrained their involvement in their child’s education than parents who were not experiencing poverty. Approximately half of the parents considered to be above poverty, and also reported that being involved in the students’ education was difficult due to their financial situation (Figure 6).

![Figure 4: 10th graders’ parents’ educational attainment and level of attainment they would like their child to have more time to be involved in their student’s education (Figure 5.)](image)

In the statewide surveys, students (4th, 7th, and 10th grades) were queried about their specific interests in science and math. Differences between Hispanic and white respondents were noted. White students reported liking math and science more than Hispanic students in both seventh and tenth grades (Figure 7.) High school students were also queried about their concerns for future education. The most important considerations reported were: high school grades, scores on college entrance exams, availability of financial aid, and the cost of college. Where differences exist, Hispanic students and parents are more likely to say these factors are “very important” to their college-going decision.
Jerome County:
In our sample from Jerome County (n=208) women were significantly overrepresented, with 65% of county respondents being women when compared to 2010 U.S. Census statistics (50%). Hispanics in the survey were underrepresented, comprising 2% of the Jerome County survey sample, compared to 34% of the population. However, this was the highest percentage of Hispanics participating in the county surveys across the state in this study.

Almost 30% of the Jerome County’s respondents had one or more children in K-12 education, and another 4% had children who were not yet in the K-12 system. Of these parents, 86% were sending their children to traditional public schools, 7% had children in private schools, a small number (2%) had children in a charter school, and the remaining 5% of parents were homeschooling their children. Over 73% of K-12 parents said they volunteered at least once a year at their schools. Our 2011 focus group with Latino parents revealed their commitment to their children’s education though they struggled with how to support their children academically due to language and cultural barriers.

A large number of K-12 Jerome County parents (77%) felt they had the appropriate skills to help their children with homework in general, yet almost as many (71%) said that they at least occasionally felt their math and science knowledge made it difficult to help their children with math and science homework. About half of the parents (53%) did not have as much time as they would like to be involved with their children’s education. Even though a good number of parents wished they could do more to support their children’s education, a large number of them (79%) said their children performed “above average” or “excellent” in math. However, Jerome County was among the rural communities where individuals were less knowledgeable about college preparation. Most notably, Jerome County’s respondents were less confident than respondents from other counties on which classes a student should take to be successful in college and less sure of how to help someone apply to a four-year college. Jerome County’s respondents were also asked to agree or disagree with the statement, “Science can come into conflict with my religious beliefs.” Of the respondent types, 88% of those with no children and 63% of those with children not yet in school were more likely to disagree with this statement. Parents with K-12 children (62%) and parents whose children completed K-12 (54%) were more likely to agree with the statement. When tested with the “culture of science” questions, gender proved to have a significant effect on two of the “culture of science” questions. Men held less trust in science, were less likely to support schools’ discussing humans’ impact on global climate change, and were more likely to agree that community members rely too much on science and not enough on religion. When Jerome County’s respondents were asked to what extent they agreed or disagreed with the statement, “Scientific knowledge changes so rapidly, it is hard to know what to trust,” a majority (68%) agreed.

Pilot Intervention

Interest and Engagement

Direct assessment (observation) during camp activities demonstrated 100% child engagement and 92% understanding of the hands-on activities that were non experimental in nature. For measurement and experimentation themes there was some levels of disengagement. The lowest engagement and understanding was observed with the lessons on predicting, measuring, and comparing weights of marshmallow and marbles, which had a 75% engagement and the lesson on container shape and liquid volume which had only 50% engagement. These lessons belonged to the experimentation theme. Reduced engagement in these two activities may be partially explained by the limited supplies for each child to experiment with allowing for distractions. For example, 5 to 8 children shared one balancing scale and two measuring jars; thus, some of the children participated in this activity by observing rather than actually doing it.

Parents were asked to indicate the level of their children’s interest in math and science before and after the camp. About 74% of the parents reported that their children were very interested in math and science before the camp and the percentage increased to 80% after the camp (Figure 9). Similarly, when parents were asked to indicate their children’s level of excitement before and after the camp, almost 63% reported very excited before the camp compared to 87% after the camp, however, the differences in responses before and after the camp were not statistically significant. Ninety three percent of the parents reported feeling that the math and science activities were helpful to their children’s learning.

Of the 27 activities conducted, more than half of the children preferred the following hands-on activities: measuring temperature and weight in the measurement theme; demonstrating the speed of germ spread and identifying different types of germs in the germ theme; and demonstrating float and sink and evaporation in the experimentation theme. Overall, all of the children preferred four activities out of 27, and of those four, almost half the children preferred the “Germ Speed” activity. The “Germ Speed” lesson involved filling balloons with confetti and glitter, pumping air into the balloons, and popping them to release the glitter into the air to demonstrate what happens when someone coughs without covering their mouth. This activity took place outside and each child had a balloon. More than a 25% of the children preferred the “Composite Color” activity, which involved making secondary and tertiary colors from primary ones. “Sink and Float” and “Germ Matching” received equal preference (Figure 10).
Figure 9: Level of children’s interest in math and science before and after the camp as perceived by the parents.

Figure 10: Overall math and science activities as preferred by the preschoolers.

**Parental Experience**

Out of 37 parents/guardians that sent their children to the camp, 30 responded to the survey. All surveys were offered in both English and Spanish so that language would not be a barrier to responding. Eighty percent of the parents were mothers and the rest were father figures. In two situations (7%), both parents were involved and in two situations the male figure was a boyfriend or an uncle. More than half of the male parents (57%) had no high school diploma, compared to 47% of female parents. More than 30% of the parents were single, either never having been married (27%) or separated (6%). The average number of people per household was 5, and the number ranged from 2 to 9 people. This is almost twice Idaho’s average household size according to the 2007-2011 censuses (United State Census Bureau, 2012). Despite large family sizes, only 23% of the households had fulltime jobs. In addition, the majority (54%) of these families made between $10,999 - 24,999, which is 2 to 4 times less than the Idaho median household income of $46,890, based on U.S. Census of 2012. Seventy percent of the parents were Hispanic, which

"Sometimes it’s hard [to support your children in school] because a lot of parents do not speak English, or teachers don’t speak Spanish. But one should keep an eye and educate their children. If your child likes math, or likes another course, in whatever they like, even if it costs you _me (it is hard) or costs money you have to do it for your child and find a way to help them._”

Quote from the Latino parent focus group discussion in Jerome
is higher that the state average of 11.6% Hispanic population. Sixty seven percent of the respondents were Catholics.

When asked in surveys about camp activities with their children, about 80% of the parents said they learned a lot, 17% percent said they learned a little bit, and only 1 out of 27 parents responded that they learned nothing (Figure 11).

![Pie chart showing parents' learning levels](image)

Figure 11: How much parents learned from the camp.

Pre and post-camp surveys indicated that 44% of the parents’ confidence level increased from somewhat confident to very confident and this difference was statistically significant ($p = 0.003$). When asked if they are likely to send their children to another camp, 93% of the parents responded very likely.

![Bar chart showing parents' confidence levels](image)

Figure 12: Parents' confidence level before and after the Summer camp.

One year follow up surveys
One year after the summer camp, the Head Start teachers reported that 20% of the children still remembered the math and science concepts from the camp, 33% somewhat remembered, and 46% remembered them extensively. Of those who still remembered math and science concepts extensively, 80%, 40%, and 20% remembered germ, measurement, and experimentation concepts, respectively. The teachers also observed a large increase in the participation of parents in the Head Start program. While some parents joined the Head Start policy council and extensively volunteered in classroom activities such as dental hygiene, others participated in education-related conversations with school staff.
Discussion
Hispanics comprise the fastest growing demographic among school age children in the U.S. and the same trend is occurring in Idaho. In addition to cultural differences, Hispanic families in Idaho also experience greater poverty levels and lower educational attainment than their white counterparts. This means that more Hispanic students are First-Generation College Students (FGCS). Education is clearly linked to economic prosperity, and with STEM jobs in demand, science and math education are critical to improving the socio-economic status of communities with high Hispanic populations. However, Hispanic students underperform in math and science in Idaho. Each year, Idaho’s public school students take the Idaho Standards Achievement Test (ISAT). ISAT scores show lower proficiency among Hispanic students in all subjects, especially science. Only 43% of Hispanic 5th, 7th, and 10th graders are proficient or advanced in science, compared to 72% of non-Hispanics. Only 66% of Hispanic 3rd - 10th graders are proficient compared to 82% of non-Hispanics (Idaho State Department of Education).

These students face challenges that white students with higher socio-economic status may not. According to a report released by ACT/COE (the Council for Opportunity in Education (COE) (2013) and ACT/CEO (2014), about a quarter of high-school graduates who took the ACT in 2013 met all four of its college-readiness benchmarks, in English, reading, mathematics, and science. But students whose parents did not go to college fared quite a bit worse: only 9 percent of them met all four benchmarks. Ramos-Sanchez and Nichols (2007) report that first-generation students are more concerned about their finances, feel less prepared for entering college, and overall lack a basic understanding about the expectations of college than do their non-first-generation peers. Engle and O’Brien (2006) report that lack of financial resources and family encouragement negatively affects first-generation students from going to college.

This appears to be true for Hispanic parents in our study. While they have high aspirations for their students’ academic future, they expressed concern with time to help them, their own abilities in math and science, and the financial burdens of college. These obstacles result in FGCS students deciding not to pursue higher education or arriving at college underprepared and overly committed such that a large number of these students do not complete a bachelor’s degree. Those who do complete the degree are less likely to complete a degree in a STEM field.

Additionally, Hispanic students may have to deal with cultural conflicts when considering STEM careers. In our study, Jerome County parents with children K-12 or older tended to feel more conflict between science and their religious beliefs and a large percentage of the sample indicated a certain degree of distrust in scientific knowledge. This suggests a need to further investigate what aspects of scientific knowledge seem most at odds with their beliefs and values in order to address these in any proposed interventions. At the same time, identify cultural elements that can be instrumental in increasing the understanding of scientific knowledge.

We hypothesized that introducing children to science and math concepts early would provide lasting benefits in terms of their understanding of concepts and their interest and comfort level with science and math. Initial evidence from the pilot intervention suggest that interest of Hispanic children in science and math can be increased early in their childhood and that the concepts are retained to some extent. However, longitudinal studies are needed to assess the lasting benefits of this approach. Future interventions would likely be more effective if sufficient resources were available to keep all students occupied rather than having to alternate working with the materials. Literature suggests that one-time events without follow up activities throughout the academic year may not have lasting effects. The UI team collaborated with Head Start teachers to develop and deliver hands-on bilingual STEM activities to the children, actively involving the teachers in the development of science and math materials and camp activities. Involving the teachers throughout the process was done with the understanding that they would likely continue to use these materials during the academic year and disseminate the activities to other preschools in the area. We are proposing future pre-school interventions in Hispanic communities that occur more frequently and have curriculum intentionally infused in the pre-school academic year activities. Assessment of this approach should include teacher observations, parent observations, and student achievement in science and math in grades K-3.
From our studies and other research, we suggest that involving parents in Hispanic youth education could help them feel more comfortable helping their students with science and math and could improve their level of comfort overall with science and scientists. In addition to engaging the parents in the camp activities, the pilot intervention was intentionally conducted with Head Start teachers at the Head Start facility in Jerome. There already exists a sense of trust between parents/guardians and the Head Start school because of the partnership that exists between the two and the Head Start teachers speak Spanish. This likely contributed to the positive effects seen with parental engagement and continued participation in their children’s education throughout the school year. We know that the parent-teacher communication gap interferes with students’ of color’s academic experience and achievement. Attempts by both teachers and parents to close the gap are met with different challenges. Teachers lack the knowledge to integrate parents in their children’s education, have received little training in strategies for working with diverse parents, and possess skills that are limited to handling what they perceive as difficult parents (LaRocque et al., 2011). On the other hand, parents are constrained by cultural mores, linguistic barriers, and a lack of understanding practices, procedures, and policies that govern school and education systems in general. Understanding and closing this gap would benefit from research that explores avenues for parent integration into the school system and cultural relevancy training for educators.

**Conclusion**

Parent involvement and early childhood experiences can positively impact a student’s interest in and achievement in science and math. These factors appear to be especially important for Hispanic students who are facing additional barriers such as poverty, language, and cultural differences. Programs that address parental engagement and early learning for Hispanic students need to consider the cultural context of the families and the perceptions of the community about science and scientists in order to be relevant and effective. Working with already established and trusted organizations can reduce the trust issues when delivering interventions. Longitudinal studies that track student interest and achievement and parental involvement throughout elementary school and research that investigates cultural values that conflict with traditional education systems are logical next steps.

**Acknowledgments**

This project was supported by the Micron Foundation under the leadership of Dr. Debbie Storrs, Dr. Corinne Mantle-Bromley, and the research team of Dr. John Mihelich, Dr. Leontina Hormel, Ms. Susan Stauffer, and Dr. Ana Alcocer. We would like to sincerely acknowledge Irina Crooston-Kapler for her guidance in developing the pilot project and the Jerome Head Start administrator for collaboration and allowing us to use the facility. We also wish to thank all the teachers and high school students for delivering the hands-on activities; and the parents and preschoolers for their participation.

Open Art Therapy Studios on Campus: A Case Study

Duanita G Eleniak PhD Sarah Canning BA Demill Keevil BFA Raman Samra BFA
Adler University, Vancouver BC Canada

Submission # 1168
deleniak@adler.edu scanning@my.adler.edu akeevil@my.adler.edu rsamra@my.adler.edu

Abstract: A case study of Open Art Therapy Studios at Adler University, Vancouver BC Canada campus demonstrates the effectiveness of creating community and connection to increase Well-being of students, staff, faculty, alumni and community partners. Open Studios, their background and rationale are described in the paper, as is the story of one way that the University realizes its mission of training socially responsible practitioners. New ways of evaluating educational programs teaching meta-verbal skills whose curriculum is based on relating with creativity and imagination are encouraged within a new Worldview which allows subjectivity its rightful place and which honors the illogical and irrational as valid and critical elements.

INTRODUCTION

Alfred Adler’s key ideas about maintaining healthy functioning center around the ideas that fundamentally humans all have a need to belong (Ferguson, 2010) and that a sense of cohesive community is crucial to Well-Being (King & Shelley, 2008). Thus the importance of a positive community atmosphere on campus has always been valued at Adler University.

When the Masters of Counselling Psychology:Art Therapy (MCP:AT) program began on the Vancouver, British Columbia Canada campus in 2014 it was decided that the value of ‘community’ would be enhanced by exploring the role of art making in campus community development.

Studio One, the new classroom for the counselling art therapy program, was opened during non-class times to students from all programs, staff, faculty, Alumni and community partners. The MCP: Art Therapy students were trained to provide Open Art Therapy Studios and shifts in community feeling and connectedness began to be realized almost immediately.

In this paper the Open Art Therapy Studios held on campus will be described. Following will be a description of the key positive results experienced. Finally, areas for exploration and further research will be identified.

OPEN ART THERAPY STUDIOS ON CAMPUS

For MCP: Art Therapy Students at Adler University in Vancouver, Canada training begins ‘at home’ in Studio One, the classroom that became an art studio for students in the dual degree graduate program in counseling and art therapy.

As part of their initial training, students in the program learn to serve the community by doing a Social Justice Practicum (SJP). They go into agencies and countries in need and provide whatever help is necessary. When the MCP: Art Therapy program began, the Dean, Dr. Larry
Axelrod, thought it would be a good idea to offer a SJP and service to our very own school community by opening Studio One to our staff, faculty, alumni and students from all of the programs. And thus began our commitment to community service and community building on campus. Little did we know when we began what absolute wonders this idea would bring to our school and to the field of art therapy education.

**An Atmosphere of Peace:** I will always remember walking into Studio One during the winter holiday Season the very first year it opened when the students created ‘Winter White’ (Eleniak, 2014). My heart overflowed with joy when I realized that these incredible students had worked with aesthetics – line, shape and color- in order to create an environment which induced a feeling of PEACE that was palpable to the experience of all who entered the space. It was a rainy Vancouver day and the light coming through the floor to ceiling windows was minimal at best. Everything inside the room was white. The tablecloths were white, the art materials were white; even all of the food on the side buffet was white.

As I relaxed into the vibration that the students and their brilliant site supervisor had set, I realized that I was getting the same feeling that I got when I walked at night in the moonlight in fresh fallen snow. There was a pregnant hush in the air. There was a softening and stillness in the world they had created which gave me the feeling of pure peace! Love coursed through me as I realized (as only a proud teacher can) that my students had “got it”. They had deeply integrated all of the teachings on the importance of creating a therapeutic environment to a profound level. My work as teacher felt complete. They were becoming ‘healers’.

**A Place of Refuge:** I will never forget another miracle I witnessed during those magical hours at Winter White which happened when a student who had just experienced a powerful event in her personal life wandered into the Open Studio in shock. It was as if she had been hit by a truck, and it was just moments before she had to write her final exams. I watched the beauty in action (wishing I could record it for Youtube) as the MCP: Art Therapy students sat the student down and began a dance behind and to the side of her. As the student sat and spoke of her woes, the MCP: Art Therapy students placed by her hand a cup of tea, in front of her some paper, by the other side of her some pens and paints. They placed her in a healing bubble with everything that she needed to calm and ground herself literally at her fingertips. I watched the MCP: Art Therapy students move in silent knowing providing the tools of relief. I saw the color come back into the student’s face as she talked and created and allowed the healing energy of Winter White to soothe her very being. As the student left, now ready to take her final exams, I marveled at this profound scene of community and connection that I had been honored to witness.

**An Opportunity to Share:** And finally, I love to remember when the Admissions staff came through Winter White with a group of prospective students and their families who were on a tour of the school after attending the Open House. I watched as the MCP: Art Therapy students (who had been prepared that such a tour was going to happen) worked as a team to
make these people feel welcome. The MCP: Art Therapy student who had been elected prior to the tour coming in to act as ‘leader’ for the experience got up out of her seat and encouraged the group forward to have all of them totally enter the space. Very often people will simply stand at the door or come in only a little way and gentle encouragement is needed to bring them forward into the experience. In her “Winter White” fur hat (and with the large gestures that only a counselor interested in movement and art therapy can do), Leanne Bird directed the groups attention to the 2014 Cohort Mandala which the students created on their very first day of their program only months earlier. With ease and in the spirit of fun, the MCP: Art Therapy students shared their experience of the program with these newcomers who were ‘peeking’ into this world of Adler University and art therapy. These prospective students gained valuable answers to their questions of what life was like as a student in the MCP: Art Therapy program. Even more importantly, just by being in that Open Studio environment they gained a full body experience of what our students are capable of doing and what our Adler community in the school is all about!

**Open Studio Description:** For Open Studio MCP: AT students create a space where art materials are available for the Campus community to engage in art-making. The student facilitators are there to provide inspiration and assist participants in their creative process. The facilitators strive to ensure the Studio remains a safe and positive space for all who enter. Whenever the Studio is open, simple art materials are available and student counselling/art therapists serve as artists in residence greeting everyone who enters with an attitude of “radical hospitality.” There may also be special events in the studio, such as classes, workshops, and guest speakers.

Open Studios are accessible to students across all programs, staff, faculty, alumni, and community partners. The groups are drop-in. Participants can come and go and make as much or as little use of the time, support, and art materials offered as they like. New participants are welcomed warmly to have an experience of therapeutic art.

**The Approach:** The Open Studio approach is based on the Adlerian values of cooperation, compassion for others, and contribution to the good of society. It is grounded in Adler’s concept of *Gemeinschaftsgefühl*, which can be roughly translated into two separate terms: community feeling and social interest. Community feeling refers to “the warm, empathic bond people have with one another and with the world they live in—the feeling of being connected to others” (Mosak & Maniaci, 1999, p. 113). Social interest is action-based and refers to “what individuals are driven to do by the sense of community and belonging they feel” (Mosak & Maniaci, 1999, p. 113). In Open Studio, both community feeling and social interest are emphasized. Action is taken by the MCP:AT students to ensure an environment where community feeling is present.

**The Focus on Environment:** MCP: AT students are trained in the philosophy of Dr. Marie-Jose Dhaese (2011) who asserts that the environment contributes to 80% of healing. The Open Studio environment is intentionally focused on acceptance. Student facilitators are trained to create an atmosphere that promotes a sense of peace and safety. Many participants view the Open Studio as a safe haven on campus where they can go to relax and rejuvenate.

There is a focus on esthetics every time MCP:AT students set up an Open Studio. Lighting is intentionally adjusted to set the mood and tone for the day. Shape is considered in the positioning
of desks, easels, and display of materials. Sound is emphasized by either creating an atmosphere in which silence is honored or by playing soft non-lyrical music. Attention is given to smell through light aromatherapy scents. The temperature in the room is adjusted if it feels too hot or cool. Every sense is given careful thought.

**The Tea and Cookies:** In Open Studio, there is a tradition of “breaking bread together.” Tea and cookies draw people into the studio and facilitate conversation. This is often how the creative process starts. Participants sit down and are immediately offered a cup of tea and something to eat. They can sit and relax over a cup of tea while they consider what art materials are calling out to them that day. The array of delicate china teacups with mismatched patterns is a signature element of the Open Studio at Adler University.

**Encouragement:** One of Adler’s key concepts is encouragement, and this is given great weight by MCP: AT students in their facilitation of Open Studios. Watts and Pietrzak (2000) note several important elements of the emphasis on encouragement in Adlerian therapy:

> The encouragement-focused process helps build hope and the expectancy of success in clients by demonstrating concern, active listening, and empathy; communicating respect and confidence; focusing on strengths, assets, and resources; helping clients generate perceptual and behavioral alternatives; focusing on efforts and progress; and helping clients see the humor in life experiences. (as cited in Carlson, Watts, & Maniaci, 2006, p. 39)

In Open Studio, this may take the form of encouraging a community member in distress from issues in his or her personal life, encouraging a student who is highly stressed because of academic expectations or encouraging hesitant artists as they delve into the creative process. There are endless ways one can encourage another, and Open Studio is an environment in which MCP:AT students do just that.

**Attitude:** Attitude is everything. MCP:AT students are trained to maintain a positive and productive space for every person who enters. As mentioned previously, Open Studios operate with an attitude of “radical hospitality.” MCP:AT students are there to enthusiastically serve the community, whether this means providing support, offering instruction in various forms of art-making, or simply pouring a hot cup of tea. When people walk by the studio, it is common for MCP: AT students to usher them in and simply offer them five minutes to sip some tea and unwind. Participants may pick up a pencil and begin to draw, or they may leave when their teacup is empty. Either way, radical hospitality has been offered and a welcoming space has been experienced creating an effect on community.

**Location:** Open Studios at Adler University’s Vancouver campus take place in Studio One, the classroom for the MCP: AT program. Studio One is a space that was designed with the creation of art and community in mind. Tabletops and easels are available to work on and the cupboards are full of art supplies. There are also shelves for art storage. Each MCP: AT student has their own labelled space. The uncarpeted floors can easily be cleaned, and there is a sink in the room. There is ample natural light with an entire wall of floor-to-ceiling windows. Studio One is located next to the student lounge, so students often pass by Studio One on their breaks from class.
Format. Open Studios are held during weekdays when students, staff and faculty are on campus. The schedule is subject to change based on student availability and requests from community members.

Number of MCP: AT Students Co-facilitators: This number is dependent on the number of participants. Two to four students facilitate the majority of Open Studios. This number may be lower on slow days and higher on busy days.

Supervision: MCP: AT students are supervised while learning how to facilitate Open Studios. Students are required one hour of supervision for every five hours of direct work with participants in Open Studios. Weekly group supervision and individual supervision is provided. Group supervision is an opportunity for MCP:AT students to gather and enhance their learning with the valuable input of a qualified supervisor. Students may work in this time to run ideas by the group, as well as to talk about the benefits and rewards of hosting Open Studios.

Required reading: In preparation for running Open Studios, students are required to read Cathy Moon’s (2002) book, *Studio Art Therapy: Cultivating the Artist Identity in the Art Therapist*. Moon (2002) writes of a model rooted in the studio environment and delves into several key topics, including: the importance of the art therapist cultivating his or her identity as an artist; envisioning and constructing the studio space; the relational aesthetic; and the social responsibility entailed in being an art therapist. According to Moon (2002), “to consider our work environments as works of art brings an intentional focus to the creation of therapeutic space and engages our artist identity in the process” (p. 83).

Pat Allen’s (2001) chapter in *Approaches to Art Therapy: Theory and Technique* (2nd ed.) is also a useful source for information regarding an Open Studio approach. Allen (2001) discusses the spiritual elements involved in the Open Studio process.

**KEY POSITIVE IMPACTS ON THE UNIVERSITY COMMUNITY**

Providing a community art space on campus has resulted in the following key positive impacts:

1. **Social Support**: Open Studios provided campus community members a place where they could go to get to know each other. They could share their common experiences as graduate students. They could enjoy getting to know each other outside of their formal roles as faculty, staff and students made art together. The social support experienced allowed for enhanced Well-Being on campus.

2. **Emotional Support**: The enhanced engagement between students, staff, faculty, alumni and community partners allowed a sense of community belonging to evolve: “*This sense of belonging ... can only be won by being involved, by cooperating, and experiencing, and being useful to others. Out of this emerges a lasting, genuine feeling of worthiness.*” (Adler, 1926)

**Promotion of Relaxation**: Having a community art space where MCP:AT students consciously created a physical environment promoting relaxation impacted outcomes such as reduction of student anxiety. Students would come before their exams to color a quick mandala, have a cup of tea and center. They reported doing better on their exams because they took a moment to be still, breathe and relax before going in. They also
reported enjoying having a place to go to debrief during particularly anxious times, after exams, during periods where lots of assignments were due or after particularly difficult experiences in the field.

**Increased Caring for others:** Boundaries between programs of study dissolved as people got to know each other. There was a perceived increase in harmony between students, faculty and staff that participated. A spirit of cooperation on campus was fostered.

**Increased Sense of Hope and Positivity:** The increased sense of belonging to an accepting community of shared experience focusing on positive interests assisted to help campus community members improve their sense of personal well-being, a quality that they reported flowed into their personal lives and their ability to do homework more effectively.

**Empowerment:** As the shared sense of community increased Open Studios became a safe space where members took ownership and created the kind of campus atmosphere of the University that they wanted to ‘belong’ to.

3. **Opportunity to Engage as Socially Responsible Practitioners:** The “home-like” environment created in Studio One fostered an atmosphere which drew people together in conversations, many of which focused around shared interests of social justice and social change. The atmosphere was conducive to contemplation as the campus community imagined new initiatives in the larger universal community. It became an arena of development in becoming a socially responsible practitioner.

It is also important to note that the conscious creation of a connected community in the educational environment models the importance of self-care for students, a lesson that will hopefully flow over to their work when they graduate.

4. **Promotion of Creative Thought, Conversations and Community Art Making:** Having a “public home” space on campus allowed people to drop in, share, work, play and enjoy each other’s company. In the peace and sense of ease that ensued, community members opened to their creative life force and began to act from a place of inspiration. Enhanced creativity fostered inspiration on campus that effused the atmosphere and enhanced learning capacity.

5. **Integration of Adler University’s Strategic Plan:** On a larger organizational level, Adler University has a 2015-2020 Strategic Plan which “charts the direction for realizing our mission and our vision to be the leading academic institution advancing socially responsible practice, healthy communities, and a more just society.” With such a grand plan it becomes even more important that we begin by increasing Well-Being and health with our own community.
**Innovation in Education and Community Engagement:** Having Open Studios on campus integrates into one of the plans Key Strategies: “Create *Excellence* and innovation in education and community engagement”. The Open Art Therapy Studios are an innovative initiative which begins with community engagement at home, on our campus.

**Wellness of Students and Improved Support of the Learning Environment:** Open Art Therapy Studios integrates with the goals of Adler University Strategic Plan which includes “the development of Excellence Plans in ten areas, addressing the wellness of students and the improved support of the learning and work environment”. Open Studios allow us to maintain a healthy campus community ready to move into the community at large to continue the pioneering work of Alfred Adler.

**Enhanced Adlerian Experience:** While surrounded with an ‘Adlerian” atmosphere amidst peers committed to social justice and social change, students at Adler University actually study all of the traditional theoretical approaches in psychology and are able to choose their personal theoretical orientation from among them. Students have only one course specifically dedicated to teaching Adlerian principles.

This has been identified as an area which needed to be fortified if we were to be able to ensure our commitment to training socially responsible practitioners. Open Art Therapy Studios are one of the ways that students are able to experience Adlerian values at a deeper level by working with art. They do this through our most popular Open Studio special workshop called *Cows Can Be Purple*. This is an 8-week experiential Adlerian art therapy group following the way of Sadie (Tee) Dreikurs, author of *Cows Can Be Purple* (1986). Participants learn tools for personal development and work with traditional Adlerian art therapy methods including early recollections, birth order, and lifestyle work.

A donation is requested to attend this special Open Art Therapy Studio. All the money collected is used to buy art supplies for community practicum sites who have no budget to buy their own. This element further reinforces the idea of social responsibility for our campus community and allows for direct community outreach.

The program has become very popular with students from the other counselling programs who express their appreciation of experiencing work with meta-verbal methods.

**AREAS FOR FUTURE FOCUS/RESEARCH**
1. Ferguson’s (2010) research can be expanded upon if the connections between the enhancement of concern for campus community members and the strengthening of cognitive restructuring procedures were explored.

2. Reilly’s (Flood & Coleman, 2015) research on arts-based learning in non-arts classrooms and creating multiple ways of knowing and increasing creative thinking in graduate education could be expanded upon particularly as teachers from other programs at Adler University continue to invite the MCP: Art Therapy students into their classrooms after experiencing the enhanced Well-being of community feeling in Open Studios.

3. The evaluation of education programs in which meta-verbal skills are taught require research paradigms which can allow for subjectivity and which appreciate the illogical and irrational components of creativity and imagination. We recommend that future research be focused on the creation and development of this type of program evaluation. We assert that these program evaluations need to be created outside of the current Newtonian Paradigm, the worldview which is sometimes referred to as “Scientific Materialism” (Mack, 2002). This worldview honors the “scientific method” which is based in the assumption of ‘objectivity’, a concept which quantum physics has disputed. The ‘evidence’ supporting such educational programs’ efficacy would need to be based in the subjective experience and ‘real life’ differences that happen for all those involved in the transformative effects of an educational program whose curriculum is based in teaching relationship with creativity and imagination. This Open Studio story provides context:

Towards A New Vision of Program “Evaluation”: As Program Director I was graced to be in the right place at the right time as two students from another program at Adler University poked their heads in the door during the special Open Studio held during the holiday season at the same time all of the final exams and projects are due for students on campus. I watched as the MCP: Art Therapy students moved into action. Working with their well honed Adlerian skills of encouragement, I witnessed them “draw” the two students into the space.

The students had been burning the midnight oil for days as they did their studying and completed their papers for semester end. They began as most people do, by saying why they could not come into the studio for even a moment. They had studying to do. They had too much work. They were too “stressed out”. And as they resisted I watched the MCP: Art Therapy students work their “magic”. They listened to them and their woes while at the same time moving with intentionality and sureness. It was their job in Open Studio to provide a moment’s relief for these students and to assist them in self-care knowing how hard it is to remember to take care of oneself especially in “crunch times” like semester end in a graduate program!

It brought a tear to my eye to see these MCP: Art Therapy students take such gentle care of their campus colleagues. I thought, “It is at school where we must learn to take care of each other. It is at school where we must remember to teach ourselves and our colleagues to take care of ourselves. It is at school where we must have an experience of being reminded to take a moment for self-care.”
I listened to the student’s words and could hear them as mine especially at times when I have a mountain of work to accomplish. I heard them give all the good reasons why they had no time. No time for fun. For interesting conversation. For a cup of tea. To take care of themselves. To relax. To enjoy. To love life. To regenerate. To imagine. To be peaceful. Just no time!

I watched and participated as several of us stood up to match the students in their standing posture just inside the door of Studio One. They told us how their life was as students in their program and how they needed to just work and focus on getting back to their studies. We listened while we moved with our knowing that their studies were about to go so much better for them because they actually were taking 5 minutes to stand in the atmosphere of peace the MCP: Art Therapy students had consciously created in Studio One. They were at that very moment standing in, breathing in, relaxing in and absorbing the peace of Winter White.

We gave oranges and our “free range eggs” for them to take as they went back to the student lounge to study. We listened as they de-briefed about the lack of sleep they were getting and the level of pressure they were feeling as they moved through academia. As counselors we listened deeply. In a most natural way the MCP: Art Therapy students practiced the microskills of counseling and the students returned to their work refreshed.

Days later I bumped into these same two students by the elevators. I had just interviewed a prospective new MCP: Art Therapy student so I introduced them to her. I cannot even describe in words the love that welled up in my heart as these same two students told the prospective student how wonderful the MCP: Art Therapy program is and how much the Open Studios do for them and for their fellow students in the Adler U campus community. Then one of the students turned to look directly at me in the eye and she said with the utmost of conviction “Those Open Studios are a life-saver!” I was moved beyond words! How I appreciated that encounter. It affirmed all we were doing as faculty, staff and students in the brand new program. Who could ask for any better of a program evaluation?! (Now how do you capture that quantitatively?)

CONCLUSION

Having Open Studios on Adler University campus is an important component for training Masters in Counselling Psychology/Art Therapy in engagement skills, basic counselling micro-skills, the creation of healing physical environments, and to assist people to move through creative blocks. Having a public home space on campus for students from all programs, staff, faculty, Alumni and community partners assists to foster a strong sense of belonging which, according to Adler is essential to healthy functioning for human beings. Open Studios help to provide the campus community with social and emotional support as well the opportunity to explore becoming a socially responsible practitioner beginning in one’s own community. Through community art making creativity among community members was enhanced. Open Studios are a living way that elements of Adler University’s overall five year strategic plan are operationalized in order to remain a leading edge institution committed to walking its talk about the provision of innovative education within a supportive community committed to social justice.

For Ferguson and Nation: Justice and Education via Anti-Biased Reform

Dannielle Joy Davis

Saint Louis University

Abstract

U.S. society continues to experience inequities, stratification, and segregation within its educational and social systems. This work explores these injustices by employing the Christian based theory, The Matthew Effect, as a framework for education and anti-biased police reform. The Bible’s Book of Matthew reads, “For unto everyone that hath shall be given, and he shall have abundance. But from him that hath not shall be taken away even that which he hath” (Matthew 25:29). Use of The Matthew Effect as a conceptual framework in understanding social outcomes reveals how shifting perspectives or expectations of others may influence police reform, educational policy, practice, and the subsequent outcomes of citizens’ lives.

Introduction

The Bible’s Book of Matthew states “For unto everyone that hath shall be given, and he shall have abundance. But from him that hath not shall be taken away even that which he hath” (Matthew 25:29). This verse inspired sociologist Robert K. Merton to describe the phenomenon of advantage resulting in further advantage and disadvantage, which yields continued circumstances described as The Matthew Effect. In the book, The Matthew Effect: How Advantage Begets Further Advantage, author Daniel Rigney explains:

The study of Matthew effects…is concerned less with the sources of inequity than with how these inequities persist and grow through time. It explores the mechanisms of processes through which inequities, once they come into existence, become self-
perpetuating and self-amplifying in the absence of intervention, widening the gap between those who have more and those who have less. No theory of stratification is complete without attention to such processes. (Rigney, 2010, p. 1)

In other words, those who have more opportunities may have an expectation that such opportunities and benefits, whether economic or otherwise, continue. Even if individuals have modest expectations, they at least know of the possibility of opportunity. Hence, they look for or anticipate potential opportunity, and it often finds them. When in college, the author regularly examined university bulletin boards seeking information. As a young African American woman, examining bulletin boards was critical, as she benefitted greatly from the practice which included: Gaining information on scholarships and awards that were later received; opportunities to travel throughout Africa and Europe, as well as employment. Knowing others who traveled globally and won scholarships, she knew opportunities were out there and sought them out, thereby benefitting both economically and intellectually.

Likewise, an individual who has no vision of possibilities may have challenges in making choices that yield future opportunities. For instance, an individual in poverty with a gifted child attending an under-resourced, low performing school may not know steps to take to ensure cultivation of the child’s gifts. How might the parent advocate for and succeed in ensuring her child is identified by gifted programs? Often times, such parents don’t realize the extent to which actions on behalf of their children result in economic and educational benefits. They may experience limitation due to lack of information and communication with other parents of gifted children or don’t know what questions to ask authorities with power to influence their experiences positively. Just as The Matthew Effect suggests, they may feel powerless about a current impoverished condition, yielding less future benefits than more connected and informed
families of the same socioeconomic background. In some cases, this lack of information may lead to continued intergenerational poverty.

The Matthew Effect similarly can be applied to the underlying dogma of how social groups are perceived. KIPP Academy schools demonstrate how moving away from a deficit mentality of poor minority youth facilitates success. Similarly, efforts to reform the recruitment, hiring, and training of police officers center upon: Identifying recruits who served minority communities in the past; focus upon community service in hiring processes in efforts to develop a more empathetic police force; and prioritizing diversity training by hiring Diversity Officers in charge of continuous anti-biased and anti-racism training for police forces. This work intends to explore The Matthew Effect and Freire’s description of social justice as they relate to these reform efforts, particularly as they regard anti-biased police reform.

**Freire, Bias, and Social Justice**

Our vocation, Freire argues, centers upon humanization. Oppression, exploitation, injustice, and oppressive violence thwarts this vocation (1993). Dehumanization distorts the vocation of becoming more human for both the oppressor and the oppressed. An interesting component of the theory includes the assertion of the mutuality of liberation. Freire describes liberation as a mutual process where those seeking liberation “must perceive the reality of oppression not as a closed world from which there is no exit, but a limiting situation that they can transform” (Freire, p. 49). Activists who work towards anti-biased police reform understand that the current state of police relationships with Black communities can be ameliorated and improved.

However, dwelling in the duality of wanting to be like those with power, and acknowledging that being like those in power means being oppressive, hinders progress towards
liberation for those without it (Freire, 1993). Within such duality, “the oppressed do not see the “new man” as the person to be born from the resolution…as oppression gives way to liberation” (Freire, 1993, p. 46). Rather, the oppressed may become oppressors themselves (1993). An individualistic vantage point and identification with the oppressive system, fosters false consciousness, where they do not affiliate themselves with the oppressed group despite economic similarities, as the case of police officers from poor, isolated White backgrounds. In essence, the combination of racism, lack of education, and sparse exposure to racial and cultural others fosters White mental oppression. Freire offers as an example a peasant, who once becoming an overseer, behaves harsher towards people than the land owner himself (1993). Hence, when viewed from the lens of Freire, White racism can be viewed as a form of White mental oppression. This form of oppression perniciously chips away at White humanity and their ability to interact rationally with humankind as a whole.

Similarly, individualism can counter democratic collective efforts towards positive change. Individualism fails to draw upon external and internal networks that inform improvements and foster excellence. Isolation and failure to learn from networks may stifle transformation resulting in stagnation. Stagnation may take place at individual, meso, and organizational levels. Thus, in applying the principle of The Matthew Effect, the peasant Freire refers to accumulates more power via force over others, similar to a White police officer holding racial bias. What is taken away is the individual’s own humanity and inability to transform to higher levels of being, knowing, and behaving. Such a lack of transformation reflects a form of stagnation and oppression that hinders emotional, intellectual development and subsequent unification efforts with others, thereby truncating the social and interpersonal strength derived from healthy cross-racial collaboration and community.
Discussion

Biased behavior often breeds abuse in both professional and personal lives. When used to promote justice and equity, The Matthew Effect as a framework counters negative effects of biased behavior and decision making. Positive and negative influences are formed both within and beyond institutional walls and may yield a Matthew Effect for organizations. Anti-biased police reform measures, such as recruitment and hiring centered upon prior social service, and implementing Diversity Directors to shift police culture to value anti-biased and anti-racist training, illustrate positive mindsets that may yield corresponding favorable outcomes for police-community relations.

Fear comprises a primary element of psychological distress. Fear of moving forward, fear of change, or fear of lost resources and opportunities may fuel mental conditions including depression, anxiety, racism, and sexism. Acting out of fear may not only influence individuals’ personal lives, but their professional lives as well. Fear, in the form of racism and bias, may emerge in the workplace, influencing decision making, response to change, organizational climate, morale, and productivity.

Despite being a negative emotion, fear may or may not result in unfavorable results. However, certain factors such as power differentials and racial bias, increases the likelihood of it hindering rather than enhancing outcomes. Fear coupled with power and a separatist outlook yields discriminatory behavior, including racism, sexism, ageism, and ableism. Officers holding such thoughts do not view subordinates nor constituents as equal members of society, but as separate independent “problems.” Similarly, viewing an organization as separate pieces rather than as a whole thwarts vision towards growth. Holistic change via anti-biased police reform
promises to influence various facets of police culture, to promote officers who view racial
minority communities as valuable extensions of themselves that matter.

Biography

Dr. Dannielle Joy Davis is an Associate Professor of Higher Education at Saint Louis University. A graduate of the University of Illinois at Urbana-Champaign, she has studied and conducted research in Ghana, South Africa, Senegal, Egypt, Germany, the Netherlands, and Belgium. Her interdisciplinary research examines the experiences of marginalized groups in educational settings, the role of organizational policy and practice in the promotion or inhibition of egalitarian academic and occupational outcomes, and spirituality in the workplace and other learning environments. She has published over 40 refereed journal articles, book chapters, academic commentaries, volumes, and reviews. She is Co-editor of the books *Black Women in Leadership: Their Historical and Contemporary Contributions* (Peter Lang Publishing), *Social Justice Issues and Race in the College Classroom: Learning from Different Voices* (Emerald Group Publishing Ltd.), and *Intersectionality in Education Research* (Stylus Publishing). Dr. Davis has served as an Associate Editor for *Learning for Democracy: An International Journal of Thought and Practice* and *The International Journal of Religion and Spirituality in Society*. She currently is a member of the Editorial Board for the *Journal of Colorism Studies*. 
Title: Developing an Aspiring Leaders Skills Assessment

Authors:

capellin@brandman.edu

Dr. Laurie Wellner
Adjunct Professor
Brandman University
lwellner@brandman.edu

Abstract:

Brandman University, part of the Chapman University system, commenced an innovative re-design of their Master of Arts in Educational Leadership and Administration with Preliminary Administrative Services Credential Program in 2014-2015 with the vision to be a leader in the state of California in preparing “leaders of the future” who are prepared to transform schools in the 21st century. This dynamic poster session will present the development of an Aspiring Leaders Skills Assessment (ALSA) based on the newly adopted California Administrator Performance Assessment Expectations (CAPEs) and California Administrator Content Expectations. The six overarching leadership domains assessed include; Instructional Leadership, School Improvement Leadership, Organizational and Systems Leadership, Community Leadership, Professional Learning and Growth Leadership, and Visionary Leadership. Corresponding assessment items in each domain will be shared. Further, the session will describe how the ALSA is being utilized in the program to measure individual leadership growth longitudinally and for program assessment.

Abstract:

Brandman University, part of the Chapman University system, commenced an innovative re-design of their Master of Arts in Educational Leadership and Administration with Preliminary Administrative Services Credential Program in 2014-2015 with the vision to be a leader in the state of California in preparing “leaders of the future” who are prepared to transform schools in the 21st century. Principals who are 21st century technology leaders model technology use and integrate it in their day-to-day leadership practice on a regular basis. This session will highlight the collaborative development of custom technology badges and the system created to recognize students who achieve mastery in the use of educational technology through their successful integration of technology. Mastery is demonstrated through authentic applied leadership assignments based on the International Society of Technology in Education (ISTE) Standards for Administrators. Technology Badges are awarded in seven distinct domains; Animated Media, Collaboration, Data Collection, E-Publishing, Learning Management, Print Media and Research & Organization. Students who earn all required technology badges are awarded the “21st Century Leader” badge which is a requirement for successful completion of the program.
Investment in human resources development via study abroad programs: Is it worth it?

Investment in human resources development via study abroad programs: Is it worth it?

There is vast literature that underscores the importance of education and training on human capital development for the benefit of a nation (Aghion, 2008; Ginzberg, 1958; Tkachenko, & Ardichvili, 2013). At present, governments, non-governmental organizations, regional institutions, and global communities are investing substantial financial resources in the development of human resources via formal education, informal education, vocational trainings, and other services. In the midst of the initiatives, investment in human resource development (HRD) via study abroad programs has been recognized an increasingly popular trend. According to the Institute of International Education (2014), Chinese students studying in the United States account for 31% of all international students, while the number of students from India and The Republic of South Korea account for 12% and 8% respectively. While the number of study-abroad students keeps increasing every year (e.g., from 2013 to 2014 the number of international students studying in the US has grown by 8%), the impact of study-abroad programs is attracting more attention among scholars from various fields (eDee & Stewart, 2003; Paige et al., 2009; Pietro, 2015; Kuchinke, & Ardichvili, 2014). While there is some evidence on the positive impact of study-abroad programs on graduates’ intercultural competence, cross-cultural awareness, and employability, there is still lack of understanding of how a person’s participation in a study-abroad program impacts the economic and social well-being not only of the participant, but also his/her larger social systems, e.g., family, organization, community, or even a nation. In other words, given the significant investment in HRD via study-abroad initiatives, there is little knowledge on their return on investment: Is it worth it? And, if it does, what makes it worthwhile?

The proposed study design aims to investigate this problem. In particular, the study aims to explore various predictor variables of the perceived impact of participation in both short-term and long-term international student exchange programs on the economic and social well-being of the participants, their family, organization, community and country. In particular, the following independent variables are currently considered in the study design: (a) types of programs (semester exchange, Master’s, Doctoral, and Post doctoral), (b) types of fields (e.g., science, business, public policy-affairs, other social science), (c) time after
participation, (d) prior career path, and (e) gender. We are planning to obtain data by surveying alumni of the three exchange programs, graduated over the period of 2000-2012, in the country of Cambodia. The three study-abroad programs are Fulbright, Australia Awards, and Japanese Grant Aid for Human Resource Development Scholarship (JDS).

This study aims to make a number of contributions. First of all, this paper addresses a gap in the literature by empirically examining the relationships between participation in study-abroad program and the participant’s (perceived) impacts on social and economic well-being of family, organization, community, and country. Secondly, this paper will provide a more insightful view of study abroad programs to Cambodian students who plan to apply for the programs. We hope students will become more informed candidates for the programs in which they are interested. Thirdly, on a more practical level, we hope that the findings of the study will benefit the key stakeholders engaged in the study-abroad initiatives in Cambodia (program staff, donors, policy makers) and will be useful to inform a broader audience, academics and policy makers, studying the impact of study abroad.

At present, the design of the study is being further developed. We expect to be able to elaborate on the study design in details and present the survey instrument at the conference.

Abstract

The proposed research examined through this report is a systematic review of best practices in student success across multiple colleges of engineering. The focus will be on underrepresented populations, however, it is expected that the results will be applicable across other populations of students as well. Mixed method analysis of several retention and intervention programs will be applied at the following institutions: Purdue University, Pennsylvania State University, Arizona State University, Kansas State University, Virginia Tech, and the University of Texas at Austin. In addition, it is proposed to examine how effectively each of the institutions utilize the following external intervention programs: Guaranteed 4.0 Learning Systems, and The National GEM Consortium.

The research objectives are to explore the effects of the utilization of brain-based learning, academic coaching, standardized engineering student organization support, and standardized transition programs to improve academic success and retention in engineering across several institutions. Outcomes expected include increased definition of factors contribute to student success in engineering, and the creation of a model of collaboration across institutions in pipeline development, transition to college, and transition to graduate school.

The National Association of Multicultural Engineering Program Advocates (NAMEPA) is a collection of universities across the United States that focuses on under-represented student success throughout the pipeline. NAMEPA is at the beginning stages of research to explore best practices in using brain-based learning for academic success, academic advising, successful transition programs and increasing graduate studies across six universities and two external organizations. The NAMEPA organization would like to share the results of institutional best practices, results, and plans for collaborative research.
Introduction

This document reflects preliminary discussion for broad research on best practices for retention and graduation of racially underrepresented students in engineering. Underrepresented populations in this study are defined as citizens and permanent residents of the United States who are of African, Native, Hispanic or Latin American descent. This population is severely underrepresented in engineering colleges at 16.5% (ASEE, 2015), even though they compose 32% of the nation (US Census Bureau, 2014). The proposed study will examine how the dependent variables, academic performance, retention, graduation, and graduate school entrance, are affected by the independent variables composed of those factors which render successful transition and retention programming.

While the institutions utilize several similar best practices to address these factors, the goal of further research is to examine a few single strategies and define the variables that yield the highest likelihood of student success. For example, the first year summer bridge is a common strategy designed to increase academic success. This research would seek to examine several summer bridge programs across institutions, and identify factors that are correlated with retention and graduation, through both quantitative data (such as time spent in academic review or group average GPAs and retention rates) as well as qualitative data (collecting a record of the students’ perspectives on factors that they believe have contributed to their success). By utilizing multiple institutions, and multiple cohorts, a large data set can be evaluated.

Theory and Research Literature

Preliminary studies could be conducted using quantitative secondary data reflecting retention and graduation rates of student cohorts that began six to ten years ago and tracking each student through well-defined retention program participation, scholarship awards, entrance to the engineering major, dropout rates or graduation with a baccalaureate degree in engineering over the past five years. Those factors that are most strongly correlated with graduation would be significant in forming a strong model for intervention programming. This is similar to the method used by Freeman (2009) who examined five cohorts of underrepresented engineers who completed their bachelor’s degree and compared their first year records of Standard Aptitude Test (SAT) scores, high school grade point averages (GPAs), community economic index, and the college entrance math placement scores when they applied. Upon comparing those who graduated in engineering with those who changed majors or dropped out of college, a multinomial logistic regression showed that the combined effect of these variables explained 75.6% of the variance in graduation outcome (or, predict4d the likelihood of graduation in engineering with a
75.6% accuracy). The same model could be used to examine the correlation of other variables associated with retention intervention programming.

Quantitative data would reveal what worked, however, qualitative data would be needed to explain why it worked, and what the students perceive as being the most effective factors in their success, or decisions to continue on to graduate school. This data could be collected from focus groups of more recent cohorts as they progress towards graduation. Many of the successful strategies identified through this study would be useful to institutions seeking to increase the numbers of engineering and other STEM professionals, especially those students that are marginalized or underrepresented in the academy based on gender, race, socio-economic status, and the first generation college experience.

While the study is still in planning stages, following in this report, several institutions provide examples of current programs that have proven to be best practices at each college over several years. All programs are based on research proven methods of retention including Tinto’s research in effective learning communities (Tinto, 2007; Tinto & Love, 1995), the effectiveness of math-intensive summer bridges (Tyson, Lee, Borman and Hanson, 2007; Maton, Hrabowski and Schmitt, 2000; Hrabowski & Maton, 1995), scholarship support (Engstrom & Tinto, 2008), successful transition programming between two year and four year campuses (Cohan, Yin, Freeman, et al., 2014; Berger & Malaney, 2003), and the importance of undergraduate research and engagement as factor correlated with student’s likelihood of continuing on to seek a graduate degree (Hirst, Bolduc, & Liotta, et al., 2014; Eagan, Hurtado, & Chang, et al., 2013).

An additional factor which may lend more uniformity to the methods of retaining students include the external systems that each of the institutions participate in at varying levels. These would include the Guaranteed 4.0 system created by Dr. Donna O. Johnson, and the GEM Consortium. The Guaranteed 4.0 system is designed primarily for undergraduates providing them with a system for how to study effectively. The system includes, a workshop series presentation by Dr. Johnson, books, worksheets and online tools that assist students in reinforcing that methodology throughout the semester (Guaranteed 4.0 Learning System, 2015; Johnson, D.O., & Chen, Y.C. 2004). It is often provided in conjunction with first year seminars, summer bridges, or offered broadly at the beginning of any given semester on an annual basis. Students who follow this method of studying report better academic performance.

The GEM Consortium focuses on providing funding and success strategies to racially underrepresented STEM students seeking graduate degrees (M.S. or Ph.D.). Members of the GEM Consortium include
corporate partners, universities and the GEM organization which coordinates student applications for fellowship funding with resources available through the corporate supporters and universities. Students applying are required to apply to graduate school with member universities. Those selected as GEM Fellows receive fellowship funding through the corporate supporter and the member university (The National GEM Consortium, 2015).

Most of the institutions included in this report have utilized the services of the GEM Consortium and the Guaranteed 4.0 system. Further study of how these organizations apply these external resources, and which method is most successful could result in best practices that can be applied in a more uniform and effective manner across a variety of educational systems.

Institutions involved in student retention programming are listed below with examples of a best practices and the current outcomes of those programs or processes. Most of the institutions have some version of all of the best practices below, however, each institution is unique and utilizes its own measure of success. The advantage of a study involving multiple institutions would be to streamline the measures of success so that comparisons can be made between them, and clear solutions can be designed for implementation by a broader audience.

Successful programming below includes:

- a first year summer bridge to address academic performance and advising of first year students
- A first year summer bridge and a three-day orientation to address academic performance of a wider audience of students
- a living-learning community for students who transition from first year to graduating seniors at a single institution
- transitional retention program for students whose continuation includes changing campuses
- research experience for undergraduates and international education to encourage students to consider graduate school and expose them to global collaboration.

All of these are described below with each institution’s assessment of the problem addressed, methodology and description of the program, data indicating success, and limitations of the program.
Gaps in first year retention rates and academic performance between underrepresented minority (URM) students and majority students persist in undergraduate engineering programs at predominantly white universities. While the academic rigor and new post-secondary environment present a difficult transition for students in general, underrepresented minorities may face additional obstacles such as academic and social isolation and negative stereotypes. These high ability students certainly have the potential to successfully complete undergraduate studies in engineering at a high level. However, the transition at this particular leverage point remains a primary challenge to student success.

**Program Description: Engineering Academic Boot Camp**

In the summer of 2005, the *Engineering Academic Boot Camp* at Purdue University was launched to improve the transition of underrepresented engineering students into the majority campus culture and to provide students a framework for approaching the new academic challenges associated with undergraduate engineering studies.

The *Engineering Academic Boot Camp* is structured as a non-credit bearing five-week simulation of the first semester engineering experience at Purdue. Calculus, Chemistry, Physics, MATLAB, English, and an engineering design project at its core. Students received instruction on how to learn through the *Guaranteed 4.0* system. Additionally, students are engaged in mentoring from peers and professionals, corporate tours, time management, team building, and social activities. Embracing the best practices of learning communities, engineering students are required to live, study, and have classes together in preparation for global competition.

**Limitations**

The *Engineering Academic Boot Camp* costs $4000 per student to execute. The Purdue MEP currently relies on corporate and individual gifts to underwrite the program. As a result, attendance to the program is limited.

**Outcomes**

After a three-year pilot period, the *Engineering Academic Boot Camp* has demonstrated the importance of transition of URMs into a majority institution in achieving higher first semester performance and first year retention in engineering.
20% increase in retention of underrepresented minority students in engineering over the past decade

Average first year retention 93.5% over the last 7 years
  - 12.2% better than URMs that did not participate
  - 6.1% better than the rest of the engineering cohort

Summer Bridge and First Year Orientation Program
Kansas State University
Multicultural Engineering Program

There is a need to strengthen cumulative GPA to effect retention in the college of engineering for multicultural students and prepare students to be competitive for internships and scholarships. The 6-week Multicultural Academic Program Success (MAPS) Summer Bridge Program was beyond capacity, could only accept 30 students with more than 100 applicants annually from the colleges of engineering, agriculture and business. To accommodate additional students, the 3-day program, Kompass: Navigating your way to a 4.0 GPA, was implemented. Both are Project IMPACT programs.

Program Description: MAPS and Kompass

The implementation of the best practice of MAPS and Kompass accomplished the same goal of strengthening the GPA. MAPS is a math intensive 6-week summer bridge program, and Kompass is a 3-day extended orientation program to support students not admitted into the summer bridge program and/or those who did not apply to the 6-week program. MAPS and Kompass both implement mentors, academic preparation through the Guaranteed 4.0 Program, first year scholarships, and corporate executive contact during the program for students in engineering, agriculture or business. The 6-week program students come into their first year with a GPA from the summer and have financial support for the Fall and Spring semesters, but have a small amount of follow up during the school year. The 3-day Kompass program students have a zero GPA upon entering KSU, are awarded a non-renewable $1,000 scholarship, have weekly mentor meetings and monthly professional development activities.

Limitations:

Needed are:
  - Sustained funding for a MAPS Coordinator, Kompass Coordinator and scholarships for continuing Project IMPACT students.
  - Funding for peer-to –peer mentors for a full year of interaction in the Kompass program.
Sustained participation of students in implementing the Guaranteed 4.0 principles.

Outcomes:

Summer 2014 MAPS:
- 34 Summer students in the MAPS Program
- 80% or 27/34 obtained a 4.0 during the summer (5 or 6 credit hours in 6 weeks)
- Average GPA was 3.926 for the 9 engineering students

Fall 2014
- Average Fall SEMESTER GPA was 3.41 for the 9 engineering students from Summer 2014

Spring 2015
- Average CUMULATIVE GPA was 3.40 for the 9 engineering students from Summer 2014
- One of the nine students did not use the Guaranteed 4.0 principles
  - The Average CUMULATIVE GPA was 3.53 for the 8 participating engineering students

Summer 2015 MAPS
- 30 Summer students in the MAPS Program
- 87% or 26/30 obtained a 4.0 during the summer (5 or 6 credit hours in 6 weeks)
- Average GPA was 3.926 for 10 engineering students

Summer 2015 Kompass
- 26 students trained in the Guaranteed 4.0 Program
- 15 of them are engineering students

Fall 2015
- A total of 56 freshmen trained in the Guaranteed 4.0 program are brought into Project IMPACT
  - We are looking forward to seeing first semester GPAs for these students

Living-Learning Communities

Virginia Tech
Center for the Enhancement of Engineering Diversity (CEED)

Learning Communities have long been part of higher education’s approaches to academic enrichment, and they have taken on many forms and versions as the years have passed. Such programs that have a residential component are typically called Living-Learning Communities, or LLCs, and usually involve housing the participants in the same residence hall or portion of a residence hall. The usual expected participant outcomes from learning community implementation are improvements in academic success.
and persistence, an enhanced sense of community among the participants, and more engagement in the campus environment, including stronger connections to academic units.

The implementations of *Hypatia* and *Galileo Living-Learning Communities* were done with these expected outcomes in mind, particularly persistence. It is recognized that first-to-second year attrition in engineering programs is most severe, and that intervention at the freshman level is paramount to increasing persistence to graduation in engineering degree programs. Thus, freshman living-learning communities for engineering students seem to offer a very viable means to improve retention in engineering, especially at institutions that require, or strongly encourage, on-campus residence for freshman students. Assessment of the *Hypatia* and *Galileo* living-learning communities includes longitudinal tracking of cumulative grade point average and retention. We also document community demographics and survey the residents on program satisfaction and on the impetus to participate.

**Program Description: Hypatia and Galileo Living-Learning Communities**

*Hypatia* is a living-learning community for women in engineering that currently contains 173 freshmen. It was established in fall 2001 for female freshmen entering Virginia Tech in the College of Engineering. The community was implemented through the then Office of Minority Engineering Programs (now the Center for the Enhancement of Engineering Diversity, CEED), with additional associated costs provided largely through industrial sponsorship. *Galileo* is the male counterpart to *Hypatia* and has 273 male freshman engineering students. This men’s community was established in fall 2005 as part of an expansion of freshman intervention programs to improve retention in the College of Engineering. The expansion effort was made possible through the award of a STEP (STEM Talent Expansion Program) grant from the National Science Foundation. Both communities are physically located in Lee Hall.

Outside of size, and sex of the participants, the community structures are essentially the same. The RAs in both communities often join forces to implement the programming activities that Residence Life requires of RAs, and these activities often have an engineering theme. Other community activities are implemented by CEED and STEP grant staff, with assistance from the RAs, and these are both engineering and social events. Both communities have a required academic component for the fall semester in the form of a seminar course. Course content is focused on personal, professional and academic skill development. Topics include

- Resume creation and career fair participation
- Learning to write cover letters and thank you notes to interviewers
• Developing a four-year academic plan, charting classes
• Learning methods of tracking grades in order to have a successful semester from the beginning
• Interviewing professional engineers about their path
• Participating in community events led by upper class committees
• Completing 10 hours of community service during fall semester and one event per month during spring semester

Beginning in 2004, a select group of 1st year students were allowed to remain within the community to serve in various capacities (mentors, committee leaders). As the communities grew in size, it was decided that a student leadership component could be added that would both benefit the upper class students as well as assist in providing support for the 1st year students. In 2009 the Galipatia Leadership Team was created comprised of 3rd and 4th year students who remained committed to the success of the community. 2nd year students serve in the following capacities

In addition to mentoring, the second year students also organize and lead the following committees for the communities:

• Academic support – holding regular study hours to help students with homework, leading and organizing review sessions, hosting events to help with study skills, etc.
• Social – planning and organizing events for students to interact and meet each other outside of class
• Service learning – planning and organizing community service activities
• Outreach – planning and organizing K-12 efforts, including hands-on activities for students to learn about engineering and hosting school visits to campus
• Professional development - planning and organizing events with corporate partners and campus partners, such as Smith Career Center, to assist students in preparing for internships and future work skills
• Communications – collecting information from the other committees to distribute to first-year students in a weekly email, weekly newsletter, and Facebook page

Limitations
The physical space limits the overall size of the community. Lee Residence Hall is shared with the College of Science residential communities resulting in approximately 600 beds for Hypatia and Galileo.
Outcomes

The retention and graduation rates for the community are tracked and compared to a matching control group. Over the lifetime of the communities the participants are graduating at a higher rate.

Campus Transition Programming

Arizona State University

Academic Success Programs

There are several factors that contribute to the attrition rate of marginalized populations in engineering. These include lack of recruitment, encouragement, and support of engineering and computer science upper division transfer students, especially women and underrepresented students (African American, Hispanic/Latino, or Native American) with unmet financial need in non-metropolitan community colleges.

The state of Arizona has 22 community colleges (CC), three state, and one private university. Most of the students attending a CC do so because the college has lower tuition (about 1/3) than a university and further the student can save on room, board, and gas since the school is not far from their home. “Transfer shock” is very real. This term describes not only the half to full grade point decrease usually experienced the first semester at a large university, but also all of the changes from free parking, small classes, night
classes (to accommodate working), and many opportunities to interact with the class professor.

Historically, the Ira A. Fulton Schools of Engineering (including Computer Science) did not have any special programs to support students once they transferred. In 2002 an upper division Academic Success and Professional Development seminar and scholarship program was begun with funding from the NSF S-STEM program. This program, with an emphasis on females and underrepresented minority students with unmet financial need has developed and been refined during the past 14 years.

**Program and Process Descriptions**
The process of guiding a student from a community college through to graduation in engineering at a four year institution is managed in three stages:

1. Recruitment with preparation for transfer
   - University professor classroom visits to CCs
   - Transfer Course Pathways
   - Open House Visits by CC students to the university

2. Academic and financial support
   - Transfer Center for students
   - Academic Success and Professional Development, a 2-credit repeatable class
   - Guaranteed 4.0 Plan
   - Scholarships

3. Encouragement to go on to graduate school
   - Nuts & Bolts of Graduate School
   - Graduate Student Panel
   - Industry Speakers with graduate degrees

This process is based on ground theory, Social Cognitive Career Theory, and Tinto’s formula for what colleges need to do to retain and to graduate students (Tinto, 2007; Tinto & Love, 1995).

**Recruitment with Preparation for Transfer**
The United States needs more engineers. The community college system is a largely untapped resource for more engineers, especially females and underrepresented minority students. Engineering is not on the career horizon for most CC students. The goal of professors visiting mathematics, science, and engineering classes is to create a desire in the students to consider if engineering or computer science might be the career for them. The CC students are also told about the importance of applying early to be eligible for scholarships. Other tips include spending most of their time on campus, to get into a study
group right away for each class, and to have their classes scattered during the week if possible. A large lesson for new transfer is that the classes are now harder and the pace faster, so they will not be able to duplicate working half to full-time and taking a full academic load, as many did in the CC.

**Academic and Financial Support**

The equivalency of all CC and state university classes is available and course map pathways from CC to university to graduation have been developed for most majors. A two credit Academic Success and Professional Development class has been developed for scholarship students (class is required) and is also open to other students, who attend due to word of mouth or at the suggestion of an academic advisor. The class is not remedial, but does build up the students with skills that are not ordinarily addressed in the regular classroom. Topics include: success tips for transfers built on 14 years of working with transfer students, the resume, the elevator speech, how to work a career fair, writing an interest paper, the value of participating in student organizations, internships, research, and graduate school. Also included in the topics is networking with other students and professors. Most importantly, underlying this course is the “Guaranteed 4.0 Plan” created by Donna O. Johnson. This plan includes a detailed time management schedule, as well as a method on how to “learn how to learn.” This research-proven plan gives students a program that they can use to do well in their academics. Mentoring of the newer students is encouraged for the students farther along in their studies.

In addition to the “Guaranteed 4.0 Plan” introductory session, the class meets seven times per semester. Each of the seven meetings is held four times to keep the meetings small, from 10-25. The students can choose which of the four times is most convenient for them for each meeting.

**Graduation and Professional Development**

Transfer students are encouraged to use the Motivated Engineering Transfer Students (METS) Center for homework assignments and projects, asking questions, and networking. The homework assignments each semester are designed to make the students do what they should be doing to be good students. For example, at the beginning of each semester, each student has to update their resume and make out a detailed time management schedule for the semester. Several meetings are devoted each year to research and graduate school. Most undergraduate students do not know what research really is, nor that it is important to have a Master’s degree for industry in order to have a better chance to work in their area of interest such as design or development. Many challenging industrial problems are limited to engineers or computer scientists with graduate degrees. Also, many students only find their real interest while pursuing a Master’s degree. A higher starting salary by $10-15,000 for a Master’s degree is an extra bonus.
Limitations:
Space for a dedicated Transfer Center for students to use to do homework, ask questions, and network is key. Sustained funding for a METS Director (with engineering degrees) and scholarships is essential, as well as dedicated faculty who are willing to drive long distances to visit non-metropolitan CCs and who are passionate in working with and encouraging students to graduate and to go to graduate school.
Providing the students with a $4,000 scholarship per academic year covers a little less than 40% of tuition costs and allows students to work less or not at all, which greatly helps their academics. Knowing that they need to maintain a 3.0 GPA and get an A in the Academic Success Class motivates the scholarship student to do the assignments required and to do well in their academics.

Outcomes:
- The METS Center space has been institutionalized, as well as transfer student funding to staff the Center
- A one credit Academic Success Class is now provided by the Dean's Office for all new transfer students (required of most majors and in lieu of the introductory ASU 101 for freshmen)
- Over half of the Academic Success Class do not have scholarships. They enrolled due to the encouragement of another student who told them how good the class is or at the suggestion of an academic advisor
- The graduation rate of program scholarship students is 95% (vs. 70% for all upper division transfer students both nationally and in the Fulton Schools of Engineering)
- 50% of the graduated scholarship students go right on to graduate school (vs. <20% nationally for all students, <12% for all upper division transfer students in Fulton).
- Sixty percent of all scholarship students are females and/or underrepresented minorities and all have unmet financial need.

Research Experiences for Undergraduates (REU) and International Education

*Pennsylvania State University*

*Center for Engineering Outreach and Inclusion*

Increasing the numbers of underrepresented engineers who complete the M.S. or the Ph.D. is a national challenge. Students who participate in undergraduate research have a higher likelihood of continuing on to graduate school. Typical REU program experiences often involve the student applying to study with a
professor at another university location. All students are not accepted and it is safe to say that there are not enough REUs to accommodate all applicants, and more are always needed. Penn State College of Engineering provided two REU programs that had a high concentration of Penn State underrepresented students. Both were presented very differently from typical REU programs, but the goal was to encourage more Penn State students to pursue research. The two programs are the College of Engineering Research Initiative (CERI) and Summers by Design: Peru

**Program Description: College of Engineering Research Initiative (CERI)**
The College of Engineering Research Initiative (CERI) targeted the general undergraduate engineering population, but diverse students were directed towards it and formed 22% of the REU participant population with 14 out of 61 students participating in 2014.

CERI is an REU program was designed to support Penn State undergraduate engineering students in conducting research with Penn State faculty. The program provided a stipend to each student selected to conduct and complete their proposed engineering research project in conjunction with a PSU faculty member and that faculty member’s associated research group. Included in this program were a series of processional development workshops, including information on applying to graduate school, laboratory visits to pique student’s interest in a wide array of technical topics, a paper, and a required public presentation of findings (whether poster or symposium presentation). Students received summer stipends of $5000. Faculty received $1000 for expenses associated with supervising the student’s project.

**Outcomes**
While the project was open to 8500 engineering students at University Park campus, underrepresented groups were actively encouraged to apply, with the Multicultural Engineering Program (MEP) director conducting workshops to assist students in understanding how to write a simple research proposal when approaching faculty. These students formed community along with other students in the program, and performed well. The total research group of 61 was intentionally balanced with a composition of 14 international students, 48 majority students, 14 underrepresented students, 15 first year students, 14 women, and each of the thirteen undergraduate majors in the college were represented. For the whole, the retention a year later was at 93%, and at 100% for underrepresented students participating.

**Limitations:**
Funding (solely through the Dean’s office) is not continuing in the future for the research program to be repeated at the same level of participation. While it began at 61 participants in summer of 2014, and did
continue through summer 2015 with 46 participants, summer 2016 is not anticipated unless additional funding is forthcoming. CERI will continue through the academic year with 35 students or so. Sustainability is a challenge.

**Program Description: Summers by Design: Peru**

Engineering Pathways involves ten Penn State engineering students who traveled with Dr. Amy Freeman and Dr. Julio Urbina to the Universidad Nacionial de Ingeriera in Lima, Peru. This research and international education program that was designed for them is called, Summers by Design: Peru. It was a part of an existing series of international experiences available to engineering students traveling to study in a number of countries. Drs. Freeman and Urbina are Co-Principal Investigators for the National Science Foundation (NSF) award for Scholarships in Science Technology, Engineering and Math project (S-STEM award #1154473), entitled, *Engineering Pathways: An Undergraduate Scholars Program*. The project focuses on renewable scholarship funding and educational retention programming for underrepresented, women, and first generation engineering students, ten of whom form a cohort of Pathways Fellows, a group that continues to form community for four years until graduation.

The 2015-16 academic year is the third year for this project. In Spring of 2015, these students were rising juniors and expressed an interest in traveling abroad. This project was the focus of biweekly meetings for the upcoming year as they prepared to interact with students in Peru, and learn more about the importance of being globally articulate and engaged. The average cumulative GPA for Pathways Fellows at the time of the international trip was at 3.31. The group met biweekly throughout the year with faculty to prepare for the trip. This project provided a research opportunity and international exposure to students who statistically are less likely to travel abroad.

**Outcomes**

All of the Pathways Fellows entered Penn State as Engineering students, and all have participated in continuing retention programming such as the 6-week PreFirst Year in Science and Engineering summer bridge, a living and learning community called First Year in Science and Engineering (FISE) House, biweekly meetings with the faculty and group reading and discussion of the book, *The Power of Habit*, by Duhigg. The group is composed of 4 women, 6 men, 8 racially underrepresented students.

The project, Summers By Design: Peru, included several components: a collaborative engineering research project involving the informal housing in Peru, and how these structures could be more efficient, preliminary study of the country and culture of Peru, faculty and student travel to Peru, interactive
learning with Peruvian students, tours of engineering projects in Peru, and student presentation of their solutions regarding the informal settlements, including a model of housing and improvements. Students presented to the presidents and officials of the hosting institutions, and the Dean’s Advisory Board for Engineering Diversity. Pathways Fellows are retained at 100% with 8 majoring in engineering, and 2 in other STEM fields.

Limitations
Funding remains an issue. This was an outstanding experience for these students, however, we do not foresee it happening at the same international magnitude for future students, in that the NSF grant is finite, and was combined with funding from the engineering Dean’s office.

Summary
While all the institutions utilize programs that are effective and fit each campus culture and designated funding parameters, a uniform guide would be useful to others seeking to implement these best practices. Multiple cohorts who have completed programming at each campus would present a large data set to refine accurate outcomes and predictors of success. Ideally, this would ensure the completion of more engineering degrees with in underrepresented groups and broaden participation in the profession.

Increasing STEM Freshmen Retention: creating an academic bridge and research program

Fewer than 40% of students who enter college intending to major in a STEM field graduate with a STEM degree. To address this issue, an innovative retention program focusing on academic readiness and freshmen research opportunities was developed and implemented. Program innovation, goals, outcomes and three years of retention data will be presented.

Abstract:

Fewer than 40% of students who enter college intending to major in a STEM field graduate with a STEM degree. This lack of retention is one factor that has led the United States to lag behind other countries in STEM workforce development. To address this issue, an innovative retention program focusing on freshmen academic readiness and research opportunities was developed and implemented. Program innovation, goals, outcomes and three years of retention data will be presented.

To increase retention of freshmen STEM majors, a two-prong program was developed to improve academic readiness and provide research experience. A fall semester academic bridge program (which morphed into a week-long summer program immediately preceding freshmen orientation) was implemented. The goals were to: (1) increase student competency in skills necessary for successful STEM undergraduate education as well as STEM careers; (2) increase retention of students in STEM majors from freshman to sophomore year through an academic bridge; (3) foster a social support network of peers; and (4) encourage undergraduate student interest in STEM related disciplines and increase awareness of available STEM careers. The bridge program was led by a variety of STEM faculty and designed so that necessary academic skills were learned within a context of hands-on applications with minimal lecturing. Upperclass peer mentors were also available to assist with the program, act as mentors throughout the academic year, and plan social activities for the group. An unassessed by-product of upperclassmen participation was the development of skills such as time management, organization, and mentoring techniques.

The second-prong of the program was a semester-long freshmen research experience. The goals were to: (1) increase retention of students in STEM disciplines from freshman to sophomore years through undergraduate research experiences and (2) encourage students to present the results of their research at the SJC Undergraduate Colloquium. The research experience was designed such that one-on-one weekly faculty mentoring created an environment conducive for confidence building and success.

Program specifics and data will be presented to show student success and retention rates. Students who self-selected to participate in the program had a higher ACT score than the students who chose not to participate. From first to second semester, 91.7% of participants choose to remain in the STEM majors whereas 72.9% of the non-participants remained. Overall, students with weaker backgrounds benefitted most from the program.
Pathways of STEM Indigenous Women from Degree Programs into the Workforce

Higher Education / Indigenous Education

Paper Session

The lack of women in STEM has been discussed for years and progress has been made to address this disparity. However, little research has focused on indigenous (Native American, Native Hawaiian, Alaska Native) women. This group is disproportionately small, and hence typically overlooked in large data discussions. This study will focus on indigenous women in STEM to identify attrition points in the pipeline and impact factors of successful women at those same points.

Abstract:

It is widely known that diverse teams are more creative and produce more innovative results. Unfortunately, creating diverse teams in science, technology, engineering and mathematics (STEM) fields continues to be a challenge. One reason is the lack of women in, and the loss of women from, STEM degree programs from undergraduate through the doctorate. It has also been found that a surprisingly large number of women who do earn STEM degrees choose not to continue on in the STEM workforce. This disparity has been studied for several years and many factors are believed to contribute, such as: a lack of female role models, inadequate mentoring, gender pay gap, gender stereotyping, and lack of flexibility to care of family obligations, to name a few. The majority of studies in this arena examine women as a group. However two landmark studies on STEM women of color, Shirley Malcom’s 1976 paper entitled ‘The Double Bind: The Price of Being a Minority Woman in Science’ and a follow-up 35 years later by Dr. Malcom and her daughter, Dr. Lindsey Malcom provided critical insights. They found that women of color are facing different challenges today: "Now it is less about rights versus wrongs and more about support versus neglect; less about the behavior of individuals and a culture that was accepting of bias as the 'natural order of things' and more about the responsibilities and action (or inaction) of institutions."

This study aims to investigate an oft-neglected subset of women of color, namely indigenous (Native American, Native Hawaiian, and Alaska Native) women. Their numbers are often lost in the compilation of data, and hence their pathways into STEM degrees and the STEM workforce are overlooked. This project will investigate the pipeline of indigenous women in STEM over the past several years, and discuss factors that may influence persistence in STEM areas.

A numerical study of data from the National Center for Science and Engineering Statistics will be presented to examine the persistence of indigenous women through undergraduate and graduate STEM degree programs, and the transition into the STEM
workforce. We expect to identify points of attrition through this pipeline. We will then attempt to align attrition points with insights gathered from interview data of women self-identified as Native American, Native Hawaiian, and/or Alaska Native with earned Ph.D.s in STEM disciplines working in academia. This qualitative study focused on an examination of the intersection of one’s education and career path with cultural identity. We expect to be able to identify the major attrition points of indigenous women from the STEM pipeline and the major impact factors of successful indigenous women at those same points. Our end goal is to provide useful insights on the success of STEM indigenous women that can be used to facilitate recruitment and retention programs and policies in higher education.
Presentation Title: Career Preparation for Online Learners: A Model for Experiential Learning in the Online Classroom

Topic Area: Higher Education

Presentation Format: Paper Session

Presentation Description:
As online learning becomes more prevalent in higher education, students are challenged in their ability to engage in experiential learning opportunities that prepare them for their future careers. Traditional universities found success in campus based opportunities, but such prospects are non-existent in the online learning environment. Therefore, the objective of this presentation is to introduce a 3-tiered co-curricular model for higher education experiential learning in the online classroom for virtual learners.

Full Abstract:

This paper seeks to resolve the following problem: colleges and universities have left employers concerned with the educational systems’ ability to provide online students with real world experience for practical workforce application (Allen & Seaman, 2014). In a recent study conducted by the Babson Survey Research Group, survey results indicated that, “Academic leaders selected “Workforce development / Gainful employment” second most often, with 20.4% picking it as the most important factor and 64.4% as one of their top three factors” (Allen & Seaman, 2014, p. 37). This is not a novice notion, as career preparation is uncommon at universities where online learning is the primary modality of instruction (Heckman, Østerlund, & Saltz, 2015). Institutions of higher education prepare students to apply knowledge to various positions across different disciplines, but do not afford students the opportunity to gain real world practice, which has been determined by employers as a top desired behavior for students to gain experience and become career ready (Benson, Johnson, Taylor, Treat, Shinkareva, & Duncan, 2004).

Traditional brick and mortar institutions, have struggled for many years to produce the next generation of quality future faculty in the higher education industry (Bogle, Blondin, Miller, & the PFF Staff, 1997). In 1993, the Council of Graduate Schools (CGS) and the Association of American Colleges and Universities (AAC&U) partnered together to launch the Preparing Future Faculty (PFF) program. This program prepares campus graduate students interested in embarking upon a career in higher education with concrete experience in the higher education field, while simultaneously completing a graduate degree. The experiences typically include acquiring skills in teaching, researching, presenting, lecturing, and/or publishing (Bogle, Blondin, Miller, & the PFF Staff, 1997). The PFF program has found success with providing experiential learning
opportunities to students in order to increase their readiness for a career in higher education (Bogle, Blondin, Miller, & the PFF Staff, 1997).

This paper seeks to utilize the framework of experiential learning activities utilized in the PFF program and incorporate them into the online learning environment for virtual students. Upon completion of an online degree program, students enter into the fierce and competitive job market with little to no experience in their respective industry (Heckman, Østerlund, & Saltz, 2015). The same is true for the higher education industry, as the field is steadily becoming more and more competitive annually (Duderstadt, 2001). Therefore, this paper will explore the concept of piloting a three tiered co-curricular virtual internship program in the areas of teaching, researching, and graduate internships, as “there is real-world, applied knowledge acquired through an experiential learning process” (Hansen, 2008, p. 95).

The virtual internship program uses Kolb’s Experiential Learning Theory to combine his Experiential Learning Cycle with applied higher education career experiences for graduate students at an online university. Kolb asserts that, “learning is the process whereby knowledge is created through the transformation of experience” (Kolb, 1984, p. 38). Thus, the pilot internship program will provide graduate students with palpable experience in the higher education industry in the areas of teaching, research, presenting, and publishing. In conclusion, this pilot will answer two questions: (1) Is a graduate internship model sustainable and desired in the online environment? (2) Will virtual teaching, researching, presenting, and lecturing experiential learning opportunities better prepare students to enter a career in higher education?

Using High-Engagement Strategies in a College Classroom

Peiyong Yu¹ and Jason Levy²

Abstract: Many students have expressed frustration learning technical materials and abstract concepts in economics and public administration courses. This study explores the high-engagement strategies to incentivize student interactivity with their instructors and peers in a college classroom and to increase their abilities to articulate difficult concepts in their own words. By applying the herein proposed original teaching strategies, improvements in student enrollment, academic performance, and course satisfaction are documented. While these results apply only to economics and public administration courses over a period of one year, plans are in place to use the most successful approaches in other courses at University of Hawaii – West Oahu in the future.

Introduction

This paper seeks to increase student performance and satisfaction in economics and public administration courses. Creative solutions are put forth to increase students’ abilities to master technical materials and abstract concepts in these courses. We began with a basic question born out of our students’ frustration with learning difficult concepts from economics and public administration courses: how do faculties make the classroom more fun and engaging so that students will improve their learning outcomes? Studies show that those students’ family lives, extracurricular intellectual activities, and opportunities for classroom participation all influence their academic achievement, and these factors will also influence students’ behavioral engagement (Robinson and Mueller 2014). How do we faculties provide ample opportunities for students to engage with their peers and instructors? Let us explore some of our strategies here:

¹ Peiyong Yu: Instructor of economics at University of Hawaii – West Oahu
² Jason Levy: Associate Professor of Public Administration at University of Hawaii – West Oahu
Strategy one: Present and Prepared Technique

Students have to be in the classroom to engage with each other. People respond to incentives. The traditional incentive is to reward students with grades on exams, homework and quizzes. Interested students usually learn the best, and there are three major students’ interests such as passing the course, finding a good job and making money. In order to help students realize their goals, instructors have to incentivize the students to come to the classroom to participate. Our incentive strategy for students to come is by using “Present and Prepared” technique. There is a paper with three columns: the first column includes their names, the second column named ‘present’, and the third column named ‘prepared’. Students who mark both present and prepared will get three points if they actively participate in the class discussion, think-pair-share activities, etc. in each of the class. Students will get 0 point if they are not present. This takes about 10% of their final grades. The other format of this strategy is to assign students YouTube videos as homework, which is related to the class topic that is due before the lecture. They will get 2 points for being prepared if they submit the discussion questions on time, and another point if they are present in the class. Extra bonus point(s) will be given to students who participate actively or provide insightful comments, etc.

Strategy two: using polleverywhere.com

We asked students to install PollEv App on their smartphones so that they can actively participate in the class polling. The polling can be multiple choice or open-box questions. For example, we asked students to use that App to guess which country is the richest nation in the world. You can see all the answers popping up on the screen: US, Luxembourg, Switzerland, China, Qatar, etc. there are also some funny answers there. When each group of our students finishes their presentation, we will use polleverywhere.com to collect their peers’ evaluations and count them as half of the presenters’ scores.

Strategy three: multi-functional slides
Student perception of interest depended so heavily on the colors, design, movement, sound, and even the number of slides shown, although, most important, PowerPoint was deemed effective only when it was used by competent and interesting lecturers (Clark 2008). My slides are very colorful and each slide has its own unique movement. Short and fun clips are embedded in the slides, such as video clips from the Big Bang Theory, Grey’s Anatomy, Simpsons, etc. Those short clips are from criticalcommons.org. Students commented that those short videos are closely related to economic concepts that under discussions and helping them to absorb the new ideas such as price discriminations, consumer surplus, price elasticity, etc. Interesting pictures are also embedded in my slides, such as the image of Elsa standing behind her palace from the “Frozen” movie under the question: what is the opportunity cost of Elsa to choose to live in the Icy Palace all by herself? Another example: an interesting question is posed under the picture of the movie poster “The Interview”: what is the tradeoff of North Korea to use billions of dollars on nuclear weapons while borrowing millions of dollars from the UN to feed their own people? Students show interests in discussing popular topics that are related to their lives.

Strategy four: various games in the class

In the beginning of the class, we will ask five or six students to be judges to each read one different sentence (either true or false) related to the previous lecture. All the students will decide which judge or judges that claimed the false statements. I brought small white boards for each two students to write down their answers. This “Judge” game helps to excite students in the beginning of the class and incentivize students to review the important concepts beforehand.

The other classroom game is to give each group a different concept to allow them to write their own scripts to play out and elaborate the concepts. For example, we taught 10 different forms of price discriminations and we also had 10 groups. Each group chose randomly from the 10 cards indicating what kind of price discrimination they were experiencing. After they finish writing the scripts, they have to play out like a short skit in front of the class. Students commented that
playing out the concepts give them lasting memories and also help them apply theories to their real lives.

Voki assignments allow students to create their own avatar and narrate the 3-2-1 assignment within 90 seconds. 3-2-1 assignment refers to 3 concepts they have learned in this chapter, 2 applications they can apply in their lives, and 1 question. In the review session before the exam, I will write down each student’s questions (4 chapters) from the Voki and then ask Row one to face Row two, and Row three to face Row four; it is like speed date. I give them 3 minutes to answer each other’s questions and then rotate. So each student has a chance to talk to the rest of his/her classmates to learn from their perspectives. They will elect who is the best answerer in the end. Group exercises/games nurture attachment relationships in the classroom, which also incentivize students to be eager to be present with their group members/friends. Attachment provides feelings of security, so that students can explore freely (Bergin, C. and Bergin, D. 2009).

Finally, the game for students to prepare for the exam is called “Jeopardy Game”. There are jeopardy game templates downloadable online; instructors can make jeopardy questions under different groups such as Chapter 1, Chapter 2, etc. Students can work as a group to answer each chapter’s questions. In my class, there are 10 groups, so I have to make 2 sets of jeopardy games. Five groups will compete for the first set of game, and the rest of five groups will compete for the second set of game. Within each set, there is ranking based on their grades. Extra bonus points will be added to their exam based on their jeopardy rankings within the five groups. Students have to study hard to earn the bonus points.

**Strategy five: Problem-Based-Learning (PBL)**

Lam (2004) stated in her work:” The fact that the acquisition of theories and field experience are often scheduled independently creates a gap. Students often fail to relate the practice situation to relevant theories, even though such theories have been covered in class. The linkage between the two is not automatic. The real situation is often much more complex than what is illustrated in class, and students have to make decisions that require them to consider all kinds of factors within a limited time” (p. 372). In dealing with social dimensions of disaster
recover problems, a whole range of theories from macro to micro and from business to individual could be relevant. So we create all sorts of real life scenarios, and students will group themselves to discover a recover plan for the society, business or individuals, and then share the plan with the rest of the class. It is rewarding to see our students learning efficiently and exploring freely in the classroom. When we watch our students performing their scripts about different government forms (Socialism, Capitalism, Nazism, Representative Democracy, Pure Democracy, Autocracy, and Anarchism, etc.), we also learned something from our students: their creativity, free spirits, and teamwork!

Evaluation

The e-café form allowed students to express opinions about the course and the instructor. Positive comments relating directly to the engaging strategies included the following:

“good course, good PowerPoint slides, interesting videos”

“... gives great power point lectures and uses different media often to keep microeconomics interesting.”

“...teaching style is very effective and the course material was taught in a way that was easy to understand.”

“...the strong point[s] of this course is how she provides videos and songs for examples to help us understand each section better...”

“...her lecture style is entertaining and effective. She made economics interesting; sometimes I believe is very hard to do.”

“I walked into microeconomics not knowing what to expect. What can I say, all I read is food magazines all day, I couldn’t even tell you the difference between an economy and ecology before I took this course. All in all, the knowledge I gained in this class tied to concepts learned in accounting and marketing, both classes that I have taken this semester. I can only say I wish I took the class before I started the others, especially marketing, because it
helped me understand what was to be expected from certain activities and what the response would be.”

These comments support the notion that students prefer engaging materials that make the subjects fun and learning strategies that relate course concepts to their own professional goals.

Discussion

Segal (2008) explained that the noncognitive skills such as interpersonal interactions, behavior in the classroom, and various personality traits like aggression, externality, self-esteem, and friendliness are closely related to labor market success. When planning the course, faculties need to take the interpersonal interactions skills into consideration. Using the high-engaging strategies help students develop various noncognitive and cognitive skills to help them succeed in their current or future careers. These strategies can be reliant on technological innovations such as PollEv App, “incentives” to learners such as “Present and Prepared” technique, novel homework designs such as Voki assignments, spicy classroom activities such as skits, plays and scripts or multi-media uses during the lectures. The enrollment data indicates positive growth of students’ interests in courses utilizing engaging strategies.

Innovations in Distance Education to Engage Students Online

Peiyong Yu\textsuperscript{1} and Jason Levy\textsuperscript{2}

\textbf{Abstract:} Distance education plays an essential role in giving students flexible time to both work and study, especially in a high-cost living state such as Hawaii. Both educational and professional successes are important to students with jobs and children. How to provide quality instruction with engaging strategies is very important in providing educational access and higher educational opportunities to our island students. This study explores the technology use, course design and online assignments to engage students online.

\textbf{Introduction}

Distance education, the process of learning through either videoconferencing or the interactive use of the World Wide Web, has become a major force in higher education in the United States (JBHE Foundation, Inc 2004). According to the U.S. Department of Education, there were 21,147,055 students enrolled in distance education courses at Title IV institutions. Based on the National Center for Education Statistics using fall 2012’s data, 27\% of all students in Hawaii State have either enrolled exclusively in distance education courses or partially enrolled in some distance courses. This percentage is larger than many other states such as California (17\%), New York (15\%), Texas (25\%) and Illinois (20\%). The reasons why Hawaiian students are more eager to take online courses include geographical constraints (it is hard to drive to another island), family accountability (high costs of living in Hawaii force students to take multiple jobs), and time constraints (many of the students here are nontraditional students such as military families, and traffic congestion problems on islands). This paper explores different online engaging strategies to help improve students’ retentions and performances.

\textbf{Distance Education}

Distance education has three features: 1. educational communication between instructor and participant is separated by a geographical distance, 2. communication is two-way and interactive, and 3. a form of technology is used to facilitate the learning process (Thach and Murphy 1995). How effective are the distance educations? Some studies conclude the following: blended and purely online learning conditions implemented within a single study generally result in similar student learning outcomes; elements such as video or online quizzes do not appear to influence

\textsuperscript{1} Patricia Yu: Instructor of economics at University of Hawaii – West Oahu
\textsuperscript{2} Jason Levy: Associate Professor of Public Administration at University of Hawaii – West Oahu
the amount that students learn in online classes; online learning can be enhanced by giving learners control of their interactions with media and prompting learner reflection, and providing guidance for learning for groups of students appears less successful than does using such mechanism with individual learners (Means, et al.). This study agrees partially with those findings.

Delivery Systems

University of Hawaii uses Laulima as the online course management system, which is used for traditional face-to-face, online, and hybrid classes. There are several steps to allow students to use Laulima to watch the lecture videos. First step, we use HoverCam to deliver the content. Students will see our faces when we open the camera; warm greetings allow students to feel connected. Then we switch to the computer camera, so students can see the PowerPoints. If any documents need to be shown, we can switch the document camera to show students, for example, how to draw supply and demand curves or perfectly elastic curve. Second step, we download the video from the HoverCam site to the moviemaker, which helps to edit the video with titles, introduction music and other modifications. Third step, the edited videos are uploaded to the YouTube site (faculties can establish their own YouTube channels). The last step, embed the YouTube video on Laulima’s Modules. Students now can just clip the Modules on Laulima to watch all the lecture videos. Students spoke highly of those high-quality videos, which allow them to get connected with us and also see different formats of teaching (document camera, embedded videos on PowerPoints, and faculties interacting with the students by showing their faces).

Engagement Strategies

There is a world of distance education with its own dynamics, issues, discussion forum, organizational support, and collaborative projects (Valcke and Thorpe 1995). According to Kearsley (2000), the most significant applications of computer-mediated communication in E-learning environments are discussion forums (Shana 2009). The closest interaction place on Laulima is the Discussion and Private Messages Forums, which include General Questions area, Class Discussions forum, and Student Lounge. The first discussion assignment for the students is to introduce themselves there by posting their profile pictures and sharing their hobbies, talents, favorite TV shows, movies, jobs, dreams, and life anecdotes, etc. Students love interacting with their peers on this forum. One student shared that: “…my major is Business Administration. A fun fact about me is that I have a[n] identical twin sister but unfortunately, you guys won’t be able to witness that in person. Shucks! One of my favorite things to do that I do as a job is being a hairstylist for weddings. I recently just got into it a year ago and I really love doing it…” We encourage students replying at least one of their classmates. Faculties do have to reply each of the students to welcome them to this online class. After reading one student’s comments on his passion in video games, I commented that: “…I started playing Clash of Kings on my phone and experienced the core issue of economics -- scarcity. I have to get gold to purchase wood, iron,
and wheat to build my castle and feed the soldiers. When enemies attacked my castle, I have to get enough resources to heal the wounded troops. Gaming industry is very lucrative and promising…” Students can easily connect with the faculties if they have similar experiences or languages. Effective communication between teacher and learner is essential to sophisticated learning experiences and distance learners cultivate a host of faculty relationships (Muirhead 2000). This interaction builds real connections online in the beginning of the semester.

In addition to the weekly comments for online discussion forums, we also encouraged students to write on subjects that were relevant to economics or public administration subjects. First, the weekly online discussion questions can only be found through watching the lecture videos in the Modules on Laulima. This incentivizes students to finish the discussion homework after watching the lectures, which include the discussion questions in the middle or in the end. For example, when interesting subjects such as price gouging or the role of government was mentioned, we will raise the weekly discussion questions as, “what do you think about price gouging? Is price gouging moral or immoral? Is it good for the consumers?” or “what is the link between the Animal Farm (an allegorical novel written by George Orwell in 1945) and the role of government?” Students have to at least open the lecture video to locate where the homework questions are, which gives students’ strong incentives to follow up the class progress. Faculties have to address the divergent comments related to those controversial topics. For example, students may prefer the communist system enjoying the pig figure (Napoleon) in the Animal Farm representing an undisputed tyrant, while the others may prefer the democratic system. Some students abhor the price gouging, while the others see the underlying benefits of price gouging as a function of the invisible hand of the market mechanism. When divergences came, faculties need to be patient and creative to lead the students out of the superficial thinking loops. Critical thinking and deeper understandings are essential to the distance learners too. It is also a good idea to ask all your online students to give you their phone numbers in order to keep some of the important dialogs timely. The communication problems that occur during online courses reveal that both teachers and students must be active participants who are consistently involved in relevant academic dialog (Muirhead 2000).

The other way to engage with online student is through this Voki assignment. We had 2 year subscription ($49.95/2 years) of Voki Classroom to try with students. It is free for students to create fun and unique Voki characters that can talk. It is a creative, easy-to-use tool that helps motivate students and improve lesson comprehension and student participation online. For each chapter, there is a 3-2-1 assignment for students to use Voki to articulate 3 concepts they have learned in this chapter, 2 applications and 1 question. Faculty need to make sure that they understand the solutions to their questions in the end. This Voki assignment also trains students’ spoken skills. There are four basic skills that are necessary for online students including computer skills, literacy/discussion skills, time management skills and interactive skills (Rowntree 1995). The discussion role through this Voki assignment is reflected on their self-reflections: either through discussing the concepts/applications to a Voki character or acting like
a Voki character. The micro time management skills can be reflected on Voki recording’s 90 seconds limit. Our students manage to elaborate the 3-2-1 homework within the time frame. There might be some confusions of Voki registration or homework submission through students’ computers, but this is a great opportunity to engage with students to improve their computer skills by giving detailed instructions.

The links between online class and in-person class can also be explored to expand distance learners’ resource uses. There are two major ways to help connect two lecture formats especially when faculties teaching one same course with two sections (one section is online and the other one is in-person): 1. Invite guest speakers to your in-person class and also include your online students; 2. Record your games played out in your in-person class and share the videos with your online students. The games include in-person class debates, script and plays, and other online games. Creativity can be trained through game-playing and interactivity in the class. Creativity is the ability to imagine or invent something new with the attitude to accept change and newness, a willingness to play with ideas and possibilities, a flexibility of outlook, the habit of enjoying the good, while looking for ways to improve it; and creative people work hard and continually to improve ideas and solutions, by making gradual alternations and refinements to their work (Harris 1998). Students’ imaginations run wild while they are collaborating with their partners to write scripts and play them out in front of their peers, or cooperating with group members to finish the game tasks. When the games cannot be played with distance learners, faculties can record the in-person activities and share the resources with distance learners. Jeopardy games can be played in additional time periods with the distance learners before the exam to help students review the content.

What are other strategies that you can engage with your online students? Six general strategies based on Amabile (1999) can be revised to guide us towards a better online learning ambience: 1. Challenge – creating learning activities that stretch the students but do not overwhelm them. The individual should be effectively tested beyond their current knowledge and skills. For our case, we create learning activities in both discussion and essay homework. For example, one activity is to ask students to visit the Henry Loui’s Restaurant in Honolulu and talk to its manager and write an essay about fixed costs, variable costs, economies of scale and profit-maximization rule. 2. Freedom – instructor can enhance reflective skills by having clearly defined goals that give students the opportunity to complete an assignment in a variety ways (eg. PowerPoint slides or a detailed outline) foster self-directed learning. Our PowerPoint slides include many funny but thought-provoking pictures and embedded video links. Students commented that those short videos from the criticalcommons.org are really interesting and helping them digest the concepts better when they go back to play the videos again. It is very flexible for the students to review the materials shown in the lecture videos at any time. 3. Resources – this can involve the quality of interpersonal relationships between students and between students and their instructors. Other YouTube videos that help students digest specific abstract concepts are embedded in the Modules on Laulima. All other kinds of resources such as Voki registration information,
individual project template, lecture notes, etc. are stored in the Resource folder on Laulima. 4. Work-group features – learning teams who have a diversity of cognitive skills, professional, cultural and education experiences can enhance creativity. Teachers who create online learning teams can use information from personal biographies at the start of their classes to integrate a degree of diversity into their learning teams. Group project allows a group with different majors including business administration, public administration, marketing, finance, mathematics, anthropology, economics, and others to work together and contribute to the project in different perspectives. 5. Supervisory encouragement – teachers play a vital role in helping students work through anxiety when tackling difficult assignments. Professional judgement is needed to know when to give more detailed instructions to students who are struggling because part of the process is learning to be patient when working through complex problem solving issues. In our case, we can download students’ contact info from MyUH services. From the ‘Statistics’ tab on Laulima, we can find out which students are lagging behind without logging on Laulima for more than a week. Faculties are encouraged to call students or their family to make sure that they are keeping up with the course’s progress and they submit their homework on time. 6. Organizational support – teacher and students need to feel that their work is important. Teachers can become discouraged about integrating innovative instructional methods into their online classes if his work is rarely affirmed by their organization leaders. Distance educators can feel isolated at times and it is wise for them to develop professional relationships with other educators to cultivate best teaching practices. In our case, we have the Center for Teaching and Learning Excellence (CTLE) serving as a resource for UH West Oahu faculty to develop effective, innovative teaching through learning. The center promotes online teaching research and assessment driven by faculty interests and motivated by faculty desires. They also provide us support for the sharing of ideas, the evolution of existing teaching methods, and the exploration of new pedagogical strategies.

Discussion

Black and Mcclintock (1995) devised seven steps to the Interpretation Construction (ICON) Design Model: 1. Observation – students make observations of authentic artifacts anchored in authentic situations. They learn better from the real-world examples. 2. Interpretation construction – students construct interpretations of observations and construct arguments for the validity of their interpretations. The 3-2-1 assignment allows students to interpret their own understanding of the concepts and articulate two different applications through the Voki Classroom. 3. Contextualization – students access background and contextual materials of various sorts to aid interpretation and argumentation. The individual project assignment allows students to research the background of crucial economic or public issues and provide argument toward specific solutions to those chosen issues. 4. Cognitive apprenticeship – students serve as apprentices to teachers to master observation, interpretation and contextualization. Distance learners tend to lose their focus on academia, so the masters need to keep eyes on their apprentices. Getting students’ contact information in the beginning of the semester is very
helpful to keep track of the students. 5. Multiple interpretations – students gain cognitive flexibility by being exposed to multiple interpretations. The discussion forum allows students to exchange their different perspectives on controversial issues, which incentivize students to interact with their peers by debating or discussing. 6. Multiple manifestations – students gain transferability by seeing multiple manifestations of the same interpretations. Cartoons, pictures, videos, games, active learning slides, etc. are embedded on the Power Point slides. The in-person class materials are sometimes transferable to the online class such as recorded video of classroom debates, role-plays, games or invited guest speakers, etc.

We briefly touched upon the subject of integrating innovative engagement strategies into online teaching in this study. Online students are very volatile and they tend to lose concentrations on school duties; thus, incentivizing them to keep up with the online lecture is very important. Student curiosity should be continually encouraged by developing an interesting, highly engaged learning climate that excites students’ intellectual activities. Csikszentmihalyi (1996) commented that, “if the next generation is to face the future with zest and self-confidence, we must educate them to be original as well as competent”.

References

ABSTRACT
Student comprehensible notions, language, and taxonomy of environmental and cultural sustainability were needed; for student affairs educational efforts and for the development of early-career student affairs professionals. A grounded theory research and curriculum development approach with those professionals yielded, affirmed, and refined the notions, language, and taxonomy that developed and satisfied these professionals. The grounded theory research and curriculum development approach is presented.

Grounding a Taxonomy for Teaching Environmental and Cultural Sustainability

Introduction
The author researched environmental and cultural sustainability theories and models with a view to teach them to early-career American student affairs professionals. The outcome of his research was a determination that most related sustainability theories and models were more sophisticated in notions, language, and taxonomies than the early-career student affairs professionals would find effective when educating students via student affairs functions.

- There was little sustainability language that was comprehensible for most undergraduate students and early-career student affairs professionals.
- There was little sustainability language commonly defined and utilized in higher education and student affairs publications.
- There was no taxonomy to define, distinguish, and assess improvement of environments from lower to higher orders of “sustainability” that would be well-suited for educating students via student affairs functions.

Thus determined, it became necessary to ground a theory and model, including taxonomy, fitting for these early career professionals’ development and their educational work in student affairs.

How could this be done and could early-career student affairs professionals find it appropriate for sustainability educational efforts via student affairs functional areas?
Initial Grounding Process, Analysis, and Taxonomy

Participants and Data Collection

Over a span of two years, a total of 60 early-career professionals in student affairs participated in conversations about sustainability with the author. Those conversations were in groups that averaged 10 participants. Each conversation lasted two and one-half hours.

The 60 participants were working in student affairs functional areas at 11 colleges and universities. Each was completing a graduate degree in either higher education administration or college student personnel at a common institution. Most of the participants’ undergraduate experiences were at different colleges and universities from most of the United States, and they represented a high level of human diversity. Their baccalaureate degrees were from numerous fields and disciplines across the arts, sciences, and professions. No more than two participants expressed an academic expertise in environmental or cultural sustainability.

Prior to the participants’ conversations about sustainability, each early-career professional in student affairs was provided with identical literature from higher education and student affairs publications (see References; other than, Gullahorn & Gullahorn, 1963, and Strange & Banning 2001 & 2015). Prior to reading the literature, the participants were told the articles addressed principles and practices of environmental and cultural “sustainability” as considered and implemented by leaders and educators in American higher education institutions. The participants then read the literature no sooner than a week prior to the conversations.

Questions, Analysis, Findings

Each of the conversations was guided by four questions. The constant comparative approach to analyzing the early-career professionals in student affairs responses was utilized. The following paragraphs contain the questions and findings from analysis organized by themes.

Conversations began with the question, “What is ‘sustainability’?” The participants’ offered definitions were varied and the following themes emerged.

- The primary definition was preservation and/or wise consumption of the physical and natural environment itself.
- The secondary definition linked preservation and/or wise consumption of the physical and natural environment to availability of resources for the next generation.
- The tertiary definition was preservation and/or wise consumption of the physical and natural environment resources for reasons of economics.
- Missing from offered definitions were notions related to
  - improving the environment,
  - “sustainability” education,
  - application of “sustainability” to cultures, and
  - application of “sustainability” to communities.

The next question was focused on “sustainability” language. “How could the ‘sustainability’ terminology used in the literature you read be improved?” The young professionals noted the following.
Approximately 10 terms like “sustainability” were synonymously utilized between and within the articles. None of those utilized terms was defined in the articles. As captured by one early-career professional participant, “these seem to be ‘buzz words’ that no longer have a clear meaning.” There was frustration regarding the “sustainability” language presented to/used with higher education and student affairs professionals.

- Though the respondents were committed to some aspect of “sustainability” being part of the professional and educational outcomes of their work, they were not interested in scientific/technical/scholarly “sustainability” language for their work in higher education and student affairs, and
- The participants were not satisfied that the “sustainability” language they encountered in the higher education and student affairs articles was beneficial for achieving the educational and professional outcomes of their work.

The third and fourth questions related to the early-career professionals’ educational work in higher education. “How do you nurture students to learn, grow, and develop in regard to ‘sustainability’?” and “How do you measure ‘sustainability’ improvement?”

Regarding nurturing student learning, growth, and development in regard to “sustainability,” responses clustered into two themes.

- The second most supported theme was a combination of passive modeling of “sustainability” behaviors (carrying reusable water bottles, reducing printing, etc.) and indirect “sustainability” communications (posters, recycling containers).
- The theme generated by most early-career professionals was “I do not know enough about ‘sustainability,’ had not thought of ‘sustainability’ as an outcome I could nurture through my work in student affairs, and/or I would not know how to nurture student learning, growth, and development in regard to ‘sustainability.’”

Though each early-career professional had a common scholarly knowledge of assessment (and some had hands-on experience), none had suggestions regarding “How do you measure ‘sustainability’ improvement?” In follow-up, the early-career professionals contributed these themes about why they did not know.

- An inability to discern the meaning of the word “sustainability.”
- An inability to operationalize the “sustainability” notion and/or value for measurement, evaluation, and decisions relative to accomplishments and improvements.
- Lacking a non-scientific/non-technical/non-scholarly “sustainability” taxonomy fit for their work in higher education and student affairs, an inability to define and distinguish lower and higher orders of “sustainability.”

**Refining Grounding Process and Proposed Taxonomy**

With the above provided by the first group of early-career professionals in student affairs (and each subsequent group), the participants were provided with a working taxonomy (in hard copy) and a verbal explanation (presentation and dialog) of it.
The taxonomy itself is described in full in a forthcoming publication. Concisely presented in this paper and proceedings, the notions and language of environmental and cultural sustainability, in ascending order of lower-to-higher order are arranged below.

“Thrive”

“Survive”

“Alive”

Participants were asked, “Does the taxonomy contain notions of sustainability (environmental and cultural) and language that all undergraduates could comprehend?” Also, “Do the lower and higher orders of sustainability (environmental and cultural) make sense within the educational contexts of student affairs functional areas?”

Responses to both questions were overwhelmingly affirming of the notions, language, and the ordering of them from low-to-high. Also, these elements of the taxonomy were considered appropriate for environmental and cultural sustainability educational efforts via student affairs functional areas.

Participants’ recommendation for improvement to the taxonomy itself was the addition of a fourth level. That suggested level would be situated between “survive” and “thrive.” [It has subsequently been inserted and labeled “strive” and is also addressed in the forthcoming publication.]

“Thrive”

“Strive”

“Survive”

“Alive”

Participants also encouraged that definitions of each level be linked to actions of those who lead environmental and cultural sustainability educational efforts via student affairs functions: This work remains in progress. Also, given that overall growth and progress toward a next level of development sometimes comes through periods of “regression,” “resting,” and “or “rebuilding,” respondents suggested the taxonomy must also incorporate those periods as developmental processes.

“Rebuilding”

“Resting”

“Regression”

This notion of non-linear sequential progress is not unlike John E. Gullahorn and Jeanne E. Gullahorn’s extension of the U-Curve Hypothesis, the W-Curve Hypothesis Model, as it relates to culture shock and change (1963).
Conclusion

The author determined that student comprehendible notions, language, and taxonomy of environmental and cultural sustainability for educational efforts via student affairs functional areas was needed for the development and work of early-career student affairs professionals. The use of a grounded theory research and development approach with those professionals yielded, affirmed, and refined student comprehendible notions, language, and a taxonomy. While still a scholarly work in process, these early-career professionals are satisfied that this is a valuable tool for their sustainability educational efforts in student affairs. The grounded theory and development approach was successful.

Title: Influence of the Language of Mathematics on Instructional Approaches, within a Secondary School Environment.

Topic Areas: Mathematics Education; Teacher Education

Presentation Format: Paper Session

Description: This session is designed to examine assessment results of students attempting to demonstrate competence meeting state mandated mathematics standards, to complete graduation requirements. The research includes a comparison of baseline to final data, for a diverse sample of secondary students in an urban school system in the Northeastern part of the United States. Qualitative factors will guide the discussion as profiles will add structure to the presentation and discussion. Perspectives of practitioner, researcher and teacher educator are essential elements of this session.

Abstract

Research Objectives: The purpose of this research is to identify the most effective approaches to mathematics instruction on the secondary level. Examination of the research will guide the discussion as the strategies are used to provide pre-service graduate students with the tools to study their students, and engage in customized instructional design.

Large urban school systems have experienced a multitude of transformations during the 21st century, one of which involves transitioning target populations. As educators, our responsibility is to ensure thorough understanding of how our students learn, and address their academic and co-curricular needs. A sample of data from a small urban high school gives breadth to understanding the unique academic needs of all students. Comparisons of baseline and final data demonstrated that 62 out of 70 secondary students showed between 5% and 300% growth on state mathematics assessments. The purpose of this research was to examine the approaches, most effective in positive student performance outcomes on the secondary level. Once identified, the approaches can be incorporated by pre-service teachers to implement effective instructional practices.
Student Model of Acquiring Scientific Method, Ways of Viewing and Thinking, and Domain-specific Knowledge for Simulated Teaching Games

ABSTRACT

Matsuda (2005) developed a Simulated Teaching Game (STG) that simulates a virtual lesson based on plan data for each lesson, in order to replace the microteaching approach of Allen and Ryan (1969). Lesson situations in the STG are updated by a set of rules in a game board. In those, rules to change learners’ situations are important, and in order to improve the rule for Mathematics and Information Study education, student models were proposed. In this study, we propose a new student model for usual science lessons with reference to student models for the STG of Mathematics and Information Studies. During this process, we extend the model based on the latest model of problem-solving activities, the “Warp and Woof model,” because no previous student model has been developed based on this. In addition, our new model focuses on cultivation of the ability to self-learn for problem solving in daily life.

Key Words: science education, student model, simulated teaching game, problem-solving ability, ways of viewing and thinking, warp and woof model.

INTRODUCTION

Simulated Teaching Game comprising the Instructional Activities Game

Matsuda has been in charge of the teacher promotion program in Tokyo Institute of Technology. In order to teach the instructional design method in this program, he developed an instructional activities model (Matsuda et al. 1992) as well as a training system for lesson design, “Kyou-an Koubou” (Matsuda et al. 1999), and the Instructional Activities Game (IAG) system (Matsuda 2005) according to the model. This study is concerned with the Simulated Teaching Game (STG), which is a game type of the IAG system.

The STG was developed to simulate a virtual lesson on the basis of plan data for each lesson, in order to replace the microteaching approach of Allen and Ryan (1969). An STG game board is represented as a set of production rules. Every rule of the game board is described by a combination of the following: (1) rule ID, (2)
conditions for rule activation, (3) questions for the user, (4) dialogue interface and options, (5) rules for updating variables, and (6) rules for providing feedback. The game flow is controlled by a lesson plan that comprises a sequence of steps. At each step, the system saves the data obtained in that step along with the variables, which are used to represent the lesson situation or retain the user’s responses, in its working memory. These are then compared with (2), the conditions for rule activation, for every rule, and if any rule is activated, its corresponding action that consists of (3) to (6) is executed. Although lesson plans executed in the STG can be created by a user in the DMG, it is also possible to manually create more complicated lesson plan data embedded with several pieces of content and methods of instruction that are used for conducting discussions with users in order to change their concept of what constitutes good lessons.

Necessity of an Appropriate Student Model of Simulated Teaching Games

Lesson situations in the STG are updated by a set of rules on the game board; particularly, a rule-set that included rules to change learners’ situations. However, these rules tended to become large and difficult to manage while trying to pay attention to the consistency and priority of execution among varieties of rules. Therefore, Matsuda and Ohgami (2011) developed learner-agents as a Java applet that could represent learners’ situations as well as rules to update them. However, the model was very poor and lacked the versatility to represent cognitive aspects, i.e., understanding and utilization of knowledge. Therefore, Matsuda (2013a) designed a student model of a virtual lesson game for mathematics teaching and extended it to informatics education (Matsuda 2013b).

According to Bruer’s (1993) statement that domain-specific knowledge, meta-cognitive skills, and general strategies are all elements of human intelligence and expert performance, Matsuda’s (2013a, b) student model consists of domain-specific knowledge, views and ways of thinking, and knowledge of problem-solving scripts. Views and ways of thinking help students control the direction of problem-solving activities and self-learning, which are then associated with meta-cognitive skills, although these remain distinct from one another. Though the Japanese National Course of Studies includes the utilization of views and ways of thinking as objectives in each subject area, it does not show their concrete items or contents. On the other hand, Matsuda (2012) proposed each set of items in Mathematics, Science, and Information Studies. Bruer (1993) illustrated a variety of different strategies ranging from study skills to means-end analysis (Newell & Simon 1972). On the other hand, Matsuda adopted Matsuda et al.’s (2012) problem-solving processes as a framework for instructional gaming materials for Information Studies as a problem-solving script. Although the design framework was extended to the “Warp and Woof model” of Problem-solving (Matsuda 2015) by considering commonalities of problem-solving activities in varieties of subject areas, none of the STG student models has been extended yet.

The Need to Develop a Student Model of Simulated Teaching Games for Science Education

The latest STG game board for science education has developed as a minor revision of that for mathematics education (Matsuda & Noda 2004). The difference between those of science and mathematics is the addition of rules concerned with scientific ways of viewing and thinking as opposed to those of mathematics. In contrast, the student model of problem-solving processes has not been taken into consideration. In addition, there are no rules to evaluate the appropriateness of contents of instruction that should depend on features of domain-specific knowledge, but rules to evaluate general features, such as higher-lower relationships among objectives and types of objectives (Bloom et al. 1956) achieved by instruction of each content point. Of course, it is not appropriate if the game board works well for a specific content type, like Matsuda and Ohgami (2011), it is necessary to develop a student model that can simulate and evaluate a lesson that reflects features of the specific subject area.
while having flexibility within the subject.

**PURPOSE**

In this paper, we propose a new student model for the STG of Science education with reference to student models for the STG of Mathematics and Information Studies. During this process, we extend the model based on the latest model of problem-solving activities, the “Warp and Woof” model because no previous student model has been developed based on this.

**IMPORTANT EVALUATION POINTS IN MICROTEACHING OF SCIENCE**

*Choice of Units to Design a Student Model of Simulated Teaching Games for Science Education*

As mentioned previously, it is necessary to develop a student model that can simulate and evaluate varieties of lessons in Science. However, it is necessary to develop a model based on some specific content. As an alternative of the content unit for it, “Boyle and Charles's law” that was chosen for the previous STG can be picked up. This topic also has the advantage of being content that is common to both physics and chemistry. However, in order to discuss a model, it is important to analyze the lesson plans written by the students in order to obtain the clues of evaluation points and appropriate feedback generated as student's reactions. To this end, the lesson plans written about this unit are not suitable. Since those lesson plans were written on the lesson design training system that offers choices in menu form, even when the description is insufficient, it is difficult to identify whether it was caused by restrictions of the system or a student's insufficient consideration.

On the other hand, in the course of the teaching methods for science, all students write lesson plans for both physics and chemistry about the unit that they will take charge of during their practice teaching in June or September. The lesson plans are written or typed on the lesson plan templates provided. Therefore, when the contents are insufficient or inappropriate, this can be attributed to the students’ lack of consideration or knowledge. The practice teaching in September is ongoing; as a result, it will offer clues to help analyze the lesson plans. We include “Balance of force” in physics, and “Acids and bases” in chemistry, as examples of units in the practice teaching in September.

*Analysis of Students’ Lesson Plans of “Balance of Force” in Physics*

The main contents of the series of lessons are composition and decomposition of a force(s) and balance of forces, and the law of action and reaction. Before and after these lessons, various forces and the law of movement are learned respectively. The “Basic Physics” textbook contains around 240 pages, which is studied over 70 school hours. Therefore, every lesson needs to progress about three pages per school hour; it is necessary to design instruction to prompt learners to understand the essence and to utilize learning outcomes well after selecting the important contents that should be mastered. In addition, the balance of two forces, the method of composition and decomposition of a force(s) based on it, the law of action and reaction, and the fact that a force changes movement have already been learned at junior high school level.

The question typically seen in the content is “Which is the relation between the force A and B, a relation of balance or a relation of an action and reaction?” For example, forces A and B typically correspond to the gravity on an object and the force in which an object pulls the earth. There is a similar question, such as “What balanced
force is generated by the force A?” Although these questions are asked with the intention of reducing students’ misunderstanding, the opposite is sometimes the case. The purpose of a series of lessons including this one is to clarify forces working on an object, to seek resultant force, to formulate an equation of motion based on it, and to determine direction and value of acceleration. As a method of finding out the forces working on an object, balance of force, and the law of action and reaction are all utilized. However, the former is used, not to overlook, but to find a force by using the fact that the resultant force working on the object is zero when an object follows the law of inertia. On the other hand, the latter serves as a method to find out the force that works on an object regardless of its state of movement as a fundamental mechanism that generates a force. Although the above-mentioned questions ask to distinguish difference between them, because they are used for different purposes, these questions have the possibility of inviting confusion and misunderstanding.

Therefore, it is important in this lesson to clarify the context where learning outcomes should be utilized. Moreover, it is also important to specify the difference from the contents already studied in junior high school, and to advance the lesson/topic efficiently. For that purpose, it is meaningful to advance a lesson/topic along with the framework of problem solving. In order to clarify the aim of study, it is necessary to show the relationship among lessons and the issues to be resolved as an advanced organizer. Moreover, it is necessary to use an instructional method like the hypothesis-and-experiment teaching method (Kasetsu Jikken Jugyo Kenkyukai 2008) in order to cultivate scientific thinking after showing typical problem situations and examples of misunderstanding.

**Analysis of Students’ Lesson Plans of “Acids and Bases” in Chemistry**

This lesson is the introduction of “Acid-base” reactions and explains the extension of the acid-base definition from Arrhenius to Brønsted-Lowry. In subsequent lessons, students learn the valence of acids and bases and neutralization reactions. The pace of lesson advance is the same as that of physics. Although textbooks include the definition of pH in this unit, in practice teaching, it will be taught after neutralization reaction; thus, changing the prescribed order. The nature of acid and alkali and the fact that neutralization reactions generate water and salt have already been learned in junior high school science, means those quantitative relations are the main themes in high school science (MEXT 2009).

However, science lessons should differ from mathematics lessons. Both in physics and chemistry it is important to solve the reasons why phenomena arise, and to formulize quantitative relations based on this. The point of instruction is not to make lessons only about solving numerical calculation problems. Considering this point, it is important to establish the appropriate criteria for taking up examples, including relationships with the examples to review knowledge learned at junior high school level and the consideration of time efficiency.

The first point to improve the lesson plans written by past students is the necessity to specify the prospect and usefulness of study, similar to the case of physics. The second point is the inappropriateness of taking up the example (NaCl), when reviewing ionization because the relationship between it and the topic of this lesson is not clear. The third point is inappropriateness is explaining the change to from calling bases in high school science from alkali at junior high school science as mere paraphrasing. In order to prepare for the extension of the acid-base definition, a change of focus from classification of substances to their roles in neutralization reactions should be emphasized in the change of names from alkali to bases. In addition, although Arrhenius's definition only explains phenomena about reactions in aqueous solution and pays attention to both H⁺ and OH⁻, similar phenomena occur in the air then the generalized definition by Brønsted-Lowry that pays attention simply to H⁺ is necessary. An important example here is NH₃ + H₂O ⇌ NH₄⁺ + OH⁻. Although NH₃ does not have OH⁻, if NH₃ proofs into water, some reacts to water and generates OH⁻. This example is just suitable for extending a definition. Although some lesson plans used this example, they only explained that water is used as an acid, and
do not prompt learners to regard acids and bases anything but a role of the substance in a reaction. This might cause students to misunderstand that water is acid and that acidity is a property of a substance.

In addition, there are some more detailed points that require improvement. First, although taste or tactile senses were assumed as learner’s reactions about properties of acids and alkalis, they learned that to lick or touch a substance recklessly is dangerous from the viewpoint of safety education. It is possible that a few learners have actually licked the substances referred to frequently when they learn about acids and bases. Therefore, it is better to emphasize experienced facts in the experiment at junior high schools level, such as the change of color of litmus paper, and the generation of hydrogen. In addition, explaining explicitly or postponing explanations, such as the “⇔” sign, particularly in the case of hydrogen is something to be considered.

Treatment of Ways of Viewing and Thinking in Other Subject Areas

The contents of science education changes from qualitative at junior high school level to quantitative at high school level. Therefore, in the high school science, mathematical formulization of phenomena is introduced. Moreover, in order to investigate deep principles that can explain more phenomena generally whilst utilizing conceptual extension, analogy, and induction as mathematical ways of viewing and thinking. That is the reason why mathematical ways of viewing and thinking were left in the previous STG for science education while rules about scientific ways of viewing and thinking (Table 1) have been added.

Table 1: Matsuda’s (2012) Scientific Ways of Viewing and Thinking

| a) | Examine hypotheses by means of experiments or observations. |
| b) | Consider a special case in which one of the factors is ignored or added. |
| c) | Deconstruct an experimental condition into various factors. |
| d) | Estimate the results of an experiment quantitatively by using hypothetical function. |
| e) | Examine whether the same results can be repeated. |
| f) | Plan an experiment focusing on examining a specific hypothesis. |
| g) | Examine consistency with known laws and facts. |
| h) | Consider the results that can confirm a hypothesis. |
| i) | Consider methods to change a specific factor of experimental conditions. |
| j) | Summarize the conditions or characteristics of phenomena focusing on their spatial properties. |
| k) | Summarize the conditions or characteristics of phenomena focusing on their timing of occurrence. |
| l) | Consider phenomena from the viewpoints of retention, transformation, and balance. |
| m) | Consider phenomena from the viewpoints of (dis)continuity and (ir) reversibility. |
| n) | Consider phenomena from the viewpoints of energy transaction and electrical property. |
| o) | Consider phenomena from the viewpoints of the structure of atoms and electron configuration. |

Furthermore, Taguchi and Matsuda (2015) pointed out that it is better to utilize ICT for finding data collected by another person than to conduct observations or experiments independently when developing a design framework of gaming instructional materials for “Exploration Activities” in Science. To this end, they required the utilization of informatical and systematical ways of viewing and thinking that should be cultivated in informatics education. This study follows their policy in order to cultivate the ability to self-learn by collecting and utilizing information resources, such as textbooks, teacher’s explanations, and web pages.

DISCUSSION FOR DESIGNING A STUDENT MODEL

Elements of Model and Principles of Design

We assume that a student model for Science consists of script knowledge (problem-solving procedure), ways of viewing and thinking, and domain-specific knowledge like those for Mathematics and Information
Study. Because a student model of STG is designed to simulate student’s responses, it should be able to represent, not only desirable or adequate states of mastery, but also incorrect or unexpected states of understanding. As a result, overlay model and bug model are typically used. This study assumes that student teachers have learnt “Dimensional Analysis (Sakamoto 1979)” that is an instructional design method designed to classify reasons for misunderstanding and errors, and that they are familiar with the bug model. Our model aims to mix these two models.

Because script knowledge corresponds to general strategies stated in Bruer (1993) as one of three elements necessary for human intelligence and expert performance, it needs to have commonality beyond subject areas or contents. In Japanese schools, cooperation between subject areas and cultivation of general strategies were seldom taken into consideration in subject education (Task Force for Discussing Policy of the Next National Curriculum, 2014), and the framework of problem solving as general strategies is not explicitly taught in the present education system (Matsuda 2015). Moreover, because problem solving is considered as an activity to utilize acquired knowledge, the framework to perform problem solving while acquiring new knowledge is not taken into consideration. However, Matsuda’s (2015) model of problem solving includes the woof activities, collecting => processing => summarizing information, in all the processes of warp activities. The woof activities include a mechanism to acquire new knowledge. Therefore, if this script knowledge can be utilized without being associated to the quality and appropriateness of the teachers’ instructions, students can become active learners, and gain understanding and utilize their knowledge by themselves.

However, the details of the “warp and woof” model of problem solving have only been considered for Information Studies. Therefore, I examine the necessary activities for cultivating self-learning abilities in usual science lessons, i.e., not for cultivating problem-solving abilities in Exploration Activities of science, based on the “warp and the woof” model of problem solving (Figure 1). The tasks in the warp activities are the same as those of Information Studies, and the woof activities are those that should be performed in the usual lessons of science instead those of Information Studies.

The purpose of the first task of the Goal Setting process is to recognize the purpose and method for using learning outcomes of science study, as well as to clarify one’s own policy of learning in the lesson. Learners collect the information such as, the contents learned already, phenomena, and problems dealt with in the lesson, and then based on the differences among them they guess the points of learning and necessary scientific thinking in this lesson. Moreover, they need to have a prospect of what should they learn and how should they reconstruct their own knowledge. However, in textbooks, it is sometimes unclear which aspects of the contents are pre-requisite knowledge. For example, although two definitions appear in “Acids and bases,” it is unclear for students whether the first one is new or not and what the purpose of learning the first one is.

The purpose of the second task is to make a plan of study. Learners need to prepare not only for listening to their teacher’s explanations passively but also for understanding it positively by recalling the known phenomena and similar problems concerned with lesson contents, and applying the explanation to them deductively, or inducing and using analogy from them conversely. Moreover, learners need to plan their utilization of study skills in the lesson. Probably, the point of flipped learning is at the root of this task.

Script Knowledge of Problem-solving Procedure

In the ‘Generate Alternatives’ process and the ‘Rational Judgment’ process, learners need to think as in the lesson of a hypothetical experiment, not by group style but individually. They choose a phenomenon that should be verified by themselves, and induce its reason by acquiring and applying new domain-specific knowledge if necessary. In order to verify the hypothesis, the experiment can be performed actually, but they may look for data or description on web. In the ‘Rational Judgment’ process, logic induced in the ‘Generate Alternatives’
reasons for errors and typical examples of misunderstanding, useful to analogical thinking as internal
pointed out that the “warp and woof” model of problem-solving suggested that if the difference among purposes
priorities. The script knowledge at this time consisted of only warp activities. Conversely, Matsuda (2014) also
pre-acquired knowledge and reconstructing a schema.

Although what was described above is the ideal script knowledge, it is also required to model the situation
of not mastering it. To this end, Matsuda (2013a, b) assumed that the model that has two or more script
knowledge aspects other than ideal number, such as a trial-and-error problem-solving script changes their
priorities. The script knowledge at this time consisted of only warp activities. Conversely, Matsuda (2014) also
pointed out that the “warp and woof” model of problem-solving suggested that if the difference among purposes
of warp activities is not clearly paid attention to, useless circularity, i.e., trial-and-error, might occur. This
statement suggests that mastery of the appropriate procedure is understood by the strength of relationship between the elements of the script knowledge and whether the necessary elements can be activated in problem solving contexts.

**Ways of Viewing and Thinking**

Matsuda (2014) supposes that ways of viewing and thinking have two functions, making problem solving easy and supporting acquisition of a domain-specific knowledge. Based on the assumption that when the domain-specific knowledge is memorized it is chunked as the form of a frame (Barr and Feigenbaum 1981), and the mechanism to perform these functions is explained as follows. As shown in Figure 1, a way of viewing and thinking is activated in the specific context of script knowledge, which then activates the associated internal knowledge. It refers to the value of a specific slot, or associates its value to the value of another slot or another piece of knowledge in order to get a conclusion. In this process, if there is a slot that has no value, the learning program for filling the slot value automatically is activated, and it will support acquisition of another value.

In the case of "Exploration Activities" in science, Taguchi and Matsuda (2015) examined where each scientific way of viewing and thinking, shown in Table 1, should be utilized in the warp activities of Figure 1. This paper conducted similar discussions in the case of performing self-study in a regular science lesson while referring to Taguchi and Matsuda’s result (Figure 1). At that time, we premised using mathematical, informational, and systematical ways of viewing and thinking together.

In the ‘Goal Setting’ process, symbolization, generalization, and abstraction of the mathematical ways of viewing and thinking are assigned to collecting information activities and g), j), and k) of scientific ways of viewing and thinking are assigned to processing information activities as concrete methods of performing informational and systematical ways of viewing and thinking “analyzing a problem systematically.” For example, the target lessons of both physics and chemistry, take up familiar phenomena as problems, and abstract and symbolize them using a domain-specific knowledge. In many cases, a more complicated phenomenon is a more general phenomenon, for example no constraints about the number of forces involved, which requires paying attention to the differences of factors and results among phenomena by using j) and k). In addition, considering consistency with a known law, phenomena, etc., two or more candidates of possible hypothesis should be generated.

In the ‘Generate Alternatives’ process, the logic for explaining the formulized problem as far as one can be convinced is constituted. Because this study emphasizes the importance of cultivating students’ scientific ability of thinking and problem solving, we give priority to utilization of information resources, such as textbooks, teacher’s instructions, and the web rather than doing experiments and observations oneself. Considering consistency with a known law and phenomena, reliable information should be chosen. Then learners constitute the logic to explain a hypothesis by deduction, induction, and analogy, using information as clues. At this time, it is necessary to constitute the explanation, paying attention to the scientifically important concept, and then using scientific ways of viewing and thinking l), m), n), and o) in high school science. In the ‘Rational Judgment’ process, it is necessary to examine the constituted logic critically and pay attention to the possibility that the logic will be rejected. For this end, we prepare the following viewpoints in the framework of rational judgment, the possibility of a broad interpretation or excessive generalization, the existence of an anti-example and the existence of inconsistency with the fact, and existence of unnecessary explanation. These should be memorized as internal knowledge.

In the ‘Derivation of Optimized Solution’ process, learners need to check e) in Table 1 while unifying new knowledge with the pre-acquired knowledge and applying renewed knowledge to a new problem.
Domain-specific Knowledge: Internal and External Knowledge

As mentioned previously, domain-specific knowledge is memorized in the form of a frame. At this time, Matsuda (2013a, b) assumes that domain-specific knowledge has common slots for each subject area. According to this assumption, this study assumes that there are common slots for Science as shown in Table 2. Hereafter, we explain roles, necessity, and their relation to ways of viewing and thinking for these slots, using examples in Table 2. In addition, we need to explain a different type of domain-specific knowledge not concerned with specific contents as shown in Figure 1.

In the ‘Goal Setting’ process, learners need to define the aim of studying this lesson by themselves. For example, they need to compare new contents, such as “balance of three or more forces” and “an example of an acid-base reaction other than in aqueous solution,” to learned contents, such as “balance of two forces” and “definition of acids and alkalis in aqueous solution,” and notice those relations, such as generalization and quantification. If these relations are explicitly explained by the teacher or in the textbook, a question that prompts learners to pay attention to these relationships is made, or learners can utilize the ways of viewing and thinking mentioned above, i.e., those that would support their understanding of the relationships better. Moreover, if they have a special domain-specific knowledge, independent of the contents, about the meaning and the purpose of the science study, they can find out the purpose appropriate in this context. If the purpose slot is filled through such a process, its importance goes up and will be activated in the required scene of problem solving more preferentially than old knowledge.

Table 2: Slots necessary for domain-specific knowledge in science education and relations among them.

It is important to choose a typical example to be memorized from two or more examples for understanding a new example analogically. In order to grasp the relationship of two or more examples, it is necessary to decompose the factors constituting examples. The factor related to the purpose of studying new content also has a high possibility of being related to the purpose of studying the new contents that follow. If the connection to the other slots or knowledge is strong, such as the clarifying factor related to choosing the law and procedure necessary to apply it, knowledge can be activated and focused. The relationship with a factor and induced misunderstandings concerned with it helps critical examination in the ‘Rational Judgment’ process effectively.
For example, when compounding three or more forces, it is more efficient to compute resultants about each x and y direction after decomposing all the force in the direction of x-y rather than compounding every two forces gradually. The former method is also useful in understanding equations of motion. Therefore, it is necessary to relate the purpose of studying decomposition of force with the situation of problem solving, and to memorize it. Moreover, it is necessary to relate the method of decomposing in the direction of x-y with a real problem-solving situation as a typical example, and to memorize it. The figure showing the balance of gravity and the force created by a pulled thread, and the figure showing the relationship between action and reaction when a spring is pulled by hand are looked at, and there is a possibility of mixing these up. Therefore, it is necessary to relate these two examples with the difference in the situation in problem solving, and to memorize them.

SUMMARY AND FUTURE DIRECTIONS

In order to improve STG for Science education, we propose a new student model for usual science lessons with reference to student models for the STG of Mathematics and Information Studies. During this process, we extend the model based on the latest model of problem-solving activities, the “Warp and Woof model,” because no previous student model is developed on the basis of this problem-solving activities model. In addition, our new model focuses on the cultivation of ability to self-learn as problem-solving in daily life.

However, our model is not concrete enough and too conceptual to implement as learner-agent in the STG. Therefore, we need to design a learner-agent function based on this model while describing domain-specific knowledge of the lessons completely and developing automatic knowledge acquisition programs that realize a function of the ways of viewing and thinking. Based on this, we also need to realize the new STG for Science education and verify its effects through its practical application in our teacher promotion program.

Building, 3D-designing, testing and analyzing both mechanical flapping birds and Arduino-based robotic cars was conducted in a six week engineering outreach program for middle and high school students. Thirteen participants from Superior Jr./Sr. High School students at the Superior Unified School District in Arizona took place in this study. Students from 7th, 8th and 9th grades benefited by learning from experienced engineers working in their field of study. The students were exposed to Arizona State University (ASU) student organizations such as Micro Air Vehicle (MAV) club, Society of Hispanic Professional Engineers (SHPE) and engineering alumni. The program, which was sponsored through the NASA Space Grant, sparked imaginations through hands-on learning by using principles of flight, physics and engineering concepts. The project helped minority females who are traditionally not exposed to these types of programs. The students benefited from this engineering project to help influence their education, career interests and opinions on what engineers do in addition to course concepts such as lift, drag, thrust, weight, velocity, average velocity, angles (“SOHCAHTOA”), programming, mean, median, range, mode, graphs, introduction to MATLAB and Arduino engineering.

softwares. After the program, results showed 85% increase in knowing what type of engineer the middle and high school students would want to become in the future. Also, a 20% increase thought engineering is fun and a 30% increase in the students’ perception and motivation in becoming engineers in the future. The goal of the program was met to change the perception on how the students perceive engineering through a hands-on approach to learning mathematical concepts. Overall, through the use of flapping mechanical birds and robotic cars showed that students benefited in this six week engineering outreach program.

I. Introduction

In an effort to confront formidable STEM education pipeline challenges facing the nation, we proposed a Mechanical Flapping Bird STEM Outreach Program targeting 7th - 9th grade female minority students. The program aimed to empower students with motivation and confidence, via fun and exciting hands-on learning activities, to pursue professions within the areas of Science, Technology, Engineering, and/or Mathematics (STEM). In [4] a 2009 survey of over 1250 students conducted by the American Society of Quality (ASQ) showed that most teenagers would not consider an engineering career. According to [9] in 2008 Science and Engineering Indicators, underrepresented minorities, including Blacks, Hispanics, and American Indians/Alaska Natives, constituted only 9% of both academic doctoral employment and full-time faculty positions, up from 2% in 1973. Based on [7], [8] the number of females involved in STEM-related fields remains low – especially for Hispanic females (Landivar, 2013). The proposed program is expected to result in effective 7th, 8th and 9th grade methods that can be readily implemented in schools across the nation.

The main goal of this project was to design a mechanical flapping bird. This helped the students to become familiar with issues associated with modeling, designing, and building a flapping wing mechanical bird micro air vehicle (MAV) drones [1], [2], [3]. The topic addressed drawing shapes and sizes of birds and getting familiar with their dimensional configurations. Studying the aerodynamics of flight can be an arduous task for kids, but it is essential for determining the distance and velocity the bird micro air vehicle performs during a typical flight mission. This motivated the topic for designing a mechanical bird. The first step was to design a mechanical bird micro air vehicle. Students examined shapes and sizes of different wings and fuselage to determine maximum distance and velocity by altering the dimensions of different shaped mechanical birds. The students gained mechanical and aerospace engineering skills from working together to design more efficient types of flapping bird wing configurations that produced the greatest amount of lift and the least amount of drag from learning aerodynamic concepts with practicing engineers they interacted with. The students designed their own mechanical birds. This enabled the students to have their drawings/design come to life and put their designs to the test to see how much lift their mechanical bird can achieve.

The first step was for each group to build and test two mechanical flapping birds and compare them. The platform that the mechanical bird used was a premade balsa wood structure with red and blue wings. The body of the mechanical bird was easy to put together. The structure was premade with precut holes for mounting parts and pieces that could easily be integrated together. Students examined various flight regime paths. The students conducted experimental tests to determine the mechanical bird vehicle’s performance. The students gained mechanical engineering skills from building and designing their own mechanical birds and learning from practicing engineers. The students worked together as a team to achieve their goals and build two mechanical flapping birds that flew. The student could use these vehicles to understand search
and rescue missions. A wind tunnel will be incorporated in the future for the students to use at ASU.

We had cohorts that consisted of 3-4 students. The first student recorded the distance in feet that the bird traveled, another student timed in seconds with a stopwatch the duration the vehicle traveled, another student recorded all the data down on a data table on a sheet of paper to later be placed into a spreadsheet, and finally another student flew/tested the mechanical flapping bird [18], [19]. The students computed velocity using fundamental equations in physics such as distance = velocity * Time or X=VT. After the students computed the velocity they plotted height as a function of distance with projectile motion equations to visually represent their data they had collected. The students plotted in MATLAB the data they collected from their built mechanical birds. Projectile motion concepts were incorporated. Angles from using “SOHCAHTOA” were used so they could calculate the angle the mechanical birds flew at. Then they plotted the trajectory of their mechanical birds. The equations that the students used increased their understanding of physics and how the equations of motion determined the mechanical birds performance. The students realized how much of an engineering background they got out of this by using a hands-on approach to solving real world problems. The students made conclusions from the data they collected based on the maximum time the bird traveled, the minimum time the bird traveled, the maximum distance the bird traveled, the minimum distance the bird traveled, the average distance the bird traveled and the average time the bird traveled.

Additionally, the students built mobile robots that were controlled by the programmable Arduino boards. The Arduino Robocars were built from pre-made acrylic platforms which are easily assembled with a screwdriver set. Students learned how to program the Arduino board to read distance with the use of an ultrasonic sensor and control the speed of motor-wheels [5], [6]. The use of the ultrasonic sensor allowed them to compare the distance measured with a ruler from a structure. Velocity was calculated based on the distance and time that the robot reached at each programmed step. At the end, students participated in a competition where their robots performed an obstacle avoidance task. The team that reached the final line in the shortest time was the winner. The collected data from the distance, time and velocity was analyzed using mathematical concepts that the students learned in their traditional classes.

In this engineering outreach program, the students gained engineering experience that encompassed a designed, built, and analyzed flapping mechanical birds and Arduino robotic vehicle. This is important because the students gained understanding on what factors impacted the performance of designing and testing micro air vehicles and ground vehicles. Students from 7th, 8th and 9th grades should now be able to grasp and visually interpret from their Matlab programming codes and data analysis how changing different parameters in the mechanical flapping bird affects its flight performance through their poster. On the poster, the students showed accomplishments by having designed, built and tested a mechanical flapping bird [16], [17]. The students have gained mechanical and aerospace engineering skills by using a hands-on approach to solving real world problems.

The approach taken leverages 6 semesters of very successful student-centered mentor-driven pedagogical testing involving 4th-6th graders at 12 Title 1 elementary schools. This has involved 276 students (216 during Fall 2012-Spring 2014, 60 during Fall 2014-Spring 2015. Most students have been underrepresented minorities: Hispanics/Latinos (46%), Black/African American (37%), Asian/Pacific Islander (7%), American Indian (7%), white (3%), females (49%). See videos at https://www.youtube.com/watch?v=dOX-ouw8Oio (Spring 2015); https://www.youtube.com/watch?v=Wtu0NyQwFc8 (Fall 2014). At the end of our program, a
talk was given by Dr. Rodriguez and the students were exposed to hearing about missions to Mars, spacecraft, planetary exploration, space telescopes like Kepler, rovers, use of robot swarms, the new Boeing 787 aircraft, hypersonic vehicles, reusable rockets, future space travel, iron man suits, the future of computers and the internet, and using 3D printers to build stuff – including human organs.

II. Target Audience Demographics

Students from Superior Junior High School (JHS) in Superior, Arizona were targeted. This school – situated approximately 54 miles (one hour drive) from the main Arizona State University (ASU) campus – is a Title 1 school. Title 1 students are “at risk low-income 100% free lunch” students. Thirteen students participated in this program. At Superior, 85% of the students are underrepresented minorities; 50% are female. Furthermore, this fall 2015 semester, 100% of all the program students were female underrepresented minority students. The targeted 7th-9th graders represent a critical demographic – one that is critical in order to strengthen the nations’ STEM pipeline. The Mechanical Flapping Bird STEM Outreach Program serves Hispanic/Latino, African American/Black, Caucasian, Native American/American Indian, Asian/Pacific Islander, that comprise of 69.23%, 7.69%, 15.38%, 7.69% and 0%. In addition the district that the program serves comprises of mainly Hispanics/Latinos. According to Science and Engineering Indicators, in 2008, underrepresented minorities (blacks, Hispanics, and American Indians/Alaska Natives) constituted about 9% of both total academic S&E doctoral employment and full-time faculty positions, up from 2% in 1973.

III. Team

While most of the planned activities were led by Michael Thompson (ASU Mechanical Engineering PhD student, Hispanic) and a 2014-2015 NASA Grant Fellow, activities involved the following collaborators: Superior School educators (Arlynn Godinez, Director of Curriculum and Instruction at Superior; Valerie Garcia, Superior Junior High Student Advisor, and William Duarte, Principal of Superior), 1 ASU Electrical Engineering PhD student (female: Victoria Serrano, Hispanic, Vice-President of the MAV Club), ASU Micro Air Vehicle (MAV) and SHPE club students, 6 practicing engineers (ASU Alumni), (1 female: Deyzi Ixtabalan, Manufacturing Engineer, Hispanic, NorthStar Aerospace, 2: female, Maia Garcia, systems engineer, Hispanic, Honeywell); (3: female, Yamille Perez, Industrial Sales Representative, Hispanic, Caterpillar Inc., (4: Male, Rafael Haro, Design Engineer, Hispanic, General Motors), (5: female, Hannah Kolar, Mechanical Engineer, Caucasian, Honeywell), (6:female, Ruby Gomez, Hispanic, Design Engineer, Raytheon). In addition, a Hispanic ASU engineering professor and IEEE member, Dr. Armando Antonio Rodriguez, MAV club advisor and mentor to Michael Thompson, and others contributed to the outreach program. The ASU team, under the guidance of Dr. Rodriguez, has many years of technical outreach experience with underrepresented minorities. Dr. Rodriguez received a 1996 White House Presidential Excellence Award from President Clinton for leading a research-mentoring program on Flexible Autonomous Machines operating in an uncertain Environment (FAME) serving students across engineering.
IV. Technical Approach Taken.

The program consisted of six weeks of planned activities in the Fall 2015 semester. Fifteen 7th-9th grade students were bused from Superior JHS to meet with Michael Thompson and other invited speakers (see team) for 6 consecutive Saturday sessions (9am to 1PM) on the ASU main campus within Dr. Rodriguez’ Intelligent Systems Laboratory. Each student built, flight tested, collect data, analyzed, altered, retested and reanalyzed a (rubber-band powered) mechanical flapping bird vehicle (41 cm wing span, weighing 7 grams). In addition, students were exposed to speakers (see team, particularly Dr. Rodriguez) that addressed the importance of school, grades, coursework, studying, the ongoing scientific revolution (aerospace, communications, computing, electronics, entertainment, personalized medicine, regenerative medicine, etc.), the importance of high school and college and ever exciting career opportunities. Dr. Rodriguez has been recognized nationally for leading impassioned student-centered mentor-driven discussions on these national matters. When taken collectively, the goal of these activities, were simply to capture the imaginations of the students and let them see how relevant and vitally important their schooling is. The semester culminated by having the student’s present posters at ASU.

Week 1 Project - Designing/Modeling Mechanical Flapping Wing Bird Micro Air Vehicles

The main goal of this project was to design a mechanical flapping bird. This helped the students to become familiar with issues associated with modeling, designing, and building a flapping wing mechanical bird micro air vehicle (MAV) drone. The topic addressed drawing shapes and sizes of birds and getting familiar with their dimensional configurations. Studying the aerodynamics of flight can be an arduous task for kids, but it is essential for determining the distance and velocity the bird micro air vehicle performs during a typical flight mission [17],[18],[19]. This motivates the topic for designing a mechanical bird. The first step was to design a mechanical bird micro air vehicle. Students examined shapes and sizes of different wings and fuselage to determine maximum distance and velocity by altering the dimensions of different shaped mechanical birds.

The students gained mechanical and aerospace engineering skills from working together to design more efficient types of flapping bird wing configurations that produced the greatest amount of lift and least amount of drag from learning aerodynamic concepts with practicing engineers they interacted with [10], [11], [12]. The students designed their own mechanical birds. From Figure 1 above we can see that this enabled the students to have their drawings/design come to life and put their designs to the test to see how much lift their mechanical bird achieved.

Figure 1. From left to right. 3D-pen designed bird, 3D-designed glasses and students 3D-drawing.
**Week 2 Project - Building Flapping Wing Mechanical Bird Micro Air Vehicles (MAV)**

The main goal of this project was to build mechanical flapping birds. This helped students to become familiar with issues associated with modeling, controlling, designing, and building a flapping wing mechanical bird micro air vehicle (MAV) drone [13], [14], [15]. From Figure 2 we can see that the first step for each group was to build and test 2 mechanical flapping birds and compare them.

![Figure 2. From left to right. Testing and fully designed 3D-pen mechanical flapping birds.](image)

The platform that the mechanical bird uses is a premade balsa wood structure with red and blue wings. The body of the mechanical bird was easy to put together. The structure came premade with precut holes for mounting parts and pieces that can be easily integrated together. Students examined various flight regime paths. The students conducted experimental tests to determine the mechanical bird vehicle’s performance. The students gained mechanical engineering skills from building and designing their own mechanical birds learning from practicing engineers. The students worked together as a team to achieve their goal and build the two mechanical flapping birds that flew.

**Week 3 Project - Testing / Experimental Velocity Data Collection of the vehicles**

The main goal of this project was to test and collect data of the mechanical birds that the students built. Each group flew mechanical flapping birds. We had four cohorts that consisted of 3-4 students. The first student recorded the distance in meters the bird traveled, another student timed in seconds with a stopwatch the duration the vehicle traveled, another student recorded all the data down on a data table on a sheet of paper to later be placed into a spreadsheet, and finally another student flew/tested the mechanical flapping bird. From the Figure 3 we can see the data being the bird flying, the data plotted into Matlab engineering software and the data from the flying mechanical bird being measured and collected.

![DREAM TEAM- Trajectory of Vehicle](image)
Figure 3. From left to right. Testing and plotting data collected in Matlab engineering software.

Next the students computed velocity using the one of the fundamental equations of physics that distance = velocity * Time or X=VT. Then, after the students computed the velocity they graphed the velocity as a function of time to visually represent their data they have collected. The students graphed the data they collected from their built mechanical birds. Projectile motion concepts were incorporated using angles from “SOHCAHTOA”. The students used “SOHCAHTOA” to calculate the angle that the mechanical birds flew at. Then, they graphed / plotted the trajectory of their mechanical birds in Matlab engineering software. The equations that the students used increased their understanding of physics and how the equations of motion determined the mechanical bird’s flight performance. The students realized how much of an engineering background they obtained by using a hands-on approach to solving real world mathematical problems. The students made conclusions from the data they collected based on the maximum time the bird traveled, the minimum time the bird traveled, the maximum distance the bird traveled, the minimum distance the bird traveled, the average distance the bird traveled and the average time the bird traveled.

**Week 4 Project – Building & Programming Robotic Car Systems with Arduino Boards**

The students built a 2-wheeled robot in mechatronics. This allowed them to integrate mechanical parts such as the base and wheels together with electromechanical systems such as the motors. This project provided an extension of the flapping mechanical birds experiments by integrating programming skills through the use of an Arduino Mega microcontroller. The students programmed their Arduino robotic car with Arduino software [2],[3]. Students learned basic concepts about programming such as: including libraries, defining variables, setting the baud rate of the connection between the computer and the Arduino board, and the logic of the program. Students discovered how the velocity of the car can be increased by setting up a higher speed value in the Arduino program. This data was used to plot the velocity of the car (in cm/s) versus the "speed" command in the program. Students created a table for the "speed" value starting from 100 to 250 with an increment of 25 units. Then, they measured the distance that the car traveled (in centimeters) and the time that the car used to reach its final position (in seconds). This information was used to calculate velocity in cm/s at each value of the "speed" command. After the table was created, a plot was generated for the velocity of the car which was predominantly linear as it was expected. Once the students completed this experiment, another program was provided to measure distance with an ultrasonic sensor. Students learned how to connect each wire of the ultrasonic sensor into the different pins of the Arduino board. Additionally, they specified in the program the pins that they were using on the Arduino board, so that the connections and the program were consistent. As can be seen from Figure 4, this would help the students to develop engineering skills using robotics.
The students needed to measure the distance with the ultrasonic sensor, so that the robot could perform an obstacle avoidance mission. This would help the students to develop engineering skills using robotics and eventually integrating it with other vehicles such as the flapping birds. Near the end of the week 4 project the students began working on finalizing their poster to practice their presentation with the engineers.

**Week 5 Project – Building & Programming Robotic Car Systems with Arduino Boards**

The students built robotic cars which were controlled by the programmable Arduino boards. After building the Arduino robotic cars the students competed against each other. The Arduino robotic cars were built from pre-made acrylic platforms which are easily assembled with a screwdriver set. Students learned the basic concepts of programming an Arduino Mega board such as declaring the libraries to be used, specifying the variables of the program, setup the communication between the computer and the programmable board, and using commands in a loop. Additionally, they familiarized with concepts such as: how to program the Arduino board to read distance with the use of an ultrasonic sensor, and how to control the speed of the motor-wheels. From Figure 5 we can see below the students in the competition.

The use of the ultrasonic sensor allowed them to measure distance from a fix object. Velocity was also calculated based on the distance and time that the robot reaches at each programmed speed value command. At the end, students participated in a competition where their robots performed an obstacle avoidance task. The team that reached the final line in the shortest time was the winner. The collected data from distance, time and velocity was analyzed using mathematical concepts that the students learned in their traditional classes.
**Week 6 Project - Students Present Final Poster Presentation for Science Fairs Entitled:**

*“Designing, Building, Testing and Analyzing Micro Air Vehicles”*

In this project, the students presented through a poster their finalized work that encompassed designing, building and analyzing mechanical flapping bird micro air vehicles. This is important because the students gained understanding on what factors impacted the performance of designing and testing micro air vehicles. From [6], it has been demonstrated that having tangible interfaces benefits the learning process of young students. From Figure 6 below we can see the students from 7th, 8th and 9th grade were able to grasp and visually interpret from their Matlab programming codes and data analysis how changing different parameters in the mechanical flapping bird affected its flight performance.

![Students with posters](image)

Figure 6. From left to right. Superior Jr./Sr. high school students with their posters.

On the poster, the students showed their accomplishments by having designed, built and tested two mechanical flapping birds. The students benefited and gained mechanical and aerospace engineering skills by using a hands-on approach to solving real world mathematical problems.

**V. COMMUNITY PARTNERSHIPS - ORGANIZATIONS / CLUBS INVOLVED**

The students built, designed, tested, collected data and plotted their data in matlab working with real professional / PhD graduate / undergraduate student engineers. Work was performed in an enjoyable atmosphere where the students enjoyed Mexican food, Tamales, and was able to network with the professional / PhD graduate / undergraduate student engineers. The students were able to ask career based questions such as "Do you like your job?"; "What do you do at Honeywell / Raytheon / General Motors Co. / APS / Caterpillar / Ford Motor Co. ?" Are you the only girl who work in your group?" The students learned that women in engineering is rare based on the last question. From Figure 7 and 8 below the groups can be seen below. The entire group of engineers showed the students their great motivation to help the students learn.
In detail, the total number of representative engineering clubs / organizations / companies involved was eleven. The total number of engineering clubs/organizations involved were three. The total number of engineering companies involved were seven. The organizations / companies were the following: 1) MAV Club; 2) SHPE de ASU; 3) SHPE Phoenix; 4) Superior Jr./Sr. High School; 5) Ford Motor Co.; 6) Honeywell; 7) NorthStar Aerospace; 8) Raytheon; 9) Caterpillar; 10) Arizona Public Services Co.; 11) General Motors Co. The students interacted with the following types of engineers in the program: Aerospace, Mechanical, Computer Science, Electrical, Bio-medical, Civil, Nuclear and Chemical Engineering. Majority of the engineers in the program were from aerospace engineering. The benefit of having the program was that the students were able to have an intellectual discussion about what do these engineers do? Each high school student was able to choose an engineering major they had in mind that they picked based on all the engineers discussions they had over the six week program. Every professional / PhD / working engineer spoke for about 5 minutes on what they do at their respective company. Each engineer from their company was able to explain to the students how they lover their job and the work that they have the opportunity to do is exciting.
VI. FLOW CHART OF ENGINEERING OUTREACH PROGRAM

The flow chart below shows the progression of steps taken of how the program was handled. The engineering outreach program was broken up into nine phases that can be seen below from Figure 9.

Phase 1 was to start building and designing mechanical flapping birds and Arduino robotic car systems. The second phase was to utilize 3D-pens to enhance the student innovation and creativity to design parts. The 3D-pen lets the students have an artistic component to their engineering design by creating specific parts for the mechanical flapping bird. The third phase consisted of testing the mechanical flapping bird. The fourth phase was collecting the data from the newly build and designed mechanical bird air vehicle systems. The fifth phase was to assemble all the vehicles in order to gather the appropriate information. The sixth phase was to program the data into Matlab engineering software. The seventh phase was to plot the data into Matlab to obtain the trajectory of the flight path. The eighth phase was to have a competition with the Arduino robotic cars. The final phase was brought together in a culmination of creation of a poster that demonstrates what the students have learned throughout the six weeks engineering outreach program.
VII. MIDDLE AND HIGH SCHOOL GROUPS WITH MENTORS

The students worked closely with their engineers. Group 1 was named “Los Diablos” group and contained four undergraduate engineer, and 1 PhD Graduate engineer with a total of five mentors for that group. From Figure 10 and 11 shows the groups 1-4 with some of the high school students and engineers.

![Figure 10: From left to right. Groups 1 and 2 of the engineering outreach group photo.](image1)

![Figure 11: From left to right. Groups 3 and 4 of the engineering outreach group photo.](image2)

Group 2 was named “Dream Team” with two undergraduate engineers, one masters graduate engineer with a total of three mentors for that group. Group 3 was named “Panthers” and contained three professional engineers who work in their field of study, two undergraduate engineers with a total of five mentors for that group. Group 4 was named “Pink Birds” with two professional engineers who work in their field of study, three undergraduate engineers, one masters graduate engineer with a total of six mentors for that group.

VIII. RESULTS AND DISCUSSION

During the Fall 2015 semesters, we captured the imaginations of 13 Title 1 Hispanic girls – girls lacking role models at home; many of which will be the first to graduate from high school/college. We plan to stay in touch with these girls – to serve them as mentors (in principle) forever. Impact-wise, this goal is superceded only by our plan to scale up our activities in the future across many more Arizona K-12 schools. Technically, the program addressed performance-based vehicle design for MAVs. This work impacted many communities, especially Hispanics involved in the MAV Club, SHPE de ASU. It encourages students to pursue engineering undergraduate degrees and graduate school.

The 3D-pen red mechanical bird had a much higher payload than the blue mechanical bird. The students put more of the 3D-pen plastic on top of the bird and weighed the vehicle down. The micro air vehicle club had built hoops where the students were able to fly the bird through the hoops. This helped the students to aim the bird at a higher angle of attack and fly mechanical birds through a series of tests. The students tested both the red and blue mechanical birds five times and collected distance and time measurements. With this data the high school students were able to compute the velocity of the mechanical birds. Then the students calculated the angle
with "SOHCAHTOA." After the students had the angle and velocity the students were able to use projectile motion equations to plot the trajectory of the micro air vehicles in matlab engineering software. The hands-on project-based program lets the students engage in an intellectual stimulating conversation about career paths that helps the students learn what engineers actually do. The students were able to observe that by using projectile motion equations both of their red and blue mechanical birds were able to fly at very different speeds. From the High school students plots the group, "Los Diablos" flew the blue bird with a much higher trajectory however by starting off with a greater angle of attack then the 3D-pen red mechanical bird.

The 3D-pen red mechanical bird was able to fly further due to the light weight of the bird. The students were easily able to grasp "SOHCAHTOA" concepts and calculate the flight path angle that they calculated to be around 53 degrees. For the dream team group, the students were able to observe that the blue mechanical bird was able to fly much higher and further then their red mechanical bird.

In the beginning the high school students were not sure what majors they would like to pursue, but by the end of the engineers talks we asked the students and each high school student was able to choose an engineering major. This was because they were exposed to hearing and seeing real engineers that look like them. The students were surrounded by engineers and they were able to help the students. Since we had actually more engineers to high school students the event was able to run smoother, that is the goal every time. The plan is to let the students see and talk to “real” engineers to impact them in a meaningful way. We initially had some issues and problems with with (4) defective 3D-Printing pens of the 2.0 version. We overcame that obstacle with support from the career center, Robin Hammound, who was able to fund some more 3D-printing pens to keep the 3D-pen session week going. The results of the six sessions can be seen here below.

![Figure 12](image.png)

Figure 12. Survey results showing before and after the program if the students now thought math is more fun.

Despite the level of difficulty of engineering, a mathematical approach was taken to battle this and can be demonstrated through the results obtained before and after our engineering outreach program. The results revealed that students using a hands-on approach approach when learning mathematical concepts increased students confidence in mathematics. From Figure 12, a 20% increase thought engineering is fun and a 30% increase in the students’ perception and motivation in becoming engineers in the future for the Superior Jr./Sr. High School students. As shown in the plot, the answer in "what is the highest college degree they plan to earn", students would like to pursue as high as a PhD degree. This is something that none of the students even had in mind prior to our engineering outreach program. Students received a end of the session
presentation to motivate the students to pursue higher education by Dr. Rodriguez, an electrical engineering professor. In addition, after the program, the results showed that the students choose an engineering major based on the discussions we have had during the six week engineering outreach program.

![Survey results showing before and after of what kind of engineer the high school students wanted to become.](image1)

**Figure 13.** Survey results showing before and after of what kind of engineer the high school students wanted to become.

From Figure 13, After the program, results showed 85% increase in knowing what type of engineer the middle and high school students would want to become in the future. Prior to the program, students were not sure and didn't know what types of engineering were available. Based on the results collected, the majority of the students after the program wanted to become mechanical engineers. This was due to the majority of engineers from the ten different organizations / companies involved talked about what they do at their company and how they love their engineering jobs. Not only could the students choose a major, but the Superior Jr. Sr. High School students changed their opinion on "how fun engineering is", based on working a real hands-on approach to learning mathematical concepts.

![Survey results showing before and after of the highest college degree the students plan to earn.](image2)

**Figure 14.** Survey results showing before and after of the highest college degree the students plan to earn.
Figure 15. Athletes of the week news showing one of the high school participants wanting to pursue mechanical engineering based on this engineering outreach program.

As can be seen from above from Figure 15, after the program one of the students, Marlee Esatico made newspaper headlines where she would like to major in mechanical engineering based on our engineering outreach program. This shows the effort and motivation we put into the program motivates and sparkles interest for the students to pursue engineering. Our goal was met positively, it change the perception on how middle and high school students perceive engineering through a hands-on approach to learning mathematical concepts. In particular, they benefited by learning from professional engineers working in their field and engineering students who are currently pursuing their bachelors, masters and PhD degrees in various fields such as mechanical and electrical engineering. This unique group were multidisciplinary background so that the students could learn what different types of engineers do and they could understand how they could one day become like them. The use of flapping mechanical birds and robotic cars in an engineering outreach program for six weeks overall showed that the students benefited.

**IX. CONCLUSION AND FUTURE WORK**

At the end of our engineering outreach program we concluded the following: 1) 100% of the students were female; 2) 66.7% of the students were Hispanic / Latino; 3) 50% of the students said they DO NOT want to be engineers; (This shows that engineering could be seen as a field mostly for men); 4) However, 54.5% said yes, engineering is fun!; 5) 41.7% said science is kind of fun; 6) 58.3% of the students said they CAN NOT name different
types of engineers; 7) 41.7% of our students said they would like to pursue a masters degree; 8) 63% of the students said they do NOT know if there is a difference between math and engineering.

In the middle of the program we concluded the following: 1) 33.3% wanted to become Electrical Engineers; 2) 33.3% wanted to become Aerospace Engineers; 3) 16.7% wanted to become Biomedical Engineers; 4) 16.7% said they do not know if they want to become an engineer; 33.3% of the students said they DO NOT want to be engineers. Some of the responses that students gave on why they do or do not want to become engineers were: 1) “I dont know if i want to be an engineer because i dont know a lot about what they do”; “I wanna be an engineer because it makes good money and my step dad works at SRP and knows a lot about engineering.”; “I learn a lot from him too.”; “I want to be in the medical fields of engineering.”; “I want to because i would really like to make good money and have a good life.”; “I don't know if i do or don't.”; “No because i want to be a softball player.”

In the near future, we plan to have the middle/ high school students work with real 3D-printers and Solid Works engineering software so that they can design mechanical pieces from scratch. We plan to host the next engineering outreach events in the Spring semester. We plan to host from January 9th to Feb 13th. Those 6 six consecutive Saturdays. Future work for this project would be to do a 3D-drawn structure for the entire mechanical flapping bird with the high school students. After testing only one of the birds with some parts being 3D-drawn we led to the conclusion that the plastic is actually strong enough for the entire bird to be 3D-drawn. The high school students were able to only 3D-draw the frame of the wings and tail of the mechanical flapping bird. In Figure 5 below, Victoria Serrano, PhD student in Electrical Engineering was able to 3D-draw almost the entire vehicle out of ABS plastic. However, future work on this would require some templates for the high school students to 3D-draw the different parts of the mechanical flapping bird.

Figure 16. Victoria Serrano, PhD student in Electrical Engineering 3D-drawing parts of the mechanical flapping bird out of ABS plastic.
Acknowledgments
This work was supported by the NASA Space Grant program, under Grant No. NNH15ZHA003N. The IRB number approval for this study was STUDY00003055. We greatly thank Valerie Garcia, Arlynn Godinez, Dr. Rodriguez and Dr. Tskalis for supporting this program. Bussing the students to Arizona State University was instrumental to run the program. We appreciate their interest in our work and their support.

Abstract

The University of Hawaii at West Oahu (UHWO) is a diverse and indigenous-serving institution that embraces Native Hawaiian values while simultaneously providing an accessible and affordable college experience and fostering excellence in teaching and learning. Blended learning is put forth as an empirically tested strategy to improve student learning, facilitate student access to a quality education, support indigenous culture and traditions, develop new opportunities, meet instructional and institutional goals, and find solutions for diminishing resources. Resilience is widely accepted as a desirable property of human and environmental systems which must cope with the impacts of rising sea levels. Building disaster resilient Pacific island communities requires managing the unexpected and cascading impacts of inundation and other coastal hazards that cross policy domains, geographic, political, and sectoral boundaries. In the relatively near term, the impacts of global sea level rise are expected to contribute to the increased frequency of extreme water levels at the shoreline of Pacific Island nations. We discuss how faculty members use the blended mode to enrich teaching and learning and how students draw on hybrid course offerings to graduate faster and improve learning. In this paper we highlight best instructional practices, key strategic issues, and new pedagogical approaches for the blended approach. We also highlight challenges with declining resources, faculty development and assessment/evaluation revealed through our detailed experiences in teaching and learning practice and research.
1. Introduction

Resilience is widely accepted as a desirable property of human and environmental systems which must cope with the impacts of rising sea levels. Building disaster resilient Pacific island communities requires managing the unexpected and cascading impacts of inundation and other coastal hazards that cross policy domains, geographic, political, and sectoral boundaries. In the relatively near term, the impacts of global sea level rise are expected to contribute to the increased frequency of extreme water levels at the shoreline of Pacific Island nations. A resilient coastal community is able withstand external shocks associated with rising sea levels, persist, and rebuild itself when necessary, preferably in a stronger (UN/ISDR, 2002). The resilience concept is embraced by decision makers searching for increased flexibility, robustness, and adaptability in the face of rising sea levels: applications range from hydrologic and hydraulic engineering ("safe-fail systems") to resilient financial instruments (i.e. portfolio hedging). Hazards associated with sea-level rise combine with social vulnerabilities to create potential disasters, such as catastrophic inundation and erosion.

Resilient communities possess the ability to anticipate, self-organize, adapt, and continuously learn from rising sea levels in order to provide better protection against future coastal hazards. Improved resilience to climate variability and change, in turn, is acknowledged to promote sustainable societies and to reduce socio-economic vulnerabilities. In the context of sea level rise, the paradigm shift from crisis management to community based disaster resilience is shown in Table 1.
Table 1. The evolution of risk assessment and emergency management (modified from ISDR, 2002).

</table>
The emerging and holistic concept of community disaster resilience requires us to recognize that lives and property can be secured through sustainable local pre- and post-disaster planning in advance of an extreme sea-level event. For example, homes raised above the expected flood elevation (“homes on stilts”) are better designed than many non-elevated structures to cope with an inundation event. The remainder of the paper is organized as follows. Section 2 describes the risks associated with climate change and sea level rise to Pacific Islands. Next, research advances carried out by the Pacific Region Integrated Climatology Information Products (PRICIP) group is discussed (Section 3). The Coastal Services Center (CSC) is part of the National Oceanic and Atmospheric Administration's (NOAA) National Ocean Service. It supports the well being of coastal communities by working with private and public sector partners in order to link people, information, and technology in a holistic fashion that considers environmental, social, and economic issues (Section 4). Finally, conclusions are provided in Section 5.

2. The Gravity of Threats to Pacific Islands
Using mid-range scenarios, in which a rise in the sea level of 40 cm is envisaged by the 2080s, the number of people threatened worldwide from coastal flooding is projected to more than double to 200 million (Patz and Kovats, 2002). Table 2 illustrates the current global rate of mean sea level rise. The number of global “environmental refugees” is expected to reach 50 million by 2010, with small, low-lying island populations at the greatest risk (Potter, 2008): rising sea levels currently pose a threat to more than half a billion people that live within 5 meters above sea level around the world. (and the more than 100 million people worldwide live within one meter of mean sea level). Results shows that sea-level rise is an ongoing and accelerating process with a high likelihood of becoming a grave danger to coastal communities on Pacific islands. There have been several major coastal storms to affect Pacific islands in recent decades: Hurricane Iniki (central North Pacific) hit the island of Kauai in Hawaii in 1992, leading to $2.5 billion in physical damages. SuperTyphoon Pongsona (western North Pacific) struck on December 8, 2002 and caused $700 million in damages on the island of Guam. Other notable historical storm “event anatomies” in the Pacific Ocean region include Typhoon Chata’an (western North Pacific) and Cyclone Heta (central South Pacific). The strong winds, heavy rains, and high seas (storm surge, etc) that accompany these disasters pose a direct threat to the well-being of Pacific communities.

The citizens of some Pacific island states and deltaic coasts do not have the luxury of retreating inland from the coast, and may face involuntary relocation. For example, in the Pacific nation of Tuvalu, a ring of nine Polynesian islands, several thousand people have already left for other nations because of rising seas and displaced people from low-lying areas could provide the human reservoir for the spread of disease, including malaria (Potter, 2008). Accordingly businesses, non-governmental organizations and the public sector have an obligation to evaluate
the impacts of sea level rise on Pacific islanders and to propose innovative solutions to mitigate these effects. In the Pacific ocean, meltwater is expected to constitute a long term threat of sea-level rise (in the second half of the twenty-first century), with thermal expansion of the upper ocean posing the greatest immediate challenge. Table 3 shows the current trend of relative sea level rise at select Pacific Island locations. Observed rates of relative sea level rise for select US Flag and Affiliated Pacific Islands are shown (Figure 1).

Climate-related factors can exacerbate existing fragile situations beyond the tipping point for many Pacific Island governments, even those that appear stable. Accordingly, developed nations have begun to consider the best ways to assist low lying island states as the impacts of sea-level rise and climate change begins to take its toll on families, communities and nations of Pacific islands. For example, in 2008, Australia focused on the humanitarian impacts of climate change in the Asia Pacific region, by hosting a conference entitled “The People’s Assembly: Sustainable Solutions for Victims of Sea Level Rise”, held at the Queensland State Library in late August. In this assembly event, a panel of scientific, business, academic, humanitarian and
environmental leaders debated outlined practical adaptive strategies that Australia could implement to assist nations throughout the Asia Pacific region that were impacted by rising sea levels. Recommended solutions include improved training in meteorology (and related sciences) and the development of advanced early warning systems to predict extreme events in order to increase the adaptive potential of affected communities. The international aid agency Oxfam released a blueprint (Oxfam 2008) for Australia’s new engagement with Pacific nations, which recommended reducing greenhouse gas emissions by at least 95 per cent by 2050; developing renewable energy alternatives; providing financial support funding to help Pacific nations adapt to rising sea levels; and assisting communities displaced by the results of climate change (including governance arrangements and preparations for forced immigration).

3. Pacific Region Integrated Climatology Information Products (PRICIP) project

The Pacific Region Integrated Climatology Information Products (PRICIP) project seeks to enhance the resilience of communities in the Pacific region to coastal storms. The PRICIP seeks to provide decision-makers in coastal areas with timely, relevant, and accurate information about the causes and consequences of “storminess” in the Pacific and to improve our understanding of storm phenomena including strong winds, heavy rains and high seas that pose a grave danger to people and infrastructure (see bottom of Figure 2). At the top of the PRICIP conceptual framework (Figure 2) it is shown that users have access to a variety of tailored storm information products (forecasts, etc) that will help to build community resilience. The use of their climatological decision support systems and integrated information products can help coastal communities in the Pacific region to undertake disaster planning and respond appropriately to inundation hazards.

PRICIP’s suite of integrated information products can be used by flood mitigation planners, government officials, non-profit organizations, and community leaders in order to improve the management of coastal inundation hazards and to better understand patterns and trends of storm frequency and intensity within the Pacific region. This includes spatio-temporal information about coastal inundation and erosion risks (at time scales ranging from hours to years) as well as the longer-term climatological perspective.
Figure 2. PRICIP Conceptual Framework (PRICIP, 2008)
A suite of strong winds, heavy rains, and high seas derived data and information is served via the PRICIP Portal, the gateway by which coastal storm products developed through the PRICIP project, as well as those that originate from other sources, can be viewed and retrieved. For example, the University of Hawaii Sea Level Consortium, UHSLC, (http://uhslc.soest.hawaii.edu/) has developed products for PRICIP which examine extreme event climatology at Honolulu by deconstructing the tide gauge record into seasonal, tidal, and high frequency water level components. Sources of information include NOAA’s Integrated Surface Hourly (ISH) mean sea level pressure and wind speed data; the Global Historical Climate Network (GHCN) precipitation dataset; the National Water Level Observing Network (NWLon) tide gauge records; the National Data Buoy Center (NDBC) wave buoy records; the U.S. Army Corps of Engineers’ Coastal Data Information (CDIP) buoy data, and other data. This information will be targeted to decision-makers in key sectors including emergency management, health care, water and natural resource management, energy and commerce, transportation and communication, and recreation and tourism. A summary of sector-specific impacts associated with specific extreme events is provided, as well as its historic context climatologically.

The intent is to convey the impacts associated with extreme events and to familiarize users with in-situ and remotely sensed products that are commonly used to track and forecast weather and climate. To carry out this work, theme-specific data integration and product development teams have been established. These teams are comprised of climate and storm experts from NOAA’s National Climatic Data Center (NCDC), Center for Operational Products and Services (CO-OPS), Coastal Services Center (CSC), National Weather Service (NWS), and the National Marine Fisheries Service (NMFS), as well as the University of Hawai‘i, University
of Alaska, University of Guam, Oregon State University, and the Scripps Institution of
Oceanography. Work includes delineating event return recurrence intervals via Generalized
Extreme Value (GEV) analyses and correlating event characteristics with regional climatological
indices (e.g., ENSO and PDO).

4. NOAA Coastal Services Center

The Coastal Services Center (CSC) is part of the National Oceanic and Atmospheric
Administration's (NOAA) National Ocean Service. The CSC is a partner in over 100 ongoing
projects geared to resolve site specific coastal issues. The RVAT (Risk and Vulnerability
Assessment Tool) was produced by the CSC. It uses 3-D storm surge visualization to help
decision makers identify people, property, and resources that are at risk of injury, damage, or
loss from the potential impacts of storm surge and other hazards. Based on the RVAT Hazards
Locator Tool, the Tutuila Hazard Assessment Tool (T-HAT, 2008) was developed by the NOAA
Coastal Services Center (CSC) with the assistance of the NOAA Pacific Services Center (PSC)
and the American Samoa Coastal Management Program, which is part of the American Samoa
Department of Commerce, and the National Oceanic. Using Internet Explorer, this ArcIMS-
based tool can be viewed at www.csc.noaa.gov/t_hat/.

In 2004, a near miss by Hurricane Heta caused strong winds and heavy rains on the island of
Tutuila, the largest and most populated of the seven South Pacific islands that make up the U.S.
territory of American Samoa (Figure 3). More than 3,000 families were displaced from their
homes and the island had no electricity or water. In addition to hurricanes, Tutuila, is vulnerable
to tsunamis, flooding, landslides, and earthquakes. T-HAT capitalizes on GIS hazard data used in American Samoa's recently completed Hazard Mitigation Plan, which the Disaster Mitigation Act of 2000 requires states and territories to complete to receive Federal Emergency Management Agency (FEMA) funding for hazards mitigation.

The Coastal Zone Management Agency in American Samoa uses T-HAT to assist with permitting requirements and to increase the technical capabilities of their staff and the general public. The tool is now used daily by administrative assistants to inform the public about natural hazard risks when they apply to the American Samoa Coastal Management Program for building and development permits. T-HAT provides an easy to use Web-based GIS tool that allows the
coastal program staff and permit applicants to rapidly and accurately identify potential hazard risks for any location on Tutuila.

T-HAT is extremely valuable for visualizing the range of hazards that a project might face. For example, Figure 4 identifies high, medium, and low flood risk zones in the Nu’uuli/Ituau village in Tutuila while Figure 5 displays tsunami risk.
Figure 4. Flood risk in Tutuila, American Samoa.
Figure 5. Tsunami Risk along the coast of Tutuila, American Samoa
5. Conclusions

Global average temperatures increased by 1.3°F (plus or minus 0.3°F) over the twentieth century and atmospheric carbon dioxide levels are now higher than at any time in the past half a million years. The impacts of sea-level rise are on the rise worldwide, including statistically-probable but unanticipated catastrophes as well as moderate-scale repetitive events. In 2007, a total of 960 disasters caused about 82 billion dollars in damage, affecting at least a quarter billion people, disproportionately affecting vulnerable communities in developing nations (Munich Re, 2008). Natural disasters alone killed over 150,000 people in the first half of 2008, more than in all of 2004 when the Boxing Day Tsunami struck coastlines of Indian Ocean nations.

The resilient worldview can help Pacific Island communities to overcome pathological behavior including institutional rigidity, social dependencies, political hegemony, and ecological degradation. The need to strengthen interdisciplinary linkages among the fields of disaster resilience, inundation modeling, sustainable community planning, and all-hazards coastal mitigation is emphasized. The lessons learned in the Pacific region will be valuable for low-lying island states around the world. For example, in November 2008, the president of the Maldives, an archipelago of almost 1,200 coral islands located south-southwest of India, indicated his desire to relocate the entire country. Future work should emphasize the development of dynamically driven storm surge model, using a community-modeling approach for the next generation of storm surge modeling and forecasting.

Abstract

An online course management system (asynchronous learning network) has been developed in WordPress to transform teaching and learning in Public Administration and Social Divisions at UHWO. The online learning resources used to support our novel asynchronous learning network include social media (twitter, facebook, etc), email, electronic mailing lists, threaded conferencing systems, online discussion boards, wikis, and blogs. This asynchronous communication is supplemented traditional synchronous components such as videoconferences involving disaster management role playing, exercises and training (including Community Emergency Response Team training) as well as text and voice chat. This research uses the aforementioned tools determine ethical considerations in online teaching and learning. Asia’s worst flooding of 1998 occurred in China and is used as a case study. Ethical decisions are key to shaping the disaster studies field and they must be included in the online classroom: It is important that values and ethical considerations are made explicit during the disaster planning process so that under conditions of pressure of urgency and criticality they can be made consistent with the ethical judgments that underlies the emergency management decision process. It is concluded that in the community disaster planning phase, there will be innumerable issues, each with its own ethical components.
Introduction

Ethical decisions are key to shaping the disaster studies field and they must be included in the online classroom: It is important that values and ethical considerations are made explicit during the disaster planning process so that under conditions of pressure of urgency and criticality they can be made consistent with the ethical judgments that underlies the emergency management decision process. In the community disaster planning phase, there will be innumerable issues, each with its own ethical components. What humans and assets do we protect, and to what level of safety? How do we set disaster budgets and priorities? Answers explored during disaster preparedness activities should be based on key values and ethical analysis that can provide guidance during implementation Other issues include:

- How do we ensure that priority-setting judgments are not purely technical matters.
- How do we ensure the goals of transparency and accountability
- Who should receive the most resources
- Who do we rescue first?
- How do deal with families that refuse to follow mandatory evacuation orders?
- When do we stop expending resources to critically ill victims that are unlikely to survive?
- When do we phase out rescue efforts and shift to recovery mode?

The way these questions are answered reflects the ethical perspectives and moral analysis strategies of the planning group(s).

In this paper we consider the role of ethical decisions in flood management. Flood events often constitute a catastrophic disaster threat: they have an enormous impact on human well-being, jeopardizing important social development goals such as addressing poverty, ensuring adequate
food, water, and sanitation, and protecting the environment. Direct losses from floods include
drownings and injuries as well as damage to infrastructure and property, agricultural production,
and sites of historical and cultural value. Indirect health problems often arise, such as water-
borne infections, exposure to chemical pollutants released into flood waters, and vector-borne
diseases.

2. Case Study A: 1998 Yangtze River Flood

At 6,300 km (3,900 miles) the Yangtze is Asia’s longest river, the world’s third longest and the
most important waterway linking China’s leading commercial hub, Shanghai, to the less
industrialized regions of the Yangtze river basin: The fertile Yangtze River basin supports 40%
of China’s GDP (including 40% of the nation’s agricultural and industrial output) and is home to
one third of its people. The Yangtze river basin is also a vital source of natural resources,
accounting for 40% of China's freshwater resources, more than 70% of the country’s rice and
fishery production and half of its grain. The 1997–1998 El Nino and 1998 Asian summer
monsoon was one of the strongest on record, and monsoon rains continued unabated for much of
the summer. The central and southern parts of the country along the Yangtze river and its
tributaries were severely impacted by more than 60 days of heavy flooding in the Yangtze River
Valley. The Yangtze flooding constituted the world’s single most devastating natural disaster in
1998 and China’s worst flooding in over 40 years: approximately 200 million people were
affected over 50 million acres as 670 mm of precipitation occurred in the Yangtze river valley
from June to August, 1998 (Wu et al. 2003). In July and August 1998, extensive flooding also
occurred in northeast China, in the Songhuanjiang, Nenjiang and other rivers. The 1998 Yangtze
floods affected more than 180 million people, killing approximately 4,000, damaging more than
10 million homes and forcing 14 million people to relocate. Direct economic losses were put at 31 billion US dollars.

Four factors which significantly worsened the impact of heavy rain during the 1998 flood were:

• Deforestation and overgrazing, sharply reducing the capacity of forests and grasslands to retain water; Forest cover in Sichuan province fell from 20% of the land area in the 1950s to 9% by the late 1970s (Kirby, 2001)

• Loss of lakes and wetlands, cutting the capacity of the river's middle and lower reaches to store water. The surface area of the lakes along the Yangtze shrunk from 17,198 sq km in 1949 to only 6,605 sq km in 1980. In the early 1950s, the Yangtze basin had contained 4,033 large and small lakes, of which about 1,100 were lost over the past half century.

• Rising erosion rates, causing rivers and wetlands to fill with silt. For example, one of the largest reservoirs in Guangxi province, Changgang, has lost half a million cubic metres of capacity annually as it silts up.

• Snowmelt and melting glaciers in the Qinghai-Tibetan plateau

Both the amount of precipitation over the Yangtze river catchment and the floodwater discharge from the upper basin of the Yangtze river did not exceed the historical extremes during the 1998 flooding, but water levels in the middle basin far exceeded the historical maximum. Historically, dikes have been built to control flooding along the Yangtze River, but the 1998 flood levels in the middle reaches of the Yangtze River forced Chinese officials to consider dramatic strategies to save large cities on the Yangtze River from inundation. During the summer of 1998, it was
feared that Yangtze River flooding would cause the dikes along the Yangtze to fail to some degree, particularly those already weakened due to erosion, aging, or neglected repairs.

To minimize the probability of a catastrophic dike failure in the densely populated city of Wuhan (central China's largest industrial center, with more than 7 million residents in China’s central Hubei province) and neighboring farmland, Chinese authorities deliberately destroyed dikes in Jianli County (Hubei province), about 90 miles upriver from Wuhan. This preventative action was successful in diverting floodwaters away from Wuhan, lowering the height of the Yangtze River at Wuhan. While this purposeful destruction of dikes at Jianli temporarily prevented Wuhan from being flooded, the social and economic impact on Jianli Country was immense: more than 500,000 people living adjacent to the Yangtze River were forced to evacuate (many on extremely short notice).

However, Chinese officials believed that saving Wuhan from inundation might also require opening floodgates and the deliberate destruction of dikes in the Jingjiang section of the Yangtze River which runs from Zhijiang (Hubei Province) to Chenglingji (Hunan Province). It is one of the most hazardous parts of the Yangtze River: the many bends in the river slow down the water and the riverbed is high due to the resulting sand and mud deposits. The higher water level in the Jingjiang leads to the ancient Chinese saying: “The danger of the Yangtze River lies in Jingjiang”.

The 180 km Jingjiang river embankment provides defense for the central Chinese city of Wuhan and the major Beijing-Guangzhou Railway transportation artery. It also protects the productive 30,000 km² Jianghan plain (an alluvial plain located in the middle and south of Hubei province
which borders the Dongtinghu Plain and has an area of more than 30 thousand square kilometers).

The Jingjiang flood plain lies in central Hubei province which is home to over 300,000 people. The Jingjiang flood diversion area had not been used since 1954, when floods killed more than 30,000 people. However, purposefully destroying dikes at Jingjiang would reduce the risk of dikes suddenly bursting at Shashi City. Accordingly, extensive preparations were put in place to dynamite the Jingjiang dikes and divert waters into the Jingjiang floodplain. This was expected to submerge more than 1,000 square kilometers (386 square miles) of land and 27,000–33,000 ha (68,000–82,000 acres) of farmland in the Jingjiang floodplain. Deliberately flooding towns and villages in the Jingjiang area required the approval of the State Council of the People's Republic of China (國務院), the chief administrative authority of the People's Republic of China. Since 1954 China’s State Council has been constitutionally identical to the Central People's Government (中央人民政府), particularly in relation to local governments. China’s state council is chaired by the Premier and includes the heads of each governmental department and agency. Currently, the council has 35 members: the premier, one executive vice premier, three vice premiers, five state councilors (of whom two are also ministers), and 25 additional ministers and chairs of major agencies.

In 1952 the Jingjiang Flood Diversion Project was undertaken in the northeastern part of the Gong’an County. Officials at the Jingjiang Flood Diversion Management Bureau were instructed to begin destroying dikes and opening floodgates when water levels on the Yangtze reached a record high of 45 m (149 feet) at the monitoring station in Shashi city, just north of the area that would be flooded. Fortunately, the water level at the Shashi monitoring station remained
approximately 6 cm (2 in.) below the 45-m level. However, as a precautionary measure 330,000 people were evacuated from the Jingjiang region.

August 6, 1998: Hubai Provincial Flood Control Headquarters advised that there were critical flood levels. More than 300,000 people in the flood diversion area were evacuated to make room for diverted floodwaters.

August 16, 1998: The water level in Shashi rose to 45.22 meters, which exceeded the 45.00 meter state stipulated flood diversion mark. However, in a bid to reduce losses, officials decided not to divert water.

August 20, 1998: The sixth Yangtze River crest threatened Wuhan and 2.3 million citizens and soldiers provided support for the Jingjiang River embankment.

However, in the summer of 1998 floods weakened the Jingjiang River embankment so 40,000 Chinese People’s Liberation Army soldiers and half a million local citizens helped to withstand the floodwaters.

**Case Study B: Deliberate Yellow River Flood Warfare**

The Imperial Japanese Army quickly obtained large swaths of Chinese territory at the onset of the Second Sino-Japanese War in 1937 and by June 1938, the Japanese had control of all of North China. On June 6, 1938 the Japanese imperial army captured Kaifeng, the capital of Henan, and threatened to take over Zhengzhou which would have directly endangered the major Chinese cities of Wuhan and Xi'an (as Zhengzhou stood at the junction of the critical Pinghan and Longhai Railways). To deter further Japanese advances into western and southern China, the
Chinese Nationalist leader General Chiang Kai-shek opened the dikes on the Yellow River near Zhengzhou on the advice of Chen Guofu, a prominent political ally in party affairs. Specifically, the dike was destroyed on June 5, 1938 and June 7, 1938 at Huayuankou, on the south bank of the Yellow River causing flooding in the Eastern states of Henan, Anhui, and Jiangsu.

The deliberate floods constitute what many consider to be the largest war induced environmental disaster in history (Dutch, 2009; Lary, 2004). This act of environmental warfare destroyed thousands of square kilometers of farmland and shifted the mouth of the Yellow River hundreds of miles south. It is estimated that the disaster affected approximately five million people. In particular, the flood inundated thousands of villages, thereby driving villagers from their homes and creating three million refugees. It is estimated that at least 400,000-500,000 died from the flooding with another half a million becoming homeless. Besides this large death toll, the ecological toll on agricultural and other ecological resources was severe: crops in the abandoned, flooded countryside were destroyed and irrigation channels were ruined. Moreover, even once the water eventually receded the soil was often uncultivable as much of the land was covered in silt. Both private property and public infrastructure were destroyed, leaving survivors destitute.

3. Logistic Regression

Discriminant function analysis (DFA) is typically employed in the presence of a categorical dependent variable if all of the predictors are continuous and nicely distributed about the mean. It is used primarily to predict group membership from a set of continuous predictors. Specifically, DFA assumes multivariate normality, i.e. the means of the various Dependent Variables (DVs) in
each cell and all linear combinations of the DVs are normally distributed. On the other hand, Logit analysis is usually employed if all of the predictors are categorical

Logistic regression is used to predict a categorical (usually dichotomous) variable from a set of predictor variables where the predictor variables are a mix of continuous and categorical variables and/or if they are not nicely distributed. The medical community often uses logistic regression for problems in which the dependent variable is whether or not a patient has a disease. For a logistic regression, the predicted dependent variable is a function of the probability that a particular individual will be in one of the categories (i.e. that an individual has a disease, given her set of scores on the predictor variables).

As an example of the use of logistic regression in disaster research consider the Yangtze River flood case study. Disaster management college students ($N = 630$) were asked to pretend that they were serving as a member of the State Council of the People's Republic of China hearing arguments for and against the destruction of dikes at Jianli and Jingjiang. The discussion included a description of the emergency management options in logical but emotional language. Various points of view were put forth and computer simulations were carried out to show the impact of the proposed evacuations and dam breaches on communities. Each participant read one of five different scenarios which described the goals and benefits of the proposed dam breaches. They were:

- **ECONOMIC** – protecting down-stream economic assets including the central Chinese city of Wuhan and the major Beijing-Guangzhou Railway transportation artery
- **ENVIRONMENTAL** – the need to protect the productive Jianghan plain
• SOCIAL – the challenges associated with evacuation and the threats to life safety associated with flooding.

• POLITICAL – understanding the decision making process in China’s state council and the Jingjiang Flood Diversion Management Bureau.

• MILITARY – camouflaged soldiers reinforced the earthen dikes along the banks of the Yangtze river in order to help back the swollen river. With waters on the Yangtze at their highest levels in 44 years, nearly 5 million people in five provinces were mobilized to help fortify the embankments.

After reading the background of the Yangtze River flooding and the other case materials, each student was asked whether or not to proceed with the study. Participating students were asked to fill out an Ethics Position Questionnaire (EPQ) (Forsyth, 1980) which assesses personal moral philosophy. The instrument contains two dimension: relativism and idealism. Scoring high on the relativism subscale of the EPQ is consistent with a personal and situational moral philosophy and a rejection of universal moral principles. Overall, high scorers on the idealism subscale of the EPQ espouse a concern for the welfare of others and believe that ethical behavior leads only to positive outcomes, never to bad or mixed consequences. (Forsyth, Nye, & Kelley, 1985).

The EPQ asks questions about acceptance of issues that vary in terms of relativism and idealism. The instrument contains 20 Likert-type items (each with a 9-point response scale from “completely disagree” to “completely agree”). The relativism scale includes items such as “Different types of moralities cannot be compared as to ‘rightness’” and “What is ethical varies from one situation to another.” The idealism scale, in contrast, measures one’s perspective on positive and negative consequences with such items as “A person should make certain that their
actions never intentionally harm another even to a small degree” and “If an action could harm an innocent other then it should not be done” (Forsyth, 1980). It is important to note that idealists (persons who score high on the idealism dimension) do not make ethical decisions by balancing good consequences against negative outcomes; rather, for an idealist, the existence of any negative outcomes may make a behavior unethical, even though there may be many positive consequences.

Figure 1. Four-fold classification of Personal Moralities based on Idealism and Relativism (Forsyth, 1980)

A four-fold classification based on Idealism and Relativism is shown in Figure 1. There are four quadrants that categorize various individuals on the basis of their personal moral philosophy and ethical choices: Situationalists, Absolutists, Exceptionalists and Subjectivists. Situationalists are highly relativistic and idealistic contextualists: they believe that individuals should seek to achieve the best outcomes possible, but that moral rules cannot be universally applied across all situations: adherents prescribe close examination of individual situation in reaching a contextually appropriate moral evaluation. Absolutists, like Situationists, are also idealistic; they
support decisions that yield positive, desirable consequences. However, Absolutists are not
relativistic; they believe that ethical absolutes must be included in any code of ethics.

Subjectivists and Exceptionalists are both low in terms of idealism. Subjectivists are pragmatic
relativists that reject universal moral rules (high relativism) and believe that following rules will
not necessarily lead to the best outcomes for all concerned (less idealistic about the possibility of
achieving humanitarian goals). Its adherents make subjective, individualistic moral judgments
rather than basing their ethical choices on more “objective” information, such as universal moral
absolutes or the extent to which a given action harms others. Finally, Exceptionists are principled
pragmatists who endorse moral rules as guides for behavior, but believe that following actions
that lead to some negative consequences shouldn’t necessarily be dismissed. Low in both
relativism and idealism they are willing to make exceptions to their moral principles. Human and
animal rights activists tend to be high in idealism and low in relativism. This study examines
whether gender, idealism and relativism are related towards attitudes in complex emergency
management decisions.

We begin with a simple bivariate logistic regression, using student’s decisions as the
dichotomous criterion variable and gender as a dichotomous predictor variable where we have
coded gender with 0=Female, 1=Male and decision with 0=stop the decision to breach the dam
and 1=continue with the decision to breach the dam. Our regression model involves predicting
the logit, i.e. the natural log of the odds of have made one or the other decision. That is:

\[
\ln(\text{odds}) = \ln\left( \frac{\hat{y}}{1 - \hat{y}} \right) = a + bX
\]
where \( \hat{y} \) is the predicted probability of the event which is coded with 1 (continue with the plans to destroy the dykes and open the floodgates) rather than 0 (not to proceed with dynamiting the dykes and opening the floodgates). \( 1 - \hat{y} \) is the predicted probability of the other decision and \( X \) is the predictor variable, gender. The intercept (constant term) is given by \( a \) and \( b \) is the slope from the logistic regression equation.

An iterative maximum likelihood procedure is used to construct a logistic regression model.

Starting with an arbitrary value of the regression coefficients an initial model for predicting the observed data is constructed. Errors in the aforementioned prediction are then evaluated and the regression coefficients are changed in order to make the likelihood of the observed data greater under the new model. The procedure is iterative since the procedure repeats until the differences between the latest model and the previous model are trivial (i.e. the model converges).

Observing the statistical output we observe that 630 cases are used in the analysis (Figure 1)

</tbody>
</table>

Table 1. Case Processing Summary

Block 0 output is for a model that includes only the intercept (constant term). Given the base rates of the two decision options 58.4% (i.e. 368/630) of students decided to stop the dam destruction implementation while 41.6% decided to allow it to continue (Table 2). Without any other information the best statistical inference is to predict, for every case, that the student will decide to stop the dam destruction. Using that strategy one would be correct 58.4% of the time.
Table 3 (variables in the equation) shows that the intercept only model is

\[
\text{ln(\text{odds})} = -0.340 \quad \text{which yields the predicted odds is } [\text{Exp}(B)]=0.711. \quad \text{That is, the predicted odds of deciding to continue with the dyke destruction is } 0.711. \quad \text{Since 262 of the students decided to continue the dyke destruction and 368 decided to stop the destruction, our observed odds are } 262/368 = 0.712
\]

Table 3. Variables in the Equation

Now look at Block 1 output where the gender variable is added as a predictor. The Omnibus Test of Model Coefficients (Table 4) illustrates a Chi-square of 48.198 on 1 df, significant beyond .001. This is a test of the null hypothesis that adding the gender variable to the model has significantly increased our ability to predict decisions made by the students. The -2 Log likelihood statistic (807.247) models how well the model predicts the decisions (the smaller the better) as shown in the model summary (Table 5). The Cox and Snell $R^2$ (0.074) is similar to the interpretation of $R^2$ in multiple regression, but does not reach a maximum value of 1, whereas the Nagelkerke $R^2$ can reach a maximum of 1.

Table 5. Model Summary

### 4. Conclusions

The Variables in the Equation output (Table 6) shows us that the regression equation is $\ln(\text{odds}) = -0.788 + 1.176 \text{Gender}$. We can now use this model to predict the odds that a subject of a given gender will decide to continue with the dyke destruction. When the student is a woman (gender = 0), then $\text{odds} = e^{-0.788+1.176(0)} = e^{-0.788} = 0.455$. That is, a female student is only 0.455 as likely to approve the dyke destruction as she is to stop the destruction. For male students (gender = 1) then $\text{odds} = e^{-0.788+1.176(1)} = e^{0.388} = 1.474$. That is, a male student is 1.474 times more likely to decide to continue the dyke destruction as she is to stop the destruction.

The odds are now converted to probabilities. For women students in the study

$$
\hat{y} = \frac{\text{odds}}{1 + \text{odds}} = \frac{0.455}{1 + 0.455} = 0.31
$$
That is the model predicts that 31% of women will decide to continue to destroy the dykes. For men

\[ \hat{y} = \frac{odds}{1 + odds} = \frac{1.474}{1 + 1.474} = 0.60 \]

That is our model predicts that 60% of men will decide to continue to destroy the dykes.

The variables in Equation output (Table 6) provides the odds ratio predicted by the model: Exp(B) provided in the right most column. The odds ratio is obtained by raising the base of the natural log to the \( b \)th power, where \( b \) is the slope from the logistic regression equation. In our model the result is \( e^{1.176} = 3.241 \) which means that the model predicts the odds of deciding to continue the dam destruction are 3.241 times higher for men than they are for women. For men, the odds are 1.474, and for women they are 0.455. The odds ratio is: \( 1.474/0.455 = 3.24 \)

a. Variable(s) entered on step 1: gender.

Table 6. Variables in the Equation

In order to classify subjects according to their decision we establish the following decision rule: If the probability of the event is greater than or equal to 0.5 (the SPSS threshold set by default), then it is predicted that the event will take place (in some cases we may wish to set the threshold higher or lower than 0.5). Using the 0.5 threshold we classify a student into the “Continue with Dam Destruction” category if the estimated probability is more than 0.5, which it is for every male student. A subject is classified into the “Stop the Dam Destruction” category if the estimated probability is less than 0.5 which it is for every female student.

The sensitivity of the prediction, i.e. the percentage of occurrences correctly predicted is now examined: \( P(\text{correct} | \text{event occurred}) \). For the “Continue with Dam Destruction” event the Classification Table (Table 7) shows us that this rule allows us to correctly classify 137/(125+137)=52.3% of the subjects where the predicted event was observed. For the
specificity of the prediction, i.e. the percentage of nonoccurrences correctly predicted we have: $P(\text{correct} | \text{event did not occur}) = 275/(275+93) = 74.7\%$. Hence this rule correctly classifies 74.7% of the subjects where the predicted event did not occur (i.e. “Stop Dam Destruction”). Overall the predictions were correct 412 (i.e. 275+137) out of 630 times for an overall success rate of 65.4%. Recall that the overall success rate was 58.4% for the model with the intercept only.

Title: Curriculum Detailing for Online Courses in Applied Education

Topic Area: Curriculum, Research and Development

Presentation format: Paper session

Description
The paper discusses issues in curriculum design and detailing for Applied Education courses which are taught mainly using online format. Applied education, targeted for adults, needs to prepare the graduates to apply the knowledge and skills directly into professional practice. The learning theories and their relevance for developing curriculums for applied education in the online delivery mode is discussed and a strategy for optimizing the content is presented.

Authors

Introduction
This paper discusses issues in design and detailing of curriculum for online teaching and learning of applied education courses. One of the key factors that make applied education programs different than other programs is that “graduates from applied education programs experience a more rapid integration into the labour market as compared to graduates from liberal arts education programs (Adamuti-Trache, Hawkey, & Schuetze, 2006).” The market focus or society readiness of the graduates of applied education has been a driving factor for students to join an applied education program.

In addition to job readiness, other main characteristics of applied education can be summarized as follows.

- The learners are adults
- The learners have a well-defined and preconceived idea about their landing career or career goal.
- The learners come with their own perception of the programs they are joining. The perception may sometimes be completely wrong or it may change with time as they spend more time in the programs and have more insights on the nature of the job.
- The job market is dynamic, interdependent and globalized and the learners need to be prepared for this.
- The learners need not only to equip themselves with the skills that they can apply immediately in solving practical problems in the society but they also need to learn the fundamental knowledge to adapt to the ever changing nature of the job market and the advancement of technology.

Although applied education’s focus is on imparting skills and knowledge that can be applied directly in the society, the depth and breadth of what needs to be taught to achieve the set of skills and knowledge is not a solved problem. The skill, knowledge and expertise relevant today can be obsolete tomorrow. Moreover, the real life problems are unique in nature and the set of skills and expertise required is not only to solve the existing and known problems but also to solve anticipated and unanticipated problems in the field of their expertise and beyond. Therefore, the learners need to acquire broader sets of skills, fundamental knowledge and knowledge in broad range of areas pertinent to the field so that they are competent in applying that knowledge to known, anticipated and unanticipated issues. Defining the depth and breadth of required skills and knowledge is one of the challenges for curriculum design and detailing. Although this is a generic issue for all types of education, this is a challenge for applied education where learners already have a perception of what their goal is and their motivation may decline to learn a content which has no direct connection with their perceived goal of the program.

Online learning of applied education
With the advancement of information and communication technology, there is proliferation of application of online resources in education and learning. Furthermore, many applied education courses
and programs are being offered completely online or with major learning components in online platform. As online education is gaining rapid popularity and more and more learners will be using online platform for learning, applied education also needs to adapt its content to fit in teaching and learning for the online mode. Defining and detailing the curriculum of applied education for online learning has further philosophical and practical issues.

The students in applied education are adults who come with a more or less defined career goal. If they find courses that they cannot establish a direct link with their career goal, they get less motivated to learn. This is a real challenge for online courses, as in online learning the onus is more on students and they require greater degree of self-regulation, as pointed by Kauffman (2015), for better performance. The students may be disengaged from learning if they don’t find relevancy of the content to their career goal.

In addition to the relevancy of the content, the learners also need to be able to process or realize the raw content presented in the form of data or information to a higher order of content in the form of knowledge or wisdom. Ackoff (1989) classified the content of human mind into five categories of Data, Information, Knowledge, Understanding and Wisdom which was presented as a pyramid by Bernsetin (2009). Data is raw symbol, information is meaningful data and knowledge is application of the information. In today’s world of rapidly advancing information and communication technology, there is no scarcity of data. Learners are overwhelmed with data and lack of a structured way to look into the data and extract meaningful information from that data can disengage the learners. A proper facilitation from the instructor in extracting relevant data, analyzing the data to skim meaningful information and laddering the information to arrive at relevant knowledge is required to engage the learners. As students have more onus of learning in online learning, a breakdown of role of learners, facilitators and strategies for interaction with the content are key for encouraging online learners for continuous engagement.

**Learning theories, applied education and online platform**

A theoretical framework for defining and detailing applied education curriculum for teaching and learning in online platform is discussed in this paper. There are many learning theories which have been grouped into three main categories: Behaviorist learning theory, Cognitivist learning theory and Constructivist learning theory (Harasim, 2015, p.9). Mackeracher (2004) points out that behaviorist theory permeates our lives as learners through instructional technology “encompassing the development of sound educational resources such as instructional manuals, self-instructed learning modules (as cited in Merriam and Bierema, 2013)” and so on. Merriam and Bierema (2013) also underscore the fact that “behaviorism is particularly evident in adult career and technical education, business and industry, and the military.”

Against this background, the paper discusses key implications of instructional design in particular, and behaviorist theory in general, in applied education. The paper further extends the context and concept to apply the theories for online learning and teaching of applied education.

Development of a Gaming Material and a Design Framework for Integrating Career Education into PBL in Mathematics

Kohei Numazaki

ABSTRACT

Several national and international surveys have showed that a very low percentage of Japanese high school students believe mathematics to be useful in daily life. One solution for this problem is to integrate mathematics education into career education but there are few attempts. Therefore, Numazaki and Matsuda (2015) developed a gaming material and a design framework for integrating entrepreneurship education as a part of career education into problem-based learning (PBL) in mathematics. However, results of a trial lesson using the developed material showed that few students acknowledged the importance of utilizing mathematical ways of viewing and thinking. Additionally, few recognized that topic of the gaming material was relevant to their own career planning. Therefore, in this study, we revised and expanded the previous framework, and developed a new gaming material based on the revised framework. Regarding the framework, we added and emphasized utilization of abstraction and symbolization, which offer more mathematical benefits than quantification and visualization. Moreover, we emphasized the association of mathematics education with career education focused on cultivating basic and general abilities required for career development. Regarding the gaming instructional material, we changed the topic from preparation of a business plan for opening a bakery to proposing a new ice cream product in a company in order to emphasize the importance of mathematics in broader business contexts. In addition, clear indications for prompting utilization of mathematical ways of viewing and thinking are in all the processes.

INTRODUCTION

A very low percentage of Japanese high school students think that mathematics is useful in daily life, and they do not want to work in areas that require learning outcomes of mathematics education (National Institute for Educational Policy Research 2007). PISA’s 2012 survey (OECD 2012) revealed that Japanese students’ motivation for mathematics learning was the lowest in the world. This issue was recognized and addressed as early as 2009, when the Japanese Nation Course of Studies (NCoS) was revised, and problem-based learning (PBL) was introduced into the Japanese curriculum, namely Mathematics 1 (a compulsory subject) and Mathematics A. However, it is doubtful that PBL in mathematics will play the expected role in the new curriculum. Matsuda and Matsuda (2011) pointed out that the problems in the NCoS guidebook and in the textbooks authorized by the Ministry of Education, Culture, Sports, Science and Technology (MEXT) were inadequate for cultivating students’ ability to apply learning outcomes to problem-solving in everyday life.

Therefore, Ito and Matsuda (2013, 2014) developed instructional materials for PBL in mathematics by introducing gaming methods into some topics related to daily life, and have verified the materials’ educational effects. However, Ito and Matsuda do not solve a problem of students do not want to work in areas that require learning outcomes of mathematics education. One solution for this problem is to associate mathematics education with career education.

In Japanese schools, career education has been conducted mainly during Time for Special Activities and Time for Integrated Study. The Central Council of Education (2011) stated that the purpose of career education is to prompt students to become socially and vocationally independent through cultivation of their basic, general abilities, including 1) Ability to establish relationship and community, 2) Ability to understand and manage oneself, 3) Problem-solving ability, and 4) Career-planning ability. These basic and general abilities should be cultivated in each subject area, paying attention to the connection between subject and career education.
However, as Shimomura (2008) stated, career education in Japan is not associated with subject areas; it is instead focused on providing knowledge about workplace experiences, and the four basic abilities listed above are not always consciously included.

Based on the above discussion, Numazaki and Matsuda (2015) proposed a topic cultivating entrepreneurship through mathematical PBL. They examined and proposed a design framework for gaming instructional materials, and developed a gaming material that provides learners with the mission to create a business plan. Their framework is based on Ito and Matsuda’s (2013) framework, and is designed to provide education on three elements: problem-solving scripts, ways of viewing and thinking, and domain-specific knowledge. Matsuda (2013) stated that these three elements correspond with Bruer’s (1993) statement that general strategies, meta-cognitive skills, and domain-specific knowledge are all elements of human intelligence and expert performance.

![Figure 1: Numazaki and Matsuda's (2015) framework for integrating entrepreneurship education into mathematics education.](image)

However, results of a trial lesson using the developed material showed that although students understood the usefulness of mathematics in society, few acknowledged the importance of utilizing mathematical ways of viewing and thinking. One reason for this is insufficient instruction in mathematical ways of viewing and thinking; another is insufficient incorporation of abstraction and symbolization, which offer more mathematical benefits, in contrast to quantification and visualization, which are easy but low-level mathematical methods.

Additionally, Numazaki and Matsuda (2015) selected entrepreneurship education as a part of career education; the topic of the instructional gaming material was creation of a business plan to rebuild a family business. However, few students recognized that this topic was relevant to their own career planning. For successful integration of mathematics and career education, the versatility and effectiveness of mathematics learning outcomes in other contexts must be emphasized. This necessitates a redesign of the gaming material based on the above points.
PURPOSE

In Japanese schools, career education has been conducted mainly during Time for Special Activities and Time for Integrated Study. In this study, we expanded Numazaki and Matsuda’s (2015) framework, emphasizing the association of mathematics education with career education, and improving issues found in the trial lesson. In addition, we developed a new gaming material based on the expanded framework.

ASSOCIATION OF BASIC AND GENERAL ABILITIES WITH MATHEMATICS EDUCATION

As mentioned previously, basic and general abilities comprise four elements: “ability to establish relationship and community,” “ability to understand and manage oneself,” “problem-solving ability,” and “career-planning ability.” The primary purpose of mathematics education, alternately, is acquisition and utilization of mathematical knowledge. Mathematical ways of viewing and thinking are also included, playing a role in connecting acquisition and utilization of knowledge. Therefore, we integrate career education into mathematics education to emphasize the association of basic and general abilities with mathematical knowledge, and with Matsuda’s (1993) mathematical ways of viewing and thinking.

Ability to establish relationship and community

The Central Council of Education (2011) states that “ability to establish relationship and community” is the ability to understand one’s own situation; to participate in society by playing a vital role in cooperation and collaboration with others; to proactively build the future society with understanding for the ideas and situations of various others; and to listen to others’ opinions and express one’s own ideas accurately. The council has additionally specified these related elements: “ability to understand another’s character, ability to encourage others, communication skills, teamwork, and leadership.”

We consider as the basis of these elements devices of communication that build consensus by gaining reliance and enhancing persuasiveness. Taibo (1998) defined communication as “success when speaker’s encoding and receiver’s decoding are matched.” Conversely, Hall’s (1980) communication model focuses more on the importance of decoding than of encoding. One additional study suggests that encoding experiences are useful in decoding messages from others (Manstead, Wagner, & MacDonald 1986); thus, experiences of the “encoding” variety are significant.

“Encoding” corresponds in part with “symbolization,” one of the mathematical ways of viewing and thinking. However, encoding in communication has a broader meaning than does symbolization. Matsuda (1993) explained that symbolization is conversion of expressions to language in the real world and to formulae in the mathematics world. However, encoding in communication includes many varieties of conversion among each expansion. Therefore, encoding in communication includes Matsuda’s (1993) described “symbolization, quantification, visualization, and realization,” as well as devices to heighten persuasiveness, such as promotion of understanding by decreasing ambiguity and enhancing redundancy.

Moreover, from the speaker’s viewpoint, structure of messages and concretion of abstract concepts are devices that promote the receiver’s understanding (Sawer 2006). Therefore, abstraction and concretion, along with deduction, induction, and analogy, are used to make structured messages more effective.

Based on the above points, we associate mathematical ways of viewing and thinking with the ability to establish relationship and community.

Ability to understand and manage oneself

The Central Council of Education (2011) states that “ability to understand and manage oneself” comprises the ability to understand one’s own future potential, based on consideration of the questions “What can I do?”, “What do I value?”, and “What do I wish to do?”; the ability to behave positively while maintaining a mutual relationship with society; and the ability to control one’s thoughts and emotions in order to learn willingly for future growth. The council has additionally listed the following related elements: understanding one’s own role, positive attitude when considering the future, maintaining self-motivation, maintaining patience, managing stress, and proactive attitude. Moreover, it states that this ability concerns acting with self-efficacy.

According to Bandura (1986), methods for enhancing self-efficacy include 1) performance accomplishments, 2) vicarious experiences, 3) verbal persuasion, and 4) emotional arousal. He states that “performance accomplishments” are particularly important. Therefore, cultivation of these abilities is an appropriate strategy for enhancing self-efficacy. MEXT (2011) selected PBL as an example to cultivate understanding and management of oneself in mathematics education; it allows students to realize “I can do it if I try.” However, much like the question of the chicken and the egg, it is difficult to tell whether students’
perception of self-efficacy influences their willingness to meet challenges with tenacity, or vice versa. We also consider the perspective gained by performing problem-solving activities useful in enhancing students’ self-efficacy. To this end, we believe that problem-solving scripts and mathematical ways of viewing and thinking should be taught; students should be prompted to utilize these skills and self-evaluate their own levels of mastery, and to recognize improvement in problem-solving results and processes. They will then be able to recognize enhancement in their own problem-solving ability.

However, “problem-solving ability” is considered in the next topic. Therefore, we consider the relationship between understanding oneself and mathematics in this section. Saito et al. (2007) divided the career planning process into three objectives: “to understand my real self,” “to explore my own future,” and “to choose my own career.” Here, the ability “to understand my real self” corresponds with the “ability to understand oneself,” and involves methods such as 1) self-reflection, 2) taking a psychological test, and 3) seeking others’ evaluations. Self-reflection requires cataloging experiences, thinking about them, and considering them in light of test results and others’ evaluations. To this end, individuals must be able to make an analogy of their own aptitude based on the results of others’ self-reflection, to deduce explanation of their own character from test results, and to induce their own character and aptitude from a combination of experiences, test results, and others’ evaluations. Therefore, the necessary mathematical perspectives of analogy, deduction, and induction are associated with the ability to understand and manage oneself.

Problem-solving ability

The Central Council of Education (2011) states that “problem-solving ability” means the ability to discover and analyze various problems at work, to make appropriate plans through this analysis, and to solve the problems. In addition, they have listed the following related elements: “understanding, choosing, and processing information; understanding the essence of things; pursuing the causes of phenomena; discovering problems; planning; attitude to deliver; and ability to evaluate and improve.”

MEXT (2009) stated that “mathematical activities” are important in mathematics education and explained typical mathematical activities: “To find a problem by oneself, to make a work plan for solving it, to analyze and process it, to reflect on the meanings of results, and to expand the results.” Ability to perform these tasks thus corresponds with problem-solving ability. In the latest NCoS, PBL was introduced into the mathematics curriculum in order to promote mathematical activities. Ito and Matsuda (2013, 2014) developed a framework for PBL in mathematics and confirmed its educational effects. This framework emphasized utilization of mathematical ways of viewing and thinking; our new framework also adopts this policy.

Career-planning ability

The Central Council of Education (2011) defines “career-planning ability” as the ability to collect, choose, and utilize information about various ways of living, and to make proactive decisions about one’s career by understanding the value of work, by defining the meaning of work in relation to one’s own positions and roles in life and society, and by properly making use of information about diversified lifestyles.

A traditional career theory, Super’s (1969) vocational development theory assumes that each occupation requires a characteristic pattern of abilities and personality traits. Similarly, Schein’s (1978) study of “career anchors” emphasized career matching. He stated that reflection on the questions “What is one good at?”, “What are one’s needs and motives?”, and “What are one’s values to govern one’s choices about work?” formulates the foundation for a career. However, our new gaming material concerns not self-understanding itself, but instead proficiency in methods of self-understanding, through analysis of the features of one’s company and products.

Various types of career-planning methods exist, one of which is scenario planning (Nishimura 2012). This method has been used by companies making business strategies, and focuses on maintenance of flexibility as the most important consideration. Because our focus is on cultivating basic and general abilities to prepare for a career in the long term, we take a position more like that of scenario planning (preparing for the future with flexibility) than that of Saito et al. (2007) (considering a career plan for the present).

Numazaki & Matsuda (2015) highlighted functional, probabilistic, and statistical ways of viewing and thinking as the mathematical tools necessary for maintaining flexibility in solutions. Moreover, in scenario planning, functions are used in forecasting, statistics is used in understanding scenarios, and probability is used in quantifying and evaluating scenarios. However, to truly understand scenarios, we must utilize not only statistical perspectives but also statistical knowledge, particularly “mean, validation, correlation and effect-cause,” as they correspond to the big ideas (Wiggins & McTighe 2006).
DEVELOPMENT OF A NEW FRAMEWORK FOR INTEGRATING CAREER EDUCATION INTO MATHEMATICS EDUCATION

Numazaki & Matsuda’s (2015) framework consists of three elements: problem-solving scripts, ways of viewing and thinking, and domain-specific knowledge. In this study, we revised that framework with a focus on ways of viewing and thinking (an attempt to solve the issues found in the trial lesson) and on domain-specific knowledge (an attempt to associate mathematics education with career education), as shown in the Figure 2. In the following sections, we explain in detail our revisions to the framework.

Figure 2: The developed framework for integrating mathematics, entrepreneurship, and career education

Ways of viewing and thinking

Based on the issues found in the previous study, we reconsidered the correspondence not only between abstraction and symbolization but also between the whole framework of mathematical ways of viewing and thinking. Based on the Matsuda’s (2012) framework, we defined the correspondence between problem-solving processes and mathematical ways of viewing and thinking as shown in Figure 3.
One purpose of the “goal-setting process” is to understand a problem. In the mathematical problem-solving process shown in Figure 3, it is essential to formalize a problem from the real world into the math world. However, to understand a problem in the real world, one must first consider how mathematical concepts can be used to formalize it. To this end, transformations such as quantification and realization are needed, along with ways of thinking such as specialization and generalization. In the “generate alternatives process,” formalization of the problem is performed via abstraction, and specialization allows the individual to handle the problem mathematically. At this point, a variety of formalization alternatives can exist. In addition, in order to solve these formulas by utilizing domain specific knowledge, variety of alternatives also exist. During the “rational judgment process,” formulas and solutions derived by the generate alternatives process are verified using analogy, induction, and deduction, along with visualization and quantification of solutions. No mathematical ways of viewing and thinking are applied during the “derivation of optimized solution process”; rather, to consider what is suitable, informatic and systematic ways of viewing and thinking are applied. During the “consensus building process,” through which solutions are explained comprehensibly, it is necessary to use transformation of expressions in the real world as devices for communication, as shown in Figure 3.

Domain-specific knowledge

Domain-specific knowledge can be classified as internal knowledge or external knowledge. Internal knowledge corresponds to “big ideas,” as defined in the theory of “Understanding by Design” (Wiggins and McTighe 2006). In our previous study, we considered a revised version of the rational judgment framework originally proposed by Tamada and Matsuda (2004) to be internal knowledge, and knowledge of marketing and pricing to be external knowledge. In the present study, we added the concepts of “mean, variance, correlation, and cause-effect,” major concepts in scenario planning, to the internal knowledge category.

DEVELOPMENT OF A NEW INSTRUCTIONAL GAMING MATERIAL

We developed a new instructional gaming material based on the new framework as described in the following paragraphs. Moreover, clear indications for mathematical ways of viewing and thinking in all processes were added to solve previous issues.

The topic of the new material was changed from preparation of a business plan for opening a bakery to proposing a new ice cream product in a company; this general context should emphasize the importance of mathematics in broader business contexts. We chose ice cream as a product because it will likely be familiar to upper secondary school students.

Goal-setting process

The players’ first task is to understand and analyze the conditions and goals of the problem. Their second task is to determine business plan policies as sub-goals and develop a work plan. Their objective is “to propose a new ice cream product in a confectionery company to solve the problem of stagnant sales.” Their goal is to develop a business plan to produce the new product; the condition given is that the loan must be repaid in three years. They are required to use quantification and realization to understand the problem.
When the players determine sub-goals, they must consider factors such as “decreasing cost,” “assessing risk,” and “maximizing benefit.” They are prompted to use generalization and specialization to consider various benefits by referring to Figure 4, which indicates transformations. When developing their work plans, they must consider the various ways they can utilize mathematics to solve the problem, and the merits of each method. Additionally, they are required to consider what information is needed to generate a business plan, as well as effective collection methods.

**Figure 4:** An example chart to help students formulate problems by transforming

**Generate alternatives process**

During this process, players first collect information according to the plan they generated during the goal-setting process. This information includes the domain-specific knowledge of 3Cs, STP, and 4Ps present in the previous gaming material, and the knowledge of mean, validation, correlation, and cause-effect added to the new gaming material. Players acquire this knowledge while collecting information about “the company, market research, product ideas for ice cream, suppliers, machinery, advertisement strategies, income, and expenditure plan.” The market research topic includes information about both macro environment and microenvironment. “Macro environment” refers to factors such as politics, economics, society, and technology; “microenvironment” refers to factors such as the condition of competitors, market trends concerning ice cream, and customer needs. When collecting information, players can utilize functional perspectives to forecast population and market trends, and statistical perspectives to consider correlation and cause-effect of differences among phenomena as a part of scenario planning. These methods are considered again during the review process even if unused during problem-solving, to emphasize the usefulness of mathematics. To pursue understanding of the players’ own hypothetical company, they are required to use three methods: self-analysis, financial analysis by ICT, and third-party evaluation. During this activity, they are prompted to utilize mathematical ways of viewing and thinking, including analogy, deduction, and induction. To develop an expenditure plan, players must formulate expenditure formats; they are also prompted to utilize abstraction, which was insufficiently covered in the previous study. For market research, players are prompted to estimate customer numbers using abstraction.

Second, players must create a business plan based on the data they collect by way of analogy, induction, and deduction. They are asked to consider main customers, product ideas, suppliers, machinery, points of sale, advertisement methods, regular prices, unit sales, and sales goals. If they did not collect enough information or did not understand the information accurately, product idea choices are limited and mathematical methods unavailable. Regular prices, unit sales, and sales goals are developed using a break-even point provided as an Excel sheet, based on functional ways of viewing and thinking.

**Figure 5:** An example to formulate sales estimation
Rational judgment process

During this process, players are required to revise their business plan to account for any problems that arise related to the three viewpoints in Figure 7 and risk assessment. Figure 7 shows a revised version of the rational judgment framework (Tamada & Matsuda 2004). First, players must ask themselves, “Does this product contain any artificial additives that are banned in foreign countries?” This requires them to consider whether there are any customer-related problems. Second, they must ask themselves, “Have I chosen any defective machines?” Third, they must ask, “Does this plan provoke other divisions’ antipathy?”

When analyzing risks, players consider some potential business scenarios and assess risks based on informatic perspectives and viewpoints. They are required to quantify probability and size of damages for each scenario. They are also required to visualize these probabilities and the size of damages. If size of damages is large, they must consider counterplans. Scenario planning is implemented in this material through all these activities. If players discover any issues during this process, they must return to the generate alternatives process to revise their business plan.

Derivation of optimized solution process

Players choose one alternative as their optimized plan after rounds of progress through the generate alternatives process and the rational judgment process. First, they must consider rights and responsibilities for decision by utilizing informatic and systematic ways of viewing and thinking. They subsequently choose their optimal business plan and specify the reasons for their choice based on benefits and conditions of the problem. At the same time, they must consider which benefits were important, including the benefits of using mathematical or other methods.

Consensus-building process

During this process, players explain their business plan to the decision maker, a manager of the ice cream division. Their explanation must use induction/deduction based on their collected data. Additionally, when explaining risks and counterplans, they must describe their collected data using symbolization. If their explanation meets with approval, they receive feedback from the game and move on to the review process. If not,
they return to the rational judgment process to revise their business plan again, with a time limit. If they are unable to gain approval within the time limit allowed, the system considers the mission failed, and the players move on to the review process.

**Review process**

All of the players’ choices are saved in a log. This provides them with the opportunity to reflect on their activities. The game can also return feedback information based on this log. After receiving feedback, players are prompted to acquire or confirm the necessary knowledge: problem-solving scripts, mathematical ways of viewing and thinking, and domain-specific knowledge such as “mean, validation, correlation, and cause-effect.” The relationship between these ways of viewing and thinking, domain-specific knowledge, and career education are indicated clearly.

**CONCLUSION AND FUTURE PERSPECTIVES**

We expanded a framework for designing instructional gaming materials integrating mathematics education and entrepreneurship/career education. Moreover, we developed new materials based on the expanded framework. We intend to conduct trial lessons using the new materials in the near future.

Introduction

Over the past three years, faculty in graduate education at Texas A&M University–Texarkana have completed the proposal process to apply for and receive the university’s first doctoral degree program. The degree, a Doctor of Education in Education Leadership, offers individuals in the region a practitioner-based, web-enhanced degree program designed for working professionals. Establishing a need for the degree program was a step in the process that required major planning, development and implementation. This paper provides an outline of the needs assessment process and suggests a multi-step approach to developing a successful needs assessment.

Background and Need

A&M-Texarkana has a presence in northeast Texas, southwest Arkansas, northwest Louisiana, and southeast Oklahoma. As a comprehensive university, A&M-Texarkana offers 17 undergraduate programs and 12 graduate programs. The region is largely rural, and the university attracts a large population of first generation college students. The enrollment at the university hovers around 1800 with a goal of becoming a regional institution that serves approximately 2500. Over the past five years, the university, previously an upper division and master’s degree granting institution, expanded downward to offer freshmen and sophomores and, simultaneously, entered into a cooperative doctoral program with sister institution, Texas A&M University-Commerce, with intentions of establishing a standalone doctorate as soon as feasibly possible.

The need for a doctoral degree in Education Leadership with a concentration in school administration has been well documented in this region of Texas for some time. Individuals wishing to pursue an advanced degree in this region have had to commute great distances and/or seek out online programs. A&M University-Texarkana faculty and administration, committed to providing this degree, realized that demonstrating that need through a strong needs assessment was a critical first step in insuring that an adequate student base existed.

Steps in Establishing a Needs Assessment

Before a proposal can be developed, approved, and implemented, a demonstrated need must exist. Since 2002, only one new degree program has been approved and established at the university. A careful review of the population that yielded a positive result would be critical to build on for the
standalone program. The suggestions below are meant to assist in the creation of future needs assessments and provide a roadmap for completing such a process.

**Understand what you want to know**

Every successful needs assessment is well defined. The first step is to identify exactly what answers are needed to address the proposal. Questions should be formulated in a manner that provides relevant data on the topic and can be extrapolated for later reporting. In this needs analysis, four major ideas drove the needs analysis:

- Is a doctoral program in Education Leadership (Education Administration) a desirable degree in this region?
- Is there enough interest in this degree in this region to create sustainability of the program?
- What are the career tracks for the persons who indicate interest in pursuing this degree?
- What program delivery format would be most desirable?

**Know your audience**

Successful needs assessments must have a defined target audience. This was possibly the easiest step in creating the needs assessment. Since the proposed degree was in education administration, we determined that the target audience should be mid-level administrators and aspiring administrators in our region’s public schools. With this information, we identified approximately 900 individuals that would receive the survey.

**Understand what others have done**

Understanding what is in the literature on the topic is very important, but always be sure to seek out advice from those in the region who have input (Hunt, 2005). In order to prepare the needs assessment survey and survey delivery format, a review of the literature was Step 1. An abundance of literature on needs assessments exists, and the literature includes plenty of texts to choose from on the subject. Additionally, faculty chose a couple of regional universities that have been successful in similar projects. By interviewing faculty at these institutions, survey questions were modified and refined. This step was
critical in not only understanding what others have done successfully but also helped to clarify what could prove to be unsuccessful.

**Allow ample time to develop the survey**

Fowler (1993) states that, "In surveys, answers are of interest not intrinsically but because of their relationship to something they are supposed to measure. Good questions are reliable (providing consistent measures in comparable situations) and valid (answers correspond to what they are intended to measure)." (p.69) Quantifying the time it will take for a strong survey to be developed is impossible, but it should be understood that much time and consideration is involved in this step. Allow for input from various stakeholders while questions are being formulated and tested. It is critical to make sure the survey questions harvest the data that will provide the support needed before the survey ever begins.

**Identify the survey tool**

Many online survey tools are on the market, so obtaining one that will accomplish the task of delivering questions and collecting data. The best approach is to select a tool that is familiar or is easy to learn. For this effort, Survey Monkey was the most expedient because of its ease of use and its affordability.

**Inform the audience what you need**

When recruiting participants for the survey, make sure the target audience understands why their responses are important to the proposal. Provide enough details to educate, but be careful not to be too verbose. Figure 1 shows the short but concise explanation that was provided to the participants.
**Personalize the requests**

Personalizing the survey request is one of the most important steps in creating a successful needs assessment. Data was assembled into a spreadsheet and included name, current title, school district and access code (along with several other columns) as column headers. Each person was issued a 6-digit access code that must be entered in order to complete the survey. The access code purpose was two-fold: it ensured that only individuals that had an access code could complete the survey and that each access code could only complete one survey. Figure 2 represents the required survey field for access code.

Figure 2: Access code display.
**Remind but be patient**

The needs assessment survey for the doctoral degree was available for completion for approximately 60 days. To urge participants to complete the survey, reminders should be sent out, biweekly, to persons that have not completed the survey. Throughout this time frame, it may be tempting to send email reminders more often but beware of exhausting the participants’ patience.

**Have an opt out**

If an email is perceived as spam, individuals want a way to remove themselves from an email list. If the email list serve is not sophisticated enough to include an opt-out link, take the extra time to remove each person on an individual basis as requested. Doing so will insure that individuals who do participate are doing so because they are interested in supporting the effort.

**Be available**

Participants in the needs assessment may or may not have questions or concerns about the survey, project, or their participation. Timely responses to emails and phone calls regarding the needs assessment are critical.

**Ask the participants if they would like to know more**

Creating a situation where survey participants can elect to provide their email addresses for future contact can prove beneficial in many ways. Having the individuals’ email addresses provide support in two areas: to enable future focus groups and to provide more information to interested individuals after the survey is completed and the data are analyzed. Figure 3 provides an example of how to request an email address for future contact purposes.

Figure 3: Email request situation.
Conclusions

Creating a needs assessment can be a daunting task. However, by completing a very systematic process and attending to details along the way, the process can be simplified and can provide effective results. The survey at A&M-Texarkana yielded amazing results because faculty employed a systematic approach. The survey was sent to 900 participants and approximately 650, or 72% responded. A needs assessment contains several considerations, and each step should be carefully considered. Understanding and implementing the above mentioned steps will help to create a strong and successful needs assessment.

5. **Abstract**

   Every cultural tradition of scientific knowledge and methods are different. In the Korean Peninsula, we have massive material we could infer the past scientific knowledge. The Korean recording history of natural phenomena began about a thousand years ago. We used a sourcebook published by Korea Meteorological Administration titled “Meteorological Records from Ancient Korea including Astronomical and Seismological Records from ≪SAMGUK SAGI (History of the Three Kingdoms)≫ & ≪SAMGUK YUSA (Memorabilia of the Three Kingdoms)≫”. The Samguk Sagi and the Samguk Yusa are the history books (reports) were written in 1145 and 1285, respectively. They contain history of politics, diplomacy, human life, and natural phenomena in ancient country of Korea. The sourcebook contains the natural phenomena recording only from two history books with additional descriptions. This contains 112 meteorological data (including drought, frost, hail, rain, snow, flood, thunder, wind, lightning, etc.), 66 astronomical data (including solar eclipse, comet, meteor, Venus, etc.), and 88 seismological data (including earthquake) from BC54 to AD927. It is sufficient for learning materials as science and history of science.

   We would like to propose a new approach that utilizes the traditional science materials in science education. We introduce a science activity using meteorological, astronomical, and geological data in ancient reports. Students do scientific research like a scientist as selecting, analyzing, interpreting data using the ancient data. This is accompanied by a variety of scientific research methods and inquiry process. Students' research subjects are ‘Is there any periodically features of solar eclipse’s cycle?’, ‘What’s the difference between ancient and today’s earthquake in seismic cycles, distribution and strength?’, ‘Is this true that a school of fish are recorded fell from the sky? Or false?’. Students developed scientific insight could select meaningful information for their scientific research, analyzed scientific data, and interpreted the result based on scientific thinking. Furthermore student understood the scientific result more narrative and contextual. In addition, students found that the ancient recording of natural phenomena are very scientific even if it is rather descriptive and qualitative than analytic and quantitative. It was proved that it is very useful heritage for generations as historical, cultural and scientific.

Abstract

Despite the challenges experienced in schools in South Africa regarding producing excellent academic performance, some schools have managed to produce excellent matriculation results. The aim of this article was to establish the lessons learnt from schools that excel despite odds. We interviewed current school principals, stakeholder leadership including three former school principals of the four schools. The results show the odds against which the four best performing schools in Vhembe excel academically. We established unique contributions that the teachers, school leadership, traditional leadership, parents and community leadership made to the academic excellence associated with the schools. We argue in agreement with considerable literature that the school culture of academic excellence is inherently significant and further indicate how the culture of academic excellence in those four schools was developed over the years.

Keywords: Excel despite odds, best performing schools, academic excellence.

Description: The purpose of this presentation is to present the impact of assessment development on teaching and learning in a K-12 setting. Today more school districts are beginning to develop their own assessments to measure student learning outcomes. This presentation describes the process of how a school district uses assessment development to create district-wide assessments and improve student learning.

**Abstract**

The purpose of this presentation is to present to an audience of K-12 educators the impact of assessment development on teaching and learning. Assessment development is a rigorous process that is often times left to the experts found in large testing companies. Today, however, more school districts are beginning to develop their own assessments to measure student learning outcomes. This presentation describes the process of how a school district uses assessment development to create district-wide assessments and improve student learning.

In response to the demands of creating valid and reliable assessments across multiple subject areas and grade levels, a 50 hour Assessment Development course was created. Informational flyers and Interest Forms were sent out throughout the district to solicit teacher participation in the assessment development process. As a result, there were 38 teachers from a variety of subject areas and grade levels who submitted Interest Forms.
School district personnel from the Department of Research, Evaluation, Assessment and Accountability created four assessment development modules in order to facilitate teachers through process. An overview of these four modules---Creating a Test Blueprint, Item Writing, Test Formatting, and Revisions/Edits will be discussed during the presentation. The presenters will also discuss how the team of teachers will reconvene in the fall to review item statistics after the administration of pre-assessments to students. Once the item statistics are reviewed, the assessments will undergo further revisions and edits prior to the administration of post-assessments during the spring.

The 50 hour assessment development course received rave reviews from teachers who participated. The majority of the feedback was for the course to be a requirement for all teachers within the district. As a result of this course, teachers not only created a valid and reliable assessment, but made the connection between teaching, learning, and assessment. The assessment development process can be a powerful tool used to improve teaching and learning throughout a school district.

The format of the presentation will include an overview of the process and a question and answer period. Individuals who attend this presentation will be able learn the steps in creating an assessment development course that can be reasonably implemented within their school district. Attendees will be able to ask specific questions to presenters on how to implement the assessment development process in their district, school, or classroom.
Is Task-Based Instruction Effective in Promoting English Language Learners’ Literacy Skills?

Introduction

There are many language teaching methods and approaches developed since the 1970. The revolution began from the traditional methods, such as Grammar Translation method and the Audiolingual method, to a communicative approach that focuses on learners’ communicative competence. With the linguistic demands placed on English Language Learners (ELLs) and that teachers are held accountable for students’ test scores, both general and English as a Second Language (ESL) teachers are now facing a great deal of instructional challenges. Many models, including the theme based model, the adjunct model (Snow, 2001), and the sheltered instruction model (Echevarria, Vogt, & Short, 2008) have been cultivated in light of facilitating ELLs to acquire both content and language, which is also known as content-based instruction (Briton, Snow, & Wesche, 1989). Research has shown that language learners benefit from content-based instruction because they not only need to acquire Basic Interpersonal Communication Skills (BICS) but also Cognitive Academic Language Proficiency (CALP), two terms coined by
Cummins (1981). There are numbers of ways for teaches to integrate content and language instruction (e.g., Celic, 2009; Huang, 2000; Mohan, 1986). Results of these studies show that CBI is effective in helping ELLs acquire both content and language.

Another method derived from the communicative approach is Task-based instruction (TBI) which has received a great deal of attention in the literature of second language acquisition (e.g., BavaHarji, Gheitanchian, & Letchumanan, 2014; Cao, 2012; Li, 2000; Mao, 2012; Miao, 2014; Thompson & Millington, 2012). The results suggest that TBI has a positive impact on learners’ acquisition of a target language. However, a great deal of studies seems to focus on how the method helps learners acquire English as a foreign language (EFL) and/or at a university setting. Limited studies have been conducted to look at how the method promotes younger ELLs’ second language acquisition; more importantly, how do ELLs acquire both content and language skills through task instruction. Thus, the purpose of the present study is to investigate what impact TBI has on developing secondary school ELLs’ language skills and content knowledge. In particular, taking a qualitative study approach, we examined how TBI facilitates these ELLs develop their literacy skills and knowledge. The following questions guided the present study:

1) Is task-based instruction effective in promoting ELLs literacy skills? If so,
2) In what ways does task-based instruction facilitate ELLs writing skills?

**Literature Review**

A body of research has indicated that integration of language and content facilitates learners’ academic and language development (Brinton, Snow, & Wesche, 1989; Marsh, Cenoz, & Hornberger, 2007; Mohan, 2001; Nordmeyer & Barduhn, 2010). In addition, with the
influence of communicative language teaching, applied linguists suggest teachers to use tasks to help students acquire a target language (Brandl, 2008). There are different ways to call this teaching method, namely, task-based instruction (TBI), task-based language teaching (TBLL), task-based language teaching and learning (TBTL), and task-based teaching (TBT). For the purpose of this paper, we will use the term TBI throughout. Advocates of TBI believe that the best way to learn a language is by means of exposure and negotiation of meaning during communicative tasks (Willis, 1996). Nunan (2004) states that TBI is language instruction which “involves learners in comprehending, manipulating, producing on interacting in the target language while their attention is focused on mobilizing their grammatical knowledge in order to express meaning, and in which the intention is to convey meaning rather than to manipulate form” (p. 4). In other words, TBI focuses on students using the target language to achieve an outcome through negotiation of meaning. A task can be categorized as the following types: information gap, problem solving, decision making, jig-saw, role play, stimulations, discussions, and projects all of which stress the importance of interaction and negotiation of meaning (Rubdy, 1998). Skehan (1998) also suggests that a task not only needs to be meaningful and has a purpose, but it also needs to relate to real world tasks.

Several TBI designs have been introduced. Ellis (2009) summarizes the designs and concludes that TBI consists of three stages: pre-task, during task, and post task. Another TBI framework that has received a great deal of attention in the literature is that of Willis (1996), which includes pre-task, task cycle, and language focus. The framework not only focuses on fluency but it also requires accuracy during a task. According to Willis, students receive an introduction of the topic and instruction of the task during the pre-task phase, which prepares them to perform the task. Then, they plan, conduct, and report the task during the task cycle; and
finally with the guidance of the teachers, students review and analyze particular language features and practice them during the language focus phase. As such, TBI offers a pedagogic paradigm in which students are given opportunities to work with the target language from the beginning of a task (Willis & Willis, 2001; 2007).

A body of research has been conducted to examine the effectiveness of using TBI to facilitate English instruction. Studies have looked at whether TBI benefits learners in acquisition of different language skills. For examples, scholars (e.g., Cao, 2012; Li, 2000; Marashi & Dadari, 2012; Miao, 2014; Zhang & Hung, 2013) investigate if TBI facilitates learners’ writing skills by looking at their scores on writing pretest and posttest. Other studies also explore if TBI promotes learners’ reading comprehension (e.g., Mao, 2012; Sidek, 2012), speaking skills (e.g., BavaHarji, Gheitanchian, & Letchumanan, 2014; Torky, 2006), and grammar use (e.g., Furuta, 2002; Thompson & Millington, 212). While all of the results of the studies suggest that learners benefit significantly from TBI, some scholars claim that TBI may not be useful. Ur (2013) argues that language instruction should not focus on one particular method. Rather, it is more effective if teachers design language lessons that are based on the needs of the students as well as the teachers’ experience. In the same token, Swan (2005) also points out that very little research has proven that TBI alone causes successful second language acquisition for students with various contextual factors, especially those in the beginning and intermediate levels who have inadequate exposure of English outside the classroom. Thus, “[t]he naturalistic communication-driven pedagogy characteristic of TBI has serious limitations, especially as regards the systematic teaching of new linguistic material” (p. 397).

Despite the debate of TBI addressed above, scholars continue to examine the effectiveness of the method in various contexts. However, a great deal of studies looks at the
results quantitatively; very few studies specifically examined how and in what ways TBI promotes students’ language learning. Also, the majority of the studies seem to focus on teaching and learning English as a foreign language (EFL) or studying the language in university settings; very few research studies have emphasized how TBI promotes literacy learning in the elementary or secondary level. Thus, the purpose of the study is to investigate how TBI facilitates literacy development of ELLs at the high school level. Specifically, this study takes a slant at how using a task can promote ELLs’ development of writing skills and literacy knowledge, character narration in particular.

Methods

This qualitative case study took place in an ESL course at a public high school in the Northeast region of the USA. The emphasis of the course was on grammar, reading, writing, listening, and speaking with variety content topics. In other words, the class focuses on integration of language and content instruction. For this study, we selected Willis’ (1996) TBI framework that consists of pre-task cycle, task cycle, and language focus. Before implementing the task, the students were asked to write a narrative of a character of their choice from the book *Run Away Home* (McKissack, 1997) that they had previously read. This piece of writing served as a pre-test for this study. Upon completion of the task, the students were asked to revise their writing based on what they had learned during the task and their revision served as a post-test. The pre and post-test writing samples produced by the participants were graded using a rubric which focused on character description, language use, and mechanics developed by the teacher. The participants’ essays were then analyzed to examine how TBI benefited the participants’ development of writing skills and literacy knowledge. The details of the task are described in the section below.
Participants

The ELLs at the school were divided into three levels based upon a proficiency test upon admission to the school or previous transcript grades if they had ever taken ESL. The three levels were either beginner, intermediate and advanced. The participants of this study were from the intermediate class. A total of four students were selected from the class because they were able to participate in the whole process. Of the four participants, there were one Spanish speaking student, two Arabic speaking students, and one Chinese speaking student. Two students were in 9th grade and two were in 11th grade. The length of time that the participants had stayed in the United States at the time of the study ranged from two to nine years.

Task Design

Data were the two essays that the students produced before and after the task. They served as pre and post-tests for the purpose of this study. During the pre-task cycle, the teacher explained to the students what a narrative was and showed them writing samples of narratives. The students were also introduced the task they were to perform during the task cycle. The task consisted of three steps. First, the students discussed the character they selected during the pre-task cycle with a peer and the teacher. Then, they were asked to conduct a self-critique on the character narrative that they produced during the pre-task cycle following the guidelines (Appendix 1) given by the teacher. The guidelines mainly focused on what the students thought of their own writing in general. After that, the students were to share their writing with a partner and provided feedback on each other’s writing based on the guidelines given (Appendix 2). This set of guidelines emphasized the students’ language on character description. The task was communicative in that it reflected on what the students would possibly encounter in real life. In
other words, the skills involved in the task were important parts “of readiness for college, careers, and life in the 21st century” (Achieve, 2015). During the language focus phase, the teacher selected a grammar feature that she deemed the students needed to pay additional attention to according to their performance in the pre-task and during task cycles. In this case, the present participle was selected. The teacher provided feedback on the grammar feature as a class. She also conducted one-on-one meetings in which the students were given examples of correct usage of the present participle as well as character development using the grammar feature. The students were then instructed to examine their writing, implement present participle phrases, and strengthen their character description in the second essay. Their writing samples were analyzed to examine how TBI facilitated their development of writing narratives. Findings are reported in the following section.

**Results**

Based on the analysis of the participants’ writing samples, four themes were generated. They are: character description, language use, use of present participle, and sentence structure. Findings were presented in a narrative format supported by the participants’ output from the writing samples.

**Finding 1: Character Description**

In regards to writing narratives, almost all of the participants wrote a summary of the chosen character or the story rather than writing a descriptive piece about their character in the pre-test. However, there was an increase in character description in all of the participants’ post-test. The major difference between the two essays in terms of character description was that characters in the pre-test were very one-dimensional and reactive, instead of having their own
thoughts or background story and being proactive which could be seen in the pro-test. The below experts from one of the participants illustrated such improvement:

Pre-test: “His grandfather, the chief of the tribe, could not help it. They took all the fresh guys, among them was Sky.”

Post-test: “His grandfather, the chief of the tribe, could not help. He was old and he felt scared inside, even when in that moment he looked so brave. They took all the young men, among them was Sky.”

In addition, the use of adjectives was improved overall. The number of adjectives used in the pre-test was limited. However, the participants made good use of adjectives in the post-test to describe their characters to make them more descriptive. For example,

Pre-test: “The students of hit say, “Mr. Ben we would remember it…”

Post-test: “The abused students replied, “Mr. Ben, we would remember it…”

Finding 2: Language Use

Verb choice appeared to be one of the major difficulties in the participants’ writing samples. There were problems in the use of consistent verb tenses and correct subject-verb agreement in all of the participants’ writing samples. Such a difficulty appeared frequently especially in the pre-test. Although the difficulty of using appropriate verb phrases diminished in the post-test, the problem still existed. For example, the sample below shows an inappropriate use of verb tense and subject-verb agreement. A participant wrote in her post-test,

“Before Sara were born, she has a child who was exposed to this sickness, so she knew this better than anything else.”
On the other hand, there was a slight improvement of using verb phrases in the post-test. For example,

*Pre-test:* “Every day Sky live in School dormitory, his mom and father both are farmer, was so poor.”

*Post-test:* “Every day, Sky lived in the School dormitory, his mom and dad were both farmers, and were so poor.”

Besides verb phrases, some participants’ vocabulary seemed to expand comparing to the pre-test. They attempted to use more advanced-level vocabulary to describe the character’s feelings as well as actions. The examples below from two of the participants show the improvement of vocabulary use to describe the sad feelings of the characters in the post-test.

*Pre-test:* “Papa explained to them the situation and they all were so sad.”

*Post-test:* “Papa explained to them the situation and they all were dejected.”

*Pre-test:* “Sky said “By” to the family and looked very sad to Sarah.

*Post-test:* “Sky said “Bye” to the family and looked very mournful toward Sarah.

**Finding 3: Use of Present Participle**

In the pre-test, the participants’ writing samples lacked sentence variety. Most of their sentences were simple in structure. After the task cycle, the participants not only attempted to use more adjectives in the sentences as previously mentioned in the finding section, but there was also a clear increase in the use of sentence variety in the majority of the participants’ post-test. In terms of using present participle phrases, only two participants attempted to use this
feature in their narrative writing during the pre-test. After the task cycle and language focus on the correct usage of present participle, despite the fact that not all of their attempts were correct, all of the participants increased their use of present participle in describing their characters in the post-test. One participant had one correct use of the feature out of four of his attempts, while another participant had only two attempts with one used correctly. The experts below illustrated the participants’ use of present participle phrases in their writing.

“Thinking so much about it, Sky became dizzy and lost his consciousness.”

“Sky remembered his little brother’s death, wishing he returns again.”

“Sky and his family quickly got ready with their pipes, sacs and everything, escaping from their land.”

**Finding 4: Sentence Structure**

All of the participants had difficulties producing correct sentence structure in their pre-test and pro-test. Such problems include the incorrect use of punctuations, pronounce, and double use of verb in a sentence. These occurred frequently in the pre-test. Although, the inappropriate use of sentence structure still existed in the post-test, there was an immense improvement in syntax. The experts below demonstrate this fact.

*Pre-test:* “When In 1887 Sky was forty year old, he with his family live in a country.”

*Pro-test:* “In 1887, Sky was fourteen years old, he lived with his family in the country.”

*Pre-test:* “Every day Sky’s family need to go to the fields to work very hard they make was not much money, but can allows them to eat three meals for a day.”
Post-test: “Daily, Sky’s family needed to go to the fields to work very hard as they did not make much money; but it allowed them to eat three meals a day.”

Overall, the majority of the students’ pre-tests were not advanced in their academic language and mechanics. There was also a lack of character description in all of the participants’ writing. In the post-tests, all of the participants’ writing was longer and there was more of an attempt of writing with an expanded vocabulary and with more complex sentences, especially present participle phrases. The majority of the participants’ post-test showed that they thought deeply about how to link character actions/motivations with their present participles.

Significance of the Study

Based on the findings of the study, it appeared that TBI is effective in promoting ELLs’ writing skills. Such a method facilitated the participants’ learning process in that it encouraged interaction among the students as well as between the students and the teacher. More importantly, the participants’ character descriptions and language use improved. Implementing TBI in writing instruction allowed the participants to think deeply about the characters by using more adjectives and present participle phrases rather than merely summarizing what they did in the story.

Previous research (e.g., Wong, Armento, & Staggard, 2015) reveals that ELLs need adequate guidance to distinguish the difference between summary and narrative writing. The findings of the study also showed that the participants lacked knowledge of such differences despite the fact that the teacher had discussed with the class the features of narratives and showed them examples during the pre-task cycle. This suggests that in order to make good use of the time spent in the pre-task cycle, more attention needs to be given when introducing narrative
writing to students by setting specific lesson objectives during the pre-task cycle so that teachers can assess students’ understanding of what a narrative is before proceeding to the task cycle. This way, students will have a clear expectation of the type of writing they will be producing before being introduced to the task they will be performing. As such, teachers can pay more attention to a selected language feature during language focus phase. Such findings also suggest that instructional assessment should not be ignored in each cycle within task-based instruction.

The lack of proficiency in the language withholds ELLs’ ability to use vocabulary or sentence variety to express their ideas in the writing process (Peregoy and Boyle, 2013). In the study, the researchers used TBI to help the participants acquire present participle phrases in hopes of increasing their sentence variety that assist them to express a main idea and its complementary idea, while painting a more vivid, in-depth character with regards to their thoughts and actions. The analysis of the post-test indicates that the participants constructed increasingly complex sentences that reflected their developing thoughts. Although all of the participants attempted to apply present participle in their post-test, only one student was able to apply all of the phrases correctly. What could have been done differently in this procedure was to have students create several instances of present participle phrases, and then have their peers check the phrases, and re-interpret them back to the creator. In this way, struggling students can consult with their peers to check the intended meaning and feel encouraged to provide more specificity in their narratives.

While composing narrative essays, asking students to flesh out characters or depict settings, ELLs may struggle to construct such full-bodied descriptions, or strain to convey the thoughts of their characters with intricacy. To achieve descriptions, the participants in this study often created sentences that contained many verbs, but often, of inconsistent tense; the result is
that their intended meaning is not communicated smoothly due to multiple verb disagreement. Therein existed a common problem – elongated sentences with the aim of expressing extended idea, but inhibited by too many verbs that did not connect their main and supporting ideas. In other words, they produced run-on sentences with incongruent verb issues. On the other hand, a few participants presented the opposite issue. They did not include enough details in their essays, but still used excess verb tenses.

Research suggests that form-focused instruction benefits ELLs’ academic writing skills (Carlo, August, McLaughlin, Snow, Dressler, Lipman, Lively, & White, 2004; Ferris, 1995; 2002; Genesee, Lindholm-Leary, Saunders, & Christian, 2006; Stuart, 1999, Wong et.al, 2015). In this study, the teacher provided one-on-one meetings with each participant in which she discussed character development as well as the use of present participle during the language focus phase. The participants’ improvement in the post-test could be highly related to the form-focus instruction and the discussion about the characters with the teacher. However, all the participants had difficulties using verb phrases correctly. Even though the language feature focused in this study was present participle, students need to be able to use basic grammar structures before moving onto complex sentences. Thus, going back to basic grammar instruction is necessary (Wong et. al., 2015).

Conclusion

In this study, we examined the effectiveness of TBI in facilitating ELLs’ literacy skills, particularly in narrative writing at the secondary level. Our findings indicated that TBI promote ELLs’ writing skills in that through performing the task, the participants’ character description and language use improved. The learning outcomes of SLA and literacy knowledge through TBI
are two folds: the participants not only gained knowledge in the use of present participles, vocabulary, the use of adjectives, albeit errors continuously existed, but their writing skills of character description also improved. As suggested in this study, TBI is beneficial in promoting ELLs’ literacy skills. However, it is important for teachers to have specific instructional goals during the pre-task cycle so as to make sure students have a solid understanding of the task and background knowledge needed for them to perform the task. In addition, it is necessary for teachers to assess students’ ability to use previously learned grammar before introducing new and advanced grammar features. All in all, acquiring literacy skills means that students need to have knowledge on various ingredients. The results of the study imply that task-based instruction is effective in facilitating ELLs’ literacy skills, but it requires teachers’ careful planning and more than one task maybe necessary in order to see significant progress.

ENTREPRENEURIAL LEARNING: EXPLORATION INTO EDUCATIONAL STRATEGIES FOR OWNER MANAGED SMALL FIRMS

Proposal submission for the 14th Annual Hawaii International Conference on Education

Abstract:
Research studies are now available which focus on organizational learning strategies for large corporate entities in the private sector. The concept of learning and organizational structures has been an evolving process since its inception by Chris Argyris. Drawn from Kurt Lewin’s System Theory and organizational development research in the 1940s, organizational learning provides a framework for learning to become a continuous, iterative process (Morgan, 1997). Organizational learning in small business enterprises (SBE) is discussed in the literature as an underserved area of training and development. Additional research is needed to further understand and explore how to policy makers, private businesses, educators, and other institutions can effectively support current SBE, and provide theoretical and practical data for entrepreneurial education programs (Gibb, 2009; Rae and Carwell, 2005, Cope, 2005).

The panel presentation will align itself with literature that examines entrepreneurial and small business internal and external processes and strategies that promote or inhibit personal and organizational learning (Kempster and Cope, 2010; McKay, 2001). Specifically, this session examine some of the work of prominent researcher who has contributed significantly to the awareness, practice and education of small business owners globally. Additionally, we will explore entrepreneurial learning strategies in the context of social constructivism and action learning in small businesses.
Both entrepreneurship and learning is inherently constructivist, behavioral and social processes. The term entrepreneurial learning therefore means learning to recognize and act on opportunities, and interacting socially to initiate, organize and manage ventures. Based upon the review of the literature, our panel will discuss four (4) areas of learning in the full lifecycle of successful entrepreneurs in an effort to generate ideas and feedback to broaden the perspective on learning in owner managed small business.

New Venture Creation  
Succession Planning |

The US Census recorded over seven million businesses with less than 250 staff paid over 3.3 million in payroll expenditures in 2012. These U.S. small businesses employed about half or
56.1 million of the nation’s private workforce in 2012 (SBA, 2014). Understanding the significant impact small business has on the US economy, there is limited in-depth analysis of how entrepreneurs learn to become leaders of their enterprise. And what external learning strategies owner managed small firms (OMSF) use to develop personally, and the impact leadership development has on the organization (Kempster and Cope, 2010). The session will summarize entrepreneurial learning and learning strategies used by small business owners for sustainability and growth to better understand learning opportunities that address not only the objective or “what” of training, but the “how” and “why” in the processes of learning.

Proposal of my paper
This research is to look into various women’s shirts collar drafting methods and to recognize the difference by comparing shape of collars of clothes made in real and 3D simulated images. It intends to offer basic materials for pattern draft of shirts collars by making it possible to predict real collar shapes with 3D simulated images based on those data.
Comparison of shirts collar shape and images between real and 3D simulation

SuJoung, Cha
Major of Fashion, Department of Beauty Design, Woosong University

1. Introduction

Recently, the application of 3D clothing CAD program is increased to save time and cost of various design development for being set up to customer’s eye level. So, it is very meaningful to find out differences between real and 3D simulation clothes.

Thus, this study is to look into various women’s shirts collar drafting methods and to recognize the difference by comparing shape of collars of clothes made in real and 3D simulated images. With that, it intends to offer basic materials for pattern draft of shirts collars by making it possible to predict real collar shapes with 3D simulated images.

2. Method of study

1) Design for study: The design for this study is the shirts collar of dual structure that is composed of band collar and shirts collar.

2) Shirts collar terms

(1) Shirts Collar: In this study, it is defined to only collars which stand collar and shirts collar form one collar.

(2) Upper Collar: It is defined to collar that makes up of upper shape connected to stand collar.

(3) Raising Size of Stand Collar: It is a raising size from center front vertically for drawing shirts collar.

(4) Collar Drawing Space: It is a drawing space between stand collar and upper collar.

(5) Outside Length of Collar: It is a decision line of collar shape from upper collar center back line to collar point.

(6) Outside Angle of Collar: It is a decision part of shirts collar end shape which is an angle of the upper collar edge.

(7) Inside Angle of Collar: It is an angle for line that determines the end shape of the collar, which is an angle between upper collar and stand collar (Figure 1).
3) Making experimental clothes
(1) Using program: DC Suite Version 5.0 program from Seoul National University Digital clothing center was used to make 3D clothes for this study.
(2) Making experimental clothes
A. Making real experimental clothes: The material used in this study is 100% cotton muslin for excluding influence factors for visual evaluation.
B. 3D simulation: After making pattern in 3D, data which is applied properties of muslin is compared to real one.

4) Evaluation scale: The 25 items for the evaluation to measure shirts collar image are selected by extracting 25 adjectives from previous studies (Jang, 2004; Kim et al., 2010; Lee, 2009). Using seven point scale, high grade is for positive image. For example, if suggested image of photo is close to ‘clear’, it has 7 point but if it is close to image of ‘untidy’, it is 1 point.

5) Data Analysis: In this study, data was statistically analyzed through the SPSS WIN 18.0 program. One-way ANVOA was performed for comparisons of image evaluation by shirts collar and Duncan's multiple range tests were performed for comparisons of shirts collar image. T-test was performed to compare shirts collar image between 2D and 3D.

### 3. Results

The results of this study to find to various women’s shirts collar drafting methods and to recognize the difference by comparing shape of collars of clothes made in real and 3D simulated images. It intends to offer basic materials for pattern draft of shirts collars by making it possible to predict real collar shapes with 3D simulated images based on those data, is as follows.

1) The results of comparing shirts collar shape, it had some differences between real and 3D simulation pattern in spite of using same drafting method. The angle of collar to collar is proportioned the length of collar to collar. If the angle of collar to collar was small, the length of collar to collar was in proportion to short at real clothes but it had not to apply at 3D simulation pattern. Also, it had differences between inside angle and outside angle of collar.

2) The results of comparing fitting condition between real and 3D simulation clothes, three-dimensional effect of 3D simulation cloth had difference with real cloth. The collar shape had some differences in fitting condition

4) The results of evaluating real collar image, suit and office look’s collar of having professional, neat

4. Conclusion

This study found out complement parts for commercialization of 3D simulation clothes as looking into differences of image and pattern between the real and 3D simulation. Also, it offers useful information since it is possible to understand differences of image and pattern shape depending on the drafting methods.

However, because this study was accomplished one item of shirts collar, there will be limits to apply for all clothing. Therefore, studies for various clothing items will be in need.

7. Description:

This study mostly explores the current status about the implementation of mathematics content standards for high school in Taiwan. Collected data come from the math teachers’ surveys in high schools. In addition, researchers examine and compare the Common Core for USA and the Syllabus for Singapore.
Abstract

This study mostly explores the current status about the implementation of mathematics content standards for high school in Taiwan. These standards were modified and published for Grade 10 to Grade 12 students in 2010. Basically, these standards are absolutely important because the domains of math textbooks and later assessments are determined accordingly, so they have great influence on students’ learning. In fact, reforms in math education have been made over past two decades. Many changes are visible indeed, including curriculum, pedagogy and assessment. Particularly, many countries including Taiwan pay much effort in the reforms of curriculum.

Both of quantitative and qualitative data are collected and analyzed in this study. Most data come from the math teachers’ surveys in high schools. Some selected face-to-face interviews are also included. In addition, researchers examine and compare the following two documents which contain what students are expected to learn: (1) USA: Common Core State Standards for Mathematics (Published in 2010) and (2) Singapore: Primary Mathematics Syllabus and Lower Secondary Mathematics Syllabus (Implemented from 2007). Some findings and implications will be shared and discussed in the presentation.

Key words: learning expectation, opportunity to learn, guidelines(or standards).
The challenges of Integrated Curriculum (Beane, 1997) in a new school: A Principal’s view

Curriculum, Research and Development

Paper session

Setting up a brand new elementary school with limited resources is a challenge. Trialling a new model of curriculum, James Beane’s model of Integrated Curriculum (1997) using a democratic approach, which had not been used schoolwide in New Zealand before, proved to be another challenge. In this reflective narrative, the Foundation Principal of this new school, shares the evolution of the model and the unexpected results it brings.
The challenges of Integrated Curriculum (Beane, 1997) in a new school: A Principal’s view

Background:
The journey towards Curriculum integration first began when I was appointed as a Lecturer in a Bachelor of Teaching programme, in a well known New Zealand University. The programme I was employed to work in, used James Beane’s model of Curriculum Integration (p. 8, 1997) as a way of training teachers. Whilst I took the first year students through the traditional compartmentalised New Zealand curriculum documents (1993), as a member of the teaching team, I had a fast track learning experience about this model of curriculum which was the basis of the second and third year students learning. I then attended the Innovative Teaching and Learning Conference in Invercargill in 2003, and listened to Beane himself, and observed his wife Barbara Broadhagen in action, with a random group of local students. What I saw fascinated me, and began to whet my appetite to read and study more about this innovative model. The opportunity to put this knowledge (that I had begun to accumulate into practice), came three years later, when I was offered the chance to set up a brand new school, in a small rural setting, in a picturesque location, in the South Island of New Zealand.

Process:
The new school began with two classes and I was fortunate enough to be able to take one of our University graduates, who had won a position there, with me as a teacher in the school. As it was a brand new situation, the model of Curriculum Integration needed to be explained carefully to the Establishment Board (who were very excited about it), the parents and the students when they began at the school. Fortunately, the other classroom teacher, who had been working for many years experimenting with inquiry learning, found that this model provided, what she felt, was a logical next step.

Subject matter from the local context (personal integration) formed the initial basis for the children’s studies as there was much to do and set up, and the surrounding environment was very beautiful, and loaned itself to exploration in an integrated way. As it was a Special Character school, students then began to ask questions about the world around them more, the impact of our actions, about the environment, global warming and what they could do to solve issues in these areas began to emerge.
A group of five year olds decided to fundraise each month, to sponsor a World vision child, middle school children set about cleaning up the shores of the nearby lake, while senior students wrote to the City Council about the introduction of traffic lights in a busy intersection in the town, as part of their developing problem solving skills, which emerged from asking these questions.

Other skills such as social integration, began to emerge in students through opportunities to demonstrate citizenship, working collaboratively in groups and developing increasing self discipline for the students. The results of this integration was that as a school staff, we seemed to spend minimal time on behavioural issues and most of our time on learning. This was an unexpected positive spin off from the Curriculum Integration model.

Like Beane’s model of Curriculum Integration (1997), the model we used was student designed, (in that the children had the power to make decisions about what they studied), i.e. they suggested questions they wanted the answers to, and then they voted as a group over a few days to narrow this study question down, until there was agreement within the group about the specific questions to be answered in their study. The areas studied were generated from students’ personal and social concerns, by asking the students what questions they had about the world, or about themselves? What did they wonder about? What kept them awake at night?

These questions were grounded in the concept of democratic education (Beane, p. 50, 1997) with all students having one vote on what they should study, and with all voices being heard. In this way they began to develop the values of social justice and equal views for all. Respecting others was part of the school ethos which was based on the notion of treating others as you want to be treated, and the fact that while at school, students understood we worked together and supported one another as a family. There was a strong focus on inclusion in the school and involving everyone, no matter who they were, and as the school grew, so too did the number of students with special needs.

In this way, (as in Beane’s model) personal and social integration skills as well as a focus on democracy, dignity and diversity (pp. 8-9, 2005) were key components of the model developed.

The benefits of adopting the Curriculum Integration model were that student development needs were met, by providing intellectual challenge, and there was a greater sense of power and control provided for students over what they studied. Student initiated projects, particularly fundraising and ideas to reach out beyond themselves, also seemed to be increasingly prevalent.

This sense of involvement and control, led to a decrease in the occurrence of behavioural incidents in the classroom, due to higher interest levels by students. The other benefit of adopting this approach, was the fact that students had greater freedom and a greater range of ways in which they worked, making learning more interactive and providing greater flexibility in what they studied, how they studied it and how they presented their work and how it was assessed. Effectively students were involved at every step of the process and had a voice at each level.
Community experts were invited in to talk with students, providing community involvement in the school and this meant networks and connections were established locally, leading to an increase in the profile of the school which resulted in a growing presence in the community and roll growth.

Evidence of the development of democratic citizenship and entrepreneurialism increased in the students at the school over time. One savvy student offered to pay other children to vote for her question, which she really wanted answered! This made staff realise that some children very quickly grasped the notion of democracy and the power of the vote. Five year olds reaching out beyond themselves to sponsor a child (who was not as fortunate as they were) clearly demonstrated increasingly levels of citizenship and awareness about the world. The living of the values in the school and children’s willingness to move beyond the school and help in the community, for example cleaning up the lake and planting trees, demonstrated their citizenship not just to staff but to parents and others outside the school. Social action became an integral component at the end of each unit studied by the students, demonstrating to them the power they can have to be agents of change.

Over time, community stakeholders bought in more to the process, as they understood the Curriculum Integration model and began to see the benefits in the lives of their children. Weekly newsletters from the school (which were also given out at the library/church and available online), explained what the children were studying. Each term an invitation was extended to parents, Grandparents and friends of the school to attend an open afternoon/evening, where the children took their families/others around the school, and explained to them what they were learning. This developed social skills in the children.

Displays of childrens’ work were on the walls all around the school, with explanations of what they were learning, so that any person entering the school could see the Curriculum Integration process in action. The media was invited into school events and again this promoted the school, to the wider community, along with fortnightly assemblies, run by various classes providing an opportunity to showcase their work.

Teacher reports and feedback to parents helped them to understand the process of Curriculum integration and realise the benefits it brought to their children and the authentic learning opportunities provided. Self and peer assessment models involving students feedback became a regular feature of assessment in the school.

As a safeguard to ensure the national curriculum was being covered, staff worked hard to develop a model of curriculum coverage where they tracked back (over the course of a year) the questions studied by students and the curriculum areas these fitted into. In term 4, if there were gaps in curriculum coverage, these were met by deliberate teaching in particular areas, to ensure the requirement of a broad and balanced curriculum was met. The Principal then took this information one step further and developed it into a matrix of coverage at beginning, middle and senior school, to ensure students were not repeating areas over time. This became a most useful piece of information, for the staff team.
Reflecting back:

I believe the use of Curriculum Integration in our new rural primary school was very successful. Learning was described by students as “the best education ever”, others’ said they “learnt so much” and that there was “fun in their learning”. Student behaviour was generally excellent as students were highly motivated and very involved in their learning. As a staff, we were “purists” and this is often the best way to be. It is my belief on reflection, that we were naively successful, we made mistakes at times but learnt from these.

Challenges:

Some parents never seemed to endorse the model. Whether this was passive resistance or apathy on their part is unclear. The Ministry of Education audit review body, (ERO) which visited in the first year of the school’s opening was critical that the model was not fully developed but evolving, however as we explained this was the nature of the process. On their second visit three years later, they were far more complementary. The fact that Curriculum Integration with a democratic approach was a different model and not pre planned by teachers, was a challenge to the way things had always been done in our system and change often creates critics.

When I left the school after four years as Principal, it was in great heart, the roll had quadrupled, staff had a clear understanding of the model and were working together very effectively, and I believed that Curriculum Integration was firmly embedded in the school.

Abstract

We would like to discuss the Adaptive Collaborative Learning (ACL) on the Cloud Services, which integrates different systems and applications into one comprehensive system. The experimental pilot studies conduct on the ACL and provide further observation for applying the ACL. And we discuss the ACL would affect the Learning Fields.

1. Introduction

For many years we have in Japan neglected a focus on encouraging logical thinking and individual creativity in our schools. As a result, education in Japan is often perceived as cramming, with students often tending to avoid tackling harder conceptual problems. Instructors assess students not on originality but whether they adhere to a certain format. Hence, the challenges we face for the future of education are to find better ways to encourage students to think, create their own ideas, and achieve knowledge rather than responding with cookie-cutter predictability.

Project Based Learning (PBL) is an innovative instructional strategy that has been widely applied at educational institutions of variety of levels. PBL encourages students to engage in “real world” problem-solving investigations. It also allows students to autonomously conduct their study in a more constructive manner as well as develop the critical thinking skills of causal reasoning. Likewise, current Knowledge Management (KM) theories and practices have in many ways played equally important roles in corporations and educational institutions. KM and education share the same philosophies that play critical roles at many organizational levels that require an efficient understanding of their collective information and knowledge.

In this article, we would like to emphasize the importance of combination of PBL, KM, and Collaborative Learning on the Cloud and the incorporation of technology into education. We also would like to demonstrate how our approach enhances student skills and abilities by introducing case studies conducted at Chuo University in Japan. We describe the mechanism of human intellectual development and knowledge structuralizing process by studying topics in cognitive science as possible aids for new knowledge creation – categorization, metaphor, and metonymy.

In 21st century society, knowledge has attained independent value of its own. “Knowledge” in the networked society reflects the new value resulting from the dynamic interactions and sharing among knowledge of individuals’ and organizations’. Today, the rapid aging of the population amid
extremely low birthrate is pressing concerns to the Japanese society as it may threaten Japan’s most valuable assets for its established economy, its intellectual resources. Alike, this concern has spread among government, industries, and citizens.

In this paper, we introduce the Adaptive Collaboration Learning (ACL) and discuss its potentials in the new paradigm of the 21st century networked society. It is an innovative information technology system for knowledge creation based on the Cloud Computing and XML Web Services. It is a new system that produces dynamic and valuable interactions among human resources through sharing, interlocking, and collaborating with different types of knowledge.

2. Basic Concept of ACL and XML Web Services

We can envision a future business world where an organization no longer functions on its own but collaborates with a variety of other organizations. In other words, organizations will no longer need to stick to specific data or applications. Rather, they will need to be flexible enough to adopt appropriate objects according to each business model and project. Likewise, in the Ubiquitous Society, continuous innovations are always required, and collaboration and sharing knowledge within and outside of the organization are essential for survival. We can realize this knowledge sharing and management system-Adaptive Collaboration (AC)-by incorporation XML Web Services and iDC (Fig.1).

In terms of applying AC into e-Government and e-Local Governments, it is imperative to build a system as a Social System with the perspectives of users in mind instead of those of the system or service providers. The XML Web Services based e-Government and e-Local Government system will enable AC with utilizing SOAP/XML data sharing, dynamic data linking among governmental bodies, automatic linking and execution between application modules on the Web (Ohashi M. edi., 2004).

The XML Web Services enables us to automatically link the distributed applications online to realize AC. Automatically coordinating applications (objects) distributed on the Web may also present the optimum options for business and public services. Accordingly in the Ubiquitous Society, incorporating iDC and XML Web Services will provide a bridge between the traditional top-down, hierarchical organization and the horizontal business models. (Hori M. & Ohashi M., 2005b)

3. Experimental Pilot Study on Adaptive Collaboration

3-1. Implications of the study

In the Ubiquitous Society, open networked information systems are vital as they enable people to collaborate with others regardless of location and type of business. In that environment, we will experience shifts in our communications both in terms of quantity and quality. Not only “Human-to-PC,” but a new pattern of “PC-to-PC” will expand the dimension of communications. The information we share with others will include not only textual information but a disparate range of data and information, and including knowledge that is essential for decision making.

Therefore, the primal benefit of collaboration is the sharing of knowledge, information, and data with others. In order to realize this, there needs to be a space or “ba” where a variety of applications help users to produce new knowledge, information, and data that are appropriately shared and re-used among users. We conducted a demonstration experiment to examine technologies that are essential to build this knowledge sharing environment.

The information and knowledge sharing space has two distinctive attributions – static and dynamic. One is that it statically unifies the management of information and related behaviors, and the other is that it adds actions to make it adaptive to the dynamic operation processes. The stored data are structured for the purpose of re-use, hence it is also the “ba” that encourages knowledge recycling.

Since there are many possible operations imaginable that are suited for the Adaptive Collaboration, its goal is to provide users with a workspace to accomplish their own tasks instead of simply offering functions such as word processing or spreadsheet applications. The workspace may offer email and bulletin board services or document management services. The possibilities are infinite as it is also able to integrate specialized applications for each operation into the user interface.

3-2. Requirement and Purpose of the Study

For successful collaboration, it is essential that data, information, and knowledge are continuously stored and can be shared among many individuals. In order to do so, it is critical not only to build a reliable infrastructure and developed network, but also to consider how the data should flow on the network along with how the data should be applied and utilized. For certain fields, it is strongly preferred that contents still be usable without depending on specific applications or software, or when values are changed 100-200 years from today. That is, data and content need to be constantly viewed, utilized, and processed by many users. Furthermore, the system needs to be flexible enough for the distribution and re-use of data and content as they might be stored at dispersed locations at different times.

Therefore, the essential requirements for AC are the following: 1) users are geographically-dispersed and belong to different organizations, 2) knowledge information is easy to store and retrieve, and long-term information storage needs to be safe and secure, 3) knowledge information needs to be available for high-level statistical processing and analysis, and 4) it operates uninterruptedly, and it is low in cost and highly-reliable.

The purpose of the study is to realize the real-time AC environment through data sharing. For this purpose, we conducted the following experiments: 1) a demonstration experiment on the Storage Management which enables users to share information located in the iDC storage, 2) a demonstration experiment on data management by applying XML Web Services into the real-time collaborative work system through data sharing(Ohashi M.,edi,2004,2003a)(Web Services Initiative,2005).
3-3. Experimental Methods

For ensuring the durability and universality of data, it is important to standardize a character encoding scheme and data structure as well as a system that reconstructs and personalizes data according to the need of a user. In terms of data structure, it is necessary to standardize data format that is both open and global for the purpose of information transmission and distribution across the world. In terms of personalization, it is indispensable to consider how to systemize knowledge so that a system could tailor and reconfigure data for each user depending on a situation to utilize stored data. Collaboration can be divided into three categories from the perspectives of a long term use, “ba” on the Internet, and application of the XML Web services technology into digital data: 1) intensive utilization of network infrastructure, 2) network utilization for information and knowledge, and 3) integrated utilization of distributed data in a large area.

In order to realize this open and flexible data structure and information distribution, it is necessary to conduct demonstration experiments in the following ways:

- Providing and integrating an Active utilization environment and a Static, long term environment on the network, an Adaptive space.
  - MAN (Metropolitan Area Network + iDC (Internet Data Center)
- Building an environment with the XML Web Services technology that is independent of a system and application.

In order to examine the feasibility of these mentioned above, we conducted a demonstration experiment. First, we examined the possibility of collaboration among corporations, universities, and research institutions by building an information sharing environment prior to applying XML Web Services into the data management system which utilizes the information stored within the iDC. Second, we examined the effectiveness of the data storage system and evaluated whether the external applications are capable of high-level utilization such as its proficiency of producing knowledge out of information, presenting data effectively, and storing know-how (Fig. 2).

3-4. Results of the Experiment

The demonstration experiment proved that real-time discussion with sharing data and resources among the geographically-dispersed teams was possible. Furthermore, we confirmed that it is
possible to collaboratively edit and process image data between remote locations using a high-speed network.

For the future agenda, if we plan the long-term use of the system, it is necessary to consider how to manage the Web services and how to develop and spread its computer architecture in corporations. In other words, in order to administer the relationship between different Web services on the multivendor delivery platform, it is necessary to consider how to manage many different components involved in this system such as network operation management, service management, and Web Services management including ERP, CRM, SCM, EAI, and, EC.

Physically storing files and data and keeping them readable for a long time do not necessarily mean keeping them understandable for a long time. It is critical for a variety of systems to be able to cooperate in order to process diverse data while extensively accessing meaningful data. To facilitate this, it is essential to utilize a unified meta-standard technology such as XML, and to add autological, self-explanative description onto data themselves.

4. Conclusion

The Adaptive Collaborative Learning, which has drawn attention as a new network system that supports the future Ubiquitous Society. The ACL is capable of functioning with the legacy system that has been widely utilized in organizations while integrating a number of different applications seamlessly. With these beneficial features, more innovative business activities can be conducted such as sharing the order information across the organization, improving efficiency in CRM, risk management, delivery management, profit-cost management, cash flow accounting, balance sheet adjustment, account receivable factoring, updating and comparing the transition of sales, and making strategic decision and setting practical business goals.

The ACL is the most versatile system that facilitates to realize the AC in the Ubiquitous Society. For instance of incorporating the XML Web Services, since it is solely application/system independent, this also assists the flexible coordination with other systems and creates a seamless environment for the user hence it is highly functional as a core system.

The Ubiquitous Society is a society grounded upon the collaboration around human knowledge within organizations and individuals. The biggest bottleneck of the ACL might not be the difficulties in developing the technologies and infrastructures. Rather, it might be the introverted and closed nature of human beings.

Acknowledgement

This paper is mainly based on work in the project funded by Scientific research fund of MEXT(the Ministry of Education, Science and Culture). This paper is also based on work in the research project of Institute of Cultural Science of Chuo University. We would like to thank MEXT and the project members of Chuo University for their help in gathering information in preparing this paper.

Co-constructing strategies for success with students with Dyslexia in a Tertiary education setting in New Zealand: A Practitioner’s view

Special Education

Paper session

Barbara Fogarty-Perry,
Disability Adviser,
Student Success,
Otago Polytechnic,
PO Box 1910
Dunedin,
New Zealand.

Email: Barbara.fogarty@op.ac.nz

This presentation outlines the partnership and strategies developed with students to support others with dyslexia, in a range of post-secondary programmes, in a New Zealand Polytechnic.

By working on the provision of a range of approaches, from talking with the students themselves to find out what they needed to succeed, and then getting these students together regularly, they became less isolated and empowered to share ideas with one another. Strategies that worked for different students were demonstrated and shared along with a range of ICT applications to support learning. Working with staff across the institution to build capability in how to support students with dyslexia, occurred at the same time, as well as providing a range of other supports. This paper explores the ways in which students with dyslexia can be supported in post-secondary settings to succeed and the challenges this can present.
Co-constructing strategies for success with students with Dyslexia in a Tertiary education setting in New Zealand: A Practitioner’s view

By Barbara Fogarty-Perry,
Disability Adviser,
Student Success,
Otago Polytechnic,
Dunedin,
New Zealand.

barbara.fogarty@op.ac.nz

Background:

With over 40% of students who are active users of the Disability Support Service at Otago Polytechnic in 2015, identifying as dyslexic, this area became the focus of research and development for the Disability Advisory Service. From professional readings and research, attendance at workshops, discussion with colleagues and partnering with students themselves, a list of strategies along with a range of approaches enabling students to succeed, have emerged.

This presentation outlines the way the partnership developed, along with the range of strategies which enabled students with dyslexia to succeed in passing their assessments at a Higher Education level.

Definitions:

Dyslexia, (which has multiple definitions), is defined by the Ministry of Education in New Zealand as “a spectrum of specific learning difficulties and is evident when accurate and/or fluent reading and writing skills, particularly phonological awareness, develop incompletely or with great difficulty. This may include difficulties with one or more of reading, writing, spelling, numeracy, or musical notation. These difficulties are persistent despite access to learning opportunities that are effective and appropriate for most other children” (MOE, 2015).

Mike Styles from Ako Aotearoa describes dyslexia as “a specific literary condition where people have significant difficulties in reading and writing and spelling” He goes on to discuss the difference between fluid intelligence (ability to think logically and solve problems in novel situations) compared to crystalline intelligence (intelligence based on experience and skills such as reading and writing), commenting that dyslexic people have at least average fluid intelligence, but are limited in their crystalline intelligence caused by phonological decoding issues (Styles, p.1, 2015).

The British Dyslexia Association (2015) defines dyslexia as “a specific learning difficulty that mainly affects the development of literacy and language related skills. It is likely to be present at birth and to be life-long in its effects. It is characterised by difficulties with phonological processing, rapid
naming, working memory, processing speed, and the automatic development of skills that may not match up to an individual's other cognitive abilities”.

Dyslexia affects a broad range of students in different ways via:

- Auditory processing – how the brain recognises and interprets sounds
- Language processing – affecting comprehension/oral language skills
- Visual processing – visual discrimination and visual memory skills
- Auditory/visual integration – ability to follow instructions
- Memory – recall and comprehension skills
- Attention – focus/easily distracted

Reading Rockets, (n.d.)

Process:

The process began when an increasing number of students with dyslexia identified their condition and requested support from the Disability Support Service at Otago Polytechnic at the beginning of 2015. Assessment documentation was provided to the service from each student, and after discussion with colleagues and attendance at Ako Aotearoa workshops around “Supporting Adult Dyslexics in tertiary education and training”, and talking with students themselves, common strategies began to emerge, for what worked for these students.

A support group was established for students with dyslexia at Otago Polytechnic and lunch was provided. An ICT expert was invited to attend to support the use of applications and online support. Initially students were shy and reluctant to share what worked for them, but over time, they became more comfortable with one another and began to share their own successes and strategies. These strategies were recorded and formulated into an evolving list. The ICT expert brought other ideas to the group from online research and demonstrated various functions of computer applications, for example in MS Word, which helped students access these and ideally they were free, so no cost was involved. Other students shared ideas such as using cellphones to video lectures, accessing podcasts, and trialling mindmapping tools to assist with note taking and writing. This group encouraged students to feel less isolated and encouraged them to share what worked well with others, co-constructing a collective body of knowledge together.

Workshops for lecturing staff were then held to build capability in the organisation, in both face to face and online forums and these were run collaboratively by the Disability Advisory and Learning Advisers. Collaborative sharing amongst Lecturers developed an environment where all could learn together (Maori concept of Ako). The Disability Adviser then attended a regional workshop and requested that this area be placed on the agenda for discussion with other Disability Advisers, across the South Island of New Zealand. A sub-group was formed informally as a result of this network, and through email and face to face conversations, once again strategies for success and ICT applications (many of which the students themselves spoke about) were shared, which had the effect of affirming what was already happening at Otago Polytechnic in the area of Disability Support, for students with dyslexia.

Strategies:

Strategies that worked for students with dyslexia as shared by the students included the following:

- Drama helps commit information to memory
- Clearly (part of Evernote) changes fonts, background, overlays, colour
- Dyslexia Friendly (specific font designed for dyslexics in 2014)
Examples of these strategies in action included two Nursing students who requested peer support and additional exam time. Both of these students passed with As and Bs in their exams and feedback, given from the students at the end of exam time, indicated how helpful these supports were for them. An engineering student with Dyslexia and Irlin’s syndrome, passed all of his exams with additional time and overlays, as well as pre-arranged positioning for natural lighting in the exam room, and during class time.

Additional time and the use of Note takers (other students), peer tutors and Reader Writers were provided to other students studying for Sports Management Degrees and Horticultural Diplomas during the semester and this ensured they were given additional support to process information and extra time was provided during exams for the students to process information. They all passed their courses.

A dyslexia friendly environment has a range of characteristics present according to the British Dyslexia Association (2014), such as attention to paperwork, for example, font size, background colour and the availability of overlays if required by students. The use of Powerpoint presentations with pastel backgrounds, Arial fonts of size 12-14, as well as assistive technology, staff training and supportive Managers all combine to create a supportive environment for dyslexics to help them succeed.
Challenges:

Challenges throughout this process involved finding the right ICT expert who would investigate and follow through on student ideas and suggestions. Costs and licensing issues can preclude students from accessing programmes such as Dragon Naturally Speaking, for example, this programme was ordered for two students but in the end they could not afford it. Assessments for students to initially identify as dyslexic are also expensive and this can create a barrier for students to access support in the early stages and to identify as dyslexic.

Summary:

While the list and the group continues to grow, research in the field of Dyslexia is a relatively young discipline. It is vital to continue to share ideas with one another and learn together in order to continue to build on this increasing body of knowledge at all levels for the benefit of those who are dyslexic.

2016 Conference Proceedings

We would like to thank all those who attended the 2016 Hawaii International Conference on Education. We look forward to seeing you at the 15th Annual Conference to be held in January 2017. Please check the website this February for dates and further details.

To search for a specific paper presented, or to browse all of the proceedings, please click the appropriate button on the right.
